<td>The time in the current user’s display format and time zone. The parameter must be formatted using the current user’s preferred display format, such as HH:mm:ss.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var gt = new GlideTime();
gt.setDisplayValue('01:00:00');  // User Time Zone
gs.info(gt.getDisplayValueInternal());  // User Time Zone

**Scoped GlideTime - setValue(String o)**

Sets the time of the GlideTime object in the internal time zone.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>o</td>
<td>String</td>
<td>The time in hh:mm:ss format.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var gt = new GlideTime();
gt.setValue('01:00:00');  //Internal Time Zone, UTC
gs.info("time is "+ gt.getByFormat('hh:mm:ss'));

**Scoped GlideTime - subtract(GlideTime startTime, GlideTime endTime)**

Gets the duration difference between two GlideTime object values.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startTime</td>
<td>GlideTime</td>
<td>The start value.</td>
</tr>
<tr>
<td>endTime</td>
<td>GlideTime</td>
<td>The end value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideDuration</td>
<td>The duration between the two values.</td>
</tr>
</tbody>
</table>

```javascript
var gd1 = new GlideTime();
gd1.setDisplayValue("09:00:00");
var gd2 = new GlideTime();
gd2.setDisplayValue("09:10:00");

var dur = GlideDate.subtract(gd1, gd2); //the difference between gdt1 and gdt2
gs.info(dur.getDisplayValue());
```

### GlideTimeline - Global

The GlideTimeline class provides the core implementation for configuring and displaying a Glide Windowing Toolkit Timeline.

For security, the GlideTimeline has already been instantiated as a single instance variable named glideTimeline. All configurations should be made in the client script section of the corresponding schedule page that references this instance variable.

### GlideTimeline - groupByParent(Boolean b)

Specifies whether or not to group timeline items by their parent. If true, this will nest all child items inside their parent. This affects the ordering of display and children will always be listed immediately after their parent. The default value for the groupByParent property is false.

If true, this will nest all child items inside their parent. This affects the ordering of display and children will always be listed immediately after their parent. The default value for the groupByParent property is false.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If true, displays Timeline Items grouped by parent.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.groupByParent(true);
```

**GlideTimeline - registerEvent(String strServerEvent, String strScriptIncludeName)**

Registers the specified Timeline server event. The `strServerEvent` must be one of the allowed events for registration to work correctly. When the event occurs, the GlideTimeline sends a request to the server and processes the event as handled inside the `strScriptIncludeName` class.

The `strServerEvent` must be one of the allowed events for registration to work correctly. When the event occurs, the GlideTimeline sends a request to the server and processes the event as handled inside the `strScriptIncludeName` class.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strServerEvent</td>
<td>String</td>
<td>Specifies one of the following case-sensitive events:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• getItems</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementMoveX</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementMoveY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementMoveXY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementSuccessor</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementTimeAdjustStart</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• elementTimeAdjustEnd</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• inputBox</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• itemMove</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strScriptIncludeName</td>
<td>String</td>
<td>Specifies the name of the class to receive the <code>strServerEvent</code>. This class must be defined in a script include that extends AbstractTimelineSchedulePage.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

`glideTimeline.registerEvent("getItems", "TimelineGanttSchedulePage");`

**GlideTimeline - setAutoRefresh(Number intSeconds)**

Specifies the number of seconds to wait before performing an auto refresh of the data on the timeline. Setting the number of seconds to 0 will turn auto refresh off. By default, auto refresh is disabled. If `intSeconds` is greater than 0 and less than the minimum allowed time in seconds (10), it will be set to 10 seconds.

Setting the number of seconds to 0 will turn auto refresh off. By default, auto refresh is disabled. If `intSeconds` is greater than 0 and less than the minimum allowed time in seconds (10), it will be set to 10 seconds.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>intSeconds</td>
<td>Number</td>
<td>An integer specifying the time in seconds between auto-refreshing.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

`glideTimeline.setAutoRefresh(15); // Sets the interval for auto-refreshing to 15 seconds.`
GlideTimeline - setDefaultPointIconClass(String icon_class)

Specifies the default icon class to use for Timeline Spans with zero duration if no icon class was explicitly specified in the properties of the Timeline Span returned from the server. The default value for the setDefaultPointIconClass property is milestone.

The default value for the setDefaultPointIconClass property is milestone.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>icon_class</td>
<td>String</td>
<td>String that specifies one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• milestone</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• blue_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• sepia_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• green_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• red_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• black_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• blue_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• sepia_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• green_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• red_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• black_circle</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
glideTimeline.setDefaultPointIconClass('blue_circle');
```

GlideTimeline - setExtraAjaxParam(String strName, String strValue)

Allows setting of additional parameters in the client script to be made available to the corresponding Script Include events by using the getParameter() method. URI parameters that are prefixed with sysparm_timeline_ will automatically be included in all server side AJAX calls.
URI parameters that are prefixed with `sysparm_timeline_` will automatically be included in all server side AJAX calls.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strName</td>
<td>String</td>
<td>The URI parameter name.</td>
</tr>
<tr>
<td>strValue</td>
<td>String</td>
<td>The value of strName.</td>
</tr>
</tbody>
</table>

**GlideTimeline - setInitialViewRange(String objStartDate, String objEndDate)**

Specifies the initial viewable range for the timeline. The format of the start and end dates must be in the default timestamp format: `yyyy-MM-dd HH:mm:ss`. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

The format of the start and end dates must be in the default timestamp format: `yyyy-MM-dd HH:mm:ss`. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objStartDate</td>
<td>String</td>
<td>The start time of the view range in format: <code>yyyy-MM-dd HH:mm:ss</code> .</td>
</tr>
<tr>
<td>objEndDate</td>
<td>String</td>
<td>The end time of the view range in format: <code>yyyy-MM-dd HH:mm:ss</code> .</td>
</tr>
</tbody>
</table>
### GlideTimeline - setInitialViewRange(Number objStartDate, Number objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objStartDate</td>
<td>Number</td>
<td>The start time of the view range in milliseconds.</td>
</tr>
<tr>
<td>objEndDate</td>
<td>Number</td>
<td>The end time in milliseconds.</td>
</tr>
</tbody>
</table>

```javascript
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM and end on June 28th, 2010 at 2:00 PM UTC time.
glideTimeline.setInitialViewRange("2010-06-20 08:00:00", "2010-06-28 14:00:00");
```

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM and end on June 28th, 2010 at 2:00 PM UTC time.
glideTimeline.setInitialViewRange(1277046000000, 1277647200000);
```
GlideTimeline - setInitialViewRange(String objStartDate, Number objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objStartDate</td>
<td>String</td>
<td>The start time of the view range in format: yyyy-MM-dd HH:mm:ss.</td>
</tr>
<tr>
<td>objEndDate</td>
<td>Number</td>
<td>The end time in milliseconds.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example Explanation

```javascript
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM and end on June 28th, 2010 at 2:00 PM UTC time.
glideTimeline.setInitialViewRange("2010-06-20 08:00:00", 1277647200000);
```

GlideTimeline - setInitialViewRange(Number objStartDate, String objEndDate)

Specifies the initial viewable range for the timeline. The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.

The default range is the range that specifies the earliest Timeline Span point to the end of the latest Timeline Span. If the `initialViewRange` property is specified, it will override the default range.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objStartDate</td>
<td>Number</td>
<td>The start time of the view range in milliseconds.</td>
</tr>
<tr>
<td>objEndDate</td>
<td>String</td>
<td>The end time of the view range in format: yyyy-MM-dd HH:mm:ss.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### Example Explanation

```java
// Sets the initial range to begin on June 20th, 2010 at 8:00 AM and end on June 28th, 2010 at 2:00 PM UTC time.
glideTimeline.setInitialViewRange(1277046000000, "2010-06-28 14:00:00");
```

### GlideTimeline - setReadOnly(Boolean b)

Enables or disables all timeline event interaction. If enabled, event interaction is determined from the corresponding attributes specified by each Timeline Item. The default value for the `readOnly` property is `false`.

If enabled, event interaction is determined from the corresponding attributes specified by each Timeline Item. The default value for the `readOnly` property is `false`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If <code>true</code>, marks the entire timeline as <code>read-only</code> (non-interactive).</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.setReadOnly(true);
```
GlideTimeline - showDependencyLines(Boolean b)

Specifies whether or not to show dependency lines between Timeline Spans. This method applies only if the set of Timeline Items returned from the server includes dependency relationships. The default value for the showDependencyLines property is **false**.

This method applies only if the set of Timeline Items returned from the server includes dependency relationships. The default value for the showDependencyLines property is **false**.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If <strong>true</strong>, displays dependency lines on the timeline; otherwise, does not.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.showDependencyLines(true);
```

GlideTimeline - showGridLines(Boolean bShowGridlines, Number amount)

Specifies whether or not to show grid lines for each row of data on the timeline. By default, grid lines are enabled.

By default, grid lines are enabled.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bShowGridlines</td>
<td>Boolean</td>
<td>If <strong>true</strong>, timeline shows grid lines; otherwise, does not display grid lines.</td>
</tr>
<tr>
<td>amount</td>
<td>Number</td>
<td>amount</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td>ReturnValue</td>
</tr>
</tbody>
</table>

```
glideTimeline.showGridLines(false); // Disables grid lines.
```

**GlideTimeline - showLeftPane(Boolean b)**

Specifies whether or not to show the left hand pane in the timeline. The default value for the `leftPane` property is `true`.

The default value for the `leftPane` property is `true`.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If <code>true</code>, the timeline shows the left pane; otherwise, the left pane is not be displayed.</td>
</tr>
</tbody>
</table>

```
glideTimeline.showLeftPane(false);
```

**GlideTimeline - showLeftPaneAsTree(Boolean b)**

Specifies how to show child items in the left pane of the timeline. Child items are displayed either as nested, indented nodes with expand and collapse capability or on a single indent level. The default value for the `showLeftPaneAsTree` property is `false`.

The default value for the `showLeftPaneAsTree` property is `false`. 
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If true, child item nodes are shown as indented with expand/collapse capability; otherwise, all left pane items are displayed at a single indent level.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
glideTimeline.showLeftPaneAsTree(true);```

**GlideTimeline - showLeftPaneInputBox(Boolean b, String strDefaultValue)**

Specifies whether or not to show the text input box at the bottom of the left pane with a default value as specified by `strDefaultValue`. If the left pane is disabled via `showLeftPane()`, the input box will not be visible. The default value for the `showLeftPaneInputBox` property is `false`.

If the left pane is disabled via `showLeftPane()`, the input box will not be visible. The default value for the `showLeftPaneInputBox` property is `false`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If true, show the left pane input box.</td>
</tr>
<tr>
<td>strDefaultValue</td>
<td>String</td>
<td>The default value to display in the input box.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
glideTimeline.showLeftPaneInputBox(true, 'Add a new task ...');```
GlideTimeline - showSummaryPane(Boolean b)

Specifies whether or not to show the summary pane at the bottom of the timeline. The default value for the showSummaryPane property is true.

The default value for the showSummaryPane property is true.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If true, the timeline includes the summary pane; otherwise, the summary pane is not displayed.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.showSummaryPane(false);
```

GlideTimeline - showTimelineText(Boolean b)

Specifies whether or not to show the timeline text underneath each Timeline Span in the primary timeline pane. The default value for the showTimelineText property is false.

The default value for the showTimelineText property is false.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If true, displays descriptive text underneath each Timeline Span; otherwise, no text is displayed underneath each Timeline Span.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.showTimelineText(true);
```
GlideTimeline - snapVertScrollingIntoRows(Boolean b)

Specifies whether or not the vertical movement of timeline span objects (if appropriately registered to perform this event) should snap adjust into the closest row. By default this value is enabled.

By default this value is enabled.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>b</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

GlideTimeline - sortByLeftLabelText(Boolean b)

Specifies whether or not to group items by their left label text. The default value for the sortByLeftLabelText property is false.

The default value for the sortByLeftLabelText property is false.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>b</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

glideTimeline.snapVertScrollingIntoRows(false);

GlideTimeline - sortByLeftLabelText(Boolean b)

Specifies whether or not to group items by their left label text. The default value for the sortByLeftLabelText property is false.

The default value for the sortByLeftLabelText property is false.
glideTimeline.sortByLeftLabelText(true);

**GlideTimeline - sortByStartDate(Boolean b)**

Specifies whether or not to sort the list of Timeline Items returned by the earliest start date of an item's Timeline Span objects. If `groupByParent()` is set `true`, items are sorted after grouping has occurred. The default value for the `sortByStartDate` property is `false`.

If `groupByParent()` is set `true`, items are sorted after grouping has occurred. The default value for the `sortByStartDate` property is `false`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If <code>true</code>, sort Timeline Items chronologically starting with their earliest start date.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

glideTimeline.sortByStartDate(true);

**GlideTimeline - sortByTimelineLabelText(Boolean b)**

Specifies whether or not to sort the list of Timeline Items returned in alphabetical order according to the text that was specified to show in the Timeline Pane.

⚠️ **Note:** This sort order still applies even if the timeline text has been set `false` via the `showTimelineText()` method. Additionally, if `groupByParent()` is set `true`, items will be sorted appropriately after grouping has occurred.

The default value for the `sortByTimelineLabelText` property is `false`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>If <code>true</code>, sorts Timeline Items alphabetically by the text specified in each item's timeline span text.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
glideTimeline.sortByTimelineLabelText(true);
```

**GlideTimelineItem - Global**

`GlideTimelineItem` extends the abstract `ScheduleItem` class to define additional properties that are specific to the time line.

A time line item is essentially any item that is displayed in a singular row across the time line. A `GlideTimelineItem` has zero or more associated spans (`TimelineSpan` objects).

**GlideTimelineItem - createTimelineSpan(String tableName)**

Creates a new `TimelineSpan` object associated with the current instance object.

If no other `TimelineSpan` objects exist, the newly created object will share the same `sys_id` as current instance object. Otherwise, a randomly generated GUID will be used.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The name of the table associated with current object.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The newly-created span object instance.</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - createTimelineSpan(String tableName, String sys_id)**

Creates a new `TimelineSpan` object associated with the current instance object using the specified table and `sys_id`.
### GlideTimelineItem - getImage()

Returns a string specifying the name of the image file associated with the current GlideTimelineItem.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the image file associated with the current GlideTimelineItem. If no image is associated with the current item, an empty string (&quot;&quot;) is returned.</td>
</tr>
</tbody>
</table>

### GlideTimelineItem - getIsDroppable()

Indicates whether or not the current instance object should be allowed as a "drop zone" when moving timeline elements vertically.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### GlideTimelineItem - getImage()

Returns a string specifying the name of the image file associated with the current GlideTimelineItem.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the image file associated with the current GlideTimelineItem. If no image is associated with the current item, an empty string (&quot;&quot;) is returned.</td>
</tr>
<tr>
<td>Returns</td>
<td></td>
</tr>
<tr>
<td>-------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Boolean</td>
<td>True if droppable; false otherwise.</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - getLeftLabelText( )**

Returns the text to be displayed in the left pane (if enabled).

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the text to be displayed in the left pane.</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - getParent( )**

Returns the unique `sysId` of the current GlideTimelineItem's parent object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The unique sysId of the current GlideTimelineItem's parent object. If the parent does not exist, this will return an empty string (&quot;&quot;).</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - getTimelineSpans( )**

Returns all the `TimelineSpan` objects associated with the current instance in an ArrayList.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The list of TimelineSpan objects associated with the current instance.</td>
</tr>
<tr>
<td>Array</td>
<td></td>
</tr>
</tbody>
</table>

GlideTimelineItem - GlideTimelineItem(String tableName)

Create a "dummy" GlideTimelineItem object.

This is useful for creating rows that do not allow any YMoving into; however, contain nested children (e.g. The top-level "Users" row in the Group Resource Timeline). The sys_id needs to be unique for DOM level functions to parse correctly. By default this object will not be "droppable" because a table name was not specified.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The name of the table associated with current object.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

GlideTimelineItem - GlideTimelineItem(String tableName, String sys_id)

Constructor that sets the required table and sys_id properties.

The rest of this object’s properties should be set by the caller. By default, this object instance is "droppable" since a table name is specified.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The name of the table associated with current object.</td>
</tr>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The sys ID for the object.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

GlideTimelineItem - isTextBold()

Indicates if the left pane text is set to be displayed using a bold style.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the text should be bolded; otherwise false.</td>
</tr>
</tbody>
</table>

GlideTimelineItem - setImage(String strImageName)

Sets the name of the image file (including it's path) to use as the icon for the item in the left pane.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strImageName</td>
<td>String</td>
<td>The name of the image, including its path.</td>
</tr>
<tr>
<td>Returns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>void</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**GlideTimelineItem - setIsDraggable(Boolean b)**

Sets whether or not the current instance object can be clicked and dragged into another GlideTimelineItem.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>b</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - setLeftLabelText(String strText)**

Specifies the text to display in the left pane for this item.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>strText</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**GlideTimelineItem - setParent(String sysId)**

Sets the parent of the current GlideTimelineItem.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>The sysID of the GlideTimelineItem that should become the parent of the current GlideTimelineItem.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**GlideTimelineItem - setTextBold(Boolean b)**

Specifies whether or not to bold the text style of the item in the left pane.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>Boolean</td>
<td>True if text in left pane should be bolded; otherwise false.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**GlideTransformLog - Scoped, Global**

Creates a GlideTransformLog object to log messages to localhost logs.

**Related information**

- GlideImportLog
- GlideImportSetRun
- GlideImportSetTable
- GlideImportSetTransformer
- GlideImportSetTransformMap

**GlideTransformLog - error(String message)**

Logs a message of type Error to localhost logs.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Transform log message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var importLog = new GlideTransformLog();
importLog.error('Error executing transform');
```

#### GlideTransformLog - GlideTransformLog()

Instantiates an GlideTransformLog object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var importLog = new GlideTransformLog();
```

#### GlideTransformLog - info(String message)

Logs a message of type Info to localhost logs.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Transform log message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
```javascript
var importLog = new GlideTransformLog();
importLog.info('Successfully executed the transform.');
```

**GlideTransformLog - warn(String message)**

Logs a message of type Warn to localhost logs.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Transform log message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var importLog = new GlideTransformLog();
importLog.warn('Transform taking longer than expected');
```

**GlideUICompatibility - Scoped**

The scoped GlideUICompatibility class provides the ability for scoped applications to define their own minimum browser versions. This is done by creating system properties for the scoped application.

You create the properties using the sys_properties list and assign a version number. When you do this from the scoped application, the `<scope-name>` prefix is automatically added to the property name. The scoped application UI compatibility properties are:

- `<scope-name>.ui.ie_minimum`
- `<scope-name>.ui.chrome_minimum`
- `<scope-name>.ui.firefox_minimum`
- `<scope-name>.ui.safari_major_version_minimum`

You can then use the scoped GlideUICompatibility class to determine if the current browser is supported.

**Scoped GlideUICompatibility - getCompatibility()**

Returns the terms "block" or "allow" based upon the browser version.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Either block or allow</td>
</tr>
</tbody>
</table>

```
UICompatibility = new GlideUICompatibility(gs.getCurrentScopeName());
var blockOrAllow = UICompatibility.getCompatibility();
gs.info(blockOrAllow);
```

Output: allow

**Scoped GlideUICompatibility - GlideUICompatibility(String scopeName)**

Creates a GlideUICompatibility object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopeName</td>
<td>String</td>
<td>The application's scope name</td>
</tr>
</tbody>
</table>

**Scoped GlideUICompatibility - isBlocked()**

Determines if the browser is not supported.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the browser is not supported.</td>
</tr>
</tbody>
</table>
UICompatibility = new GlideUICompatibility(gs.getCurrentScopeName());
var blocked = UICompatibility.isBlocked();
gs.info(blocked);

Output: false

**GlideUIScripts - Client**
Access UI scripts from within client-side code.

There is no constructor for this class. Access methods using the g_ui_scripts global object in any client-side code, such as client or validation scripts.

If calling a UI script with UI Type set to Mobile / Service Portal, use the g_ui_scripts['nameOfScript'] syntax. If calling a UI script with the UI Type set to All or Desktop, use the getUIScript() method to load the script. However, this method is not supported in Internet Explorer 11 when called outside of the Angular application environment. If calling a UI script outside of an Angular context using IE11, you must call the script directly.

⚠ **Note:** This class does not support UI scripts with the Global field set to true.

**GlideUIScripts - getUIScript(String scriptName)**
Calls a UI script with the UI Type set to All or Desktop from a client script or other client-side code. Returns a promise.

Use the then() function to perform an asynchronous action after the call resolves.

⚠ **Note:** This method is not supported in Internet Explorer 11 when called outside of the Angular application environment. If calling a UI script outside of an Angular context using IE11, call the script directly using the g_ui_scripts['nameOfScript'] syntax.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scriptName</td>
<td>String</td>
<td>API name of the UI script to run.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Promise</td>
<td>The result of the asynchronous call.</td>
</tr>
</tbody>
</table>
function onLoad() {
  // Call the UI script directly if the UI Type is Mobile / Service Portal, for example:
  // g_ui_scripts['myUIScript'];

  // Use the method if the UI Type is All or Desktop
  g_ui_scripts.getUIScript('myUIScript').then(function(script) {
    script.myUIScriptMethod();
  }, function() {
    console.log('The script did not load');
  });
}

**GlideURI - Global**

Enables handling the URI parameter.

For more information on using URIs:

- Navigate by URL
- Navigation stack

See also `action - getGlideURI()`.

**GlideURI - deleteMatchingParameter(String match)**

Deletes one or more parameters from the URI that match the beginning of the provided string.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match</td>
<td>String</td>
<td>Partial name of one or more parameters to remove from the query portion of a URI.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to delete URI parameters that partially match the name provided.

```javascript
// create the GlideURI object
var uri = action.getGlideURI();
```
uri.deleteMatchingParameter('sysparm_list_');
uri.deleteMatchingParameter('sysparm_record_');

**Scoped equivalent**
This method is not available in scoped applications.

**GlideURI - deleteParameter(String name)**
Removes a specified parameter from the query portion of the URI.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to delete a URI parameter.

```java
// create the GlideURI object
var uri = action.getGlideURI();

uri.deleteParameter('sysparm_referring_url');
```

**Scoped equivalent**
This method is not available in scoped applications.

**GlideURI - get(String name)**
Returns the value of the specified parameter.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>
## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value for the specified parameter.</td>
</tr>
</tbody>
</table>

```javascript
// create the GlideURI object
var uri = action.getGlideURI();
uri.set('sysparm_query', 'priority=2^active=true');
var fileString = uri.get('sysparm_query');
gs.info(fileString);
```

### Output:

```
priority=2^active=true
```

### Scoped equivalent

To use the `get()` method in a scoped application, use the corresponding scoped method: **GlideURI - `get(String name)`**.

### GlideURI - `getFileFromPath()`

Returns the file name portion of the URI.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var gURI = action.getGlideURI();
var fileString = gURI.getFileFromPath();
gs.info(fileString);
```

### Scoped equivalent

To use the `getFileFromPath()` method in a scoped application, use the corresponding scoped method: **GlideURI - `getFileFromPath()`**.
**GlideURI - getMap()**

Returns a map (key value pairs) containing each parameter in the query and its associated value.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to get `sysparm_query` parameters. See also `action - getGlideURI()`.

```java
gs.action.getGlideURI().getMap().get('sysparm_query');
```

**Scoped equivalent**

This method is not available in scoped applications.

**GlideURI - set(String name, String value)**

Sets the specified parameter to the specified value.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The parameter name.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set value of a `sysparm_query` field. See also `action - getGlideURI()`.
```javascript
var gURI = action.getGlideURI();
gURI.set('sysparm_query', 'priority=2^active=true');
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

**Scoped equivalent**

To use the `set()` method in a scoped application, use the corresponding scoped method: GlideURI - `set(String name, String value)`.

**GlideURI - setView(String view)**

Adds the `sysparm_view` parameter to the query with the named view.

A view defines the elements that appear when a user opens a form or a list. The `sysparm_view` parameter specifies the view to be used for a list or a form. For more information on views, see View management.

See also:

- action - `getGlideURI()`
- GlideModalV3 - `switchView(String newView)`

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>view</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

The following example shows how to add the major incidents view to the URI query in the Incidents [incident] table. For example, `sysparm_view=Major%20Incidents`. See also action - `getGlideURI()`.

```javascript
// create the GlideURI object
var uri = action.getGlideURI();
```
// Adds the Major incidents to the query
uri.setView('Major Incidents');

// https://instance.service-now.com/incident.do?sys_id=0&sysparm_view=Major%20Incidents ...

Scoped equivalent
This method is not available in scoped applications.

GlideURI - toString(String path)
Reconstructs the URI string and performs the proper URL encoding by converting non-valid characters to their URL code. For example, converting & to '%26'.

Parameters set with the `set()` method are encoded with the URI as well.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>The base portion of the system URL to which the URI is appended.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL.</td>
</tr>
</tbody>
</table>

The following examples shows how to convert invalid characters to URL code in an instance URL. See also `action - getGlideURI()`.

```javascript
var gURI = action.getGlideURI();
fileString = gURI.toString('https://<your instance>.service-now.com/navpage.do');
```

Scoped equivalent
To use the `toString()` method in a scoped application, use the corresponding scoped method: GlideURI - toString(String path).

GlideURI - Scoped
Enables handling the URI parameter in scoped applications.

For more information on using URIs:

- Navigate by URL
- Navigation stack
See also: GlideURI - Global.

**GlideURI - GlideURI()**

Instantiates a GlideURI object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

**GlideURI - get(String name)**

Returns the value of the specified parameter.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

```javascript
var gURI = new GlideURI();
gURI.set('sysparm_query', 'priority=2^active=true' );
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

Output:

```
priority=2^active=true
```

**GlideURI - getFileFromPath()**

Returns the file name portion of the URI.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The file name portion of the URI.</td>
</tr>
</tbody>
</table>

```javascript
var gURI = new GlideURI();
var fileString = gURI.getFileFromPath();
gs.info(fileString);
```

---

**GlideURI - set(String name, String value)**

Sets the specified parameter to the specified value.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The parameter name.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var gURI = new GlideURI();
gURI.set('sysparm_query', 'priority=2^active=true' );
var fileString = gURI.get('sysparm_query');
gs.info(fileString);
```

### Output:

```javascript
priority=2^active=true
```
**GlideURI - toString(String path)**

Reconstructs the URI string and performs the proper URL encoding by converting non-valid characters to their URL code. For example, converting `&` to `%26`.

Parameters set with the `set()` method are encoded with the URI as well.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>The base portion of the system URL to which the URI is appended.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL.</td>
</tr>
</tbody>
</table>

```javascript
var gURI = new GlideURI();
fileString = gURI.toString('https://<your instance>.service-now.com/navpage.do');
```

**GlideURLV3 - Client**

Provides methods for manipulating a URI.

The GlideURLV3 API can be used in client-side scripts using ListV2 and ListV3 APIs.

ℹ️ **Note:** This API is not supported by Service Portal, Now Mobile, or Agent Workspace.

**GlideURLV3 - addParam(String name, String value)**

Adds a query string name-value pair to the URL.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the query string parameter.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Query string value.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The GlideURL</td>
</tr>
</tbody>
</table>

```javascript
var gu = new GlideURL('incident.do');
var url = gu.addParam('sys_id', '-1');
```

**GlideURLV3 - getURL(Object additionalParams)**

Get the entire context path and query string parameters as a single URI.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalParams</td>
<td>Object</td>
<td>A name-value pair object that contains parameters that are added to this URL request only. These additional parameters are not saved to the GlideURL object.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The GlideURL with the specified additional parameters added to the end.</td>
</tr>
</tbody>
</table>

**GlideURLV3 - GlideURL(String contextPath)**

Creates an instance of the GlideURL class.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contextPath</td>
<td>String</td>
<td>A relative path for the URL.</td>
</tr>
</tbody>
</table>

**GlideUser - Client**

The GlideUser API provides access to information about the current user and current user roles. Using the GlideUser API avoids the need to use the slower GlideRecord queries to get user information.
The GlideUser methods and properties are accessed through a global object (g_user) that is only available in client scripts. GlideUser

- contains name and role information about the current user.
- is typically used in client scripts and UI policies but is also found in UI actions that run on the client.
- cannot be used in business rules or UI actions that run on the server.
- avoids the need for GlideRecord queries to get user information.

Session information about the current user and current user roles is contained in the client (web browser). All GlideUser methods except `getClientData()` access the session information that is available by default. The `getClientData()` method requires setup on the server and use of `putClientData()` to make session information available.

**GlideUser - firstName**

Returns the current user's first name.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>firstName</td>
<td>String</td>
<td>Current user's first name.</td>
</tr>
</tbody>
</table>

```javascript
alert('first name = ' + g_user.firstName);
```

**GlideUser - getClientData(String key)**

Returns a client value set using `setClientData()` or GlideSession -- `putClientData()`.

Session client data is a set of named strings that may be setup on the server using GlideSession -- `putClientData()`. You can use `getClientData()` during form load time to get information that the client script needs to make decisions about the form. For example, to identify which fields should be visible.

See also **GlideForm**.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the client data to retrieve.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the client data.</td>
</tr>
</tbody>
</table>

```javascript
var loginLanguage = g_user.getClientData("loginlanguage");
```

### GlideUser - getFullName()

Returns the first and last name of the current user.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current user's full name.</td>
</tr>
</tbody>
</table>

```javascript
var formalName = g_user.getFullName();
```

### GlideUser - hasRole(String role, Boolean includeDefaults)

Returns true if the current user has the specified role or the admin role.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role</td>
<td>String</td>
<td>Role to check.</td>
</tr>
<tr>
<td>includeDefaults</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external,</td>
</tr>
</tbody>
</table>

Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeDefaults</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Explicit roles. Default: false</td>
</tr>
<tr>
<td>role</td>
<td>String</td>
<td>Role to check.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the current user has the specified role.</td>
</tr>
</tbody>
</table>

```
var isInternal = g_user.hasRole('snc_internal', true);
```

```
var isItil = g_user.hasRole('itil');
```

GlideUser - `hasRoleExactly(String role, Boolean includeDefaults)`

Determines whether the current user has the specified role.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeDefaults</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Explicit roles. Default: false</td>
</tr>
<tr>
<td>role</td>
<td>String</td>
<td>Role to check.</td>
</tr>
</tbody>
</table>
var isInternal = g_user.hasRoleExactly('snc_internal', true);

var isItil = g_user.hasRoleExactly('itil');

GlideUser - hasRoleFromList(String roles, Boolean includeDefaults)

Returns true if the current user has at least one of the specified roles or has the admin role.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roles</td>
<td>String</td>
<td>Comma-separated list of roles to check</td>
</tr>
<tr>
<td>includeDefaults</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external, in the request. For additional information on roles, see Roles. Default: false</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the current user has a role in the list or the admin role.</td>
</tr>
</tbody>
</table>

var isOK = g_user.hasRoleFromList("itil, maint");

var isOK = g_user.hasRoleFromList("itil, maint, snc_internal", true);

GlideUser - hasRoles(Boolean includeDefaults)

Returns true if the current user has any role.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeDefaults</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to include default roles, such as snc_internal and snc_external,</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>in the request. For additional information on roles, see Roles. Default: false</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the current user has at least one role.</td>
</tr>
</tbody>
</table>

```javascript
var yesRole = g_user.hasRoles();

var yesRole = g_user.hasRoles(true);
```

**GlideUser - lastName**

The current user's last name.

```javascript
alert('last name = ' + g_user.lastName);
```

**GlideUser - setClientData(String key, String value)**

Sets a client value that you can retrieve using `getClientData()`.

See also GlideForm.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the client data to store as a key.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number</td>
<td>Value to assign to the key.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

```javascript
function onSubmit() {
  if (!g_user.getClientData('keyName')) {
    var now_GR = new GlideRecord('incident');
    now_GR.addActiveQuery();
    now_GR.setLimit(1);
    now_GR.query(cb);
    return false;
  }
  return true;
}

function cb(now_GR) {
  // <insert glide operation >
  g_user.setClientData('keyName', now_GR.getValue('<number>'));
  g_form.submit();
}
```

**GlideUser - userID**

Returns the sys_id of the current user.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>sys_id of the current user.</td>
</tr>
</tbody>
</table>

```javascript
var userID = g_user.userID;
alert('Current user ID = ' + userID);
```
GlideUser - userName

This property is the current user's username, for example gsmith02. It is not the user's name, for example George Smith.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userName</td>
<td>String</td>
<td></td>
<td>Current user's username.</td>
</tr>
</tbody>
</table>

```javascript
var userName = g_user.userName;
alert('Current user = ' + userName);
```

GlideUser - Scoped

The scoped GlideUser API provides access to information about the current user and current user roles. Using the scoped GlideUser API avoids the need to use the slower GlideRecord queries to get user information.

Scoped GlideUser - getCompanyID()

Returns the current user's company sys_id.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Company sys_id</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getCompanyID());
```

Scoped GlideUser - getDisplayName()

Returns the current user's display name.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's display name</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getDisplayName());
```

### Scoped GlideUser - getDomainID()

Returns the identifier of the user's current session domain.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.

```javascript
var domain = new GlideRecord('domain');
domain.get(gs.getUser().getDomainID());
gs.info(domain.name);
```
**Scoped GlideUser - getEmail()**

Returns the user's email address.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's email address</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getEmail());
```

**Scoped GlideUser - getFirstName()**

Returns the user's first name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's first name</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName());
```

**Scoped GlideUser - getID()**

Gets the sys_id of the current user.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's sys_id</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getID());
```

**Scoped GlideUser - getLastName()**

Returns the user's last name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's last name</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getLastName());
```

**Scoped GlideUser - getName()**

Returns the user ID, or login name, of the current user.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User ID</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getName());
```

**Scoped GlideUser - getPreference(String name)**

Get the specified user preference value for the current user.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the preference.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The preference value.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
currentUser.savePreference('myPref','red');
gs.info(currentUser.getPreference('myPref'));
```

**Scoped GlideUser - getRoles()**

Returns a list of roles that includes explicitly granted roles, inherited roles, and roles acquired by group membership.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of all roles available to the user</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getRoles());
```

Scoped GlideUser - `getUserRoles()`

Returns the list of roles explicitly granted to the user.

Unlike the `getRoles()` method, this method does not return roles the user inherits or roles acquired from group membership.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of roles explicitly assigned to the user</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getUserRoles());
```

Scoped GlideUser - `hasRole(String role)`

Determines if the current user has the specified role.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role</td>
<td>String</td>
<td>Role to check</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the user has the role.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.hasRole('admin'));
```

Scoped GlideUser - isMemberOf(String group)

Determines if the current user is a member of the specified group.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>String</td>
<td>Group to check</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the user is a member of the group.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.isMemberOf('Capacity Mgmt'));
```

Scoped GlideUser - savePreference(String name, String value)

Saves a user preference value to the database.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The preference to save.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The preference value.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------</td>
<td>---------------</td>
<td></td>
</tr>
<tr>
<td>void</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
currentUser.savePreference('myPref','red');
gs.info(currentUser.getPreference('myPref'));
```

**GlideUser - Global**

The GlideUser API provides access to information about the current user and current user roles.

Using the GlideUser API avoids the need to use the slower GlideRecord queries to obtain user information.

**GlideUser - getCompanyID()**

Returns the current user's company sys_id.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Company sys_id</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getCompanyID());
```

**Scoped equivalent**

To use the `getCompanyID()` method in a scoped application, use the corresponding scoped method: **Scoped GlideUser - getCompanyID()**.

**GlideUser - getDisplayName()**

Returns the current user's display name.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's display name</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getDisplayName());
```

**Scoped equivalent**

To use the `getDisplayName()` method in a scoped application, use the corresponding scoped method: **Scoped GlideUser - getDisplayName()**.

**GlideUser - getDomainDisplayValue()**

Returns the display value of the user's session domain.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The display value of the user's session domain.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getDomainDisplayValue());
```

**Scoped equivalent**

There is no workaround for scoped applications.
**GlideUser - getEmail()**

Returns the user's email address.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User's email address</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getEmail());
```

**Scoped equivalent**

To use the `getEmail()` method in a scoped application, use the corresponding scoped method: **Scoped GlideUser - getEmail().**

**GlideUser - getFirstName()**

Returns the user's first name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object/String</td>
<td>User's first name.</td>
</tr>
</tbody>
</table>

**Note:** The data type for the returned value is object, however, the information is returned as a string.

```javascript
var currentUser = gs.getUser();
var userName = currentUser.getFirstName();
```
Scoped equivalent

To use the `getFirstName()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - getFirstName()`.

**GlideUser - getID**

Returns the sys_id of the current user.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getID());
```

Scoped equivalent

To use the `getID()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - getID()`.

**GlideUser - getLastName()**

Returns the user's last name.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>----------</td>
</tr>
<tr>
<td>Object/</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**Note:** The data type for the returned value is object, however, the information is returned as a string.

```javascript
var currentUser = gs.getUser();
var userName = currentUser.getLastName();
gs.info('User Last Name: ' + userName);
gs.info('Data type: ' + typeof userName);
```

*** Script: User Last Name: Smith
*** Script: Data type: object

### Scoped equivalent

To use the `getLastName()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - getLastName()`.

### GlideUser - getMyGroups()

Returns an iterator containing the list of all groups to which the user belongs. Only active groups are returned.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator</td>
<td>A list of sys_ids for the active groups to which the user belongs.</td>
</tr>
</tbody>
</table>

**An example**

```javascript
var groupsArray = gs.getUser().getMyGroups().toArray();
gs.info(groupsArray[0]);
```

Output: cfcbad03d711110050f5edcb9e61038f

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Scoped equivalent
There is no scoped equivalent for this method.

GlideUser - getName()
Returns the user ID, or login name, of the current user.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User ID</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getName());
```

Scoped equivalent
To use the `getName()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - getName()`.

GlideUser - getRoles()
Returns a list of roles associated with the user. Includes explicitly granted roles, inherited roles, and roles acquired by group membership.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Comma-separated list of user roles.</td>
</tr>
</tbody>
</table>
var currentUser = gs.getUser();
gs.info(currentUser.getRoles());

Output:

admin, hr_fulfiller, itsa_fulfiller, security_admin

Scoped equivalent

To use the `getRoles()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - getRoles()`.

GlideUser - getUserByID (String id)

Returns the user object associated with the passed-in user ID (sys_id in sys_user) or user_name.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>Unique ID (sys_id) or user_name of the desired user record.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>User object associated with the specified sys_id or user_name.</td>
</tr>
</tbody>
</table>

Example using user name (user_name).

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName()); // print the first name of the logged in user
var newUser = currentUser.getUserByID('abel.tuter'); // fetch a different user using the user_name field
gs.info(newUser.getFirstName()); // print the first name of the Abel Tuter user
```

Example using user ID (sys_id).

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.getFirstName()); // print the first name of the logged in user
var newUser = currentUser.getUserByID('62826bf03710200044e0bfc8bcbe5df1'); // fetch Abel Tuter user using sys_id from sys_user record
gs.info(newUser.getFirstName()); // print the first name of the Abel Tuter user
```
GlideUser - getUserRoles()

Returns the list of roles explicitly granted to the user.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object/String</td>
<td>List of comma-separated roles explicitly assigned to the user.</td>
</tr>
</tbody>
</table>

**Note:** The data type for the returned value is object, however, the information is returned as a string.

```javascript
var currentUser = gs.getUser();
var userRoles = currentUser.getUserRoles();
gs.info('User Roles: ' + userRoles);
gs.info('Data type: ' + typeof userRoles);
```

**Scoped equivalent**

To use the `getUserRoles()` method in a scoped application, use the corresponding scoped method: **Scoped GlideUser - getUserRoles()**.

GlideUser - hasRole(String role)

Determines if the current user has the specified role.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role</td>
<td>String</td>
<td>Role to check</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the user has the role.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.hasRole('admin'));
```

Scoped equivalent

To use the `hasRole()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - hasRole(String role)`.

GlideUser - isMemberOf(String group)

Determines if the current user is a member of the specified group. Only active groups are evaluated by this method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group</td>
<td>String</td>
<td>Group to check</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the user is a member of the group.</td>
</tr>
</tbody>
</table>

```javascript
var currentUser = gs.getUser();
gs.info(currentUser.isMemberOf('Capacity Mgmt'));
```

Scoped equivalent

To use the `isMemberOf()` method in a scoped application, use the corresponding scoped method: `Scoped GlideUser - isMemberOf(String group)`.

GlideXMLUtil - Scoped, Global

Provides methods to remove invalid characters from an XML string, and to validate an XML string.

Access these methods using the static object `GlideXMLUtil`. This class is available in scoped and global scripts.
GlideXMLUtil - removeInvalidChars(String xmlString)

Removes invalid characters from an XML string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlString</td>
<td>String</td>
<td>The string to be processed.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A string with invalid characters removed.</td>
</tr>
</tbody>
</table>

```javascript
var test = "test\btab";
var removedTest = GlideXMLUtil.removeInvalidChars(test);
gs.info(removedTest);
```

Output: testtab

GlideXMLUtil - validateXML(String xmlString, Boolean nsAware, Boolean forgiveUnclosed)

Determines if the specified string is valid XML.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlString</td>
<td>String</td>
<td>The string to be validated.</td>
</tr>
<tr>
<td>nsAware</td>
<td>Boolean</td>
<td>When true, the validation is aware of name spaces. When false, the validation ignores name spaces.</td>
</tr>
<tr>
<td>forgiveUnclosed</td>
<td>Boolean</td>
<td>When true, the validation does not check for &lt;xml&gt; tags enclosing the string.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Returns null if the string is valid. Returns an error string describing the error if the specified string is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var s = "<?xml version="1.0" encoding="UTF-8"?><unload unload_date="2017-11-27 21:56:14"><incident action="INSERT_OR_UPDATE"><active>true</active></incident></unload>";
var xml = GlideXMLUtil.validateXML(s, false, false);
gs.info(xml);
```

Output: null

### Guided Tours - Client

Provides methods for launching and stopping guided tours.

This API includes methods used in Guided Tour Designer.

**Guided Tours - startTour(String tour_id, Number step_number, Function cb_function)**

Starts a tour. Because this method is asynchronous, you must pass a callback function to determine operation success.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tour_id</td>
<td>String</td>
<td>Sys ID of the tour from the Guided Tours [sys_embedded_tour_guide] table.</td>
</tr>
<tr>
<td>step_number</td>
<td>Number</td>
<td>Optional. Step at which to start the tour. If not provided (or step number is 0), tour starts from the beginning.</td>
</tr>
<tr>
<td>cb_function</td>
<td>Function</td>
<td>Optional. Callback function called by <code>startTour()</code> method after attempt to launch the tour.</td>
</tr>
<tr>
<td>cb_function.err</td>
<td>Object</td>
<td>Points to the error object if any occurred during the operation:</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>err = { success: false, message: 'string containing the error object' }</code></td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Null otherwise.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

//create a callback function to handle the result of the API call
var cbFunction = function(err) {
  if (err) {
    console.log('Error Occurred');
  }
  else {
    console.log('The tour with tourid=%s was successfully launched', tourId);
  }
}

//calling the startTour method
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6a780', 2, cbFunction);

Guided Tours - endTour()

Stops a currently playing tour. This method silently exits if no tours are playing.

Complete signature includes top.NOW.guided_tours.api preceding the method name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null</td>
<td>Null</td>
</tr>
</tbody>
</table>
// create a callback function to end the tour if it starts correctly
var cbFunction = function(err) {
  if (err) {
    console.log('Error Occurred');
  }
  else {
    // tour has started so we can call endTour
    top.NOW.guided_tours.api.endTour();
  }
}

// calling the startTour method so that we can end the tour as soon as it starts
top.NOW.guided_tours.api.startTour('a297e04b732313007077edcc5ef6a780', 2, cbFunction);

Guided Tours - applyListFilter(Function filter_func)
Sets a function to retrieve filtered tour results when the getAllTours() method is called.

Complete signature includes top.NOW.guided_tours.api preceding the method name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter_func</td>
<td>Function</td>
<td>Filter function that takes a single tour object from the tours[] array returned from getAllTours() method.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows basic API usage.

// create a filter function
var filtFunction = function(tour) {
  // only return those tours whose name starts with 'my'
  return tour.name.indexOf('my') === 0;
}

// apply the filter
top.NOW.guided_tours.api.applyListFilter (filtFunction);

//call the getAllTours method to observe the filtered tours
top.NOW.guided_tours.api.getAllTours (function(er, tours) {
  if(!er) {
    console.log('The filtered tours are: ');
    console.log(tours);
  }
});

The following example shows how to use the options field on the tour object to add JSON with custom tour identifiers for reading and filtering tours inside the filter_func() function.

top.NOW.guided_tours.api.applyListFilter(function(tour) {
  var options = (tour.options)? JSON.parse(tour.options): null;
  return (options && options.my_param) ? (options.my_param == my_value) : false;
});

Guided Tours - getAllTours(Function cb_function)

Gets a list of tours on the current page from which this method is called. Because this method is asynchronous, a callback function must be passed to determine operation success and get a list of tours.

Complete signature includes top.NOW.guided_tours.api preceding the method name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cb_function</td>
<td>Function</td>
<td>Callback function called by getAllTours() after attempt to fetch all tours for the current page from which getAllTours() method is called.</td>
</tr>
<tr>
<td>cb_function.err</td>
<td>Object</td>
<td>Points to the error object if any occurred during the operation:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>err = { success: false, message: 'string containing the error object' }</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Null otherwise.</td>
</tr>
<tr>
<td>cb_function.tours</td>
<td>Array</td>
<td>List of available tours for the page.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If no tours are present on the page, cb_function.tours returns undefined.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>if(!tours) console.log('No tour present')</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

```javascript
//create a callback function to handle the result of the API call
var cbFunction = function(err, tours) {
  if (err) {
    console.log('Error Occurred');
  } else {
    if(!tours) console.log('No tour present')
    else {
      tours.forEach(function(t) {
        console.log(t);
      });
    }
  }
}
//calling the getTours method
top.NOW.guided_tours.api.getAllTours(cbFunction);
```

Guided Tours - loadPlayer()

Loads the guided tours player on a page in which guided tours player is not present by default.

Complete signature:

```javascript
NOW.guided_tours.api.loadPlayer()```

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Guided Tours - events.on(String event_name, Function listener_function)**

Attaches an event listener to a guided tour event.

Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_name</td>
<td>String</td>
<td>Event name to be attached to the listener. Valid event names:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• stepStarted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourStarted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourEnded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourCompleted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourFailed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourAbandoned</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourDismissed</td>
</tr>
<tr>
<td>listener_function</td>
<td>Function</td>
<td>Listener to be added.</td>
</tr>
<tr>
<td>listener_function</td>
<td>Object</td>
<td>Passed to <code>listener_function()</code> by each event in the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For stepStarted events:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>{tour: '&lt;tour_sys_id&gt;', step: step_num}</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For all other events:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>{tour: '&lt;tour_sys_id&gt;'}</code></td>
</tr>
</tbody>
</table>

**Note:** Clear any event listener after it solves its purpose.

JSON parameters:
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tour_sys_id</td>
<td>String</td>
<td>Guided tour ID from the Guided Tours [sys_embedded_tour_guide] table</td>
</tr>
<tr>
<td>step_num</td>
<td>Number</td>
<td>Value between 0 (first step) and n (final step)</td>
</tr>
</tbody>
</table>

The following example shows basic API usage.

```javascript
//create a callback function to handle the result of the api call
var eventListenerTourStarted = function() {
  console.log('The tour has started');
};
var eventListenerTourEnded = function() {
  console.log('The tour has ended');
};

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted',eventListenerTourStarted);
top.NOW.guided_tours.events.on('tourEnded', eventListenerTourEnded);

... //start a tour
top.NOW.guided_tours.api.startTour ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
//As soon as the tour starts the eventListenerTourStarted gets fired
...
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired
...

//removing the event listeners
top.NOW.guided_tours.events.off('tourStarted',eventListenerTourStarted);
top.NOW.guided_tours.events.off('tourEnded', eventListenerTourEnded);
```

The following example shows how to use the `listener_function` parameter with `obj` as an argument.

```javascript
top.NOW.guided_tours.events.on("tourStarted", function (obj){console.log(obj)});
```

**Guided Tours - events.off(String event_name, Function listener_function)**

Removes an existing event listener.
Complete signature includes `top.NOW.guided_tours.api` preceding the method name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_name</td>
<td>String</td>
<td>Event name to be removed from the listener. Valid event names:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourStarted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourEnded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourCompleted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourFailed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourAbandoned</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• tourDismissed</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• stepStarted</td>
</tr>
<tr>
<td>listener_function</td>
<td>Function</td>
<td>Optional. If provided, specified listener function is removed from remaining event listeners attached with that event. If not provided, all listener functions attached to that event are removed.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
//create a callback function to handle the result of the api call
var eventListenerTourStarted = function() {
    console.log('The tour has started');
}
var eventListenerTourEnded = function() {
    console.log('The tour has ended');
}

//attaching event listeners for tourStarted and tourEnded Events
top.NOW.guided_tours.events.on('tourStarted', eventListenerTourStarted);
top.NOW.guided_tours.events.on('tourEnded', eventListenerTourEnded);
...
```

//start a tour
```
top.NOW.guided_tours.api.startTour ('a297e04b732313007077edcc5ef6a780', 2, cbFunction);
```
//As soon as the tour starts the eventListenerTourStarted gets fired
...
top.NOW.guided_tours.api.endTour();
// eventListenerTourEnded gets fired
...

//removing the event listeners

  top.NOW.guided_tours.events.off('tourStarted', eventListenerTourStarted);
  top.NOW.guided_tours.events.off('tourEnded', eventListenerTourEnded);

helpers - UI Builder

The helpers API provides general functionality that is common across page scripts, eliminating the need to write scripts for simple functionality such as opening and closing a modal.

This API is only available to page scripts, it is not available in any other UI Builder scripts including:

- component property value scripts
- component visibility scripts
- event payload scripts
- UX client script includes

helpers - helpers.modal.close(String modalId)

Closes the specified modal on the current page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>modalId</td>
<td>String</td>
<td>Modal component ID of the modal to close. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
This example shows closing a modal with a component ID that ends with `alert-modal`.

```javascript
function handler({api, event, imports, helpers}) {
    helpers.modal.close("[component-id$='alert_modal']")
}
```

**helpers - helpers.modal.open(String modalId, Object options)**

Opens the specified modal on the current page.

You can only display one modal at a time within a page. If a modal is currently open, and you call this method, the existing modal is hidden and the new modal appears.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>modalId</td>
<td>String</td>
<td>Component ID of the modal to open. Component IDs are auto generated when a component is dragged and dropped on the UI Builder stage. You can locate the ID on the property page.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional.</td>
</tr>
</tbody>
</table>

```javascript
"options": {
    "content": "String",
    "contentFullWidth": Boolean,
    "headerLabel": "String",
    "size": "String"
}
```

- **options.content**
  - **Type**: String
  - **Description**: Text content for the modal.

- **options.contentFullWidth**
  - **Type**: Boolean
  - **Description**: Flag that indicates whether to remove the horizontal padding around the body of the modal in order to fit wider content. Valid values:
    - true: Remove the padding.
    - false: Do not remove the padding.
  - **Default**: false

- **options.headerLabel**
  - **Type**: String
  - **Description**: Text content for the modal header.
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| options.size | String| Size of the modal container. Most sizes automatically expand to fill the viewport when the screen size is small. Valid values:  
• sm  
• md  
• lg  
• fullscreen  
Default: sm |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows opening a modal with a component ID that ends with `alert-modal`.

```javascript
function handler({api, event, imports, helpers}) {
    helpers.modal.open("[component-id$='alert_modal']")
}
```

`helpers - helpers.navigate.setRouteParams(Object params)`

Passes the specified parameters down to other components on the same page.

Use this method in any page component that wants to add a parameter in a URL. You may want to add a parameter to a URL when another component needs to know the current value of that parameter when it changes, so it can react to it. For example, use this method to pass the `selectedIndex` of a tab component so it reflected in the URL to give focus to that tab.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>params</td>
<td>Object</td>
<td>Key-value pairs of optional parameters to pass to other components.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>This must be a plain, flat object with only primitive values. Array or object references are ignored and not added to the URL. All specified keys # must be part of# the optional parameters# in the route configuration or they are also ignored. For additional information on optional parameters, see Create a page in UI Builder.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This code example shows how to append the URL `params/selected-tab-index/2`. Note that the parameter in the actual URL is changed from camel case to snake case, so `selectedTabIndex` becomes `selected-tab-index`.

```javascript
function handler({api, event, helpers, imports}) {
    helpers.navigate.setRouteParams({'params': {'selectedTabIndex': 2}});
}
```

**helpers** - `helpers.navigate.to(String route, Object fields, Object params, Boolean redirect, Boolean passiveNavigation, String targetRoute)`

Navigates from one screen to another based on the specified route and field information. URL changes and the respective screen loads are observed.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| route    | String  | Name of the route. Must be a valid entry from UX App Routes (sys_ux_app_route.list). This value is reflected in the URL, and the URL is created based on the `route`, `fields`, and `optionalParams` column values: /<route>/<field1Value>/<field2Value>/params/<optionalParamKey1>/<optionalParamValue1>/<optionalParamKey2>/<optionalParamValue2>  

For example: `/record/incident/12345/params/selectedTabIndex/4`
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fields</td>
<td>Object</td>
<td>Optional. Key-value pairs of required parameters. For example: 'fields': {'table': 'incident', 'sysId': '12345'}.</td>
</tr>
<tr>
<td>params</td>
<td>Object</td>
<td>Optional. Key-value pairs of optional parameters. For example: 'params': {'selectedTabIndex': 4}.</td>
</tr>
</tbody>
</table>
| redirect | Boolean    | Flag that indicates whether to remove the latest history entry from the browser history. For example, if you navigate to sites A, B and then C. If redirect is set to true while navigating to C, the history entry for B is removed. The browser history only shows only A and C. Valid values:  
  • true: Removes the latest history entry, and redirects to the latest URL.  
  • false: Does not remove any history entries. Default: false |
| passiveNavigation | Boolean | Flag that indicates whether to perform background navigation. Background navigation is when a page is opened but it is not active or shown. For example, opening an inactive tab for the page, but it is not visible but loaded in the background. Valid values:  
  • true: Perform background navigation.  
  • false: Do not perform background navigation. Default: false |
| targetRoute | String or Object | Sub navigation to a drill-down, deep-link, or sub-tab. If set to current, the current route does a sub-navigation under the current URL.  
For example, if /record/incident/123 is the current URL, and the following call is made:  
  helper.navigate.to('record', {'table': 'problem', 'sysId': '567'}, {}, false, false, 'current'); |
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The following URL is generated: /record/incident/123/sub/record/problem/567</td>
</tr>
</tbody>
</table>

**Note:** `targetRoute` can be either a string such as 'current' or an object, such as navigation `NAV_ITEM_SELECTED` payload.

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to navigate to a page passing just the `route` parameter.

```javascript
function handler({api, event, imports, helpers}) {
    helpers.navigate.to('test');
}
```

This example shows how to navigate to a page passing the `route` and `fields` parameters.

```javascript
function handler({api, event, imports, helpers}) {
    helpers.navigate.to('test', {'key': 'value'});
}
```

This example shows how to navigate to a page passing the `route`, `fields`, and `params` parameters.

```javascript
function handler({api, event, helpers, imports}) {
    helpers.navigate.to('test', {'key': 'value'}, {'first': 'FirstName', 'last': 'LastName'});
}
```

**helpers - helpers.screen.updateStatus(Object statusObj)**

Enables pages to report their status updates, such as title, icon, dirty state, message, and error changes.

Status updates are reported to WorkspaceChrome or AppShell, whichever the outer layer is, and acting as the host.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| statusObj | Object   | Payload to send to the current page to report that the content has been updated. Valid values:  
  - `dirtyModalId`: (String) ID of the modal that has changed.  
  - `hasError`: (Boolean) Flag that indicates that there are errors on the page.  
  - `hasUpdate`: (Boolean) Flag that indicates that there were updates to the page.  
  - `icon`: (String) Name of the updated or new icon.  
  - `isDirty`: (Boolean) Flag that indicates whether the page is dirty (values have changed).  
  - `message`: (String) Updated/new message.  
  - `screenKey`: (String) ID of the screen on which the change occurred. Every screen has a `screenKey` as a property on the screen macroponent inside `sn-canvas-screen`.  
  - `status`: (String) Status operation for this action. This value must be one of the following: inserted, deleted, saved, or closed.  
  - `title`: (String) Updated/new display title.  
  - `tooltipPreview`: (JSON) Updated or new tool tip. For example, `tooltipPreview : { primaryTitle, secondaryContent: {} }` |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
screen.updateStatus({'dirtyModalId': 'customModalId', 'isDirty': true});
```
helpers - helpers.snHttp(String url, Object options)

Makes an HTTP request to the ServiceNow instance and returns a promise with the results.

⚠️ **Note:** There is a known issue where objects named `options` are omitted from the HTTP response.

```json
{
  options: {},
  otherFields: {}
}
```

becomes

```json
{
  otherFields: {}
}
```

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>HTTP endpoint relative to the instance URL. For example, <code>/api/now/table/incident</code> or <code>/api/now/table/incident/a83820b58f723300e7e16c7827bdeed</code>.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Describes the contents of the HTTP request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;options&quot;: {</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;batch&quot;: Boolean,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;body&quot;: {Object},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;headers&quot;: {Object},</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;method&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td>options.batch</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether this HTTP request should be batched with other HTTP requests made to the instance. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Make request as part of a batch request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Make dedicated request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: true</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options.body</td>
<td>Object</td>
<td>Optional. Data to send as the request body. Only applicable for request methods <code>PUT</code>, <code>POST</code>, and <code>PATCH</code>. Elements in the object depend on the type of HTTP method. For details, refer to the code examples below. Default: <code>{}</code></td>
</tr>
<tr>
<td>options.headers</td>
<td>Object</td>
<td>Optional. Additional HTTP request headers. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td></td>
<td>headers: {</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;Content-Type&quot;: &quot;application/json&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;Accept&quot;: &quot;application/xml&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td>options.method</td>
<td>String</td>
<td>Optional. HTTP method. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DELETE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• GET</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PATCH</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• POST</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PUT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: GET</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Object that describes any error returned by the REST API. Data type: Object</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>&quot;error&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;data&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;message&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;options&quot;: {Object},</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: Number,</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error.data</td>
<td>Response returned from the HTTP API. Data type: Defined by REST API</td>
</tr>
<tr>
<td>error.message</td>
<td>Message describing the error encountered when trying to process the HTTP request.</td>
</tr>
<tr>
<td></td>
<td><img src="https://via.placeholder.com/15" alt="Note: This parameter is not always returned." /> Data type: String</td>
</tr>
<tr>
<td>error.options</td>
<td>Describes the original HTTP request. Data type: Object</td>
</tr>
<tr>
<td>error.options.headers</td>
<td>Object containing a list of all of the request headers sent in the request. Data type: Object</td>
</tr>
<tr>
<td>error.options.responseHeaders</td>
<td>Object containing a list of all of the response headers sent in the request. Data type: Object</td>
</tr>
<tr>
<td>error.status</td>
<td>Returned HTTP error status code, such as 400, 405, or 500. Data type: Number</td>
</tr>
<tr>
<td>error.statusText</td>
<td>Returned HTTP status message, such as Bad Request. Data type: String</td>
</tr>
<tr>
<td>response</td>
<td>Returned when HTTP request is successful. The response to the HTTP request. Data type: Any</td>
</tr>
</tbody>
</table>

The following example show how to call `snHttp()` which returns a promise.
function handler({api, event, helpers, imports}) {
  helpers.snHttp('/api/now/table/u_movie', {method: 'GET'})
    .then(({response}) => {
      // do something with the table data
    })
    .catch(({error}) => {
      const message = `Error: ${error.data.error.message}`;
      console.error(message);
      api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
        id: 'alert5',
        status: 'high',
        icon: 'info-circle-outline',
        content: message,
        action: { type: 'dismiss' }
      });
    });
}

The following example show how to call `snHttp()` using `async` and `await`.

async function handler({helpers}) {
  try {
    const result = await helpers.snHttp('/api/now/table/u_movie', {method: 'GET'});
  } catch ({error}) {
    const message = `Error: ${error.data.error.message}`;
    console.error(message);
    api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
      id: 'alert5',
      status: 'high',
      icon: 'info-circle-outline',
      content: message,
      action: { type: 'dismiss' }
    });
  }
}

The following example show how to set up a POST request.

function handler({api, helpers, event, imports}) {
  helpers
    .snHttp('/api/now/table/incident', {
      method: "POST",
      body: {
        description: "Sample description",
      }
    });
}
The following example show how to set up a PUT request.

```javascript
function handler({api, helpers, event, imports}) {
  helpers
    .snHttp(`/api/now/table/incident/a83820b58f723300e7e16c7827bdeed2`, { 
        method: "PUT",
        body: {
            activity_due: "1970-04-02 18:26:17"
        },
        headers: {
            "Content-Type": "application/json",
            "Accept": "application/xml"
        }
    })
    .then(({ response }) => { 
        // handle PUT request response
    })
    .catch(({ error }) => { 
        // handle PUT request errors
    });
}

helpers - helpers.timing.clearInterval(Number timeoutId)
Cancels the execution of the function that was scheduled through a prior setInterval() call.
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutId</td>
<td>Number</td>
<td>Unique identifier of the scheduled function to clear. This value is returned by the corresponding setInterval() call.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows using `clearInterval()` to cancel a timing operation that was previously set using the `setInterval()` method. This function could be invoked by a user clicking a **Disable Auto-refresh** button on a page.

```javascript
function handler({api, helpers}) {
  api.setState('intervalId', ({currentValue}) => {
    if (currentValue > -1) {
      helpers.timing.clearInterval(currentValue);
    }
    return -1;
  });
}
```

**helpers** - `helpers.timing.clearTimeout(Number timeoutId)`

Cancels the execution of the function that was scheduled through a prior `setTimeout()` call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutId</td>
<td>Number</td>
<td>Unique identifier of the scheduled function to clear. This value is returned by the corresponding setTimeout() call.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
This code example shows how to terminate a timer with the specified `timeoutId`.

```javascript
function handler({api, helpers}) {
    api.setState('timeoutId', ({currentValue}) => {
        if (currentValue > -1) {
            helpers.timing.clearTimeout(currentValue);
        }
        return -1;
    });
}
```

`helpers - helpers.timing.setInterval(Function fn, Number delay)`

Repeatedly executes the specified function, using the specified delay value as the interval between function calls.

Unlike the native JavaScript `setInterval()` method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to repeatedly execute.</td>
</tr>
<tr>
<td>delay</td>
<td>Number</td>
<td>Length of the time-interval between each function execution. Unit: Milliseconds</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique identifier of the function execution operation. Use this value in the <code>helpers - helpers.timing.clearInterval(Number timeoutId)</code> method if you need to cancel this operation.</td>
</tr>
</tbody>
</table>

This code example shows how to refresh the timestamp on a page every second. This function could be invoked by a user clicking an **Enable Auto-refresh** button on a page.

```javascript
function handler({api, helpers}) {
    // Every one second, refresh the value of current timestamp client state parameter
    const intervalId = helpers.timing.setInterval(() => {

    });
}
```
api.setState('currentTimestamp', new Date().toString(), 1000);

// The interval ID is kept in state to use when calling the
helpers.timing.clearInterval() method at a later point
api.setState('intervalId', intervalId);
}

helpers - helpers.timing.setTimeout(Function fn, Number delay)

Executes the specified function, after the specified delay.

Unlike the native JavaScript setTimeout() method, this method does not support passing a code string to evaluate as the first argument. Any additional arguments are passed to the function itself.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to execute.</td>
</tr>
<tr>
<td>delay</td>
<td>Number</td>
<td>Length of the time to wait before calling the specified function.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Milliseconds</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique identifier of the function execution operation. Use this value in the helpers - helpers.timing.clearTimeout(Number timeoutId) method if you need to cancel this operation.</td>
</tr>
</tbody>
</table>

This code example shows how to set a 20 minute timer. You could associate this function with a button **Remind me in 20 minutes**.

```javascript
function handler({api, helpers}) {
  const timeoutId = helpers.timing.setTimeout(() => {
    api.emit('NOW_UXF_PAGE#ADD_NOTIFICATIONS', {
      id: 'alert5',
      status: 'high',
      icon: 'info-circle-outline',
```
content: 'Try to look away at something that is 20 feet away from you for a total of 20 minutes."

action: { type: 'dismiss' }
});
}, 20 * 60 * 1000);

// The timeout ID is kept in state to use when calling the helpers.timing.clearTimeout() method at a later point
api.setState('timeoutId', timeoutId);
}

helpers - helpers.translate(String message, String tokens)
Asynchronously retrieves and translates the specified message based on the current user's session language.

You can use this method with the api - setState(String stateParam, Any value) to bind the translated value to other fields on the page.

**Note:** You can call this method using a promise or `async` and `await`. The code examples below show both implementations.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Message to translate.</td>
</tr>
<tr>
<td>tokens</td>
<td>String</td>
<td>Optional. Comma-separated list of parameters to use for replacing string variables. For example:</td>
</tr>
</tbody>
</table>

```javascript
helpers.translate('Text {0} {1}', 'to', 'translate');
```

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Translated text string.</td>
</tr>
</tbody>
</table>

The following example shows how to pass in table field references to embed in the corresponding variables in a string, using a promise.

```javascript
function handler ({api, helpers}) {
  helpers.translate('Welcome {0} {1}!', user.firstName, user.lastName)
  .then((translatedText) => {
    ...
  });
}
The following example shows how to use `async` and `await` in your function instead of a promise.

```javascript
async function handler ({api, helpers}) {
  const translatedText = await helpers.translate('Welcome to {0}', 'ServiceNow');
  api.setState('greeting', translatedText);
}
```

**HistoryWalker - Scoped, Global**

The `HistoryWalker` API uses the audit/history tables to generate a historical version of an existing record.

It supports the ability to return a GlideRecord to a previous update count (walked GlideRecord) with the appropriate GlideElements populated. After the walked GlideRecord is retrieved, the API provides the ability to move forward and backward the update numbers navigating through its historical updates.

To use this class in scoped and global applications, use the `sn_hw` namespace identifier. The History Walker plugin (com.glide.history_walker) that is enabled by default is required to access the `HistoryWalker` API.

⚠ **Note:** For offline updates, the `HistoryWalker` API is initiated automatically and the only two methods that you can use are: `walkTo()` (the input argument for this method can only be zero) and `walkForward()`. Other available methods cannot be invoked for offline updates.

The `HistoryWalker` API provides two ways to retrieve the audit data:

- **Using History Set:** A History Set entry is created (if not available or not up to date) from the data in the Sys Audit `[sys_audit]` table for the record that you are going to walk through. The History Set table contains records (History Lines) with the actual changes to field values that occurred. Methods of the `HistoryWalker` API retrieve the history data from the generated History Lines, instead of querying the `sys_audit` table.

- **Using Sys Audit table:** In this case, the `HistoryWalker` API extracts data directly querying the `sys_audit` table.

By default, it populates the data to support the `changes()`, `changesFrom()`, and `changesTo()` methods in the walked record, as well as provides record and field level security. Additionally, it can enable journal fields and variables to be also populated in the walked GlideRecord when walking through the updates.
This API enables you to:

- Apply the appropriate history/audit data to get an existing GlideRecord to the state it was in a specific update count.
- Instruct the HistoryWalker API to use sys_audit table instead of sys_history_set/sys_history_line tables to retrieve its data.
- Turn off row-level access control.
- Turn off field-level access control.
- Turn off retrieval and processing of “changes” data.
- Enable journal fields.
- Enable variables.

**HistoryWalker - HistoryWalker(String tableName, String sysId)**

Fetches the database record based on the parameters, using the History Sets to retrieve the historic data.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of table containing the record to retrieve.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>sys_id of the record to retrieve.</td>
</tr>
</tbody>
</table>

### Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
if (hw.walkTo(3)) {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' + oldPriority);
} else

    gs.info('Incident does not have update number 3');
```

### Output:

```
Incident priority in update number 3 was 4
```
HistoryWalker - HistoryWalker(String tableName, String sysId, Boolean useAudit)

Fetches the database record based on the parameters, using the History Sets or Audit data to retrieve the historic data, depending on the third parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of table containing the record to retrieve.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>sys_id of the record to retrieve.</td>
</tr>
<tr>
<td>useAudit</td>
<td>Boolean</td>
<td>• If set to true, uses audit data to retrieve historic date.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If set to false, uses history set to retrieve historic date.</td>
</tr>
</tbody>
</table>

**Example**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue(), true);
if (hw.walkTo(3)) {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' + oldPriority);
} else
    gs.info('Incident does not have update number 3');
```

**Output:**

```
Incident priority in update number 3 was 4
```

HistoryWalker - getUpdateNumber()

Gets the update number of the current walked glide record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>int</td>
<td>Current update number or, -1 if record is not found</td>
</tr>
</tbody>
</table>

Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(3);
gs.info('Update number: ' + hw.getUpdateNumber());
```

Output:

```
Update number: 3
```

**HistoryWalker - getWalkedRecord()**

Gets the record filled with the history/audit data after walking to an update number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The walked GlideRecord.</td>
</tr>
</tbody>
</table>

Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(0);
var walkedRecord = hw.getWalkedRecord();
gs.info('Priority in update number 0: ' + walkedRecord.priority);
hw.walkTo(1);
```
walkedRecord = hw.getWalkedRecord();
gs.info('Short description in update number 1: ' + walkedRecord.short_description);

Output:

Priority in update number 0: 4
Short description in update number 1: My monitor has stopped working

HistoryWalker - getWalkedRecordCopy()

Returns a copy of the record filled with the history/audit data after walking to an update number.

**Note:** The `getWalkedRecord()` API might modify the obtained `walkedRecord` after walking to another update number. The `getWalkedRecordCopy()` API gets a clone to the walked record to prevent that.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A copy of the walked GlideRecord.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC00000015');

var walkedRecord = [];
var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(0);
walkedRecord[0] = hw.getWalkedRecordCopy();
hw.walkTo(1);
walkedRecord[1] = hw.getWalkedRecordCopy();

gs.info('Priority in update number 0: ' + walkedRecord[0].priority);
gs.info('Short description in update number 1: ' + walkedRecord[1].short_description);
```

Output:
HistoryWalker - isFieldLevelSecurity()

Specifies if the record-level read access is applied on the record when retrieving from the database.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if field level security is enabled, else returns false.</td>
</tr>
</tbody>
</table>

Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Field level security is active: ' + hw.isFieldLevelSecurity());
```

Output:

Field level security is active: true

HistoryWalker - isRecordLevelSecurity()

Specifies if the record-level read access is applied on the record when retrieving from the database.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the record-level security is enabled, else returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Record level security is active: ' + hw.isRecordLevelSecurity());
```

**Output:**

Record level security is active: true

---

### HistoryWalker - isWithChanges()

Specifies if any of the methods that walk the record from one update to another, support the “changes” data for each element.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the changes support is enabled, else returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Changes is active: ' + hw.isWithChanges());
```

**Output:**

Changes is active: true
HistoryWalker - isWithJournalFields()

Specifies if journal type fields are populated from the historical values.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if journal fields are populated, else returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Populating journal fields is active: ' + hw.isWithJournalFields());
```

Output:

```
Populating journal fields is active: false
```

HistoryWalker - isWithVariables()

Specifies if values are set for variables that are recorded in the history.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if including values for variables, else returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Setting variables is active: ' + hw.isWithVariables());
```
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
gs.info('Populating variables is active: ' + hw.isWithVariables());

Output:

Populating variables is active: false

**HistoryWalker - setFieldLevelSecurity(Boolean fieldLevelSecurity)**

Sets the field-level read access on each element before setting the historical value of that element in the GlideRecord. If the field-level security is enabled, it prevents the API to populate the fields of the walked record that the user of the API does not have access to.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldLevelSecurity</td>
<td>Boolean</td>
<td>If set to true, field-level security is enabled. The default value is true.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.setFieldLevelSecurity(false);
hw.walkTo(0);
```

**HistoryWalker - setRecordLevelSecurity(Boolean recordLevelSecurity)**

Sets the record-level read access on the record when retrieving from the database. The record-level security prevents the API to retrieve the walked record if the user of the API does not have access to the GlideRecord.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recordLevelSecurity</td>
<td>Boolean</td>
<td>If set to true, record-level read access security is enabled. The default value is true.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.setRecordLevelSecurity(false);
hw.walkTo(0);
```

**HistoryWalker - setWithChanges(Boolean withChanges)**

Sets the “changes” data support for each element for a method that walks the record from one update to another.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>withChanges</td>
<td>Boolean</td>
<td>If set to true, the “changes” data is supported for each element. The default value is true.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example: With the Changes data support

```javascript
var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(0);
do {
```
function printChangedFields(hw) {
    var walkedGr = hw.getWalkedRecord();
    var fields = GlideScriptRecordUtil.get(walkedGr).getChangedFieldNames();
    gs.info("Fields changed at update " + hw.getUpdateNumber() + " were:");
    for (var j = 0; j < fields.size(); j++)
        gs.info(" " + fields.get(j));
    gs.info("\n");
}

Example: Without the Changes data support

var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.setWithChanges(false);
hw.walkTo(0);
do {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' +
    oldPriority);
} while (hw.walkForward());

HistoryWalker - setWithJournalFields(Boolean withJournalFields)
Specifies if journal type fields are populated from the historical values.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>withJournalFields</td>
<td>Boolean</td>
<td>If set to true, include journal-type fields. Th default value is false.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.setWithJournalFields(true);
if (hw.walkTo(0)) {
    var workNotes = hw.getWalkedRecord().work_notes;
    gs.info('Work Notes in update number ' + hw.getUpdateNumber() + ' was ' + workNotes);
}

HistoryWalker - setWithVariables(Boolean withVariables)
Specifies if variables are populated from the historical values.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>withVariables</td>
<td>Boolean</td>
<td>If set to true, values are populated for variables. The default value is false.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.setWithVariables(true);
hw.walkTo(0);
if (hw.walkTo(0)) {
    var varUrgency = hw.getWalkedRecord().variables.urgency;
    gs.info('Variable Urgency in update number ' + hw.getUpdateNumber() + ' was ' + varUrgency);
}
```
**HistoryWalker - walkBackward()**

Applies the appropriate history/audit data to get a walked GlideRecord to the state when it was one update number backward. If the previous update count is missing from the history/audit data, it will walk to the previous available update count.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if walking to the specified update number was possible. Else, returns false, for example if already walked to the update number 0.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(incGr.sys_mod_count);
do {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' + oldPriority);
} while (hw.walkBackward())
```

**Output:**

```
Incident priority in update number 5 was 2
Incident priority in update number 4 was 4
Incident priority in update number 3 was 4
Incident priority in update number 2 was 4
Incident priority in update number 1 was 4
Incident priority in update number 0 was 4
```
**HistoryWalker - walkForward()**

Applies the appropriate history/audit data to get a walked GlideRecord to the state when it was one update number forward. If next update count is missing from the history/audit data, it will walk to the next available update count.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if walking to the specified update number was possible. Else, returns false, for example if already walked to the GlideRecord update count.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC00000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
hw.walkTo(0);
do {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' + oldPriority);
} while (hw.walkForward())
```

**Output:**

```
Incident priority in update number 0 was 4
Incident priority in update number 1 was 4
Incident priority in update number 2 was 4
Incident priority in update number 3 was 4
Incident priority in update number 4 was 4
Incident priority in update number 5 was 2
```
**HistoryWalker - walkTo(int updateCount)**

Applies the appropriate history/audit data to get a GlideRecord to the state it was in a specific update count. Use getWalkedRecord() or getWalkedRecordCopy() after walking to an update number to retrieve the “walked” GlideRecord.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>updateCount</td>
<td>Integer</td>
<td>The update number to walk to.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>true if walking to the specified update number was possible, false otherwise, for example if the requested update is greater than the update count of the GlideRecord, or if there is no history/audit data of the requested update number</td>
</tr>
</tbody>
</table>

**Example:**

```java
var incGr = new GlideRecord('incident');
incGr.get('number', 'INC0000015');

var hw = new sn_hw.HistoryWalker(incGr.getTableName(), incGr.getUniqueValue());
if (hw.walkTo(3)) {
    var oldPriority = hw.getWalkedRecord().priority;
    gs.info('Incident priority in update number ' + hw.getUpdateNumber() + ' was ' + oldPriority);
} else
    gs.info('Incident does not have update number 3');
```

**Output:**

```
Incident priority in update number 3 was 4
```

**HostnameJS - Global**

Formats host names according to property settings.

Use with any server-side script when you need to format host names.
HostnameJS - format(String hostname, String source)
Formats the specified host name according to the property settings.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>String</td>
<td>The host name to format</td>
</tr>
<tr>
<td>source</td>
<td>String</td>
<td>The property settings source</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The system name</td>
</tr>
</tbody>
</table>

HostnameJS - getDomainName()
Returns the DNS domain name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The domain name</td>
</tr>
</tbody>
</table>

```javascript
var hjs = new HostnameJS();
hjs.getDomainName();
```

HostnameJS - getSysName()
Returns the current system name.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The system name</td>
</tr>
</tbody>
</table>

```javascript
var hjs = new HostnameJS();
hjs.getSysName();
```

**hr_ActivitySet - Scoped**

Handles lifecycle event activity set cases.

Lifecycle event activity sets represent different stages in the lifecycle event process. You must define when the activity set is triggered, such as immediately upon creation of the lifecycle event case or after the completion of another activity set. Each activity set is associated with a single lifecycle event.

The hr_ActivitySet API requires the HR Lifecycle Events plugin (com.sn_hr_lifecycle_events).

See also Understanding Enterprise Onboarding and Transitions.

**hr_ActivitySet - hr_ActivitySet()**

Instantiates an instance of the hr_ActivitySet class.

**hr_ActivitySet - createLECaseByService(String hrService, Object caseValues)**

Creates a lifecycle event case based on a specified HR service.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hrService</td>
<td>String</td>
<td>Sys ID of HR service in the HR Services [sn_hr_core_service] table to be assigned to the lifecycle event case.</td>
</tr>
<tr>
<td>caseValues</td>
<td>Object</td>
<td>Key-value pairs containing a value for each case field.</td>
</tr>
<tr>
<td>caseValues.subject_person</td>
<td>String</td>
<td>Sys ID of subject person's name in the User [sys_user] table.</td>
</tr>
<tr>
<td>caseValues.opened_for</td>
<td>String</td>
<td>Sys ID of case opened for subject person in the Users [sys_user] table.</td>
</tr>
<tr>
<td>caseValues.subject_person_job</td>
<td>String</td>
<td>Sys ID of subject person's Business title in the Jobs [sn_hr_core_job] table.</td>
</tr>
<tr>
<td>caseValues.location</td>
<td>String</td>
<td>Sys ID of subject person's location in HR profile in the Locations [cmn_location] table.</td>
</tr>
<tr>
<td>caseValues.department</td>
<td>String</td>
<td>Sys ID of subject person's department in HR profile in the Departments [cmn_department] table.</td>
</tr>
<tr>
<td>caseValues.subject_person_hr_profile</td>
<td>String</td>
<td>Sys ID of subject person's HR profile in the HR Profiles [sn_hr_core_profile] table.</td>
</tr>
<tr>
<td>caseValues.short_description</td>
<td>String</td>
<td>Case description.</td>
</tr>
<tr>
<td>caseValues.state</td>
<td>Number</td>
<td>Number representing uniquely-defined custom case state.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Sys ID of the created case in the HR Lifecycle Events Cases [sn_hr_le_case] table.</td>
</tr>
</tbody>
</table>

Output includes summary with Operation Table and Row Count columns. Click the link in the row count column adjacent sn_hr_le_case table to view the new case.

```javascript
var caseValues = {
    'subject_person': '62826bf03710200044e0bfc8bcbe5df1',
    'opened_for': '0e826bf03710200044e0bfc8bcbe5d7c',
    'subject_person_job': 'f8d56900587d3700964f4efae452b3db',
    'location': '25ab9d1d0a0a0bb300537fd25687439d',
    'department': '93b25282c0a8000b0b55c8ab34e2f1e6',
    'subject_person_hr_profile': '330370019f22120047a2d126c42e7012',
    'short_description': 'Short description',
    'state': 10
};

var activity = new sn_hr_le.hr_ActivitySet();
var createCase = new activity.createLECaseByService('4719647c67a60300132a6c3b5685ef16', caseValues);
```

Output:

```javascript
...
insert sn_hr_le_case 1
...
```

hr_ActivitySet - hasActiveCaseByService(String spUser, String hrService, String jobId)

Checks for a case matching the specified combination of subject person user, HR service, and job.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spUser</td>
<td>String</td>
<td>Sys ID of subject person user in the Users [sys_user] table.</td>
</tr>
<tr>
<td>hrService</td>
<td>String</td>
<td>Sys ID of HR service in the HR Services [sn_hr_core_service] table.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobId</td>
<td>String</td>
<td>Sys ID of subject user's job title in the HR Services [sn_hr_core_service] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if matching case exists, false otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var userId = '62826bf03710200044e0bfc8bcbe5df1'; // Abel Tuter
var hrServiceId = '64fa4c53534222003066a5f4a11c0875'; // Onboarding HR Service
var jobId = '3D62826bf03710200044e0bfc8bcbe5df1'; // Sample Job sys_id for the example

var activity = new sn_hr_le.hr_ActivitySet();

var hasActiveLECase = activity.hasActiveCaseByService(userId, hrServiceId, jobId);

gs.info('User has an active HR case: ' + hasActiveLECase);
```

Output:

```
sn_hr_le: User has an active HR case: false
```

**hr_ActivityUtils - Scoped**

Enables creating HR cases from a record producer.

The hr_ActivityUtils script include requires the HR Lifecycle Events plugin (com.sn_hr_lifecycle_events).

**hr_ActivityUtils - createCaseFromProducer(GlideRecord current, Object producer, String cat_item.sys_id)**

Creates a case from a record producer and service. This method is intended to be called as-is to create a producer and does not require supplying data.

The following variables can be configured in a record producer to provide additional capabilities as follows:
• **job** – References `sn_hr_core_job` and maps to `subject_person_job` in an HR case

• **opened_for** – References `sys_user` and maps `opened_for` in an HR case

• **concurrent_job** – If the record producer includes this variable (by activating checkbox) and parameters have job information, creates a new job in `sn_hr_core_job` table

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>GlideRecord for case to be created.</td>
</tr>
<tr>
<td>producer</td>
<td>Object</td>
<td>Comma-separated key value pair containing data as questions and answers that are automatically provided when a user submits an answer to a record producer question.</td>
</tr>
<tr>
<td>cat_item.sys_id</td>
<td>String</td>
<td>Looks up the HR service of case being created and variable names to populate the description.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>New case in related table, varies by product.</td>
</tr>
</tbody>
</table>

This method is intended to be called as-is to create a producer and does not require supplying data.

```
new sn_hr_core.hr_ActivityUtils(current).createCaseFromProducer(producer, cat_item.sys_id);
```

### hr_Utils - Scoped

Provides basic functionality for the HR application.

The `hr_Utils` API requires the HR core plugin (com.sn_hr_core).

**hr_Utils - hr_Utils()**

Instantiates an instance of the `hr_Utils` class.
hr_Utils - getPrimaryJob(String userId)

Gets the Sys ID of the active primary job for a provided user.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>Sys ID of the HR user from the User [sys_user] table assigned an active or future job in which Primary is true.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>If present and active, Sys ID of the primary job from the Jobs [sn_hr_core_job] table, null otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var result = new sn_hr_core.hr_Utils().getPrimaryJob('5137153cc611227c000bbd1bd8cd2007');
gs.info('Result: ' + result);
```

Output:

Result: eb3c69463cd63740964fb8b1ce04f9ae

hr_Utils - switchPrimaryJob(String userId String jobId)

Switches the primary job of a user.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>Sys ID of HR user from the Users [sys_user] table.</td>
</tr>
<tr>
<td>jobId</td>
<td>String</td>
<td>Job Sys ID from the Jobs [sn_hr_core_job] table.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>Encoded JSON with message and status, error otherwise.</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var result = new sn_hr_core.hr_Utils().switchPrimaryJob('5137153cc611227c000bbd1bd8cd2007', 'bc884e72c0ebf00964fb8b1ce04f9d7');
gs.info('Result: ' + result);
```

Output:
```
Result: {"message":"Switched primary job for the user successfully","status":"success"}
```

**HttpRequestAuthedData - Scoped**

The `HttpRequestAuthedData()` API provides methods to access and set values in a signed REST or SOAP request.

Generate outbound signing requests using these APIs in the following order:

1. `HttpRequestData`: Build the API request.
2. `AuthCredential`: Create a credential object or update an existing one. Use the credential to sign the request through the `RequestAuthAPI` class.
3. `RequestAuthAPI`: Sign the request and return an `HttpRequestAuthedData` object.
4. `HttpRequestAuthedData`: Get information about the signed request.
5. `GlideHTTPRequest`: Send the signed request.

Before using these APIs, you must [configure an authentication algorithm](#) to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the `sn_auth` namespace identifier. You can instantiate this class using the constructor, or you can return an `HttpRequestAuthedData` object from the `generateAuth()` method in the `RequestAuthAPI` class.

**HttpRequestAuthedData - HttpRequestAuthedData()**

Instantiates an `HttpRequestAuthedData` object.

You can instantiate this class using the constructor, or you can return an `HttpRequestAuthedData` object from the `generateAuth()` method in the `RequestAuthAPI` class.
### HttpRequestAuthedData - addHeader(String key, String value)

Adds a header to the HttpRequestAuthedData object.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the HTTP header.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the HTTP Header.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

//Get AuthCredential
var credential = new
  sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cff8faf6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// Update the signed response
output.addHeader('access-rights', 'public-read');
```
HttpRequestAuthedData - addQueryParam(String key, String value)

Adds a query parameter to the HttpRequestAuthedData object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the query parameter.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the query parameter.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

//Get AuthCredential
var credential = new
sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662c6f8f6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// Update the signed response
output.addQueryParameter('api_version', 'v2');

HttpRequestAuthedData - getCredentialValue()

Returns the credential value that was included when the request was signed.
Use a credential value to store a cookie, signature, or other value needed for an authentication algorithm. For example, create a Get Connection Info (GCI) step with a script that retrieves and stores a one-time token for a REST or SOAP call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Text of the credential value.</td>
</tr>
</tbody>
</table>

This example shows the retrieval of a credential value.

```javascript
var RequestAuthGCISigner = Class.create();
RequestAuthGCISigner.prototype = Object.extend(new RequestAuthInternal(), {
    initialize: function() {
        RequestAuthInternal.prototype.initialize.call(this);
    },
    generateAuth: function(authAPI) {
        var requestData = authAPI.getHttpRequestData();
        // get credentials
        var credential = authAPI.getAuthCredential();
        var username = credential.getAttribute("user_name");
        var password = credential.getAttribute("password");
        var httpRequestSignedData = new sn_auth.HttpRequestAuthedData();
        var directive = requestData.getDirective();
        // set CREDENTIAL_VALUE
        httpRequestSignedData.setCredentialValue(username+":"+password);
        httpRequestSignedData.setDirective("CREDENTIAL_VALUE");
        httpRequestSignedData.setStatus("SUCCESS");
        gs.info("The Credential Value is " + httpRequestSignedData.getCredentialValue());
        return httpRequestSignedData;
    },
    type: 'RequestAuthGCISigner'
});
```
Output:

The Credential Value is someUsername:somePassword

HttpRequestAuthedData - getDirective()

Returns whether the signature is applied to the request in the header, as a query parameter, or as a credential value.

By default, the system applies the signature to the header. You can apply the signature as a query parameter or credential value by using the setDirective() API.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String| Whether the signature is applied to the header, as a query parameter, or as a credential value. Values include:  
  • HEADER: The signature is applied to the request header.  
  • QUERY: The signature is applied as a query parameter.  
  • CREDENTIAL_VALUE: The signature is applied as a credential value. |

```javascript
// Define HttpRequestData
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

//Get AuthCredential
```
var credential = new
sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cfff8fa6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();
output.setDirective("header");

gs.info("Signature applied to: " + output.getDirective());

Output:

Signature applied to: HEADER

HttpRequestAuthedData - getHeaderMap()

Returns an object containing the headers that were included when the request was signed.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object | Key-value pairs that define all of the headers included when the request was signed. Each key-value pair includes these parts:
  • key: String. Name of the header.
  • value: String. Value of the header. |

// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );
// Get an AuthCredential object
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cffe8f6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// get the signed response detail
var authH = headerM["Authorization"];
var xamzdateH = headerM["X-Amz-Date"];
var content256 = headerM["x-amz-content-sha256"];

gs.debug('authH:' + authH );
gs.debug('xamzdateH:' + xamzdateH );
gs.debug('content256:' + content256 );

Output:

*** Script: [DEBUG] authH:AWS4-HMAC-SHA256
Credential=lsjfljljflillfwek/20191127/us-east-1/s3/aws4_request,
SignedHeaders=host;x-amz-acl;x-amz-content-sha256;x-amz-date,
Signature=5c349011324910c34596ba7abbd10e07c4127774049f8953418bd7bed7d02b90

*** Script: [DEBUG] xamzdateH:20191127T175210Z
*** Script: [DEBUG] content256:UNSIGNED-PAYLOAD

HttpRequestAuthedData - getQueryMap()

Returns an object containing the query parameters included when the request was signed.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object | Key-value pairs that define the query parameters included when the request was signed. Each key-value pair includes these parts:
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• key:</td>
<td>String. Name of the query parameter.</td>
</tr>
<tr>
<td>• value:</td>
<td>String. Value of the query parameter.</td>
</tr>
</tbody>
</table>

```javascript
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2');
httpRequestData.addQueryParam('limit', '1000');
httpRequestData.addQueryParam('offset', '1');

// Get an AuthCredential object
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// Get the signed response
queryMap = output.getQueryMap();

gs.info("API Version is: " + queryMap["api_version"]);```

Output:

API Version is: v2

**HttpRequestAuthedData - getStatus()**

Returns the status of the request signing.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The status of the request signing.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>• SUCCESS: The system successfully signed the request.</td>
</tr>
<tr>
<td></td>
<td>• FAIL: The system failed to sign the request.</td>
</tr>
<tr>
<td></td>
<td>• SKIPPED: The system skipped signing because the information was incomplete.</td>
</tr>
</tbody>
</table>

```javascript
// Define the HttpRequestData object
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cfffaf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// Get the signed status
gs.info("Status is: " + output.getStatus());
```

Output:

```
Status is: SUCCESS
```
HttpRequestAuthedData - getStatusMessage()

Returns a detailed message about the request signing. If the request signing fails, this method returns the error message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Message about the request signing. If the request signing fails, returns one of these error messages:</td>
</tr>
</tbody>
</table>

- **credential is not valid**: Check the AuthCredential object you used to sign the request. Make sure an authentication algorithm is associated with the credential. For more information, see [Configure an authentication algorithm](#).

- **Request data is empty. Request auth is skipped**: Check the HttpRequestData object because required information may be missing.

- **Can't find script includes scope**: Verify that the authentication algorithm record and associated script includes used to sign the request are in the correct scope.

```javascript
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2');
httpRequestData.addQueryParam('limit', '1000');
httpRequestData.addQueryParam('offset', '1');

// Get AuthCredential object and set an attribute
var credential = new sn_auth.AuthCredential();
```
credential.setAttribute("user_name", "admin");
credential.setAttribute("password", "admin");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();

// Get the signed status
gs.info("Status message is: " + output.getStatusMessage());

Output:

Status message is: credential is not valid.

HttpRequestAuthedData - setCredentialValue(String credential_value)

Sets a credential value for the HttpRequestAuthedData object.

Use a credential value to store a cookie, signature, or other value needed for an authentication algorithm. For example, create a Get Connection Info (GCI) step with a script that retrieves and stores a one-time token for a REST or SOAP call.

Use the setCredentialValue() method to set the Credential Value data pill for REST, SOAP, and GCI steps in Flow Designer.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_value</td>
<td>String</td>
<td>Text of the credential value.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set a credential value for a GCI step.

```javascript
var RequestAuthGCISigner = Class.create();
RequestAuthGCISigner.prototype = Object.extend(new RequestAuthInternal(), {
    initialize: function() {
        RequestAuthInternal.prototype.initialize.call(this);
    },
    generateAuth: function(authAPI) {
        var requestData = authAPI.getHttpRequestData();
```
// get credentials
var credential = authAPI.getAuthCredential();
var username = credential.getAttribute("user_name");
var password = credential.getAttribute("password");
var httpRequestSignedData = new sn_auth.HttpRequestAuthedData();
var directive = requestData.getDirective();
var b64data = GlideStringUtil.base64encode(username+":"+password);

// set CREDENTIAL_VALUE
httpRequestSignedData.setCredentialValue("Basic "+b64data);
httpRequestSignedData.setDirective("CREDENTIAL_VALUE");
httpRequestSignedData.setStatus("SUCCESS");
return httpRequestSignedData;
}

type: 'RequestAuthGCISigner'
});

HttpRequestAuthedData - setDirective(String directive)
Defines whether to apply the signature to the signed request in the header, as a query parameter, or as a credential value.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directive</td>
<td>String</td>
<td>Whether to apply the signature to the header, query parameter, or credential value of the signed request. Values include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• query: Applies signature as a query parameter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• header: Applies signature to the request header.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• credential_value: Applies signature to the credential value.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

// Define HttpRequestData
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

// Get AuthCredential
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662c8f8f6a74b");

// Create RequestAuthAPI and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();
output.setDirective("header");

HttpRequestAuthedData - setStatus(String status)
Sets the status of the request signing.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The status of the request signing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• success: The system successfully signed the request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• fail: The system failed to sign the request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• skipped: The system skipped signing because the information was incomplete.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

// Define the HttpRequestData object
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662c0f8bfa6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();
output.setStatus("fail");

// Get the signed status
gs.info("Status is: " + output.getStatus());

Output:

Status is: FAIL

HttpRequestAuthedData - setStatusMessage(String statusMessage)
Sets a status message for the request signing.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statusMessage</td>
<td>String</td>
<td>Message to set for the request signing status.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

// Get an AuthCredential object
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cff8faf6a74b");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();
output.setStatusMessage("The request was successfully signed.");

// Get the signed status message
gs.info("Status message is: " + output.getStatusMessage());

Output:

Status message is: The request was successfully signed.

HttpRequestData - Scoped

The HttpRequestData API provides methods to build and manipulate a REST request before applying a signature and sending it to an endpoint.

Generate outbound signing requests using these APIs in the following order:

1. HttpRequestData: Build the API request.
2. AuthCredential: Create a credential object or update an existing one. Use the credential to sign the request through the RequestAuthAPI class.
3. RequestAuthAPI: Sign the request and return an HttpRequestAuthedData object.
4. HttpRequestAuthedData: Get information about the signed request.
5. GlideHTTPRequest: Send the signed request.

Before using these APIs, you must configure an authentication algorithm to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the sn_auth namespace identifier. You can instantiate this class using the constructor, or you can return an HttpRequestData object from the getHttpRequestData() method in the RequestAuthAPI class.
HttpRequestData - HttpRequestData()
Instantiates an HttpRequestData object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

var httpRequestData = new sn_auth.HttpRequestData();

HttpRequestData - addHeader(String key String value)
Adds a header to the HttpRequestData object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the HTTP header.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the HTTP Header.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example creates a REST request payload.

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read' );
```

HttpRequestData - addQueryParam(String key, String value)
Adds a query parameter to the HttpRequestData object.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the query parameter.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the query parameter.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2');
```

**HttpRequestData - deleteHeader(String key)**

Removes a header from the HttpRequestData object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the HTTP header to remove.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
```
HttpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
HttpRequestData.setContent(content);
HttpRequestData.deleteHeader('x-amz-acl');

**HttpRequestData - getConnectionAliasID()**

Returns the sys_id of the Connection & Credential alias associated with the IntegrationHub REST step.

You can pass the sys_id to the ConnectionInfoProvider API to retrieve information about the connection.

ℹ️ **Note:** You can only use this method in an IntegrationHub REST step. For more information, see REST step.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Sys_id of the alias record from the Connection &amp; Credential Aliases [sys_alias] table associated with the request.</td>
</tr>
</tbody>
</table>

```javascript
var httpRequestData = new sn_auth.HttpRequestData();
var id = httpRequestData.getConnectionAliasID();

var credential = new sn_cc.ConnectionInfoProvider().
var connectionInfo = credential.getConnectionInfo(id);
```

**HttpRequestData - getConnectionExtendedAttribute(String name)**

Returns the value of a connection attribute associated with the Connection & Credential alias associated with IntegrationHub REST step.

ℹ️ **Note:** You can only use this method in an IntegrationHub REST step. For more information, see REST step.

For more information about connection attributes, see Create connection attributes for IntegrationHub.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the connection attribute.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the connection attribute.</td>
</tr>
</tbody>
</table>

This example returns the value of a connection attribute set on the Connection & Credential alias associated with the REST step.

```javascript
var httpRequestData = new sn_auth.HttpRequestData();
gs.info("API Version is: " +
    httpRequestData.getConnectionExtendedAttribute('api_version'));
```

HttpRequestData - getContent()

Returns the content of the request in the HttpRequestData object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Content of the request.</td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');
var ct = httpRequestData.getContent();
```
Output:

```
Action=SendMessage&MessageBody=This is a test message
```

**HttpRequestData - getDate()**

Returns the date when the request was signed.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The difference between January 1, 1970 UTC and when the request was signed. Unit: Milliseconds</td>
</tr>
</tbody>
</table>

```javascript
var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');

gs.info("Date: "+httpRequestData.getDate());
```

Output:

```
Date: 1349333576093
```

**HttpRequestData - getDirective()**

Returns whether the signature is applied to the request in the header or as a query parameter.

By default, the system applies the signature to the header. You can apply the signature as a query parameter using the `setDirective()` API.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Whether the signature is applied to the header or as a query parameter. Values include: • HEADER: The signature is applied to the request header. • QUERY: The signature is applied as a query parameter.</td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
gs.info( "Signature applied to: " + httpRequestData.getDirective() );
```

Output:

Signature applied to: HEADER

HttpRequestData - getEndpoint()

Returns the endpoint set for the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Endpoint set for the request.</td>
</tr>
</tbody>
</table>
var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
gs.info( "Endpoint is: " + httpRequestData.getEndpoint() );

Output:

Endpoint is: https://s3.amazonaws.com

HttpRequestData - getExpiry()

Returns the time in seconds before the signature expires starting when the request was signed using the generateAuth() method in the RequestAuthAPI class.

The expiration is commonly set by the third-party service you are sending the request to, which overrides any value set by the setExpiry() method. For example, if the expiration is set to 900 seconds by the third-party service and you use the setExpiry() method to set the expiration to 300 seconds, the getExpiry() method returns 900 seconds.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Time before the signature expires. Unit: Seconds</td>
</tr>
</tbody>
</table>

var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
httpRequestData.setExpiry(300);
Signature expires in: 300

HttpRequestData - getHeader(String key)
Returns the value associated with the given HTTP header.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of HTTP header.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the given HTTP header.</td>
</tr>
</tbody>
</table>

Header value is: public-read

HttpRequestData - getHeaderMap()
Returns an object containing the headers included in the request.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object | Key-value pairs that define all of the headers associated with the request. Each key-value pair includes these parts:  
  • Key: String. Name of the header.  
  • Value: String. Value of the header. |

```javascript
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');
httpRequestData.addHeader('content-type', 'application/json');

var map = httpRequestData.getHeaderMap();

for(var x in map) {
    var y = map[x]
    gs.info(x, y);
}
```

Output:

```javascript
*** Script: x-amz-acl
*** Script: content-type
```

**HttpRequestData - getHost()**

Returns the host used in the request.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Host used in the request.</td>
</tr>
</tbody>
</table>

```javascript
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setHost('myHost')
httpRequestData.setService('s3')
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage\MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');

gs.info("Host is: " + httpRequestData.getHost());
```

Output:

Host is: myHost

**HttpRequestData - getHttpMethod()**

Returns the HTTP method used in the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>HTTP method used in the request.</td>
</tr>
</tbody>
</table>
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');

gs.info("HTTP method is: " + httpRequestData.getHttpMethod());

Output:

HTTP method is: PUT

HttpRequestData - getQueryParam(String key)

Returns the value of the specified query parameter.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the query parameter to get the value of.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the query parameter.</td>
</tr>
</tbody>
</table>

var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2');

gs.info("API version is: " + httpRequestData.getQueryParam('api_version'));

Output:
**HttpRequestData - getQueryParamMap()**

Returns an object containing the query parameters included in the request.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object | Key-value pairs that define the query parameters associated with the request. Each key-value pair includes these parts:  
• Key: String. Name of the query parameter.  
• Value: String. Value of the query parameter. |

```javascript
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addQueryParam('api_version', 'v2');
httpRequestData.addQueryParam('limit', '1000');
httpRequestData.addQueryParam('offset', '1');

var map = httpRequestData.getQueryParamMap();
gs.info("api_version is: " + map['api_version']);
```

### Output:

`api_version is: v2`
HttpRequestData - getRegion()

Returns the region for the request that will be used in signing.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the region.</td>
</tr>
</tbody>
</table>

```javascript
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);

gs.info("Region is: " + httpRequestData.getRegion());
```

Output:

Region is: us-east-1

HttpRequestData - getService()

Returns the service defined in the request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Service defined in the request.</td>
</tr>
</tbody>
</table>
var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');

gs.info("Service is: " + httpRequestData.getService());

**Output:**

```
Service is: s3
```

**HttpRequestData - setContent(String content)**

Defines the content to send in the request.

† **Note:** This method is not supported in script includes or MID server scripts.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>String</td>
<td>Content to send in the request.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod('put');
var content = "This is a test message";
httpRequestData.setContent(content);

**HttpRequestData - setDate(Number date)**

Defines the date of the request used for signing.

Use this method only when testing whether the signature is created correctly based on a timestamp. In production, the signing request uses the time that you generated the signature; manually setting this value may cause the signing request to fail.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| date   | Number| The difference between January 1, 1970 UTC and the date used to sign the request.  
        |       | Unit: Milliseconds                                                          |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint = "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDate(1349333576093);
```

### HttpRequestData - setDirective(String directive)

Defines whether to apply the signature to the request in a header or as a query parameter.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| directive | String | Whether to apply the signature to the header or as a query parameter.        
        |        | Values include:                                                            |
        |        | • query: Applies signature as a query parameter.                            |
        |        | • header: Applies signature to the request header.                          |
        |        | Default: header                                                            |
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setDirective("query");
```

HttpRequestData - setEndpoint(String endpoint)

Defines the endpoint to send the request to.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>String</td>
<td>Endpoint to send the request to. The endpoint can include query parameters, path, and version.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint="https://third-party-endpoint/path-parameters/version";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
```

HttpRequestData - setExpiry(Number expiry)

Sets the amount of time before the signature expires starting when the request is signed using the `generateAuth()` method in the RequestAuthAPI class.

The expiration is commonly set by the third-party service you are sending the request to, which overrides any value set by the `setExpiry()` method. For example, if the expiration is set to 900 seconds by the third-party service and you...
use the `setExpiry()` method to set the expiration to 300 seconds, the `getExpiry()` method returns 900 seconds.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiry</td>
<td>Number</td>
<td>Amount of time before the signature expires.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Seconds</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://s3.amazonaws.com";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.addQueryParam("list-type", "2");
httpRequestData.setService('s3');
httpRequestData.setHttpMethod('get');
httpRequestData.setExpiry(300);
```

HttpRequestData - `setHost(String host)`
Definitions the host used in the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>String</td>
<td>Name of the HTTP request host.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setHost('myHost');
```
HttpRequestData.setService('s3');
HttpRequestData.setRegion('us-east-1');
HttpRequestData.setHttpMethod('put');
var content = "Action=SendMessage&MessageBody=This is a test message";
HttpRequestData.setContent(content);
HttpRequestData.addHeader('x-amz-acl', 'public-read');

**HttpRequestData - setHttpMethod(String httpMethod)**

Sets the HTTP method to use in the request.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>httpMethod</td>
<td>String</td>
<td>HTTP method to use in the request.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
HttpRequestData.setRegion('us-east-1');
HttpRequestData.setHttpMethod('put');

**HttpRequestData - setRegion(String region)**

Defines the region to use for the request in signing.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>region</td>
<td>String</td>
<td>The region to use to sign the request. Available values are determined by the third-party API's requirements.</td>
</tr>
</tbody>
</table>
### HttpRequestData - setService(String service)

Defines the service for the request.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>String</td>
<td>The service for the request.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### i18NV3 - Client

Provides methods to get and format translated messages.

The i18N methods are accessed using the g_i18n global object.

#### i18NV3 - getMessage(String msgKey, Function callback)

Retrieves a translated message.
If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msgKey</td>
<td>String</td>
<td>The message to be retrieved.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>The function to be called when the message has been retrieved. The callback function has one argument, a string that is the translated message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### i18NV3 - getMessages(Array msgKeys, Function callback)

Retrieves a set of messages.

If the specified string exists in the database for the current language, then the translated message is returned. If the specified string does not exist for the current language, then the English version of the string is returned. If the string does not exist at all in the database, then the ID itself is returned.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msgKeys</td>
<td>Array</td>
<td>An array of keys specifying the messages to be retrieved.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>The function to be called when the messages have been retrieved. The callback function has one argument, an object containing key-value pairs, where key is the requested message key, and the value is the translated string.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

i18NV3 - format(String message, Object map)

Formats a string containing named tokens with values from a map.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to have the tokens added.</td>
</tr>
<tr>
<td>map</td>
<td>Object</td>
<td>The map of name/value pairs to replace in the message.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The formatted string</td>
</tr>
</tbody>
</table>

// Returns: "The rich young ruler was very very rich"
nowapi.g_i18n.format("The {p1} {p2} {p3} was very very {p1}", {p1: "rich", p2: "young", p3: "ruler"});

ICalUtilSNC - Global

The ICalUtilSNC API provides functions to generate iCalendar compliant events.

ICalUtilSNC - formatICalComponent(Array arrEvents)

Generates a formatted VCALENDAR component.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrEvents</td>
<td>Array</td>
<td>Contains the properties that make up a VCALENDAR component.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Contains properties needed to form a VCALENDAR.</td>
</tr>
</tbody>
</table>

ICalUtilSNC - formatICalEvent(Array arrEvent, Boolean useAlarm)

Generates a formatted VEVENT.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrEvent</td>
<td>Array</td>
<td>Contains the individual properties that make up a VEVENT.</td>
</tr>
<tr>
<td>useAlarm</td>
<td>Boolean</td>
<td>If true, adds a VALARM to the VEVENT.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The formatted VEVENT.</td>
</tr>
</tbody>
</table>

ICalUtilSNC - formatRecurringRule (Object ruleObj)

Formats the RRULE property for a VEVENT.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ruleObj</td>
<td>Object</td>
<td>Contains the properties for the RRULE property.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The formatted RRULE property.</td>
</tr>
</tbody>
</table>

ICalUtilSNC - getDateFromScheduleDateTime (GlideScheduleDateTime scheduleDateTime)

Returns the date from the GlideScheduleDateTime.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleDateTime</td>
<td>GlideScheduleDateTime</td>
<td>A GlideScheduleDateTime representation of the date and time.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Formatted date.</td>
</tr>
</tbody>
</table>

**ICalUtilSNC - getSDT(String sdtStr, String timeZone)**

If provided with a formatted date time string, it returns a GlideScheduleDateTime object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sdtStr</td>
<td>String</td>
<td>Formatted ScheduleDateTime.</td>
</tr>
<tr>
<td>timeZone</td>
<td>String</td>
<td>If provided, will be used for the generated GlideScheduleDateTime.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideScheduleDateTime</td>
<td>A GlideScheduleDateTime representation of the sdtStr.</td>
</tr>
</tbody>
</table>

**ICalUtilSNC - getTimeFromScheduleDateTime (GlideScheduleDateTime scheduleDateTime)**

Returns the time from the GlideScheduleDateTime.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleDateTime</td>
<td>GlideScheduleDateTime</td>
<td>A GlideScheduleDateTime representation of the date and time.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Formatted time.</td>
</tr>
</tbody>
</table>

### IdentificationEngine - Scoped

The `IdentificationEngine` API uses the Identification and Reconciliation framework to minimize the creation of duplicate configuration items (CIs) and to reconcile CI attributes by only accepting information from authorized data sources when updating the Configuration Management Database (CMDB).

When using this class in a scoped application, use the `sn_cmdb` namespace identifier.

### IdentificationEngine - createOrUpdateCI(String source, String input)

Inserts or updates configuration items and non-Configuration Management Database (CMDB) configuration items (classes not extending from `cmdb_ci`) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>String</td>
<td>Required. A JSON formatted string of configuration items to add or update.</td>
</tr>
</tbody>
</table>

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items</td>
<td>Array</td>
<td>Array of objects that define the items to add or update.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;items&quot;:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>{</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;className&quot;:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;display_values&quot;:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>{Object}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;internal_id&quot;:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;lookup&quot;: [Array]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;related&quot;: [Array]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;settings&quot;: {Object}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;sys_object_source_info&quot;: {Object}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;values&quot;: {Object}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>}</td>
<td></td>
<td></td>
</tr>
<tr>
<td>input.items.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table such as cmdb_ci_linux_server or cmdb_ci_win_server.</td>
</tr>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs, where the name is the field name and the value is the referenced display value. If you want to use the sys_id instead of the display value for reference fields, pass the information in the <code>input.items.lookup.values</code> parameter instead of in this parameter.</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input.items.internal_id</strong></td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td><strong>input.items.lookup</strong></td>
<td>Array</td>
<td>Identifies the top-level item containing the lookup (lookup-based identification). These records are used to identify the configuration item based on a lookup table that has a reference back to cmdb_ci. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For example:

```json
"lookup": [
  {
    "className": String,
    "internal_id": String,
    "sys_object_source_info": {Object},
    "values": {Object}
  }
]
```

| **input.items.lookup.className** | String | Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. |

</table>
|      |            | **input.items.values**<br>Fields to create or update for this related item as name/value pairs, where the name is the field name. For a reference field, the value must be the referenced sys_id.<br>If you want to use the display value instead of the sys_id for reference fields, pass this information in a `display_values` object instead of in the `values` object.<br>Field names and types depend on the fields selected by the user, such as:
```
"values": {
  "host_name": "String",
  "ip_address": "String",
  "name": "String",
  "os_name": "String",
  "sys_class_name": "String"
}
```
|      | Object     | **input.referenceItems**<br>Array of objects that define references between items in the input payload. |
|      | Array      | Array of objects that define references between items in the input payload. |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input.referencetItems.referenced</code></td>
<td>String</td>
<td>The <code>internal_id</code> defined for the item being referenced by another item.</td>
</tr>
<tr>
<td><code>input.referencetItems.referencedBy</code></td>
<td>String</td>
<td>The <code>internal_id</code> defined for the item that references another item.</td>
</tr>
<tr>
<td><code>input.referencetItems.referenceField</code></td>
<td>String</td>
<td>Name of the reference field in the class/table for the <code>referencedBy</code> item.</td>
</tr>
<tr>
<td><code>input.relations</code></td>
<td>Array</td>
<td>Array of objects that specify relationships between items in the payload.</td>
</tr>
</tbody>
</table>

An object in this array can use either of two formats:

- The object can define a relationship between two top-level items (only) using name-value pairs, with values representing item indexes from the payload items array.

```json
"relations": [
  {
    "child": Number,
    "parent": Number,
    "sys_rel_source_info": Object
  }
]
```
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;type&quot;</td>
<td>String</td>
<td>The object can define a relationship between any two items, including top-level, related, or lookup items, using <code>parent_id</code> and <code>child_id</code> key/value pairs, with values representing <code>internal_id</code> values defined for those items.</td>
</tr>
</tbody>
</table>

- The object can define a relationship between any two items, including top-level, related, or lookup items, using `parent_id` and `child_id` key/value pairs, with values representing `internal_id` values defined for those items.

```json
"relations": [
  {
    "child_id": "String",
    "parent_id": "String",
    "sys_rel_source_info": {Object},
    "type": "String"
  }
]
```

- `input.relations.child`: Number Integer index of the CI object in the array that represents the child in the relationship (items, items.related, or items.lookup).

- `input.relations.child_id`: String The `internal_id` of the child item in the relationship (items, items.related, or items.lookup).

- `input.relations.parent`: Number Integer index of the parent item in the relationship (items, items.related, or items.lookup).
<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>&quot;identificationAttempts&quot;: [Array], &quot;identifierEntrySysId&quot;: &quot;String&quot;, &quot;info&quot;: [Array], &quot;inputIndices&quot;: [Array], &quot;maskedAttributes&quot;: [Array], &quot;operation&quot;: &quot;String&quot;, &quot;relatedItems&quot;: [Array], &quot;relatedSysIds&quot;: [Array], &quot;sysId&quot;: &quot;String&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**<String>.items.additionalRelatedItems**

List of JSON objects that provides information about additional lookup and related items that were processed but not provided as part of the input payload. These items come from partial payloads.

This information is not currently returned.

Data type: Array

```
"additionalRelatedItems": [ 
  { 
    "className": "String", 
    "inputIndices": [Array], 
    "operation": "String", 
    "sysId": "String" 
  }
]
```

**<String>.items.additionalRelatedItems.className**

Class/table name (sys_class_name) of the CI that was created or updated.

Data type: String

**<String>.items.additionalRelatedItems.inputIndices**

Index of the corresponding input item. For top-level items, it is a list of integers. For related items, it is a list of related item indices.

Data type: Array
<table>

</tr>
<tr>
<td></td>
<td>&quot;searchOnTable&quot;: &quot;String&quot;</td>
</tr>
</tbody>
</table>

`<String>.items.identificationAttempts.attemptResult` Results of the attempt to identify the CI.

Possible values:

- **MATCHED**: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes.

- **MULTI_MATCH**: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes.

- **NO_MATCH**: Identification failed. No CI was found in the identifier rule table which matched the specified attributes.

- **SKIPPED**: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied.

Data type: String
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>

Data type: String

<String>.relations.sysId

Sys_id of the dependent relationship CI.
Data type: String

The following shows how to reclassify a configuration item.

```javascript
var payload = {
    "items": [
        {
            "className": "cmdb_ci_win_server",
            "values": {
                "short_description": "Linux server description",
                "name": "Linux Server 1"
            }
        }
    ]
};

var input = JSON.stringify(payload);
var output = sn_cmdb.IdentificationEngine.createOrUpdateCI('ServiceNow', input);

gs.info(JSON.stringify(JSON.parse(output), null, 2));
```

Output:

```json
{
    "items": [
        {
            "className": "cmdb_ci_linux_server",
            "operation": "NO_CHANGE",

IdentificationEngine - createOrUpdateCIEnhanced(String source, String input, Object options)

Inserts or updates configuration items and non-Configuration Management Database (CMDB) configuration items (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

In addition to providing the functionality of the createOrUpdateCI() method, this method also supports:
• Handling partial payloads
• Handling partial commits
• Removing duplicate items within a payload
• Generating output summaries

For additional information on IRE and more detailed explanations of the data used by this method, see Identification and Reconciliation (IRE).

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>String</td>
<td>Required. A JSON formatted string of configuration items to add or update.</td>
</tr>
<tr>
<td>input.items</td>
<td>Array</td>
<td>Array of objects that define the items to add or update.</td>
</tr>
</tbody>
</table>

#### input.items

- className: String
- display_values: Object
- internal_id: String
- lookup: Array
- related: Array
- settings: Object
- sys_object_source_info: Object
- values: Object

#### input.items.className

- Required. Class/table name, sys_class_name, of the items.
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs, where the name is the field name and the value is the referenced display value. If you want to use the <code>sys_id</code> instead of the display value for reference fields, pass the information in the <code>input.items.lookup.values</code> parameter instead of in this parameter. Reference field names depend on the fields selected as:</td>
</tr>
<tr>
<td>input.items.internal_id</td>
<td>String</td>
<td>Unique identifier for the associated payload. This can be any value but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup</td>
<td>Array</td>
<td>Identifies the top-level item containing the lookup (lookup-based identification). These</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create. This value can be any CMDB class/table, such as cmdb_serial_number or cmdb_ci.</td>
</tr>
<tr>
<td>input.items.lookup.internal_id</td>
<td>String</td>
<td>Unique lookup item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info</td>
<td>Object</td>
<td>Defines a unique CI identifier for a specific data source. Different sources may have different name-value pairs.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this field. It can be any string that uniquely identifies the source feed.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_name</td>
<td>String</td>
<td>Data source information of the CI. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_native_key</td>
<td>String</td>
<td>Unique key-id for the item from the source. The data source generates this key. It can be any string that is unique to the item.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date/time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss.</td>
</tr>
<tr>
<td>input.items.lookup.values</td>
<td>Object</td>
<td>Field information as name-value pairs, where the name is the field name. When updating reference fields, the value must be the referenced sys_id.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field names and types</td>
<td></td>
<td>Field names and types depend on the fields selected by the user, such as:</td>

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.related.className</td>
<td>String</td>
<td>Required. Class name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_software_instance or cmdb_key_value.</td>
</tr>
<tr>
<td>input.items.related.internal_id</td>
<td>String</td>
<td>Unique identifier for this related item in this payload. Can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info</td>
<td>Object</td>
<td>Object that makes up a unique CI identifier for a specified data source. Different data sources may have different name-value pairs for the same CI.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.related.sys_object_source_info.source_name</td>
<td>String</td>
<td>any string that uniquely identifies the source feed.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_native_key</td>
<td>String</td>
<td>Unique key/ID from the source for the related item. The data source generates this key. It can be any string that is unique to the item.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date and time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss</td>

| input.items.settings.updateWithoutSwitch | Boolean | Flag that indicates whether the item can be updated and the class switched. Valid values:  
- true: Update the item but class switching is not permitted.  
- false: Both item update and class switching are permitted.  
Default: false |
| input.items.settings.updateWithoutUpgrade | Boolean | Flag that indicates whether update and upgrade are both permitted for this item. Valid values:  
- true: Update the item but upgrade is not permitted.  
- false: Both item update and upgrade are permitted.  
Default: false |
| input.items.sys_object_source_info | Object | Unique CI identifier for a specific source. |

</tbody>
</table>

**input.referencelItems**

Array

Array of objects that define references between items in the input:

```
{"reference": {
  "referenced": "String",
  "referencedBy": "String",
  "referenceField": "String"
}}
```

**input.referencelItems.referenced**

String

The `internal_id` defined for the item being referenced by another item.

**input.referencelItems.referencedBy**

String

The `internal_id` defined for the item that references another item.
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.referenceltems.referenceField</td>
<td>String</td>
<td>Name of the reference field in the class/table for the referencedBy item.</td>
</tr>
</tbody>
</table>
| input.relations                        | Array    | Array of objects that specify relationships between items in the input payload. An object can use either of the following formats:

- The object can define a relationship between two top-level items using `parent` and `child` name-value pairs, with values representing item indexes from the payload:

  ```json
  "relations": [
    {
      "child": Number,
      "parent": Number,
      "sys_rel_source_info": {Object},
      "type": "String"
    }
  ]
  ```

- The object can define a relationship between any two items, including top-level, related, or lookup items, using `parent_id` and `child_id` keys, with values representing `internal_id` values defined for those items:

  ```json
  "relations": {
    "parent_id": Number,
    "child_id": Number
  }
  ```

Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.relations.child</td>
<td>Number</td>
<td>Integer index of the CI object that defines the child in the relationship. (items, items.related, or items.lookup.)</td>
</tr>
<tr>
<td>input.relations.child_id</td>
<td>String</td>
<td>The internal_id of the child item in the relationship. (items, items.related, or items.lookup.)</td>
</tr>
<tr>
<td>input.relations.parent</td>
<td>Number</td>
<td>Integer index of the parent item in the relationship. (items, items.related, or items.lookup.)</td>
</tr>
<tr>
<td>input.relations.parent_id</td>
<td>String</td>
<td>The internal_id of the parent item in the relationship. (items, items.related, or items.lookup.)</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info</td>
<td>Object</td>
<td>Discovery source information for the relationship. For non-dependency relationships, this information is saved in the Relationship Sources [sys_rel_source] table (not persisted for identifyCIEnhanced() or identifyCI() methods.)</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info.source_name</td>
<td>String</td>
<td>Discovery source name. Default: Discovery source passed in the API method parameter.</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info.source_feed</td>
<td>String</td>
<td>Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in the sys_rel_source table.</td>
</tr>
<tr>
<td>input.relations.type</td>
<td>String</td>
<td>Type of relationship that exists between the parent and child items. Must be a name field value from the CI Relationship Type [cmdb_rel_type] table.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional, but {} or null must be passed-in. Options to enable or disable features.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options.deduplicate_payloads</td>
<td>Boolean</td>
<td>Flag that indicates whether duplicate items are merged or considered errors. Valid values: true: Merge duplicate items.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Consider duplicate items as errors. Default: true</td>
</tr>
<tr>
<td>options.generate_summary</td>
<td>Boolean</td>
<td>Flag that indicates whether the returned results contain summary information. The details of the returned summary can be accessed.</td>
</tr>
</tbody>
</table>

**Note:**
- If `partial_payloads` is set to true, both `partial_commits` and `deduplicate_payloads` are enabled, even if they are set to false, as those features are essential for partial payloads functionality.

```
"options": {
  "deduplicate_payloads": "Boolean",
  "generate_summary": "Boolean",
  "partial_commits": "Boolean",
  "partial_payloads": "Boolean"
}
```
<table>
<thead>
<tr>

<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.summary</td>
<td>&lt;String&gt;</td>
<td>return results table. Valid values: • true: Include summary information. • false: Do not include summary information. Default: false</td>
</tr>
<tr>
<td>options.partial_commits</td>
<td>Boolean</td>
<td>Flag that indicates whether partial commit support is enabled. For additional information on partial commits, see Enhanced IRE features. Valid values: • true: Partial commit enabled. • false: Partial commit disabled. Default: true</td>
</tr>
<tr>
<td>options.partial_payloads</td>
<td>Boolean</td>
<td>Flag that indicates whether partial payload support is enabled. For additional information on partial payloads, see Enhance IRE features and Create an IRE data source rule. Valid values: • true: Partial payload enabled. • false: Partial payload disabled. Default: true</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>String</td>
<td>Data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;</td>

<tr>
<td>• UPDATE_WITH_UPGRADE: An existing CI in the target table is updated and its class is changed to a more specialized class (descendent class).</td>
<td></td>
</tr>
</tbody>
</table>

**<String>.additionalCommittedItems.sysId**
Sys_id found for this additional CI through identification.
Data type: String
Notable values:
- Unknown: Identification of this additional CI failed. See errors for details.

**<String>.additionalCommittedItems.warnings**
Array of objects that describe a warning encountered while processing this additional CI.
Data type:

```json
  "warnings": [
    {
      "error": "String",
      "message": "String"
    }
  ]
```

**<String>.additionalCommittedItems.warnings.error**
Type of warning encountered while processing this additional CI.
Returns (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.warnings.message</code></td>
<td>Warning message encountered while processing this additional CI. Data type: String</td>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;mergedPayloadIds&quot;: [&quot;String&quot;]</td>
<td>-</td>
</tr>
</tbody>
</table>

**<String>.additionalCommittedRelations.operation**

Operation that was performed for the additional dependent relationship CI. Possible values:
- INSERT: The dependent relationship CI is inserted into the target table as a new record.
- INSERT_AS_INCOMPLETE: The dependent relationship CI had errors and is inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table.
- INSERT_AS_PARTIAL: The dependent relationship CI had errors and is inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.
- NO_CHANGE: No operation is performed for the dependent relationship CI.
- UPDATE: An existing dependent relationship CI in the target table is updated.

Data type: String

**<String>.hasError**

Flag that indicates whether any item or relation has errors.

Data type: Boolean

**<String>.hasWarning**

Flag that indicates whether any item or relation has warnings.

Data type: Boolean

],
IdentificationEngine - identifyCI(String jsonString)

Determines the operation (insert/update) to perform with the specified payload without committing the operation in the database.

This works just like createOrUpdateCI(), but does not commit the result.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| jsonString | String   | A JSON formatted string of configuration items to be added or updated. Each input string is in the format 'items: [{}, relations: [{}]}, where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are:  
  - className - Sys_class_name of the CI to be created or updated.  
  - values: {} - Field information for the CI as name-value pairs, where the name is the field name.  
  - lookup: [{],} - List of records with each item having name-value pairs like the items list.  
  The possible name-value pairs within the relations list are:  
  - parent - Index of the parent item in the dependency relation  
  - child - Index of the child item in the dependency relation  
  - type - Relationship type. This is one of the name field values from the cmdb_rel_type table. |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String | A JSON formatted string that is a list of results. Each result string is in the format 'items: [{}, relations: [{}]}, where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are:  
  - className - Sys_class_name for the CI that was updated or created.  
  - operation - Operation to perform, which is one of the following:  
    ◦ DELETE  
    ◦ INSERT  
    ◦ NO_CHANGE  
    ◦ UPDATE  
    ◦ UPDATE_WITH_DOWNGRADE |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ UPDATE_WITH_SWITCH</td>
<td></td>
</tr>
<tr>
<td>◦ UPDATE_WITH_UPGRADE</td>
<td></td>
</tr>
</tbody>
</table>

- `sysId` - Sys_id of the CI that was updated or created.
- `relatedSysIds` - List of sys_id values of CIs used during lookup based identification.
- `identifierEntrySysId` - Sys_id of identifier entry used during matching.
- `errors` - List of errors in the format of (error, message string)
- `duplicateIndices` - List of indexes of items that are duplicates of the current item.
- `identificationAttempts` - List of attempts in the format of (attributes, identifierName, attemptResult, searchOnTable) where
  - `attributes` - Attributes of identifier entry used during identification
  - `identifierName` - CI identifier to which this identifier entry belongs
  - `attemptResult` - One of SKIPPED, NO_MATCH, MATCHED, MULTI_MATCH
  - `searchOnTable` - Table searched during the identification process.

The possible name-value pairs within the relations list are:
- `className` - Relationship CI's class name and is always cmdb_rel_ci
- `operation` - Type of operation: INSERT, UPDATE, NO_CHANGE
- `sysId` - Sys_id of the relationship CI inserted or updated

The following shows how to reclassify a configuration item.

```javascript
var payload = {
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      }
    }
  ]
}```
Output:

```json
{
   "items": [
      {
         "className": "cmdb_ci_linux_server",
         "operation": "NO_CHANGE",
         "sysId": "440577800f321010150efc91ff767e94",
         "identifierEntrySysId": "556eb250c3400200d8d4bea192d3ae92",
         "identificationAttempts": [
            {
               "attributes": [],
               "info": "sys_object_source SKIPPED",
               "identifierName": ",",
               "attemptResult": "SKIPPED",
               "hybridEntryCiAttributes": []
            },
            {
               "attributes": [
                  "serial_number",
                  "serial_number_type"
               ],
               "identifierName": "Hardware Rule",
               "attemptResult": "SKIPPED",
               "searchOnTable": "cmdb_serial_number",
               "hybridEntryCiAttributes": []
            },
            {
               "attributes": [
                  "serial_number"
               ],
               "identifierName": "Hardware Rule",
               "attemptResult": "SKIPPED",
               "searchOnTable": "cmdb_ci_hardware",
               "hybridEntryCiAttributes": []
            }
         ]
      }
   ]
}
```
IdentificationEngine - identifyCIEnhanced(String source, String input, Object options)

Determines the Configuration Management Database (CMDB) operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this method to simulate submission of a payload.

This method is similar to the IdentificationEngine - identifyCI(String jsonString) method, however it also supports the following functionality:
- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is `INSERT_AS_PARTIAL` or `INSERT_INCOMPLETE`.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>String</td>
<td>Required. A JSON formatted string of configuration items to add or update.</td>
</tr>
<tr>
<td>input.items</td>
<td>Array</td>
<td>Array of objects defining the items to add or update.</td>
</tr>
<tr>
<td>input.items.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the items added or updated.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>the configuration item (CI) to create or update</td>
<td>String</td>
<td>This value can be any CMDB class/table, such as <code>cmdb_ci_linux_server</code> or <code>cmdb_ci_win_server</code>.</td>
</tr>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs, where the name is the field name and the value is the referenced display value. If you want to use the sys_id instead of the display value for reference fields, pass the information in the <code>input.items.lookup.values</code> parameter instead of in this parameter. Reference field names depend on the fields selected, such as:</td>
</tr>
<tr>
<td>input.items.internal_id</td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup</td>
<td>Array</td>
<td>Identifies the top-level item containing the lookup (lookup-based identification).</td>
</tr>
</tbody>
</table>

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input.items.lookup.className</code></td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as <code>cmdb_serial_number</code> or <code>cmdb_ci</code>.</td>
</tr>
<tr>
<td><code>input.items.lookup.internal_id</code></td>
<td>String</td>
<td>Unique lookup item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td><code>input.items.lookup.sys_object_source_info</code></td>
<td>Object</td>
<td>Defines a unique CI identifier for a specific data source. Different sources may have different name-value pairs for the same CI.</td>
</tr>
</tbody>
</table>

records are used to identify the configuration item based on a lookup table that has a reference back to cmdb_ci.

For example:

```
"lookup": [
  {
    "className": "String",
    "internal_id": "String",
    "sys_object_source_info": {
      (Object)
      "sys_object_source_info": {
        "source_feed": "String"
      }
    }
  }
]
```
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The data source generates this feed name. It can be any string that uniquely identifies the source.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_name</td>
<td>String</td>
<td>Data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the CI.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The data source generates this field. It can be any string that uniquely identifies the source information.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_native_key</td>
<td>String</td>
<td>Unique key-id for the item from the source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The data source generates this key. It can be any string that uniquely identifies the source information.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date/time that the item was scanned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Format: YYYY-MM-DD hh:mm:ss</td>
</tr>
<tr>
<td>input.items.lookup.values</td>
<td>Object</td>
<td>Field information as name-value pairs, where the name is the field name. When updating reference fields, the value must be the referenced sys_id.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Field names and types depend on the fields selected by the user, such as:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>{ *values*: { *serial_number*: *String, *serial_number_type*: *String, *valid*: *String, *ip_address*: *String, *mac_address*: *String} }</td>
</tr>
<tr>
<td>input.items.related</td>
<td>Array</td>
<td>Reference to the top-level item that contains the related list. Rules in the Related Entry (cmdb_related_entry) define what type of records can be in this array. These records are used to add items based on a related table that has a reference to the CI that is being identified. The related table may or may not extend cmdb_ci. These records are not used to identify the CI item.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>{ *related*: { *class*: *String, *internal_id*: *String, *sys_object_source_info*: {Object}, *values*: {Object} }</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>&lt;String&gt;</strong></td>
<td>JSON formatted string that is a list of results for the configuration items in the input string. Data type: String</td>
</tr>
</tbody>
</table>

```json
{
    "additionalCommittedItems": [Array],
    "additionalCommittedRelations": [Array],
    "hasError": "Boolean",
    "hasWarning": "Boolean",
    "items": [Array],
    "relations": [Array],
    "summary": {Object}
}
```

**<String>**.additionalCommittedItems

List of CIs that were committed during the IRE processing of the current payload, but were not present in the current input payload.

Data type: Array

```json
"additionalCommittedItems": [
    {
        "className": "String",
        "errorCount": Number,
        "operation": "String",
        "identificationAttempts": [Array],
        "inputIndices": [Array],
        "markers": [Array],
    }
]
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;mergedPayloads&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;sysId&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>]</td>
</tr>
</tbody>
</table>

### `<String>.additionalCommittedRelations`

Array of objects that describe a dependent relationship CI that was not included in the request body relations list to insert or update.

Data type: Array

```
"additionalCommittedRelations": [|
|   {|
|     "className": "String",
|     "inputIndices": [Array],
|     "markers": [Array],
|     "mergedPayloadIds": [Array],
|     "operation": "String" |
|   } |
| ]
```

### `<String>.hasError`

Flag that indicates whether any item or relation has errors.

Data type: Boolean

### `<String>.hasWarning`

Flag that indicates whether any item or relation has warnings.

Data type: Boolean

### `<String>.items`

List of objects that describe the created or updated CIs.

Data type: Array

```
"items": [|
|   {|
|     "additionalRelatedItems": [Array],
|     "className": "String",
|     "duplicateIndices": [Array],
|     "errorCount": Number,
|     "errors": [Array],
|     "identificationAttempts": [Array],
|     "identifierEntrySysId": "String",
|     "info": [Array],
|     "inputIndices": [Array],
|   } |
| ]
```
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;maskedAttributes&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;operation&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;relatedSysIds&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;sysId&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`<String>.items.additionalRelatedItems` objects that provide information about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads.

Data type: Array

- "additionalRelatedItems": [ |
- "className": "String", |
- "inputIndices": [Array], |
- "mergedPayloadIds": [Array], |
- "operation": "String", |
- "sysId": "String" |
- ]

- `<String>.items.additionalRelatedItems.className`
  Class/table name (sys_class_name) of the CI that was created or updated.
  Data type: String

- `<String>.items.additionalRelatedItems.inputIndices`
  Index values for CIs from the request body `items` array that correspond to this related item.
  Data type: Array of Numbers

- `<String>.items.additionalRelatedItems.mergedPayloadIds`
  List of sys_ids of the partial payloads that were merged into the related item. Located in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.
  Data type: Array

- `<String>.items.additionalRelatedItems.operation`
  Type of operation.
  Possible values:
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
|      | • INSERT: New CI was inserted into the database.  
         • NO_CHANGE: No CI changes were made.  
         • UPDATE: Existing CI was updated.  
         Data type: String |
|<String>.items.additionalRelatedItems.sysId | Sys_id of the CI that was updated or created.  
   Data type: String |
|<String>.items.className | Class/table name (sys_class_name) of the CI that was created or updated.  
   Data type: String |
|<String>.items.duplicateIndices | List of indexes of CIs that are duplicates of the current item.  
   Data type: Array |
|<String>.items.errorCount | Number of errors encountered while processing the item.  
   Data type: Number |
|<String>.items.errors | Array of objects in which each object describes an error encountered while processing this CI.  
   Data type: Array |
|              | "errors": [ |
|              |   { |
|              |     "error": "String", |
|              |     "message": "String" |
|              |   } |
|              | ] |
|<String>.items.errors.type | Type of error encountered while processing the CI.  
   Data type: String |
|<String>.items.errors.message | Error message encountered while processing the CI.  
   Data type: String |
|<String>.items.identificationAttempts | List of attempts that were made to identify the CIs.  
   Data type: Array |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;identificationAttempts&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;attemptResult&quot;: &quot;String&quot;,</td>
</tr>
<tr>

<tr>
<td></td>
<td>&quot;hybridEntryCiAttributes&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;identifierName&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;searchOnTable&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

#### <String>.items.identificationAttempts.attemptResult

Possible values:

- **MATCHED**: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes.
- **MULTI_MATCH**: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes.
- **NO_MATCH**: Identification failed. No CI was found in the identifier rule table which matched the specified attributes.
- **SKIPPED**: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied.

Data type: String

#### <String>.items.identificationAttempts.attributes

List of CI identifier entry attributes that were used during the identification process.

Data type: Array

Attribute names and types depend on the request body data and the identifier in use, such as:

```
"attributes": [ |
  "serial_number": "String", |
  "serial_number_type": "String", |
] ```
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.items.identificationAttempts.identifierName</td>
<td>Identifier rule used for this CI identification attempt. Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.identificationAttempts.searchOnTable</td>
<td>Name of the table searched during the identification process. Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.identifierEntrySysId</td>
<td>Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.info</td>
<td>List of objects that contains additional information about the processing of the item. Data type: Array</td>

<td>Reclassification type that was skipped. Possible values:</td>
</tr>
<tr>
<td>• SKIPPED_CLASS_SWITCH</td>
<td></td>
</tr>
<tr>
<td>• SKIPPED_CLASS_DOWNGRADE</td>
<td></td>
</tr>
<tr>
<td>• SKIPPED_CLASS_UPGRADE</td>
<td></td>
</tr>
<tr>
<td>Data type: String</td>
<td></td>
</tr>
<tr>
<td>&lt;String&gt;.items.info.message</td>
<td>Message that provides additional insights into the reason for skipping the reclassification. Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.info.ruleSysId</td>
<td>Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.inputIndices</td>
<td>Returns the indices of the corresponding input CI. For top-level items, it is a list of integers. For related or lookup CIs, it is list of JSON objects. Data type: Array of Numbers</td>
</tr>
<tr>
<td>&lt;String&gt;.items.maskedAttributes</td>
<td>List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array</td>
</tr>
</tbody>
</table>
| <String>.items.operation | Operation that took place. Possible values:  
  - INSERT: New CI was inserted into the database.  
  - INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table.  
  - INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table.  
  - NO_CHANGE: No CI changes were made.  
  - UPDATE: Existing CI was updated.  
  - UPDATE_WITH_DOWNGRADE: CI was updated and the class changed to a more generic class (ancestor class).  
  - UPDATE_WITH_SWITCH: CI was updated and the class changed to a class that is not ancestor or descendent.  
  - UPDATE_WITH_UPGRADE: CI was updated and the class changed to a more specialized class (descendent class). Data type: String |
| <String>.items.relatedItems | List of JSON objects that provide information about the processed related items. Data type: Array |

*relatedItems*:

```javascript
[]
```
Returns (continued)

<tr>
<td></td>
<td>&quot;warnings&quot;: [Array]</td>
</tr>
</tbody>
</table>

<String>.items.relatedItems.className
Data type: String

<String>.items.relatedItems.errorCount
Data type: Number

<String>.items.relatedItems.errors
List of errors that occurred during processing of the related item.
Data type: Array

"errors": [
|
| "error": "String", |
| "message": "String"
|

<String>.items.relatedItems.errors.error
Type of error encountered while processing the related item.
Data type: String

<String>.items.relatedItems.errors.message
The error message encountered while processing the related item.
Data type: String

<String>.items.relatedItems.inputIndices
Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects.
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>

<td></td>
</tr>
</tbody>
</table>

Data type: String

<String>.items.relatedItems.sysId
Data type: String

<String>.items.relatedItems.warningCount
Data type: Number

<String>.items.relatedItems.warnings
Array of objects that describes a warning encountered while processing the related items.
Data type: Array

```
"warnings": [
{
  "error": "String",
  "message": "String"
}
]
```

<String>.items.relatedSysIds
List of the sys_id values of the CIs used during lookup-based identification of related items.
Data type: String

<String>.items.sysId
Sys_id of the CI that was updated or created.
Data type: String

<String>.relations
List of JSON objects that provides information about the processed relations.
Data type: Array

```
"relations": [
{
```
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **className**: "String",
- **errorCount**: Number,
- **errors**: [Array],
- **inputIndices**: [Array],
- **operation**: "String",
- **sysId**: "String"

### <String>.relations.className

- Synonym: class_name of this dependent relationship CI.
- Only supported value:
  - cmdb_rel_ci: CI Relationship table.
- Data type: String

### <String>.relations.errorCount

- Description: Number of errors encountered when processing the dependent relationship CI.
- Data type: Number

### <String>.relations.errors

- Description: Array of objects that describe errors that were encountered while processing this dependent relationship CI.
- Data type: Array

```json
"errors": [
  {
    "error": "String",
    "message": "String"
  }
]
```

### <String>.relations.inputIndices

- Description: Indexes for the dependent relationship CI objects in the request body relations array that correspond to this dependent relationship CI.
- Data type: Array

### <String>.relations.operation

- Description: Type of operation performed.
- Possible values:
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• INSERT: The dependent relationship CI was inserted into the target table as a new record.</td>
</tr>
<tr>
<td></td>
<td>• INSERT_AS_INCOMPLETE: The dependent relationship CI had errors and was inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table.</td>
</tr>
<tr>
<td></td>
<td>• INSERT_AS_PARTIAL: The dependent relationship CI had errors and was inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.</td>
</tr>
<tr>
<td></td>
<td>• NO_CHANGE: No operation was performed.</td>
</tr>
<tr>
<td></td>
<td>• UPDATE: An existing dependent relationship CI in the target table was updated.</td>
</tr>
</tbody>
</table>

Data type: String

- `<String>.relations.sysId` – Sys_id of the dependent relationship CI.
  - Data type: String

- `<String>.summary` – List of JSON properties that provide statistics on how many items were inserted, updated, and such, per class.
  - Data type: Array

- `<String>.summary.<class_name>` – Statistics for a specific class.
  - Data type: Object

```json
<class_name>: {
  "additionalInsertedItemCount": Number,
  "errorCount": Number,
  "incompleteItemCount": Number,
  "insertedItemCount": Number,
  "partialItemCount": Number,
  "skippedItemCount": Number,
  "unchangedItemCount": Number,
  "updatedItemCount": Number,
  "warningCount": Number
}
```

- `<String>.summary.<class_name>.additionalInsertedItemCount` – Number of items inserted due to processing of partial payloads.

**IdentificationEngine - runIdentificationAudit(GlideRecord now_GR)**

Runs an identification audit against the specified configuration item (CI) to detect duplicates.

If duplicates are found, duplication tasks are created. Only use this method on CI types with independent identification rules.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>CI on which to run the audit to detect duplicates. The CI must have independent identification rules.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to check a record in the Linux Servers [cmdb_ci_linux_server] table for duplicates.

```javascript
var sysId = '<cbdb_ci_sys_id>';  
var gr = new GlideRecord('cmdb_ci_linux_server');  
gr.get(sysId);  
SNC.IdentificationEngineScriptableApi.runIdentificationAudit(gr);
```

**IdentificationEngineScriptableApi - Global**

The IdentificationEngineScriptableApi uses the Identification and Reconciliation framework to minimize the creation of duplicate configuration items (CIs) and to reconcile CI attributes by only accepting information from authorized data sources when updating the Configuration Management Database (CMDB).

**IdentificationEngineScriptableApi - createOrUpdateCI(String source, String input)**

Inserts or updates configuration items and non-Configuration Management Database (CMDB) configuration items (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>String</td>
<td>Required. A JSON formatted string of configuration items to add or update.</td>
</tr>
<tr>
<td>input.items</td>
<td>Array</td>
<td>Array of objects that define the items to add or update.</td>
</tr>
<tr>
<td>input.items.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_ci_linux_server or cmdb_ci_win_server.</td>
</tr>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs,</td>
</tr>
</tbody>
</table>

Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.internal_id</td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup</td>
<td>Array</td>
<td>Identifies the top-level item containing the lookup (lookup-based identification). These records are used to identify the configuration item based on a lookup table that has a reference back to cmdb_ci. For example:</td>
</tr>
</tbody>
</table>

```json
"lookup": {
  "className": "String",
  "model_id": "String",
  "location": "String"
}
```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.className</td>
<td>String</td>
<td>Required. Class/table name, <code>sys_class_name</code>, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as <code>cmdb_serial_number</code> or <code>cmdb_ci_network_adapter</code>.</td>
</tr>
<tr>
<td>input.items.lookup.internal_id</td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info</td>
<td>Object</td>
<td>Unique CI identifier for a specific source. <strong>sys_object_source_info</strong>: <code>{source_feed: String, source_name: String, source_native_key: String, source_recency_timestamp: String}</code></td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name. It can be any value, but must be unique within the payload.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>

<tr>
<td>]</td>
<td></td>
</tr>
</tbody>
</table>

### <String>.items.additionalRelatedItems.className

Class/table name (sys_class_name) of the CI that was created or updated.

Data type: String

### <String>.items.additionalRelatedItems.inputIndices

Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects.

Data type: Array of Numbers or Array of objects

### <String>.items.additionalRelatedItems.inputIndices.mainIndex

Index value from the request body items array that corresponds to the CI parent of the additional related item.

Data type: Number

### <String>.items.additionalRelatedItems.inputIndices.subIndex

Index value from the request body items.lookup array that corresponds to the additional related item.

Data type: Number

<td>• SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied.</td>
</tr>
</tbody>
</table>

Data type: String

```json
<String>.items.identificationAttempts.attributes
```

List of CI identifier entry attributes that were used during the identification process.

Data type: Array

Attribute names and types depend on the request body data and the identifier in use, such as:

```json
"attributes": {
  "serial_number": "String",
  "serial_number_type": "String"
}
```

```json
<String>.items.identificationAttempts.hybridEntryCiAttributes
```

No values are currently returned.

`<String>.items.identificationAttempts.identifierName`

Identifier rule used for this CI identification attempt.

Data type: String

`<String>.items.identificationAttempts.searchOnTable`

Name of the table searched during the identification process.
## Returns (continued)

<table>

Identify an independent CI with lookup-based identification.

```javascript
var payload = {items: [
    {className:'cmdb_ci_netgear',
    values: {name:'ny8500-nbxs08',
    ports:'1200'},
    lookup: [{className:'cmdb_serial_number',
    values:{serial_number:'1234ABCD',
    serial_number_type:'uuid',absent:'false',valid:'true'}},
    {className:'cmdb_serial_number',
    values:{serial_number:'3456EFGH',
    serial_number_type:'system',absent:'false',valid:'true'}}]
  ];

var jsonUntil = new JSON();
var input = jsonUntil.encode(payload);
var output = SNC.IdentificationEngineScriptableApi.createOrUpdateCI('ServiceNow', input);
gs.print(output);
```

Output:

```javascript
{
    "items": [
        {
            "className": "cmdb_ci_netgear",

Scoped equivalent

To use the `createOrUpdateCI(String source, String input)` method in a scoped application, use the corresponding scoped IdentificationEngine method: `IdentificationEngine - createOrUpdateCI(String source, String input)`.

IdentificationEngineScriptableApi - `createOrUpdateCIEnhanced(String source, String input, Object options)`

Inserts or updates configuration items and non-Configuration Management Database (CMDB) configuration items (classes not extending from cmdb_ci) in the CMDB based on identification and reconciliation rules. Use this API instead of updating the CMDB directly.

In addition to providing the functionality of the `createOrUpdateCI()` method, this method also supports:

- Handling partial payloads
- Handling partial commits
- Removing duplicate items within a payload
- Generating output summaries

For additional information on IRE and more detailed explanations of the data used by this method, see Identification and Reconciliation (IRE).

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| input  | String    | Required. A JSON formatted string of configuration items to add or update.
| input.items | Array | Array of objects that define the items to add or update. |

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_ci_linux_server or cmdb_ci_win_server.</td>
</tr>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs, where the name is the field name and the value is the referenced display value. If you want to use the sys_id instead of the display value for reference fields, pass the information in the input.items.lookup.values parameter instead of in this parameter. Reference field names depend on the fields selected by the user, such as:</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input.items.internal_id</code></td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td><code>input.items.lookup</code></td>
<td>Array</td>
<td>Identifies the top-level item containing the lookup (lookup-based identification). These records are used to identify the configuration item based on a lookup table that has a reference back to cmdb_ci. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>input.items.lookup.className</code></td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class, such as cmdb_ci_network_adapter.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>input.items.lookup.internal_id</code></td>
<td>String</td>
<td>Unique lookup identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td><code>input.items.lookup.sys_object_source_info</code></td>
<td>Object</td>
<td>Defines a unique CI identifier for a specific data source. Different sources may have different name-value pairs.</td>
</tr>
<tr>
<td><code>input.items.lookup.sys_object_source_info.source_feed</code></td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name. It can be any string that uniquely identifies the source.</td>
</tr>
<tr>
<td><code>input.items.lookup.sys_object_source_info.source_name</code></td>
<td>String</td>
<td>Data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td><code>input.items.lookup.sys_object_source_info.source_native_key</code></td>
<td>String</td>
<td>Unique key-id for the item from the source.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date/time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss</td>
</tr>
<tr>
<td>input.items.lookup.values</td>
<td>Object</td>
<td>Field information for the CI as name-value pairs, where the name is the field name. When updating reference fields, the value must be the referenced sys_id. Field names and types depend on the fields selected, such as:</td>
</tr>
<tr>
<td>input.items.related</td>
<td>Array</td>
<td>Reference to the top-level item that contains the related list. Rules in the Related Entry [cmdb_related_entry] define what type of records can be in this array. These records are used to add items based on a related table that has a reference to the CI being identified.</td>
</tr>
</tbody>
</table>

<td>input.referencedItems.referencedBy</td>
<td>String</td>
<td>The <code>internal_id</code> defined for the item that references another item.</td>
</tr>
<tr>
<td>input.referencedItems.referenceField</td>
<td>String</td>
<td>Name of the reference field in the class/table for the <code>referencedBy</code> item.</td>
</tr>
</tbody>
</table>
| input.relations | Array | Array of objects that specify relationships between items in the input payload. An object in this array can use either of two formats.  
- The object can define a relationship between two top-level items (only) using `parent` and `child` name-value pairs, with values representing item indexes from the payload. |

```json
"relations": [
  {
    "child": Number,
    "parent": Number,
    "sys_rel_source_info": {Object}
  }
]
```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.relations.child</td>
<td>Number</td>
<td>Integer index of the CI object in the items array that represents the child in the relationship (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>input.relations.child_id</td>
<td>String</td>
<td>The <code>internal_id</code> of the child item in the relationship (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>input.relations.parent</td>
<td>Number</td>
<td>Integer index of the parent item in the items array (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>

</thead>
</table>
| options.generate_summary  | Boolean| Flag that indicates whether the returned results contain summary information. For the details of the returned summary, see `<String>` in the return results table. Valid values:     
|                           |       | • true: Include summary information.                                      |
|                           |       | • false: Do not include summary information.                                |
|                           |       | Default: false                                                              |
| options.partial_commits   | Boolean| Flag that indicates whether partial commit support is enabled. For additional information on partial commits, see Enhanced IRE features. Valid values:       
|                           |       | • true: Partial commit enabled.                                              |
|                           |       | • false: Partial commit disabled.                                             |
|                           |       | Default: true                                                               |
| options.partial_payloads  | Boolean| Flag that indicates whether partial payload support is enabled. For additional information on partial payloads, see Create an IRE data source rule. Valid values:       
|                           |       | • true: Partial payload enabled.                                             |
|                           |       | • false: Partial payload disabled.                                           |
|                           |       | Default: true                                                               |
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Valid value:  
- true: Partial payload enabled.  
- false: Partial payload disabled.  
Default: true | | |
| source | String | Data source of the CI information. This value must be one of the values defined for the discovery_source field of the Configuration Item [cmdb_ci] table. |

## Returns

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| <String> | JSON formatted string that is a list of results for the configuration items in the input string.  
Data type:  
```json
{
  "additionalCommittedItems": [Array],  
  "additionalCommittedRelations": [Array],  
  "hasError": "Boolean",  
  "hasWarning": "Boolean",  
  "items": [Array],  
  "relations": [Array],  
  "summary": Object
}
```
| <String>.additionalCommittedItems | List of CIs that were committed during the IRE processing of the current payload. |
Returns (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>not present in the current input payload.</td>
<td></td>
</tr>
</tbody>
</table>

Data type:

```
{  
  class_name: "String",  
  errorCount: Number,  
  operation: "String",  
  identificationAttempts: [Array],  
  inputIndices: [Array],  
  markers: [Array],  
  mergedPayloads: [Array],  
  sysId: "String"  
}
```

**<String>.additionalCommittedItems.className**  
Sys_class_name of this additional CI.  
Data type: String

**<String>.additionalCommittedItems.errorCount**  
Number of errors encountered while processing this additional CI.  
Data type: Number

**<String>.additionalCommittedItems.errors**  
Array of objects that describes errors encountered while processing this additional CI.  
Data type: Array

```
{  
  error: "String",  
  message: "String"  
}
```

**<String>.additionalCommittedItems.errors.error**  
Type of error encountered while processing the additional CI.  
Data type: String
## Returns (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.errors.message</code></td>
<td>Error message encountered while processing the additional CI. Data type: String</td>
</tr>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.identificationAttempts</code></td>
<td>Array of objects in which each object describes an attempt made to identify this additional CI. Data type: Array</td>
</tr>
</tbody>
</table>
| `<String>.additionalCommittedItems.identificationAttempts.attemptResult` | Outcome of this additional CI identification attempt. Possible values:  
- MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes.  
- MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes.  
- NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes. |
## Returns (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied.</td>
<td></td>
</tr>
<tr>
<td>&lt;String&gt;.additionalCommittedItems.identificationAttempts.attributes</td>
<td>Array of CI identifier entry attributes used during this additional CI identification attempt. Data type: Array. Attribute names and types depend on the request body data and the identifier in use, such as:</td>
</tr>
<tr>
<td>&lt;String&gt;.additionalCommittedItems.identificationAttempts.hybridEntryCiAttributes</td>
<td>Array of CI identifier entry attributes used during this additional CI identification attempt. Data type: Array. Attribute names and types depend on the request body data and the identifier in use, such as:</td>
</tr>
<tr>
<td>&lt;String&gt;.additionalCommittedItems.identificationAttempts.identifierName</td>
<td>Identifier rule used for this additional CI identification attempt. Data type: String.</td>
</tr>
<tr>
<td>&lt;String&gt;.additionalCommittedItems.identificationAttempts.searchOnTable</td>
<td>Name of the table searched for this additional CI identification attempt. Data type: String.</td>
</tr>
</tbody>
</table>
## Returns (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.identifierEntrySysId</code></td>
<td>Sys_id for the identifier rule used to identify this additional CI. Notable values: • Unknown: Identification of this additional CI failed. See errors for details.</td>
</tr>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.inputIndices</code></td>
<td>Array of index values for CIs from the request body items array that correspond to this additional CI. Data type: Array</td>
</tr>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.markers</code></td>
<td>Array of marker values for internal use. Data type: Array</td>
</tr>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.mergedPayloads</code></td>
<td>Array of sys_id values for partial payloads from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table that were merged during processing of this additional CI. Data type: Array</td>
</tr>
<tr>
<td><code>&lt;String&gt;.additionalCommittedItems.operation</code></td>
<td>Operation performed for this additional CI. Data type: String Possible values:</td>
</tr>
</tbody>
</table>

### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• DELETE</td>
<td>An existing CI is removed from the target table.</td>
</tr>
<tr>
<td>• INSERT</td>
<td>The additional CI is inserted into the target table as a new record.</td>
</tr>
<tr>
<td>• NO_CHANGE</td>
<td>No operation is performed for the additional CI.</td>
</tr>
<tr>
<td>• UPDATE</td>
<td>An existing CI in the target table is updated.</td>
</tr>
<tr>
<td>• UPDATE_WITH_DOWNGRADE</td>
<td>An existing CI in the target table is updated and its class is changed to a more generic class (ancestor class).</td>
</tr>
<tr>
<td>• UPDATE_WITH_SWITCH</td>
<td>An existing CI in the target table is updated and its class is changed to another class which is not an ancestor or descendent class.</td>
</tr>
<tr>
<td>• UPDATE_WITH_UPGRADE</td>
<td>An existing CI in the target table is updated and its class is changed to a more specialized class (descendent class).</td>
</tr>
</tbody>
</table>

*<String>.additionalCommittedItems.sysId*<br>

**Sys_id** found for this additional CI through identification.  
Data type: String  
Notable values:  
• Unknown: Identification of this additional CI failed. See errors for details.

*<String>.additionalCommittedItems.warnings*<br>

Array of objects that describe a warning encountered while processing this additional CI.  
Data type: Array
## Returns (continued)

<table>
<thead>

IdentificationEngineScriptableApi - identifyCI(String jsonString)

Determines the operation (insert/update) to perform with the specified payload without committing the operation in the database.

This works just like createOrUpdateCI(), but does not commit the result.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| jsonString | String| A JSON formatted string of configuration items to be added or updated. Each input string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are:

  - className - Sys_class_name of the CI to be created or updated.
  - values:[] - Field information for the CI as name-value pairs, where the name is the field name.
  - lookup:[{}] - List of records with each item having name-value pairs like the items list.

The possible name-value pairs within the relations list are:

  - parent - Index of the parent item in the dependency relation
  - child - Index of the child item in the dependency relation
  - type - Relationship type. This is one of the name field values from the cmdb_rel_type table. |
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String | A JSON formatted string that is a list of results. Each result string is in the format 'items: [{}], relations:[{}]', where each item within the items and relations lists contains name-value pairs. The possible name-value pairs within the items list are:  
  • className - Sys_class_name for the CI that was updated or created.  
  • operation - Operation to perform, which is one of the following:  
    ◦ DELETE  
    ◦ INSERT  
    ◦ NO_CHANGE  
    ◦ UPDATE  
    ◦ UPDATE_WITH_DOWNGRADE  
    ◦ UPDATE_WITH_SWITCH  
    ◦ UPDATE_WITH_UPGRADE  
  • sysId - Sys_id of the CI that was updated or created.  
  • relatedSysIds - List of sys_id values of CIs used during lookup based identification.  
  • identifierEntrySysId - Sys_id of identifier entry used during matching.  
  • errors - List of errors in the format of (error, message string)  
  • duplicateIndices - List of indexes of items that are duplicates of the current item.  
  • identificationAttempts - List of attempts in the format of (attributes, identifierName, attemptResult, searchOnTable) where  
    ◦ attributes - Attributes of identifier entry used during identification  
    ◦ identifierName - CI identifier to which this identifier entry belongs  
    ◦ attemptResult - One of SKIPPED, NO_MATCH, MATCHED, MULTI_MATCH  
    ◦ searchOnTable - Table searched during the identification process.  
  The possible name-value pairs within the relations list are: |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• className</td>
<td>Relationship CI's class name and is always cmdb_rel_ci</td>
</tr>
<tr>
<td>• operation</td>
<td>Type of operation: INSERT, UPDATE, NO_CHANGE</td>
</tr>
<tr>
<td>• sysId</td>
<td>Sys_id of the relationship CI inserted or updated</td>
</tr>
</tbody>
</table>

Identify an independent CI with lookup-based identification.

```javascript
var payload = {items: [
  {className:'cmdb_ci_netgear',
   values: {name:'ny8500-nbxs08',
            ports:'1200'},
   lookup: [{className:'cmdb_serial_number',
             values:{serial_number:'1234ABCD',
                     serial_number_type:'uuid',absent:'false',valid:'true'},
             {className:'cmdb_serial_number',
              values:{serial_number:'3456EFGH',
                     serial_number_type:'system',absent:'false',valid:'true'}}]},
  ];

var jsonUntil = new JSON();
var input = jsonUntil.encode(payload);
var output = SNC.IdentificationEngineScriptableApi.identifyCI(input);
gs.print(output);
```

Output:

```
{
  "items": [
    {
      "className": "cmdb_ci_netgear",

Scoped equivalent

To use the `identifyCI(String jsonString)` method in a scoped application, use the corresponding scoped IdentificationEngine method: `IdentificationEngine - identifyCI(String jsonString)`.

`IdentificationEngineScriptableApi - identifyCIEnhanced(String source, String input, Object options)`

Determines the Configuration Management Database (CMDB) operation (insert/update) to perform with the specified payload (request body), without committing the operations in the database.

Use this method to simulate submission of a payload.

This method is similar to the `IdentificationEngineScriptableApi - identifyCI(String jsonString)` method, however it also supports the following functionality:

- Partial payloads
  - In case of an item having a warning or error, indicates if an item operation is `INSERT_AS_PARTIAL` or `INSERT_INCOMPLETE`.
  - Returns the sys_ids of partial payloads that were merged with existing partial payloads.
- Supports payload deduplicate feature.
- Generates a summary.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>String</td>
<td>Required. A JSON formatted string of configuration items to add or update.</td>
</tr>
<tr>
<td>input.items</td>
<td>Array</td>
<td>Array of objects that define the items to add or update.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_ci_linux_server or cmdb_ci_win_server.</td>
</tr>
<tr>
<td>input.items.display_values</td>
<td>Object</td>
<td>Reference fields to create or update for this related item as name-value pairs, where the name is the field name and the value is the referenced display value. If you want to use the sys_id instead of the display value for reference fields, pass the information in the input.items.lookup.values parameter instead of in this parameter. Reference field names depend on the fields.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>input.items.internal_id</td>
<td>String</td>
<td>Unique item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_ci.</td>
</tr>
</tbody>
</table>

For example:

```json
"lookup": [
    {
        "className": "String",
        "internal_id": "String",
        "sys_object_source_info": {
            Object
        },
        "values": {
            Object
        }
    }
]
```

input.items.lookup.className

| String | Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_ci. |

For example:

```json
"lookup": [
    {
        "className": "String",
        "internal_id": "String",
        "sys_object_source_info": {
            Object
        },
        "values": {
            Object
        }
    }
]
```

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.internal_id</td>
<td>String</td>
<td>Unique lookup item identifier for the associated payload. This can be any value, but must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info</td>
<td>Object</td>
<td>Defines a unique CI identifier for a specific data source. Different sources may have different name-value pairs.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name. It can be any string that uniquely identifies the source feed.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_name</td>
<td>String</td>
<td>Data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.lookup.sys_object_source_info.source_native_key</td>
<td>String</td>
<td>Unique key-id for the item from the source. The data source generates this key. It can be any string that is unique to the item.</td>
</tr>
<tr>
<td>input.items.lookup.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date/time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss</td>
</tr>
<tr>
<td>input.items.lookup.values</td>
<td>Object</td>
<td>Field information for the CI as name-value pairs, where the name is the field name. When updating reference fields, the value must be the referenced sys_id. Field names and types depend on the fields selected, such as:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>input.items.related</td>
<td>Array</td>
<td>Reference to the top-level item that contains the related list. Rules in the Related Entry [cmdb_related_entry] define what type of records can be included, and rules in the items base tables define which external keys can be referenced.</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.related.className</td>
<td>String</td>
<td>Required. Class/table name, sys_class_name, of the configuration item (CI) to create or update. This value can be any CMDB class/table, such as cmdb_software_instance or cmdb_key_value.</td>
</tr>
<tr>
<td>input.items.related.internal_id</td>
<td>String</td>
<td>Unique identifier for this related item in this payload. You can use any value, but it must be unique within the payload.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info</td>
<td>Object</td>
<td>Object that makes up a unique CI identifier for a specified data source. Different sources may have different name-value pairs for the same CI.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_feed</td>
<td>String</td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name. It can be any string that uniquely identifies the source feed.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_name</td>
<td>String</td>
<td>Identifies the data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_native_key</td>
<td>String</td>
<td>Unique key/ID from the source for the related item. The data source generates this key. It can be any string that is unique to the item.</td>
</tr>
<tr>
<td>input.items.related.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date and time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss</td>

</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input.items.sys_object_source_info</strong></td>
<td><strong>Object</strong></td>
<td>Unique CI identifier for a specific source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>source_feed</strong>: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the source can have multiple feeds, use this field to provide the name of the feed sending this item. The data source generates this feed name. It can be any string that uniquely identifies the source feed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>source_name</strong>: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data source of the CI information. This value must be one of the choice values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>source_native_key</strong>: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unique key/id for the item from the source.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>source_recency_timestamp</strong>: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The recency timestamp of this source.</td>
</tr>
</tbody>
</table>

- true: Update the item but upgrade is not permitted.
- false: Both item update and upgrade are permitted.

Default: false
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.items.sys_object_source_info.source_recency_timestamp</td>
<td>String</td>
<td>UTC date and time that the item was scanned. Format: YYYY-MM-DD hh:mm:ss</td>
</tr>
</tbody>
</table>
| input.items.values            | Object | Fields to create or update for this related item as name/value pairs, where the name is the field name. For reference fields, the value must be the referenced sys_id. If you want to use the display value instead of the sys_id for reference fields, pass this information in a `display_values` object instead of in the `values` object. Field names and types depend on the fields selected by the user, such as: |}

```json
  "values": {
    "host_name": "String",
    "ip_address": "String",
    "name": "String",
    "os_name": "String",
    "sys_class_name": "String"
  }
```
| input.referenceltems         | Array  | Array of objects that define references between items in the input payload. |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input.referenceltems.referenced</code></td>
<td>String</td>
<td>The internal_id defined for the item being referenced by another item.</td>
</tr>
<tr>
<td><code>input.referenceltems.referencedBy</code></td>
<td>String</td>
<td>The internal_id defined for the item that references another item.</td>
</tr>
<tr>
<td><code>input.referenceltems.referenceField</code></td>
<td>String</td>
<td>Name of the reference field in the class/table for the referencedBy item.</td>
</tr>
<tr>
<td><code>input.relations</code></td>
<td>Array</td>
<td>Array of objects that specify relationships between items in the input payload. An object in this array can use either:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The object can define a relationship between two top-level items using <code>parent</code> and <code>child</code> name-value pairs, with values representing item indexes.</td>
</tr>
</tbody>
</table>

Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.relations.child</td>
<td>Number</td>
<td>Integer index of the CI object in the items array that represents the child in the relationship (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>input.relations.child_id</td>
<td>String</td>
<td>The internal_id of the child item in the relationship (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>input.relations.parent</td>
<td>Number</td>
<td>Integer index of the parent item in the items array (items, items.related, or items.lookup).</td>
</tr>
</tbody>
</table>

- The object can define a relationship between any two items, using top-level, related, and lookup items, with parent_id and child_id key/value pairs representing the values for these items.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input.relations.parent_id</td>
<td>String</td>
<td>The <strong>internal_id</strong> of the parent item in the relation (items, items.related, or items.lookup).</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info</td>
<td>Object</td>
<td>Discovery source information for the relationship. For non-dependency relationships, this information is saved in the Relationship Sources [sys_rel_source] table (not persisted for identifyCIEnhanced() or identifyCI() methods.).</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info.source_name</td>
<td>String</td>
<td>Discovery source name. Default: Discovery source passed in the API method parameter.</td>
</tr>
<tr>
<td>input.relations.sys_rel_source_info.source_feed</td>
<td>String</td>
<td>Any string that is a sub-discovery/scan within the discovery source. Default: 'UNKNOWN' is stored in the source_feed column when creating a record in sys_rel_source table.</td>
</tr>
<tr>
<td>input.relations.type</td>
<td>String</td>
<td>Type of relationship that exists between the parent and child items. Must be a name field value from...</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>the CI Relationship Type</td>
<td></td>
<td>[cmdb_rel_type] table.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional, but {} or null must be passed in. Optional object options to enable or disable features.</td>
</tr>
<tr>
<td>options.deduplicate_payloads</td>
<td>Boolean</td>
<td>Flag that indicates whether duplicate items are merged or considered errors.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Merge duplicate items.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Consider duplicate items as errors.</td>
</tr>
</tbody>
</table>

**Note:**
- If `partial_commits` is set to true, both `partial_commits` and `deduplicate_payloads` are enabled, even if they are set to false, as those features are essential for partial payloads functionality.

```json
"options": {
  "deduplicate_payloads": "Boolean",
  "generate_summary": "Boolean",
  "partial_commits": "Boolean",
  "partial_payloads": "Boolean"
}
```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options.generate_summary</td>
<td>Boolean</td>
<td>Flag that indicates whether the returned results contain summary information. For the details of the returned summary, see <code>&lt;String&gt;</code> in the return results. Valid values: • true: Include summary information. • false: Do not include summary information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td>options.partial_commits</td>
<td>Boolean</td>
<td>Flag that indicates whether partial commit support is enabled. For additional information on partial commits, see Enhanced IRE features. Valid values: • true: Partial commit enabled. • false: Partial commit disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: true</td>
</tr>
<tr>
<td>options.partial_payloads</td>
<td>Boolean</td>
<td>Flag that indicates whether partial payload support is enabled. For additional information on partial payloads, see Enhanced IRE features and Create an IRE data source rule.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: true</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Valid values:
- true: Partial payload enabled.
- false: Partial payload disabled.

Default: true

source

String

Data source of the CI information. This value must be one of the values defined for the discovery_source field of the Configuration Item [cmdb_ci] table.

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;</td>
<td>JSON formatted string that is a list of results for the configuration items in the input string. Data type: String</td>
</tr>
</tbody>
</table>

```
{
  "additionalCommittedItems": [Array],
  "additionalCommittedRelations": [Array],
  "hasError": "Boolean",
  "hasWarning": "Boolean",
  "items": [Array],
  "relations": [Array],
  "summary": [Object]
}
```

| <String>.additionalCommittedItems | Committed items were committed during the IRE processing of the current payload, but were not present in the current input payload. Data type: Array |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
"additionalCommittedItems": [
{
  "className": "String",
  "errorCode": Number,
  "operation": "String",
  "identificationAttempts": [Array],
  "inputIndices": [Array],
  "markers": [Array],
  "mergedPayloads": [Array],
  "sysId": "String"
}
]
```

**<String>.additionalCommittedRelations**

Array of objects that describe a dependent relationship CI that was not included in the request body relations list to insert or update.

Data type: Array

```
"additionalCommittedRelations": [
{
  "className": "String",
  "inputIndices": [Array],
  "markers": [Array],
  "mergedPayloadIds": [Array],
  "operation": "String"
}
]
```

**<String>.hasError**

Flag that indicates whether any item or relation has errors.

Data type: Boolean

**<String>.hasWarning**

Flag that indicates whether any item or relation has warnings.

Data type: Boolean

**<String>.items**

List of objects that describe the created or updated CIs.

Data type: Array

```
"items": [
{
  "additionalRelatedItems": [Array],
```
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```json
"className": "String",
"duplicateIndices": [Array],
"errorCount": Number,
"errors": [Array],
"identificationAttempts": [Array],
"identifierEntrySysId": "String",
"info": [Array],
"inputIndices": [Array],
"maskedAttributes": [Array],
"operation": "String",
"relatedSysIds": [Array],
"sysId": "String"
```

### `<String>.items.additionalRelatedItems`

List of JSON objects that provide information about additional lookup and related items that were processed but not provided as part of the input payload. These items are from partial payloads.

Data type: Array

```json
"additionalRelatedItems": [ 
  
  
  "className": "String",
  "inputIndices": [Array],
  "mergedPayloadIds": [Array],
  "operation": "String",
  "sysId": "String"

  
]`
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.items.additionalRelatedItems.mergedPayloadIds</td>
<td>List of sys_ids of the partial payloads that were merged into the related item. Located in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table. Data type: Array</td>
</tr>
</tbody>
</table>
| <String>.items.additionalRelatedItems.operation | Possible values:  
- INSERT: New CI was inserted into the database.  
- NO_CHANGE: No CI changes were made.  
- UPDATE: Existing CI was updated.  
Data type: String |
| <String>.items.additionalRelatedItems.sysId | Sys_id of the CI that was updated or created. Data type: String |
| <String>.items.className | Class/table name (sys_class_name) of the CI that was created or updated. Data type: String |
| <String>.items.duplicateIndices | List of indexes of CIs that are duplicates of the current item. Data type: Array |
| <String>.items.errorCount | Number of errors encountered while processing the item. Data type: Number |
| <String>.items.errors | Array of objects in which each object describes an error encountered while processing this CI. Data type: Array |

```
"errors": [
  {
    "error": "String",
    "message": "String"
  }
]
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>&lt;String&gt;.items.errors.message</td>
<td>The error message encountered while processing the CI. Data type: String</td>
</tr>
<tr>
<td>&lt;String&gt;.items.identificationAttempts</td>
<td>List of attempts that were made to identify the CIs. Data type: Array</td>
</tr>
</tbody>
</table>

```
"identificationAttempts": [
  {
    "attemptResult": "String",
    "attributes": [Array],
    "hybridEntryCiAttributes": [Array],
    "identifierName": "String",
    "searchOnTable": "String"
  }
]
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.items.identificationAttempts.attemptResult</td>
<td>Results of the attempt to identify the CI. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• MATCHED: Identification succeeded. A unique CI was found in the identifier rule table which exactly matched the specified attributes.</td>
</tr>
<tr>
<td></td>
<td>• MULTI_MATCH: Identification failed with an error. Duplicate CIs were found in the identifier rule table when matching against the specified attributes.</td>
</tr>
<tr>
<td></td>
<td>• NO_MATCH: Identification failed. No CI was found in the identifier rule table which matched the specified attributes.</td>
</tr>
<tr>
<td></td>
<td>• SKIPPED: Identification not attempted. The attributes required for this identifier rule table search were not provided, so the rule was not applied.</td>
</tr>
</tbody>
</table>

Data type: String |

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.items.identificationAttempts.attributes</td>
<td>List of CI identifier entry attributes that were used during the identification process. Data type: Array</td>
</tr>
</tbody>
</table>
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Attribute names and types depend on the request body data and the identifier in use, such as:</td>
</tr>
</tbody>
</table>
|      | ```
|      | "attributes": {
|      | "serial_number": "String",
|      | "serial_number_type": "String",
|      | }
|      | ``` |
|      | Identifier rule used for this CI identification attempt. |
|      | Data type: String |
|      | Name of the table searched during the identification process. |
|      | Data type: String |
|      | Sys_id for the identifier rule used to identify the CI. Located in the Identifier Entry [cmdb_identifier_entry] table. |
|      | Data type: String |
|      | List of objects that contains additional information about the processing of the item. |
|      | Data type: Array |
|      | ```
|      | "info": [
|      | |
|      | "code": "String",
|      | "message": "String",
|      | "ruleSysId": "String"
|      | ]
|      | ``` |
|      | Reclassification type that was skipped. |
|      | Possible values: |
|      | • SKIPPED_CLASS_SWITCH |
|      | • SKIPPED_CLASS_DOWNGRADE |
|      | • SKIPPED_CLASS_UPGRADE |
|      | Data type: String |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;String&gt;.items.info.message</code></td>
<td>Message that provides additional insights into the reason for skipping the reclassification. Data type: String</td>
</tr>
<tr>
<td><code>&lt;String&gt;.items.info.ruleSysId</code></td>
<td>Sys_id of the reclassification restriction rule that was matched. Applicable only when IRE skips reclassification due to reclassification restriction rule. This value is empty if the reclassification is skipped due to a payload or global flag. Data type: String</td>
</tr>
<tr>
<td><code>&lt;String&gt;.items.inputIndices</code></td>
<td>Indexes of the corresponding input CI. For top-level items, it is a list of integers. For related or lookup CIs, it is list of JSON objects. Data type: Array of Numbers</td>
</tr>
<tr>
<td><code>&lt;String&gt;.items.maskedAttributes</code></td>
<td>List of attributes whose update by a non-authoritative data source was skipped as defined by the Reconciliation Rules. Data type: Array</td>
</tr>
</tbody>
</table>
| `<String>.items.operation`     | Operation that took place. Possible values:  
  - INSERT: New CI was inserted into the database.  
  - INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table.  
  - INSERT_AS_PARTIAL: Item was saved in cmdb_ire_partial_payloads table.  
  - NO_CHANGE: No CI changes were made.  
  - UPDATE: Existing CI was updated.  
  - UPDATE_WITH_DOWNGRADE: CI was updated and the class changed to a more generic class (ancestor class).  |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| • UPDATE_WITH_SWITCH: CI was updated and the class changed to a class that is not ancestor or descendent.  
• UPDATE_WITH_UPGRADE: CI was updated and the class changed to a more specialized class (descendent class). |  

Data type: String

<String>.items.relatedItems

JSON objects that provide information about the processed related items.

Data type: Array

```
"relatedItems": [
  {
    "className": "String",
    "errorCount": Number,
    "errors": [Array],
    "inputIndices": [Array],
    "mergePayloadIds": [Array],
    "operation": "String",
    "sysId": "String",
    "warningCount": Number,
    "warnings": [Array]
  }
]
```

<String>.items.relatedItems.className

Class/table name (sys_class_name) of the related item.

Data type: String

<String>.items.relatedItems.errorCount

Number of errors detected while processing the related items.

Data type: Number

<String>.items.relatedItems.errors

List of errors that occurred during processing of the related item.

Data type: Array

```
"errors": [
  {
    "error": "String",
  }
]
```
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| | "message": "String"
| | }
| | ]

### <String>.items.relatedErrors

Type of error encountered while processing the related item. Data type: String

### <String>.items.relatedErrors.message

The error message encountered while processing the related item. Data type: String

### <String>.items.relatedErrors.inputIndices

Index of the corresponding input item. For top-level items, it is a list of integers. For related or lookup items, it is list of JSON objects. Data type: Array of Numbers or Array of Objects

```
"inputIndices": [
  {
    "mainIndex": Number,
    "subIndex": Number
  }
]
```

### <String>.items.relatedErrors.mainIndex

Index value from the request body items array that corresponds to the CI parent of the related item. Data type: Number

### <String>.items.relatedErrors.subIndex

Index value from the request body items.lookup array that corresponds to the related item. Data type: Number

### <String>.items.relatedErrors.mergedPayloadIds

List of sys_ids of the partial payloads that were merged into the CI during processing. Data type: Array

### <String>.items.relatedErrors.operation

Operation that took place. Possible values:
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• INSERT: New related CI was inserted into the database.</td>
<td></td>
</tr>
<tr>
<td>• INSERT_AS_INCOMPLETE: Item was saved in cmdb_ire_incomplete_payloads table.</td>

<td></td>
</tr>
<tr>
<td>• UPDATE: Existing related CI was updated.</td>
<td></td>
</tr>
<tr>
<td>• UPDATE_WITH_DOWNGRADE: Related CI was updated and the class changed to a more generic class (ancestor class).</td>
<td></td>
</tr>
<tr>
<td>• UPDATE_WITH_SWITCH: Related CI was updated and the class changed to a class that is not ancestor or descendent.</td>
<td></td>
</tr>
<tr>
<td>• UPDATE_WITH_UPGRADE: Related CI was updated and the class changed to a more specialized class (descendent class).</td>
<td></td>
</tr>
</tbody>
</table>

Data type: String

| <String>.items.relatedItems.sysId | The sys_id of the related item. |
| Data type: String |

| <String>.items.relatedItems.warningsCount | Number of warnings encountered when processing the related items. |
| Data type: Number |

| <String>.items.relatedItems.warnings | Array of objects that describes a warning encountered while processing the related items. |
| Data type: Array |

```json
"warnings": [
  {
    "error": "String",
    "message": "String"
  }
]
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<String>.items.relatedSysIds` | List of the sys_id values of the CIs used during lookup-based identification of related items.  
Data type: String |
| `<String>.items.sys_id` | Sys_id of the CI that was updated or created.  
Data type: String |
| `<String>.relations` | List of JSON objects that provides information about the processed relations.  
Data type: Array |
|    | ![](image) |
| `<String>.relations.className` | Sys_class_name of this dependent relationship CI.  
Only supported value:  
• `cmdb_rel_ci`: CI Relationship table.  
Data type: String |
| `<String>.relations.errorCount` | Number of errors encountered when processing the dependent relationship CI.  
Data type: Number |
| `<String>.relations.errors` | Array of objects that describe errors that were encountered while processing this dependent relationship CI.  
Data type: Array |
<p>|    | <img src="image" alt="" /> |</p>
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;String&gt;.relations.inputIndices</td>
<td>Indexes for the dependent relationship CI objects in the request body relations array that correspond to this dependent relationship CI. Data type: Array</td>
</tr>
</tbody>
</table>
| <String>.relations.operation | Type of operation performed. Possible values:  
  - INSERT: The dependent relationship CI was inserted into the target table as a new record.  
  - INSERT_AS_INCOMPLETE: The dependent relationship CI had errors and was inserted into the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table.  
  - INSERT_AS_PARTIAL: The dependent relationship CI had errors and was inserted into the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.  
  - NO_CHANGE: No operation was performed.  
  - UPDATE: An existing dependent relationship CI in the target table was updated. Data type: String |
| <String>.relations.sysId   | Sys_id of the dependent relationship CI. Data type: String                                                                                                                                                  |
| <String>.summary           | List of JSON properties that provide statistics on how many items were inserted, updated, and such, per class. Data type: Array                                                                                 |
| <String>.summary.<class_name> | Statistics for a specific class. Data type: Object                                                                                                                                                        |
### Returns (continued)

</table>

- `<String>.summary.<class_name>.additionalInsertedItemCount`: Number of items inserted due to processing of partial payloads.
  - Data type: Number
- `<String>.summary.<class_name>.errorCount`: Number of errors encountered when processing items.
  - Data type: Number
- `<String>.summary.<class_name>.incompleteItemCount`: Number of items inserted in the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table.
  - Data type: Number
- `<String>.summary.<class_name>.insertedItemCount`: Number of items created.
  - Data type: Number
- `<String>.summary.<class_name>.partialItemCount`: Number of items saved in the Partial Payload table [cmdb_ire_partial_payloads].
  - Data type: Number
- `<String>.summary.<class_name>.skippedItemCount`: Number of items that were skipped.
  - Data type: Number
- `<String>.summary.<class_name>.unchangedItemCount`: Number of items that had entries but were not modified.
  - Data type: Number
- `<String>.summary.<class_name>.updatedItemCount`: Number of items updated.
  - Data type: Number
- `<String>.summary.<class_name>.warningCount`: Number of items that generated a warning when processed.
  - Data type: Number

IdentificationEngineScriptableApi - runIdentificationAudit(GlideRecord now_GR)

Runs an identification audit against the specified configuration item (CI) to detect duplicates.

If duplicates are found, duplication tasks are created. Only use this method on CI types with independent identification rules.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>CI on which to run the audit to detect duplicates. The CI must have independent identification rules.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Scoped equivalent

To use the `runIdentificationAudit(GlideRecord now_GR)` method in a scoped application, use the corresponding scoped IdentificationEngine method:

IdentificationEngine - runIdentificationAudit(GlideRecord now_GR).

IDResult - Global

A container class for the result of a CI Identifier.

Use with any server-side discovery script.
IDResult - IDResult(Boolean explore, String sysID)

Creates an instance of the IDResult class.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>explore</td>
<td>Boolean</td>
<td>Set to true if the CI should be explored; otherwise, false.</td>
</tr>
<tr>
<td>sysID</td>
<td>String</td>
<td>An existing CI's sys_id, or null if no existing CI could be found.</td>
</tr>
</tbody>
</table>

IEventSender - Global

The IEventSender API provides methods to send events from a MID Server to a ServiceNow instance and to query the status of the event queue.

Before calling any methods within this class, you must call the SNEventSenderProvider.getEventSender() method to instantiate an IEvent object.

Use the Event API to add/update fields within an event. Use the SNEventSenderProvider API to instantiate an event sender object. Then use the IEventSender API to send the event to a ServiceNow instance.

You must activate the Event Management (com.glideapp.itom.snac) plugin before attempting to access this API. The Event Management plugin requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

For additional information on event management, see Event Management.

IEventSender - getQueueSize()

Returns the size of the event queue.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Size of the event queue.</td>
</tr>
<tr>
<td></td>
<td>If an event queue is not currently implemented, returns &quot;0&quot;.</td>
</tr>
</tbody>
</table>
var event = new Event();
event.setField("source", "SAP Solman");
event.setField("severity", "3");
event.setField("time_of_event", "2019-18-05 13:12:05");
event.setField("type", "SAP object");
// parameter added to additional info section
event.setField("user", "admin");
var eventSender = SNEventSenderProvider.getEventSender();
var sendStatus = eventSender.sendEvent(event); // send event
var queueSize = eventSender.getQueueSize(); // check the size of the event queue

IEventSender - isFullQueue()
Checks if the event queue has exceeded its maximum size.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean | Flag that indicates whether the event queue has exceeded its maximum size. When this happens, no additional event messages can be queued until the queue decreases in size. Valid values:  
- true: Event queue is full.  
- false: Event queue is not full and can add more event entries. |

var eventSender = SNEventSenderProvider.getEventSender();
if (!eventSender.isFullQueue()) // If queue is not full, send event
    eventSender.sendEvent(event);

IEventSender - sendEvent(Object event)
Places the specified event in the event queue.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>IEventSender</td>
<td>Event object to place in the events queue.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the event was successfully queued</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Event was queued</td>
</tr>
<tr>
<td></td>
<td>• false: Error</td>
</tr>
</tbody>
</table>

```javascript
var eventSender = SNEventSenderProvider.getEventSender();
eventSender.sendEvent(event); // send event
```

## Image - Scoped, Global

Creates an Image object representing an image and its layout insert in a PDF. Enables defining attributes such as scale, alignment, and border color.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

You can add an image to a PDF using one of the following methods:

- **Cell** – `addImage(Image image)` – Adds an image to a table cell
- **Table** – `addImageCell(Image image)` – Adds a cell that contains an image to a table.
- **Document** – `addImage(Image image)` - Adds an image to a page

## Image - Image(String attachmentSysId)

Instantiates a new Image object. Used to verify if an image attachment exists and is available for modification.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentSysId</td>
<td>String</td>
<td>Sys_id of an image in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

The following example shows how to create a `Image` object.

```javascript
var image = new sn_pdfgeneratorutils.Image("<sys_id>");
```

**Image – scaleAbsolute(Number width, Number height)**

Scales an image to absolute width and height sizes. This setting does not preserve the width-height ratio of the image and might result in undesired stretching if settings are not precise.

To scale to an absolute size that preserves width-height ratio of an image, use the `scaleToFit()` method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Image width in points.</td>
</tr>
<tr>
<td>height</td>
<td>Number</td>
<td>Image height in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add an image to a PDF with absolute width and height settings.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var scaleAbsPic = new sn_pdfgeneratorutils.Image("<img_sys_id>");
scaleAbsPic.scaleAbsolute(25,50);
document.addImage(scaleAbsPic);
document.saveAsAttachment("incident", "<record_sys_id>", "docWithImg.pdf");
```
**Image – scaleToFit(Number width, Number height)**

Scales an image to an absolute size while preserving the width-height ratio.

Resulting output varies by image aspect ratio. If the width and height parameter values do not match the image aspect ratio, one value renders smaller in output than the value given.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Maximum image width in points.</td>
</tr>
<tr>
<td>height</td>
<td>Number</td>
<td>Maximum image height in points.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to insert an image scaled to fit using the `Cell.addImage()` method.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// add a table
var table = new sn_pdfgeneratorutils.Table([1,3],false);

// text for the left column
var text = "sample image";

// add a table cell for the image in the right column
var imgCell = new sn_pdfgeneratorutils.Cell(1, 1);

// add an image and set it scale-to-fit
var scaleToFitPic = new sn_pdfgeneratorutils.Image("<img_sys_id>");
scaleToFitPic.scaleToFit(90,175);

// add the image to the cell
imgCell.addImage(scaleToFitPic);

// add the right cell
table.addTextCell(text);

table.addCell(imgCell);
```
Image – setAutoScale(Boolean value)

Enables scaling width and height to a page or cell while retaining dimensions.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| value  | Boolean    | Flag that indicates whether to automatically scale an image. Valid values:  
|        |            | • true: Automatically scales the image  
|        |            | • false: Image does not scale  
|        |            | Default: false |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add an image to a PDF with automatic scaling. The image is added using the Table – addImageCell() method.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Add a table
var table = new sn_pdfgeneratorutils.Table([1,2],false);

// Text in left column
var text = "sample image";
```
// Image in right column
var autoScaledPic = new sn_pdfgeneratorutils.Image("<image_sys_id>");
autoScaledPic.setAutoScale(true);

table.addTextCell(text);
table.addImageCell(autoScaledPic);

document.addTable(table);
document.saveAsAttachment("incident", ":<record_sys_id>", "imgAutoScale.pdf");

Image – setColoredBorder(Color color, Number width)
Sets a border on a PDF in the specified color.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>Color</td>
<td>Image border color.</td>
</tr>
<tr>
<td>width</td>
<td>Number</td>
<td>Width of the border in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a five-point red-colored border on an image.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var borderColor = new sn_pdfgeneratorutils.Color([1.0,0.0,0.0]);

// declare image using sys attachment
var image = new sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

image.setColoredBorder(borderColor, 5);
document.addImage(image);
document.saveAsAttachment("incident", ":<record_sys_id>", "docWithBorderedImage.pdf");
```
Image – setHorizontalAlignment(String alignment)
Sets the horizontal alignment of the image.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Positions image alignment on a page or block element. Valid values: • Center • Left • Right Default: Left</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add a centered image on a PDF page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare image using sys attachment
var image = new sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");

String alignment = "Center";
image.setHorizontalAlignment(alignment);
document.addImage(image);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", ",<sys_id>, "docWithImageCentered.pdf");
```

Image – setNoBorder()
Sets an image to have no border.
The following example shows how to add an image to a document without a border.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare image using sys attachment
var image = new sn_pdfgeneratorutils.Image("<imgAttachment_sys_id>");
image.setNoBorder();
document.addImage(image);
document.saveAsAttachment("incident", "<sys_id>", "docWithImgNoBorder.pdf");
```

### Interaction - Scoped

Use the Interaction API to define the behavior for interaction records.

⚠️ **Note:** This method has been deprecated.

This class requires the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction).

To use this class in a scoped API, use the `sn_interaction` namespace identifier.

**Scoped Interaction - create(Object options)**

Create an interaction.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Field values for an interaction record. The channel field with the channel sys_id and channel metadata are required. If a queue is not included in the parameter, the system returns Interaction b2c0a3af202a1300964f959e0488de75 has no queue specified... running queue matching rules.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Interaction</td>
</tr>
</tbody>
</table>

```javascript
var interactionObj = sn_interaction.Interaction.create(
  {
    channel: '28a59893873103002ae97e2526cb0b5d',
    channel_metadata: {},
    opened_for: '46d44a23a9fe19810012d100cca80666',
    queue: 'f3a50867b3030302186a72256a8dcb7'
  });
```

### Scoped Interaction - getInteraction(GlideRecord interaction)

Get an interaction record.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interaction</td>
<td>GlideRecord</td>
<td>Interaction record from the interaction table [interaction] that is retrieved from the system.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Interaction</td>
</tr>
</tbody>
</table>

```javascript
var now_GR = new GlideRecord('interaction');
now_GR.get('608a21bd096a9300964ffbd57ba7dd8d');
var interaction = sn_interaction.Interaction.getInteraction(now_GR);
```
Scoped Interaction - transferToAgent(String sysID)

Transfer an interaction record to an agent using the sys_id for the agent.

When an interaction is transferred from one agent to another, the interaction needs to be accepted or rejected using GlideRecord APIs. Use the GlideRecord API to change the state of the interaction and update. For more information, see the GlideRecord - update method.

ℹ️ Note: This method has been deprecated.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>SysID</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

```javascript
var now_GR = new GlideRecord('interaction');
GR.get('24b927ef202a1300964f959e0488de2d');
var interaction = sn_interaction.Interaction.getInteraction(GR);
interaction.transferToAgent('6816f79cc0a8016401c5a33be04be441');
```

Scoped Interaction - transferToQueue(String sysID)

Transfer an interaction record to an interaction queue.

Transferring an interaction from one queue to another closes the original interaction and creates an interaction in the new queue.

ℹ️ Note: This method has been deprecated.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>SysID</td>
</tr>
</tbody>
</table>
### Scoped Interaction - accept()

Accept a new interaction.

Accepting a transfer only works for pending transfers. Find any pending transfers in the Interaction Agent Transfer [interaction_agent_transfer] table.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the transfer is accepted.</td>
</tr>
</tbody>
</table>

```javascript
var now_GR = new GlideRecord('interaction');
GR.get('24b927ef202a1300964f959e0488de2d');
var interaction = sn_interaction.Interaction.getInteraction(GR);
interaction.transferToQueue('86fee1933b101300088d832b44efc474');
```

### IPAddressFixup - Global

After a device has been successfully discovered, ensures that no other device has the same IP address. If any duplicates are found, the IP address field is cleared.

Use with any server-side Discovery script to validate IP addresses.

#### IPAddressFixup - dedupe(String tableName, String ip)

Removes duplicates of the specified IP address in the specified table.

```javascript
var now_GR = new GlideRecord('interaction');
GR.get('b2c0a3af202a1300964f959e0488de75');
var interaction = sn_interaction.Interaction.getInteraction(GR).accept();
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table to check for duplicates</td>
</tr>
<tr>
<td>ip</td>
<td>String</td>
<td>The IP address to check for</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### IPAddressFixup - dedupeAll()

Removes all duplicate IP addresses from the tables.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### IPAddressFixup - fix()

Removes all duplicate IP addresses and ensures that the parent ip_address record is set to one of the NIC's IP addresses.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**IPAddressFixup - getParentIP()**

Returns the parent IP address for the current device.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IPAddressFixup - syncIP()**

Ensures that the parent ip_address record is set to one of the NIC's IP addresses, or leaves it alone if there were no NICs.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**IPAddressFixup - setParentIP(String ip)**

Sets the IP address field for the current CI.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>String</td>
<td>The IP address for the current CI.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**IPService - Global**

Encapsulates an IP Service.

Use this class during the discovery scanning phase.

**IPService - creates**

The table where this service creates entries.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>creates</td>
<td>String</td>
<td>The table where this service creates entries.</td>
</tr>
</tbody>
</table>

**IPService - description**

Description of the IPService.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the IPService.</td>
</tr>
</tbody>
</table>

**IPService - getFromArrayList(Array list)**

Returns an array of IPService instances specified by a Java ArrayList of sys_ids.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Array</td>
<td>List of sys_ids.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>IPService instances</td>
</tr>
</tbody>
</table>

### IPService - IPService(Object source)

Creates an instance of the IPService class.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Object</td>
<td>Either a GlideRecord instance or a sys_id string</td>
</tr>
</tbody>
</table>

### IPService - port

The TCP or UDP port used by the service.

#### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>String</td>
<td>The TCP or UDP port used by the service.</td>
</tr>
</tbody>
</table>

### IPService - protocol

The protocol used by the service ("UDP", "TCP", or "TCP/UDP").

#### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td>String</td>
<td>The protocol used by the service (&quot;UDP&quot;, &quot;TCP&quot;, or &quot;TCP/UDP&quot;).</td>
</tr>
</tbody>
</table>
IPService - name
A short name or handle for the IPService.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the IPService</td>
</tr>
</tbody>
</table>

IPService - serviceName
A long, descriptive English name for the IPService.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceName</td>
<td>String</td>
<td>A long, descriptive English name for the IPService.</td>
</tr>
</tbody>
</table>

IPService - sysID
The sys_id of this record.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysID</td>
<td>String</td>
<td>The sys_id of this record.</td>
</tr>
</tbody>
</table>

JavascriptProbe - Global
Provides methods for using the JavascriptProbe on the MID server.
Use these methods in server scripts to send a probe to the MID server from JavaScript.

JavascriptProbe - addParameter(String name, String value)
Adds a parameter with the specified value to the probe.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The parameter name</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>The parameter's value</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.addParameter('support_feat', 'yes');
```

JavascriptProbe - create()

Creates the probe for the current MID server, puts it on the output queue, and sets its state to "ready".

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.setJavascript('jspr_script');
jspr.create();
```

JavascriptProbe - JavascriptProbe(String midServer)

Creates an instance of the JavascriptProbe.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midServer</td>
<td>String</td>
<td>The MID server name</td>
</tr>
</tbody>
</table>

**JavascriptProbe - setJavascript(String script)**

Adds a script to the probe.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>String</td>
<td>The script to add to the probe</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('jspr_source');
jspr.setJavascript('jspr_script');
```

**JavascriptProbe - setName(String name)**

Sets the name of the JavascriptProbe

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name to give the JavascriptProbe.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');

**JavascriptProbe - setSource(String ip)**

Sets the source of the probe.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>String</td>
<td>The IP address of the target probe.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var jspr = new JavascriptProbe('msserv');
jspr.setName('jsprobe100');
jspr.setSource('100.100.100.1');

**J2js - Global**

2JS script include allows you to convert Java objects to JavaScript objects.

If the given value is a Java object that can be converted to an equivalent JavaScript object, that conversion is performed and the result is returned. Otherwise the original Java object is returned.

The J2js class is available to server-side scripts.

The specific conversion performed in the order they are checked.

- Java String -> JavaScript string
- Java Boolean -> JavaScript boolean
- Java Integer -> JavaScript number
- Java Long -> JavaScript number
- Java Double -> JavaScript number
- Java Byte -> JavaScript number
- Java Float -> JavaScript number
- Java Short -> JavaScript number
• Java Character -> JavaScript number
• Java array -> JavaScript Array with order preserved
• Java List -> JavaScript Array with order preserved
• Java Map -> JavaScript Object with the key/value pairs translated into
  property/value pairs
• Java Set -> JavaScript Array in arbitrary order

Conversions are performed recursively on the elements of arrays, lists, or
collections. For example, given a Java ArrayList of ArrayLists of Strings, this will
return a JavaScript Array of Arrays of strings.

J2js - j2js(Object javaObject)

Converts a java object from system code to a JavaScript object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>javaObject</td>
<td>Object</td>
<td>A Java object from system code such as a Packages call.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>A JavaScript object if the parameter can be converted, otherwise it returns</td>
</tr>
<tr>
<td></td>
<td>the Java object.</td>
</tr>
</tbody>
</table>

```
var tu = new TableUtils("cmdb_ci_win_server");
var classes = tu.getHierarchy();
//getHierarchy returns a Java ArrayList, which is not exactly like a JavaScript Array
//for example you cannot get length
gs.print("classes = " + classes);
gs.print("classes.length = " + classes.length);

//convert to a JavaScript Array
gs.include("j2js");
var jsClasses = j2js(classes);
gs.print("jsClasses = " + jsClasses);
gs.print("jsClasses.length = " + jsClasses.length);
```
Output:

```
classes = [cmdb_ci_win_server, cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci]
classes.length = undefined
jsClasses = cmdb_ci_win_server, cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci
jsClasses.length = 5
```

### JSON - Global

Provides methods to create JSON objects from a string, and to turn JSON objects into strings.

The JSON API has dynamic and static methods. You access the dynamic methods by creating a JSON object. To use the dynamic methods in a scoped application, add the global prefix when calling the constructor. You access the static methods by using the static JSON object.

The JavaScript ES5 native JSON object is used instead of the JSON static methods. If your script needs the old behavior, use the `encode()` and `decode()` methods.

This example creates a JSON object.

```javascript
// obj is a JSON formatted object
var parser = new JSON(); // encode() and decode() are dynamic methods.
var str = parser.encode(obj);
```

The `encode()` and `decode()` methods are deprecated. Use the JavaScript JSON object instead.

This example creates a JSON object in a scoped script.

```javascript
// obj is a JSON formatted object
var parser = new global.JSON();
var str = parser.encode(obj);
```

This example uses the static methods.

```javascript
// obj is a JSON formatted object
var str = JSON.stringify(obj);
// str is a string containing content to be turned into a JSON formatted object
var obj = JSON.parse(str);
```

### JSON - decode(String str)

Creates an object or primitive type from a JSON formatted string.

⚠️ **Note:** This class is deprecated. Use the JavaScript JSON object instead.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String</td>
<td>A JSON formatted string.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An object created from the specified string.</td>
</tr>
</tbody>
</table>

```
var str = '{"name":"George","lastname":"Washington"}';
var parser = new JSON();
var obj = parser.decode(str);
gs.info('The first name is ' + obj.name);
```

Output: The first name is George

To use in a scoped script.

```
var str = '{"name":"George","lastname":"Washington"}';
var parser = new global.JSON();
var obj = parser.decode(str);
gs.info('The first name is ' + obj.name);
```

Output: The first name is George

**JSON - encode(Object jsonObject)**

Creates a string from a JSON object.

⚠️ Note: This class is deprecated. Use the JavaScript JSON object instead.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsonObject</td>
<td>Object</td>
<td>The JSON object to be turned into a string.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string.</td>
</tr>
</tbody>
</table>
```javascript
var obj = {"name":"George","lastname":"Washington"};
var parser = new JSON();
var str = parser.encode(obj);
gs.info('The object ' + str);
```

Output: The object {"lastname":"Washington","name":"George"}

To use in a scoped script.

```javascript
var obj = {"name":"George","lastname":"Washington"};
var parser = new global.JSON();
var str = parser.encode(obj);
gs.info('The object ' + str);
```

**JSON - JSON()**

Creates an instance of the JSON class.

This class is deprecated. Use the JavaScript JSON object instead.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**JSON - parse(String str)**

Creates an object or primitive type from a JSON formatted string.

The JavaScript ES5 native JSON object is used instead of the JSON static methods. If your script needs the old behavior, use the `encode()` and `decode()` methods.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String</td>
<td>A JSON formatted string.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An object created from the specified string.</td>
</tr>
</tbody>
</table>
var str = '{"name":"George","lastname":"Washington"}';
var obj = JSON.parse(str);
gs.info('The first name is ' + obj.name);

Output: The first name is George

**JSON - stringify(Object jsonObject)**

Creates a string from a JSON object.

The `JSON.stringify()` method can only convert numbers, strings, and Java
native objects to strings. It cannot convert user-defined objects to strings, unless
those objects provide a `toJSON()` method. The call to `current.sys_id()` returns
a GlideElement object which does not have a `toJSON()` method, so the return
value for `stringify` is empty: `"{}`. The JavaScript ES5 native JSON object is used
instead of the JSON static methods. If your script needs the old behavior, use the
`encode()` and `decode()` methods.

`JSON.stringify()` converts a value to JSON notation using the following
guidelines:

- If the value has a `toJSON()` method, it is responsible for defining the data that is
  serialized.
- Boolean, number, and string objects are converted to the corresponding
  primitive values during stringification; in accordance with the traditional
  conversion semantics.
- If a function, undefined, or a symbol is encountered during conversion,
  it is either omitted (when it is found in an object) or censored to null
  (when it is found in an array). `JSON.stringify()` also returns undefined
  when passing in "pure" values, such as `JSON.stringify(function(){})` or
  `JSON.stringify(undefined)`.
- All symbol-keyed properties are ignored, even when using a `replacer()`
  function.
- Instances of Date implement the `toJSON()` function by returning a string (the
  same as `date.toISOString()`), thus they are treated as strings.
- The numbers Infinity and NaN, as well as the value null, are all considered null.
- For all other object instances, only their enumerable properties are serialized.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>jsonObject</td>
</tr>
</tbody>
</table>
## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>JSON formatted string.</td>
</tr>
</tbody>
</table>

```javascript
var obj = {"name":"George","lastname":"Washington"};
var str = JSON.stringify(obj);
gs.info('The object ' + str);
```

Output: The object `{"name":"George","lastname":"Washington"}`

It is also possible to define a `replacer()` function and use that in the `stringify()` call. This function leverages the `GlideElement.toString()` method to provide a string representation of the GlideElement object.

```javascript
function replacer(name, val) {
    // convert GlideElement to string
    if ( val && val.constructor === GlideElement ) {
        return val.toString();
    } else {
        return val; // return as is
    }
}

var s = global.JSON.stringify(obj, replacer);
gs.info("json="+s);
```

### JSONParser - Global

Provides a JSON parser that does not use the JavaScript `eval()` function. The methods of JSONParser do not validate the JSON string. This class cannot be used in a scoped application. Use the JavaScript JSON object instead.

⚠️ **Note:** This class is deprecated. Use the JavaScript JSON object instead.

### JSONParser - JSONParser()

Creates a JSONParser object. This class cannot be used in a scoped application. Use the JavaScript JSON object instead. This class is deprecated. Use the JavaScript JSON object instead.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## JSON - Scoped

Provides scoped methods to create JSON objects from a string, and to turn JSON objects into strings.

For scoped applications, the JSON API uses static methods that call the JavaScript ES5 native JSON object.

### Scoped JSON - parse(String str)

Creates an object or primitive type from a JSON formatted string.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String</td>
<td>A JSON formatted string.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An object created from the specified string.</td>
</tr>
</tbody>
</table>

```javascript
var str = '{"name":"George","lastname":"Washington"}';
var obj = JSON.parse(str);
gs.info('The first name is ' + obj.name);
```

Output:

```
The first name is George
```

### Scoped JSON - stringify(Object jsonObject)

Creates a string from a JSON object.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jsonObject</td>
<td>Object</td>
<td>The JSON object to be turned into a string.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string.</td>
</tr>
</tbody>
</table>

```javascript
var obj = {"name": "George", "lastname": "Washington"};
var str = JSON.stringify(obj);
gs.info('The object' + str);
```

Output:

The object {"name": "George", "lastname": "Washington"}

**JSONStreamingAPI - Scoped**

Build a large streaming JSON payload to use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as a JSON string for a non-streaming option.

Use these methods in the Flow Designer script step with the `sn_ih` namespace identifier. For example, you can use this API to create a JSON payload in the Flow Designer Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Flow Designer Script step.

You can only use this API within the Flow Designer environment.

To use this class, you must call the `build()` method in the `JSONStreamingBuilder` class to return a `JSONStreamingAPI` object. See `JSONStreamingBuilder - Scoped`.

**API call order**

Generate JSON payloads using these APIs in the following order:

1. `JSONStreamingBuilder`: Creates a builder object
   - Use these methods in the following order to create a builder object:
     1. `JSONStreamingBuilder()`: Instantiates the `JSONStreamingBuilder` object.
     2. `withAttachment()`: Optional. Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments.
[streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.

3. `expiresAt()`: Optional. Sets a time when the attachment expires. Must also call the `withAttachment()` method.

4. `build()`: Returns a JSONStreamingAPI object.

**JSONStreamingAPI: Builds the JSON payload**

Use these methods in the following order to create the JSON payload:

1. `startObject()`: Creates the parent JSON object.
2. Methods to generate the JSON key-value pairs, such as `writeFieldName()`, `writeString()`, and `writeNumberField()`.
3. `endObject()`: Closes the parent JSON object.
4. `getJSONString()` or `getAttachmentId()`: Returns the JSON string or attachment ID that you created.
5. `close()`: Closes the JSONStreamingAPI object.

**Size limits**

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

**Example**

This example create a JSON object and stores it in the Attachment [sys_attachment] table with a defined expiration date. You can use this option to create payloads under 5 MB.

```javascript
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName") // Adds a "firstName" field
    .writeString("John") // Writes the value of the "firstName" field
    .writeFieldName("lastName")
    .writeString("Smith")
```

Alternatively, this example uses the API in the Script step and creates the payload as a JSON string. You can use this option to create payloads under 5 MB.

(function execute(inputs, outputs) {

  var builder = new sn_ih.JSONStreamingBuilder().build();

})
builder.startObject()
    .enablePrettyPrint()
    .writeFieldName("firstName")
    .writeString("John")
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25")
    .writeFieldName("address")
    .startObject()
      .writeStringField("streetAddress", "21 2nd Street")
      .writeStringField("city", "Santa Clara")
      .writeStringField("state", "CA")
      .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray()
      .startObject()
        .writeFieldName("type")
        .writeString("home")
        .writeFieldName("number")
        .writeString("212 555-1234")
      .endObject()
      .startObject()
        .writeFieldName("type")
        .writeString("fax")
        .writeFieldName("number")
        .writeString("646 555-4567")
      .endObject()
    .endArray()
  .endObject()

outputs.payload = builder.getJSONString();
}

)(inputs, outputs);

Output:

{
  "firstName" : "John",
  "lastName" : "Smith",
  "age" : 25,
  "address" : {
    "streetAddress" : "21 2nd Street",
    "city" : "Santa Clara",
    "state" : "CA",
    "postalCode" : "11111"
  }
  }
JSONStreamingAPI - close()  
Closes the JSONStreamingAPI object. Must call this method to close the stream after building a JSON object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.
    builder.startObject() // Begins generating the JSON object.
        .writeField("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
        .writeField("lastName")
        .writeString("Smith")
        .writeNumberField("age", "25") // Write a number field named "age" with value "25"
```
```java
.builder.writeFieldName("address")
    .startObject() // Start a new object nested under the parent object
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
        .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray() // Start an array
        .startObject() // Add the first object to the array
            .writeFieldName("type")
            .writeString("home")
            .writeFieldName("number")
            .writeString("212 555-1234")
        .endObject()
        .startObject() // Add another object to the array
            .writeFieldName("type")
            .writeString("fax")
            .writeFieldName("number")
            .writeString("646 555-4567")
        .endObject()
    .endArray()
    .endObject()
}

 gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

catch (err) {
    gs.log(err);
}

finally {
    builder.close();
}
```

**JSONStreamingAPI - disablePrettyPrint()**

Ends pretty print JSON formatting.

Before calling this method, you must first call `enablePrettyPrint()` to add JSON formatting to a specific section.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example adds pretty print formatting to the `address` object.

```java
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age", "25")
        .enablePrettyPrint()
        .writeFieldName("address")
        .startObject()
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .disablePrettyPrint()
        .writeFieldName("phoneNumber")
        .startArray()
            .startObject()
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject()
                .writeFieldName("type")
                .writeString("fax")
                .writeFieldName("number")
        .endArray()
    .endObject()
```
gs.log(builder.toJSONString());
}
catch (err) {
  gs.log("Exception: " + err);
}
finally {
  builder.close();
}

Output:
{
  "firstName":"John","lastName":"Smith","age":25,
  "address" : {
    "streetAddress" : "21 2nd Street",
    "city" : "Santa Clara",
    "state" : "CA",
    "postalCode" : "11111"
  },"phoneNumber":[{
    "type":"home","number":"212 555-1234"},{"type":"fax","number":"646 555-4567"}]
}

**JSONStreamingAPI - enablePrettyPrint()**

Adds pretty print formatting to a JSON object, or a section of a JSON object.

To disable pretty print formatting in a JSON object section, use the `disablePrettyPrint()` method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.enablePrettyPrint()
        .startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age", "25")
        .writeFieldName("address")
        .startObject()
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
        .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray()
        .startObject()
        .writeFieldName("type")
        .writeString("home")
        .writeFieldName("number")
        .writeString("212 555-1234")
        .endObject()
        .startObject()
        .writeFieldName("type")
        .writeString("fax")
        .writeFieldName("number")
        .writeString("646 555-4567")
        .endObject()
        .endArray()
        .endObject()

    gs.log(builder.getJSONString());
}

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}
Output:

```json
{
    "firstName" : "John",
    "lastName" : "Smith",
    "age" : 25,
    "address" : {
        "streetAddress" : "21 2nd Street",
        "city" : "Santa Clara",
        "state" : "CA",
        "postalCode" : "11111"
    },
    "phoneNumber" : [ {
        "type" : "home",
        "number" : "212 555-1234"
    }, {
        "type" : "fax",
        "number" : "646 555-4567"
    } ]
}
```

**JSONStreamingAPI - endArray()**

Closes an array within the parent JSON object.

Call the `startArray()` method first to open the array.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
} `
var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName") // Adds a "firstName" field
    .writeString("John") // Writes the value of the "firstName" field
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
    .writeFieldName("address")
    .startObject() // Start a new object nested under the parent object
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray() // Start an array
    .startObject() // Add the first object to the array
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
    .endObject()
    .startObject() // Add another object to the array
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

    gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

try {
}

catch (err) {
    gs.log(err);
}

finally { }
builder.close();

**JSONStreamingAPI - endObject()**

Closes an object within the parent JSON object.

Call the `startObject()` method first to open the object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
    .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25") // Write a number field named "age" with value "25"
        .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
        .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
```

```java
.startArray()                  // Start an array
.startObject()                // Add the first object to the array
    .writeFieldName("type")
    .writeString("home")
    .writeFieldName("number")
    .writeString("212 555-1234")
.endObject()
.startObject()                // Add another object to the array
    .writeFieldName("type")
    .writeString("fax")
    .writeFieldName("number")
    .writeString("646 555-4567")
.endObject()
.endArray()
.endObject()

gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

catch (err) {
    gs.log(err);
}

finally {
    builder.close();
}

JSONStreamingAPI - getAttachmentId()

Returns the sys_id of the attachment record in the Streaming Attachments [streaming_attachment] table that contains the JSON payload.

You must call the withAttachment() method in the JSONStreamingBuilder class to save the JSON payload as an attachment before calling this method. See JSONStreamingBuilder - Scoped.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```java
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25") // Write a number field named "age" with value "25"
        .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject() // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject() // Add another object to the array
                .writeFieldName("type")
                .writeString("fax")
                .writeFieldName("number")
                .writeString("646 555-4567")
            .endObject()
        .endArray()
    .endObject();
}
```

finally {
    builder.close();
}

**JSONStreamingAPI - getJSONString()**

Returns the JSON object as a string.

To return the JSON object as a string, do not call the `withAttachment()` method in the `JSONStreamingBuilder` class. See **JSONStreamingBuilder - Scoped**.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Contains the JSON object built using the <code>JSONStreamingAPI</code>.</td>
</tr>
</tbody>
</table>

```javascript
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25")
        .writeFieldName("address")
        .startObject()
        .writeStringField("streetAddress", "21 2nd Street")
    .endObject()
    .endArray()
}
```
.writeStringField("city", "Santa Clara")
.writeStringField("state", "CA")
.writeStringField("postalCode", "11111")
.endObject()
.writeStringField("phoneNumber")
.startArray()
.startObject()
.writeStringField("type")
.writeString("home")
.writeStringField("number")
.writeString("212 555-1234")
.endObject()
.startObject()
.writeStringField("type")
.writeString("fax")
.writeStringField("number")
.writeString("646 555-4567")
.endObject()
.endArray()
.endObject()

gs.log(builder.getJSONString());
}

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}

Output:

{
    "firstName" : "John",
    "lastName" : "Smith",
    "age" : 25,
    "address" : {
        "streetAddress" : "21 2nd Street",
        "city" : "Santa Clara",
        "state" : "CA",
        "postalCode" : "11111"  
    },
    "phoneNumber" : [ 

JSONStreamingAPI - startArray()

Opens an array within the parent JSON object.

Include the endArray() method to close the array.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName") // Adds a "firstName" field
    .writeString("John") // Writes the value of the "firstName" field
  .writeFieldName("lastName")
    .writeString("Smith")
  .writeNumberField("age","25") // Write a number field named "age" with value "25"
  .writeFieldName("address")
    .startObject() // Start a new object nested under the parent object
      .writeStringField("streetAddress", "21 2nd Street")
}
```
JSONStreamingAPI - startArrayField(String fieldName)

Creates an array within the parent JSON object.

Surround this method with the **startArray()** and **endArray()** methods to open and close the array.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The name of the array.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

```java
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();
    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age", "25")
        .writeFieldName("address")
        .startObject()
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
        .writeStringField("postalCode", "11111")
        .endObject()
        .startArrayField("phoneNumber")
        .startArray()
        .startObject()
            .writeFieldName("type")
            .writeString("home")
            .writeFieldName("number")
            .writeString("212 555-1234")
        .endObject()
        .startObject()
            .writeFieldName("type")
            .writeString("fax")
            .writeFieldName("number")
            .writeString("646 555-4567")
        .endObject()
    .endArray()
    .endObject()
    gs.log(builder.getJSONString());
}
```

```java
catch (err) {
    gs.log("Exception: " + err);
}
```
finally {
  builder.close();
}

JSONStreamingAPI - startObject()
Opens an object within the parent JSON object.
Requires the endObject() method to close the object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName") // Adds a "firstName" field
    .writeString("John") // Writes the value of the "firstName" field
  .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
  .writeFieldName("address")
    .startObject() // Start a new object nested under the parent object
      .writeStringField("streetAddress", "21 2nd Street")
      .writeStringField("city", "Santa Clara")
      .writeStringField("state", "CA")

JSONStreamingAPI - writeBoolean(Boolean state)

Adds a Boolean value to the parent JSON object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>Boolean</td>
<td>The boolean value to add to the parent JSON object. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

```java
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeFieldName("activeUser")
        .writeBoolean(true)
        .writeNumberField("age", 25)
        .writeFieldName("address")
            .startObject()
                .writeStringField("streetAddress", "21 2nd Street")
                .writeStringField("city", "Santa Clara")
                .writeStringField("state", "CA")
                .writeStringField("postalCode", "11111")
            .endObject()
        .writeFieldName("phoneNumber")
            .startArray()
                .startObject()
                    .writeFieldName("type")
                    .writeString("home")
                    .writeFieldName("number")
                    .writeString("212 555-1234")
                .endObject()
                .startObject()
                    .writeFieldName("type")
                    .writeString("fax")
                    .writeFieldName("number")
                    .writeString("646 555-4567")
                .endObject()
            .endArray()
    .endObject()

    gs.log(builder.getJSONString());
}
```
catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}

JSONStreamingAPI - writeBooleanField(String fieldName, Boolean value)
Adds a Boolean field and value to the parent JSON object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The name of the field to add to the parent JSON object.</td>
</tr>
<tr>
<td>value</td>
<td>Boolean</td>
<td>The boolean value to add to the parent JSON object.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeBooleanField("activeUser", true)
        .writeNumberField("age", "25")
        .writeFieldName("address")
        .startObject()
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
    .closeObject();
}
gs.log(builder.getJSONString());
}

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}

**JSONStreamingAPI - writeFieldName(String name)**

Adds a field name to the parent JSON object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Field name to add to the parent JSON object.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>
This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```java
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
    .writeFieldName("lastName")
        .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
    .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
    .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject() // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject() // Add another object to the array
                .writeFieldName("type")
                .writeString("fax")
                .writeFieldName("number")
                .writeString("646 555-4567")
            .endObject()
        .endArray()
    .endObject()

    gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}
```

```java
catch (err) {
    ...
```
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .writeFieldName("firstName")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeFieldName("activeUser")
        .writeNull()
        .writeNumberField("age", "25")
        .writeFieldName("address")
        .startObject()
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray()
        .startObject()
            .writeFieldName("type")
        .endObject()
    .startObject()
        .writeFieldName("address")
    .endObject()
} finally {
    builder.close();
}

**JSONStreamingAPI - writeNull()**

Adds a null value to the parent JSON object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>
JSONStreamingAPI - writeNullField(String fieldName)

Adds a field with a null value to the parent JSON object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The name of the null field.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

```javascript
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();
    builder.startObject()
        .writeFieldName("firstName")
        .writeNullField("lastName")
    .endObject()
}
```
```java
.builder.writeString("John")
.builder.writeString("Smith")
.builder.writeStringField("streetAddress", "21 2nd Street")
.builder.writeStringField("city", "Santa Clara")
.builder.writeStringField("state", "CA")
.builder.writeStringField("postalCode", "11111")
.builder.writeObject()
.builder.writeStringField("phoneNumber")
.builder.startArray()
.builder.writeObject()
.builder.writeStringField("type")
.builder.writeString("home")
.builder.writeStringField("number")
.builder.writeString("212 555-1234")
.builder.writeObject()
.builder.writeObject()
.builder.writeStringField("type")
.builder.writeString("fax")
.builder.writeStringField("number")
.builder.writeString("646 555-4567")
.builder.writeObject()
.builder.writeObject()
.builder.writeObject()

gs.log(builder.getJSONString());
}

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}
```

**JSONStreamingAPI - writeNumberField(String fieldName, String encodedValue)**

Adds a number field and value to the parent JSON object.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The name of the number field.</td>
</tr>
<tr>
<td>encodedValue</td>
<td>String</td>
<td>The value of the number field.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```java
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age", "25") // Write a number field named "age" with value "25"
        .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject() // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
        .endArray()
    }
```
```javascript
try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        // Add another object to the array
        .writeFieldName("type")
        .writeField("fax")
        .writeField("number")
        .writeFieldName("646 555-4567")
    .endObject()
    .endArray()
    .endObject()

    gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

catch (err) {
    gs.log(err);
}

finally {
    builder.close();
}
```

**JSONStreamingAPI - writeRaw(String text)**

Adds a raw value to the parent JSON object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>Raw text to add to the parent JSON object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>
```java
 gs.log(builder.getJSONString());
 }

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}
```

**JSONStreamingAPI - writeString(String text)**

Adds a string value to the parent JSON object.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The string value to add to the parent JSON object.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25") // Write a number field named "age" with value "25"
        .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject() // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject() // Add another object to the array
```
JSONStreamingAPI - writeStringField(String fieldName, String value)

Adds a string field and value to the parent JSON object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The name of the field to add to the parent JSON object.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value of the field.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingAPI</td>
<td>Streaming JSON object used to construct the payload.</td>
</tr>
</tbody>
</table>

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.
}
```
builder.startObject() // Begins generating the JSON object.
  .writeFieldName("firstName") // Adds a "firstName" field
  .writeString("John") // Writes the value of the "firstName" field
  .writeFieldName("lastName")
  .writeString("Smith")
  .writeNumberField("age","25") // Write a number field named "age" with value "25"
  .writeFieldName("address")
  .startObject() // Start a new object nested under the parent object
    .writeStringField("streetAddress", "21 2nd Street")
    .writeStringField("city", "Santa Clara")
    .writeStringField("state", "CA")
    .writeStringField("postalCode", "11111")
  .endObject()
  .writeFieldName("phoneNumber")
  .startArray() // Start an array
    .startObject() // Add the first object to the array
      .writeFieldName("type")
      .writeString("home")
      .writeFieldName("number")
      .writeString("212 555-1234")
    .endObject()
    .startObject() // Add another object to the array
      .writeFieldName("type")
      .writeString("fax")
      .writeFieldName("number")
      .writeString("646 555-4567")
    .endObject()
  .endArray()
  .endObject()

gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

catch (err) {
  gs.log(err);
}

finally {
  builder.close();
}
**JSONStreamingBuilder - Scoped**

Create a builder object used to build a large streaming JSON payload to use in a REST or SOAP request to send bulk data to a third-party API. You can also create the payload as a JSON string for a non-streaming option.

Use these methods in the Flow Designer script step with the `sn_ih` namespace identifier. For example, you can use this API to create a JSON payload in the Flow Designer Script step and pass the returned value to the REST step to send the request to a third-party service. For more information, see the Flow Designer Script step.

You can only use this API within the Flow Designer environment.

**API call order**

Generate JSON payloads using these APIs in the following order:

**JSONStreamingBuilder: Creates a builder object**

Use these methods in the following order to create a builder object:

1. `JSONStreamingBuilder()`: Instantiates the JSONStreamingBuilder object.
2. `withAttachment()`: Optional. Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.
3. `expiresAt()`: Optional. Sets a time when the attachment expires. Must also call the `withAttachment()` method.
4. `build()`: Returns a JSONStreamingAPI object.

**JSONStreamingAPI: Builds the JSON payload**

Use these methods in the following order to create the JSON payload:

1. `startObject()`: Creates the parent JSON object.
2. Methods to generate the JSON key-value pairs, such as `writeFieldName()`, `writeString()`, and `writeNumberField()`.
3. `endObject()`: Closes the parent JSON object.
4. `getJSONObject()` or `getAttachmentId()`: Returns the JSON string or attachment ID that you created.
5. `close()`: Closes the JSONStreamingAPI object.
Size limits

Payloads generated through this API cannot exceed these size limits:

- Attachments: 200 MB
- Strings: 5 MB

Examples

This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```java
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John")          // Writes the value of the "firstName" field
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
    .writeFieldName("address")
        .startObject() // Start a new object nested under the parent object
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
    .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject() // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject() // Add another object to the array
                .writeFieldName("type")
                .writeString("fax")
                .writeFieldName("number")
                .writeString("646 555-4567")
        .endArray()
}
```

Alternatively, this example shows how to use the API in the Script step and create the payload as a JSON string. You can use this option to create payloads under 5 MB.

(function execute(inputs, outputs) {

    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
        .enablePrettyPrint()
        .writeTextElement("firstName","John")
        .writeString("John")
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25")
        .writeFieldName("address")
        .startObject()
            .writeStringField("streetAddress", "21 2nd Street")
            .writeStringField("city", "Santa Clara")
            .writeStringField("state", "CA")
            .writeStringField("postalCode", "11111")
        .endObject()
        .writeFieldName("phoneNumber")
        .startArray()
            .startObject()
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")

    })
Output:

{{
"firstName": "John",
"lastName": "Smith",
"age": 25,
"address": {
  "streetAddress": "21 2nd Street",
  "city": "Santa Clara",
  "state": "CA",
  "postalCode": "11111"
},
"phoneNumber": [
  {
    "type": "home",
    "number": "212 555-1234"
  }, {
    "type": "fax",
    "number": "646 555-4567"
  }
]
}}

**JSONStreamingBuilder - build()**

Returns a JSONStreamingAPI object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to create a JSON object and store it in the Attachment [sys_attachment] table with a defined expiration date.

```javascript
try {
  var ttl = new GlideDateTime("2011-01-01 12:00:00");
  var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.

  builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName") // Adds a "firstName" field
    .writeString("John") // Writes the value of the "firstName" field
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
    .writeFieldName("address")
    .startObject() // Start a new object nested under the parent object
      .writeStringField("streetAddress", "21 2nd Street")
      .writeStringField("city", "Santa Clara")
      .writeStringField("state", "CA")
      .writeStringField("postalCode", "11111")
    .endObject()
    .writeFieldName("phoneNumber")
    .startArray() // Start an array
      .startObject() // Add the first object to the array
        .writeFieldName("type")
        .writeString("home")
        .writeFieldName("number")
        .writeString("212 555-1234")
      .endObject()
      .startObject() // Add another object to the array
        .writeFieldName("type")
        .writeString("fax")
        .writeFieldName("number")
        .writeString("646 555-4567")
      .endObject()
    .endArray()
}
```
```
var ttl = new GlideDateTime("2011-01-01 12:00:00");
var builder = new sn_ih.JSONStreamingBuilder()
    .withAttachment() // Creates the JSON object in streaming mode within an attachment.
    .expiresAt(ttl) // Sets an expiration date for the attachment.
    .build(); // Creates the JSONStreamingAPI object.
```
builder.startObject() // Begins generating the JSON object.
    .writeFieldName("firstName")   // Adds a "firstName" field
    .writeString("John")          // Writes the value of the "firstName" field
    .writeFieldName("lastName")
    .writeString("Smith")
    .writeNumberField("age","25") // Write a number field named "age" with value "25"
    .writeFieldName("address")   // Start a new object nested under the parent object
        .writeStringField("streetAddress", "21 2nd Street")
        .writeStringField("city", "Santa Clara")
        .writeStringField("state", "CA")
        .writeStringField("postalCode", "11111")
        .endObject()
    .writeFieldName("phoneNumber")
        .startArray() // Start an array
            .startObject()  // Add the first object to the array
                .writeFieldName("type")
                .writeString("home")
                .writeFieldName("number")
                .writeString("212 555-1234")
            .endObject()
            .startObject()  // Add another object to the array
                .writeFieldName("type")
                .writeString("fax")
                .writeFieldName("number")
                .writeString("646 555-4567")
            .endObject()
        .endArray()
    .endObject()

gs.log(builder.getAttachmentId()); // Returns the sys_id of the attachment.
}

} catch (err) {
    gs.log(err);
}

} finally {
    builder.close();
}
**JSONStreamingBuilder - JSONStreamingBuilder()**

Instantiates the JSONStreamingBuilder object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

```javascript
var builder = new sn_ih.JSONStreamingBuilder()
```

**JSONStreamingBuilder - withAttachment()**

Creates the JSON object as a streaming attachment and stores it in the Streaming Attachments [streaming_attachment] table. If you do not call this method, the API creates the payload as a JSON string.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSONStreamingBuilder</td>
<td>Builder object used to initiate the JSON payload.</td>
</tr>
</tbody>
</table>

This example shows how to build the JSON payload and save it as an attachment.

```javascript
try {
    var ttl = new GlideDateTime("2011-01-01 12:00:00");
    var builder = new sn_ih.JSONStreamingBuilder()
        .withAttachment() // Creates the JSON object in streaming mode within an attachment.
        .expiresAt(ttl) // Sets an expiration date for the attachment.
        .build(); // Creates the JSONStreamingAPI object.

    builder.startObject() // Begins generating the JSON object.
        .writeFieldName("firstName") // Adds a "firstName" field
        .writeString("John") // Writes the value of the "firstName" field
        .writeFieldName("lastName")
        .writeString("Smith")
        .writeNumberField("age","25") // Write a number field named "age" with value "25"
}
```
writeFieldName("address")  // Start a new object nested under the parent object
.writeStringField("streetAddress", "21 2nd Street")
.writeStringField("city", "Santa Clara")
.writeStringField("state", "CA")
.writeStringField("postalCode", "11111")
.endObject()

writeFieldName("phoneNumber")
.startArray()  // Start an array
.startObject()  // Add the first object to the array
.writeFieldName("type")
.writeString("home")
.writeStringField("number")
.writeString("212 555-1234")
.endObject()
.startObject()  // Add another object to the array
.writeFieldName("type")
.writeString("fax")
.writeStringField("number")
.writeString("646 555-4567")
.endObject()
.endArray()
.endObject()

gs.log(builder.getAttachmentId());  // Returns the sys_id of the attachment.
}

catch (err) {
    gs.log(err);
}

finally {
    builder.close();
}

This example shows how to build the JSON payload and save it as a string.

try {
    var builder = new sn_ih.JSONStreamingBuilder().build();

    builder.startObject()
      .writeFieldName("firstName")
      .writeString("John")
      .writeFieldName("lastName")

.writeString("Smith")
.writeStringField("age","25")
.writeFieldName("address")
.startObject()
.writeStringField("streetAddress", "21 2nd Street")
.writeStringField("city", "Santa Clara")
.writeStringField("state", "CA")
.writeStringField("postalCode", "11111")
.endObject()
.writeFieldName("phoneNumber")
.startArray()
.startObject()
.writeFieldName("type")
.writeString("home")
.writeFieldName("number")
.writeString("212 555-1234")
.endObject()
.startObject()
.writeFieldName("type")
.writeString("fax")
.writeFieldName("number")
.writeString("646 555-4567")
.endObject()
.endArray()
.endObject()

gs.log(builder.getJSONString());
}

catch (err) {
    gs.log("Exception: " + err);
}

finally {
    builder.close();
}

Output:
{
    "firstName" : "John",
    "lastName" : "Smith",
    "age" : 25,
    "address" : {
        "streetAddress" : "21 2nd Street",
        "city" : "Santa Clara",
        "state" : "CA",
        "postalCode" : "11111"
    }
}
JSUtil - Global

JSUtil is a class of shortcuts for common JavaScript routines.

Script includes and business rules that are marked as Application = "global" and Accessible from = "All applications" can be used in scoped scripts.

JSUtil is not available in scoped scripts.

The JSUtil API is available in server-side scripts.

JSUtil - doesNotHave(Object item)

Checks if item is null or is undefined.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The object to check</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified object is null or undefined.</td>
</tr>
</tbody>
</table>

```
var x = "the quick brown fox";
var y = ";
var z;

gs.print("x = \" + x + ", JSUtil.doesNotHave(x) = " + JSUtil.doesNotHave(x));
```
gs.print("y = "' + y + ", JSUtil.doesNotHave(y) = " + JSUtil.doesNotHave(y));
gs.print("z = "' + z + ", JSUtil.doesNotHave(z) = " + JSUtil.doesNotHave(z));

Output:
x = 'the quick brown fox', JSUtil.doesNotHave(x) = false
y = '', JSUtil.doesNotHave(y) = false
z = 'undefined', JSUtil.doesNotHave(z) = true

**JSUtil - escapeAttr(String text)**

Escape ampersands commonly used to define URL attributes.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The text</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The text with ampersands properly escaped.</td>
</tr>
</tbody>
</table>

```javascript
var attr = "sysparm_query-active=true&sysparm_view=special";
gs.print(JSUtil.escapeAttr(attr));
```

Output: This is the returned text. If the text is displayed in the application, the page will render the escaped ampersand with a single ampersand.

sysparm_query-active=true&sysparm_view=special

**JSUtil - escapeText(String text)**

Escapes invalid XML characters such as "< > &".

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The text</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The text with escape characters added.</td>
</tr>
</tbody>
</table>

```javascript
var html = "<b>This is my title</b>";

gs.print(JSUtil.escapeText(html));
```

Output: This is the value returned. If the result is displayed in the application, the page renders the brackets back so it appears that it is not escaped.

```javascript
<b>This is my title</b>
```

JSUtil - getBooleanValue(GlideRecord now_GR, String field)

Returns the value in a boolean GlideRecord field.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>A GlideRecord</td>
</tr>
<tr>
<td>field</td>
<td>String</td>
<td>The field from which to retrieve the boolean value.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns the value in a boolean GlideRecord field, returns true if value of field is true, &quot;true&quot;, 1, or &quot;1&quot;.</td>
</tr>
</tbody>
</table>

```javascript
var inc = new GlideRecord("incident");

//get an active incident
inc.addActiveQuery();
inc.setLimit(1);
inc.query();
inc.next();

gs.print(JSUtil.getBooleanValue(inc, "active"));
```

Output: true
**JSUtil - has(Object item)**

Checks if item is not null and is not undefined.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The Object to check</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified object is not null and is not undefined.</td>
</tr>
</tbody>
</table>

```javascript
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = " + x + ", JSUtil.has(x) = " + JSUtil.has(x));
gs.print("y = " + y + ", JSUtil.has(y) = " + JSUtil.has(y));
gs.print("z = " + z + ", JSUtil.has(z) = " + JSUtil.has(z));
```

**Output:**

```
x = 'the quick brown fox', JSUtil.has(x) = true
y = '', JSUtil.has(y) = true
z = 'undefined', JSUtil.has(z) = false
```

**JSUtil - instance_of(Object item, String class)**

Checks to see if the specified object is a member of the specified class.

For JavaScript objects, this method behaves exactly like the JavaScript operator "instanceof", but also supports Java objects.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The object to check</td>
</tr>
<tr>
<td>class</td>
<td>String</td>
<td>The class to check</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified object is a member of the specified class.</td>
</tr>
</tbody>
</table>

```javascript
var a = ['a', 'b', 'c'];
var b = 10;
var c = new GlideRecord("incident");

gs.print("JSUtil.instance_of(a,'Array') = " + JSUtil.instance_of(a,Array));
gs.print("JSUtil.instance_of(a,'String') = " + JSUtil.instance_of(a,String));

gs.print("JSUtil.instance_of(b,'String') = " + JSUtil.instance_of(b,String));

js.print("JSUtil.instance_of(c,'GlideRecord') = " + JSUtil.instance_of(c,GlideRecord));
```

**Output:**

JSUtil.instance_of(a,'Array') = true
JSUtil.instance_of(a,'String') = false
JSUtil.instance_of(b,'String') = false
JSUtil.instance_of(c,'GlideRecord') = true

### JSUtil - isJavaObject(Object value)

Checks if the specified object is a Java class.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Object</td>
<td>The object to check</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the specified object is an instance of a Java class.</td>
</tr>
</tbody>
</table>

```javascript
var tu = new TableUtils("incident");
var classes = tu.getHierarchy(); //Java ArrayList
var tables = ["task", "incident"]; //JavaScript Array
```
gs.print("JSUtil.isJavaObject(classes) = " + JSUtil.isJavaObject(classes));
gs.print("JSUtil.isJavaObject(tables) = " + JSUtil.isJavaObject(tables));

Output:

JSUtil.isJavaObject(classes) = true
JSUtil.isJavaObject(tables) = false

**JSUtil - logObject(Object obj, String name)**

Logs all the properties in the given object: name, type, and value.

Output is written to the console if you are running from a background script or have debug logging enables. The output is also written to the system log.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>Object</td>
<td>The object for which to enumerate properties</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Optional name for the logged object</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var arr = ['a','b','c'];

var inc = new GlideRecord('incident');
//get an active incident
inc.addActiveQuery();
inc.setLimit(1);
inc.query();
inc.next();

JSUtil.logObject(arr, "arr");
JSUtil.logObject(inc, "inc");
```

Output:

Log Object: arr
Array of 3 elements
[0]: string = a
JSUtil - nil(Object item)
Checks if item is null, undefined, or evaluates to the empty string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The object to check</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the item is null, undefined, or evaluates to the empty string.</td>
</tr>
</tbody>
</table>

```javascript
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = " + x + ", JSUtil.nil(x) = " + JSUtil.nil(x));
gs.print("y = " + y + ", JSUtil.nil(y) = " + JSUtil.nil(y));
gs.print("z = " + z + ", JSUtil.nil(z) = " + JSUtil.nil(z));
```

Output:

- x = 'the quick brown fox', JSUtil.nil(x) = false
- y = '', JSUtil.nil(y) = true
- z = 'undefined', JSUtil.nil(z) = true

JSUtil - notNil(Object item)
Checks if item is null, undefined, or evaluates to the empty string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The object to check</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------</td>
<td>--------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Boolean</td>
<td>True if the item exists and is not empty.</td>
<td></td>
</tr>
</tbody>
</table>

```
var x = "the quick brown fox";
var y = "";
var z;

gs.print("x = '" + x + "', JSUtil.notNil(x) = " + JSUtil.notNil(x));
gs.print("y = '" + y + "', JSUtil.notNil(y) = " + JSUtil.notNil(y));
gs.print("z = '" + z + "', JSUtil.notNil(z) = " + JSUtil.notNil(z));
```

**Output:**

```
x = 'the quick brown fox', JSUtil.notNil(x) = true
y = '', JSUtil.notNil(y) = false
z = 'undefined', JSUtil.notNil(z) = false
```

**JSUtil - toBoolean(Object item)**

Converts the specified object to a Boolean.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Object</td>
<td>The object to convert</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the specified object is a boolean, it is passed through. Non-zero numbers return true. Null or undefined return false. Strings return true only if exactly equal to 'true'.</td>
</tr>
</tbody>
</table>

```
var zero = 0;
var one = 1;
var number = 12;
var trueBoolean = true;
var trueString = "true";
var otherString = "random text";
```
gs.print("JSUtil.toBoolean(zero) = "+JSUtil.toBoolean(zero));
gs.print("JSUtil.toBoolean(one) = " + JSUtil.toBoolean(one));
gs.print("JSUtil.toBoolean(number) = " + JSUtil.toBoolean(number));
gs.print("JSUtil.toBoolean(trueBoolean) = " + JSUtil.toBoolean(trueBoolean));
gs.print("JSUtil.toBoolean(trueString) = " + JSUtil.toBoolean(trueString));
gs.print("JSUtil.toBoolean(otherString) = " + JSUtil.toBoolean(otherString));

Output:

JSUtil.toBoolean(zero) = false
JSUtil.toBoolean(one) = true
JSUtil.toBoolean(number) = true
JSUtil.toBoolean(trueBoolean) = true
JSUtil.toBoolean(trueString) = true
JSUtil.toBoolean(otherString) = false

JSUtil - type_of(Object value)

Determines the type of the specified object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Object</td>
<td>The object to check</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String | The type of the specified object.  
  • 'null' if the given value is null or undefined  
  • 'string' if the given value is a primitive string or a String wrapper instance  
  • 'number' if the given value is a primitive number or a Number wrapper instance  
  • 'boolean' if the given value is a primitive boolean or a Boolean wrapper instance  
  • 'function' if the given value is a function  
  • 'object' otherwise |
var a = ["a","b","c"];
var b = 10;
var c = new GlideRecord("incident");
var d = true;
var e;

gs.print("JSUtil.type_of(a) = "+JSUtil.type_of(a));
gs.print("JSUtil.type_of(b) = "+JSUtil.type_of(b));
gs.print("JSUtil.type_of(c) = "+JSUtil.type_of(c));
gs.print("JSUtil.type_of= "+JSUtil.type_of(d));
gs.print("JSUtil.type_of(e) = "+JSUtil.type_of(e));

Output:

JSUtil.type_of(a) = object
JSUtil.type_of(b) = number
JSUtil.type_of(c) = object
JSUtil.type_of= boolean
JSUtil.type_of(e) = null

**JSUtil - unescapeAttr(String text)**

Restore ampersands from escaped text.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The text</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The text with escape characters removed.</td>
</tr>
</tbody>
</table>

var attr = "sysparm_query-active=true\&sysparm_view=special";

gs.print(JSUtil.unescapeAttr(attr));

Output:

sysparm_query-active=true&sysparm_view=special
JSUtil - unescapeText(String text)

Removes escape characters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>The text to process.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The text without escape characters.</td>
</tr>
</tbody>
</table>

```javascript
var html = "&lt;b&gt;This is my title&lt;/b&gt;";
gs.print(JSUtil.unescapeText(html));
```

Output: This is the value returned. If the text is displayed in the application the page, it renders the html tags and displays the text in bold.

```html
<b>This is my title</b>
```

KMFCryptoOperation API - Scoped, Global

The KMFCryptoOperation class provides methods for performing cryptographic operations using the KMF cryptographic module.

To use this API, you must have already created and configured a Key Management Framework (KMF) cryptographic module with one or more cryptographic specifications and created/imported its associated key. For details, see Cryptographic module overview.

The KMFCryptoOperation object generated using this API represents a cryptographic operation, such as a Symmetric Encryption. Use the KMFCryptoOperations() method to create this object, the builder methods to set properties on the object, and the doOperation() method to execute the operation.

You can use this API in both scoped and global applications. You must always specify the `sn_kmf_ns` namespace when calling this API.

KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName)

Creates a KMFCryptoOperation object for the specified module and operation.
This API leverages builder methods. Builder methods update properties on the KMFCryptoOperation object, such as changing the desired output format of the data. Not all builder methods are valid for all operations. The builder methods available for each operation are noted in the parameters table below.

The following builder methods are valid for all operation types:

- `withInputFormat()`
- `withOutputFormat()`
- `withOutputType()`

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cryptoModuleName</td>
<td>String</td>
<td>Name of the Key Management Framework (KMF) cryptographic module to use. You must create this module before calling this method. For details, see Create a cryptographic module.</td>
</tr>
<tr>
<td>operationName</td>
<td>String</td>
<td>Name of the operation to perform. Valid values (not case-sensitive):</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASYMMETRIC_DECRYPTION: Data decryption using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Data Decryption cryptographic purpose.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Additional builder methods: withAdditionalInput()</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default input format: Formatted - Formatted to the KMF specifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output format: KMFBASE64 - Base64 encoded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASYMMETRIC_ENCRYPTION: Data encryption using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Data Encryption cryptographic purpose.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Additional builder methods: withAdditionalInput()</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default input format: KMFBASE64 - Base64 encoded</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default output format: Formatted - Formatted to the KMF specifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Default output type: String. Output can also be an KMFEncryptionPayload object. RSA and ECIES are compatible with both. For additional information on the KMFEncryptionPayload object, see withAdditionalInput().</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASYMMETRIC_UNWRAPPING: Key unwrapping using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Key Unwrapping cryptographic purpose.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Additional builder methods: withAlgorithm()</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default input format: Formatted - Formatted to the KMF specifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output format: KMBase64 - Base64 encoded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ASYMMETRIC_WRAPPING: Key wrapping using an asymmetric-key algorithm. Requires a KMF cryptographic module with an Asymmetric Key Wrapping cryptographic purpose.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Additional builder methods: withAlgorithm(), withSysId()</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default input format: KMBase64 - Base64 encoded</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output format: Formatted - Formatted to the KMF specifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>◦ Default output type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MAC_GENERATION: Generation of a Message Authentication Code (MAC). Symmetric-key algorithm based to provides data integrity and authentication. Requires a KMF cryptographic module with a Symmetric Authenticity cryptographic purpose.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Additional builder methods: None
- Default input format: KMFBase64 - Base64 encoded
- Default output format: Formatted - Formatted to the KMF specifications
- Default output type: String

- MAC_VERIFICATION: Verification of a MAC. Symmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Symmetric Authenticity cryptographic purpose.
  - Additional builder methods:
    - withAdditionalInput()
  - Default input format: KMFBase64 - Base64 encoded
  - Default output format: KMFNone - No decoding
  - Default output type: Boolean

- SIGNATURE_GENERATION: Generation of a digital signature. Asymmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Signature Generation cryptographic purpose.
  - Additional builder methods: None
  - Default input format: KMFBase64 - Base64 encoded
  - Default output format: Formatted - Formatted to the KMF specifications
  - Default output type: String

- SIGNATURE_VERIFICATION: Verification of a digital signature. Asymmetric-key algorithm based to provide data integrity and authentication. Requires a KMF cryptographic module with a Signature Verification cryptographic purpose.

</tbody>
</table>

This example instantiates a KMFCryptoOperation object for the module `global.sj_cm` to perform a Symmetric Encryption operation. You must include the namespace for both global and scoped applications.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTION");
```

This example shows how to specify options to update the default output type and output format.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTION")
 .withOutputType("STRING").withOutputFormat("FORMATTED");

var cipherText=op.doOperation("hi");
```
This example shows how to perform an Asymmetric Encryption operation using an Integrated Encryption Scheme (EC-IES). Note that long values, such as `signature`, have been truncated and replaced with an ellipse for readability.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_ENCRYPTION")
  .withInputFormat("KMFNONE")
  .withOutputType("PAYLOAD");

var cipherText = op.doOperation("hi");

/*
cipherText contains an object similar to this JSON: {
  "signature": "pkg...",
  "ephemeral_key": "BDi...",
  "ciphertext": "afFS..."
}
*/
```

This example shows how to perform an Asymmetric Decryption operation using EC-IES.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_DECRYPTION")
  .withAdditionalInput({
    "signature": "pkg...",
    "ephemeral_key": "BDi..."
  })
  .withOutputFormat("KMFNONE");

var clearText = op.doOperation("afFS...");
```

** KMFCryptoOperation - doOperation(Object data) **

Performs the cryptographic operation defined by the current KMFCryptoOperation object on the supplied data and returns the result.

** Parameters **

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>Required except if the <code>withSysId()</code> builder method has previously been called on the associated KMFCryptoOperation object. Input data on which to perform the cryptographic operation.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on the operation type.</td>
<td>Data results after performing the operation specified in the associated KMFCryptoOperation object.</td>
</tr>
<tr>
<td>• MAC_VERIFICATION and</td>
<td></td>
</tr>
<tr>
<td>SIGNATURE_VERIFICATION:</td>
<td></td>
</tr>
<tr>
<td>Boolean</td>
<td></td>
</tr>
<tr>
<td>• All others: String</td>
<td></td>
</tr>
</tbody>
</table>

This example uses the `doOperation()` to create a MAC.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","MAC_GENERATION");
var data = "aGk=";
var mac = op.doOperation(data);
```

**KMFCryptoOperation - withAdditionalInput(Object additionalInput)**

Sets the additional input needed to perform the cryptographic operation.

For example, during a Message Authentication Code (MAC) verification, use this method to pass in the generated MAC tag. Similarly, during signature verification, use it to pass in the signature. You can also use this method to pass additional data, a KMFEncryptionPayload object, when performing an asymmetric operation with an integrated cipher, such as Elliptic Curve Integrated Encryption Scheme (EC-IES.)

ℹ️ **Note:** The additional input does not have to be in the same format as what is currently set on the KMF Crypto Operation object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalInput</td>
<td>String or Object</td>
<td>Optional, except for Asymmetric Decryption operations when using EC-IES. Additional input data needed to perform the cryptographic operation specified in the KMFCryptoOperation object. Supported string formats:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FORMATTED: Formatted to the Key Management Framework (KMF) specifications.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• KMFBASE64: Base64 encoded.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalInput.ciphertext</td>
<td>String (Base64)</td>
<td>Required for Asymmetric Decryption, optional for all other operations. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If using an RSA algorithm: RSA ciphertext</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• If using an EC-IES algorithm: Integrated AES ciphertext</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Available from the Asymmetric Encryption operation when the output type is set to <strong>payload</strong>.</td>
</tr>
<tr>
<td>additionalInput.derivation_secret</td>
<td>String (Base64)</td>
<td>Optional, only used for the Asymmetric Encryption or Asymmetric Decryption operations with EC-IES. Shared secret to use during the key derivation process of the integrated scheme.</td>
</tr>
<tr>
<td>additionalInput.ephemeral_key</td>
<td>String (Base64)</td>
<td>Required for the Asymmetric Decryption operation when using EC-IES, optional for all other operations. Ephemeral public key to use during the basic agreement process of the integrated scheme.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Available from the Asymmetric Encryption operation when the output type is set to <strong>payload</strong>.</td>
</tr>
<tr>
<td>additionalInput.ephemeral_key_format</td>
<td>String</td>
<td>Optional, only used for the Asymmetric Encryption or Asymmetric Decryption operations with EC-IES. Overrides the format of the public key represented by the <code>ephemeral_key</code> parameter. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• x962</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• der</td>
</tr>
</tbody>
</table>

**KMFEncryptionPayload object format:**

```
{
  "ciphertext": String,
  "derivation_secret": String,
  "ephemeral_key": String,
  "ephemeral_key_format": String,
  "signature": String
}
```
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>additionalInput.signature</td>
<td>String (Base64)</td>
<td>Required for the Asymmetric Decryption operation with EC-IES, optional for all others. The signature of the ciphertext to validate using the signature verification process of the integrated scheme. Available from the Asymmetric Encryption operation when the output type is set to <code>payload</code>.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withAdditionalInput()` to add a string-based signature to the KMFCryptoOperation object.

```javascript
var signature = "John Doe";
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SIGNATURE_VERIFICATION")
  .withAdditionalInput(signature);

var value = GlideStringUtil.base64Encode("Text to encode"); // Default input format is KMFBase64
var result = op.doOperation(String(value));
```

This example uses `withAdditionalInput()` to add a signature and ephemeral key to the KMFCryptoOperation object. Note that long values, such as those in the `doOperation()` call and `payload` description, have been truncated and replaced with an ellipse for readability.

```javascript
var payload = new sn_kmf_ns.KMFCryptoPayload();
payload.signature = "pkg...");
payload.ephemeral_key = " BDi...";
payload.ephemeral_key_format = "x962";

var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","ASYMMETRIC_DECRYPTION")
  .withAdditionalInput(payload)
  .doOperation("afFS...");
```

KMFCryptoOperation - `withAlgorithm(String algorithm)`

Sets the algorithm associated with the key material to wrap.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>algorithm</td>
<td>String</td>
<td>Algorithm to use. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AES: Symmetric key type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• EC: Asymmetric key type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HMAC: Symmetric key type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RSA: Asymmetric key type</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withAlgorithm()` to change the encryption algorithm used to EC.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm", "ASYMMETRIC_WRAPPING").withAlgorithm("EC");
var value = GlideStringUtil.base64Encode("Sample key"); // Default input format is KMFBase64
var result = op.doOperation(String(value));
```

**KMFCryptoOperation - withInputFormat(String inputFormat)**

Sets the data format for the input data on which the cryptographic operation will be performed. Uses the specified format when decoding the data.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputFormat</td>
<td>String</td>
<td>Format of the input data. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• FORMATTED: Formatted to the Key Management Framework (KMF) specifications.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• KMFBASE64: Base64 encoded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• KMFNONE: No encoding.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Default: Value determined by the operation specified when the KMFCryptoOperation object was instantiated. For more information, see KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName).</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withInputFormat()` to change the input format to have no encoding.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_ENCRYPTION").withInputFormat("KMFNone");
var result = op.doOperation("Text with no encoding"); // Pass in unencrypted String
```

**KMFCryptoOperation - withOutputFormat(String outputFormat)**

Sets the data format of the output data that is returned by the cryptographic operation. Uses the specified format when encoding the data.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| outputFormatString | String  | Format of the output data. Valid values:
  
  • FORMATTED: Formatted to the Key Management Framework (KMF) specifications.
  
  • KMFBASE64: Base64 encoded.
  
  • KMFNONE: No decoding. Only supported for MAC_VERIFICATION and SIGNATURE_VERIFICATION.
  
  Default if this method is not called: Value determined by the operation specified when the
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KMFCryptoOperation object was instantiated. For more information, see KMFCryptoOperation - KMFCryptoOperation(String cryptoModuleName, String operationName).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withOutputFormat()` to set the output format of the decryption to KMFNone (default is KMFBase64.)

```java
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_DECRYPTION").withOutputFormat("KMFNone");
var clear_data = op.doOperation(<FORMATTED_data>); // Pass in default of FORMATTED data
```

### KMFCryptoOperation - `withOutputType(String outputType)`

Sets the data type for the output data returned after the cryptographic operation is performed.

**Note:** When you instantiate the KMFCryptoOperation object for `MAC_VERIFICATION` or `SIGNATURE_VERIFICATION` operations, you must also call this method, passing boolean, to set the correct output type or an exception is thrown when you execute the operation.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>outputType</td>
<td>String</td>
<td>Type of output data. Not all output types are applicable to all operations. For an unsupported type, an exception is thrown. Valid values (not case-sensitive):</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
|      |      | - String: Not valid for MAC_VERIFICATION or SIGNATURE_VERIFICATION operations.  
|      |      | - Boolean: Only valid for MAC_VERIFICATION or SIGNATURE_VERIFICATION operations.  
|      |      | - Payload: Only valid for the ASYMMETRIC_ENCRYPTION operation. Use this output type for EC-IES. |

**Note:** When specifying an output of **Payload**, the output of the `doOperation()` method is a KMFEncryptionPayload object. For more information on the structure of this object, see `withAdditionalInput()`.

Default: Value determined by the operation, specified when the KMFCryptoOperation object was instantiated. For more information, see `KMFCryptoOperation(String cryptoModuleName, String(operationName))`.

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withOutputType()` to set the output type for MAC_VERIFICATION to Boolean.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","MAC_VERIFICATION")
   .withOutputType("Boolean").withAdditionalInput(<MAC>);
var value = GlideStringUtil.base64Encode("Text to sign"); // Default input type is KMFBase64
var result = op.doOperation(String(value));
```

**KMFCryptoOperation - withSysId(String sysId)**

Sets the sys_id of the key to wrap on the KMFCryptoOperation object. Applicable to symmetric and asymmetric wrapping of keys.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of the key to wrap. Located in the Module Key [sys_kmf_module_key] table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example uses `withSysId()` to define the key to wrap.

```javascript
var op = new sn_kmf_ns.KMFCryptoOperation("global.sj_cm","SYMMETRIC_WRAPPING").withSysId("0d06ce525b231010f86db341d81c777");
var wrappedKey = operation.doOperation(); // No need to pass data when using withSysId()
```

### Line - Scoped, Global

Creates a Line object using methods to draw a line in a PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

#### Line - Line()

Instantiates a new `Line` object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

The following examples shows how to create a `Line` object.

```javascript
var line = new sn_pdfgeneratorutils.Line();
```

#### Line - drawLine(Document document, Number pageNo, Number xPos, Number yPos, Number width, Number lineWidth)

Places a line on a document page.
The following example shows how to create a line at the lower margin of a document page. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var num = 1;
var xpos = 100;
var ypos = 100;
var width = 450;
var linewidth = 2.5;

document.addNewPage();

var line = new sn_pdfgeneratorutils.Line();

line.drawLine(document, num, xpos, ypos, width, linewidth);

document.saveAsAttachment("incident", "<sys_id>", "line.pdf");
```
Line – setColor(Color color)

Sets the color of a line.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>Color</td>
<td>Line color.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to create a line and set its color in a document. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var num = 1;
var xpos = 100;
var ypos = 100;
var width = 450;
var linewidth = 2.5;

var color = new sn_pdfgeneratorutils.Color([0.5,0.5,0.8]);   //given as array of RGB values;
document.addNewPage();
var line = new sn_pdfgeneratorutils.Line();
line.setColor(color);
line.drawLine(document, num, xpos, ypos, width, linewidth);
document.saveAsAttachment("incident", "<sys_id>", "lineWithColor.pdf");
```

LinterCheckAstNode API - Scoped, Global

Provides methods for getting abstract syntax tree (AST) node details in linter checks.
This API is included with the Instance Scan (com.glide.instance_scan) plugin. For more information, see Instance Scan.

Use the methods in this class to run linter checks on AST node types by adding code to the Script field in the Linter Check form. For more information, see Advanced linter check scripts.

Create a linter check to identify any issues in a script. When a linter check is run on a record, an abstract syntax tree for its code is generated. You can use the abstract syntax tree to analyze issues with the code.

Access methods in this API using the Instance Scan engine.rootNode object.

**LinterCheckAstNode - getNameIdentifier()**

Retrieves the string value of a name node type. A name node represents a simple identifier that is not a keyword, such as a function or variable name.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

The following example uses the Findings API incrementWithNode() method in a linter check. Use this method in the Script field of the Linter Check form.

```javascript
(function(engine) {
    engine.rootNode.visit(function(node) {
        if (node.getTypeName() === "NAME" &&
            node.getNameIdentifier() === "soughtFunction" &&
            node.getParent().getTypeName() === "CALL") {
            engine.finding.incrementWithNode(node);
        }
    });
})(engine);
```

**LinterCheckAstNode - getParent()**

Gets the parent node object of the accessed node.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Parent node object of the accessed node.</td>
</tr>
</tbody>
</table>

The following example uses the Findings API `incrementWithNode()` method in a linter check. Use this method in the Script field of the Linter Check form.

```javascript
(function(engine) {
    engine.rootNode.visit(function(node) {
        if (node.getTypeName() === "NAME" &&
            node.getNameIdentifier() === "soughtFunction" &&
            node.getParent().getTypeName() === "CALL") {
            engine.finding.incrementWithNode(node);
        }
    });
})(engine);
```

### LinterCheckAstNode - getTypeName()

Gets the type of the accessed node.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Type name of the accessed node. For example, a function call in the source is tokenized as a node with the type name of CALL. See Token class for all node type names.</td>
</tr>
</tbody>
</table>

The following example uses the Findings API `incrementWithNode()` method in a linter check. Use this method in the Script field of the Linter Check form.
LinterCheckAstNode - visit(Function callbackFunction)

Accesses each node in the subtree starting from this node and executes a given callback function on each node.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callbackFunction</td>
<td>Function</td>
<td>Callback function to be executed on each node in the subtree of this node. This callback function takes a node as a parameter which is the node to be visited.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example uses the Findings API incrementWithNode() method in a linter check. Use this method in the Script field of the Linter Check form.

```javascript
(function(engine) {
    engine.rootNode.visit(function(node) {
        if (node.getTypeName() === "NAME" &&
            node.getNameIdentifier() === "soughtFunction" &&
            node.getParent().getTypeName() === "CALL") {
            engine.finding.incrementWithNode(node);
        }
    });
})(engine);
```
Logger - Global

Inbound email actions can use this JavaScript function to append messages to the email log.

The Logger class provides methods that add standard, warning, and error messages to the email log. The added message has its source set to email.<Sys ID of incoming email>.

Logger - log(String msg)

Appends the specified message to the email log.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>String</td>
<td>Text to append to the email log. These should be information type messages.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

logger.log("Some information");

Logger - logError(String msg)

Appends the specified error message to the email log file.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>String</td>
<td>Error message to append to the email log</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
logger.logError("Some error");

**Logger - logWarning(String msg)**

Appends the specified warning message to the email log file.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>String</td>
<td>Warning message to append to the email log</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

logger.logWarning("Some warning");

**LSOFParser - Global**

Parses the output of the `lsof` command: `lsof -i4TCP -n -P -F pcnfT`

Use this API with a discovery script when you need to parse `lsof` output.

**LSOFParser - error(String msg)**

Generates the specified error message.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg</td>
<td>String</td>
<td>The error message</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - initFileDescriptor()**

Initializes the file descriptor process.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - initProcess()**

Initializes the parser process.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - on_p(String line)**

Sets the current PID.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>String</td>
<td>The PID</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
LSOFParser - on_c(String line)
Sets the current command.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>String</td>
<td>The command</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

LSOFParser - on_f(String line)
Sets the current file descriptor.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>String</td>
<td>The file descriptor</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

LSOFParser - on_n(String line)
Sets the current address.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>String</td>
<td>The address</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - on_T(String line)**

Sets the current state.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>String</td>
<td>The state</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - on_endFileDescriptor()**

Closes the file descriptor process.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**LSOFParser - on_endProcess()**

Closes the parser process.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

LSOFParser - parse(String lsofOutput)

Parses the specified `lsof` output.

Results are available in connections and listeners arrays, and errors are recorded in `errorString()` and `isValid()`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lsofOutput</td>
<td>String</td>
<td>The <code>lsof</code> output</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Messaging - Scoped

Perform actions in a third-party messaging application.

This class requires the Messaging Notification plugin (com.glide.notification.messaging) and an integration with a third-party messaging application such as Slack or Teams. Use these methods in an action script in the Message Actions [messaging_observer_handler] table.

Use the `sn_notification` namespace to access the Messaging API.
Scoped Messaging - send(GlideRecord messagingApplication, String recipient, GlideRecord messagingContent, GlideRecord target)

Sends a custom message to a third-party application in response to a messaging event. For example, you can send a custom welcome message to a Slack channel when the Now Actions application installs.

Use this method in an action script in the Message Actions [messaging_observer_handler] table.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>messagingApplication</td>
<td>GlideRecord</td>
<td>Third-party application to send a message to from the Messaging Entities [messaging_application] table.</td>
</tr>
<tr>
<td>recipient</td>
<td>String</td>
<td>Recipient of the message. When the instance receives an inbound message, you can send a response to a Slack channel, Team, or individual user ID found in the inbound payload.</td>
</tr>
<tr>
<td>messagingContent</td>
<td>GlideRecord</td>
<td>Message content to send from the Messaging Contents [messaging_content] table.</td>
</tr>
<tr>
<td>target</td>
<td>GlideRecord</td>
<td>Record used to define dynamic field values in the message. Table must match the Target table field in the Messaging Contents record. If the Messaging Contents record does not use a target table, set the value to null.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

//Send a message to a Teams user
var app = new GlideRecord('messaging_application');
app.get('1f2d26527f4213007f005212bdfa9102');

var content = new GlideRecord('messaging_content');
content.get('17f1f9617320130082999cfd7bf6a706');

sn_notification.Messaging.send(app, '29:1ojsqDg1xuA_jZ70PD12_6E7mn7P6Mo0wK7z0n21b1L-SaNXYVI1cR716qnc11AGvdmhy2-kXh76IEVpUHXdz3w', content, null);

//Send a message to a Slack user
var app = new GlideRecord('messaging_application');
app.get('5d2e38c07f6113007f005212bdafa9160');

var content = new GlideRecord('messaging_content');
content.get('69c48ba77310130082999cfd7bf6a7af');

sn_notification.Messaging.send(app, 'U8P706QFQ', content, null);

//Send a message to a Slack channel
var app = new GlideRecord('messaging_application');
app.get('5d2e38c07f6113007f005212bdafa9160');

var content = new GlideRecord('messaging_content');
content.get('69c48ba77310130082999cfd7bf6a7af');

sn_notification.Messaging.send(app, 'CA6232N65', content, null);

**MIDServer - Global**

Encapsulates the notion of a MID server.

Use these methods in server scripts to manage a MID server using Ajax.

**MIDServer - getByName(String name)**

Returns the specified MID server.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>GlideRecord</td>
</tr>
</tbody>
</table>
**MIDServer - getForPing(DiscoverySchedule schedule, DiscoveryRange range)**

Returns the MID Server with the specified schedule and range set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule</td>
<td>DiscoverySchedule</td>
<td>The discovery schedule</td>
</tr>
<tr>
<td>range</td>
<td>DiscoveryRange</td>
<td>The discovery range set</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The MID server</td>
</tr>
</tbody>
</table>

**MIDServer - getDefault(DiscoverySchedule schedule)**

Returns the MID server associated with the specified schedule (the MID server with the same name). If there is no associated MID server, gets the next MID server in the ecc_agent table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule</td>
<td>DiscoverySchedule</td>
<td>The discovery schedule</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The MID server</td>
</tr>
</tbody>
</table>

**MIDServer - hostname**

The name of the MID server's host.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>String</td>
<td>The name of the MID server's host.</td>
</tr>
</tbody>
</table>
**MIDServer - hostOS**
The operating system of the MID server's host.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>hostOS</td>
<td>String</td>
<td>The operating system of the MID server's host.</td>
</tr>
</tbody>
</table>

**MIDServer - ip**
The IP address of the MID server's host.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ip</td>
<td>String</td>
<td>The IP address of the MID server's host.</td>
</tr>
</tbody>
</table>

**MIDServer - name**
Name of the MID server.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>name</td>
<td>String</td>
<td>Name of the MID server</td>
</tr>
</tbody>
</table>

**MIDServer - network**
The network containing the MID server's host.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>network</td>
<td>String</td>
<td>The network containing the MID server's host. For example, &quot;10.10.10.0/24&quot; or &quot;10.10.10.0/255.255.255.0&quot;.</td>
</tr>
</tbody>
</table>

**MIDServer - routerIP**
The IP address of the MID server host's default router.
Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>routerIP</td>
<td>String</td>
<td>The IP address of the MID server host’s default router.</td>
</tr>
</tbody>
</table>

MIDServer - status

The MID server's status ("Up" or "Down").

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The MID server's status (&quot;Up&quot; or &quot;Down&quot;).</td>
</tr>
</tbody>
</table>

MIDServer - sysID

The sys_id of the MID server record.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysID</td>
<td>String</td>
<td>The sys_id of the MID server record.</td>
</tr>
</tbody>
</table>

MIDServer - url

The URL the MID server uses to contact the instance.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>The URL the MID server uses to contact the instance.</td>
</tr>
</tbody>
</table>

MIDServer - version

Version of the MID server (WAR name).
### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Version of the MID server (WAR name).</td>
</tr>
</tbody>
</table>

**MIDServer - windowsDomain**

Windows domain of the MID server’s host (if it is a Windows machine).

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>windowsDomain</td>
<td>String</td>
<td>The Windows domain of the MID server's host.</td>
</tr>
</tbody>
</table>

**MIDServerAjax - Global**

Provides AJAX functionality for sending a test probe to the MID server.

Use in server scripts to test a MID server using AJAX.

#### MIDServerAjax - ajaxFunction_testProbe()

Sends a test probe to the MID server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contains the agent name, test probe ID, topic, name, and source.</td>
</tr>
</tbody>
</table>

```javascript
var msaj = new MIDServerAjax();
msaj.ajaxFunction_testProbe();
```

**MIDServerAjax - MIDServerAjax()**

Creates an instance of MIDServerAjax.
<table>
<thead>
<tr>
<th>Parameters</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MIDServerCluster - Global**

Finds the MID server clusters for a given MID server and reassigns the jobs if necessary.

If the MID server agent is up, this class gathers all MID servers (including the original agent) in the load balance clusters that the original agent is part of. If the MID server agent is down and the cluster is load balanced, the class gathers the other agents. If the server agent is down, and the cluster is failover, it gathers the next failover agent. The class then randomly returns the MID server in the final list of MID servers.

Use in server scripts to get MID server cluster information.

**MIDServerCluster - clusterExists()**

Determines if a cluster exists.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if a cluster exists; otherwise, false.</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var midgr = new GlideRecord("ecc_agent");
midgr.addQuery("name", "allwinmid");
midgr.query();
midgr.next();

var mscl = new MIDServerCluster(midgr);
gs.print(mscl.clusterExists());

Output: true
```
**MIDServerCluster - getClusterAgent()**

Gets the cluster agent.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The agent name</td>
</tr>
</tbody>
</table>

// Assuming "mid1" and "mid2" are in a cluster
var midgr = new GlideRecord("ecc_agent");
midgr.addQuery("name", "mid1");
midgr.query();
midgr.next();

var mscl = new MIDServerCluster(midgr);
gs.print(mscl.getClusterAgent());

Output: mid2

**MIDServerCluster - MIDServerCluster(GlideRecord agent)**

Brief description of the method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>GlideRecord</td>
<td>The MID server agent</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**MIDServerFileSync - Global**

Checks to see if there are any changes to attachments on tables that are instances of MID server synchronized files (ecc_agent_sync_file) and, if so, notifies the MID servers of a change.

The tables that extend the sync tables are MID Server JAR file (ecc_agent_jar) and MID Server MIB File (ecc_agent_mib).

Use in server scripts to notify MID servers.

### MIDServerFileSync - MIDServerFileSync()

Creates an instance of MIDServerFileSync.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### MIDServerFileSync - notifyMIDServers(String table)

Checks for any changes to attachments on the specified table that are instances of MID server synchronized files and, if so, notifies the MID servers of a change.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>String</td>
<td>The table to check</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msfs = new MIDServerFileSync();
msfs.notifyMIDServers('ex.table.name');
```

**MIDServerFinder - Global**

Finds a list of MID servers for given IP addresses.

Use in server scripts to get the server list.
MIDServerFinder - getMIDServers()

Gets the names of MID servers available for a given range and capability.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of MID server names. If no MID servers are available, returns an empty array.</td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
var msnames = msf.getMIDServers();

for(var i=0; i<msnames.length; i++) {
    gs.print(msnames[i]);
}
```

MIDServerFinder - getMIDServersBySysId()

Gets the sys_ids of MID servers available for a given range and capability.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of MID server sys_ids. If no MID servers are available, returns an empty array.</td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
```
var msids = msf.getMIDServersBySysId();
for(var i=0; i<msids.length; i++) {
    gs.print(msids[i]);
};

MIDServerFinder - getStatusMessage()
Gets the state of the finder operation.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The status message</td>
</tr>
</tbody>
</table>

var msf = new MIDServerFinder();
gs.print(msf.getStatusMessage());

MIDServerFinder - MIDServerFinder()
Creates an instance of MIDServerFinder.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**MIDServerFinder - setActive(Boolean flag)**

Sets whether to look for active or inactive MID servers. By default, searches are for active MID servers unless inactive is specified by this method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flag</td>
<td>Boolean</td>
<td>If true, look for inactive MID servers. If false, do not look for inactive MID servers.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setActive('true');
```

**MIDServerFinder - setCapabilities(Array capabilities)**

Sets the technologies for which to look.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities</td>
<td>Array</td>
<td>Contains a list of capabilities, for example - capabilities = [&quot;ssh&quot;,&quot;wmi&quot;,&quot;snmp&quot;,&quot;os_domain&quot;:&quot;disco&quot;],{&quot;phase&quot;:1} ]</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
var capab = ["ssh","wmi","snmp"];
msf.setCapabilities(capab);
```
**MIDServerFinder - setDebug(Boolean onOrOff)**

Turns debugging on or off.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onOrOff</td>
<td>Boolean</td>
<td>True to turn on debugging; false to turn debugging off.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setDebug('true');
```

**MIDServerFinder - setRanges(String ranges)**

Sets the range of IP addresses for which to look.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ranges</td>
<td>String</td>
<td>A comma-separated list in one of these formats.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IP addresses (10.10.10.1, 10.10.10.2)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IP networks (10.10.10.0/23)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• IP ranges (10.10.1-10.10.11.254)</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msf = new MIDServerFinder();
msf.setRanges('10.10.10.1-10.10.11.254');
```
MidServerFinder - setRangesByIPOrHostname(String ipOrHostname)

Determines if the input is a single IP or a hostname, and passes the IP or multiple IPs to the setRanges() method.

If the value of ipOrHostname is an IP address, it is passed into the setRanges() method. If the value is a hostname, we look up the DNS table (cmdb_ip_address_dns_name) to try resolving the hostname. The result, either an IP or multiple IPs, is then passed into the setRanges() method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipOrHostname</td>
<td>String</td>
<td>The IP address, IP range, or host name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msf = new MidServerFinder();
msf.setRangesByIPOrHostname('10.10.10.1-10.10.11.254');
```

MidServerManage - Global

Allows you to manage a MID server, by sending messages to start, stop, upgrade, get logs, send test probes, and send system messages.

Use in server scripts to send messages to a MID server.

MidServerManage - grab_logs(String agentName, String logs)

Gets the logs for the specified MID server.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
<tr>
<td>logs</td>
<td>String</td>
<td>The type of log to get (Optional)</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The log message</td>
</tr>
</tbody>
</table>

```
var msm = new MIDServerManage();
msm.grab_logs('serv1');
```

Output: Background message, type:info, message: Grabbing MID Server Logs

**MIDServerManage - MIDServerManage()**

Creates an instance of MIDServerManage.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MIDServerManage - restart(String agentName)**

Restarts the specified MID server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
var msm = new MIDServerManage();
msm.restart('serv1');
```

**MIDServerManage - stop(String agentName)**

Stops the specified MID server.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msm = new MIDServerManage();
msm.stop('serv1');
```

#### MIDServerManage - system_msg(String agentName, String cmd, String name)

Creates a system message for the specified MID server.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
<tr>
<td>cmd</td>
<td>String</td>
<td>The value of the probe source field</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the probe</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msm = new MIDServerManage();
msm.test_probe('mid.server.serv1', 'command', 'probe_id');
```

#### MIDServerManage - text_probe(String agentName, String probeID, String topic, String ename, String source)

Sends a test probe for the specified MID server.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
<tr>
<td>probeId</td>
<td>String</td>
<td>The ID of the probe to send</td>
</tr>
<tr>
<td>topic</td>
<td>String</td>
<td>The information for the topic field</td>
</tr>
<tr>
<td>ename</td>
<td>String</td>
<td>The name for the probe</td>
</tr>
<tr>
<td>source</td>
<td>String</td>
<td>The information for the source field</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The probe for the specified MID server</td>
</tr>
</tbody>
</table>

```javascript
var msm = new MIDServerManage();
msm.test_probe('mid.server.serv1', 'probe_id', 'topic text', 'name', 'source text');
```

### MIDServerManage - upgrade(String agentName)

Upgrades the specified MID server.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agentName</td>
<td>String</td>
<td>The MID server name</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var msm = new MIDServerManage();
msm.upgrade('serv1');
```

### MIDServerSelector - Global

Finds a MID server based on capabilities and target IP address.

Use in server scripts to find a MID server with specific capabilities.
**MIDServerSelector - findAgent(String target)**

Finds the MID server based on the capabilities and target IP address.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target</td>
<td>String</td>
<td>The target IP address</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
```

**MIDServerSelector - getError()**

Gets the error messages for the current MID server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
mss.getError();
```
**MIDServerSelector - getWarning()**

Gets the warning messages for the current MID server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
mss.findAgent('100.101.10.10');
mss.getWarning();
```

**MIDServerSelector - MIDServerSelector()**

Creates an instance of MIDServerSelector.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**MIDServerSelector - setCapabilities(Array capabilities)**

Sets the technologies for which to look.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| capabilities | Array     | A list of capabilities, for example - capabilities = \[
|          |            | "ssh","wmi","snmp",{"os_domain":"disco"},{"phase":1}\].               |

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mss = new MIDServerSelector();
var capab = ["ssh","wmi","snmp"];
mss.setCapabilities(capab);
```

**MLPredictor - Global**

Provides utility methods for Predictive Intelligence predictions.

⚠️ **Note:** This API has been deprecated and is intended to be removed in a future release. Refer to Using ML APIs for the most recent guidelines.

The MLPredictor API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the sn_ml namespace.

This class contains all methods necessary to get prediction results from input data.

**MLPredictor - applyPrediction(GlideRecord now_GR, Array solutions)**

Sets predicted values from an array of specified solutions to a specified record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>The record on which to apply the array of predicted solutions.</td>
</tr>
<tr>
<td>solutions</td>
<td>Array</td>
<td>Specified solution objects associated with the GlideRecord.</td>
</tr>
</tbody>
</table>
The following example demonstrates using the applyPrediction() method in a business rule.

```javascript
(function executeRule(current, previous /*null when async*/) {
    var mlPredictor = new MLPredictor();
    // Get the list of active solutions for the glide record table
    var solutions = mlPredictor.findActiveSolutionsForRecord(current);
    // Run prediction and apply predicted value to the record
    mlPredictor.applyPrediction(current, solution);
})(current, previous);
```

MLPredictor - applyPredictionForSolution(GlideRecord now_GR, Object solution)
Applies a predicted value from a specified classification solution to the specified GlideRecord.

For each solution in the GlideRecord, call this method to predict the results and set the field value on the incident to those results.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord object containing values on which to run a prediction and apply the results.</td>
</tr>
<tr>
<td>solution</td>
<td>Object</td>
<td>Classification solution object to be executed.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True upon prediction success, error otherwise.</td>
</tr>
</tbody>
</table>

To use this template, copy the Incident Based Prediction (Template) business rule, make the new record Active, and follow the commented instructions to initialize the solutionNames variable.
function executeRule(current, previous /*null when async*/) {
    var solutionNames = ["solution1", "solution2", ...];

    /* For domain separation (MSP) use case */
    // var solutionNames;
    // if (current.sys_domain == "A")
    //    solutionNames = ["solution_A1", "solution_A2", ...];
    // else if (current.sys_domain == "B")
    //    solutionNames = ["solution_B1", "solution_B2", ...];
    // else
    //    ...

    var predictor = new MLPredictor();
    var info = "";
    solutionNames.forEach(function(solutionName) {
        var solution = predictor.findActiveSolution(solutionName);
        if (!solution)
            return;
        /* The next line of code does the prediction and updates the current record. */
predictor.applyPredictionForSolution(current, solution);

        /* If no prediction is done, do not build the prediction info message. */
        if (!predictor.applyPredictionForSolution(current, solution))
            return;

        /* If user doesn't have 'itil' role, we don't build prediction info message. */
        if (!gs.hasRole('itil'))
            return;

        /* Building prediction info message */
        var fieldName = solution.getPredictedField();
        var fieldLabel = current.getElement(fieldName).getED().getLabel();
        var predictedDisplayValue = current.getDisplayValue(fieldName);
        var msg = gs.getMessage("Predicted {0} for {1}.", [predictedDisplayValue, fieldLabel]);
        if (info.length > 0)
            info += " ";
        info += msg;
    });
    /* Print out prediction info message on screen. */
    if (info.length > 0) {
        var incidentUrl = "<a href=" + current.getLink() + ">
" + current.number + ":</a>";
        gs.addInfoMessage(incidentUrl + " " + info);
}
**MLPredictor - findActiveSolution(String solutionName)**

Gets the solution object.

This method only returns the solutions if the ml_solution definition and solution are active.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solutionName</td>
<td>String</td>
<td>Name of the ml_solution record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Solution object for the specified solutionName if the ml_solution definition and solution is active, null otherwise.</td>
</tr>
</tbody>
</table>

This example takes a hard-coded value and passes it to a specified Machine Learning model. You can use the outcome and confidence variables to set values or other business logic.

```javascript
var solutionName = 'ml_incident_assignment';
var shortDescriptionValue = "Unable to connect!"
var input = {
    short_description : shortDescriptionValue
};
var MLP = new MLPredictor();
var solution = MLP.findActiveSolution(solutionName);
var predictedOutcome = solution.predictText(input);
var outcome = predictedOutcome.predictedValue();
var confidence = predictedOutcome.confidence();
gs.info("Predicted value: " + outcome)
gs.info("Confidence: " + confidence)
```

**Output:**
**MLPredictor - findActiveSolutionsForRecord(GlideRecord now_GR)**

Gets active solutions for a table in a specified GlideRecord.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord from which to collect active solution objects.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of active solution objects associated with the table that the specified record is for.</td>
</tr>
</tbody>
</table>

This script passes a GlideRecord (such as an incident), and processes all solutions for the GlideRecord, returning the values for each.

```javascript
/* This is only to get a hard-coded GR */
var current = new GlideRecord('incident');
current.get('965c9e5347c12200e0ef563dbb9a7156');
var predictor = new MLPredictor();
var solutions = predictor.findActiveSolutionsForRecord(current);
solutions.forEach(function(solution) {
  var outcome = solution.predict(current);
  /* Use this to set the field to the predicted value in the GlideRecord */
  var fieldName = solution.getPredictedField();
  current[fieldName] = outcome.predictedValue();
  current.update();
});
gs.info("Predicted value: " + outcome.predictedValue())
gs.info("Confidence: " + outcome.confidence())
```
**MLPredictor - getPredictedValue(Object solution, Object outcome)**

Gets the predicted value for a specified solution based on the specified prediction outcome.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solution</td>
<td>Object</td>
<td>Solution from which to get the predicted value.</td>
</tr>
<tr>
<td>outcome</td>
<td>Object</td>
<td>Prediction outcome results for the specified solution (var outcome = solution.predict(now_GR)).</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Predicted value for specified solution based on the specified outcome of the prediction.</td>
</tr>
<tr>
<td>Null</td>
<td>Returns null if the prediction confidence does not satisfy thresholds.</td>
</tr>
</tbody>
</table>

**MLPredictor - getPredictions(GlideRecord now_GR, Object solution, Object options)**

Gets predictions for a specified solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord to be predicted.</td>
</tr>
<tr>
<td>solution</td>
<td>Object</td>
<td>Solution object to be executed.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional JSON object key value pair with the following properties:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• options.top_n: If provided, returns results up to the expected number of predictions, otherwise default is read from the glide.platform_ml.max_num_predictions system property.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• options.apply_threshold: Checks the threshold value (solution threshold for similarity, class level threshold for classification) for the solution and applies it to the result set. Default value is true.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of predicted outcome objects</td>
</tr>
</tbody>
</table>

The following example calls a specified solution and executes predictions on it.

```javascript
function printOutcomeArr(outcomeArr) {
  gs.print('################## Results ##################
  for (var i=0; i<outcomeArr.length; i++) {
    var outcome = outcomeArr[i];
    gs.print((i+1) + ' : ' + outcome.predictedValue() + ', ' + outcome.predictedValueSysId() + ', ' + outcome.confidence());
  }
}

var solutionName = 'ml_x_anc_global_prop_flip_test';
var predictor = new MLPredictor();
var solution = predictor.findActiveSolution(solutionName);

var now_GR = new GlideRecord('incident');
own_GR.get('1c741bd70b2322007518478d83673af3');

var options = {};
options.top_n = '10';            // top_n is an integer between 1 and 1000
options.apply_threshold = false; // Value can be set to true or false
```
printOutcomeArr(predictor.getPredictions(now_GR, solution, options));

**MLPredictor - isClassificationSolution(Object solution)**

Identifies if a solution object is a classification type.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solution</td>
<td>Object</td>
<td>Name of the ML solution.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the input solution is a classification type, false otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var isClassificationSolution = this.isClassificationSolution(solution);

//classification solution each class has different threshold
//therefore needs to get all the results from ml engine
if (applyThreshold && isClassificationSolution) {
    var maxClassificationTopN = 50;
    outcomeArr = solution.predictTopN(now_GR, maxClassificationTopN);
} else {
    outcomeArr = solution.predictTopN(now_GR, topN);
}

if (outcomeArr === null) {
    //instead of returning null returning empty array
    return [];
}
```

**MLPredictor - isSimilaritySolution(Object solution)**

Identifies if a solution object is a similarity type.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solution</td>
<td>Object</td>
<td>Name of the ML solution; for example, ml_incident_categorization.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the input solution is a similarity type, false otherwise.</td>
</tr>
</tbody>
</table>

MLPredictor - MLPredictor()

Instantiates a new MLPredictor object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to use an MLPredictor object in a business rule to record final values after a prediction.

```javascript
function executeRule(current, previous /*null when async*/) {
  var predictor = new MLPredictor();
  predictor.recordFinalValuesInPredictionResults(current, "On close");
}(current, previous);
```

MLPredictor - outcome.confidence()

Gets the confidence of the predicted value.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The estimated precision of the prediction as a percentage. For example, 53.84615375762915.</td>
</tr>
</tbody>
</table>

```javascript
var MLP = new MLPredictor();
var solution = MLP.findActiveSolution(solutionName);
var predictedOutcome = solution.predictText(input);
var outcome = predictedOutcome.predictedValue();
var confidence = predictedOutcome.confidence();
gs.info("Predicted value: " + outcome)
gs.info("Confidence: " + confidence)
```

**MLPredictor - outcome.predictedValue()**

Gets the predicted value from the MLPredictor outcome object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Predicted value from the Outcome object.</td>
</tr>
</tbody>
</table>

```javascript
var MLP = new MLPredictor();
var solution = MLP.findActiveSolution(solutionName);
var predictedOutcome = solution.predictText(input);
var outcome = predictedOutcome.predictedValue();
var confidence = predictedOutcome.confidence();
gs.info("Predicted value: " + outcome)
gs.info("Confidence: " + confidence)
```

**MLPredictor - outcome.predictedValueSysId()**

Gets the sys_id of the predicted value.
function printOutcomeArr(outcomeArr) {
    gs.print('################## Results ##################
    for (var i=0; i<outcomeArr.length; i++) {
        var outcome = outcomeArr[i];
        gs.print((i+1) + ' : ' + outcome.predictedValue() + ', ' + outcome.predictedValueSysId() + ', ' + outcome.confidence() + ');
    }
}

MLPredictor - recordFinalValuesInPredictionResults(GlideRecord now_GR, String reason)
Sets final prediction result values to a specified GlideRecord with an optionally specified reason.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord on which to set the final prediction result values.</td>
</tr>
<tr>
<td>reason</td>
<td>String</td>
<td>Optional. Reason for applying results.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In following example, the `recordFinalValuesInPredictionResults()` method is called when the incident is closed.

(function executeRule(current, previous /*null when async */) {
    var predictor = new MLPredictor();
}
MLPredictor - solution.getCapability()

Gets the capability information of a trained solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Definition ID and version of the trained solution, error message otherwise</td>
</tr>
</tbody>
</table>

MLPredictor - solution.getName()

Gets the name of the solution used for prediction.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the solution to use for predictions; for example, ml_incident_categorization</td>
</tr>
</tbody>
</table>

MLPredictor - solution.getPredictedField()

Gets the predicted value of a solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
/* Get a hard-coded GR */
var current = new GlideRecord('incident');
current.get('965c9e5347c12200e0ef563dbb9a7156');
var predictor = new MLPredictor();
var solutions = predictor.findActiveSolutionsForRecord(current);
solutions.forEach(function(solution) {
    var outcome = solution.predict(current);
    /* Use this to set the field to the predicted value in the GlideRecord */
    var fieldName = solution.getPredictedField();
    current[fieldName] = outcome.predictedValue();
    current.update();
    gs.info("Predicted value: " + outcome.predictedValue());
    gs.info("Confidence: " + outcome.confidence());
});

MLPredictor - solution.getThreshold(String className)

Gets the solution threshold.

The threshold represents a percentage reflecting the minimum prediction accuracy.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>className</td>
<td>String</td>
<td>A specified categorical value of the solution output field</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Value of the threshold represented as a percentage between 0 and 100.</td>
</tr>
</tbody>
</table>

MLPredictor - solution.getVersion()

Gets the version of the active solution.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Version of the active solution</td>
</tr>
</tbody>
</table>

**MLPredictor - solution.isActive()**

Determines if the specified solution is active.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the solution is active, false otherwise</td>
</tr>
</tbody>
</table>

**MLPredictor - solution.predict(GlideRecord now_GR, Object threshold)**

Gets solution prediction results as an Outcome object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord of the solution input table</td>
</tr>
<tr>
<td>threshold</td>
<td>Object</td>
<td>Threshold value (solution level threshold for similarity, class level threshold for classification)</td>
</tr>
</tbody>
</table>
**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Prediction outcome result of the specified solution (var outcome = solution.predict(now_GR))</td>
</tr>
</tbody>
</table>

solutions.forEach(function(solution) {
    var outcome = solution.predict(current);
    /* Use this to set the field to the predicted value in the GlideRecord
    var fieldName = solution.getPredictedField();
    current[fieldName] = outcome.predictedValue();
    current.update();
    */
    gs.info("Predicted value: " + outcome.predictedValue())
    gs.info("Confidence: " + outcome.confidence())
});

**MLPredictor - solution.predictTopN(GlideRecord now_GR, Object topN)**

Returns a list of outcome objects up to the expected number of predictions. Maximum number 1000 predictions.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord of the solution</td>
</tr>
<tr>
<td>topN</td>
<td>Object</td>
<td>Expected number of predictions, any number over 1000 returns 1000 results</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of outcome objects in an array including GlideRecord, threshold, system ID, and expected number of predictions (topN object)</td>
</tr>
</tbody>
</table>

var isClassificationSolution = this.isClassificationSolution(solution);

//classification solution each class has different threshold
//therefore needs to get all the results from ml engine
if (applyThreshold && isClassificationSolution) {
    var maxClassificationTopN = 50;
}
outcomeArr = solution.predictTopN(now_GR, maxClassificationTopN);
}
else {
outcomeArr = solution.predictTopN(now_GR, topN);
}

if (outcomeArr === null) {
    // instead of returning null returning empty array
    return [];
}

**MLSolution - Global**

Provides methods for handling Predictive Intelligence predictions and retrieving solution objects for all capabilities: similarity, classification, and clustering).

The **MLSolution** API provides methods commonly used among all solution capabilities and methods unique to classification and clustering solutions.

- **Common methods used for all solution objects:**
  - `getCapability()`
  - `getVersion()`
  - `isActive()`
  - `predict()`

- **Methods only used for classification and regression solutions:**
  - `applyPrediction()`

- **Methods only used for clustering solutions:**
  - `getClusterAssignments()`
  - `getClusterForRecord()`
  - `getClusterInfo()`

The **MLSolution** API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the **sn_ml** namespace.

The methods in this object are instantiated using **MLSolutionFactory**.

**Related information**

- **MLSolutionUtil**
- REST API: Get predictions for multiple solutions
**MLSolution - applyPrediction(GlideRecord now_GR)**

Gets the prediction result for a classification solution and applies it to the input GlideRecord if the confidence value is higher than the threshold.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord object containing values on which to run a prediction and apply the results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the prediction was applied:</td>
</tr>
<tr>
<td></td>
<td>• true: Prediction applied</td>
</tr>
<tr>
<td></td>
<td>• false: Prediction rejected</td>
</tr>
</tbody>
</table>

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization");
var inputGR = new GlideRecord("incident");
inputGR.get("0ef47232db801300864adfea5e961912");
mlSolution.applyPrediction(inputGR);
```

**MLSolution - getCapability()**

Gets the capability information of a trained solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Type of trained solution. Possible values:</td>
</tr>
</tbody>
</table>
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Similarity</td>
<td></td>
</tr>
<tr>
<td>• Classification</td>
<td></td>
</tr>
<tr>
<td>• Clustering</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = 1;
options.top_n_per_cluster = 3;

if (mlSolution.getCapability() == 'clustering') {
    var results = mlSolution.getClusterAssignments(options);
    // pretty print JSON results
    gs.print(JSON.stringify(JSON.parse(results), null, 2));
}
```

### MLSolution - getClusterAssignments(Object options)

Gets assignments for a clustering solution.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. Values to use to narrow down the returned results by group and level within a clustering solution. Default: Return cluster memberships for all clusters.</td>
</tr>
<tr>
<td>options.group_by</td>
<td>String</td>
<td>Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group. This field provides the same grouping as options provided in the <strong>Use Group By</strong> check box in the <strong>Clustering Definition</strong> form. The information provided varies based on the</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>table selected in the Table field. For more information, see Create and train a clustering solution.</td>
</tr>
<tr>
<td>options.top_n_per_cluster</td>
<td>Number</td>
<td>Number of top results to receive for each cluster.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object    | JSON array containing cluster information in increasing order by cluster_id:  
- cluster_id: String. Unique cluster number within a solution of clusters.  
- rec_display_id: String. Record type and number.  
- rec_sys_id: String. Record sys_id.  
- group_by: If grouped, name of the segmentation field associated with this cluster. |

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = '1';
// returns top 3 results per cluster
options.top_n_per_cluster = 3;

var results = mlSolution.getClusterAssignments(options);
```

Output:

```json
[  
{"cluster_id":"1","rec_display_id":"Incident: INC0014483","rec_sys_id":"04e33e7adb401300864adfe4e961900"},
"group_by":"network"},
```
MLSolution - getClusterForRecord(GlideRecord now_GR)

Gets the cluster information for a clustering solution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>Name of the input GlideRecord.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The cluster_id from the Cluster Summary [ml_cluster_summary] table if the record belongs to a cluster. Empty string returns if the record does not belong to a cluster.</td>
</tr>
</tbody>
</table>

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("solution_name");
var now_GR = new GlideRecord('incident');
if (mlSolution.getCapability() == 'clustering') {
  var clusterId = mlSolution.getClusterForRecord(now_GR);
}
```

MLSolution - getClusterInfo(Object options)

Gets information for a specified clustering solution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. Narrows down the returned results by group and level within a clustering solution. Default: Return cluster memberships for all clusters.</td>
</tr>
<tr>
<td>options.group</td>
<td>String</td>
<td>Optional. Identifies the segmentation field for which to retrieve cluster memberships, for example, assignment_group.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>This field provides the same grouping as options provided in the <strong>Use Group By</strong> check box in the <strong>Clustering Definition</strong> form. The information provided varies based on the table selected in the <strong>Table</strong> field. For more information, see Create and train a clustering solution.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>JSON array containing cluster information in increasing order by cluster_id:</td>
</tr>
<tr>
<td></td>
<td>- cluster_id: String. Unique cluster number within a solution of clusters.</td>
</tr>
<tr>
<td></td>
<td>- cluster_quality: String. Number from 0 to 100. Higher numbers indicate higher cluster density.</td>
</tr>
<tr>
<td></td>
<td>- cluster_size: String. Number of records in a cluster.</td>
</tr>
<tr>
<td></td>
<td>- group_by: If grouped, name of the segmentation field associated with this cluster.</td>
</tr>
<tr>
<td></td>
<td>- cluster_concept: String. Set of words that describe the cluster in descending order of frequency.</td>
</tr>
</tbody>
</table>

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_x_global_clustering");

// configure optional parameters
var options = {};
options.group_by = 'network';
options.cluster_id = 1;

var results = mlSolution.getClusterInfo(options);
```

Output:
MLSolution - getVersion()

Gets the version of the active solution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Version of the active solution.</td>
</tr>
</tbody>
</table>

```javascript
var mlSolution = sn_ml.MLSolutionFactory.getSolution("solution_name");
var solutionVersion = mlSolution.getVersion();
```

MLSolution - isActive()

Determines if a solution is active.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the solution is active.</td>
</tr>
<tr>
<td></td>
<td>• true: Solution active</td>
</tr>
<tr>
<td></td>
<td>• false: Solution inactive</td>
</tr>
</tbody>
</table>

var mlSolution = sn_ml.MLSolutionFactory.getSolution("solution_name");

var isActive = mlSolution.isActive();

**MLSolution - predict(Object input, Object options)**

Gets the prediction results from the prediction server given a GlideRecord or an array of key-value pairs.

You can use this method to call prediction with multiple input records because GlideRecord is an iterator.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Object</td>
<td>GlideRecord or array of JSON objects containing field names and values as key-value pairs.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. JSON key-value pair with the following properties:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• top_n: Number. If provided, returns the top results, up to the specified number of predictions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>JSON object containing the prediction results sorted by sys_id or record_number.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• predictedValue: String.</td>
<td>Value representing the prediction result.</td>
</tr>
<tr>
<td>• predictedSysId: String.</td>
<td>The sys_id of the predicted value. Results can be from any table on which information is being predicted.</td>
</tr>
<tr>
<td>• confidence: Number.</td>
<td>Value of the confidence associated with the prediction. For example, 53.84.</td>
</tr>
<tr>
<td>• threshold: Number.</td>
<td>Value of the configured threshold associated with the prediction.</td>
</tr>
<tr>
<td>• detailedResults: Object.</td>
<td>Similarity solutions only. JSON key-value pair containing details about the matching text indices.</td>
</tr>
</tbody>
</table>

```
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization");

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("0ef47232db801300864adfe3e961912");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization");

// multiple GlideRecord input
var input = new GlideRecord("incident");
input.addQuery("sys_created_onONLast
    week@javascript:gs.beginningOfLastWeek()@javascript:gs.endOfLastWeek()");
input.query();

// configure optional parameters
var options = {};
```
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));

Output:

```javascript
{
  input_gr_sys_id1: [
    {
      predictedValue : xxx,
      predictedSysId : xx0,
      confidence : xxx,
      threshold : xxx,
      detailedResults : [.....]
    },
    {
      predictedValue : yyy,
      predictedSysId : xx1,
      confidence : xxx,
      threshold : xxx,
      detailedResults : [.....]
    }
  ],
  input_gr_sys_id2 : [
    {
      predictedValue : xxx,
      predictedSysId : xx0,
      confidence : xxx,
      threshold : xxx,
      detailedResults : [.....]
    }
  ],
  ...
}
```

var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization");

// key-value pairs input
var input = ["short_description":"my email is not working"],
(short_description:"need help with password");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));

**MLSolutionFactory - Global**

Factory class to get an MLSolution scriptable object.

The MLSolutionFactory API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace. For more information, see Predictive Intelligence.

For usage guidelines, refer to **MLSolutionFactory scriptable objects**.

**Related information**

- **MLSolution**
- **MLSolutionUtil**
- REST API: Get predictions for multiple solutions

**MLSolutionFactory - getSolution(String solutionName, Object options)**

Gets an MLSolution object for a specified solution name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solutionName</td>
<td>String</td>
<td>Name of the solution.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. options.version: If provided, creates MLSolution instance for provided version of solutionName.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td><strong>MLSolution</strong> object of the specified solution.</td>
</tr>
</tbody>
</table>
// basic usage
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization");

// using options.version parameter
var options = {};
options.version = 1;
var mlSolution = sn_ml.MLSolutionFactory.getSolution("ml_incident_categorization", options);

**MLSolutionResult - Global**

Provides methods for managing cluster information and members of a clustering solution. You can embed the results in business logic.

ℹ️ **Note:** This API has been deprecated and is intended to be removed in a future release. Refer to Using ML APIs for the most recent guidelines.

**MLSolutionResult - findActiveSolution(String solutionName)**

Returns the solution object.

This method only returns the solutions if the ml_solution definition and solution are active (that is, trained). For information, see Create and train a clustering solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solutionName</td>
<td>String</td>
<td>Name of the clustering ml_solution record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Clustering solution object for the specified solutionName if the ml_solution definition and solution is active, null otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var solutionName = 'ml_incident_assignment';
var MLS = new MLSolutionResult();
var solution = MLS.findActiveSolution(solutionName);
```
MLSolutionResult - getClusterAssignments(String solutionName, Object options)

Returns all members of a clustering solution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solutionName</td>
<td>String</td>
<td>Name of active cluster solution.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. Narrows down results by group and level.</td>
</tr>
<tr>
<td>options.segmentation_field</td>
<td>String</td>
<td>Optional. Identifies the segmentation field. This field provides the same grouping as the options provided via the &quot;Use Group By&quot; check box in the Clustering Solution Definitions table. Information provided varies by table selected in the Table field. For information, see Create and train a clustering solution.</td>
</tr>
<tr>
<td>options.cluster_id</td>
<td>String</td>
<td>Optional. The sys_id from the ml_cluster_summary table.</td>
</tr>
<tr>
<td>options.rec_sys_id</td>
<td>String</td>
<td>Optional. The sys_id from the table record the cluster solution is based on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of outcome objects including:</td>
</tr>
<tr>
<td></td>
<td>• segmentation – Field name by which to group data</td>
</tr>
<tr>
<td></td>
<td>• cluster_num – Unique cluster number within a solution of clusters (that is, label)</td>
</tr>
<tr>
<td></td>
<td>• rec_sys_id – The sys_id from the table record that the cluster solution is based on</td>
</tr>
<tr>
<td></td>
<td>• rec_display_id – Name of the record associated with the record sys_id.</td>
</tr>
</tbody>
</table>

The following example shows how to return all cluster members for a solution without setting values for the options object.

```javascript
var solutionName = "<Name_of_Active_Cluster_Solution>";
var solutionResult = new MLSolutionResult();
var outcome_array = solutionResult.getClusterAssignments(solutionName);
for (var i = 0; i < outcome_array.length; i++) {
  // Process each outcome object...
}
```
The following example shows how to return all cluster members for one record using options.rec_sys_id.

```javascript
var now_GR = new GlideRecord('incident');
now_GR.get('sys_id');

var solutionName = "solution_example";
var solutionResult = new MLSolutionResult();
var options = { "rec_sys_id": now_GR.getUniqueValue() };
var outcome_array = solutionResult.getClusterAssignments(solutionName, options);
for (var i = 0; i < outcome_array.length; i++) {
    gs.print(outcome_array [i].segmentation + ' ' + outcome_array [i].cluster_num + ' ' + outcome_array [i].rec_sys_id + ' ' + outcome_array [i].rec_display_id);
}
```

### MLSolutionResult - getClusterInfo(String solutionName, Object options)

Returns all outcome information for a clustering solution.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>solutionName</td>
<td>String</td>
<td>Name of active cluster solution.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. Narrows down results. Default: Return cluster memberships.</td>
</tr>
<tr>
<td>options.segmentation_field</td>
<td>String</td>
<td>Optional. Identifies the segmentation field. Information provided varies by table selected in the Table field. For information, see Create and train a clustering solution.</td>
</tr>
<tr>
<td>options.cluster_id</td>
<td>String</td>
<td>Optional. The sys_id from the ml_cluster_summary table.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of outcome objects including:</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• segmentation – Field name by which to group data</td>
<td></td>
</tr>
<tr>
<td>• cluster_num – Unique cluster number within a solution of clusters (that is, label)</td>
<td></td>
</tr>
<tr>
<td>• total_members – Number of records in cluster (that is, size)</td>
<td></td>
</tr>
<tr>
<td>• cluster_quality – Cluster quality percentile value</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var solutionName = "solution_example";
var solutionResult = new MLSolutionResult();
var outcome_array = solutionResult.getClusterInfo(solutionName);
for (var i = 0; i < outcome_array.length; i++) {
  gs.print(outcome_array[i].segmentation + ' ' + outcome_array[i].cluster_num + ' ' + outcome_array[i].total_members + ' ' + outcome_array[i].cluster_quality);
}
```

**MLSolutionResult - MLSolutionResult()**

Instantiates a new MLSolutionResult object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>

</table>

**MLSolutionUtil - Global**

The **MLSolutionUtil** API provides methods for getting Predictive Intelligence predictions.

The **MLSolutionUtil** API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the **sn_ml** namespace.

For more information, see **Using ML APIs**.

**Related information**

- MLSolution
- MLSolutionFactory
**MLSolutionUtil - MLSolutionUtil()**

Instantiates a new MLSolutionUtil object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
var mlSolutionUtil = new MLSolutionUtil();
```

**MLSolutionUtil - getPredictions(Object input, Array solutionNames, Object options)**

Gets predictions for one or more specified solutions.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Object</td>
<td>GlideRecord or array of JSON objects as key-value pairs.</td>
</tr>
<tr>
<td>solutionNames</td>
<td>Array</td>
<td>Array of solution names to retrieve predictions from.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional. JSON object key-value pair with the following properties:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• top_n: Number. If provided, returns the top results, up to the specified number of predictions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• apply_threshold: Boolean. Checks the threshold value for the solution and applies it to the result set. The threshold value is solution threshold for similarity or class-level threshold for classification. Default value is true.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• custom_results_filter: String. Similarity solutions only. Specifies the allowed set from which results are returned using an encoded query.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>Array</td>
<td>JSON key-value pair containing the prediction result grouped by solution name and sorted by sys_id or record_number.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• predictedValue: String. Value representing the prediction result.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• predictedSysId: String. The sys_id of the predicted value. Results can be from any table on which information is being predicted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• confidence: Number. Value of the confidence associated with the prediction. For example, 53.84.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• threshold: Number. Value of the configured threshold associated with the prediction.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• detailedResults: Object. Similarity solutions only. JSON key-value pair containing details about the matching text indices.</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var solutionNames = ['solution1', 'solution2'];

var input = new GlideRecord("incident");
input.get("0ef47232db801300864adfe5e961912");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var mlSolutionUtil = new MLSolutionUtil();
var results = mlSolutionUtil.getPredictions(input, solutionNames, options);

// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

**Output:**

```javascript
{
  solution1: {
    input_gr_sys_id1: {
      predictedValue : xxx,
      predictedSysId : xx0,
      confidence : xxx,
      threshold : xxx,
      detailedResults : [.....]
    }
  }
```
MobileDeepLinkGenerator - Global

Embed a link to a mobile app list or form applet.

Use this API in a global server-side script to create a link to a list or form applet within these apps:

- Now Mobile
- Mobile Agent app
- Mobile Onboarding
Note:
The Mobile Onboarding is being deprecated!

With the Now Platform Rome release in September 2021, we started phasing out support for the Mobile Onboarding. Customers may no longer activate it, and we are not offering enhancements or non-critical bug fixes. Mobile onboarding features are available in the Now Mobile app for HR Service Delivery.

For example, create a link from an email, push notification, or Virtual Agent conversation that opens a record or list of records in the app. The form or list only includes data that the user has access rights to view.

For an example of this API used in a push notification, see Configure push notification message content.

MobileDeepLinkGenerator - MobileDeepLinkGenerator(String clientType)
Instantiates a MobileDeepLinkGenerator object for a specific mobile app.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clientType</td>
<td>String</td>
<td>Name of the app to create a link to. Options include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• agent: Creates a link to a list or screen in the Mobile Agent app.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• request: Creates a link to a list or screen in the Now Mobile app.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• onboarding: Creates a link to a list or screen in the Mobile Onboarding.</td>
</tr>
</tbody>
</table>

Note:
The Mobile Onboarding is being deprecated!

With the Now Platform Rome release in September 2021, we started phasing out support for the Mobile Onboarding. Customers may no longer activate it, and we are not offering enhancements or non-critical bug fixes. Mobile onboarding features are available in the Now Mobile app for HR Service Delivery.
```javascript
var glide = new global.MobileDeepLinkGenerator('onboarding');

MobileDeepLinkGenerator - getScreenLink(String documentId, Object uiParams)
Create a link to a list applet.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>documentId</td>
<td>String</td>
<td>Sys ID of the applet record in the Applets [sys_sg_screen] table.</td>
</tr>
<tr>
<td>uiParams</td>
<td>Object</td>
<td>Optional. JSON object containing any URL parameters to include in the link.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Determine which URL parameters to include by inspecting the URL you want to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>link to. In general, URL parameters filter records in the list. For example,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>var param = {'&lt;company-sys-id&gt;': 'servicenow'}, where <code>&lt;company-sys-id&gt;</code> is</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the Sys ID of a company UI parameter from the UI Parameters [sys_sg_ui_parameter]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>table for a specific mobile screen.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Link to the mobile app list applet.</td>
</tr>
</tbody>
</table>

```javascript
var uiParams = {
    "b250294ab3c12300a0d56ad4c6a8dc8c": "servicenow",
    "7250294ab3c12300a0d56ad4c6a8dc90": "santa clara"
}

var deepLinkGenerator = new global.MobileDeepLinkGenerator("request");
var link = deepLinkGenerator.getScreenLink("a75df1920f2033001befa68ca8767e50", uiParams);

MobileDeepLinkGenerator - getFormScreenLink(String formScreenId, String tableName, String recordSysId)
Create a link to a form applet.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>formScreenId</td>
<td>String</td>
<td>Sys ID of the applet record in the Applets [sys_sg_screen] table.</td>
</tr>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table containing the record in the recordSysId parameter.</td>
</tr>
<tr>
<td>recordSysId</td>
<td>String</td>
<td>Sys ID of the record to open in the applet.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Link to the record in the mobile app form applet.</td>
</tr>
</tbody>
</table>

```javascript
var deepLinkGenerator = new global.MobileDeepLinkGenerator("agent");
var link = deepLinkGenerator.getFormScreenLink("<sys_id>", current.getTableName(),
current.getValue("sys_id");
```

## MonitorMIDServer - Global

Monitors MID servers using the heartbeat probe to check for MID servers that are down, sends heartbeat requests, and kills old heartbeat requests.

Use in a server script to monitor MID servers.

### MonitorMIDServer - killOldRequests()

If there are any heartbeat probe requests that haven’t been processed, cancels them so that they don’t accumulate when a MID server is down for a while.

## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var mmsv = new MonitorMIDServer();
mmsv.killOldRequests();

MonitorMIDServer - markDowners()
Marks any non-responding MID servers as being down, by determining when the most recent heartbeat was sent and finding all non-responding servers.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var mmsv = new MonitorMIDServer();
mmsv.markDowners();

MonitorMIDServer - monitor()
Performs the functions required for a scheduled MID server monitor cycle, including killing old requests, marking the MID servers that are down, and sending heartbeat requests to all servers.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var mmsv = new MonitorMIDServer();
mmsv.monitor();
**MonitorMIDServer - MonitorMIDServer()**

Creates an instance of MonitorMIDServer.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**MonitorMIDServer - sendHeartbeatRequests()**

Sends heartbeat requests to all MID servers and notes when by updating the server status record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var mmsv = new MonitorMIDServer();
mmsv.sendHeartbeatRequests();
```

**NameValuePairs - Global**

Converts between maps and strings representing the name/value pairs in the map.

The string form is: `<name> = <value>, <name> = <value, ... where <name> is a string name, optionally surrounded by double quotes (Microsoft-style), and <value> is a string value, also optionally surrounded by double quotes. The following are all examples of valid name/value strings:

- name = value
- name = "My Value", name = value
- "My Name = this" = "My Value", "My Value, all the time", name = value
- "My Name" = "This" "name"", name = value
In the third example, the quoted values contain equals and commas. In the fourth example, the quoted value contains a quote. Instances have the following properties initialized:

- map: the map (JavaScript object being used as a hashmap) form of the name/value pairs, with Microsoft-style quotes removed
- string: the string form of the name/value pairs, with Microsoft-style quoting.

Use with any server-side script where you need convert name/value pairs between maps and strings.

**NameValuePairs - mapToString()**

Produces `this.string` from `this.map`.

---

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

---

**NameValuePairs - NameValuePairs(String stringForm)**

Creates an instance of the class initialized with the specified string.

---

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stringForm</td>
<td>String</td>
<td>The values to use when creating the object.</td>
</tr>
</tbody>
</table>

---

**NameValuePairs - NameValuePairs(Object mapForm)**

Creates an instance of the class initialized with the specified hash map.

NameValuePairs - quotify(Object value)
If the specified value contains double quotes, equals, commas, or spaces, this method surrounds the value with double quotes and doubles up any enclosed double quotes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Object</td>
<td>The value to process</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value with added quotes.</td>
</tr>
</tbody>
</table>

NameValuePairs - stringToMap()
Produces this.map from this.string.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**NetwareHandler API - Global**
Implements an SNMP handler for Netware OS.
This handler is designed to be invoked by Classify.java as an interim step toward completely moving the SNMP sensors into JavaScript.

Use this API for SNMP classification.

**NetwareHandler - classifyAndIdentify()**

Classifies and identifies the SNMP device.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**Notify - Global**

The **Notify** API allows you to interact with Notify calls and SMS messages using scripts.

Access the global **Notify** class and its associated methods in the **SNC** namespace.

**Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)**

Calls the specified E.164-compliant telephone number.

In addition, this method can automatically add the specified phone number to a specified conference call.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>notifyPhoneNumber</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>------------------</td>
</tr>
<tr>
<td>toPhoneNumber</td>
</tr>
<tr>
<td>conferenceCall</td>
</tr>
<tr>
<td>userSysId</td>
</tr>
<tr>
<td>groupSysId</td>
</tr>
<tr>
<td>sourceRecord</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example illustrates how to initiate a call to another phone number.
This example illustrates how to initiate a call to list of telephone numbers and automatically join those numbers into a new conference call.

```
var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}
```

This example illustrates how to initiate a new conference call.

```
SNC.Notify.call('+15413970605', '+91406XXXXXXX', SNC.Notify.conferenceCall(), null, null, null);
```

This example illustrates how to initiate a new conference call using a user record.

```
var sysUserGr = new GlideRecord('sys_user');
sysUserGr.get('active conference sys id');

if (conferenceGr.isValid) {
    SNC.Notify.call('+15413970605', '+91406XXXXXXX', SNC.Notify.conferenceCall(),
    sysUserGr.getUniqueValue(), null, null);
}
```

This example illustrates how to initiate a new conference call with a user, group, and source record.

```
var sysUserGr = new GlideRecord('sys_user');
sysUserGr.get('active sys user sys id');

var sysUserGroupGr = new GlideRecord('sys_user_group');
sysUserGroupGr.get('active sys user group sys id');
```
var incidentGr = new GlideRecord('incident');
incidentGr.get('incident sys_id');

if (conferenceGr.isValid) {
    SNC.Notify.call('+15413970605', '+91406XXXXXXX',
    SNC.Notify.conferenceCall(),
    sysUserGr.getUniqueValue(),
    sysUserGroupGr.getUniqueValue(),
    incidentGr.getUniqueValue());
}

**Scoped equivalent**

To use the `call()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)`.

**Notify - conferenceCall(GlideRecord sourceRecord)**

Creates a new conference call GlideRecord.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
</tr>
<tr>
<td>Optional. Record that initiated the request to create the conference call. Used to populate the source and table fields on notify_conference_call record.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
</table>

var notify = new SNC.Notify();
var from = '+14041234567';
var participants = ['-31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
  var to = participants[i];
  notify.call(from, to, conferenceCall);
}

### Scoped equivalent

To use the `conferenceCall()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - conferenceCall(GlideRecord sourceRecord)`.

### Related reference

- **Notify - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)**
  - Resumes a call after it was put in a queue (on hold).
  - Use this method to resume calls that were put in a queue with the `queueCall()` method.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>callRecord</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

The following example shows how to reactivate a call that was put on hold.

```javascript
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');
if (notifyCallGr.isValid) {
```

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Scoped equivalent

To use the `dequeueCall()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - dequeueCall(GlideRecord callRecord)`.

`Notify - forwardCall(GlideRecord call, String destination, String dtmf)`
Forwards the specified call to a different call recipient.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call</td>
<td>GlideRecord or String</td>
<td>Notify call record or the telephony provider call ID, of the call to be forwarded.</td>
</tr>
<tr>
<td>destination</td>
<td>GlideRecord or String</td>
<td>Notify phone number record or an E.164-compliant phone number, of the caller to which to forward the call.</td>
</tr>
<tr>
<td>dtmf</td>
<td>String</td>
<td>Dual Tone - Multi Frequency (DTMF) code to send upon call connection.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to forward a call to another phone number.

```javascript
var callID = 'CA92374b5aa561dab476a7001db6026edc'; // Twilio Call ID
var phoneNumber = '+91406xxxxxxx';
var dtmfTones = null;

var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    SNC.Notify.forwardCall(notifyCallGr(or) callID, phoneNumber, dtmfTones)
}
```
Scoped equivalent

To use the `forwardCall()` method in a scoped application, use the corresponding scoped method: NotifyScoped - `forwardCall(GlideRecord call, String destination, String dtmf)`.

Notify - `getAvailableClients(String notifyNumber)`

Returns a list of client sessions that are available to receive calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyNumber</td>
<td>String</td>
<td>Valid Notify phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>GlideRecord from the <code>notify_client_session</code> table for the specified phone number. Returns &quot;0&quot; if there are no available client sessions.</td>
</tr>
</tbody>
</table>

The following example shows how to use the `getAvailableClients()` method to index into the `notify_client_session` table and then iterate across all available Notify clients.

```javascript
var clientSessionGr = SNC.Notify.getAvailableClients('+185xxxxxxxx');
// Here clientSessionGr is of type GlideRecord on 'notify_client_session' table.

var isLoggedinUserAvailable = false;
while (clientSessionGr.next()) {
    if (clientSessionGr.user == gs.getUserID())
        isLoggedinUserAvailable = clientSessionGr.available;
}
gs.info('isLoggedinUserAvailable - ' + isLoggedinUserAvailable);
```

Scoped equivalent

To use the `getAvailableClients()` method in a scoped application, use the corresponding scoped method: NotifyScoped - `getAvailableClients(String notifyNumber)`. 
**Notify - getParentCallID(GlideRecord callRecord)**

Returns the sys_id of a specified call’s parent call.

Any call started by forwarding another call, such as with the Forward workflow activity, is considered a child of the original call. The original call is the parent call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>Record on the Notify Call [notify_call] table for which to return the call status.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Unique sys_id of the parent call record.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the parent call of the specified call.

```javascript
var callRecord = new GlideRecord('notify_call');
callRecord.get("0f4f5863ff13310014ecffffff28");

var notify = new SNC.Notify();
var parentCallID = notify.getParentCallID(callRecord);
```

**Notify - getPhoneNumbers()**

Returns all phone numbers and short codes available to Notify.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List</td>
<td>List of NotifyPhoneNumber objects, each object representing one phone number available to Notify.</td>
</tr>
</tbody>
</table>
```
var list = SNC.Notify.getPhoneNumbers();
for (var i = 0; i < list.size(); i++) {
  var num = list.get(i);
  gs.info(num.getNumber())
}
```

**Scoped equivalent**

To use the `getPhoneNumbers()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - getPhoneNumbers()`.

**Notify - getTokens(GlideRecord, record)**

Returns client tokens for any active telephony drivers for use in WebRTC or mobile clients.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>GlideRecord</td>
<td>GlideRecord to use to identify the Notify client, such as a group record or a user record.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Web RTC tokens for the supported drivers, as a JSON string with the following format: {driverName1: “token1”, driverName2: “token2”}, such as “TwilioDirect”:“eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx”</td>
</tr>
</tbody>
</table>

This example shows how to obtain the client tokens for the currently logged in user.

```javascript
// get Notify client Tokens per active Notify driver for the currently logged in user
var json = new SNC.Notify().getTokens();

// Parse the JSON that was return into a tokens object
var tokens = JSON.parse(json);

// Log line
gs.log('Notify client tokens for the currently logged in user');

// iterate over the driver tokens
for (var driver in tokens) {
  // do something with tokens
} // end for
```

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
gs.log(driver + ' Driver token: ' + tokens[driver]);
}

This example shows how to obtain the client tokens for every Notify group.

```javascript
// instantiate Notify
var notify = new SNC.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
    // generate Notify Client tokens per active Notify Driver for this group
    var json = notify.getTokens(notifyGroup);
    var tokens = JSON.parse(json);

    for (var driver in tokens) {
        gs.log(gs.getMessage("Notify Client token for {0} driver and Notify Group '{1}': {2}",
            [driver, notifyGroup.getValue('name'), tokens[driver]]));
    }
}
```

**Scoped equivalent**

To use the `getTokens()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - getTokens(GlideRecord, record)`.

**Notify - getTokenTTL(String owner)**

Returns the maximum amount of time that a client session stays active for a specified telephony driver before automatically timing out.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>String</td>
<td>Name of the telephony driver for which to retrieve the session length.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Twilio: for the old driver</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• TwilioDirect: for the new driver</td>
</tr>
</tbody>
</table>

The following example shows how to properly call this method and the associated response. It also shows what is returned if an invalid driver is passed.

```javascript
var owner = "TwilioDirect";  // Valid driver
var ttl = SNC.Notify.getTokenTTL(owner);
gs.info("Token TTL for " + owner + " --> " + ttl);

owner = "Abcxyz";  // Invalid driver
ttl = SNC.Notify.getTokenTTL(owner);
// For an invalid driver, we throw NoSuchNotifyDriverException saying that Abcxyzdriver is not available
// and return the default value of TTL
gs.info("Token TTL for " + owner + " --> " + ttl);
```

### Scoped equivalent

To use the `getTokenTTL()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - getTokenTTL(String owner)`.

#### Notify - hasCapability(String notifyPhoneNumber, String capability)

Determines whether the specified phone number has the specified capability.

The telephony driver associated with the phone number contains a list of all of the capabilities of the phone.

**Note:** In the base system, the Notify JS driver only has 'show_speakers' as a capability; this can be modified.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>Phone number for which to check for the specified capability.</td>
</tr>
<tr>
<td>capability</td>
<td>String</td>
<td>Capability to detect. The string text must be an exact match to what is in the phone.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the specified phone has the specified capability.</td>
</tr>
<tr>
<td></td>
<td>• true: phone has the capability</td>
</tr>
<tr>
<td></td>
<td>• false: phone does not have the capability</td>
</tr>
</tbody>
</table>

This example shows how to check if a phone has a specific capability.

```javascript
// Each driver has a defined set of capabilities.

var capability = 'show_speakers';
gs.info(SNC.Notify.hasCapability('+185xxxxxxxx', capability)); // true

capability = 'send_sms';
gs.info(SNC.Notify.hasCapability('+185xxxxxxxx', capability)); // false
```

### Scoped equivalent

To use the `hasCapability()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - hasCapability(String notifyPhoneNumber, String capability)`.

### Notify - `kick(GlideRecord participant)`

Removes the specified caller from the current Notify conference call.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
</tr>
<tr>
<td></td>
<td>GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
The following example shows how to remove a participant from a conference call.

```javascript
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    SNC.Notify.kick(notifyParticipantGr);
}
```

**Scoped equivalent**

To use the `kick()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - kick(GlideRecord participant)`.

**Notify - modifyCall(GlideRecord callRecord, NotifyAction notifyAction)**

Performs one or more actions on an active Notify phone call.

Available actions that you can perform on calls include queuing or dequeueing the call, reading text, playing audio, or forwarding the call. You can also create custom actions. Call the `modifyCall()` method after you have specified all the actions that you want to apply to the specified call. Refer to the `NotifyAction` API documentation for more information about available actions.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>callRecord</code></td>
<td>GlideRecord</td>
<td>Notify Call [notify_call] record of the call for which to apply the actions.</td>
</tr>
<tr>
<td><code>notifyAction</code></td>
<td>NotifyAction</td>
<td>NotifyAction object describing one or more actions to perform on the call. Create this object by calling one or more of the <code>NotifyAction()</code> methods.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to modify a call.

```javascript
// get the most recent call record
var callRecord = new GlideRecord('notify_call');
```
callRecord.orderByDesc('sys_created_on');
callRecord.query();

if (callRecord.next()) {
    // instantiate notify action container class
    var notifyAction = new SNC.NotifyAction();
    // The call is already in progress. Now, we want to modify the call behavior by putting
    this call in a queue.
    // So, we add a queue action to queue the call
    notifyAction.addQueue('my fancy queue');

    // modify the call by passing in the above action, putting the call in a queue
    new SNC.Notify().modifyCall(callRecord, notifyAction);
} else {
    gs.log('no such call record');
}

**Scoped equivalent**

To use the modifyCall() method in a scoped application, use the corresponding
scoped method: NotifyScoped - modifyCall(GlideRecord callRecord, NotifyAction notifyAction).

**Notify - mute(GlideRecord participantRecord)**

Mutes the specified conference call participant.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord from the notify_participant table for the participant to mute.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to mute a caller.

```javascript
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');
```
if (notifyParticipantGr.isValid) {
    SNC.Notify.mute(notifyParticipantGr);
}

Scoped equivalent
To use the `mute()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - mute(GlideRecord participantRecord)`.

**Notify - queueCall(GlideRecord callRecord)**

Puts the specified call into a queue (on hold).

Resume a queued call using the `dequeueCall()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object of the Notify Call record (notify_call table) to put on hold.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to put a call on hold (in the queue).

```javascript
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');
if (notifyCallGr.isValid) {
    SNC.Notify.queueCall(notifyCallGr);
}
```

Scoped equivalent
To use the `queueCall()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - queueCall(GlideRecord callRecord)`.
**Notify - sendBulkSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumbers, String messageBody, GlideRecord source)**

Sends a specified SMS message to the specified list of Notify clients (phone numbers).

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>Notify phone number from which the SMS message is being sent.</td>
</tr>
<tr>
<td>toPhoneNumbers</td>
<td>String</td>
<td>Comma separated list of phone numbers to which to send the SMS message. Format: E.164</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>SMS text to send.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>Source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Null</td>
</tr>
</tbody>
</table>

The following example shows how to send a bulk SMS message.

```java
var incidentGr = new GlideRecord('incident');
incidentGr.get(active incident sys_id);
if (incidentGr.isValid()) {
   SNC.Notify.sendBulkSMS('+15413970605', ['+919885XXXXXX', '+919775XXXXXX'], 'Test automation message', incidentGr);
}
```

**Scoped equivalent**

To use the `sendBulkSMS()` method in a scoped application, use the corresponding scoped method: **NotifyScoped - sendBulkSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumbers, String messageBody, GlideRecord source)**.
Notify - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)

Sends an SMS text message to an E.164-compliant phone number.

This method creates a new record on the Notify Message [notify_message] table and associates it with the source record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>Notify phone number or short code to which to send this SMS message.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>E.164-compliant phone number to which to send the SMS message.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>Body of the SMS text message.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>Source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Unique message SID; stored in the Notify Message [notify_message] record as message_id.</td>
</tr>
</tbody>
</table>

The following example shows how to send an SMS message.

```javascript
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
    SNC.Notify.sendSMS('+15413970605', '+919885XXXXXX', 'Test automation message', incidentGr);
}
```

**Scoped equivalent**

To use the `sendSMS()` method in a scoped application, use the corresponding scoped method: NotifyScoped - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source).
Notify - unmute(GlideRecord participantRecord)

Unmutes the specified conference call participant.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord from the notify_participant table for the participant to unmute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to unmute a caller.

```javascript
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    SNC.Notify.unmute(notifyParticipantGr);
}
```

**Scoped equivalent**

To use the `unmute()` method in a scoped application, use the corresponding scoped method: `NotifyScoped - unmute(GlideRecord participantRecord)`.

**Notify - Scoped**

The `NotifyScoped` API allows you to interact with Notify calls and SMS messages using scripts.

Access the scoped `Notify` class and its associated methods from the `sn_notify` namespace.

`NotifyScoped - call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall, GlideRecord conferenceCallRecord, String userSysId, String groupSysId, GlideRecord sourceRecord)`

Calls the specified E.164-compliant telephone number.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>Notify phone number from which to make the call. When you initiate a call, the outgoing call workflow for the number group associated with this number runs. Ensure this workflow includes a <strong>join conference call</strong> activity to connect the user to the conference call.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>Phone number to call. Called numbers are added to the conference call.</td>
</tr>
<tr>
<td>conferenceCall</td>
<td>GlideRecord</td>
<td>Optional. If this parameter is passed in, the callers identified in the <strong>toPhoneNumber</strong> parameter are automatically joined into the conference call identified by this record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>GlideRecord for the Notify Call [notify_call] table which identifies the conference call record. This record is automatically added to the outgoing call workflow scratchpad as the workflow.scratchpad.conference_call variable.</td>
</tr>
<tr>
<td>userSysId</td>
<td>String</td>
<td>Optional. Unique identifier (sys_id) of the user associated with the call.</td>
</tr>
<tr>
<td>groupSysId</td>
<td>String</td>
<td>Optional. Unique identifier (sys_id) of the group associated with the call.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Optional. Source record that prompted this call.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example illustrates how to initiate a call to another phone number.
var from = '+14048007337';
var to = '+31646810495';

// set up call
new sn_notify.NotifyScoped().call(from, to);

This example illustrates how to initiate a call to a list of telephone numbers and automatically join those numbers into a new conference call.

var notify = new sn_notify.NotifyScoped();
var from = '+14041234567';
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

NotifyScoped - conferenceCall(GlideRecord sourceRecord)
Creates a new conference call GlideRecord.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Optional. Record that initiated the request to create the conference call. Used to populate the source and table fields on notify_conference_call record.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
var participants = ['+31612345678', '+31623456789', '+31687654321'];

// set up a conference call
var conferenceCall = notify.conferenceCall();

// set up the outbound calls for all conference call participants
for (var i in participants) {
    var to = participants[i];
    notify.call(from, to, conferenceCall);
}

**NotifyScoped - dequeueCall(GlideRecord callRecord)**
Resumes a call after it was put in a queue (on hold).

Use this method to resume calls that were put in a queue with the `queueCall()` method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object on the Notify Call [notify_call] table with the held call you want to resume.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to reactivate a call that was put on hold.

```javascript
var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    sn_notify.NotifyScoped.dequeueCall(notifyCallGr);
}
```

**NotifyScoped - forwardCall(GlideRecord call, String destination, String dtmf)**
Forwards the specified call to a different call recipient.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call</td>
<td>GlideRecord or String</td>
<td>Notify call record or the telephony provider call ID, of the call to be forwarded.</td>
</tr>
<tr>
<td>destination</td>
<td>GlideRecord or String</td>
<td>Notify phone number record or an E.164-compliant phone number, of the caller to which to forward the call.</td>
</tr>
<tr>
<td>dtmf</td>
<td>String</td>
<td>Dual Tone - Multi Frequency (DTMF) code to send upon call connection.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to forward a call to another phone number.

```javascript
var callID = 'CA92374b5aa561dab476a7001db6026edc'; // Twilio Call ID
var phoneNumber = '+91406xxxxxxx';
var dtmfTones = null;

var notifyCallGr = new GlideRecord('notify_call');
notifyCallGr.get('active participant sys id');

if (notifyCallGr.isValid) {
    sn_notify.NotifyScoped.forwardCall(notifyCallGr(or) callID, phoneNumber, dtmfTones)
}
```

**NotifyScoped - getAvailableClients(String notifyNumber)**

Returns a list of client sessions that are available to receive calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyNumber</td>
<td>String</td>
<td>Valid Notify phone number.</td>
</tr>
</tbody>
</table>
The following example shows how to use the getAvailableClients() method to index into the notify_client_session table and then iterate across all available Notify clients.

```javascript
var clientSessionGr = sn_notify.NotifyScoped.getAvailableClients('+185xxxxxxxx');
// Here clientSessionGr is of type GlideRecord on 'notify_client_session' table.

var isLoggedInUserAvailable = false;
while (clientSessionGr.next()) {
    if (clientSessionGr.user == gs.getUserID())
        isLoggedInUserAvailable = clientSessionGr.available;
}
gs.info('isLoggedInUserAvailable - ' + isLoggedInUserAvailable);
```

**NotifyScoped - getPhoneNumbers()**

Returns all phone numbers and short codes available to Notify.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List</td>
<td>List of NotifyPhoneNumber objects, each object representing one phone number available to Notify.</td>
</tr>
</tbody>
</table>

This example illustrates how to obtain the Notify phone numbers and then iterate over the list.

```javascript
// instantiate notify
var notify = new sn_notify.NotifyScoped();
```
// get all available phone numbers
var phoneNumber = notify.getPhoneNumber();

// iterate over phone numbers
for (var i = 0; i < phoneNumber.size(); i++) {
    var number = phoneNumber.get(i);

    // perform any actions using each phone number
}

**NotifyScoped - getShortCodes()**

Returns all short codes available to Notify.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example illustrates how to obtain the Notify short codes and then iterate over the list.

// instantiate notify
var notify = new sn_notify.NotifyScoped();

// get all available shortcodes
var shortCodes = notify.getShortCodes();

// iterate over phone numbers
for (var i = 0; i < shortCodes.size(); i++) {
    var shortCode = shortCodes.get(i);
    gs.log(shortCode.getNumber());
}
//perform any actions using each shortcode
}

**NotifyScoped - getTokens(GlideRecord, record)**

Returns client tokens for any active telephony drivers for use in WebRTC or mobile clients.

This method uses the currently logged-in user record as the client.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>GlideRecord</td>
<td>GlideRecord to use to identify the Notify client, such as a group record or a user record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Web RTC tokens for the supported drivers, as a JSON string with the following format: <code>{driverName1: “token1”, driverName2: “token2”}</code>, such as “TwilioDirect”:“eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx”</td>
</tr>
</tbody>
</table>

This example shows how to obtain the client tokens for the currently logged in user.

```javascript
// get Notify client Tokens per active Notify driver for the currently logged in user
var json = new sn_notify.NotifyScoped().getTokens();

// Parse the JSON that was return into a tokens object
var tokens = JSON.parse(json);

// Log line
gs.log('Notify client tokens for the currently logged in user');

// iterate over the driver tokens
for (var driver in tokens) {
    gs.log(driver + ' Driver token: ' + tokens[driver]);
}
```

This example shows how to obtain the client tokens for every Notify group.
// instantiate Notify
var notify = new sn_notify.NotifyScoped.Notify();

// get all Notify Groups
var notifyGroup = new GlideRecord("notify_group");
notifyGroup.query();

// iterate over all notify groups
while (notifyGroup.next()) {
    // generate Notify Client tokens per active Notify Driver for this group
    var json = notify.getTokens(notifyGroup);
    var tokens = JSON.parse(json);
    for (var driver in tokens) {
        gs.log(gs.getMessage("Notify Client token for {0} driver and Notify Group '{1}': {2}",
            [driver, notifyGroup.getValue('name'), tokens[driver]]));
    }
}

This example illustrates how to obtain the client tokens for the active telephony drivers.

var notify = new sn_notify.NotifyScoped();
var now_GR = new GlideRecord('sys_user');
if (now_GR.get(gs.getUserID())) {
    gs.info(notify.getTokens(now_GR));
}

Output:

{"TwilioDirect":"eyJhxxxx.eyJleHAiOiIxxxx.7fejxxx_mbLxxx"}

**NotifyScoped - getTokenTTL(String owner)**

Returns the maximum amount of time that a client session stays active for a specified telephony driver before automatically timing out.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>String</td>
<td>Name of the telephony driver for which to retrieve the session length. Valid values:</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Twilio</td>
<td></td>
<td>for the old driver</td>
</tr>
<tr>
<td>TwilioDirect</td>
<td></td>
<td>for the new driver</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>Maximum length of the session (in seconds).</td>
</tr>
<tr>
<td>Default:</td>
<td>1800 seconds</td>
</tr>
</tbody>
</table>

The following example shows how to properly call this method and the associated response. It also shows what is returned if an invalid driver is passed.

```javascript
var owner = "TwilioDirect";  // Valid driver
var ttl = SNC.Notify.getTokenTTL(owner);
gs.info("Token TTL for " + owner + " --> " + ttl);

owner = "Abcxyz";  // Invalid driver
ttl = SNC.Notify.getTokenTTL(owner);
// For an invalid driver, we throw NoSuchNotifyDriverException saying that Abcxyzdriver is not available
// and return the default value of TTL
gs.info("Token TTL for " + owner + " --> " + ttl);
```

**NotifyScoped - hasCapability(String notifyPhoneNumber, String capability)**

Determines whether the specified phone number has the specified capability.

The telephony driver associated with the phone number contains a list of all of the capabilities of the phone.

⚠️ **Note:** In the base system, the Notify JS driver only has 'show_speakers' as a capability; this can be modified.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>String</td>
<td>Phone number for which to check for the specified capability.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>String</td>
<td>Capability to detect. The string text must be an exact match to what is in the phone.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean| Flag that indicates whether the specified phone has the specified capability.  
  • true: phone has the capability  
  • false: phone does not have the capability |

This example shows how to check if a phone has a specific capability.

```javascript
// Each driver has a defined set of capabilities.

var capability = 'show_speakers';
gs.info(sn_notify.NotifyScoped.hasCapability('+185xxxxxxxx', capability)); // true

capability = 'send_sms';
gs.info(sn_notify.NotifyScoped.hasCapability('+185xxxxxxxx', capability)); // false
```

**NotifyScoped - kick(GlideRecord participant)**

Removes the specified caller from the current Notify conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to remove a participant from a call.

```javascript
var participant = new GlideRecord('notify_participant');
participant.get('<sys_id>');
if (participant.isValid()) {
    new sn_notify.NotifyScoped().kick(participant);
}
```

**NotifyScoped - modifyCall(GlideRecord callRecord, NotifyAction notifyAction)**

Performs one or more activities on an active Notify phone call.

Use this method to change the behavior of a call. For example, transferring a call, playing audio, or forcing a hangup.

⚠️ **Note:** The scoped implementation of this method only supports custom Notify activities. Unlike the global implementation, it does not provide a NotifyAction API. For details on how to create a custom Notify activity, see Notify workflow activities.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>Notify Call [notify_call] record of the call for which to apply the actions.</td>
</tr>
<tr>
<td>notifyAction</td>
<td>NotifyAction</td>
<td>NotifyAction object describing one or more activities to perform on the call.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**NotifyScoped - mute(GlideRecord participantRecord)**

Mutes the specified conference call participant.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord from the notify_participant table for the participant to mute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to mute a caller.

```javascript
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    sn_notify.NotifyScoped.mute(notifyParticipantGr);
}
```

**NotifyScoped - queueCall(GlideRecord callRecord)**

Puts the specified call into a queue (on hold).

Resume a queued call using the `dequeueCall()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object of the Notify Call record (notify_call table) to put on hold.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var call = new GlideRecord('notify_call');
call.get('<call record sys_id>');
```
if (call.isValid()) {
    new sn_notify.NotifyScoped().queueCall(call);
}

NotifyScoped - sendBulkSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumbers, String messageBody, GlideRecord source)

Sends a specified SMS message to the specified list of Notify clients (phone numbers).

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>Phone number from which the SMS message is being sent.</td>
</tr>
<tr>
<td>toPhoneNumbers</td>
<td>String</td>
<td>Comma separated list phone numbers to which to send the SMS message. Format: E.164-compliant</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>SMS text to send.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>Source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Null</td>
</tr>
</tbody>
</table>

This example shows how to send an SMS message to multiple phone numbers (bulk SMS).

```java
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
    sn_notify.NotifyScoped.sendBulkSMS('+15413970605', ['+919885XXXXXX', '+919775XXXXXX'],
    'Test automation message', incidentGr);
}
```
NotifyScoped - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody, GlideRecord source)

Sends an SMS text message to an E.164-compliant phone number.

This method creates a new record on the Notify Message [notify_message] table and associates it with the source record.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>Notify phone number or short code to which to send this SMS message.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>E.164-compliant phone number to which to send the SMS message.</td>
</tr>
<tr>
<td>messageBody</td>
<td>String</td>
<td>SMS text message.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>Source record that prompted this SMS message, such as an incident.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Unique message SID; stored in the Notify Message [notify_message] record as message_id.</td>
</tr>
</tbody>
</table>

The following example shows how to send an SMS message.

```java
var incidentGr = new GlideRecord('incident');
incidentGr.get('active incident sys_id');
if (incidentGr.isValid()) {
    sn_notify.NotifyScoped.sendSMS('+15413970605', '+919885XXXXXX', 'Test automation message', incidentGr);
}
```

NotifyScoped - unmute(GlideRecord participantRecord)

Unmutes the specified conference call participant.
This example shows how to unmute a specified call participant.

```javascript
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    sn_notify.NotifyScoped.unmute(notifyParticipantGr);
}
```

**NotifyAction - Global**

The `NotifyAction` API allows you to define actions to send to a telephony provider.

You add actions to a `NotifyAction` object by calling the respective add function for each type of action. Each add function returns an Action object, such as a `SayAction` object for the `addSay()` function. Refer to each method example for information about returned objects.

⚠️ **Note:** The `NotifyAction` API is only valid within global applications. To utilize this type of functionality within scoped applications, you must create custom Notify workflow activities. For additional information on creating these activities, see Notify workflow activities.

**NotifyAction - addConference()**

Adds a conference action to move the current call into the current conference call.

---

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord from the notify_participant table for the participant to unmute.</td>
</tr>
</tbody>
</table>
This example demonstrates how to add a conference action and set the name of the conference.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set its name
var conference = notifyAction.addConference();
conference.setName('Brown Bag: Week 3');
```

**NotifyAction - addConference.setEndOnExit(Boolean endOnExit)**

Defines whether the conference call should end when a specified caller exits the conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| endOnExit | Boolean | Flag that indicates whether the conference call should end when the specified caller exits the current conference call.  
  • true: end the conference call when the specified caller exits the conference call  
  • false: Default. End the conference call once all participants exit |
This example demonstrates how to add a conference call action and then set it so the conference call ends when the specified caller exits.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the caller that starts the meeting
var conference = notifyAction.addConference();

// retrieve the participant for which the conference call should exit when they leave
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');
if (notifyParticipantGr.isValid) {
    conference.setEndOnExit(true);
}
```

**NotifyAction - addConference.setHangupOnStar(Boolean hangupOnStar)**

Defines whether the conference call should end when a participant presses the star (*) key.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| hangupOnStart | Boolean | Flag that indicates whether the conference call should end when a participant presses the star (*) key. Valid values:  
• true: end the conference call  
• false: Default. Don't end the conference call |
This example demonstrates how to add a conference action and then record the conference call.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the hang up action
var conference = notifyAction.addConference();
conference.setHangupOnStar(true);
```

**NotifyAction - addConference.setMuted(Boolean muted)**

Defines whether the specified caller should be muted in the current conference call.

If you do not call this method, the caller is not muted by default.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>muted</td>
<td>Boolean</td>
<td>Flag that indicates whether the specified caller should be muted in the current conference call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: caller should be muted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Default. Caller should not be muted</td>
</tr>
</tbody>
</table>

This example demonstrates how to add a conference action and then mute a specified caller.

```
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();
```
// add a conference call action and set it to mute the specified participant
var conference = notifyAction.addConference();

var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');

if (notifyParticipantGr.isValid) {
    conference.setMuted(true);
}

**NotifyAction - addConference.setName(String name)**

Sets the name of the current conference call to the specified name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name to associate with the current conference call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to add a conference action and set the name of the conference call.

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set its name
var conference = notifyAction.addConference();
conference.setName('Brown Bag: Week 3');

**NotifyAction - addConference.setRecord(Boolean record)**

Defines whether the associated conference call should be recorded.

If you do not call this method, the conference call is not recorded by default.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>Boolean</td>
<td>Flag that indicates whether the current conference call should be recorded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: start recording the conference call</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Default. Conference call is not recorded. Recording is stopped if it is currently being recorded.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to add a conference action and then record the conference call.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set it to be recorded
var conference = notifyAction.addConference();
conference.setRecord(true);
```

**NotifyAction - addConference.setStartOnEnter(Boolean startOnEnter)**

Defines whether the conference call should start when the specified caller joins the conference call.

By default, whenever there are two or more callers, the conference call starts. To make it so the conference call only starts when a specific caller joins, you must call this method for each of the other callers and set the value to “false”. By doing this, the conference call will not start until the desired person joins the conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startOnEnter</td>
<td>Boolean</td>
<td>Flag that indicates whether the conference call should start when the selected caller joins the current conference call.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• true: Default. Start the conference call when the specified caller joins the conference call.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• false: Start the conference call once it is added</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to add a conference action and then set it so the conference call does not start until the specified caller joins.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a conference call action and set the caller that starts the meeting
var conference = notifyAction.addConference();

// retrieve the participant for which the conference call should start when they arrive
var notifyParticipantGr = new GlideRecord('notify_participant');
notifyParticipantGr.get('active participant sys id');
if (notifyParticipantGr.isValid) {
  conference.setStartOnEnter(true);
}
```

NotifyAction - addDial()

Forwards a call to a specified phone number or Notify Client.

Once the addDial action is created, the associated phone number (setPhoneNumber()) or Notify Client (setClientRecord()) must also be set.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to make an outbound call and record the call.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Invoke setRecord(Boolean record) to record the call to this new number +919765xxxxxxx
dialAction.setRecord(true);
```

**NotifyAction - addDial.setCallerID(String callerID)**

Defines the caller ID for the outgoing call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callerID</td>
<td>String</td>
<td>Caller identifier to set for the outgoing call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to make an outbound call and set a call timeout.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();
```
// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Set the caller ID
dialAction.setCallerID('Planning Conf Call');

### NotifyAction - addDial.setClientRecord(String tableName, String sysID)

Sets the current caller to a Notify caller by specifying the table in which to find the Notify caller record and the caller's unique identifier.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table that contains the desired caller's information.</td>
</tr>
<tr>
<td>sysID</td>
<td>String</td>
<td>Unique identifier (sys_id) of the desired Notify caller.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set the current caller to a Notify caller using setClientRecord().

// set up a dial action to forward the call to the specified client
var action = new SNC.NotifyAction();
var dial = action.addDial();
dial.setClientRecord(notifyClientRecord.getTableName(),
    notifyClientRecord.getUniqueValue());
dial.setTimeout(activity.vars.timeout);
dial.setRecord(activity.vars.record);

### NotifyAction - addDial.setDTMF(String value)

Defines the DTMF tones to play when the call connects.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>Valid DTMF digits to play when the call connects.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to make an outbound call and defines the DTMF tones to play when the call connects.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// DTMF tones to play when call connects
dialAction.setDTMF("1246AF");
```

### NotifyAction - addDial.setHangupOnStar(Boolean hangupOnStar)

Defines whether the call should end when the star (*) key is pressed.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hangupOnStar</td>
<td>Boolean</td>
<td>Flag that indicates whether the call should end when the star (*) key is pressed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: end the call</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: don’t end the call</td>
</tr>
</tbody>
</table>
This example shows how to make an outbound call and set the hang up key to star.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// End call by pressing star
dialAction.setHangupOnStar(true);
```

**NotifyAction - addDial.setPhoneNumber(String phoneNumber)**

Defines the phone number to call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>E.164-compliant phone number to call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to make an outbound call and set a call timeout.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();
```
// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to
dial
dialAction.setPhoneNumber('+919765xxxxxxx');

**NotifyAction - addDial.setRecord(Boolean record)**

Defines whether the outgoing call should be recorded.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record</td>
<td>Flag</td>
<td>Flag that indicates whether the outgoing call should be recorded. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: record the outgoing call</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: do not record the outgoing call</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to make an outbound call and record the call.

// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to
dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Record the call
dialAction.setRecord(true);

**NotifyAction - addDial.setTimeout(Integer timeout)**

Sets the number of seconds after which the outgoing call times out.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Integer</td>
<td>Number of seconds after which the outgoing call times out. Default: 30</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to make an outbound call and set a call timeout.

```java
// Initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Call addDial() to connect to another party - this returns an object of type DialAction
var dialAction = notifyAction.addDial();

// Call setPhoneNumber(String phoneNumber) in DialAction.java to specify the phone number to dial
dialAction.setPhoneNumber('+919765xxxxxxx');

// Set the number of seconds to wait before timing out
dialAction.setTimeout(45);
```

### NotifyAction - addGather()

Presents a specified interactive phone menu to the caller.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GatherAction</td>
<td>Action added to the NotifyAction object. Use the GatherAction object to define the menu settings and options to present to the user.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1);    // the user can type 1 digit
gather.setFinishKey('*');       // # or *, useful for > 1 digit
gather.setTimeout(10);          // time to enter answer, in seconds

// add first menu item
var usSay = gather.addSay();
usSay.setText('Press 1 for english');
usSay.setLanguage('en-US');

// add second menu item
var nlSay = gather.addSay();
nlSay.setText('Kies 2 voor Nederlands');
nlSay.setLanguage('nl-NL');

// add third menu item
var frSay = gather.addSay();
frSay.setText('Choisissez 3 pour le français. ');
frSay.setLanguage('fr-FR');

// and finish off with an applause
var play = gather.addPlay();
```

**NotifyAction - addGather.addPlay()**

Plays an audio file on the call.

Refer to the NotifyAction addPlay() method for a description of the supported child methods.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlayAction</td>
<td>Action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and the number of times to loop the audio.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction var notifyAction = new SNC.NotifyAction();

// Create the gather action object var gather = notifyAction.addGather();

// Play an audio file var play = gather.addPlay();
play.setURL('http://www.wavsource.com/snds_2015-04-12_5971820382841326/sfx/applause_y.wav');
```

**NotifyAction - addGather.addSay()**

Defines the text-to-speech to read on the call.

Refer to the NotifyAction `addSay()` method for a description of the supported child methods.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SayAction</td>
<td>Action added to the NotifyAction object. Use the SayAction object to define the text and language to read.</td>
</tr>
</tbody>
</table>
```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(1);  // the user can type 1 digit
gather.setTimeout(20);       // time to enter answer, in seconds

// add first menu item
var gatherSay = gather.addSay();
gatherSay.setText('Press 1 for english');
gatherSay.setLanguage('en-US');
```

**NotifyAction - addGather.setFinishKey(String finishKey)**

Defines the key that the caller inputs to denote the end of their input.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>finishKey</td>
<td>String</td>
<td>Key that denotes the end of caller input.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0-9</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• # (default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• *</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to add a gather action and define the key that denotes the end of the caller input.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);  // the user can type four digit
gather.setFinishKey('#');    // # or *, useful for > 1 digit
```
**NotifyAction - addGather.setNumberOfDigits(Integer numberOfDigits)**

Defines the number of digits to collect.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numberOfDigits</td>
<td>Integer</td>
<td>Number of digits to collect. Zero is an invalid value.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to add a gather action and define the number of key strokes to collect.

```java
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);    // the user can type four digit
gather.setFinishKey('#');       // # or *, useful for > 1 digits
gather.setTimeout(20);          // time to enter answer, in seconds
```

**NotifyAction - addGather.setTimeout(Integer timeout)**

Defines the amount of time after which gathering of input will timeout.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Integer</td>
<td>Number of seconds to wait for caller input before timing out. Default: 10</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to add a gather action and define the input timeout value.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// present the user with a menu
var gather = notifyAction.addGather();
gather.setNumberOfDigits(4);    // the user can type 1 digit
gather.setFinishKey('#');       // # or *, useful for > 1 digits
gather.setTimeout(20);          // time to enter answer, in seconds
```

**NotifyAction - addHangUp()**

Ends an active phone call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HangUpAction</td>
<td>Action added to the NotifyAction object.</td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// hang up
notifyAction.addHangUp();
```

**NotifyAction - addQueue()**

Queues the call, which puts the call on hold.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QueueAction</td>
<td>Action added to the NotifyAction object. Use the QueueAction object to define the queue name, and queueing or dequeueing behavior.</td>
</tr>
</tbody>
</table>

This example shows how to add the call to the specified queue.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');
```

This example shows how to remove the call from the queue.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

**NotifyAction - addQueue.setDequeue(Boolean dequeue)**

Removes the call from the current call queue (takes it off of "hold").

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dequeue</td>
<td>Boolean</td>
<td>Flag that indicates whether to remove the current call from the queue.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: remove the call from the queue</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: call is put in the queue</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to remove the call from the queue.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// dequeue the call
var queue = notifyAction.addQueue();
queue.setDequeue(true);
```

### NotifyAction - addQueue.setName(String name)

Defines the name associated with a queue.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name to associate with the queue.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to define the name of a queue.

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// queue the call
var queue = notifyAction.addQueue();
queue.setName('my queue');
```

### NotifyAction - addPlay()

Plays an audio file on the call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>PlayAction</td>
<td>Action added to the NotifyAction object. Use the PlayAction object to define the audio file URL and number of times to loop the audio.</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);
```

**NotifyAction - addPlay.setLoop(Integer loop)**

Defines the number of times to play (loop through) the audio file.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>loop</td>
<td>Integer</td>
<td>Number of times to play the audio file.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(2);
```

**NotifyAction - addPlay.setURL(String url)**

Defines the URL where to obtain the audio file to play.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>URL of the audio file to play.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a play action
var play = notifyAction.addPlay();
play.setURL('http://www.moviesounds.com/2001/imsorry.wav');
play.setLoop(1);```

#### NotifyAction - addRecord()

Adds an action to record the call to the current NotifyAction object.

The recording automatically ends when the call is completed or when a specified terminate is pressed (`setFinishKey()`). The recording is then placed in the notify_record table for the associated call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to record a call.

```javascript
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();```
// Call addRecord() of NotifyAction - This returns an object of type RecordAction
var recordAction = notifyAction.addRecord();

// Optional. Define the key that callers use to stop the recording
recordAction.setFinishKey('#'); // Stop the call recording when caller presses the '#' key.

**NotifyAction - addRecord.setFinishKey(String finishKey)**

Defines the key that terminates the recording.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>finishKey</td>
<td>String</td>
<td>Key that terminates the recording.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 0-9</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• # (default)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• *</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to record a call and set the call termination key.

```javascript
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the key that terminates the recording
recordAction.setFinishKey('#'); // This means that we stop the call recording when user
                                  // presses the '#' key.
```

**NotifyAction - addRecord.setMaxDuration(Integer seconds)**

Defines the maximum length of the recording.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Integer</td>
<td>Maximum length of the recording in seconds. Default: 3600</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to record a call and set the call termination key.

```javascript
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();

// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the maximum length of the recording
recordAction.setMaxDuration(4800);
```

**NotifyAction - addRecord.setTimeout(Integer timeout)**

Sets the number of seconds of silence, after which, the recording ends.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Integer</td>
<td>Number of seconds of silence on the call, after which the recording ends. Default: 10</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates how to record a call and set the recording timeout value.

```javascript
// First we initialize NotifyAction
var notifyAction = new SNC.NotifyAction();
```
// Then we call addRecord() of NotifyAction
var recordAction = notifyAction.addRecord();

// Set the recording timeout value
recordAction.setTimeout(360);

**NotifyAction - addReject()**

Rejects an incoming call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RejectAction</td>
<td>Action added to the NotifyAction object. Use the RejectAction object to define the reason for rejecting the call.</td>
</tr>
</tbody>
</table>

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'

**NotifyAction - addReject.setReason(String reason)**

Defines the reason why the call was rejected.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>String</td>
<td>Reason why the call was rejected. Valid values:</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• busy</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• rejected</td>
<td></td>
<td>All other values are ignored.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// reject the call
var rejectAction = notifyAction.addReject();
rejectAction.setReason('busy'); // 'busy' or 'rejected'
```

**NotifyAction - addSay()**

Defines the text-to-speech to read on the call.

Multiple languages are supported with text-to-speech. Available languages depend on the telephony provider.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SayAction</td>
<td>Action added to the NotifyAction object. Use the SayAction object to define the text and language to read.</td>
</tr>
</tbody>
</table>

This example demonstrates reading text in several languages.
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak English');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kann auch deutsch sprechen');
deSay.setLanguage('de-DE');

**NotifyAction - addSay.setLanguage(String language)**

Defines the language in which to speak the text.

Use this method in conjunction with the `setText()` method to define the verbiage to speak.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>String</td>
<td>ISO 3166 language code that defines the language in which to speak the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>associated text. For example, &quot;en-US&quot; or &quot;nl-NL&quot;.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates reading text in several languages.

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
notifyAction.addSay().setText('Welcome. I can speak english');
notifyAction.addSay().setText('Ik spreek ook vloeiend nederlands');
notifyAction.addSay().setText('Und ich kan auch deutsch sprechen');

**NotifyAction - addSay.setText(String text)**

Defines the text to be read within the current call.

Use this method in conjunction with the setLanguage() method to define the language in which to speak the provided text.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>Text to read aloud within the current call.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates reading text in several languages.

// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// add a say action to say something in US English
var usSay = notifyAction.addSay();
usSay.setText('Welcome. I can speak english');
usSay.setLanguage('en-US');

// add a say action to say something in Dutch
var nlSay = notifyAction.addSay();
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kan auch deutsch sprechen');
deSay.setLanguage('de-DE');
nlSay.setText('Ik spreek ook vloeiend nederlands');
nlSay.setLanguage('nl-NL');

// and german
var deSay = notifyAction.addSay();
deSay.setText('Und ich kann auch deutsch sprechen');
deSay.setLanguage('de-DE');

### NotifyAction - addSMS()

**Sends an SMS message.**

ℹ️ **Note:** When using this function with an active call, you do not need to call the `setTo` function on the returned SMSAction object. The SMS is automatically sent to the caller.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMSAction</td>
<td>Action added to the NotifyAction object. Use the SMSAction object to define the message text and the phone number to which to send the message.</td>
</tr>
</tbody>
</table>

// Instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// Define where to send the SMS to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// Add an SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit.');
sms.setTo(number);
**NotifyAction - addSMS.setMessage(String message)**

Defines the text of the SMS message to send.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Text of the SMS message to send.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit.');
sms.setTo(number);
```

**NotifyAction - addSMS.setTo(String to)**

Sets the phone number to which to sent the SMS message.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to</td>
<td>String</td>
<td>E.164-compliant phone number to which to send the SMS message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
// instantiate NotifyAction
var notifyAction = new SNC.NotifyAction();

// define where to send the sms to
var number = new GlideElementPhoneNumber();
number.setPhoneNumber('+31612345678', true);

// add a SMS action
var sms = notifyAction.addSMS();
sms.setMessage('Lorem ipsum dolor sit amet, consectetur adipiscing elit.');</sms.setTo(number);

NotifyAction - append(NotifyAction action)

Appends the specified NotifyAction object to the current client's NotifyAction object.

There are two types of NotifyActions: terminal and non-terminal. Once you append a terminal action to a client's NotifyAction object, you cannot append any additional actions. Non-terminal actions include:

- PlayAction
- RecordAction
- SayAction
- SMSAction

All others NotifyActions are terminal. If you try to add another NotifyAction after a terminal action, the call will fail.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>NotifyAction</td>
<td>NotifyAction object to append to the NotifyAction object of the current caller.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
NotifyAction - fromJson(String json)

Deserialize a NotifyAction object from a JSON string.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>json</td>
<td>String</td>
<td>A JSON string representation of a NotifyAction object.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates deserializing a NotifyAction object.

```javascript
var json = ".... some json obtained from toJs...";

// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// deserialize and reconstruct the notify action instance
notifyAction.fromJson(json);
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);
```
// serialize the new object and log the result
newJson = newAction.toJson();
gs.log('new serialization result: ' + newJson);
gs.log('the same: ' + (json == newJson));

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]}
*** Script: new serialization result: {"fClassName":"NotifyAction","fActions": [{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]}
*** Script: the same: true

**NotifyAction - setCallRecord(GlideRecord callRecord)**

Defines the Notify call record in which to add subsequent actions.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callRecord</td>
<td>GlideRecord</td>
<td>GlideRecord containing the record of the caller (within the notify_call table) for which to add actions. This caller stays in affect until this method is called again with a different caller.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set the caller to which you want to add actions.

```java
public NotifyAction runIncomingCallWorkflow(NotifyPhoneNumber notifyPhoneNumber,
   GlideRecord callRecord) throws NoWorkflowConfiguredException,
   NoSuchNotifyGroupRecordException {
    NotifyAction notifyAction = runWorkflow(notifyPhoneNumber, COL_INCOMING_CALL_WF,
       callRecord);
    notifyAction.setCallRecord(callRecord);
    return notifyAction;
}
```

**NotifyAction - toJson()**

Serialize the NotifyAction object to a JSON string.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>JSON representation of this NotifyAction object.</td>
</tr>
</tbody>
</table>

This example demonstrates serializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add one or more notify actions
// ...

// and serialize to json
var json = notifyAction.toJson();
```

This example demonstrates both serializing and deserializing a NotifyAction object.

```javascript
// instantiate notify action
var notifyAction = new SNC.NotifyAction();

// add a queue
var queue = notifyAction.addQueue();
queue.setName('myQueueName');
queue.setDequeue(false);

// serialize to json
var json = notifyAction.toJson();
gs.log('serialization result: ' + json);

// instantiate a new notify action
var newAction = new SNC.NotifyAction();

// deserialize the json generated above
newAction.fromJson(json);

// serialize the new object and log the result
```
newJson = newAction.toJson();

gs.log('new serialization result: ' + newJson);

gs.log('the same: ' + (json == newJson));

Output: *** Script: serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]}

*** Script: new serialization result: {"fClassName":"NotifyAction","fActions":[{"fClassName":"QueueAction","fDequeue":true,"fQueueName":"myQueueName"}]}

*** Script: the same: true

**NotifyClient - Client**

The NotifyClient API allows you use Notify telephony functionality, such as making and receiving calls, from a web browser.

Several NotifyClient methods take a callback function as a parameter. Because NotifyClient calls are made asynchronously, these methods cannot return a value directly. Use the callback function to parse the returned data, such as by assigning variables or making other API calls.

**NotifyClient - addEventListener(String event, Function fn)**

Registers an event handler to listen for changes in a Notify client.

Using this method you can register multiple listeners. Each listener must be a separate method call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>String</td>
<td>Name of the event to listen for. Instead of passing strings, use the constants defined in SNC.Notify.STD_EVENTS.</td>
</tr>
</tbody>
</table>

- **CALL_START**: call has started and is in progress.
- **CALL_CANCEL**: caller canceled the call.
- **CALL_INIT**: WebRTC connected to a call (incoming or outgoing).
- **CALL_DISCONNECT**: current call has been disconnected.
- **ERROR**: Error occurred. Parameters: message(string), errCode(string)
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ message</td>
<td></td>
<td>error message to display.</td>
</tr>
<tr>
<td>◦ errCode</td>
<td></td>
<td>Optional. Associated error code.</td>
</tr>
</tbody>
</table>

• INCOMING_CALL: Call is coming in. Parameters: from(string), to(string), callId(string), parentId(string), sysId(string), isFromClient(boolean)
  ◦ from: Caller's phone number.
  ◦ to: called phone number.
  ◦ callId: SID of the call.
  ◦ parentId: parent notify_call reference. If skipParentId is set to true, this parameter should not be passed.
  ◦ sysId: WebRTC-to-WebRTC calls only. Unique identifier (sys_id) of the caller.
  ◦ isFromClient: WebRTC-to-WebRTC calls only. Flag that indicates whether the call is from another WebRTC client.

• CALL_MUTE: client is muted.
• CALL_UNMUTE: client is unmuted.
• OFFLINE: WebRTC session is not active.
• ONLINE: WebRTC session is ready. Must be set after calling the init() method.

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>Function to use to de-register a listener.</td>
</tr>
</tbody>
</table>

This example shows how to register multiple listeners.

```javascript
jQuery(function () {

  var notifyConfig = {
    autoLoadScriptResources: true // This will take care of auto loading the JS resources needed by the client (if any)
  };
```

var client = new SNC.Notify.Client(notifyConfig, true); // The second argument ensures that the proper client for the given number is auto determined
client.setCallerId('valid_notify_long_number', function () {
    // This is called after the client has been determined.

    if (!notifyConfig.vendor) // Means this number has no compatible client
        return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE, function () {
        // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE, function () {
        // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR, function (msg, code) {
        // Some error happened
    });
    //... register other event handlers here

    client.init(); // This is important to call this.
});
});

This example shows how to de-register a listener.

var dereg = notifyClient.addEventListener(SNC.Notify.STD_EVENTS.ONLINE, function () {
    ...
});
dereg();
// The event listener function is no longer triggered.

NotifyClient - call(Object identifier)
Calls the specified phone number or the phone number associated with a specified user.

_note:_ When checking the status of a call/connection, always compare against the constants provided by SNC.Notify.Status.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Object</td>
<td>JSON object that contains either a phone number to call or the sys_id of a WebRTC user. Passing a user sys_id</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>causes the call to be made through browser-to-browser communication.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can obtain the user sys_id from the Notify WebRTC Session table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If you provide both a phone number and user sys_id, the method only uses the phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates passing a phone number as the function parameter.

```javascript
notifyClient.call({
    phoneNumber: "+18001112223"
});
```

This example demonstrates passing a user record sys_id as the function parameter.

```javascript
notifyClient.call({
    userId: "6816f79cc0a8016401c5a33be04be441"
});
```

This example shows a button click handler.

```javascript
$j("#pickupCallBtn").on("click", function() {
    notifyClient.hangupCall();
});
```

This example shows an event handler.

```javascript
onConnect: function(status) {
    // webRTC receives a call connection event (incoming or outgoing).
    if (status == SNC.Notify.Status.OPEN) {
        setStatus(getTimeStamp() + " -- Successfully established call");
        showHangupButton();
    }
},
```
NotifyClient - Client(Object notifyConfig, Boolean initializeVendorClientLazily)

Instantiates a new Notify WebRTC Client object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initializeVendorClientLazily</td>
<td>Boolean</td>
<td>Flag that indicates whether to use the autoSelectVendorCallback function passed in the setCallerId() method to automatically set the caller's associated vendor (notifyConfig.vendor does not need to be defined in the constructor).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Default. Do not use the autoSelectVendorCallback function to set the caller's vendor. The vendor must be set in the constructor.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Use the autoSelectVendorCallback function to define the vendor when the caller ID is set.</td>
</tr>
<tr>
<td>notifyConfig</td>
<td>Object</td>
<td>JSON object that contains the configuration settings for the Notify WebRTC Client.</td>
</tr>
<tr>
<td>notifyConfig.autoLoadScriptResources</td>
<td>Boolean</td>
<td>Flag that indicates how to load the core JS library needed by the vendor client.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Default. Use vendor specific codes to load the required vendor JS library (enables backwards compatibility).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Use notifyClient.js to load the core JS library.</td>
</tr>
<tr>
<td>notifyConfig.callerId</td>
<td>Number</td>
<td>Registered Notify number to use. Do not directly set this value. Use the method...</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyClient.setCallerID()</td>
<td></td>
<td><code>notifyClient.setCallerID()</code> to set this value.</td>
</tr>
<tr>
<td>notifyConfig.forceRefreshToken</td>
<td>Boolean</td>
<td>Flag that indicates whether to auto-renew expired client tokens.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Do not automatically renew client tokens when they expire.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Default. Automatically renew client tokens when they expire.</td>
</tr>
<tr>
<td>notifyConfig.skipParentId</td>
<td>Boolean</td>
<td>Flag that indicates whether to immediately invoke the onIncoming caller for incoming calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Default. Do not immediately invoke the onIncoming event handler.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Immediately invoke the onIncoming event handler. By setting this flag, if there is another call, where the <code>&lt;Dial&gt;&lt;Client&gt;</code> Twiml caused the incoming call, then setting this flag causes the system to auto poll the backend. This auto poll obtains the parent notify_call reference.</td>
</tr>
<tr>
<td>notifyConfig.vendor</td>
<td>Constant</td>
<td>Vendor to which the caller belongs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SNC.Notify.Vendor.TWILIO_DIRECT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SNC.Notify.Vendor.TWILIO (older, deprecated Twilio driver)</td>
</tr>
</tbody>
</table>

The following example shows how to create the NotifyClient constructor, register various event listeners, and initialize the client driver.

```javascript
jQuery(function () {

```

```javascript
var notifyConfig = {
    autoLoadScriptResources: true // This will take care of auto loading the JS resources needed by the client (if any)
};
var client = new SNC.Notify.Client(notifyConfig, true); // The second argument ensures that the proper vendor for the given number is auto determined
client.setCallerId('valid_notify_long_number', function () {
    // This is called after the vendor has been determined.
    
    if (!notifyConfig.vendor) // Means this number has no compatible vendor
        return;

    client.addEventListener(SNC.Notify.STD_EVENTS.ONLINE, function () {
        // Ability to call is available
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.OFFLINE, function () {
        // Ability to call is _not_ available right now
    });
    client.addEventListener(SNC.Notify.STD_EVENTS.ERROR, function (msg, code) {
        // Some error happened
    });
    //... register other event handlers here
    //Show UI elements which can be used to invoke client.call() and other APIs
    client.init(); // This is important to call this.
});
```

**NotifyClient - destroy()**

Kills the current Notify client, rendering it unusable.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>
**NotifyClient - forwardCall(Object argument)**

Forwards an ongoing incoming or outgoing phone call to either a different phone number or a different WebRTC client.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>argument</td>
<td>Object</td>
<td>JSON object that contains the necessary information for forwarding the call to either a phone number or a WebRTC client (user sys_id). You can obtain this sys_id from the Notify WebRTC Session table.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example demonstrates forwarding a call to a different phone number. The dtmf attribute allows you to send DTMF dial tones to the receiving number.

```javascript
var arg = {
    type: "number",
    id: "+17012345678",
    dtmf: "1234"
}
client.forwardCall(arg);
```

This example demonstrates forwarding a call to a different Notify client.

```javascript
var arg = {
    type: "userId",
    id: "6816f79cc0a8016401c5a33be04be441"
}
client.forwardCall(arg);
```

**NotifyClient - getAvailableClients(Function callback)**

Returns a list of clients available to accept calls.

This method excludes the current client from the list. The equivalent `Notify-getAvailableClients()` method does not filter any user.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>Function</td>
<td>Function to use to parse the list of clients. This function accepts a single parameter, an array of JSON objects with the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[{sys_id: &quot;...&quot;, // user's sys_id} name: &quot;...&quot; // user's name}</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**NotifyClient - getParentId(String callId, Function callback)**

Returns the parent call identifier for a specified call identifier, if one exists.

Depending on the telephony provider, there may be a delay before the parent call identifier is returned; therefore you must provide a callback function.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callId</td>
<td>String</td>
<td>Unique identifier of the call for which to return the parent call identifier.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>Function that obtains the JSON object that contains either the parent call identifier or an error message if the identifier could not be obtained after several tries.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Parent call identifier.</td>
</tr>
</tbody>
</table>

This example shows how to use this method to obtain the parent call identifier.
This example shows the contents of the jsonObj parameter.

```javascript
{
  parentId: "xyz",
  error: "msg"
}
```

**NotifyClient - getStatus()**

Returns the normalized status of the current call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Current status of the call. The values returned by the telephony provider API are normalized by replacing the returned driver value with its equivalent value as defined in SNC.Notify.Status.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the status of the current Notify client.

```javascript
clientStatus = notifyClient.getStatus();
```

**NotifyClient - hangupCall()**

End the current call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to hang up a call.

```
$\$(\#\text{pickupCallBtn}).on(\"click\", function() {
    notifyClient.hangupCall();
});
```

**NotifyClient - init()**

Initializes the client driver.

For example, when using the Twilio client, it invokes the method `Twilio.Device.setup()`. Call this method after the user has interacted with the page. This initialization process is asynchronous, therefore, you must provide an ONLINE event handler. This handler is called when the setup process is complete and the system is ready to take or make calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to initialize the Notify client.

```
$\$(function() {
    notifyClient = new SNC.Notify.Client( notifyConfig );
    notifyClient.setCallerId( '+31858889170' );
    notifyClient.init();
});
```

**NotifyClient - mute(Boolean muted)**

Mute or unmute the current client.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>muted</td>
<td>Boolean</td>
<td>Mutes or unmutes the current call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: (or any non-true value) unmutes the current call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: mutes the current call.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to send mute the current call.

```
notifyClient.mute( "true" );
```

### NotifyClient - pickUpCall()

Answers and connects to an incoming call from a WebRTC client.

Call this method when there is a notification of an incoming call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to pickup a call.

```
$\$("#pickUpCallBtn").on("click", function() {
    notifyClient.pickupCall();
});
```
**NotifyClient - sendDtmf(String digits)**
Send one or more DTMF-valid digits over the current call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>digits</td>
<td>String</td>
<td>One or more DTMF-valid digits.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to send DTMF signals to the current call.

```java
notifyClient.SendDtmf( "1246AF" ) {} );
```

**NotifyClient - setClientAvailable(Boolean available)**
Sets the availability of an active WebRTC client agent.

This type of availability is different than an agent being in a call. In this case, an active WebRTC client may be connected and not on a call, but may not want to receive calls.

Calling this method updates the **Available** field value on the Notify Client Connected Session [notify_client_session] record associated with this client session. You can get a list of available clients using the **getAvailableClients()** method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>available</td>
<td>boolean</td>
<td>Flag that indicates whether an active WebRTC client wants to receive calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: client does not want to receive calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: client does want to receive calls.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

NotifyClient - setCallerId(String value, Function autoSelectVendorCallback)

Sets the caller ID for the current client session.

You can change or update the caller ID at any time however, the caller ID must belong to the same vendor.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>Phone number to use to make and receive calls.</td>
</tr>
<tr>
<td>autoSelectVendorCallback</td>
<td>Function</td>
<td><strong>Optional.initializeVendorClientLazily</strong> must be set to &quot;true&quot; in the constructor to use this function, otherwise an error is thrown. Name of the callback function to call once the vendor is automatically set for the specified phone number. With this option, the vendor does not need to be specified in the constructor (notifyConfig.vendor). Auto vendor selection is an asynchronous operation. Therefore, this callback is required to indicate when it is safe to call notifyConfig.init(), as this method requires that the vendor be set before it is called. In addition, you must also check if notifyConfig.vendor has been set in the callback to ensure that a vendor has been specified.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set the caller ID. This example assumes that the vendor is set in the constructor.

```javascript
$j(function() {
    notifyClient = new SNC.Notify.Client( notifyConfig );
    notifyClient.setCallerId( '+31858889170' );
    notifyClient.init();
});
```

**NotifyConferenceUtil - Scoped, Global**

The NotifyConferenceUtil API provides methods to manage Notify conference calls and SMS messages for various telephony service providers, such as Zoom and WebEx.

Using the NotifyConferenceUtil API you can:

- Create new conference calls
- Add participants by phone number or user ID
- Remove participants from a conference call
- Mute participants in a conference call
- Unmute participants in a conference call
- Obtain the capabilities of a specified service provider
- End a conference call

You can use this API in both scoped and global scripts. To use this API you must activate the Conference Notify plugin (com.snc.notify) which requires a separate subscription. For details on activating this plugin, see Activate Notify.

**NotifyConferenceUtils - addToConferenceByPhoneNumber(String toNumber, GlideRecord confGR)**

Adds a participant to a specified conference call using their phone number to identify the participant.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>toNumber</td>
<td>String</td>
<td>Phone number of the participant to add to the conference call.</td>
</tr>
<tr>
<td>confGR</td>
<td>GlideRecord</td>
<td>GlideRecord of the conference call to which to add the specified participant. These records are located in the Notify Conference Call [notify_conference_call] table.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td><strong>&lt;action&gt;.status</strong>: Status of the conference action.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td>• Valid values:</td>
</tr>
<tr>
<td></td>
<td>◦ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>◦ false: Conference action failed</td>
</tr>
<tr>
<td></td>
<td><strong>&lt;action&gt;.successMessages</strong>: If status is true, success message(s), else empty.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td><strong>&lt;action&gt;.warnMessages</strong>: If status is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td><strong>&lt;action&gt;.errorMessages</strong>: If status is false, any error messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>

## Example

```javascript
function () {
  var confGR = new GlideRecord('notify_conference_call');
  confGR.get('76d3364d0b5133008e64aabcb4673a6d');
}  ```
var confUtils = new NotifyConferenceUtils();
var actionResult = confUtils.addToConferenceByPhoneNumber("+917799555331", confGR)
if (actionResult.status)
  gs.info('Participant has been added to conference');
else {
  gs.info('join operation failed');
  actionResult.warnMessages.forEach(function (msg) {
    gs.info(msg);
  });
  actionResult.errorMessages.forEach(function (msg) {
    gs.info(msg);
  })
}
})

NotifyConferenceUtils - addToConferenceByUserId(String userId, GlideRecord confGR)

Adds a participant to the conference call referenced by the passed in GlideRecord using their unique user identifier.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>Sys ID of the participant to add to the specified conference call. This information is located in the User [sys_user] table.</td>
</tr>
<tr>
<td>confGR</td>
<td>GlideRecord</td>
<td>GlideRecord of the conference call to add the specified participant. These records are located in the Notify Conference Call [notify_conference_call] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td>&lt;action&gt;.status</td>
<td>Status of the conference action.</td>
</tr>
<tr>
<td>• Data type: Boolean</td>
<td></td>
</tr>
<tr>
<td>• Valid values:</td>
<td></td>
</tr>
</tbody>
</table>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ true:</td>
<td>Conference action succeeded</td>
</tr>
<tr>
<td>◦ false:</td>
<td>Conference action failed</td>
</tr>
</tbody>
</table>

<action>.successMessages: If `status` is true, success message(s), else empty.
- Data type: Array of Strings

<action>.warnMessages: If `status` is false, any warning messages thrown during processing.
- Data type: Array of Strings

<action>.errorMessages: If `status` is false, any error messages thrown during processing.
- Data type: Array of Strings

**Example**

```javascript
(function () {
    var confGR = new GlideRecord('notify_conference_call');
    confGR.get('76d3364d0b5133008e64aabcb4673a6d');

    var confUtils = new NotifyConferenceUtils();
    var actionResult = confUtils.addToConferenceByUserId(gs.getUserID(), confGR);

    if (actionResult.status)
        gs.info('Participant has been added to conference');
    else {
        gs.info('join operation failed');
        actionResult.warnMessages.forEach(function (msg) {
            gs.info(msg);
        });
        actionResult.errorMessages.forEach(function (msg) {
            gs.info(msg);
        });
    }
})();
```
**NotifyConferenceUtils - doConferenceAction(String action, Object data)**

Performs the specified conference call action, such as starting/ending a conference call or joining, removing, muting, or unmuting participants from a conference call.

You can start a new conference call and add participants within a single call to this method or call the method multiple times to start the call and then manage participants separately. In addition, through the passed in data object, you can configure the method to:

- Save pointers in the conference call record to the specific record (source record), such as an incident or problem, that is the topic of discussion for the conference call.
- Allow/disallow multiple conference calls for a source record.
- Automatically log the participants that were in the conference call in the "Work Notes" field of the source record.
- Have a message read aloud when a participant answers an outgoing call from the conference.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>String</td>
<td>Defines the conference call action to perform.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The following are the available conference call actions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start: Starts the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• end: Terminates the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• join: Adds the participant specified in the <code>data.items</code> array to the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• multiJoin: Adds the participants specified in the <code>data.items</code> array to</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the conference call identified in <code>data.confId</code></td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• selfJoin:</td>
<td></td>
<td>Adds the currently logged in user to the conference call (no entry in <code>data.items</code> required.)</td>
</tr>
<tr>
<td>• kick:</td>
<td></td>
<td>Removes the participant specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>• multiKick:</td>
<td></td>
<td>Removes the participants specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>• mute:</td>
<td></td>
<td>Mutes the participant specified in the <code>data.items</code> array on the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>• multiMute:</td>
<td></td>
<td>Mutes the participants specified in the <code>data.items</code> array on the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>• unmute:</td>
<td></td>
<td>Unmutes the participant specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>• multiUnmute:</td>
<td></td>
<td>Unmutes the participants specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>data</td>
<td>Object</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Boolean</td>
<td>Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the <code>data.table</code>.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>and <code>data.sysId</code> parameters. These parameters identify the record in which to add the work notes. Default: false Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• join</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• multiJoin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• selfJoin</td>
</tr>
<tr>
<td>data.allowMulticonference</td>
<td>Boolean</td>
<td>Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start</td>
</tr>
<tr>
<td>data.confId</td>
<td>String</td>
<td>Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• end</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• join</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• multiJoin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• selfJoin</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.fromNumber</td>
<td>String</td>
<td>Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. Actions for which this parameter is required: • start</td>
</tr>
<tr>
<td>data.isNewConference</td>
<td>Boolean</td>
<td>Flag that indicates whether this is a new or an existing conference call. Valid values: • true: New conference call • false: Existing conference call Default: false Actions for which this parameter is valid: • start</td>
</tr>
<tr>
<td>data.items</td>
<td>Array</td>
<td>Information for each participant to include in the conference call. Valid array values: • id: Sys ID of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start</td>
</tr>
</tbody>
</table>

**Note:** Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyParticipantId</td>
<td>Sys ID</td>
<td>Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td></td>
<td>Phone number of the participant. If this value is passed in conjunction with either the id or notifyParticipantId, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start.</td>
</tr>
<tr>
<td>email</td>
<td></td>
<td>Email address of the participant. Valid actions: join, multiJoin, start.</td>
</tr>
<tr>
<td>data.message</td>
<td>String</td>
<td>Message that is read aloud when a user answers the call, such as, &quot;P1 incident has been created please login to instance.&quot; Actions for which this parameter is valid:</td>
</tr>
<tr>
<td>data.serviceProvider</td>
<td>String</td>
<td>Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required: all</td>
</tr>
<tr>
<td>data.sysId</td>
<td>String</td>
<td>Sys ID of the source record to associate with the conference call.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the data.Table, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start</td>
</tr>
<tr>
<td>data.table</td>
<td>String</td>
<td>Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the data.sysId, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.status: Status of the conference action.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Data type: Boolean</td>
<td>• Valid values:</td>
</tr>
<tr>
<td></td>
<td>◦ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>◦ false: Conference action failed</td>
</tr>
<tr>
<td>&lt;action&gt;.successMessages: If status is true, success message(s), else empty.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td>&lt;action&gt;.warnMessages: If status is false, any warning messages thrown during processing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td>&lt;action&gt;.errorMessages: If status is false, any error messages thrown during processing.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>

Example

```javascript
(function (confId) {
  var confUtils = new NotifyConferenceUtils();
  var data = confUtils.getConferenceInputDataTemplate();
  data.table = 'incident';
  data.sysId = '1234';
  data.addToWorkNotes = false;
  data.confId = confId;
  data.message = 'p1 incident has been created';
  data.fromNumber = 'twilio/Telephony driver number';
  data.items.push({ id: 'user3SysId', phoneNumber: '+917799555332' });
  data.items.push({ id: 'user4SysId', email: 'yln99518@gmail.com' });

  var result = confUtils.doConferenceAction('start', data);
  if (result.status) {
    gs.info('Start conference action succeeded');
  } else
    gs.info('Start conference action failed');
});
```
result.errorMessages.forEach(function (msg) {
    gs.info(msg);
});
result.warnMessages.forEach(function (msg) {
    gs.info(msg);
});
result.successMessages.forEach(function (msg) {
    gs.info(msg);
});
})("activeConfSysId");

NotifyConferenceUtils - getConferenceInputDataTemplate()

Returns a JSON data template to use with the doConferenceAction() method. Using this template automatically structures the data object so that you don't have to manually create it.

Call this method prior to calling the doConferenceAction() method. For the desired conference call action, set the desired parameters within the template, and then pass the template in the doConferenceAction() call. For additional information on the valid parameters for each action, see doConferenceAction().

>Note: This is a helper method. You can also manually construct this object and pass that object into the doConferenceAction() method and have the same outcome.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record in which to add the work notes.</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td></td>
<td>Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td>• start</td>
</tr>
<tr>
<td></td>
<td>• join</td>
</tr>
<tr>
<td></td>
<td>• multiJoin</td>
</tr>
<tr>
<td></td>
<td>• selfJoin</td>
</tr>
<tr>
<td><code>data.allowMultconference</code></td>
<td>Flag that indicates whether to allow multiple conference calls for a specific record at one time.</td>
</tr>
<tr>
<td></td>
<td>For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record that is allowed to have multiple conference calls.</td>
</tr>
<tr>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td></td>
<td>Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td>• start</td>
</tr>
<tr>
<td><code>data.confId</code></td>
<td>Sys ID of the conference call.</td>
</tr>
<tr>
<td></td>
<td>The conference Sys ID is located in the Notify Conference Call <code>[notify_conference_call]</code> table.</td>
</tr>
<tr>
<td></td>
<td>Actions for which this parameter is required:</td>
</tr>
<tr>
<td></td>
<td>• end</td>
</tr>
<tr>
<td></td>
<td>• join</td>
</tr>
<tr>
<td></td>
<td>• multiJoin</td>
</tr>
<tr>
<td></td>
<td>• selfJoin</td>
</tr>
</tbody>
</table>
 Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.fromNumber</td>
<td>Service provider number to call into for the conference call.</td>
</tr>
<tr>

<tr>
<td></td>
<td>• all</td>
</tr>
<tr>
<td>data.sysId</td>
<td>Sys ID of the source record to associate with the conference call.</td>
</tr>
<tr>
<td></td>
<td>For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked.</td>
</tr>
<tr>
<td></td>
<td>This parameter is used in conjunction with the <strong>data.Table</strong>, <strong>data.addToWorkNotes</strong>, and <strong>allowMulticonference</strong> parameters.</td>
</tr>
<tr>
<td></td>
<td>Actions for which this parameter is valid:</td>
</tr>
</tbody>
</table>
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.table</td>
<td>Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the data.sysId, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid: start</td>
</tr>
</tbody>
</table>

#### Example

```javascript
(function (confId) {
    var confUtils = new NotifyConferenceUtils();
    var data = confUtils.getConferenceInputDataTemplate();
    data.confId = confId;
    var result = confUtils.doConferenceAction('end', data);
    if (result.status) {
        gs.info('Conference call has been ended');
    } else
        gs.info('End conference call action failed');

    result.errorMessages.forEach(function (msg) {
        gs.info(msg);
    });
    result.warnMessages.forEach(function (msg) {
        gs.info(msg);
    });
    result.successMessages.forEach(function (msg) {
        gs.info(msg);
    });
}
```
NotifyConferenceUtils - getServiceProvidersCapabilities()

Returns the capabilities of all telephony service provider drivers in the instance.

Possible capabilities include:

- **archive**: archives the conference after it ends
- **beepOnLeave**: plays a "beep" tone when a participant leaves the conference call
- **beepOnJoin**: plays a "beep" tone when a participant joins the conference call
- **end**: ends the identified conference call
- **filesharing**: allows file sharing between participants
- **join**: adds a participant to a conference call
- **kick**: removes a participant from a conference call
- **multiJoin**: adds multiple participants to a conference call
- **multiKick**: removes multiple participants from a conference call
- **muteOnJoin**: mutes a participant when they initially join a conference call
- **multiUnmute**: unmutes multiple participants for a conference call
- **record**: records conference calls
- **recording**: provides an on-screen indicator when the conference call is being recorded
- **screenSharing**: allows participant screens to be shared with the group
- **selfJoin**: adds the current logged in user to a conference call
- **speaking**: provides an on-screen message as to who is currently speaking
- **start**: starts the identified conference call
- **unmute**: unmutes a participant in a conference call

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Key-value pairs of the status of each driver capability.</td>
</tr>
</tbody>
</table>

Valid values:

- `isSupported = 0`: capability is not supported
- `isSupported = 1`: capability is supported

List driver capabilities for all telephony service provider drivers in the instance.

```javascript
(function () {
  var confUtils = new NotifyConferenceUtils();
  var providerToCapability = confUtils.getServiceProvidersCapabilities();
  for (var provider in providerToCapability) {
    gs.info('{0} supported capabilities 

', provider);
    var capabilities = providerToCapability[provider]
    for (var cap in capabilities)
      if(confUtils.isActionSupported(capabilities[cap].isSupported))
        gs.info('"{0}" action supported', cap);
      else
        gs.info("'{0}' action is not supported by this conference driver", cap);
  }
})();
```

Output: The method returns a node similar to the following for each active telephony service provider within the instance.

```json
{
  "Telephony": {
    "start": {
      "isSupported": 1,
      "meta": {}
    },
    "end": {
      "isSupported": 1,
      "meta": {}
    },
    "selfJoin": {
      "isSupported": 1,
      "meta": {}
    },
    "join": {
```
"isSupported": 1,
"meta": { }
},
"multiJoin": {
  "isSupported": 1,
  "meta": { }
},
"mute": {
  "isSupported": 1,
  "meta": { }
},
"multiMute": {
  "isSupported": 1,
  "meta": { }
},
"unmute": {
  "isSupported": 1,
  "meta": { }
},
"multiUnmute": {
  "isSupported": 1,
  "meta": { }
},
"kick": {
  "isSupported": 1,
  "meta": { }
},
"multiKick": {
  "isSupported": 1,
  "meta": { }
},
"record": {
  "isSupported": 0,
  "meta": { }
},
"speaking": {
  "isSupported": 0,
  "meta": { }
},
"recording": {
  "isSupported": 0,
  "meta": { }
},
"screenSharing": {
NotifyConferenceUtils - isActionSupported(Number action)

Determines whether a Notify conference action is supported by a telephony service provider.

To use this method, you must first call the getServiceProviderCapabilities() method. This method returns an object that contains information about the availability of each possible Notify conference action for each service provider configured in your instance.

For example:

```json
{
   "Telephony": {
      "start": {
         "isSupported": 1,
         "meta": {}
      },
      "end": {
         "isSupported": 0,
         "meta": {}
      }
   }
}
```
{"isSupported": 0,
  "meta": {}},
"recording": {
  "isSupported": 0,
  "meta": {}},
"screenSharing": {
  "isSupported": 0,
  "meta": {}},
"fileSharing": {
  "isSupported": 0,
  "meta": {}},
"archive": {
  "isSupported": 0,
  "meta": {}},
"muteOnJoin": {
  "isSupported": 0,
  "meta": {}},
"beepOnJoin": {
  "isSupported": 0,
  "meta": {}},
"beepOnLeave": {
  "isSupported": 0,
  "meta": {}}
}

## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>Number</td>
<td>Value of the <strong>isSupported</strong> parameter returned by the <code>getServiceProvidersCapabilities()</code> method for a specific action and service provider.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Although the <code>isSupported</code> value may appear to be a Boolean, it is actually a Number. Do not try and evaluate the capabilities as Boolean values. Use this method as the associated values may be expanded in future versions.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean| Flag that indicates whether the telephony service provider supports the specified action. Valid values:  
• true: action is supported by the service provider  
• false: action is not supported by the service provider |

Example

```javascript
(function () {
  var confUtils = new NotifyConferenceUtils();
  var providerToCapability = confUtils.getServiceProvidersCapabilities();
  for (var provider in providerToCapability) {
    gs.info('{0} supported capabilities 

', provider);
    var capabilities = providerToCapability[provider]
    for (var cap in capabilities)
      if (confUtils.isActionSupported(capabilities[cap].isSupported))
        gs.info('"{0}" action supported', cap);
      else
        gs.info('"{0}" action is not supported by this conference driver", cap);
  }
})();
```

**NotifyConferenceUtils - kickByParticipantGR(GlideRecord notifyParticipantGR)**

Removes the participant associated with the passed in GlideRecord from the current conference call.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyParticipantGR</td>
<td>GlideRecord</td>
<td>GlideRecord object of the participant to remove from the conference call. These records are located in the Notify Participant [notify_participant] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.status: Status of the conference action.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td>• Valid values:</td>
</tr>
<tr>
<td></td>
<td>○ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>○ false: Conference action failed</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.successMessages: If status is true, success message(s), else empty.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.warnMessages: If status is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.errorMessages: If status is false, any error messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>

Example

```javascript
(function () {
    var confUtils = new NotifyConferenceUtils();
    var participantGR = new GlideRecord('notify_participant'); // Participant record contains conf call ID
    participantGR.get('validParticipantSysId');
})();
```
var actionResult = confUtils.kickByParticipantGR(participantGR);
if (actionResult.status)
    gs.info('Participant has been kicked out of conference');
else {
    gs.info('kick operation failed');
    actionResult.warnMessages.forEach(function (msg) {
        gs.info(msg);
    });
    actionResult.errorMessages.forEach(function (msg) {
        gs.info(msg);
    })
}
})()
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<action>.warnMessages` | If `status` is false, any warning messages thrown during processing.  
  • Data type: Array of Strings |
| `<action>.errorMessages` | If `status` is false, any error messages thrown during processing.  
  • Data type: Array of Strings |

Example

```
(function () {
    var confUtils = new NotifyConferenceUtils();
    var participantGR = new GlideRecord('notify_participant');
    participantGR.get('validSysId');
    var actionResult = confUtils.muteByParticipantGR(participantGR);
    if (actionResult.status)
        gs.info('Participant has been muted');
    else {
        gs.info('mute operation failed');
        actionResult.warnMessages.forEach(function (msg) {
            gs.info(msg);
        });
        actionResult.errorMessages.forEach(function (msg) {
            gs.info(msg);
        });
    }
})();
```

NotifyConferenceUtils - NotifyConferenceUtils()

Instantiates a NotifyConferenceUtils object (constructor).

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example
function () {
  var confGR = new GlideRecord('notify_conference_call');
  confGR.get('76d3364d0b5133008e64aabc4673a6d');

  var confUtils = new NotifyConferenceUtils();
  var actionResult = confUtils.addToConferenceByPhoneNumber("+917799555331", confGR)
  if (actionResult.status)
    gs.info('Participant has been added to conference');
  else {
    gs.info('join operation failed');
    actionResult.warnMessages.forEach(function (msg) {
      gs.info(msg);
    });
    actionResult.errorMessages.forEach(function (msg) {
      gs.info(msg);
    });
  }
})();

NotifyConferenceUtils - unmuteByParticipantGR(GlideRecord notifyParticipantGR)

Unmutes the participant associated with the passed in GlideRecord on the current conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyParticipantGR</td>
<td>GlideRecord</td>
<td>GlideRecord object of the participant to unmute. These records are located in the Notify Participant [notify_participant] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td>&lt;action&gt;.status: Status of the conference action.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td>• Valid values:</td>
</tr>
</tbody>
</table>

Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>◦ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>◦ false: Conference action failed</td>
</tr>
<tr>
<td>&lt;action&gt;.successMessages:</td>
<td>If status is true, success message(s), else empty.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td>&lt;action&gt;.warnMessages:</td>
<td>If status is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>

(function () {
  var confUtils = new NotifyConferenceUtils();
  var participantGR = new GlideRecord('notify_participant');
  participantGR.get('validSysId');
  var actionResult = confUtils.unmuteByParticipantGR(participantGR);
  if (actionResult.status)
    gs.info('Participant has been Unmuted');
  else {
    gs.info('Unmute operation failed');
    actionResult.warnMessages.forEach(function (msg) {
      gs.info(msg);
    });
    actionResult.errorMessages.forEach(function (msg) {
      gs.info(msg);
    });
  }
})();
NotifyJsTelephonyDriver - Global

The NotifyJsTelephonyDriver API provides methods that you can use to obtain information about the capabilities of the associated telephony driver.

It is a scripted extension point that can only be used when its object is returned by another method, such as NotifyUtil - getTelephonyDriverFromNotifyNumber(). You cannot call this API directly. The calling method associates a specific driver to the interface, abstracting the details of determining the driver. Each of the available drivers implement the same interface, which is defined by the NotifyJsTelephonyDriver API.

In the following code example, the getTelephonyDriverFromNotifyNumber() method returns an implementation of this API, with the driver interface being determined by the passed in telephone number, such as TwilioNotifyJsTelephonyDriver.

```javascript
function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
  if (driver) {
    return {
      driverName: driver.getName(),
      supportsCall: driver.supportsCall(),
      supportsSMS: driver.supportsSms()
    }
  }
}
```

To see which drivers are associated with the NotifyJsTelephonyDriver extension point, navigate to System Extension Points>global.NotifyJsTelephonyDriver. All associated driver implementations appear in the Implementations tab.

For additional information on scripted extension points, see Using extension points to extend application functionality point.

To use this API you must activate the Notify (com.snc.notify) plugin. To activate specific driver implementations, such as Twilio, you must activate their specific plugin.

**NotifyJsTelephonyDriver - call(Object notifyPhoneNumber, String phoneNumber)**

Calls a specified telephone number.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>Notify PhoneNumber record that contains the Notify phone number from which to make the call. Located in the Notify Phone Number [notify_number] table.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>Telephone number to call. Format: E.164</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
  if (driver) {

  }
}
```

### NotifyJsTelephonyDriver - getCapabilities()

Returns a list of the capabilities of the telephony driver.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example returns the capabilities of the associated telephony driver.

```javascript
getDriverDetails('<notify_number>');
```

```javascript
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return {
            capabilities: driver.getCapabilities()
        }
    }
}
```

### NotifyJsTelephonyDriver - getMaxSizeForBulkSms(String phoneNumber)

Returns the maximum number of telephone numbers to which the telephony driver associated with the passed in Notify telephone number can send an SMS message to at one time.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>Notify telephone number to check for the maximum number of telephone numbers that the associated driver is able to send to in one bulk SMS message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Maximum number of telephone numbers that an SMS message can be sent to in a single bulk SMS delivery.</td>
</tr>
</tbody>
</table>

This example returns the maximum number of telephone numbers that can be sent to in a single bulk SMS message for the associated telephony driver.
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return {
            maxSmsNumbers: driver.getMaxSizeForBulkSMS(notifyNumber)
        }
    }
}
NotifyJsTelephonyDriver - getPhoneNumbers()

Returns a list of all Notify telephone numbers associated with the current telephony driver.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Comma-separated list of all Notify telephone numbers associated with the current driver.</td>
</tr>
</tbody>
</table>

This example obtains the telephony driver and returns the list of Notify phone numbers associated with the current telephony driver.

```
getDriverDetails('<notify_number>');
```

```
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return {
            phoneNumbers: driver.getPhoneNumbers()
        }
    }
}
```

NotifyJsTelephonyDriver - isActive()

Checks whether the current telephony driver is active.
This example obtains the telephony driver and returns whether the current telephony driver is active.

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
  if (driver) {
    return {
      active: driver.isActive()
    }
  }
}
```

**NotifyJsTelephonyDriver - kick(GlideRecord participantRecord)**

Removes the specified caller from the current Notify conference call.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object containing the Notify Participant [notify_participant] record of the caller to remove from the conference call.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Only returned if error. Error message that describes why the caller was not removed from the call.</td>
</tr>
</tbody>
</table>

This example mutes the associated caller in the current conference call.

```javascript
getDriverDetails('<notify_number>');
```

```javascript
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        var notifyParticipantGr = new GlideRecord('notify_participant');
        notifyParticipantGr.set('active participant sys id');

        if (notifyParticipantGr.isValid) {
            driver.kick(notifyParticipantGr)
        }
    }
}
```

**NotifyJsTelephonyDriver - mute(GlideRecord participantRecord)**

Mutes the specified caller in the current Notify conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object containing the Notify Participant [notify_participant] record of the caller to mute in the conference call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Only returned if error. Error message that describes why the caller was not muted.</td>
</tr>
</tbody>
</table>

This example mutes the associated caller in the current conference call.
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        var notifyParticipantGr = new GlideRecord('notify_participant');
        notifyParticipantGr.get('active participant sys id');

        if (notifyParticipantGr.isValid()) {
            driver.mute(notifyParticipantGr);
        }
    }
}

NotifyJsTelephonyDriver - sendAutonomousBulkSms(Object notifyPhoneNumber,
Array toPhoneNumber, String message, GlideRecord source)

Sends the specified Short Message Service (SMS) message to the specified list of telephone numbers.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Message to send.</td>
</tr>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber - Global</td>
<td>Record that contains the phone number that is sending the bulk SMS message.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord - Global</td>
<td>Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>Array</td>
<td>List of telephone numbers of the devices to receive the SMS message.</td>
</tr>
</tbody>
</table>
This example shows how to send an autonomous bulk SMS.

```
getDriverDetails('<notify_number>');
```

```
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
    }
}
```

**NotifyJsTelephonyDriver - sendSMS(NotifyPhoneNumber notifyPhoneNumber, String toPhoneNumber, String messageBody)**

Sends a specified Short Message Service (SMS) message to a specified telephone number.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notifyPhoneNumber</td>
<td>NotifyPhoneNumber</td>
<td>Notify phone number record that contains the telephone number that is sending the SMS message. Located in the Notify Phone Number [notify_number] table.</td>
</tr>
<tr>
<td>toPhoneNumber</td>
<td>String</td>
<td>Phone number to send the SMS message to. Format: E.164 compliant</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Text to send in the SMS message.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
This example sends an SMS message to a specified telephone number.

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return;
    }
}
```

**NotifyJsTelephonyDriver - supportsAutonomousBulkSms(String phoneNumber)**

Checks whether the specified Notify telephone number is capable of handling autonomous bulk Short Message Service (SMS) messages.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean| Flag that indicates whether the specified Notify telephone number supports autonomous bulk SMS. Valid values:  
• true: Supports autonomous bulk SMS.  
• false: Does not support autonomous bulk SMS. |

This example obtains the telephony driver and returns whether the driver supports autonomous bulk SMS.

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return;
    }
}
var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
if (driver) {
    return {
        supportsBulkSMS: driver.supportsAutonomousBulkSms(notifyNumber)
    }
}

NotifyJsTelephonyDriver - supportsCall()

Checks whether the current telephony driver is capable of handling telephone calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the current telephony driver supports telephone calls.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Driver supports telephone calls.</td>
</tr>
<tr>
<td></td>
<td>• false: Driver does not support telephone calls.</td>
</tr>
</tbody>
</table>

This example obtains the telephony driver and returns whether the driver supports telephone calls.

getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return {
            supportsCall: driver.supportsCall()
        }
    }
NotifyJsTelephonyDriver - supportsCallOverWebRtc()
Checks whether the specified Notify telephone number is capable of calls to a browser using WebRTC (Real-Time Communications.)

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the specified Notify telephone number supports browser calls using WebRTC.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Supports WebRTC.</td>
</tr>
<tr>
<td></td>
<td>• false: Does not support WebRTC.</td>
</tr>
</tbody>
</table>

This example obtains the telephony driver and returns whether the driver supports browser calls using WebRTC.

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
  var nUtil = new NotifyUtil();
  if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
    return;
  var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
  if (driver) {
    return {
      supportsWebRTC: driver.supportsCallOverWebRtc(notifyNumber)
    }
  }
}
```

NotifyJsTelephonyDriver - supportsSMS()
Checks whether the current telephony driver is capable of handling Short Message Service (SMS) messages.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the current telephony driver supports SMS.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Driver supports SMS.</td>
</tr>
<tr>
<td></td>
<td>• false: Driver does not support SMS.</td>
</tr>
</tbody>
</table>

This example obtains the telephony driver and returns whether the driver supports SMS.

```javascript
getDriverDetails('<notify_number>');

function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        return {
            supportsSMS: driver.supportsSMS()}
    }
}
```

**NotifyJsTelephonyDriver - unmute(GlideRecord participantRecord)**

Unmutes the specified caller in the current Notify conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participantRecord</td>
<td>GlideRecord</td>
<td>GlideRecord object containing the Notify Participant [notify_participant] record of the caller to mute in the conference call.</td>
</tr>
</tbody>
</table>
This example mutes the associated caller in the current conference call.

```
getDriverDetails('<notify_number>');
```

```
function getDriverDetails(notifyNumber) {
    var nUtil = new NotifyUtil();
    if (!notifyNumber || !nUtil.validateOutboundNotifyNumber(notifyNumber))
        return;
    var driver = nUtil.getTelephonyDriverFromNotifyNumber(notifyNumber);
    if (driver) {
        var notifyParticipantGr = new GlideRecord('notify_participant');
        notifyParticipantGr.get('active participant sys id');
        if (notifyParticipantGr.isValid) {
            driver.unmute(notifyParticipantGr)
        }
    }
}
```

**NotifyPhoneNumber - Global**

The *NotifyPhoneNumber* API allows you to query information about a Notify phone number.

Access the global *NotifyPhoneNumber* class and its associated methods in the *SNC* namespace.

**NotifyPhoneNumber - getDialCode()**

Returns the international dialing code for a Notify phone number.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>International phone code for a country.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the dial code for a phone number.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getDialCode());
}
```

### Scoped equivalent

To use the `getDialCode()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - getDialCode()**.

### NotifyPhoneNumber -getID()

Returns the ID of this phone number as defined by the telephony provider.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Identifier of the number within the telephony provider.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the unique identifier for a phone number.

```javascript
var numbers = SNC.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);
```
// Here number is of type NotifyPhoneNumber
gs.info(number.getID());
}

**Scoped equivalent**

To use the `getID()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - getID().**

**NotifyPhoneNumber - getNumber()**

Returns the numerical phone number for the current Notify caller.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

This example shows how to obtain a Notify caller's phone number.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getNumber());
}
```

**Scoped equivalent**

To use the `getNumber()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - getNumber().**

**NotifyPhoneNumber - getOwner()**

Returns the telephony provider associated with this phone number.
This example shows how to obtain the telephony provider that owns the specified phone number.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getOwner());
}
```

**Scoped equivalent**

To use the `getOwner()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - getOwner()`.

**NotifyPhoneNumber - getTerritory()**

Returns the country associated with the phone number.
This example shows how to obtain the country of a Notify caller.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getTerritory());
}
```

**Scoped equivalent**

To use the `getTerritory()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - getTerritory()**.

**NotifyPhoneNumber - isShortCode()**

Determines whether the current Notify phone number is a short code.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Boolean</td>
</tr>
<tr>
<td>• true: phone number is a short code.</td>
</tr>
<tr>
<td>• false: phone number is not a short code.</td>
</tr>
</tbody>
</table>

This example shows how to check if the current Notify phone number is a short code.

```javascript
GlideRecord notifyNumber = new GlideRecord(TABLE_NOTIFY_NUMBER);
notifyNumber.query(COL_NUMBER, notifyPhoneNumber.getNumber());

if (!notifyNumber.next()) {
    notifyNumber.initialize();
    notifyNumber.setValue(COL_OWNER, notifyPhoneNumber.getOwner());
}
```
if (notifyPhoneNumber.isShortCode()) {
    notifyNumber.setValue(COL_SHORT_CODE, notifyPhoneNumber.getNumber());
} else {
    notifyNumber.setValue(COL_PHONE_NUMBER, notifyPhoneNumber.getNumber());
}

**NotifyPhoneNumber - supportsConferenceCall()**

Determines if the Notify phone number supports conference calling.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports conference calling.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support conference calling</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support conference calling</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller supports conference calls.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsConferenceCall());
}
```

**Scoped equivalent**

To use the `supportsConferenceCall()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - supportsConferenceCall()`.
**NotifyPhoneNumber - supportsIncomingPhoneCall()**

Determines if the Notify phone number supports receiving phone calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports incoming phone calls.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support incoming phone calls</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support incoming phone calls</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can receive incoming phone calls.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsIncomingPhoneCall());
}
```

**Scoped equivalent**

To use the `supportsIncomingPhoneCall()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - supportsIncomingPhoneCall()**.

**NotifyPhoneNumber - supportsIncomingSMS()**

Determines if the Notify phone number supports receiving SMS messages.
This example shows how to determine if a Notify caller can receive incoming SMS messages.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsIncomingSMS());
}
```

**Scoped equivalent**

To use the `supportsIncomingSMS()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - supportsIncomingSMS()`.

**NotifyPhoneNumber - supportsOutgoingPhoneCall()**

determines if the Notify phone number supports initiating phone calls.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean  | Value that indicates whether the Notify phone number supports initiating outgoing phone calls.  
- true: phone number does support initiating outgoing phone calls  
- false: phone number does not support initiating outgoing phone calls |

This example shows how to determine if a Notify caller can make outgoing phone calls.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
gs.info(number.supportsOutgoingPhoneCall());
}
```

### Scoped equivalent

To use the `supportsOutgoingPhoneCall()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - supportsOutgoingPhoneCall()`.

### NotifyPhoneNumber - supportsOutgoingSMS()

Determines if the Notify phone number supports sending SMS messages.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports sending SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support sending SMS messages</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support sending SMS messages</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can initiate outgoing SMS messages.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
  var number = numbers.get(0);

  // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsOutgoingSMS());
}
```

Scoped equivalent

To use the `supportsOutgoingSMS()` method in a scoped application, use the corresponding scoped method: **Scoped NotifyPhoneNumber - supportsOutgoingSMS()**.

**NotifyPhoneNumber - supportsRecording()**

Determines if the Notify phone number supports recording phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports recording phone calls.</td>
</tr>
</tbody>
</table>
This example shows how to determine if a Notify caller can record calls.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsRecording());
}
```

**Scoped equivalent**

To use the `supportsRecording()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - supportsRecording()`.

**NotifyPhoneNumber - supportsWebRTC()**

Determines if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Boolean</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
This example shows how to determine if a Notify caller can initiate/accept browser-to-browser calls.

```javascript
var numbers = SNC.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsWebRTC());
}
```

**Scoped equivalent**

To use the `supportsWebRTC()` method in a scoped application, use the corresponding scoped method: `Scoped NotifyPhoneNumber - supportsWebRTC()`.

**NotifyPhoneNumber - Scoped**

The `NotifyPhoneNumber` API allows you to query information about a Notify phone number.

Access the scoped `NotifyPhoneNumber` API and its associated methods in the `sn_notify` namespace.

**Scoped NotifyPhoneNumber - getDialCode()**

Returns the international dialing code for a Notify phone number.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

This example shows how to obtain the dial code for a phone number.

```javascript
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();
```
// Here numbers is of type List
if (numbers.size() > 0) { 
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getDialCode());
}

Scoped NotifyPhoneNumber - getID()
Returns the ID of this phone number as defined by the telephony provider.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Identifier of the number within the telephony provider.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the unique identifier for a phone number.

var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) { 
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getID());
}

Scoped NotifyPhoneNumber - getNumber()
Returns the numerical phone number for the current Notify caller.
This example shows how to obtain a Notify caller's phone number.

```javascript
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getNumber());
}
```

**Scoped NotifyPhoneNumber - getOwner()**

Returns the telephony provider associated with this phone number.

This example shows how to obtain the telephony provider that owns the specified phone number.

```javascript
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();
```
// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getOwner());
}

Scoped NotifyPhoneNumber - getTerritory()
Returns the country associated with the phone number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the country to which the phone number belongs.</td>
</tr>
</tbody>
</table>

This example shows how to obtain the country of a Notify caller.

```java
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.getTerritory());
}
```

Scoped NotifyPhoneNumber - supportsConferenceCall()
Determines if the Notify phone number supports conference calls.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports conference calling.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support conference calling</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support conference calling</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller supports conference calls.

```javascript
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsConferenceCall());
}
```

Scoped NotifyPhoneNumber - supportsIncomingPhoneCall()

Determines if the Notify phone number supports receiving phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports incoming phone calls.</td>
</tr>
</tbody>
</table>

Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• true: phone number does support incoming phone calls</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support incoming phone calls</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can receive incoming phone calls.

```java
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsIncomingPhoneCall());
}
```

Scoped NotifyPhoneNumber - supportsIncomingSMS()

Determines if the Notify phone number supports receiving SMS messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports incoming SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support incoming SMS messages</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support incoming SMS messages</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can receive incoming SMS messages.

```java
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();
```
// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsIncomingSMS());
}

Scoped NotifyPhoneNumber - supportsOutgoingPhoneCall()
Determines if the Notify phone number supports initiating phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports initiating outgoing phone calls.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support initiating outgoing phone calls</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support initiating outgoing phone calls</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can make outgoing phone calls.

```javascript
var numbers = sn_notfy.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsOutgoingPhoneCall());
}
```
Scoped NotifyPhoneNumber - supportsOutgoingSMS()

Determines if the Notify phone number supports sending SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports sending SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support sending SMS messages</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support sending SMS messages</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can initiate outgoing SMS messages.

```java
var numbers = sn_notify.NotifyScoped.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsOutgoingSMS());
}
```

Scoped NotifyPhoneNumber - supportsRecording()

Determines if the Notify phone number supports recording phone calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports recording phone calls.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support recording phone calls</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support recording phone calls</td>
</tr>
</tbody>
</table>

This example shows how to determine if a Notify caller can record calls.

```javascript
var numbers = sn_notify.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
  var number = numbers.get(0);

  // Here number is of type NotifyPhoneNumber
  gs.info(number.supportsRecording());
}
```

### Scoped NotifyPhoneNumber - supportsWebRTC()

Determines if the Notify phone number supports calls to a browser, such as in a WebRTC implementation.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Value that indicates whether the Notify phone number supports browser-to-browser (WebRTC) calls.</td>
</tr>
<tr>
<td></td>
<td>• true: phone number does support browser-to-browser (WebRTC) calls</td>
</tr>
<tr>
<td></td>
<td>• false: phone number does not support browser-to-browser (WebRTC) calls</td>
</tr>
</tbody>
</table>
This example shows how to determine if a Notify caller can initiate/accept browser-to-browser calls.

```javascript
var numbers = sn_notify.Notify.getPhoneNumbers();

// Here numbers is of type List
if (numbers.size() > 0) {
    var number = numbers.get(0);

    // Here number is of type NotifyPhoneNumber
    gs.info(number.supportsWebRTC());
}
```

**NotifyOnTaskClient - Client**

The `NotifyOnTaskClient` API provides methods for sending SMS messages or starting/managing a conference call for various telephony service providers, such as Zoom and WebEx.

Any UI can consume the `NotifyOnTaskClient` API by explicitly including the `NotifyOnTaskClient UI script`.

Using the `NotifyOnTaskClient` API you can:

- Start a conference call
- End a conference call
- Add participants
- Perform actions that are available through the telephony driver such as:
  - mute/unmute participants
  - remove participants from a conference call
  - add participants to a conference call
  - start a conference call
  - end a conference call

The Notify (com.snc.notify) plugin requires a separate subscription. For additional information on activating the Notify plugin, see [Activate Notify](#).

**NotifyOnTaskClient - addParticipants(Object data)**

Adds the specified participants to a specified conference call.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Boolean</td>
<td>Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record in which to add the work notes. Default: false</td>
</tr>
<tr>
<td>data.confId</td>
<td>String</td>
<td>Required. Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table.</td>
</tr>
<tr>
<td>data.items</td>
<td>Array</td>
<td>Required. Information for each participant to include in the conference call. Valid array values: • <strong>id</strong>: User Sys ID; located in the User [sys_User] table. • <strong>notifyParticipantId</strong>: Participant Sys ID; located in the Notify Participant [notify_participant] table. • <strong>phoneNumber</strong>: Phone number of the participant. If this value is passed in conjunction with either the <code>id</code> or <code>notifyParticipantId</code>, this value supersedes the phone numbers in the user/participant record and is used to place the call. • <strong>email</strong>: email address of the participant.</td>
</tr>
<tr>
<td>data.message</td>
<td>String</td>
<td>Message that is read aloud when a user answers the call, such as, &quot;P1 incident has been created please login to instance.&quot;</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.serviceProvider</td>
<td>String</td>
<td>Required. Name of conference service provider, such as Zoom or Webex.</td>
</tr>
<tr>
<td>data.sysId</td>
<td>String</td>
<td>Sys ID of the source record to associate with the conference call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This parameter is used in conjunction with the data.Table, data.addToWorkNotes, and allowMulticonference parameters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You should configure this value when the conference call is initially created through a &quot;start&quot; action. If required, you can also set this value through this method.</td>
</tr>
<tr>
<td>data.table</td>
<td>String</td>
<td>Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This parameter is used in conjunction with the data.sysId, data.addToWorkNotes, and allowMulticonference parameters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You should configure this value when the conference call is initially created through a &quot;start&quot; action. If required, you can also set this value through this method.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
</tbody>
</table>

- `<action>.status`: Status of the conference action.
  - Data type: Boolean
  - Valid values:
    - true: Conference action succeeded
    - false: Conference action failed

- `<action>.successMessages`: If `status` is true, success message(s), else empty.
  - Data type: Array of Strings

- `<action>.warnMessages`: If `status` is false, any warning messages thrown during processing.
  - Data type: Array of Strings

- `<action>.errorMessages`: If `status` is false, any error messages thrown during processing.
  - Data type: Array of Strings

### Example

```javascript
function addToConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555331' });
    data.items.push({ email: 'yln99518@gmail.com' });

    NotifyOnTaskClient.addParticipants(data).then(function (result) {
        var joinActionResult = result[0];
        if(joinActionResult.status) {
            joinActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
        }
    });
}
return;
}

joinActionResult.warnMessages.forEach(function(msg) {
    console.warn(msg);
});
joinActionResult.errorMessages.forEach(function(msg) {
    console.error(msg);
});
}, function (errMsg) {
    console.log(errMsg);
});

NotifyOnTaskClient - doConferenceAction(String action, Object data)

Performs the specified conference call action, such as starting/ending a conference call or joining, removing, muting, or unmuting participants from a conference call.

You can start a new conference call and add participants within a single call to this method or call the method multiple times to start the call and then manage participants separately. In addition, through the passed in data object, you can configure the method to:

- Save pointers in the conference call record to the specific record (source record), such as an incident or problem, that is the topic of discussion for the conference call.
- Allow/disallow multiple conference calls for a source record.
- Automatically log the participants that were in the conference call in the **Work notes** field of the source record.
- Have a message read aloud when a participant answers an outgoing call from the conference.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>String</td>
<td>Defines the conference call action to perform. The following are the available conference call actions:</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>start</td>
<td></td>
<td>• start: Starts the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>end</td>
<td></td>
<td>• end: Terminates the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>join</td>
<td></td>
<td>• join: Adds the participant specified in the <code>data.items</code> array to the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>multiJoin</td>
<td></td>
<td>• multiJoin: Adds the participants specified in the <code>data.items</code> array to the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>selfJoin</td>
<td></td>
<td>• selfJoin: Adds the currently logged in user to the conference call (no entry in <code>data.items</code> required.)</td>
</tr>
<tr>
<td>kick</td>
<td></td>
<td>• kick: Removes the participant specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>multiKick</td>
<td></td>
<td>• multiKick: Removes the participants specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>mute</td>
<td></td>
<td>• mute: Mutes the participant specified in the <code>data.items</code> array on the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>multiMute</td>
<td></td>
<td>• multiMute: Mutes the participants specified in the <code>data.items</code> array on the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>unmute</td>
<td></td>
<td>• unmute: Unmutes the participant specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>multiUnmute: multiUnmute</td>
<td>multiUnmute</td>
<td>Unmutes the participants specified in the <code>data.items</code> array from the conference call identified in <code>data.confId</code></td>
</tr>
<tr>
<td>data</td>
<td>Object</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Boolean</td>
<td>Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record in which to add the work notes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start  Adam</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• join  Adam</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• multiJoin  Adam  Miranda</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• selfJoin  Adam  Lauren</td>
</tr>
<tr>
<td>data.allowMulticonference</td>
<td>Boolean</td>
<td>Flag that indicates whether to allow multiple conference calls for a specific record at one time.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record that is allowed to have multiple conference calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start  Adam</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• join  Adam</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• multiJoin  Adam  Miranda</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• selfJoin  Adam  Lauren</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| data.confId         | String | Sys ID of the conference call. The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. Actions for which this parameter is required:  
  - end  
  - join  
  - multiJoin  
  - selfJoin  
  
  **Note:** Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table. |
| data.fromNumber     | String | Service provider number to call into for the conference call.  
  Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table.  
  Actions for which this parameter is required:  
  - start |
| data.isNewConference| Boolean| Flag that indicates whether this is a new or an existing conference call.  
  Valid values:  
  - true: New conference call  
  - false: Existing conference call |
<table>

<td></td>
<td></td>
<td>• <strong>phoneNumber</strong>: Phone number of the participant. If this value is passed in conjunction with either the <strong>id</strong> or <strong>notifyParticipantId</strong>, this value supersedes the phone numbers in the user/participant record and is used to place the call.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid actions: join, multiJoin, start</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>email</td>
<td></td>
<td>• Email address of the participant. Valid actions: join, multiJoin, start.</td>
</tr>
<tr>
<td>data.serviceProvider</td>
<td>String</td>
<td>Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required: • all.</td>
</tr>
<tr>
<td>data.sysId</td>
<td>String</td>
<td>Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the data.Table, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid: • start.</td>
</tr>
<tr>
<td>data.table</td>
<td>String</td>
<td>Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>This parameter is used in conjunction with the <code>data.sysId</code>, <code>data.addtoworkNotes</code>, and <code>allowMulticonference</code> parameters. Actions for which this parameter is valid:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• start</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.status</code>: Status of the conference action.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td>• Valid values:</td>
</tr>
<tr>
<td></td>
<td>◦ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>◦ false: Conference action failed</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.successMessages</code>: If <code>status</code> is true, success message(s), else empty.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.warnMessages</code>: If <code>status</code> is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.errorMessages</code>: If <code>status</code> is false, any error messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>

The following example shows how to create a function to call `doConferenceAction()` to manipulate the participants in a conference call by passing in the action and the participants.
/**
 * @param {string} action - action to perform on the conference object or participant object
 * @param {Array} participants;
 */
function doConferenceAction(action, participants) {
  var data = NotifyOnTaskClient.getNotifyActionTemplate();
  data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
  data.confId = 'Active conference sysId';
  data.items = participants;

  NotifyOnTaskClient.doConferenceAction(action, data).then(function (result) {
    var kickActionResult = result[0];
    if (kickActionResult.status)
      console.log(action + ' succeeded');
    else {
      kickActionResult.warnMessages.forEach(function (msg) {
        console.warn(msg);
      });
      kickActionResult.errorMessages.forEach(function (msg) {
        console.error(msg);
      });
    }
  }, function (errMsg) {
    console.log(errMsg)
  });
}

// kick participants
doConferenceAction('kick', [{notifyParticipantId: 'notifyParticipantSysId'}]);

// kick multiple participants
doConferenceAction('multiKick', [{notifyParticipantId: 'notifyParticipantSysId'},
  {notifyParticipantId: 'notifyParticipantSysId'}]);

// Mute participants
doConferenceAction('mute', [{notifyParticipantId: 'notifyParticipantSysId'}]);
doConferenceAction('mute', [{notifyParticipantId: 'notifyParticipantSysId'}]);
doConferenceAction('multiMute',

// self join to any conference.
doConferenceAction('selfJoin', [{id: 'logged in userId'}]);

NotifyOnTaskClient - endConference(Object data)
Terminates the specified conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.confId</td>
<td>String</td>
<td>Sys ID of the conference call.</td>
</tr>
<tr>
<td>data.serviceProvider</td>
<td>String</td>
<td>Required. Name of conference service provider, such as Zoom or Webex.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td>&lt;action&gt;.status</td>
<td>Status of the conference action.</td>
</tr>
<tr>
<td>• Data type: Boolean</td>
<td></td>
</tr>
<tr>
<td>• Valid values:</td>
<td></td>
</tr>
<tr>
<td>◦ true: Conference action succeeded</td>
<td></td>
</tr>
<tr>
<td>◦ false: Conference action failed</td>
<td></td>
</tr>
<tr>
<td>&lt;action&gt;.successMessages</td>
<td>If status is true, success message(s), else empty.</td>
</tr>
<tr>
<td>• Data type: Array of Strings</td>
<td></td>
</tr>
<tr>
<td>&lt;action&gt;.warnMessages</td>
<td>If status is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td>• Data type: Array of Strings</td>
<td></td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;action&gt;.errorMessages</code></td>
<td>If status is false, any error messages thrown during processing.</td>
</tr>
<tr>
<td>• Data type: Array of Strings</td>
<td></td>
</tr>
</tbody>
</table>

Example

```javascript
function endConferenceCall() {
  var data = NotifyOnTaskClient.getNotifyActionTemplate();
  data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
  data.confId = 'Active conference sysId';

  NotifyOnTaskClient.endConference(data).then(function (result) {
    var endActionResult = result[0];
    if (endActionResult.status)
      console.log('Conference has been ended');
    else {
      endActionResult.warnMessages.forEach(function (msg) {
        console.warn(msg);
      });
      endActionResult.errorMessages.forEach(function (msg) {
        console.error(msg);
      });
    }
  }, function (errMsg) {
    console.log(errMsg);
  });
}
```

**NotifyOnTaskClient - getNotifyActionTemplate()**

Returns a JSON data template to use with the `doConferenceAction()` method. Using this template automatically structures the data object so that you don't have to manually create it.

Call this method prior to calling the `doConferenceAction()` method. For the desired conference call action, set the desired parameters within the template, and then pass the template in the `doConferenceAction()` call. For additional information on the valid parameters for each action, see `doConferenceAction()`. 
Note: This is a helper method. You can also manually construct this object and pass it into the `doConferenceAction()` method and have the same outcome.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record in which to add the work notes. Default: false. Actions for which this parameter is valid: • start • join • multiJoin • selfJoin</td>
</tr>
<tr>
<td>data.allowMultconference</td>
<td>Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false. Actions for which this parameter is valid: • start</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>data.confId</td>
<td>Sys ID of the conference call. &lt;br&gt;The conference Sys ID is located in the Notify Conference Call [notify_conference_call] table. &lt;br&gt;Actions for which this parameter is required:  &lt;br&gt;• end  &lt;br&gt;• join  &lt;br&gt;• multiJoin  &lt;br&gt;• selfJoin  &lt;br&gt;<strong>Note:</strong> Participant actions such as mute, unmute, and kick do not require this parameter to be set as the method obtains this information from the Notify Conference Call Participant [notify_participant] table.</td>
</tr>
<tr>
<td>data.fromNumber</td>
<td>Service provider number to call into for the conference call. &lt;br&gt;Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table. &lt;br&gt;Actions for which this parameter is required:  &lt;br&gt;• start</td>
</tr>
<tr>
<td>data.isNewConference</td>
<td>Flag that indicates whether this is a new or an existing conference call. &lt;br&gt;Valid values:  &lt;br&gt;• true: New conference call  &lt;br&gt;• false: Existing conference call  &lt;br&gt;Default: false &lt;br&gt;Actions for which this parameter is valid:  &lt;br&gt;• start</td>
</tr>
</tbody>
</table>
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.items</td>
<td>Information for each participant to include in the conference call. Valid array values:</td>
</tr>
<tr>
<td></td>
<td>• id: Sys ID of user; located in the User [sys_User] table. Valid actions: join, multiJoin, start</td>
</tr>
<tr>
<td></td>
<td>• notifyParticipantId: Sys ID of the Notify participant; located in the Notify Participant [notify_participant] table. Valid actions: join, kick, multiJoin, mute, start, unmute</td>
</tr>
<tr>
<td></td>
<td>• phoneNumber: Phone number of the participant. If this value is passed in conjunction with either the id or notifyParticipantId, this value supersedes the phone numbers in the user/participant record and is used to place the call. Valid actions: join, multiJoin, start</td>
</tr>
<tr>
<td></td>
<td>• email: Email address of the participant. Valid actions: join, multiJoin, start</td>
</tr>
<tr>
<td>data.message</td>
<td>Message that is read aloud when a user answers the call, such as, &quot;P1 incident has been created please login to instance.&quot;</td>
</tr>
<tr>
<td></td>
<td>Actions for which this parameter is valid: start, join, multiJoin</td>
</tr>
<tr>
<td>data.serviceProvider</td>
<td>Required. Name of conference service provider, such as Zoom or Webex. Actions for which this parameter is required:</td>
</tr>
<tr>
<td></td>
<td>• all</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.sysId</td>
<td>Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. This parameter is used in conjunction with the data.Table, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid: • start</td>
</tr>
<tr>
<td>data.table</td>
<td>Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the data.sysId, data.addToWorkNotes, and allowMulticonference parameters. Actions for which this parameter is valid: • start</td>
</tr>
</tbody>
</table>

The following example shows how to call getNotifyActionTemplate() to obtain the data template necessary to define the actions for doConferenceAction().

```javascript
/**
 * @param {string} action - action to perform on the conference object or participant object
```
* @param {Array} participants;
*/

function doConferenceAction(action, participants) {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.serviceProvider = 'Telephony'; // e.g 'Zoom', 'WebEx'
    data.confId = 'Active conference sysId';
    data.items = participants;

    NotifyOnTaskClient.doConferenceAction(action, data).then(function (result) {
        var kickActionResult = result[0];
        if (kickActionResult.status)
            console.log(action + ' succeeded');
        else {
            kickActionResult.warnMessages.forEach(function (msg) {
                console.warn(msg);
            });
            kickActionResult.errorMessages.forEach(function (msg) {
                console.error(msg);
            });
        }
    }, function (errMsg) {
        console.log(errMsg)
    });
}

// kick participants
doConferenceAction('kick', [{notifyParticipantId: 'notifyParticipantSysId'}]);

// kick multiple participants
doConferenceAction('multiKick', [
    {notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// Mute participants
doConferenceAction('mute', [{notifyParticipantId: 'notifyParticipantSysId'}]);
doConferenceAction('mute', [{notifyParticipantId: 'notifyParticipantSysId'}]);
doConferenceAction('multiMute', [
    {notifyParticipantId: 'notifyParticipantSysId'},
    {notifyParticipantId: 'notifyParticipantSysId'}]);

// self join to any conference.
doConferenceAction('selfJoin', [{id: 'logged in userId'}]);

NotifyOnTaskClient - start(Object data)

Starts a new conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>Object that describes the conference call.</td>
</tr>
<tr>
<td>data.addToWorkNotes</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to add information about the participants that were included in the conference call in the work notes field of the associated record. For this functionality to work, you must also specify values for the <code>data.table</code> and <code>data.sysId</code> parameters to identify the record in which to add the work notes. Default: false</td>
</tr>
<tr>
<td>data.allowMulticonference</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to allow multiple conference calls for a specific record at one time. For this functionality to work, you must also specify values in the <code>data.table</code> and <code>data.sysId</code> parameters. These parameters identify the record that is allowed to have multiple conference calls. Default: false</td>
</tr>
<tr>
<td>data.fromNumber</td>
<td>String</td>
<td>Required. Service provider number to call into for the conference call. Locate this value in the Number or Phone number column of the Notify Phone Number [notify_number] table.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| data.items       | Array   | Optional. Information for each participant to include in the conference call. Valid array values:  
  • **id**: User Sys ID; located in the User [sys_User] table.  
  • **notifyParticipantId**: Participant Sys ID; located in the Notify Participant [notify_participant] table.  
  • **phoneNumber**: Phone number of the participant. If this value is passed in conjunction with either the **id** or **notifyParticipantId**, this value supersedes the phone numbers in the user/participant record and is used to place the call.  
  • **email**: Email address of the participant. |
| data.message     | String  | Optional. Message that is read aloud when a user answers the call, such as, "P1 incident has been created please login to instance." |
| data.serviceProvider | String | Required. Name of conference service provider, such as Zoom or Webex. |
| data.sysId       | String  | Optional. Sys ID of the source record to associate with the conference call. For example, if a conference call is held to discuss a specific incident or problem, put the Sys ID of the incident or problem record in this value. This Sys ID is stored in the Source column of the NotifyConference Call [notify_conference_call] table and can later be tracked. |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data.table</td>
<td>String</td>
<td>Optional. Table that contains the source record to associate with the conference call. A source record can be any record, such as an &quot;incident&quot; or &quot;problem&quot;, that is the topic of discussion in the conference call. This table name is stored in the Table column of the NotifyConference Call [notify_conference_call] table and can be tracked. This parameter is used in conjunction with the <code>data.sysId</code>, <code>data.addToWorkNotes</code>, and <code>allowMulticonference</code> parameters.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the conference action.</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.status</code>: Status of the conference action.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td>• Valid values:</td>
</tr>
<tr>
<td></td>
<td>◦ true: Conference action succeeded</td>
</tr>
<tr>
<td></td>
<td>◦ false: Conference action failed</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.successMessages</code>: If <code>status</code> is true, success message(s), else empty.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
<tr>
<td></td>
<td><code>&lt;action&gt;.warnMessages</code>: If <code>status</code> is false, any warning messages thrown during processing.</td>
</tr>
<tr>
<td></td>
<td>• Data type: Array of Strings</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;action&gt;.errorMessages:</td>
<td>If status is false, any error messages thrown during processing.</td>
</tr>
<tr>
<td>• Data type: Array of Strings</td>
<td></td>
</tr>
</tbody>
</table>

Example

```javascript
function startConferenceCall() {
    var data = NotifyOnTaskClient.getNotifyActionTemplate();
    data.table = 'incident';
    data.sysId = '1234';
    data.serviceProvider = serviceProvider;
    data.addToWorkNotes = true;
    data.fromNumber = 'Telephony Number';
    data.items.push({ id: 'userSysId' });
    data.items.push({ phoneNumber: '+917799555332' });
    data.items.push({ email: 'yln99517@gmail.com' });

    NotifyOnTaskClient.start(data).then(function (result) {
        var startActionResult = result[0];
        if(startActionResult.status) {
            startActionResult.successMessages.forEach(function(msg) {
                console.log(msg);
            });
            return;
        }
        startActionResult.warnMessages.forEach(function(msg) {
            console.warn(msg);
        });
        startActionResult.errorMessages.forEach(function(msg) {
            console.error(msg);
        });
        }, function (errMsg) {
            console.log(errMsg);
        });
    }
```
**NotifySMS - Global**

The NotifySMS API provides methods that enable you to send Short Message Service (SMS) messages from Notify telephone numbers to devices using either their telephone numbers or a GlideRecord that has a field that contains telephone number information.

To use this API you must activate the Notify (com.snc.notify) plugin.

**NotifySMS - NotifySMS()**

Creates an instance of a NotifySMS object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

This example shows how to instantiate a NotifySMS object.

```javascript
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
  var fromNumber = getFromNumber();
  var groupId = sourceRecord.assignment_group + ' ';
  var toGr = getRecipientGRs(groupId);
  var message = 'An Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to your group';
  if (fromNumber && toGr) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToUsers(fromNumber, toGr, message, sourceRecord);
  }
}
```

**NotifySMS - sendToNumber(String fromNumber, String toNumber, String message, Object sourceRecord)**

Sends a Short Message Service (SMS) message from a specified Notify telephone number to a specified telephone number.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated to the SMS message.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fromNumber</td>
<td>String</td>
<td>Notify telephone number sending the SMS message.</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Message to send.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord  - Global</td>
<td>Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.</td>
</tr>
<tr>
<td>toNumber</td>
<td>String</td>
<td>Telephone number of the device to receive the SMS message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example illustrates how to send an SMS message to a specified phone number and stamp the associated Incident record with the message information.

```javascript
var fromNumber = getFromNumber();
var toNumber = '+123456789';
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumber(fromNumber, toNumber, message, sourceRecord);
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop) {
        return getFallbackFromNumber();
    }
    return prop;
}
```
NotifySMS - sendToNumbers(String fromNumber, Array toNumber, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified Notify phone number to a list of phone numbers.

In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fromNumber</td>
<td>String</td>
<td>Notify telephone number sending the SMS message.</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Message to send.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord - Global</td>
<td>Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.</td>
</tr>
<tr>
<td>toNumber</td>
<td>Array</td>
<td>List of telephone numbers to receive the SMS message.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
The following example illustrates how to send an SMS message to multiple telephone numbers and store the information in the associated Incident record.

```javascript
var fromNumber = getFromNumber();
var toNumbers = getRecipientNumbers();
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumbers(fromNumber, toNumbers, message, sourceRecord);
}

function getRecipientNumbers() {
    var userGr = new GlideRecord('sys_user');
    userGr.addActiveQuery();
    userGr.addQuery('first_name', 'STARTSWITH', 'A');
    userGr.setLimit(5);
    userGr.query();
    var userIds = [];
    while (userGr.next()) {
        userIds.push(userGr.getUniqueValue());
    }
    if (userIds.length > 0) {
        var nUtil = new NotifyUtil();
        return nUtil.getUniquePhoneNumbersForUsersAndGroups(null, userIds, null, 'sms', false);
    }
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop) {
        return getFallbackFromNumber();
    }
    return prop;
}

function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord('notify_number');
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
```
NotifySMS - sendToUser(String fromNumber, Object toGr, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified phone number to the user identified in a specified GlideRecord.

This method extracts the telephone number from the specified GlideRecord. In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fromNumber</td>
<td>String</td>
<td>Notify telephone number sending the SMS message.</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Message to send.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.</td>
</tr>
</tbody>
</table>
| toGr            | GlideRecord      | GlideRecord of a record type that contains a field that resolves to a user's telephone number. The record type must correlate with the record type used by the phone number resolver that is currently implemented. A phone number resolver is simply a method that obtains the user telephone number from a specific type of GlideRecord, such as a User record or a Case record. When using the default resolver, the records correspond to the User [sys_user] table. To change the type of record that the resolver uses to obtain the telephone number, use the NotifySMS - setRecordToNumberResolver(Object

The following example illustrates how to send an SMS message to a user identified in the associated Incident record and stamp the associated Incident record with the message information.

```javascript
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var fromNumber = getFromNumber();
    var toGr = sourceRecord.assigned_to.getRefRecord();
    var message = 'An Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to you';
    if (fromNumber && toGr.isValidRecord()) {
        var notifySMS = new NotifySMS();
        notifySMS.sendToUser(fromNumber, toGr, message, sourceRecord);
    }
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop) {
        return getFallbackFromNumber();
    }
    return prop;
}

function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord('notify_number');
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
        return notifyNumGr.number + '';```
NotifySMS - sendToUsers(String fromNumber, Object toGr, String message, Object sourceRecord)

Sends a Short Message Service (SMS) message from a specified Notify phone number to users found in a specified GlideRecord.

This method extracts the destination telephone numbers from the passed-in GlideRecord. In addition, you can optionally associate the Incident record that caused the SMS message to be generated with the SMS message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fromNumber</td>
<td>String</td>
<td>Notify telephone number sending the SMS message.</td>
</tr>
<tr>
<td>message</td>
<td>String</td>
<td>Message to send.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Optional. Incident GlideRecord to store in the Source field of the associated SMS message record in the Notify Message [notify_message] table. This links the Incident record that caused the SMS message to be generated to that SMS message. Default: None. If this parameter is not passed in, this information is not tracked.</td>
</tr>
<tr>
<td>toGr</td>
<td>GlideRecord</td>
<td>GlideRecord of a record type that contains a field that resolves to a user's telephone number. The record type must correlate with the record type used by the phone number resolver that is currently implemented. A phone number resolver is simply a method that obtains the user telephone number from a specific type of GlideRecord, such as a User record or a Case record. When using the default resolver, the records correspond to the User [sys_user] table. To change the type of record that the resolver uses to obtain the telephone number, use the NotifySMS - setRecordToNumberResolver(Object scriptIncludeInstance, String methodName) method.</td>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This example shows how to send an SMS message to users within a specified incident record.

```
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var fromNumber = getFromNumber();
    var groupId = sourceRecord.assignment_group + '';
    var toGr = getRecipientGRs(groupId);
    var message = 'An Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to your group';
    if (fromNumber && toGr) {
        var notifySMS = new NotifySMS();
        notifySMS.sendToUsers(fromNumber, toGr, message, sourceRecord);
    }
}
```

```
function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop){
        return getFallbackFromNumber();
    }
    return prop;
}
```

```
function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord("notify_number");
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
        return notifyNumGr.number + '';
    }
    return ''; 
}
```

```
function getRecipientGRs(groupId) {
    if (!groupId)
```
```
return;
var userMemberGr = new GlideRecord('sys_user_grmember');
userMemberGr.addQuery('group', groupId);
userMemberGr.query();
var userIds = [];
while (userMemberGr.next()) {
    userIds.push(userMemberGr.user + '');
}
var userGr = new GlideRecord('sys_user');
userGr.addActiveQuery();
userGr.addQuery('sys_id', 'IN', userIds.join(','));
userGr.query();
return userGr;
}
```

**NotifySMS - setRecordToNumberResolver(Object scriptIncludeInstance, String methodName)**

Sets the method within a script include to use to obtain the target telephone number in the GlideRecord that is passed in the `NotifySMS.sendToUser()` and `NotifySMS.sendToUsers()` methods.

By default, the `NotifyUtil.getSMSNumberForUser()` method is used to obtain the telephone number from a User [sys_user] based GlideRecord. Use the `setRecordToNumberResolver()` method if you need to create a custom method to obtain this information from a different record type, such as a Case record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>methodName</td>
<td>String</td>
<td>Name of the method to use to obtain the target telephone number in a GlideRecord.</td>
</tr>
<tr>
<td>scriptIncludeInstance</td>
<td>Object</td>
<td>Instance of the script include that contains the specified number resolver method.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set the phone number resolver to the `getSMSNumberForConsumer()` method within the `csmUtils` script include.
// Script include that contains the logic to retrieve a phone number for a consumer.
var csmUtils = new global.CSMExampleUtils();

// Example Case record used as source for sending SMS
var caseGr = new GlideRecord('sn_customerservice_case');
caseGr.get('3af265b3d1cb5010f877cb055160faxx'); // Case sys_id

var notifySms = new global.NotifySMS();

// Use the getSMSNumberForConsumer method of the csmUtils script include (CSMExampleUtils)
to obtain the phone number of the consumer.
notifySms.setRecordToNumberResolver(csmUtils, 'getSMSNumberForConsumer');

// Send an SMS message to a user whose telephone number is in the specified Case GlideRecord.
var smsText = 'This is a test message for ' + caseGr.getValue('number');
notifySms.sendToUser('+1xxxxxxxxxx', caseGr.getValue('consumer'), smsText, caseGr); // First param is the Notify phone number

This example shows the code needed for the telephone resolver method getSMSNumberForConsumer().

getSMSNumberForConsumer: function(consumerGrOrId) {
    if (!consumerGrOrId) {
        return;
    }

    var consumerId, consumerGr;
    if (typeof consumerGrOrId === "string") {
        consumerId = consumerGrOrId;
    } else if (typeof consumerGrOrId === "object" && consumerGrOrId["isValidRecord"]) {
        consumerGr = consumerGrOrId;
        consumerId = consumerGr.getUniqueValue();
    }

    if (!consumerId) {
        return;
    }

    if (!consumerGr) {
        consumerGr = new GlideRecord('csm_consumer');
        consumerGr.get(consumerId);
    }

    if (consumerGr.isValidRecord()) {
        return consumerGr.getValue('mobile_phone');
    }
}
NotifyNow API (Legacy) - Global

The legacy NotifyNow API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

⚠️ Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>
// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));

// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
  var nn = new SNC.NotifyNow();
  gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));

  // you could have added the user by sys_id as well:
  // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39',
  // user.getValue('sys_id'));
} else {
  gs.log('no such user');
}

// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
  var nn = new SNC.NotifyNow();
  gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
  gs.log('no such conference call');
}

**NotifyNow - getReadyState()**

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```java
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

**NotifyNow - getStatus()**

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>The Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```java
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```
NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)

Initiate a new conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)

Initiate a new conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
    gs.log('adding user ' + user.getValue('name') + ' with phone number ' +
            user.getValue('mobile_phone') + ' to the participant array');
    participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
```
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
    // set up conference call
    var nn = new SNC.NotifyNow();
    var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);
    // check if the conference call was successfully created
    if (conferenceCall != null) {
        gs.log('started conference call: ' + conferenceCall.getUniqueValue());
    } else {
        gs.log('could not start the conference call :(');
    }
}

### NotifyNow - isCallable(String participant)

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>A sys_user or notifynow_participant record, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether this participant can be called or not.</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
    gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));

**NotifyNow - isSMSCapable()**
Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isSMSCapable(String userID)**
Checks if a user is able to send SMS messages.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + (new SNC.NotifyNow().isSMSCapable('<user sys_id>')) ? 'yes' : 'no'));

NotifyNow - isVoiceCapable()

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));

NotifyNow - isVoiceCapable(String userID)

Checks if a user is able to make voice calls.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' +
        ((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));

**NotifyNow - kick(GlideRecord participant)**
Removes a participant from a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

**NotifyNow - mute(GlideRecord participant)**
Mutes a participant on a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```

**NotifyNow - umute(GlideRecord participant)**

Unmutes a participant on a conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```
**NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)**

Send an email question to an email address.

The `sendEmailQuestion` method produces a question body and requires users to click a link to indicate their choice.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");

new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
    "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
    "b6071733bf1111003cf585ce2c07390f", current,
    "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com", "b6071733bf1111003cf585ce2c07390f", "Please answer this question");

**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");

**NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}
```

This example uses dot-walking and the current record as the source record.

```javascript
new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);
```

**NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)**

Sends an SMS question.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>An E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
</tbody>
</table>
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
    // send the sms question
    var number = "+31612345678";
    var nn = new SNC.NotifyNow();
    nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)

Converts a local phone number to an E.164-compliant phone number based on a user's location.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.get('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(), localPhoneNumber);

gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' + user.getValue('name') + '\''s location (' + user.getValue('location') + ') ');

### NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}

var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    }
}
var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);

NotifyNow - getFrequentlyCalledUsers(Number limit)

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>The maximum number of results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The frequently called users in alphabetical order.</td>
</tr>
</tbody>
</table>
while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' + fc.getValue('sys_id'));
}

### NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

### NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for voice calls.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);

NotifyNow - getPreferredEmailAddress(GlideRecord user)
Returns a user's preferred email address

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);

NotifyUtil - Global
The NotifyUtil API provides utility methods to use when interacting with Notify calls and SMS messages using server-side scripts.

To use this API you must activate the Notify (com.snc.notify) plugin.

Using the NotifyUtil API you can:

- Obtain all of the Notify telephone numbers and related Notify information from a specified source record.
- Obtain a list of unique Notify telephone numbers.
- Determine whether there are any active conference calls for the specified source record.
- Obtain the SMS-capable number associated with the specified Notify user.
- Validate a specified Notify telephone number.
NotifyUtil - NotifyUtil()

Instantiates a NotifyUtil class object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example instantiates a NotifyUtil object.

```javascript
var notifyUtil = new NotifyUtil();
notifyUtil.getTelephonyProviders();
```

NotifyUtil - getListOfNotifyNumbersAndProviders(String sourceTable, String sourceSysId, String notifyGroupSelectorSysId, Boolean filterSMSCapableNums)

Returns all of the Notify telephone numbers and related Notify information from a specified source record, such as an incident.

You can use this information to initiate a call or send an SMS message on a particular source record. The information that is returned is based on the configuration of the Notify Provider Selector framework. For additional information, see Notify

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| filterSMSCapableNums        | Boolean    | Optional. Flag that indicates if only numbers that are SMS-capable should be returned. Valid values:  
  • true: Only return SMS-capable telephone numbers and information.  
  • false: Return all notify telephone numbers and information.  
  Default: false |
| notifyGroupSelectorSysId    | String     | Optional. Sys_id of a Notify group for which to return the notify numbers and information.  
  Default: All groups |
| sourceSysId                 | String     | Sys_id of the source record for which to return the Notify numbers and information. For example, this |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>could be the sys_id of a record in the Incident [incident] table.</td>
</tr>
<tr>
<td>sourceTable</td>
<td>String</td>
<td>Name of the table that contains the source record that contains the desired Notify numbers and information.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>confProviders</td>
<td>List of available conference providers.</td>
</tr>
<tr>
<td></td>
<td>Data type: Array</td>
</tr>
<tr>
<td>numbers</td>
<td>List of objects, each describing a single Notify number.</td>
</tr>
<tr>
<td></td>
<td>Data type: Array</td>
</tr>
<tr>
<td></td>
<td>&quot;numbers&quot;: [{</td>
</tr>
<tr>
<td></td>
<td>&quot;defaultFlag&quot;: Boolean,</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;number&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;shortCode&quot;: Boolean,</td>
</tr>
<tr>
<td></td>
<td>&quot;sysId&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}]</td>
</tr>
</tbody>
</table>

- **numbers.defaultFlag**: Flag that indicates whether the associated Notify number is the default number. Possible values:
  - `true`: Default number
  - `false`: Not the default number
  - Data type: Boolean

- **numbers.name**: Name or label of the number.
  - Data type: String

- **numbers.number**: Notify number.
  - Data type: String

- **numbers.shortCode**: Flag that indicates whether the associated Notify number is a short code.
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Possible values:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• true: Short code</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Not a short code</td>
</tr>
<tr>
<td>numbers.sysId</td>
<td>Sys_id of the Notify number.</td>
<td>Data type: String</td>
</tr>
</tbody>
</table>

This example shows how to obtain the Notify telephone numbers and related Notify information from a specified source record.

```
function updateConferenceBridges(sourceTable, sourceId) {
    var notifyUtil = new global.NotifyUtil();
    var numbersAndProviders = notifyUtil.getListOfNotifyNumbersAndProviders(sourceTable, sourceId);
    var confBridges = [];
    if (numbersAndProviders.confProviders) {
        numbersAndProviders.confProviders.forEach(function(provider){
            confBridges.push(provider);
        });
    }
    if (numbersAndProviders.numbers) {
        numbersAndProviders.numbers.forEach(function(number){
            confBridges.push(number.name);
        });
    }
}
```

**NotifyUtil - getSMSNumberForUser(String userGROrId)**

Returns the SMS-capable number associated with the specified Notify user.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>user for whom to return the SMS-capable telephone number.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>User SMS-capable telephone number. Returns null if the specified user is not found.</td>
</tr>
</tbody>
</table>

This example shows how to obtain an SMS-capable telephone number using the associated GlideRecord.

```javascript
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var fromNumber = getFromNumber();
    var nUtil = new NotifyUtil();
    var toNumber = nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord());
    var message = 'Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to you.';
    if (fromNumber && nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber && 
        nUtil.validatePhoneNumber(toNumber)) {
        var notifySMS = new NotifySMS();
        notifySMS.sendToNumber(fromNumber, toNumber, message, sourceRecord);
    }
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop) {
        return getFallbackFromNumber();
    }
    return prop;
}

function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord('notify_number');
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
}
```
if (notifyNumGr.next()) {
    return notifyNumGr.number + '';
}
return '';

NotifyUtil - getUniquePhoneNumbersForUsersAndGroups(Array numbers, Array users, Array groups, String type, Boolean getData)

Returns a list of unique Notify telephone numbers.

If you don't pass any parameters in the call, all Notify numbers within the Notify Phone Number [notify_number] table are checked for duplicates, with each available phone number only appearing once in the returned list. You can refine the return results by specifying a list of users or groups to check, or by specifying a set of numbers or number types (SMS or voice.) You can also request that the metadata associated with each number be returned along with the unique numbers. If you do not want to use a parameter, simply pass `null` as a placeholder. For example: `return nUtil.getUniquePhoneNumbersForUsersAndGroups(null, userIds, null, 'sms', false);`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getData</td>
<td>Boolean</td>
<td>Optional. Flag that indicates whether to return metadata along with the list of unique phone numbers. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Return metadata.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Do not return metadata.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
<tr>
<td>groups</td>
<td>Array</td>
<td>Optional. List of sys_id groups to check. Located in the Group [sys_user_group] table. Default: Check all groups.</td>
</tr>
<tr>
<td>numbers</td>
<td>Array</td>
<td>Optional. List of specific Notify telephone numbers to check.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: Check all phone numbers.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Optional. Type of telephone numbers to check.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values (case-sensitive):</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>voice</td>
<td>• voice • sms</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Default: Check all phone number types</td>
<td></td>
</tr>
<tr>
<td>users</td>
<td>Array</td>
<td>Optional. List of sys_ids of specific users to check. Located in the User [sys_user] table. Default: Check all users</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numbers</td>
<td>Unique Notify telephone numbers. Data type: Array</td>
</tr>
<tr>
<td>result</td>
<td>Only returned if <code>getData</code> is set to true. Metadata associated with each unique number. Data type: Object</td>
</tr>
<tr>
<td></td>
<td>&quot;result&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;number&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;sysId&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;valid&quot;: Boolean</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>result.number</td>
<td>Unique Notify telephone number. Data type: String</td>
</tr>
<tr>
<td>result.sysId</td>
<td>Sys_id of the record that contains the Notify telephone number. Located in the Notify Phone Number [notify_number] table. Data type: String</td>
</tr>
<tr>
<td>result.type</td>
<td>Always contains &quot;u&quot; for user. Data type: String</td>
</tr>
<tr>
<td>result.valid</td>
<td>Flag that indicates whether the Notify telephone number is in valid E.164 format.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>• true: Valid E.164 format.</td>
</tr>
<tr>
<td></td>
<td>• false: Not in E.164 format.</td>
</tr>
</tbody>
</table>

Data type: Boolean

This example shows how to request a specific set of unique Notify telephone numbers that have SMS capabilities.

```javascript
var fromNumber = getFromNumber();
var toNumbers = getRecipientNumbers();
var message = 'This is an example SMS';
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var notifySMS = new NotifySMS();
    notifySMS.sendToNumber(fromNumber, toNumbers, message, sourceRecord);
}

function getRecipientNumbers() {
    var userGr = new GlideRecord('sys_user');
    userGr.addActiveQuery();
    userGr.addQuery('first_name', 'STARTSWITH', 'A');
    userGr.setLimit(5);
    userGr.query();
    var userIds = [];
    while (userGr.next()) {
        userIds.push(userGr.getUniqueValue());
    }
    if (userIds.length > 0) {
        var nUtil = new NotifyUtil();
        return nUtil.getUniquePhoneNumbersForUsersAndGroups(null, userIds, null, 'sms', false);
    }
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop){
        return getFallbackFromNumber();
    }
}
function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord("notify_number");
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
        return notifyNumGr.number + ' ';
    }
    return '';
}

NotifyUtil - hasActiveConferenceCalls(String sourceRecSysId)
Determines whether there are any active conference calls for the specified source record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceRecSysId</td>
<td>String</td>
<td>Sys_id of the record to check for active conference calls. For example the sys_id of a record in the Incident table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean   | Flag that indicates whether the specified record has associated active conference calls. Possible values:  
• true: Active conference calls are available for the specified record.  
• false: No active conference calls. |

This example displays an information message if there are any active conference calls associated with an incident record

(function executeRule(current, previous /*null when async*/) {
    var nUtil = new NotifyUtil();
    if (nUtil.hasActiveConferenceCalls(current.getUniqueValue())) {

return prop;
}
gs.addInfoMessage("There are active conference calls related to this Incident.");
}
})(current, previous);

**NotifyUtil - validateOutboundNotifyPhoneNumber(String number)**

Validates a specified Notify telephone number.

The method performs three types of validation:

1. Whether the Notify number exists in the Notify Phone Number [notify_number] table.
2. Whether the Notify number has a Notify group associated with it.
3. Whether the Notify number is active.

If any one of these validations fail, the method throws an exception.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>String</td>
<td>Notify number to validate.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example illustrates how to validate a notify number.

```javascript
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
if (sourceRecord.next()) {
    var fromNumber = getFromNumber();
    var nUtil = new NotifyUtil();
    var toNumber = nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord());
    var message = 'Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to you.';
    if (fromNumber && nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber &&
        nUtil.validatePhoneNumber(toNumber)) {
        var notifySMS = new NotifySMS();
        notifySMS.sendToNumber(fromNumber, toNumber, message, sourceRecord);
    }
}
```
function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop){
        return getFallbackFromNumber();
    }
    return prop;
}

function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord("notify_number");
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
        return notifyNumGr.number + '';
    }
    return '';
}

NotifyUtil - validatePhoneNumber(String number)
Verifies that the specified number is a valid E.164 telephone number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>String</td>
<td>Telephone number to validate.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the specified number is a valid telephone number.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>• true: Valid E.164 telephone number.</td>
</tr>
<tr>
<td></td>
<td>• false: Invalid telephone number.</td>
</tr>
</tbody>
</table>

This example illustrates how to validate a telephone number.

```javascript
var sourceRecord = new GlideRecord('incident');
sourceRecord.query();
```
if (sourceRecord.next()) {
    var fromNumber = getFromNumber();
    var nUtil = new NotifyUtil();
    var toNumber = nUtil.getSMSNumberForUser(sourceRecord.assigned_to.getRefRecord());
    var message = 'Incident ' + sourceRecord.getDisplayValue() + ' has been assigned to you.';
    if (fromNumber && nUtil.validateOutboundNotifyPhoneNumber(fromNumber) && toNumber &&
        nUtil.validatePhoneNumber(toNumber)) {
        var notifySMS = new NotifySMS();
        notifySMS.sendToNumber(fromNumber, toNumber, message, sourceRecord);
    }
}

function getFromNumber() {
    var prop = gs.getProperty('custom_property_name', '');
    if (!prop)
        return getFallbackFromNumber();
    return prop;
}

function getFallbackFromNumber() {
    var notifyNumGr = new GlideRecord("notify_number");
    notifyNumGr.addActiveQuery();
    notifyNumGr.addQuery('has_sms_out', 'yes');
    notifyNumGr.query();
    if (notifyNumGr.next()) {
        return notifyNumGr.number + '';
    }
    return '';}

openFrameAPI - Client

OpenFrame is an omni-present frame that communication partners can use to integrate their systems into the ServiceNow platform.

One of the core requirements is the ability to connect and serve code from different domains that can connect seamlessly with partner subsystems. This cross domain connection is required to keep connections and callbacks registered into communication systems without any cross domain issues.

OpenFrame has two significant parts: one that lives in the ServiceNow application (referred to as TopFrame) and this API that is sourced from the
partner application. This API has the necessary methods to communicate with TopFrame and control the visual features of the OpenFrame.

**Note:** To stay current with reference to the OpenFrame library, use the following resource URI: https://[servicenow instance]/scripts/openframe/latest/openFrameAPI.min.js.

**APIs not supported on Agent Workspace**
The following functionalities are not supported on Agent Workspace:

- openServiceNowList
- OpenCustomURL

**openFrameAPI - hide()**
Hides the OpenFrame in the TopFrame.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**openFrameAPI - init(Object config, function successCallback, function failureCallback)**
Initialize OpenFrame, must be the first method called.

This method initializes communication to TopFrame and initializes any visual elements passed in the config parameter.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Object</td>
<td>An object of key value pairs. The possible keys are height, width, title, subTitle, and titleIcon. All keys are optional.</td>
</tr>
<tr>
<td>successCallback</td>
<td>function</td>
<td>The callback function used if the init method succeeds. The openframe configuration stored in the system is passed as a parameter to the callback function.</td>
</tr>
<tr>
<td>failureCallback</td>
<td>function</td>
<td>The callback function used if the init method fails.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var config = { 
  height: 300, 
  width: 200 
};

function handleCommunicationEvent(context) {
  console.log("Communication from Topframe", context);
}

function initSuccess(snConfig) {
  console.log("openframe configuration", snConfig);
  // register for communication event from TopFrame
  openFrameAPI.subscribe(openFrameAPI.EVENTS.COMMUNICATION_EVENT, handleCommunicationEvent);
}

function initFailure(error) {
  console.log("OpenFrame init failed..", error);
}

openFrameAPI.init(config, initSuccess, initFailure);
```

**openFrameAPI - isVisible(function callback)**

Checks to see if the OpenFrame is visible in the TopFrame.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>function</td>
<td>The callback function receives a parameter with a value of true or false. True if OpenFrame is visible and false if not visible.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
function callback(isVisible) {
  console.log(isVisible)
}
openFrameAPI.isVisible(callback)
```

**openFrameAPI - openCustomURL(String details)**

Opens a custom URL in TopFrame.

ℹ️ **Note:** This API is not supported on Agent Workspace.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Url</td>
<td>String</td>
<td>A string of 2083 or fewer characters.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
openFrameAPI.openCustomURL('10_cool_things.do');
```

**openFrameAPI - openServiceNowForm(Object details)**

Opens a form URL.
When an agent receives an incoming call, the OpenFrame window displays information such as the account, contact, or consumer. Clicking a link in the OpenFrame window displays the corresponding record.

- In the platform interface, this API opens a form URL in TopFrame.
- For Agent Workspace, this API supports interaction tab management. In Agent Workspace, an interaction record opens in a parent tab and the specified entity record opens in a child tab under the interaction tab.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>details</td>
<td>Object</td>
<td>Key-value pairs that identify the form URL to open.</td>
</tr>
<tr>
<td>&quot;details&quot;: {</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;entity&quot;: &quot;String&quot;;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;interaction_sys_id&quot;: &quot;String&quot;;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>&quot;query&quot;: &quot;String&quot;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>details.entity</td>
<td>String</td>
<td>Table or entity name.</td>
</tr>
<tr>
<td>details.interaction_sys_id</td>
<td>String</td>
<td>Optional. Sys_id of the interaction record to open as parent tab in Agent Workspace.</td>
</tr>
<tr>
<td>details.query</td>
<td>String</td>
<td>Query to identify the record to open, such as: query:'sys_id=&lt;record_sys_id&gt;'.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows basic usage in platform:

```javascript
openFrameAPI.openServiceNowForm({entity:'customer_account',
query:'sys_id=447832786f0331003b3c498f5d3ee452',
'interaction_sys_id':'3be092313b711300758ce9b534efc4dd'});
```

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The following example shows how to use the `query` parameter to create a new record with data provided in the form by using `sysparm_query` and an encoded query to populate the first and last name fields in Workspace:

```javascript
openFrameAPI.openServiceNowForm({
    entity: 'sys_user',
    query: 'sys_id=-1&sysparm_query=first_name=Ivan^last_name=Greggor'
});
```

**openFrameAPI - openServiceNowList(Object details)**

Opens a list URL in TopFrame.

ℹ️ **Note:** This API is not supported on Agent Workspace.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>details</td>
<td>Object</td>
<td>An object of key value pairs. The possible keys are</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• entity, the table name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• query, an encoded query string</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
openFrameAPI.openServiceNowList({entity:'case', query:'active=true'});
```

**openFrameAPI - setFrameMode(mode)**

Sets the OpenFrame mode.

The mode passed in this API:

- Sets the appropriate icon in the header: collapse or expand
- Raises the relevant event for CTI:
  - `openFrameAPI.EVENTS.COLLAPSE`
  - `openFrameAPI.EVENTS.EXPAND`
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>String</td>
<td>Set OpenFrame Mode. Enumerated options:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. openFrameAPI.FRAME_MODE.COLLAPSE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. openFrameAPI.FRAME_MODE.EXPAND</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
openFrameAPI.setFrameMode(openFrameAPI.FRAME_MODE.COLLAPSE);
```

**openFrameAPI - setFrameMode(openFrameAPI.FRAME_MODE.COLLAPSE)**

Sets the OpenFrame height.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height</td>
<td>Number</td>
<td>Height in pixels</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
openFrameAPI.setHeight(100);
```

**openFrameAPI - setHeight(height)**

Sets the OpenFrame height.

**openFrameAPI - setIcons(Array icons)**

The OpenFrame header can include icons that are placed next to the close icon.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>icons</td>
<td>Array</td>
<td>A list of icon configurations, where each icon configuration is an object with key values <code>imageURL</code>, <code>imageTitle</code>, and any other needed context.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
```

**openFrameAPI - setPresenceIndicator(presence)**

Sets the presence indicator to display agent availability in a workspace.

For more information on configuring OpenFrame, refer to Create an OpenFrame configuration

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| state | String | Presence state of the agent. Default states:
- Available
- Away
- Offline
You can also specify custom states. |
| color | String | Presence indicator color on workspace. Supported colors:
- red
- orange |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>grey</td>
<td></td>
</tr>
<tr>
<td></td>
<td>green</td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
openframeAPI.setPresenceIndicator('Available', 'green');
```

**openFrameAPI - setSize(Number width, Number height)**

Sets the OpenFrame size.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Should be greater than zero.</td>
</tr>
<tr>
<td>height</td>
<td>Number</td>
<td>Should be greater than zero.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
openFrameAPI.setSize(300, 370);
```

**openFrameAPI - setSubtitle(String subTitle)**

Sets the OpenFrame subtitle.

```javascript
openFrameAPI.setSubtitle('Subtitle here');
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subTitle</td>
<td>String</td>
<td>A string of 256 or fewer characters.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
openFrameAPI.setSubtitle('+18888888888');
```

#### openFrameAPI - setTitle(String title)

Sets the OpenFrame title.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>String</td>
<td>A string of 256 or fewer characters.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
openFrameAPI.setTitle('Incoming Call');
```

#### openFrameAPI - setTitleIcon(Object icon)

Sets the OpenFrame's title icon.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>icon</td>
<td>Object</td>
<td>Object of key value pairs. Keys include imageUrl, imageTitle, and any other context needed.</td>
</tr>
</tbody>
</table>

```java
openFrameAPI.setTitleIcon('Incoming Call');
```
openFrameAPI.setTitleIcon({imageURL:'/my/image/path.png', imageTitle:'mute', id:101});

openFrameAPI.setTitleIcon({imageURL:'https://mydomain.com/image/path.png', imageTitle:'mute', id:101});

openFrameAPI.setTitleIcon({imageURL:'https://mydomain.com/image/path.png', imageTitle:'mute', id:101});

**openFrameAPI - setWidth(width)**

Sets the OpenFrame width.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>Number</td>
<td>Width in pixels</td>
</tr>
</tbody>
</table>

openFrameAPI.setWidth(100);

**openFrameAPI - show()**

Makes the OpenFrame visible in the TopFrame.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Returns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Description</strong></td>
<td></td>
</tr>
<tr>
<td>void</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`openFrameAPI.show()`

`openFrameAPI - subscribe(openFrameAPIEVENT event, function eventCallback)`
Subscribes to the event.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>openFrameAPIEVENT</td>
<td>One of the following events:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_agent_off_interaction: PLACEHOLDER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_awa_agent_presence: In Advanced Work Assignment (AWA), this event occurs when there is any change in the agent presence state. Computer Telephony Integration (CTI) developers can subscribe to the this event to receive presence state changes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_awa_workitem_accepted: PLACEHOLDER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_awa_workitem_offered: PLACEHOLDER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_awa_workitem_rejected: PLACEHOLDER</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframe_before_destroy: Occurs before the TopFrame is unloaded.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• openframeCollapse: Occurs when the collapse icon is clicked on the OpenFrame header.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>openframe_communication</td>
<td>Application-specific and can be customized.</td>
<td></td>
</tr>
<tr>
<td>openframe_communication_failure</td>
<td>Occurs when communication to TopFrame fails.</td>
<td></td>
</tr>
<tr>
<td>openframe_expand</td>
<td>Occurs when the expand icon is clicked on the OpenFrame header.</td>
<td></td>
</tr>
<tr>
<td>openframe_header_icon_clicked</td>
<td>Deprecated. Use openframe_icon_clicked or openframe_title_icon_clicked instead.</td>
<td></td>
</tr>
<tr>
<td>openframe_hidden</td>
<td>Occurs when the OpenFrame is hidden.</td>
<td></td>
</tr>
<tr>
<td>openframe_icon_clicked</td>
<td>Occurs when any icon other than the close icon is clicked on the OpenFrame footer. The callback receives the icon object as a parameter.</td>
<td></td>
</tr>
<tr>
<td>openframe_shown</td>
<td>Occurs when the OpenFrame is shown.</td>
<td></td>
</tr>
<tr>
<td>openframe_title_icon_clicked</td>
<td>Occurs when the title icon is clicked on the OpenFrame. The callback receives the titleIcon object as a parameter.</td>
<td></td>
</tr>
</tbody>
</table>

**eventCallback**
Function called when the specified event occurs.
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| None unless described otherwise.          | Most event subscriptions have no return values, with the following exception(s):

In AWA, the openframe_awa_agent_presence event returns the presence object:

- presence: Information about an agent's current presence state and channel. Output example below.
- presence.name: Name of the agent's presence state.
- presence.available: Flag that indicates whether the agent is available.
- presence.channels: List of objects that describe the available channels of communication with the agent.
- presence.channels.name: Channel name, such as Chat or Phone.
- presence.channels.available: Flag that indicates whether the channel is available.
- presence.channels.restrict_update: Flag that indicates whether the user can restrict updates. |

Example

```javascript
function handleIconClick(context) {
  console.log("Icon was clicked", context);
}
openFrameAPI.subscribe(openFrameAPI.events.openframe_awa_agent_presence, handleIconClick);
```

Output

```javascript
// Sample presence object output
// openframe_awa_agent_presence event only

{
  "result": {
    "presence": {
      "name": "Available",
      "..."  
  }
```

openFrameAPI - version()

Returns the OpenFrame API version.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The OpenFrame API version</td>
</tr>
</tbody>
</table>

```javascript
var version = openFrameAPI.version();
console.log("API version " + version);
```
OAuthUtil - Global

This script include modifies request parameters and parses the token response during runtime.

If the external OAuth provider returns a response other than an application/JSON type response, you can customize your own version of this script include to parse responses that are in different format. Extend or copy this script include, and then reference your version from the OAuth API Script field on the Application Registry form for third-party OAuth providers. The custom script include name must start with OAuth.

For example, if the OAuth provider requires a resource parameter with value https://outlook.office365.com, the code would look like:

```javascript
```

OAuthUtil - interceptRequestParameters(requestParamMap)

Adds a name:value pair to the request parameters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestParamMap</td>
<td>String</td>
<td>The name:value pair you want to add.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OAuthUtil - parseTokenResponse(accessTokenResponse)

Parses the token received into a parameter map.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessTokenResponse</td>
<td>String</td>
<td>The access token response that you want to parse.</td>
</tr>
</tbody>
</table>
**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRosterSpanApprovalUtil - Global**

The OCRosterSpanApprovalUtil API for the PTO approval feature.

**OCRosterSpanApprovalUtil - approvePTOSpan (GlideRecord rosterSpanGr)**

Changes the type of the roster_schedule_span to time-off from approval.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRosterSpanApprovalUtil - getContextualCalUrlPerSpanProposal (GlideRecord rosterSpanProposalGr)**

Returns a URL to the on-call calendar based on the rosterSpanProposalGr.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanProposalGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A URL to the on-call calendar based on the rosterSpanProposalGr.</td>
</tr>
</tbody>
</table>
OCRosterSpanApprovalUtil - getFromDateDisplayValuePerSpanProposal (GlideRecord rosterSpanProposalGr)

Returns a formatted GlideScheduleDateTime string based on the start date of the rosterSpanProposalGr.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanProposalGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A formatted GlideScheduleDateTime string based on the start date of the rosterSpanProposalGr.</td>
</tr>
</tbody>
</table>

OCRosterSpanApprovalUtil - getPTOApproversList (GlideRecord rosterSpanProposalGr)

Returns an array of group managers based on the user's rota groups.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanProposalGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of group managers based on the user's rota groups.</td>
</tr>
</tbody>
</table>

OCRosterSpanApprovalUtil - getToDateDisplayValuePerSpanProposal (rosterSpanProposalGr GlideRecord)

Returns a formatted GlideScheduleDateTime string based on the end date of the rosterSpanProposalGr.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanProposalGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A formatted GlideScheduleDateTime string based on the end date of the rosterSpanProposalGr.</td>
</tr>
</tbody>
</table>

#### OCRosterSpanApprovalUtil - getUserNamePerSpanProposal (GlideRecord rosterSpanProposalGr)

Returns the user's name based on rosterSpanProposalGr.

| Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanProposalGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The user's name based on rosterSpanProposalGr.</td>
</tr>
</tbody>
</table>

#### OCRosterSpanApprovalUtil - isPTOApprovalRequired ()

Checks whether the system property `com.snc.on_call_rotation.pto.approval.required` is true.

| Parameters
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the system property \texttt{com.snc.on_call_rotation.pto.approval.required} is true.</td>
</tr>
</tbody>
</table>

\textbf{OCRosterSpanApprovalUtil - rejectPTOSpan (rosterSpanGr GlideRecord)}

Changes the type of the roster\_schedule\_span to rejected from approval.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rosterSpanGr</td>
<td>GlideRecord</td>
<td>A roster_schedule_span_proposal record.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

\textbf{OCRotation - Global}

The core \texttt{ORotation} builds a data structure that is used to display the calendar.

The code builds up the GlideAJAXSchedulePage object which stores a list of span items. You can use this type for the Gwt (legacy) calendar. See the \texttt{OCRotationV2} API for other calendar types. This is part of On-Call Scheduling.

\textbf{Related information}

\texttt{OCRotationV2 - Global}

\texttt{OCRotation - buildRotas()}

Builds the on-call coverage based on your groups, rotas, and rosters. This is used by the \texttt{OCRotationV2 - getSpans} method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Void</td>
<td></td>
</tr>
</tbody>
</table>

Related reference

**OCRotationV2 - getSpans()**

**OCRotation - getEndDate()**

Returns the end date for the time period for which you want to retrieve on-call coverage.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>End date for the time period for which you want to retrieve on-call coverage.</td>
</tr>
</tbody>
</table>

**OCRotation - getGroupIds()**

Returns a comma separated list of group sys_id (sys_user_group) values for an on-call schedule.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Comma separated list of group sys_id (sys_user_group) values for an on-call schedule.</td>
</tr>
</tbody>
</table>
**OCRotation - getRosterIds()**

Returns the rosters according to the selected rotas.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Rosters according to the selected rotas.</td>
</tr>
</tbody>
</table>

**OCRotation - getRotaGr(String rotaIds, String groupIds, String rosterIds, String userIds)**

Returns a GlideRecord for the cmn_rota table filtered by groups, rota, users, and roster.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaIds</td>
<td>String</td>
<td>Comma separated list of rota sys_id (cmn_rota) values for an on-call schedule.</td>
</tr>
<tr>
<td>groupIds</td>
<td>String</td>
<td>Comma separated list of group sys_id (sys_user_group) values for an on-call schedule.</td>
</tr>
<tr>
<td>rosterIds</td>
<td>String</td>
<td>Comma separated list of roster sys_id (cmn_rota_roster) values for an on-call schedule.</td>
</tr>
<tr>
<td>userIds</td>
<td>String</td>
<td>Comma separated list of user sys_id (sys_user) values for an on-call schedule.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>A GlideRecord for the cmn_rota table filtered by groups, rota, users, and roster.</td>
</tr>
</tbody>
</table>
**OCRotation - getRotaIds()**
Returns the rotas for the groups on your calendar.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Rotas for the groups on your calendar.</td>
</tr>
</tbody>
</table>

**OCRotation - getStartDate()**
Returns the start date for the time period for which you want to retrieve on-call coverage.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Start date for the time period for which you want to retrieve on-call coverage.</td>
</tr>
</tbody>
</table>

**OCRotation - getTimezone()**
Returns the timezone that your on-call calendar will use.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Timezone that your on-call calendar will use. For example, <strong>Europe/Madrid</strong> and <strong>US/Pacific</strong>.</td>
</tr>
</tbody>
</table>

**OCRotation - getUserIDs()**

This will filter the schedules return by users. Get comma separated list of user `sys_id` (sys_user) values used to filter on-call schedules.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Comma separated list of user <code>sys_id</code> (sys_user) values used to filter on-call schedules.</td>
</tr>
</tbody>
</table>

**OCRotation - setEndDate(String endDate, Boolean inclusive)**

Set the end date for the time period for which you want to retrieve on-call coverage. If the end date is not set, then the last day of the next month is applied by default. Use in conjunction with **OCRotationV2 - getSpans**.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td><code>endDate</code></td>
</tr>
<tr>
<td><code>inclusive</code></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotationV2 - getSpans()**

---

**OCRotationV2 - Global**

**OCRotationV2** is an extension of **OCRotation**, which is used by Fullcalendar.io and the DHTMLX On-Call Calendar.

**OCRotationV2** is used to get the schedule time span between two dates that are further filtered by groups, rotas, rosters, and users. You can also extend **OCRotationV2** to add or modify behavior. This is part of On-Call Scheduling.

---

**OCRotationV2 - getGroups()**

Returns an array of groups that have active rotas.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of group objects. Each contains the following attributes:</td>
</tr>
<tr>
<td></td>
<td>• sys_id of the sys_user_group record</td>
</tr>
<tr>
<td></td>
<td>• name of the sys_user_group record</td>
</tr>
</tbody>
</table>

---

**OCRotationV2 - getRostersByRotas(String rotaSysIds)**

Returns an array of active rosters for a given rota ID.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Comma separated list of rota sys_id (cmn_rota) values.</td>
</tr>
</tbody>
</table>
returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of rota objects. Each contains the following attributes:</td>
</tr>
<tr>
<td></td>
<td>• sys_id of the cmn_rota_roster record</td>
</tr>
<tr>
<td></td>
<td>• name of the cmn_rota_roster record</td>
</tr>
<tr>
<td></td>
<td>• rota sys_id of the cmn_rota record</td>
</tr>
</tbody>
</table>

**OCRotationV2 - getRotasByGroup(String groupSysIds)**

Returns an array of active rotas for a given group ID.

**Params**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupSysIds</td>
<td>String</td>
<td>Comma separated list of group sys_id (sys_user_group) values.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of rota objects. Each contains the following attributes:</td>
</tr>
<tr>
<td></td>
<td>• sys_id of the cmn_rota record</td>
</tr>
<tr>
<td></td>
<td>• name of the cmn_rota record</td>
</tr>
<tr>
<td></td>
<td>• group sys_id of the sys_user_group record</td>
</tr>
</tbody>
</table>

**OCRotationV2 - getSpans()**

Get the spans from the specified start date to the specified end date. If no start and end dates are provided, the start date defaults to a month before and the end date defaults to a month after the current time. You can also use the groups IDs, rota IDs, roster IDs, user IDs to further filter the spans.

**Params**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of spans. Each contains the following attributes: id, sys_id,</td>
</tr>
<tr>
<td></td>
<td>table, rota_id, roster_id, user_id, text, description, color, textColor,</td>
</tr>
<tr>
<td></td>
<td>start_date, end_date.</td>
</tr>
</tbody>
</table>

Get all spans for the default time period

```javascript
var spans = new OCRotationV2().getSpans();
var firstSpanStartDate = spans[0].start_date; // get the first span's start date
```

Get all spans between 1st April 2014 and 5th June 2014

```javascript
var spans = new OCRotationV2()
  .setStartDate("2014-04-01")
  .setEndDate("2014-06-05")
  .getSpans();
```

Get the Network group's spans for the default time period

```javascript
var spans = new OCRotationV2()
  .setGroupIds("287ebd7da9fe198100f92cc8d1d2154e")
  .getSpans();
```

Get ITIL User's spans between 1st January 2014 and 31st January 2014

```javascript
var spans = new OCRotationV2()
  .setStartDate("2014-01-01")
  .setEndDate("2014-01-31")
  .setUserIds("681b365ec0a80164000fb0b05854a0cd")
  .getSpans();
```

**OCRotaICalendarSNC - Global**

The OCRotaICalendarSNC API provides iCal formatted events for the a specific user's rotation.

**OCRotaICalendarSNC - cleanExpiredCache ()**

Records in the cmn_rota_resp_cache table that have a From date prior to today.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OCRotaICalendarSNC - createCalendarEvents (String groupId, String rotaId, String userId, Object dateRangeObj)

Returns list of AJAXScheduleItems for the user's on-call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>String</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AJAXScheduleItem</td>
<td>Java list of AJAXScheduleItems.</td>
</tr>
</tbody>
</table>

OCRotaICalendarSNC - createCustomEvent (String groupName, Object scheduleItemSpan, String calendarLink)

Creates a VEVENT based on the scheduleItemSpan provided.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupName</td>
<td>String</td>
<td>Name of the on-call group.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleItemSpan</td>
<td>Object</td>
<td>Span of time for the on-call period.</td>
</tr>
<tr>
<td>calendarLink</td>
<td>String</td>
<td>A link back to the on-call calendar in the instance.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A VEVENT based on the scheduleItemSpan provided.</td>
</tr>
</tbody>
</table>

OCRotaICalendarSNC - createPlaceholderCalendar (GlideRecord rotaGR, Object dateRangeObj, String calendarLink)

Creates a formatted iCalendar if the user has no upcoming on-call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaGR</td>
<td>GlideRecord</td>
<td>The cmn_rota glide record.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
<tr>
<td>calendarLink</td>
<td>String</td>
<td>A link to the on-call calendar for this user.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Formatted iCalendar with a placeholder VEVENT.</td>
</tr>
</tbody>
</table>

OCRotaICalendarSNC - getCalendarEvents (String groupId, String rotaId, String userId, Object dateRangeObj, Boolean useCache)

Returns the formatted iCalendar for the user's rotation.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>String</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
<tr>
<td>useCache</td>
<td>Boolean</td>
<td>If true, makes use of the cache table cmn_rota_resp_cache.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Formatted iCalendar for the user's rotation.</td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - getEventsFromTable (String groupId, String rotaId, String userId, Object dateRangeObj)**

Returns the formatted iCalendar for the user's rotation if found in the cmn_rota_resp_cache table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>String</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Formatted iCalendar for the user's rotation if found in the cmn_rota_resp_cache table.</td>
</tr>
</tbody>
</table>
OCRotaCalendarSNC - getIntersectRotaSpanItem (ScheduleTimeSpan timeSpan, Array rotaSpanItems)

Checks whether the provided timeSpan intersects with one of the rota span items.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeSpan</td>
<td>ScheduleTimeSpan</td>
<td>A single span for the user’s on-call.</td>
</tr>
<tr>
<td>rotaSpanItems</td>
<td>Array</td>
<td>Contains the user’s standard on-call spans.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>If the timeSpan intersects with one of the rota span items, returns an object containing the rota span item and the span that it intersects with.</td>
</tr>
</tbody>
</table>

OCRotaCalendarSNC - getMemberCalendarURL (String groupId, Object rotaId, String userid)

Creates the subscribable URL for the user’s iCalendar.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>Object</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userid</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The subscribable URL for the user’s iCalendar.</td>
</tr>
</tbody>
</table>

OCRotaCalendarSNC - getOnCallCalendarURL (GlideRecord rotaGR)

Returns a URL to the on-call calendar based on the rota record.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaGR</td>
<td>GlideRecord</td>
<td>A cmn_rota record.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>URL to the on-call calendar based on the rota record.</td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - handleOverrideMember (AJAXScheduleItem scheduleItem)**

Returns an array of the user's overrides (extra coverage).

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleItem</td>
<td>AJAXScheduleItem</td>
<td>A list of AJAXScheduleItems.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of the user's overrides (extra coverage).</td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - handleRotaMember (AjaxScheduleItem scheduleItem, Object rotaSpanItems, Object definitionItems, Array repeatRotaSpanIdArr)**

Returns an object containing the user's override (extra coverage) and excluded spans.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleItem</td>
<td>AJAXScheduleItem</td>
<td>A list of AJAXScheduleItems.</td>
</tr>
<tr>
<td>rotaSpanItems</td>
<td>Object</td>
<td>Contains the user's standard on-call spans.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>definitionItems</td>
<td>Object</td>
<td>Contains the rota's standard on-call spans.</td>
</tr>
<tr>
<td>repeatRotaSpanIdArr</td>
<td>Array</td>
<td>An array of rota span sys ids.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contains the user's override (extra coverage) and excluded spans.</td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - invalRotaRespCache** (GlideRecord rotaRespCacheGR)

Used by business rules on the cmn_rota_member, cmn_schedule_span, and roster_schedule_span tables to update the cmn_rota Resp_cache table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaRespCacheGR</td>
<td>GlideRecord</td>
<td>Record that has been updated.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - matchRotaSpanRule** (ScheduleTimeSpan timeSpan, Array rotaSpanItems, Array repeatRotaSpanIdArr, Object seriesStartTimes)

Checks whether the provided timeSpan matches one of the rotaSpanItems.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeSpan</td>
<td>ScheduleTimeSpan</td>
<td>A single span for the user's on-call.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaSpanItems</td>
<td>Array</td>
<td>Contains the user's standard on-call spans.</td>
</tr>
<tr>
<td>repeatRotaSpanIdArr</td>
<td>Array</td>
<td>An array of rota span sys ids.</td>
</tr>
<tr>
<td>seriesStartTimes</td>
<td>Object</td>
<td>Start time of the rota spans.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the timeSpan matches one of the rotaSpanItems.</td>
</tr>
</tbody>
</table>

**OCRotaCalendarSNC - populateCalendarSubscriptionSettings ()**

Used by fixed job to populate the calendar subscription fields on the cmn_rota form

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotaCalendarSNC - processSeriesEvent (List scheduleItems, Array repeatRotaSpanIdArr, String userId)**

Returns an object containing the user's rotations.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleItems</td>
<td>List</td>
<td>The user's on-call rotation as an AJAXScheduleItem list.</td>
</tr>
<tr>
<td>repeatRotaSpanIdArr</td>
<td>Array</td>
<td>An array of the cmn_rota schedule span record sys_ids.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contains the user's rotations.</td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - saveCalendarEvents (String groupId, String rotaId, String userId, Object dateRangeObj, String result)**

Inserts the user's iCalendar into the cmn_rota_resp_cache table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>String</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
<tr>
<td>result</td>
<td>String</td>
<td>The user's iCalendar.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotaICalendarSNC - sendCalendarURL (GlideRecord rotaGR)**

Queues events to send an email to all members of the rotation.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaGR</td>
<td>GlideRecord</td>
<td>A cmn_rota record.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OCRotaICalendarSNC - updateExceptionList (AJAXScheduleItem scheduleItem, ScheduleTimeSpan timeSpan, Array rotaSpanItems)

Returns an object that contains all of the timeSpans that need to be excluded from the user's iCalendar.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scheduleItem</td>
<td>AJAXScheduleItem</td>
<td>One AJAXScheduleItem.</td>
</tr>
<tr>
<td>timeSpan</td>
<td>ScheduleTimeSpan</td>
<td>A single user's standard on-call span.</td>
</tr>
<tr>
<td>rotaSpanItems</td>
<td>Array</td>
<td>Contains the user's standard on-call spans.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object that contains all of the timeSpans that need to be excluded from the user's iCalendar.</td>
</tr>
</tbody>
</table>

### OCRotaICalendar - Global

The OCRotaICalendar API is an extension of the OCRotaICalendarSNC API.

### OCRotaMember - Global

The OCRotaMember API performs maintenance operations on the cmn_rota_member table.
**OCRotaMember - deactivateUser (String userId, GlideDateTime deactivateDate)**

Deactivates the user's rota member records according to the deactivate date.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userId</td>
<td>String</td>
<td>The sys id of the user.</td>
</tr>
<tr>
<td>deactivateDate</td>
<td>GlideDateTime</td>
<td>The date from which the user's rotation is deactivated.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotaMember - hasChanged (GlideRecord current, GlideRecord previous)**

Checks whether the cmn_rota_member record has changed. Checks the Member, From, To, and Order fields have changed.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>The latest changes made to the cmn_rota_member record.</td>
</tr>
<tr>
<td>previous</td>
<td>GlideRecord</td>
<td>The original state of the cmn_rota_member record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCRotaMember - hasOrderChanged (GlideRecord current, GlideRecord previous)**

On update of a cmn_rota_member record, checks whether the order of the record has changed.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>The latest changes made to the cmn_rota_member record.</td>
</tr>
<tr>
<td>previous</td>
<td>GlideRecord</td>
<td>The original state of the cmn_rota_member record.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the order has changed.</td>
</tr>
</tbody>
</table>

### OCRotaMember - recalculate (GlideRecord current, GlideRecord previous)

Recalculates the schedule for the cmn_rota_member record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>The latest changes made to the cmn_rota_member record.</td>
</tr>
<tr>
<td>previous</td>
<td>GlideRecord</td>
<td>The original state of the cmn_rota_member record.</td>
</tr>
</tbody>
</table>

### Returns

| Type       | Description
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### OCRotaMember - validateDates (String from, String to)

Ensures that the From date occurs before or on the same date as the To date.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>String</td>
<td>Formatted date/</td>
</tr>
<tr>
<td>to</td>
<td>String</td>
<td>Formatted date/</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the From date is before or on same date as To date.</td>
</tr>
</tbody>
</table>

**OnCallContactPreferenceUtil - Global**

Utility for handling contact preferences.

For contact preference configuration, see [Configure contact preferences](#).

This utility API supports the [OnCallRotation API](#).

**OnCallContactPreferenceUtil - OnCallContactPreferenceUtil()**

Creates an instance of the OnCallContactPreferenceUtil class.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**OnCallContactPreferenceUtil - getContactsAtByEscalatee(Object escalatee, Number contactAttempt, GlideDateTime gdt, String rotaSysIds)**

Gets a list of contacts with the escalatee object. Each returned contact contains a list of user contact preferences.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>escalatee</td>
<td>Object</td>
<td>Mandatory. Escalatee object returned by the getEscalationPlan() method.</td>
</tr>
<tr>
<td>contactAttempt</td>
<td>Number</td>
<td>Optional. The attempt you are trying to contact [ default value = 1 ].</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: First attempt</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2: First reminder</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 3 or more: Subsequent reminders</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.admin</td>
</tr>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Optional. Comma-separated string of Sys IDs of shifts from the [cmn_rota] table. Default value returns Sys IDs of the shifts at current time.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array object</td>
<td>Array of escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position.</td>
</tr>
<tr>
<td>type: String</td>
<td>Type of contact, e.g., user.</td>
</tr>
<tr>
<td>sys_id: String</td>
<td>Sys ID of the user from the [sys_user] table.</td>
</tr>
<tr>
<td>rota_id: String</td>
<td>Sys ID of the shift from the [cmn_rota] table.</td>
</tr>
<tr>
<td>roster_id: String</td>
<td>Sys ID of the roster from the [cmn_rota_roster] table.</td>
</tr>
<tr>
<td>escalation_step_id: String</td>
<td>If an escalation path has been defined, Sys ID of the escalation step from the [cmn_rota_esc_step_def] table.</td>
</tr>
<tr>
<td>forced_communication_channel: String</td>
<td>String. If specified in the preferences, mandatory communication channel. Supported values include SMS, voice or email.</td>
</tr>
<tr>
<td>override_user_contact_preference: Boolean</td>
<td>Boolean. True if there are contact overrides, false otherwise.</td>
</tr>
<tr>
<td>preference_source: String</td>
<td>String. Source of preference, such as contact or group.</td>
</tr>
<tr>
<td>contact_attempt: Number</td>
<td>Contact attempts: 1 = first attempt, 2 = first reminder, and so on.</td>
</tr>
<tr>
<td>user_preferences: Array Object</td>
<td>Array Object.</td>
</tr>
</tbody>
</table>
**Returns (continued)**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦</td>
<td>type: String. User’s preferred contact format, e.g. sms, email, or number.</td>
</tr>
<tr>
<td>◦</td>
<td>&lt;name of preferred format, e.g., email or number&gt;: String. Content of preferred contact type, e.g., email address or phone number.</td>
</tr>
</tbody>
</table>

• contact_preferences, Array Object.
  ◦ type: String. User’s preferred contact format, e.g., email or number.
  ◦ <name of preferred format, e.g., email or number>: String. Content of preferred contact type, e.g., email address or phone number.

**Example:**

```javascript
var serviceDeskSysId = '<Sys_ID>';  
var ocRotation = new OnCallRotation();  
var escalationPlan = ocRotation.getEscalationPlan(serviceDeskSysId);  
var escalatee = escalationPlan[0];  
  
var onContactPrefUtil = new OnCallContactPreferenceUtil();  
var contactAttempt = 1;  
var gdt = new GlideDateTime();  
var contacts = onContactPrefUtil.getContactsAtByEscalatee(escalatee, contactAttempt, gdt);  
gs.log(JSON.stringify(contacts));
```

**Output:**

```json
[
  {
    "type": "user",
    "sys_id": "<Sys_ID>",
    "rota_id": "<Rotation_ID>",
    "roster_id": "",
    "escalation_step_id": "<Escalation_Step_ID>",
    "forced_communication_channel": "",
    "override_user_contact_preference": true,
    ".preference_source": "contact",
    "contact_attempt": 1,
    "user_preferences": [
```
OnCallContactPreferenceUtil - getUserPreferences(String userSysId, Number contactAttempt, GlideDateTime gdt, String communicationTypes)

Gets the list of contact preferences at the time at which the user has opted for communication. If no time is specified, then current time is used. This method is applicable to single and overlapping shifts.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userSysId</td>
<td>String</td>
<td>Sys ID of the user from the [sys_user] table.</td>
</tr>
<tr>
<td>contactAttempt</td>
<td>Number</td>
<td>Optional. The attempt you are trying to contact [ default value = 1 ].</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 1: First attempt</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 2: First reminder</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 3 or more: Subsequent reminders</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.</td>
</tr>
<tr>
<td>communicationTypes</td>
<td>String</td>
<td>Optional. Comma-separated string containing one or more of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• email</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• sms</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• voice</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default includes all available communication types.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Array Object</td>
<td>On-call user contact preference.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• type: String. User's preferred contact format, e.g. sms, email, or number.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• &lt;name of preferred format, e.g., email or number&gt;: String. Content of</td>
<td></td>
</tr>
<tr>
<td></td>
<td>preferred contact type, e.g., email address or phone number.</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```javascript
var onContactPrefUtil = new OnCallContactPreferenceUtil();
var contactAttempt = 1;
var gdt = new GlideDateTime();
var itilUserSysId = '<itilUserSysId>;';
var userPreferences = onContactPrefUtil.getUserPreferences(itilUserSysId, contactAttempt, gdt);
gs.log(JSON.stringify(userPreferences));
```

Output:

```json
[{  
    "type": "sms",
    "number": "5555555555"
}, {
    "type": "voice",
    "number": "5555555555"
}]
```

**OnCallContactPreferenceUtil - getCatchAllContacts(String rotaId, GlideDateTime gdt)**

Gets a list of catch-all contacts and preferences.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaId</td>
<td>String</td>
<td>Sys ID of the shift from the [cmn_rota] table.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>Optional. yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array object</td>
<td>List of catch-all contacts with preferences.</td>
</tr>
<tr>
<td></td>
<td>• type: String. Type of contact, e.g., user.</td>
</tr>
<tr>
<td></td>
<td>• sys_id: String. Sys ID of the user from the [sys_user] table.</td>
</tr>
<tr>
<td></td>
<td>• rota_id: String. Sys ID of the shift from the [cmn_rota] table.</td>
</tr>
<tr>
<td></td>
<td>• roster_id: String. Sys ID of the roster from the [cmn_rota_roster] table.</td>
</tr>
<tr>
<td></td>
<td>• escalation_step_id: String. If an escalation path has been defined, Sys ID of the escalation step from the [cmn_rota_esc_step_def] table.</td>
</tr>
<tr>
<td></td>
<td>• forced_communication_channel: String. If specified in the preferences, mandatory communication channel. Supported values include SMS, voice or email.</td>
</tr>
<tr>
<td></td>
<td>• override_user_contact_preference: Boolean. True if there are contact overrides, false otherwise.</td>
</tr>
<tr>
<td></td>
<td>• preference_source: String. Source of preference, such as contact or group.</td>
</tr>
<tr>
<td></td>
<td>• contact_attempt: Number. Contact attempts: 1 = first attempt, 2 = first reminder, and so on.</td>
</tr>
<tr>
<td></td>
<td>• user_preferences: Array Object.</td>
</tr>
<tr>
<td></td>
<td>• type: String. User's preferred contact format, e.g. sms, email, or number.</td>
</tr>
<tr>
<td></td>
<td>• &lt;name of preferred format, e.g., email or number&gt;: String. Content of preferred contact type, e.g., email address or phone number.</td>
</tr>
<tr>
<td></td>
<td>• contact_preferences, Array Object.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ type: String. User's preferred contact format, e.g., email or number.</td>
<td></td>
</tr>
<tr>
<td>◦ &lt;name of preferred format, e.g., email or number&gt;: String. Content of preferred contact type, e.g., email address or phone number.</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```javascript
var onContactPrefUtil = new OnCallContactPreferenceUtil();
var contactAttempt = 1;
var gdt = new GlideDateTime();
var rotaSysId = '<Rotation_Sys_ID>'; 
var catchAllContacts = onContactPrefUtil.getCatchAllContacts(rotaSysId, gdt);
gs.log(JSON.stringify(catchAllContacts));
```

Output:

```json
[
  {
    "type": "user",
    "sys_id": "<Sys_ID>",
    "rota_id": "<Rotation_ID>",
    "roster_id": "",
    "escalation_step_id": "<Escalation_Step_ID>",
    "forced_communication_channel": "",
    "override_user_contact_preference": true,
    "preference_source": "contact",
    "contact_attempt": 1,
    "user_preferences": [
      {
        "type": "sms",
        "number": "8587200477"
      }
    ],
    "contact_preferences": [
      {
        "type": "voice",
        "number": "5555555555"
      }
    ]
  }
]
```

OnCallRotation - Global

Use to manage on-call schedules.
For information, see On-call scheduling

**OnCallRotation - getCatchAll(String rotaID)**

Gets the sys_id of the catch all person. Use together with the `getCatchAllType()` method to determine the source of the returned id. This API is applicable for a single shift, overlapping shifts, and custom escalation.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaID</td>
<td>String</td>
<td>The sys_id of the rota.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of a sys_user, a cmn_rota_roster, or null.</td>
</tr>
</tbody>
</table>

```javascript
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var catchAll = onCallRotation.getCatchAll(rotaSysId);
gs.log(catchAll);
```

**Output:**

46d44a23a9fe19810012d100cca80666

**OnCallRotation - getCatchAllType(String rotaID)**

Gets the type of _catch all_ that lives at the end of the escalation chain. When the escalation chain finishes without assigning an on-call person, if configured, the incident is assigned to the _catch all_. This API is applicable for a single shift, overlapping shifts, and custom escalation.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaID</td>
<td>String</td>
<td>The sys_id of the rota.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String | • Null: invalid rota id or catch all is not available.  
        | • Group_manager: the manager of the group linked to the rota is the catch all person.  
        | • Individual: a configured user is the catch all person.  
        | • All: all members of the configured roster are the catch all person. |

```javascript
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var catchAllType = onCallRotation.getCatchAllType(rotaSysId);
gs.log(catchAllType);
```

Output:

`group_manager`

---

**OnCallRotation - getEscalatees(String groupSysIds, String rotaSysIds, String rosterSysIds, GlideDateTime gdt, GlideRecord taskGr)**

Gets a list of escalatees that are on-call for a given time. If no time is specified, then the current time is used. If no groupSysIds are provided, empty list is returned. This API is applicable for a single shift, overlapping shifts, and custom escalation.

**Note:** Set the taskGR parameter to enable escalation plan evaluation.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupSysIds</td>
<td>String</td>
<td>Comma-separated list of sys_ids of the sys_user_group, to filter the records by.</td>
</tr>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota sys_ids to filter the records by.</td>
</tr>
<tr>
<td>rosterSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota_roster sys_ids to filter the records by.</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDate</td>
<td>Date in the UTC timezone</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskGr</td>
<td>GlideRecord</td>
<td>Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Escalatee information such as userLds, deviceLds, and escalationGroups.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.getEscalatees(groupSysId, '', '', currentTime);
gs.log(JSON.stringify(result));
```

Output:

For single shift:

```json
[
{
  "memberId": "119f399173062300e7af6238edf6a7e7",

/**
 * create a custom escalation for service desk shift with condition as P1 for Incident
 * taskGr is optional parameter
 * if taskGr is empty then it returns list of escalatees in default escalation plan
 * if taskGr is passed then escalation policies are executed evaluated in order and list of escalatees in corresponding escalation plan is returned
 **/
var serviceDeskSysId = 'd625dccec0a8016700a222a0f7900d06';
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
var escalatees = ocRotation.getEscalatees(serviceDeskSysId, null, null, null, null, taskGr);
gs.log(JSON.stringify(escalatees));
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupID</td>
<td>String</td>
<td>The sys_id for the group from which to get the item to escalate.</td>
</tr>
<tr>
<td>dateTime</td>
<td>GlideDateTime</td>
<td>The date and time when the escalation lineup should begin.</td>
</tr>
<tr>
<td>position</td>
<td>Number</td>
<td>The position in the lineup to determine the item to escalate to (1-based, which means the count starts with 1).</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The item to escalate to, that is, escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position. Returns null if nothing is found.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatee = onCallRotation.getEscalateeAt(groupSysId, currentTime, 1);
gs.log(escalatee.name);
```

Output:

Abel Tuter

**OnCallRotation - getEscalationPlan(String groupSysId, GlideDateTime gdt, String rotaSysIds, GlideRecord taskGr)**

Gets a list of objects to escalate to, escalation plans that consist of either a user [sys_user] or notification device [cmn_notif_device], for a group’s shift at the specified date and time. This API is applicable for a single shift, overlapping shifts, and custom escalation.

The Escalation object contains the following fields:

- **Number order**: the escalation order within the lineup
- **String userId**: sys_id of the sys_user record or null
• String deviceId: sys_id of the cmn_notif_device record or null
• Boolean isDevice: true or false depending on whether the item to escalate to is a device or user
• GlideDuration timeBetweenReminders: the time between reminders being sent
• Number reminderNum: number of reminders to be sent for each item to escalate to

⚠️ Note: Set the taskGR parameter to enable escalation plan evaluation.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupID</td>
<td>String</td>
<td>sys_id for the group for which you need the escalation plan.</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>Date and time when the escalation lineup should begin. Default is now. yyyy-MM-dd HH:mm:ss is the format in UTC timezone.</td>
</tr>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota sys_ids to filter the records by.</td>
</tr>
<tr>
<td>taskGr</td>
<td>GlideRecord</td>
<td>Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>A list of escalation objects to escalate to.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.getEscalationPlan(groupSysId, currentTime);
gs.log(JSON.stringify(result));
```

Output:
For single shift:

var escalationPlan = ocRotation.getEscalationPlan(serviceDeskSysId, null, null, taskGr);
gs.log(JSON.stringify(escalationPlan));
```

**OnCallRotation - getEscalationType(String rotaID)**

Gets the type of escalation based on a simple calculation. If there is one active roster in the rota, rotate through members. If there is more than one active roster in the rota, rotate through rosters. This API is applicable for a single shift, overlapping shifts, and custom escalation.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaID</td>
<td>String</td>
<td>The sys_id for the rota to check for rosters.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>• Member: if there is one roster in the rota.</td>
</tr>
<tr>
<td></td>
<td>• Roster: if there is more than one roster in the rota.</td>
</tr>
<tr>
<td></td>
<td>• No rosters in this rota: if none of the above.</td>
</tr>
<tr>
<td></td>
<td>• Custom: If the custom escalation is applicable.</td>
</tr>
</tbody>
</table>
var rotaSysId = '349f399173062300e7af6238edf6a75e';
var onCallRotation = new OnCallRotation();
var escalationType = onCallRotation.getEscalationType(rotaSysId);
gs.log(escalationType);

Output:

custom

**OnCallRotation - OnCallRotation()**

Creates an instance of the OnCallRotation class.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

var oncall = new OnCallRotation();

**OnCallRotation - spansOverlap(ArrayList parent, ArrayList child, String timeZone)**

Checks if the parent span and child spans overlap.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parent</td>
<td>ArrayList</td>
<td>The parent spans to compare.</td>
</tr>
<tr>
<td>child</td>
<td>ArrayList</td>
<td>The child spans to compare.</td>
</tr>
<tr>
<td>timeZone</td>
<td>String</td>
<td>The name of the time zone.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the parent and child spans overlap.</td>
</tr>
</tbody>
</table>

var onCall = new OnCallRotation();

// get a time range we are interested in
var timeZone = gs.getSession().getTimeZoneName();
var dateStart = new GlideDateTime();
var dateEnd = new GlideDateTime().addMonths(1);

// convert glidedatetime to scheduledatetime because it is required
// by the function being called below
var scheduleStart = new GlideScheduleDateTime(dateStart);
var scheduleEnd = new GlideScheduleDateTime(dateEnd);
scheduleStart.setTimeZone(timeZone);
scheduleEnd.setTimeZone(timeZone);

// calculate rotation items based on the date and time given
// for all the groups the currently logged in user is a member of
gs.include("OnCallRotationPersonal");
var rotation = new OnCallRotationPersonal();
var myGroups = gs.getUser().getMyGroups();
var groupIter = myGroups.iterator();

while(groupIter.hasNext()){ 
  var rotaItems = rotation.onCallDuringPeriod(groupIter.next(), scheduleStart, scheduleEnd);

  // loop through rotation schedules
  for (var i = 0; i < rotaItems.length - 1; i++) {
    var parentItem = rotaItems[i];
    var nextItem = rotaItems[i + 1];

    // check if previous and next time spans overlap
    var overlaps = onCall.spansOverlap(parentItem.getTimeSpans(), nextItem.getTimeSpans(),
    gs.getSession().getTimeZoneName());
  }
}

---

**OnCallRotation - getEscalateesAt(String groupSysId, GlideDateTime gdt, Number position, GlideRecord taskGr)**

Gets the escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position. This API is applicable for a single shift, overlapping shifts and custom escalation.

⚠️ Note: Set the taskGR parameter to enable escalation plan evaluation.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupSysId</td>
<td>String</td>
<td>ys_id of the group.</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.</td>
</tr>
<tr>
<td>position</td>
<td>Number</td>
<td>Position of the escalation step.</td>
</tr>
<tr>
<td>taskGr</td>
<td>GlideRecord</td>
<td>Optional. Current task record. If taskGr is empty, this method returns the default escalation plan. If taskGr is passed, escalation policies are evaluated in order and this method returns the corresponding escalation plan.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>Array of escalatees (either a user, group, or device records depending on the notification rules) at a specific time and position.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatees = onCallRotation.getEscalateesAt(groupSysId, currentTime, 1);
for (var i = 0; i < escalatees.length; i++) {
gs.log(escalatees[i].name);
}
```

Output:

For overlapping shifts:

Abel Tuter  
Barbara Hindley

For custom escalation:

Abel Tuter  
Beth Anglin  
Change Management  
Barbara Hindley
// Create a custom escalation for service desk shift with condition as P1 for Incident
var serviceDeskSysId = 'd625dcce0a8016700a222a0f7900d06';
// optional parameter taskGr
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
var position = 1;
var escalatees = ocRotation.getEscalateesAt(serviceDeskSysId, new GlideDateTime(),
    position, taskGr);

// if taskGr is empty then it returns escalatees at a position in default escalation plan
// if taskGr is passed then escalation policies are executed evaluated in order and
// escalatees at a position in corresponding escalation plan is returned
for (var i = 0; i < escalatees.length; i++) {
    gs.log(escalatees[i].getDisplayValue());
}

OnCallRotation - getPrimaryUser()

Gets the sys_id of the current primary contact when there is a single shift.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>sys_id of the current primary contact.</td>
</tr>
</tbody>
</table>

Example:

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUser();
```

Output:
OnCallRotation - getPrimaryUserByRota(String rotaId)

Gets the sys_id of the current primary user of the specified shift. This API is applicable for a single shift and overlapping shifts.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaId</td>
<td>String</td>
<td>sys_id of the cmn_rota.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>sys_id of the current primary user of the specified shift.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var rotaId = '349f399173062300e7af6238edf6a75e';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUserByRota(rotaId);
gs.log(primaryUser);
```

Output:

62826bf03710200044e0bfc8bcbe5df1

OnCallRotation - getPrimaryUserName()

Gets the name of the current primary contact. This API is applicable for a single shift.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current primary contact.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUserName();
gs.log(primaryUser);
```

Output:

Abel Tuter

---

**OnCallRotation - getPrimaryUserNameByRota(String rotaId)**

Gets the name of the current primary user of the specified shift. This API is applicable for a single shift and overlapping shifts.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaId</td>
<td>String</td>
<td>sys_id of the cmn_rota.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current primary user of the specified shift.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var rotaId = '349f399173062300e7af6238edf6a75e';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUserNameByRota(rotaId);
gs.log(primaryUser);
```

Output:
OnCallRotation - getPrimaryUsers()

Gets the list of primary contacts for a shift. This API is applicable for a single shift, overlapping shifts, and custom escalation.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>List of primary contacts.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096f59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
var primaryUser = onCallRotation.getPrimaryUser();
gs.log(JSON.stringify(primaryUser));
```

**Output:**

```json
{
  "349f399173062300e7af6238edf6a75e": {
    "userSysId": "62826bf03710200044e0bfc8bcbe5df1",
    "userName": "Abel Tuter"
  },
  "35af799173062300e7af6238edf6a79e": {
    "userSysId": "d2826bf03710200044e0bfc8bcbe5dc9",
    "userName": "Barbara Hindley"
  }
}
```
OnCallRotation - whoIsOnCall(String groupSysIds, String rotaSysIds, String rosterSysIds, GlideDateTime gdt)

Gets the list of users that are on-call at a given time. If no time is specified, then current time is used. This API is applicable for a single shift and overlapping shifts.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupSysIds</td>
<td>String</td>
<td>Comma-separated list of sys_ids of the sys_user_group, to filter the records by.</td>
</tr>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota sys_ids to filter the records by.</td>
</tr>
<tr>
<td>rosterSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota_roster sys_ids to filter the records by.</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>Date in the UTC timezone</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>List of users, groups, or devices that are on-call at a given time. For example, information about userIds, deviceIds, and escalationGroups.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var escalatees = onCallRotation.whoIsOnCall(groupSysId, "", "", currentTime);
gs.log(JSON.stringify(escalatees));
```

**Output:**

For single shift:

```json

OnCallRotation - who(String groupSysId, GlideDateTime gdt, Boolean nullifyOverrideRoster, String rotaSysIds, Boolean overrideCustomEscalation, GlideRecord taskGR)

Specifies if there is an on-call user, group, or device. This API is applicable for a single shift, overlapping shifts, and custom escalation.

ℹ️ Note: Set the taskGR parameter to enable escalation plan evaluation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupSysId</td>
<td>String</td>
<td>Sys ID of the group to check for.</td>
</tr>
<tr>
<td>gdt</td>
<td>GlideDateTime</td>
<td>yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.</td>
</tr>
<tr>
<td>nullifyOverrideRoster</td>
<td>Boolean</td>
<td>True if notification list for this group is not for a specific roster, false otherwise.</td>
</tr>
<tr>
<td>rotaSysIds</td>
<td>String</td>
<td>Comma-separated list of cmn_rota sys_ids to filter the records by.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overrideCustomEscalation</td>
<td>Boolean</td>
<td>True to override default escalation policy with custom escalation, false otherwise.</td>
</tr>
<tr>
<td>taskGR</td>
<td>String</td>
<td>Optional. Current task record. If invoked with the optional taskGr parameter, this method populates escalatees based on escalation conditions.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if at least one match is found, false otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.who(groupSysId, currentTime);
gs.log(result);
```

Output:

```javascript
true
```

The following example shows how to create a custom escalation for service desk shift with condition P1 for an incident.

```javascript
/**
 * When the who() method is invoked with the optional taskGr parameter, 
 * escalatees are populated based on the conditional escalations
 */
var serviceDeskSysId = 'd625dccec0a8016700a222a0f7900d06';
var taskGr = new GlideRecord('incident');
taskGr.get('ed92e8d173d023002728660c4cf6a7bc');

var ocRotation = new OnCallRotation();
ocRotation.who(serviceDeskSysId, null, null, null, null, taskGr);
while (ocRotation.next()) {
```

OnCallRotation - whoAt(String groupSysId, GlideDateTime gdt, String rotaSysIds)

Specifies if there is an on-call user, group, or device. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

| Name       | Type            | Description                                                                 |
|------------|-----------------|                                                                            |
| groupSysId | String          | Sys ID of the group.                                                       |
| gdt        | GlideDateTime   | yyyy-MM-dd HH:mm:ss format in the UTC timezone. Default is now.            |
| rotaSysIds | String          | Comma-separated list of cmn_rota Sys IDs to filter the records by.         |

Returns

| Type      | Description                                                                 |
|-----------|                                                                            |
| Boolean   | True if there is at least one on-call user, group, or device; false otherwise. |

```javascript
var groupSysId = '096fb59173062300e7af6238edf6a783';
var currentTime = new GlideDateTime();
var onCallRotation = new OnCallRotation();
var result = onCallRotation.whoAt(groupSysId, currentTime);
gs.log(result);
```

Output:

```javascript
true
```
OnCallRotation - startEscalations(GlideRecord now_GR, String eventName, String escalationScriptName)

Start the escalations for a document(incident now_GR) and group, and specify the event name for the escalation notifications. In addition, specify the name of the business rule to call when an escalation occurs. This method should be used after a succesful call to who or whoAt methods. This API is applicable for a single shift, overlapping shifts, and custom escalation.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>Document glide record. For example, Incident now_GR.</td>
</tr>
<tr>
<td>eventName</td>
<td>String</td>
<td>Event name for the escalation notifications.</td>
</tr>
<tr>
<td>escalationScriptName</td>
<td>String</td>
<td>Business rule to call when escalation occurs</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OnCallRotation - addCurrentToNotified()

Add the current escalation member to the list of notified users so that the API knows who has been contacted. This API is applicable for a single shift, overlapping shifts, and custom escalation.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
OnCallRotation - whoIsNext(GlideRecord escalationGr)

Escalation business rules determine who in the shift should be contacted next. The escalation record passed to the method tracks the escalation between invocations of the business rule. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>escalationGr</td>
<td>GlideRecord</td>
<td>GlideRecord of Rotation escalation [cmn_rota_escalation].</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

OnCallRotation - continueEscalations(GlideRecord escalationGr)

Continue the escalations for a document(incident now_GR) and group. This API is applicable for a single shift, overlapping shifts, and custom escalation.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>escalationGr</td>
<td>GlideRecord</td>
<td>GlideRecord of Rotation escalation(cmn_rota_escalation)</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OnCallRotation - cancelEscalations(GlideRecord escalationGr)

Cancels any escalations for the GlideRecord that were started with the startEscalations API. This API is applicable for a single shift, overlapping shifts, and custom escalation.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>escalationGr</td>
<td>GlideRecord</td>
<td>GlideRecord of Rotation escalation(cm_rota_escalation)</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**OCSeriesEventGenerator - Global**

The OCSeriesEventGenerator API generates the repeating VEVENTS for a user's iCalendar.

**OCSeriesEventGenerator - getMemberCalendar (String groupId, String rotaId, String userId, Object dateRangeObj, Object memberSchedules, String calendarLink)**

Returns an array of the repeating on-call events.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupId</td>
<td>String</td>
<td>The group sys id.</td>
</tr>
<tr>
<td>rotaId</td>
<td>String</td>
<td>The rota sys id.</td>
</tr>
<tr>
<td>userId</td>
<td>String</td>
<td>The user sys id.</td>
</tr>
<tr>
<td>dateRangeObj</td>
<td>Object</td>
<td>Contains the from and to dates for the data set.</td>
</tr>
<tr>
<td>memberSchedules</td>
<td>Object</td>
<td>The user's schedule.</td>
</tr>
<tr>
<td>calendarLink</td>
<td>String</td>
<td>A link back to the on-call calendar in the instance.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of the repeating on-call events.</td>
</tr>
</tbody>
</table>
OCSeriesEventGenerator - getRosterICalEvents (GlideRecord rotaScheduleSpanGR, GlideRecord memberScheduleSpanGR, Array seriesStartTimes, Object excludeItems, String repeatUntil, String timeZone, String calendarLink)

Returns an array of VEVENTs that represent the on-call for the provided rotaScheduleSpanGR and the memberScheduleSpanGR.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaScheduleSpanGR</td>
<td>GlideRecord</td>
<td>A cmn_schedule_span glide record for a rota.</td>
</tr>
<tr>
<td>memberScheduleSpanGR</td>
<td>GlideRecord</td>
<td>A cmn_schedule_span glide record for a rota member.</td>
</tr>
<tr>
<td>seriesStartTimes</td>
<td>Array</td>
<td>An array of the repeating rota span start times.</td>
</tr>
<tr>
<td>excludeItems</td>
<td>Object</td>
<td>The schedule items that need to be excluded.</td>
</tr>
<tr>
<td>repeatUntil</td>
<td>String</td>
<td>A formatted ScheduleDateTime string.</td>
</tr>
<tr>
<td>timeZone</td>
<td>String</td>
<td>Time zone for the on-call rota.</td>
</tr>
<tr>
<td>calendarLink</td>
<td>String</td>
<td>A link to the on-call calendar for this user.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of VEVENTs that represent the on-call for the provided rotaScheduleSpanGR and the memberScheduleSpanGR.</td>
</tr>
</tbody>
</table>

OCSeriesEventGenerator - getRosterMemberEvents (GlideRecord rotaMemberGR, Array seriesStartTimes, Object excludeItems, String repeatUntil, String calendarLink)

Returns an array of the repeating on-call VEVENTS.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rotaMemberGR</td>
<td>GlideRecord</td>
<td>A cmn_rota_member record.</td>
</tr>
<tr>
<td>seriesStartTimes</td>
<td>Array</td>
<td>An array of the repeating rota span start times.</td>
</tr>
<tr>
<td>excludeItems</td>
<td>Object</td>
<td>The schedule items that need to be excluded.</td>
</tr>
<tr>
<td>repeatUntil</td>
<td>String</td>
<td>A formatted ScheduleDateTime string.</td>
</tr>
<tr>
<td>calendarLink</td>
<td>String</td>
<td>A link to the on-call calendar for this user.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of the repeating on-call VEVENTS</td>
</tr>
</tbody>
</table>

OCTimer - Global

The OCTimer API provides the ability to track the length of time it takes for a function to complete.

OCTimer - log (String name, String entry)

Logs the entry based on the function name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Function name.</td>
</tr>
<tr>
<td>entry</td>
<td>String</td>
<td>Text that will be part of the output in the log.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

OCTimer - millisToTime (Integer millis)

Takes a millisecond value and returns a formatted duration.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>millis</td>
<td>Integer</td>
<td>Duration in milliseconds.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A formatted duration.</td>
</tr>
</tbody>
</table>

#### OCTimer - result ()
Calculates the time taken for each function registered.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Time taken for each function registered.</td>
</tr>
</tbody>
</table>

#### OCTimer - start (String name)
Initializes a timer based on the name provided.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Function name.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**OCTimer - stop (String name)**

Registers the end of the timer for the provided name.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Function name.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**Optional - Scoped, Global**

The Optional API interacts with a single record returned by the GlideQuery, Stream, or GlideRecord APIs, even when it does not exist. Write scripts that are less likely to result in an error by handling null or undefined query results.

You can get an Optional object in these ways:

- Return an Optional object from these methods in the GlideQuery class. For more information, see GlideQuery.
  - getBy()
  - get()
  - insert()
  - insertOrUpdate()
  - update()
  - selectOne()
  - avg()
  - max()
  - min()
  - sum()

- Return an Optional object from the find() method in the Stream class. For more information on Stream, see the Stream API.

- Use the lazy() method to generate the value of the Optional if ever needed.

These methods are static and do not require an instance of the class:
You can use these static methods with any API that returns a single value such as GlideRecord.

Use the Optional API in scoped or global server-side scripts. This API requires the GlideQuery [com.sn glidequery] plugin.

Implementation

This API can work with the GlideQuery and Stream APIs in a builder pattern where the method calls chain together, each method building on the returned result of the previous method. Use methods to define the attributes of the query. The methods do not execute until you call a terminal method, a method that returns a query result, allowing you to define the requirements of the query before executing it.

If the query returns a single record, the system wraps the result in an Optional object. If the query returns a stream of records, the system wraps the result in a Stream object. These objects let you manage the result using a set of methods in each API.

For example, here's a script that performs a query on the Task table and groups the records by priority and returns groups with total reassignments greater than four.

```javascript
var query = new global.GlideQuery('task')
  .where('active', true) //Returns new GlideQuery object with a "where" clause.
  .groupBy('priority') //Returns new GlideQuery object with a "group by" clause.
  .aggregate('sum', 'reassignment_count') //Returns new GlideQuery object with a "sum(reassignment_count)" clause.
  .having('sum', 'reassignment_count', '>', 4) //Returns new GlideQuery object with a "having reassignment_count > 4" clause.
  .select() //Returns a stream of records wrapped in a Stream object.
  .toArray(10); //Terminal method in the Stream class that executes the query and returns the result.
```

Terminal methods

For performance reasons, a query only fetches data when you call a terminal method. These are the terminal methods from the Optional class:
• get()
• orElse()
• ifPresent()
• isEmpty()
• isPresent()

Optional - empty(String reason)
Returns an empty Optional object. Use this method in an Else clause to handle a query that might not return a result.

ℹ️ Note: This method is static. You do not need an instance of the class to use this method.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>String</td>
<td>Optional. Reason displayed in the log when Optional.get() is called on the empty Optional object.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Object used to interact with a single record.</td>
</tr>
</tbody>
</table>

This example shows you how to generate an empty Optional object when a query does not return a result.

```java
var now_GR = new GlideRecord('task');
now_GR.addQuery('approval', 'not requested');
now_GR.query();
var optional;
if (now_GR.next()) {
    optional = Optional.of(now_GR.getUniqueValue());
} else {
    optional = Optional.empty("no results");
}
gs.info(optional.get());
```

Output:
Optional - filter(Function predicate)

Applies a predicate function, a function that takes a single value and returns true or false, to the record inside the Optional object. If the function returns true, the method returns the Optional record unchanged. If the function returns false, it returns an empty Optional object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>predicate</td>
<td>Function</td>
<td>Predicate function to apply to the value inside the Optional object. Must return a Boolean value.</td>
</tr>
</tbody>
</table>

This example shows you how to apply a filter function to an Optional result.

```java
var filteredQuery = new global.GlideQuery('sys_user')
  .getBy({ sys_id: 'f682abf03710200044e0bfc8bcbe5d38' }, ['phone'])
  .filter(function (user) {
    return phoneRegex.test(user.phone);
  });
```

Optional - flatMap(Function fn)

Applies a function that returns an Optional object to the result of a query. Use this method to perform a second query using the result of the first.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to apply to the results of the query that returned the Optional object.</td>
</tr>
</tbody>
</table>
This example shows how to execute a query of the User table based on the result of a previous query.

```javascript
new global.GlideQuery('alm_asset')
  .whereNotNull('owned_by')
  .selectOne('owned_by')
  .flatMap(function (asset) {
    return new global.GlideQuery('sys_user')
      .getBy({ sys_id: asset.owned_by }, ['first_name', 'last_name', 'company.name'])
  })
  .ifPresent(GQ.jsonDebug);
```

Output:

```json
{
  "sys_id": "46d59205a9fe198101d603f5de37bfa3",
  "first_name": "John",
  "last_name": "Bohnhamn",
  "company": {
    "name": "ACME North America"
  }
}
```

### Optional - get()

Returns the record inside the Optional object, or throws an error if the query does not return a record.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>The record inside the Optional object. If the value is null or undefined, the system throws an error.</td>
</tr>
</tbody>
</table>
This example shows how to get the value of a single record.

```javascript
var value = new global.GlideQuery('sys_user')
    .selectOne('first_name') //Returns the result of the query inside an Optional object
    .get(); //Calls Optional.get() on the Optional object

gs.info(JSON.stringify(value));
```

Output:

```json
{
    "first_name": "fred",
    "sys_id": "005d500b536073005e0addeeff7b12f4"
}
```

**Optional - ifPresent(Function fn)**

Applies a function to the record within an Optional object. If the Optional object does not contain a record, the function does not execute.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>The function to apply to the record within the Optional object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to print a value if it exists.

```javascript
var user = new global.GlideQuery('sys_user')
    .where('sys_id', 'f682abf03710200044e0bfc8bcbe5d38')
    .selectOne('zip')
    .ifPresent(function (user) {
        gs.info('Zip Code: ' + user.zip);
    });
```

**Optional - isEmpty()**

Returns true if the Optional object is empty.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the result of a query contains a value.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: The query returns null or undefined.</td>
</tr>
<tr>
<td></td>
<td>• false: The query returns a value.</td>
</tr>
</tbody>
</table>

This example shows how to check whether the result of a query is empty.

```javascript
var checkEmpty = new global.GlideQuery('sys_user')
  .where('last_name', 'Barker')
  .selectOne()
  .isEmpty();

gs.info(checkEmpty);
```

Output:

```
true
```

Optional - isPresent()

Checks whether an Optional object contains a value.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the result of a query contains a value.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: The query returns a value.</td>
</tr>
<tr>
<td></td>
<td>• false: The query returns null or undefined.</td>
</tr>
</tbody>
</table>

This example shows how to check whether a query returns a result.

```javascript
var checkPresent = new global.GlideQuery('sys_user')
    .where('last_name', 'Luddy')
    .selectOne('first_name')
    .isPresent();

gs.info(checkPresent);
```

Output:

```javascript
true
```

**Optional - lazy(Function lazyGetFn)**

Returns a new Optional object. Instead of containing the record, the object contains a function to get the record that is only called if and when requested in the code.

Use this method to delay getting the value until it's needed. You might do this if requesting the value from a slow source and don't want to slow down your code unnecessarily. Otherwise, you can return an Optional object using the GlideQuery and Stream APIs.

⚠️ **Note:** This method is static. You do not need an instance of the class to use this method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lazyGetFn</td>
<td>Function</td>
<td>Function that returns a single record as a result of a query. For example:</td>
</tr>
</tbody>
</table>
|          |         | ```javascript
        var userGr = new GlideRecord('sys_user');
    ``` |
This example shows how to get an Optional object based on a GlideRecord query.

```javascript
var userOptional = global.Optional.lazy(function () {
    var userGr = new GlideRecord('sys_user');
    userGr.setLimit(1);
    userGr.query();
    return userGr.next() ? userGr.getUniqueValue() : null;
});
gs.info(userOptional);
```

Output:

Optional<005d500b536073005e0addeeff7b12f4>

### Optional - map(Function fn)

Applies a function to the result of a query.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to apply to the result of the query.</td>
</tr>
</tbody>
</table>

This example shows how to apply a function that transforms a value to upper case to the result of a query.

```javascript
var value = new global.GlideQuery('sys_user')
    .whereNotNull('first_name')
    .selectOne('first_name')
    .map(function (user) {
```

return user.first_name.toUpperCase();
});

gs.info(value);

Output:

Optional<ABEL>

Optional - of(Any value)
Wraps a given value in an Optional object. For example, you can wrap the result of a GlideRecord query in an Optional object to use the associated methods.

Note: This method is static. You do not need an instance of the class to use this method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Any</td>
<td>Value inside the Optional object.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td>Object containing the passed-in value in the format Optional&lt;value&gt;.</td>
</tr>
</tbody>
</table>

This example shows you how to generate an Optional object based on a GlideRecord query.

```javascript
var now_GR = new GlideRecord('task');
now_GR.addQuery('approval', 'not requested');
now_GR.query();
var optional;
if (now_GR.next()) {
  optional = Optional.of(now_GR.getUniqueValue());
} else {
  optional = Optional.empty("no results");
}
gs.info(optional.get());
```

Output:
Optional - orElse(Any defaultValue)

Adds a default value within the Optional object if the query does not return any results.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultValue</td>
<td>Any</td>
<td>Value within the Optional object if the query does not return any results.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Value within the Optional object if the query does not return any results.</td>
</tr>
</tbody>
</table>

This example shows how to return a value, even when the query is incorrect.

```
var user = new global.GlideQuery('sys_user')
  .get('1234', ['first_name', 'last_name'])
  .orElse({ first_name: 'Default', last_name: 'User' });

gs.info(JSON.stringify(user))
```

Output:

```
{
  "first_name": "Default",
  "last_name": "User"
}
```

**OrderGuide - Scoped**

The OrderGuide API enables you to initialize and view order guide details.

To use this class in a scoped application, use the `sn_sc` namespace identifier. The Service Catalog Scoped API plugin (com.glideapp.servicecatalog scopedefault is required to access the OrderGuide API.

**OrderGuide - OrderGuide(String sys_id)**

Creates an instance of the OrderGuide class with the specified sys_id.
### OrderGuide - getID()

Returns the `sys_id` of the order guide.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><code>sys_id</code> of the order guide.</td>
</tr>
</tbody>
</table>

#### Example:

```javascript
var cart = new sn_sc.OrderGuide("6690750f4f7b4200086eed18110c761");
console.log(cart.getID());
```

**Output:**

`6690750f4f7b4200086eed18110c761`

### OrderGuide - init(Map request)

Initialises the order guide with the specified catalog items and the variables, and returns the order guide.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Map</td>
<td>A JSON object with the Catalog item and variable details.</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map</td>
<td>A JSON object with the initialised order guide details.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var guide = new sn_sc.OrderGuide('6690750f4f7b4200086eed18110c761');

var map = {};  
map.variables = {};  
//map.sysparm_id = '6690750f4f7b4200086eed18110c761';  
map.variables['IOC633d0f4f7b4200086eed18110c74d'] =  
'221f3db5c6112284009f4becd3039cc9';  //Here ce433d0f4f7b4200086eed18110c74d is the sys_id  
of the variable and 221f3db5c6112284009f4becd3039cc9 is its value

var includedItems = guide.init(map)
```

**Output:**

```javascript
{
  "cascade_variable_map": {},
  "items": [
    {
      "order": "-1",
      "quantity": "1",
      "show_quantity": false,
      "sys_id": "a4022d7b87c20300e3010cf888cb0bb2"
    },
    {
      "order": "300",
      "quantity": "1",
      "show_quantity": false,
      "sys_id": "186d917a6fab7980575967d3d9d3e4f2"
    },
    {
      "order": "600",
      "quantity": "1",
      "show_quantity": false,
      "sys_id": "3b3ae7feda1be1004e5c08239e522b"
    }
  ],
  "variable_assignments":{}
}
```
**OrderGuide - isIncludeItems()**

Specifies if the **Show Include Toggle** (include_items) check box is selected for the specified order guide.

⚠️ **Note:** The **Show Include Toggle** field does not appear on the Order guide form by default.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Example**

```javascript
var orderGuide = new sn_sc.OrderGuide("6690750f4f7b4200086eeed18110c761");
console.log(orderGuide.isIncludeItems());
```

**Output:**

`true`

**OrderGuide - isTwoStep()**

Specifies if the two-step checkout is enabled.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the two-step checkout is enabled. Else returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var orderGuide=new sn_sc.OrderGuide("6690750f4f7b4200086eed18110c761");
console.log(orderGuide.isTwoStep());
```

**Output:**
```
false
```

---

**OrderGuide - isUseCustomCart()**

Specifies if a separate cart (different from that for catalog items) usage is enabled for a two-step order guide.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if a separate cart usage is enabled for a two-step order guide. Else, returns false.</td>
</tr>
</tbody>
</table>

**Example:**

```javascript
var orderGuide=new sn_sc.OrderGuide("6690750f4f7b4200086eed18110c761");
console.log(orderGuide.isUseCustomCart());
```

**Output:**
```
false
```

---

**OrderGuide - navigateFromMap(Map itemDetails)**

Navigates to the catalog items of an order guide.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>itemDetails</td>
<td>Map</td>
<td>A JSON object with details of catalog items in the order guide.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```javascript
var orderGuide=new sn_sc.OrderGuide.navigateFromMap(itemdetails);
```

PADomainUtils - Global

The PADomainUtils API enables you to copy Performance Analytics records between different domains on the same instance.

Use this API in server scripts to copy Performance Analytics records such as indicators, breakdowns, and dashboards, to different domains. This API enables you to create a Performance Analytics record in one domain and copy that record to any number of additional domains.

⚠ Note: This API cannot copy records into the Global domain.

To use PADomainUtils, you must satisfy these requirements:

- Performance Analytics must be enabled.
- The user running the script must have the admin role.
- The instance must use domain separation.
- The script must be run from the global domain.
- When moving or copying records, the source and target domains must be different.

PADomainUtils - copy(String runAs)

Copies Performance Analytics records to a different domain.

To copy dashboards or scheduled jobs, see copyDashboard and copyJob.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>runAs</td>
<td>String</td>
<td>The user whose domain you want to copy records to.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// copy all the Performance Analytics records from global to user's domain
var pa = new SNC.PADomainUtils();
pa.copy('09ff3d105f231000b12e3572f2b4775d');
```

### PADomainUtils - copyDashboard(String dashboardId, String runAs)

Copy a dashboard to another domain.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dashboardId</td>
<td>String</td>
<td>The sys_id of the dashboard to copy.</td>
</tr>
<tr>
<td>runAs</td>
<td>String</td>
<td>The user whose domain you want to copy the dashboard to.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
//Copy Incident Management dashboard from global to user's domain
var pa = new SNC.PADomainUtils();
pa.copyDashboard('a64b7031d7201100b96d45a3ce610335','09ff3d105f231000b12e3572f2b4775d');
```

### PADomainUtils - copyJob(String paJob, String runAs)

Copies a Performance Analytics scheduled data collection job record to another domain.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paJob</td>
<td>String</td>
<td>The sys_id of a Performance Analytics scheduled data collection job [sysauto_pa] record.</td>
</tr>
<tr>
<td>runAs</td>
<td>String</td>
<td>The user whose domain you want to copy the job to.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>An error message if an error occurs, or an empty string if there is no error.</td>
</tr>
</tbody>
</table>

```javascript
// No source domain needs to be set
var pa = new SNC.PADomainUtils();
// copy the ['PA Incident] Daily Data Collection job'
// set the 'run as' of the new record to be the 'acme.itil' user
// first argument is the sys_id of the sysauto_pa record
// the second is the sys_id of the acme.itil user record
pa.copyJob('82ba2023d7101100b96d45a3ce6103cd', '797d14341f1310005a3637b8ec8b7010');
```

## PADomainUtils - isWriteable(String table, String id)

Evaluate if you can write to a specific record identified by table and sys_id.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>String</td>
<td>The name of the table containing the record to query, such as pa_indicators.</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>The sys_id of the record to query.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Indicates that you can write to the specified record. Returns true if the record exists within the domain of the current user. Returns false if the record does not exist, or is in a different domain.</td>
</tr>
</tbody>
</table>
PADomainUtils - move(String runAs)

Moves Performance Analytics records to a different domain.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>runAs</td>
<td>String</td>
<td>The user whose domain you want to copy records to.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

// move all the Performance Analytics records from the global to the customers domain
var pa = new SNC.PADomainUtils();
pa.move('774190f01f1310005a3637b8ec8b70ef')

PADomainUtils - PADomainUtils()

Instantiates a new PADomainUtils object to move or copy Performance Analytics records from the global domain.

Use the PADomainUtils(String domainFrom) constructor instead when moving or copying records from a domain other than the global domain.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

// PADomainUtils initialized with the global domain
var globalUtils = new SNC.PADomainUtils();
PADomainUtils - PADomainUtils(String domainFrom)

 Instantiates a new PADomainUtils object to move or copy Performance Analytics records from the specified domain.

 Use the PADomainUtils() constructor instead when moving or copying from the global domain.

 Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainFrom</td>
<td>String</td>
<td>The domain to copy records from.</td>
</tr>
</tbody>
</table>

// c90d4b084a362312013398f051272c0d is the sys id of the ACME domain
var acmeUtils = new SNC.PADomainUtils('c90d4b084a362312013398f051272c0d');

PADomainUtils - setFoundation(Boolean foundation)

 Use this method to move or copy only foundational records in a hybrid domain configuration.

 You can implement a hybrid approach by maintaining some types of record in a parent domain and some types in child domains. Generally, the parent domain contains foundational records and the child domain contains higher-level records, such as widgets. The following types of record are considered foundational records.

- Bucket groups
- Buckets
- Scripts
- Breakdown sources
- Indicator sources
- Filters
- Breakdowns
- Managed sources
- Manual breakdowns
- Breakdown mappings
- Breakdown relations
Other Performance Analytics records such as widgets and indicators are not foundational records. Set this method to false to move or copy these additional records as well.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>foundation</td>
<td>Boolean</td>
<td>Indicates if only foundational records should be copied or moved by this PADomainUtils object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PADomainUtils</td>
<td>The object calling this function.</td>
</tr>
</tbody>
</table>

```javascript
var pa = new SNC.PADomainUtils().setFoundation(true);
pa.copy('bb6b58b01f1310005a3637b8ec8b70dd');
```

### PADomainUtils - setOverrides(Boolean overrides)

Use this method before copying records to set the sys_override value of the new record to the original parent record.

Using this method enables you to automatically override records in a parent domain. By overriding the parent records, the parent records do not impact the child domain. If the source domain is not the parent of the target domain when copying records, setting the sys_override value will not have any impact on behavior. You can specify an override only when copying records, not when moving records.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overrides</td>
<td>Boolean</td>
<td>Indicates that copied records in a child domain should override the source record in the parent domain. This value is true by default.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PADomainUtils</td>
<td>The object calling this function.</td>
</tr>
</tbody>
</table>

```javascript
var pa = new SNC.PADomainUtils('c90d4b084a362312013398f051272c0d');
pa.setOverrides(false);
pa.copy('bb6b58b01f1310005a3637b8ec8b70dd');
```

### Paragraph - Scoped, Global

Creates a Paragraph object representing a block of text in a PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

#### Paragraph - Paragraph(String text)

Instantiates a new Paragraph object containing a string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>Paragraph block of text.</td>
</tr>
</tbody>
</table>

The following example shows how to create a Paragraph object. For a document usage example, see Document API.

```javascript
var para = new Paragraph("hello");
```

#### Paragraph – addNewLine()

Adds an empty line after a paragraph in a document.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following example shows how to add a new line after a paragraph in a document. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);
var myPara = new sn_pdfgeneratorutils.Paragraph("This is a paragraph.");
myPara.addNewLine();
document.addParagraph(myPara);
// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", ",<record_sys_id>", "addText.pdf");
```

**Paragraph – addParagraph(Paragraph paragraph)**

Adds a paragraph. You can use this method to create a block of paragraphs with automatic line breaks.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paragraph</td>
<td>Paragraph</td>
<td>Paragraph object.</td>
</tr>
</tbody>
</table>

The following example shows how to add a section of paragraphs to a document. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);
var sectionPara = new sn_pdfgeneratorutils.Paragraph("This is the first paragraph.");
var subPara1 = new sn_pdfgeneratorutils.Paragraph("Pellentesque nec neque interdum tristique at ut lacus. Nam eget sollicitudin.");
```
var subPara2 = new sn_pdfgeneratorutils.Paragraph("Lorem ipsum dolor sit amet, consectetur adipiscing elit. Nulla vel ultrices erat.");
var subPara3 = new sn_pdfgeneratorutils.Paragraph("Aenean fermentum lorem congue metus faucibus, vitae viverra quam eleifend. Donec sed risus quis eros suscipit efficitur.");

sectionPara.addParagraph(subPara1);
sectionPara.addParagraph(subPara2);
sectionPara.addParagraph(subPara3);

document.addParagraph(sectionPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");

### Paragraph – addString(String content)

Adds a string of text to a paragraph. This method does not automatically insert a space preceding the content.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>String</td>
<td>Information to include in a paragraph.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add a new sentence to a paragraph. For a document usage example, see [Document API](#).

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var myPara = new sn_pdfgeneratorutils.Paragraph("This is the first sentence.");

myPara.addString(" This is the second sentence in the same paragraph. Spaces are not inserted automatically.")

document.addParagraph(myPara);
```
Paragraph – addStyle(Style style)
Applies a predefined style to paragraph text.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>style</td>
<td>Style</td>
<td>Style to apply to this element.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to apply a style to a paragraph. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Create a font color (result is purple)
var fontColor = new sn_pdfgeneratorutils.Color([0.5,0.0,0.5]);

// Create a style for your paragraph
var paraStyle = new sn_pdfgeneratorutils.Style();
paraStyle.setFontColor(fontColor);
paraStyle.setFontSize(10);

var myPara = new sn_pdfgeneratorutils.Paragraph("This paragraph has style.");

myPara.addStyle(paraStyle);

document.addParagraph(myPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

Paragraph – setFixedPosition(Number left, Number bottom, Number width)
Sets a paragraph element to a fixed position on the page.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>Number</td>
<td>Indentation from the left side of the PDF page in points.</td>
</tr>
<tr>
<td>bottom</td>
<td>Number</td>
<td>Position from the bottom of the PDF page in points.</td>
</tr>
<tr>
<td>width</td>
<td>Number</td>
<td>Width of the paragraph element in points. This value determines the length at which the line breaks.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a fixed position on a page. For a document usage example, see Document API.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// Create a style
var paraStyle = new sn_pdfgeneratorutils.Style();
paraStyle.setFontSize(48);
paraStyle.setBold();

// my paragraph
var para = new sn_pdfgeneratorutils.Paragraph("Document Title");
para.setFixedPosition(204,400,240);
para.setTextAlignment("text-center");
para.addStyle(paraStyle);

document.addParagraph(para);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "fileName.pdf");
```

Paragraph – setMargin(Number margin)

Sets each paragraph margin.
To set all four margins with one or more unique values, use `setMargins()`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Value of the top, right, bottom, and left margins in points.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the all margins of the paragraph to 48 points.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var margins = 48.0;
var myPara = new sn_pdfgeneratorutils.Paragraph("Paragraph text with all margins set to the same value.");
myPara.setMargin(margins);
document.addParagraph(myPara);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "docName.pdf");
```

**Paragraph – setMarginBottom(Number margin)**

Sets the bottom margin of a paragraph.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Height of the bottom margin in points.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the bottom margin of a paragraph to one point.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginBottom = new sn_pdfgeneratorutils.Paragraph("Paragraph text with bottom margin set.");
paraMarginBottom.setMarginBottom(marginVal);

document.addParagraph(paraMarginBottom);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "docName.pdf");
```

### Paragraph – `setMarginLeft(Number margin)`

Sets the left margin of a paragraph.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftMargin</td>
<td>Number</td>
<td>Width of the left margin in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the left margin of a paragraph to one point.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;
```
```javascript
var paraMarginLeft = new sn_pdfgeneratorutils.Paragraph("Paragraph text with left margin set.");
paraMarginLeft.setMarginLeft(marginVal);
document.addParagraph(paraMarginLeft);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "docName.pdf");
```

**Paragraph – setMarginRight(Number margin)**

Sets the right margin of a paragraph.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Width of the right margin in points.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the right margin of a paragraph to one point.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginRight = new sn_pdfgeneratorutils.Paragraph("Paragraph text with right margin set.");
paraMarginRight.setMarginRight(marginVal);
document.addParagraph(paraMarginRight);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "docName.pdf");
```
Paragraph – setMargins(Number marginTop, Number marginRight, Number marginBottom, Number marginLeft)

Sets a size for each paragraph margin.

To set each margin to the same value, use setMargin().

| Parameters |
|---|---|---|
| Name | Type | Description |
| topMargin | Number | Height of the top margin in points. |
| rightMargin | Number | Width of the right margin in points. |
| bottomMargin | Number | Height of the bottom margin in points. |
| leftMargin | Number | Width of the left margin in points. |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set paragraph margins. For a document usage example, see Document API.

```javascript
var para = new sn_pdfgeneratorutils.Paragraph("Paragraph text.");

var topMargin = 1.0;
var rightMargin = 1.0;
var bottomMargin = 1.0;
var leftMargin = 1.5;

para.setMargins(marginTop, marginRight, marginBottom, marginLeft);
```

Paragraph – setMarginTop(Number margin)

Sets the top margin of a paragraph.

| Parameters |
|---|---|---|
| Name | Type | Description |
| margin | Number | Height of the top margin in points. |
The following example shows how to set the top margin of a paragraph to one point.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("LETTER");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var marginVal = 1.0;

var paraMarginTop = new sn_pdfgeneratorutils.Paragraph("Paragraph text with top margin set.");
paraMarginTop.setMarginTop(marginVal);

document.addParagraph(paraMarginTop);

// save pdf as attachment to target record in the Incident table
document.saveAsAttachment("incident", "<record_sys_id>", "docName.pdf");
```

### Paragraph – `setTextAlignment(String alignment)`

Sets the text alignment of this paragraph.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Text alignment position. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-center: Aligns text to the center.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-justified: Modifies the space between</td>
</tr>
<tr>
<td></td>
<td></td>
<td>characters to completely fill text between the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>left and right sides. The final line is left-</td>
</tr>
<tr>
<td></td>
<td></td>
<td>aligned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-justified-all: Justifies text alignment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>including the final line.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-left: Align text to the left.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-right: Align text to the right.</td>
</tr>
</tbody>
</table>
The following example shows how to set the paragraph text to left alignment.

```javascript
var paragraph = new sn_pdfgeneratorutils.Paragraph("This paragraph text is centered.");
var alignment = "text-center";
paragraph.setTextAlignment(alignment);
```

**PAScorecard - Scoped**

The PAScorecard API enables you to fetch data about indicators and their associated records, such as breakdowns.

This API requires the Performance Analytics (com.snc.pa.analytics_center) application.

**PAScorecard - addParam(String parameter, String value)**

Add a query parameter to filter the returned scores.

Call this method multiple times on the same PAScorecard object to pass multiple parameters, such as the indicator sys_id and a breakdown sys_id. After specifying all parameters, call `query()` to run the query.

If you query a PAScorecard object with no parameters, the API returns a list of all indicators that are displayed on the Analytics Hub, with their scores.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuid</td>
<td>String</td>
<td>Enter a colon-separated list of sys_id values to specify which indicators, breakdowns, aggregates, and domains to query. The parameter follows this format: <code>&lt;indicator_sys_id&gt;:&lt;breakdown_sys_id&gt;:&lt;elements_filter_sys_id or element_sys_ids&gt;:&lt;lvl-2 breakdown_sys_id&gt;:&lt;lvl-2 elements_filter_sys_id or element_sys_ids&gt;:&lt;aggregate_sys_id&gt;:&lt;domain_sys_id&gt;</code></td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The parameter must begin with the sys_id of an indicator record. Optionally, you can append the sys_id values of a breakdown and breakdown element to group the response based on the breakdown, and the sys_id of an aggregate to apply that aggregate. You can use a breakdown with an aggregate, or use only one. For information about obtaining the sys_id values of records, see Unique record identifier (sys_id).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>breakdown</td>
<td>String</td>
<td>Sys_id of a breakdown to return chart information organized as defined by the breakdown. For example, the sys_id of a priority breakdown to return separate task chart information for each priority value, such as the number of open incidents / Priority / 2 - High. Data type: String</td>
</tr>
<tr>
<td>breakdown_relation</td>
<td>String</td>
<td>Specify the sys_id of a breakdown relation to breakdown the returned data using that relation. You can view available breakdown relations by setting the include_available_breakdowns parameter to true.</td>
</tr>
<tr>
<td>elements_filter</td>
<td>String</td>
<td>Specify the sys_id of an elements filter to apply that filter to the returned data.</td>
</tr>
</tbody>
</table>
| display             | String | Flag that indicates the type of indicators to return. Valid values:  
  - true: Return only indicators that display on the Analytics Hub.  
  - all: Return all indicators.  
  Data type: String  
  Default: true |
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| favorites | String   | Flag that indicates whether to return only indicators that are favorites of the querying user. Valid values:  
  • true: Return only indicators that are favorites of the querying user.  
  • false: Return all indicators.  
  Data type: Boolean  
  Default: false |
| key    | String   | Flag that indicates whether to return results only for key indicators. Valid values:  
  • true: Return the trendline_scores element.  
  • false: Do not return the trendline_scores element.  
  Data type: Boolean  
  Default: false |
| target | String   | Flag that indicates whether to return results only for indicators that have a target set on the Analytics Hub. Valid values:  
  • true: Only return results for indicators that have a target set.  
  • false: Return results for all applicable indicators.  
  Data type: Boolean  
  Default: false |
| contains | String   | Comma-separated list of names or descriptions to return results only from indicators with a matching value. All the comma-separated list items must match, or no results are returned: The list follows AND logic, not OR logic.  
  Data type: String |

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tags</td>
<td>String</td>
<td>Enter an indicator group sys_id to return the indicators in that group. Do not use <code>uuid</code> with this parameter.</td>
</tr>
<tr>
<td>per_page</td>
<td>String</td>
<td>Maximum number of indicators each query can return on a page. Data type: Number Default: 10 Maximum: 100</td>
</tr>
<tr>
<td>page</td>
<td>String</td>
<td>Specify the page number. For example, when querying 20 Analytics Hubs with the default <code>per_page</code> value (10), specify a page value of 2 to retrieve Analytics Hubs 11-20.</td>
</tr>
<tr>
<td>sortby</td>
<td>String</td>
<td>Value to use when sorting results. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• bullet</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• change</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• changeperc</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• date</td>

<tr>
<td></td>
<td></td>
<td>• name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• order</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• target</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>trend</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>value</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: value</td>
</tr>
<tr>
<td>sortdir</td>
<td>String</td>
<td>Sort direction. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• asc: Denotes ascending</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• des: Denotes descending</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: Descending</td>
</tr>
<tr>
<td>display_value</td>
<td>String</td>
<td>Data retrieval operation for reference and choice fields.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Based on this value, the display value and/or the actual value in the database are retrieved.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true returns display values for all of the fields.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false returns actual values from the database. If a value is not specified, this parameter defaults to false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• all returns both actual and display values.</td>
</tr>
<tr>
<td>exclude_reference</td>
<td>String</td>
<td>Flag that indicates whether to hide additional information provided for reference fields, such as the URI to the reference resource.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Hide additional information provided for reference fields.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Do not hide additional information provided for reference fields.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data type: Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

| include_available_aggregates | String  | Flag that indicates whether to return all possible aggregates for an indicator, including aggregates that have already been applied. Valid values:  
• true: Return all possible aggregates for an indicator, including aggregates that have already been applied.  
• false: Return no aggregates.  
Data type: Boolean
Default: false |
| include_realtime     | String  | Flag that indicates whether to return the realtime_enabled element which indicates if real-time scores are enabled for the indicator, and the realtime_value element which contains the real-time score value. This parameter is not supported for formula indicators. Valid values:  
• true: Return the realtime_enabled element.  
• false: Do not return the realtime_enabled element.  
Data type: Boolean
Default: false |
| include_target_color_scheme | String  | Flag that indicates whether to return the target_color_scheme element that contains the minimum and maximum values, and the color of each section of the target color scheme for the Analytics Hub. Valid values:  
• true: Return the target_color_scheme element.  
• false: Do not return the target_color_scheme element.  
Data type: Boolean |
Parameters (continued)

<table>
<thead>
<tr>

</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In this example, the uuid parameter specifies the Number of open incidents indicator, and the breakdown parameter specifies the Priority breakdown. Both parameters have the sys_id of the respective records as their values. The query() function returns the results as an object.

```javascript
var sc = new SNC.PAScorecard(); //in a scoped app, do not use the SNC namespace
sc.addParam('uuid', 'fb007202d7130100b96d45a3ce6103b4'); // Number of open incidents
sc.addParam('breakdown', '0df47e02d7130100b96d45a3ce610399'); // by Priority
var result = sc.query(); // Query results, which are returned as an object
for (var i = 0; i < result.length; i++)
gs.info(result[i].name + ': ' + result[i].value + ' ' + result[i].unit.display_value);
```

**PAScorecard - query()**

Perform a query based on the specified parameters and return the results as an object.

Before calling this method, configure parameters for the PAScorecard object by calling `addParam(String parameter, String value)`.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The PAScorecard object.</td>
</tr>
</tbody>
</table>

PAScorecard - result()

Get the last query result as an object.

This method does not perform a query. To perform a query before returning the result, use query().

This function cannot run in a scope other than global.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The results from the last query, returned as a JS object.</td>
</tr>
</tbody>
</table>

PASnapshot - Scoped

The PASnapshot API enables you to query information about Performance Analytics snapshots. Snapshots are the lists of records (sys_ids) that are collected at the time that the scores for those records are collected. A snapshot is made only for indicators with Collect records selected.

You can query information about a snapshot at a certain date using the indicator sys_id and date, and perform comparisons between snapshots for an indicator at different dates.
PASnapshot - getCompareIDs(String sys_id, Number date1, Number date2, String type)

Compare records in snapshots for a specified indicator at multiple dates, such as to identify records included in one snapshot but not the other.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The indicator sys_id.</td>
</tr>
<tr>
<td>date1</td>
<td>Number</td>
<td>The date of the first snapshot, in the format yyyymmdd.</td>
</tr>
<tr>
<td>date2</td>
<td>Number</td>
<td>The date of the second snapshot, in the format yyyymmdd.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Specifies what data to retrieve. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• all1: all records in the first snapshot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• all2: all records in the second snapshot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• shared: records that are in both snapshots</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• movedin: records that are in the first snapshot, but not the second</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• movedout: records that are in the second snapshot, but not the first</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A comma-separated list of sys_id values.</td>
</tr>
</tbody>
</table>

```javascript
var snapshot2 = PASnapshot.getCompareIDs('fb007202d7130100b96d45a3ce6103b4', 20160430, 20160531, 'shared');
gs.info(snapshot2);
```

Output: *** Script:
09c01200d7002100b81145a3ce6103ab,19c01200d7002100b81145a3ce6103e9,fcc01200d7002
....

PASnapshot - getCompareQuery(String sys_id, Number date1, Number date2, String type)

Get the query used to compare records in snapshots for a specified indicator at multiple dates.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The indicator sys_id.</td>
</tr>
<tr>
<td>date1</td>
<td>Number</td>
<td>The date of the first snapshot, in the format yyyymmdd.</td>
</tr>
<tr>
<td>date2</td>
<td>Number</td>
<td>The date of the second snapshot, in the format yyyymmdd.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Specifies what data to retrieve. Valid values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• all1: all records in the first snapshot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• all2: all records in the second snapshot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• shared: records that are in both snapshots</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• movedin: records that are in the second snapshot, but not the first</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• movedout: records that are in the first snapshot, but not the second</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The table, view, and encoded query as a JSON string.</td>
</tr>
</tbody>
</table>

```javascript
var snapshot4 = PASnapshot.getCompareQuery('fb007202d7130100b96d45a3ce6103b4', 20160530, 20160531, 'all1');
gs.info(snapshot4);
```

Output: *** Script: `{"view":null,"query":"sys_idINjavascript:new PAUtils().getCompareSnapshotIDs("fb007202d7130100b96d45a3ce6103b4","20160530","20160531","all1"),"table":"incident"}`

---

### PASnapshot - getIDs(String sys_id, Number date)

Get the sys_id values for all records contained in the snapshot for a specified indicator at the specified date.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The indicator sys_id.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>Number</td>
<td>The date when the snapshot was taken, in the format yyyymmdd.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A comma-separated list of sys_id values.</td>
</tr>
</tbody>
</table>

```javascript
var snapshot1 = PASnapshot.getIDs('fb007202d7130100b96d45a3ce6103b4', 20160530);
gs.info(snapshot1);
```

Output: *** Script:
09c01200d7002100b81145a3ce6103ab,19c01200d7002100b81145a3ce6103e9,fcc01200d7002 ....

PASnapshot - getQuery(String sys_id, Number date)

Get the query used to generate the snapshot for a specified indicator at the specified date.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The indicator sys_id.</td>
</tr>
<tr>
<td>date</td>
<td>Number</td>
<td>The date when the snapshot was taken, in the format yyyymmdd.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The table, view, and encoded query as a JSON string.</td>
</tr>
</tbody>
</table>

```javascript
var snapshot3 = PASnapshot.getQuery('fb007202d7130100b96d45a3ce6103b4', 20160530);
gs.info(snapshot3);
```
PDFGenerationAPI API - Scoped, Global

Provides support for PDF conversion and handling PDF fields.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

These methods can also be used for documents created by non-catalog items. The methods in this class enable the following tasks:

- Dynamically generate a PDF from an HTML string and attach it to a record
- Fill fields in a PDF
- Sign a PDF
- Unflattened, flattened, or partially flattened
- Retrieving PDF field data

Related APIs:
- PdfMergeSignRequestor
- SVGToPDFConversionAPI

**PDFGenerationAPI – convertToPDF(String html, String targetTable, String targetTableSysId, String pdfName)**

Converts an HTML string to a PDF document.

To generate a PDF with header and footer information, such as page numbers, use `convertToPDFWithHeaderFooter()`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>html</td>
<td>String</td>
<td>HTML to convert to a PDF document.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table on which to attach the converted PDF.</td>
</tr>
<tr>
<td>targetTableSysId</td>
<td>String</td>
<td>Sys_id of the record on which to attach the converted PDF.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing sys_id of the PDF attachment if conversion is successful, error message otherwise.</td>
</tr>
</tbody>
</table>

```
{
    "attachment_id": "String",
    "message": "String",
    "request_id": "String",
    "status": "String"
}
```

<Object>.attachment_id

If HTML conversion is successful, sys_id of the converted and attached PDF. The file is listed in the Attachments [sys_attachment] table.

Data type: String

<Object>.message

Message confirming success or error.

Possible values:

- Conversion failed. – No PDF created. Make sure the values provided are accurate.
- Conversion is successful. – The HTML successfully converted to PDF.
- Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id.
- Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.
- No Form associated with pdf to fill. attachmentSysId: <sys_id>
- No editable fields exist with specified names. Please check and try again. field names: <field names>
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
|      | • Request cannot proceed as the attachment with sys_id \{{{0}\}} did not pass security scan – The PDF did not pass the antivirus scan.  
• Request cannot proceed as the attachment with sys_id \{{{0}\}} is pending security scan – The PDF requires an antivirus scan.  
• Request completed successfully – Operation is successful.  
• Undefined – Sys_id provided does not exist or is not a PDF attachment.          |

- **Data type**: String

### `<Object>.request_id`
- Sys_id of the change producer request record.
- **Data type**: String

### `<Object>.status`
- Status indicating whether the operation is successful. Possible values:
  - success - Operation was successful.
  - failure – Operation was not successful. The `message` provides details.
- **Data type**: String

The following example shows how to convert HTML to a PDF and attach it to a record in the Incident [incident] table.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

// (Option) get HTML from the description field of an incident record
var gr = new GlideRecord("incident");
var html;

if (gr.get("<tableSysId=")) {
    html = gr.description.toString();
}
```
var result = v.convertToPDF(html, "incident", "<target_sys_id>", "myPDF");
gs.info(JSON.stringify(result));

Output:

{"attachment_id":"<sys_id>","message":"Conversion is successful.","request_id":"<change_sys_id>","status":"success"}

PDFGenerationAPI – convertToPDFWithHeaderFooter(String html, String targetTable, String targetTableSysId, String pdfName, Object headerFooterInfo)

Converts an HTML string into a PDF with header and footer content.

Use this method to generate PDFs with page settings:
- Header and footer information
- Margin sizes
- Orientation
- Enumeration
- Page size

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>html</td>
<td>String</td>
<td>HTML to convert to a PDF document.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table on which to attach the converted PDF.</td>
</tr>
<tr>
<td>targetTableSysId</td>
<td>String</td>
<td>Sys_id of the record on which to attach the converted PDF.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>headerFooterInfo</td>
<td>Object</td>
<td>Defines PDF header and footer details.</td>
</tr>
</tbody>
</table>

{ "FooterImageAlignment": "String", "FooterImageAttachmentId": "String", "FooterImageHeight": "String", "FooterText": "String", "FooterTextAlignment": "String", "GeneratePageNumber": "String" }
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>

**attachment_id**

If HTML conversion is successful, sys_id of the converted and attached PDF. The file is listed in the Attachments [sys_attachment] table.

Data type: String

**message**

Message confirming success or error.

Possible values:

- Conversion failed. – No PDF created. Make sure the values provided are accurate.
- Conversion is successful. – The HTML successfully converted to PDF.
- Footer Image alignment and text alignment cannot be in the same region with same alignment: 
  `<footerImageAlignment value>` – Make sure that `headerFooterInfo.FooterImageAlignment` and `headerFooterInfo.FooterTextAlignment` values are not in the same area.
- Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id.
- Given target record `[<tableName> - <targetTableSysId>]` does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.
- Invalid footer image alignment: `<invalid_option>` is provided. – Provide a valid option in the `headerFooterInfo.FooterImageAlignment` property.
- Invalid footer text alignment: " + `<invalid_option>` + " is provided. – Provide a valid option in the `headerFooterInfo.footerTextAlignment` property.
### Returns (continued)

      | • Request completed successfully – Operation is successful.  
      | • Unable to get the footer image. sysId: + `<value provided>` – Make sure the sys_id provided for headerFooterInfo.footerImageId is accurate.  
      | • Unable to get the header image. sysId: + `<value provided>` – Make sure the sys_id provided for headerFooterInfo.headerImageId is accurate.  
      | • Undefined – Sys_id provided does not exist or is not a PDF attachment.  |

Data type: String

`<Object>.request_id` Sys_id of the change producer request record.  
Data type: String

`<Object>.status` Status indicating whether the operation is successful. Possible values:  
• success - Operation was successful.  
• failure – Operation was not successful. The message provides details.  
Data type: String
The following example shows how to convert HTML to a PDF named "myPDF" and add the PDF as an attachment to a record in the Incident [incident] table. The PDF contains header and footer provided via attachment.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

// (Option) get HTML from the description field of an incident record
var gr = new GlideRecord("incident");
var html;
if (gr.get("<tableSysId>")) {
    html = gr.description.toString();
}

var hfInfo = new Object();
hfInfo["HeaderImageAttachmentId"] = "<hdrImgAttSysId>";
hfInfo["HeaderImageAlignment"] = "left";
hfInfo["FooterImageAttachmentId"] = "<ftrImgAttSysId>";
hfInfo["FooterImageAlignment"] = "TOP_CENTER";
hfInfo["FooterText"] = "Sample Footer Message";
hfInfo["PageSize"] = "A4";
hfInfo["GeneratePageNumber"] = "false";
hfInfo["TopOrBottomMargin"] = "36";
hfInfo["LeftOrRightMargin"] = "24";

var result = v.convertToPDFWithHeaderFooter(html, "incident", "<targetTbl_sys_id>",
"myPDF", hfInfo);
gs.info(JSON.stringify(result));
```

Output:

```javascript
{"attachment_id":"<sys_id>","message":"Conversion is successful.","request_id":"<change_sys_id>","status":"success"}
```

**PDFGenerationAPI – fillDocumentFieldsAndFlatten(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, Object flatten)**

Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- `isDocumentFillable()`
- `getDocumentFields()`
- `getDocumentFieldsType()`
PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFields() – Fills fields in an editable PDF and attaches it to the provided record.
- fillFieldsAndMergeSignature() – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.
- getFilledDocumentWithSignatureAsBase64() – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldsMap</td>
<td>Object</td>
<td>Optional. Key value map by PDF field name and value to fill. Use the getDocumentFields() method to get the list of available fields.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableSysId</td>
<td>String</td>
<td>Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>
| flatten         | Object| Optional. Flattening fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values:  
  - donot_flatten - Do not flatten any fields.  
  - partially_flatten - Flatten only the fields which are modified.  
  - fully_flatten - Flattens all the fields. |
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Default:</strong> fully_flatten</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;FlattenType&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Object</strong></td>
<td>Object containing sys_id of the updated PDF attachment if successful, error message otherwise.</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
</tbody>
</table>
|      |   "attachment_id": "String",
|      |   "message": "String",
|      |   "status": "String"
|      | } |
| **<Object>.attachment_id** | If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String |
| **<Object>.message** | Message confirming success or error. Valid values: |
|      | • Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id. |
|      | • Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. |
|      | • No Form associated with pdf to fill. attachmentSysId: <sys_id> |
|      | • No editable fields exist with specified names. Please check and try again. field names: <field names> |
|      | • Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan. |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>•</td>
<td>Request cannot proceed as the attachment with sys_id [{}0] is pending security scan – The PDF requires an antivirus scan.</td>
</tr>
<tr>
<td>•</td>
<td>Request completed successfully – Operation is successful.</td>
</tr>
<tr>
<td>•</td>
<td>Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
</tr>
</tbody>
</table>

Data type: String

`<Object>.status` Status indicating whether the operation is successful. Possible values:

- success - Operation was successful.
- failure – Operation was not successful. The `message` provides details.

Data type: String

The following example shows how to fill fields and flatten an editable PDF.

```javascript
var fieldMap = new Object();
fieldMap["Last Name First Name Middle Initial"] = "Tuter Abel E."
fieldMap["Date of Birth"] = "08101952"
fieldMap["US SSN"] = "111-22-9999"
fieldMap["Address"] = "PO Box 344"
fieldMap["City"] = "Jerome"
fieldMap["State"] = "AZ"
fieldMap["Zip"] = "86331"

var flatten = new Object();
flatten["FlattenType"] = "partially_flatten"

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.fillDocumentFieldsAndFlatten(fieldMap, "<attachmentSysId>", "<tableName>", "<tableSysId>", "pdfName", flatten);
gs.info(JSON.stringify(result));
```

Output:

"attachment_id": "<sys_id>", "message": "Request completed successfully.", "status": "success"
PDFGenerationAPI – fillDocumentFields(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName)

Fills fields in an editable PDF and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:

- fillDocumentFieldsAndFlatten() – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.
- fillFieldsAndMergeSignature() – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.
- getFilledDocumentWithSignatureAsBase64() – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldsMap</td>
<td>Object</td>
<td>Optional. Key value map by PDF field name and value to fill. Use the getDocumentFields() method to get the list of available fields.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableSysId</td>
<td>String</td>
<td>Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Object</td>
<td>Object containing sys_id of the updated PDF attachment if successful, error message otherwise.</td>
<td></td>
</tr>
<tr>

<td>{</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;attachment_id&quot;: &quot;String&quot;,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;message&quot;: &quot;String&quot;,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: &quot;String&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>}</td>
<td></td>
</tr>
<tr>
<td>&lt;Object&gt;.attachment_id</td>
<td>If the operation is successful, sys_id of the filled PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String</td>
<td></td>
</tr>
<tr>
<td>&lt;Object&gt;.message</td>
<td>Message confirming success or error. Valid values:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Given target record [&lt;tableName&gt; - &lt;targetTableSysId&gt;] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No Form associated with pdf to fill. attachmentSysId: &lt;sys_id&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No editable fields exist with specified names. Please check and try again. field names: &lt;field names&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Request completed successfully – Operation is successful.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
<td></td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.status</td>
<td>Status indicating whether the operation is successful. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• success - Operation was successful.</td>
</tr>
<tr>
<td></td>
<td>• failure – Operation was not successful. The message provides details.</td>
</tr>
</tbody>
</table>

The following example shows how to fill fields in an editable PDF.

```javascript
var fieldMap = new Object();
fieldMap["Address"] = "Address value here";
fieldMap["State"] = "State value here";

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.fillDocumentFields(fieldMap, "<attachmentSysId>", "<tableName>",
"<tableSysId>", "pdfName");
gs.info(JSON.stringify(result));
```

Output:

```json
{"attachment_id": "<sys_id>", "message": "Request completed successfully.", "status": "success"}
```

**PDFGenerationAPI – fillFieldsAndMergeSignature(Object fieldsMap, String sysId, String tableName, String tableSysId, String pdfName, PdfMergeSignRequestor requestor, Object flatten)**

Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

**PDFGenerationAPI** provides additional fill methods with different options:
- `fillDocumentFields()` – Fills fields in an editable PDF and attaches it to the provided record.
- `fillDocumentFieldsAndFlatten()` – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.
- `getFilledDocumentWithSignatureAsBase64()` – Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldsMap</td>
<td>Object</td>
<td>Optional. Key value map by PDF field name and value to fill. Use the <code>getDocumentFields()</code> method to get the list of available fields.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableSysId</td>
<td>String</td>
<td>Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>requestor</td>
<td>PdfMergeSignRequestor</td>
<td>Signature input returned from <code>pdfMergeSignRequestor</code>.</td>
</tr>
</tbody>
</table>
| flatten       | Object        | Optional. Flattening fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values:  
  - donot_flatten - Do not flatten any fields.  
  - partially_flatten - Flatten only the fields which are modified.  
  - fully_flatten - Flattens all the fields. |
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>

</tr>
</tbody>
</table>

The following example shows how to fill fields with signature with default settings to completely flatten the fields.

```javascript
var fieldMap = new Object();
fieldMap["Address_Salutation"] = "Address value here";

var paramMap = new Object();
paramMap["FlattenType"] = "partially_flatten";

var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
requestor.createRequest("<attachmentSysId>", "incident", "<tableSysId>", "filledPdf");
requestor.addSignatureMapping(6, 40, 50, 188, 44, "<signatureSysId>");

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.fillFieldsAndMergeSignature(fieldMap, "<attachmentSysId>", "incident", "<tableSysId>", requestor, "filledPdf", paramMap);
gs.info(JSON.stringify(result));
```

Output:

```json
{"attachment_id":"5440d993bed3010d66be1191396194e","message":"Request completed successfully.","status":"success"}
```
PDFGenerationAPI – getDocumentFields(String sysId)

Gets a list of editable fields in a PDF document. Enables listing editable PDF fields without manually opening the file to check.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing ID of the signed PDF, error message otherwise.</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;attachment_id&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;message&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>&lt;Object&gt;.fields</td>
<td>If the request is successful, list containing the name of each field in the PDF.</td>
</tr>
<tr>
<td></td>
<td>Data type: Array of strings</td>
</tr>
<tr>
<td></td>
<td>&quot;fields&quot;: [&quot;field_name&quot;]</td>
</tr>
<tr>
<td>&lt;Object&gt;.message</td>
<td>Message confirming success or error. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Exception while reading Source document contents.</td>
</tr>
<tr>
<td></td>
<td>PDF header not found. – Input attachment provided is not a valid PDF.</td>
</tr>
<tr>
<td></td>
<td>Provide the correct attachment sys_id.</td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan.</td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Request completed successfully – Operation is successful.</td>
<td></td>
</tr>
<tr>
<td>• Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
<td></td>
</tr>
</tbody>
</table>

Data type: String

<Object>.status

Status indicating whether the operation is successful. Possible values:

• success - Operation was successful.
• failure – Operation was not successful. The message provides details.

Data type: String

The following example shows how to retrieve fields in a PDF attachment.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getDocumentFields("attachmentSysId");
gs.info(JSON.stringify(result));
```

Output:

```json
{"message":"Request completed successfully.","fields":["NP_formFillable","reset","print","1SSN","Signature.1","5sigDate","Check Box21"],"status":"success"}
```

PDFGenerationAPI – getDocumentFieldsType(String sysId)

Gets the field type of set of editable fields from a PDF document.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td>Object</td>
<td>Object containing each PDF field type if successful, error message otherwise.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td>• Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
</tr>
</tbody>
</table>

Data type: String

<Object>.status

Status indicating whether the operation is successful. Possible values:

• success - Operation was successful.
• failure – Operation was not successful. The message provides details.

Data type: String

The following example shows how to retrieve field types in a PDF attachment. Results include manual returns for readability and are truncated for brevity.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getDocumentFieldsType("<attachmentSysId>");
gs.info(JSON.stringify(result));
```

Output:

```json
{ "fields_type":{ "1ADDLINE2.25":{ "pageNumber":2,"type":"text"}, "1ADDLINE2.24":{ "pageNumber":2,"type":"text"}, "1ADDLINE2.23":{ "pageNumber":2,"type":"text"}, "1ADDLINE2.22":{ "pageNumber":2,"type":"text"} , "1ADDLINE2.11":{ "pageNumber":2,"type":"text"}, 
"Check Box1":{ "fieldsDetails":{["fieldName":"Yes"]},"pageNumber":2,"type":"check_box"}, "4consentDate.6":{ "pageNumber":4,"type":"text"}, "4consentDate.7":{ "pageNumber":4,"type":"text"} }, "3SSN.9":{ "pageNumber":3,"type":"text"}, "3SSN.8":{ "pageNumber":3,"type":"text"}, "3SSN.7":{ "pageNumber":3,"type":"text"}, "pageNumber":2,"type":"check_box"}, "Check Box8":{ "fieldsDetails":{["fieldName":"Off"]},"pageNumber":2,"type":"check_box"}, "Check Box8":{ "fieldsDetails":{["fieldName":"yes"]},
```

PDFGenerationAPI – getFilledDocumentWithSignatureAsBase64(Object fieldsMap, String sysId, PdfMergeSignRequestor requestor, Object flatten)

Fills fields in an editable PDF, creates an image, and converts it to a Base64-encoded PDF.

Base64 encoding enables you to output a PDF as a string within a text document, such as HTML or JSON, without damaging the binary character syntax.

Use the following methods to determine if the PDF is fillable and get field information:

- isDocumentFillable()
- getDocumentFields()
- getDocumentFieldsType()

PDFGenerationAPI provides additional fill methods with different options:
• **fillDocumentFields()** – Fills fields in an editable PDF and attaches it to the provided record.

• **fillDocumentFieldsAndFlatten()** – Fills fields in an editable PDF, flattens the data fields, and attaches it to the provided record.

• **fillFieldsAndMergeSignature()** – Fills fields in an editable PDF, adds signature image, flattens the data fields, and attaches it to the provided record.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldsMap</td>
<td>Object</td>
<td>Optional. Key value map by PDF field name and value to fill. Use the <code>getDocumentFields()</code> method to get the list of available fields.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>requestor</td>
<td>PdfMergeSign</td>
<td>Signature input returned from <code>pdfMergeSignRequestor</code>.</td>
</tr>
</tbody>
</table>
| flatten  | Object          | Optional. Flatting fields enable locking the fields so that other users cannot change the information. Specify the key as "FlattenType" and provide a flattening option as a string. Valid values:  
  • donot_flatten - Do not flatten any fields.  
  • partially_flatten - Flatten only the fields which are modified.  
  • fully_flatten - Flattens all the fields.  
  Default: fully_flatten |

```
{
  "FlattenType": "String"
}
```

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>If successful, PDF converted to Base64 format is added to the Attachments table [sys_attachment]. Contents</td>
</tr>
</tbody>
</table>
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>reflect the PDF attachment provided with fields and signature filled. The fields are not editable unless an alternative flattening option was provided with the <code>flatten</code> parameter.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.message</code></td>
<td>Message confirming success or error. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id.</td>
</tr>
<tr>
<td></td>
<td>• Given target record <code>[&lt;tableName&gt; - &lt;targetTableSysId&gt;]</code> does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.</td>
</tr>
<tr>
<td></td>
<td>• No Form associated with pdf to fill. attachmentSysId: <code>&lt;sys_id&gt;</code></td>
</tr>
<tr>
<td></td>
<td>• No editable fields exist with specified names. Please check and try again. field names: <code>&lt;field names&gt;</code></td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id <code>{0}</code> did not pass security scan – The PDF did not pass the antivirus scan.</td>
</tr>
<tr>
<td></td>
<td>• Request cannot proceed as the attachment with sys_id <code>{0}</code> is pending security scan – The PDF requires an antivirus scan.</td>
</tr>
<tr>
<td></td>
<td>• Request completed successfully – Operation is successful.</td>
</tr>
<tr>
<td></td>
<td>• Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
</tr>
<tr>
<td><code>Data type:</code></td>
<td>String</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.status</code></td>
<td>Status indicating whether the operation is successful. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• success - Operation was successful.</td>
</tr>
<tr>
<td></td>
<td>• failure – Operation was not successful. The <code>message</code> provides details.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The following example shows how to load two fields in a PDF attachment, flatten the fields, and convert the PDF to Base64 format.

```javascript
var mymap = new Object();
mymap["City"] = "City value here";
mymap["State"] = "XX";

// create a requestor
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
requestor.createRequest("<sys_id>", "tableName", "<tableSysId>", "pdfName");
requestor.addSignatureMapping(6, 40, 50, 188, 44, "<signImgSysId>");
var processedRequestObj = requestor.processRequest();

var v = new sn_pdfgeneratorutils.PDFGenerationAPI;

var result = v.getFilledDocumentWithSignatureAsBase64(mymap, "<attachmentSysId>", processedRequestObj);
gs.info (JSON.stringify(result));
```

PDFGenerationAPI – `getPdfPageSizes(String sysId)`

Gets the page size of a PDF document.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing the size of each page if successful, error message otherwise.</td>
</tr>
</tbody>
</table>

```javascript
{
  "pages_size": {Object},
  "message": "String",
}
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;status&quot;: &quot;String&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**<Object>.pages_size**

If the operation is successful, width and height of each PDF page in points. The page number is returned as a string and the measurement values are returned as number data types.

Data type: Object

```
"pages_size": {"<page number>": [width, height]}
```

**<Object>.message**

Message confirming success or error. Possible values:

- Request cannot proceed as the attachment with sys_id [0] did not pass security scan – The PDF did not pass the antivirus scan.
- Request cannot proceed as the attachment with sys_id [0] is pending security scan – The PDF requires an antivirus scan.
- Request completed successfully – Operation is successful.
- Undefined – Sys_id provided does not exist or is not a PDF attachment.

Data type: String

**<Object>.status**

Status indicating whether the operation is successful. Possible values:

- success - Operation was successful.
- failure – Operation was not successful. The message provides details.

Data type: String

The following example shows how to display the width and height of each page in a PDF attachment.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.getPdfPageSizes (<attachmentSysId>);
```
gs.info(JSON.stringify(result));

Output:

```json
{
  "pages_size": {
    "1": [612, 792],
    "2": [612, 792],
    "3": [612, 792],
    "4": [612, 792],
    "5": [612, 792]
  },
  "message": "Request completed successfully.",
  "status": "success"
}
```

**PDFGenerationAPI – isDocumentFillable(String sysId)**

Checks if the PDF document contains editable fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing the size of each page if successful, error message otherwise.</td>
</tr>
</tbody>
</table>

```json
{
  "document_editable": "String",
  "message": "String",
  "status": "String"
}
```

- `<Object>.document_editable`
  - If the operation is successful, flag indicating whether the document is editable.
  - Valid values:
    - true: PDF document has editable fields.
    - false: PDF document does not have editable fields.
  - Data type: Boolean value provided as a string

- `<Object>.message`
  - Message confirming success or error.
  - Possible values:
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Exception while reading Source document contents. PDF header not found. – Input attachment provided is not a valid PDF. Provide the correct attachment sys_id.</td>
<td></td>
</tr>
<tr>
<td>• Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan.</td>
<td></td>
</tr>
<tr>
<td>• Request cannot proceed as the attachment with sys_id [{0}] is pending security scan – The PDF requires an antivirus scan.</td>
<td></td>
</tr>
<tr>
<td>• Request completed successfully – Operation is successful.</td>
<td></td>
</tr>
<tr>
<td>• Undefined – Sys_id provided does not exist or is not a PDF attachment.</td>
<td></td>
</tr>
</tbody>
</table>

Data type: String

<Object>.status
Status indicating whether the operation is successful. Possible values:
• success - Operation was successful.
• failure – Operation was not successful. The message provides details.

Data type: String

The following example shows how to determine if PDF document fields are editable.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
var result = v.isDocumentFillable("<attachmentSysId>");
gs.info(JSON.stringify(result));
```

Output:

```javascript
{"message":"Request completed successfully.","document_editable":"true","status":"success"}
```

PDFGenerationAPI – PDFGenerationAPI()
Instantiates a new PDFGenerationAPI object.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to create a PDFGenerationAPI object.

```javascript
var v = new sn_pdfgeneratorutils.PDFGenerationAPI;
```

**PdfMergeSignRequestor API - Scoped, Global**

Adds an image representing a signature to a PDF document.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This method creates a signature object that can be implemented in a PDF using PDFGenerationAPI.

**PdfMergeSignRequestor - PdfMergeSignRequestor()**

Instatiates a new PdfMergeSignRequestor object.

The following example shows how to create a PdfMergeSignRequestor object.

```javascript
var v = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
```

**PdfMergeSignRequestor - addSignatureMapping(Number pageNumber, Number leftMargin, Number topMargin, Number boxWidth, Number boxHeight, String sysId)**

Assigns signature size and position requirements in the PDF.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pageNumber</td>
<td>Number</td>
<td>Number of the page on which to insert the signature.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leftMargin</td>
<td>Number</td>
<td>Value in points representing the left margin area of the page at which to insert the signature.</td>
</tr>
<tr>
<td>topMargin</td>
<td>Number</td>
<td>Value in points representing the top margin area of the page at which to insert the signature image.</td>
</tr>
<tr>
<td>boxWidth</td>
<td>Number</td>
<td>Value in points representing width of the box to contain the signature.</td>
</tr>
<tr>
<td>boxHeight</td>
<td>Number</td>
<td>Value in points representing height of the box to contain the signature image.</td>
</tr>
<tr>
<td>sysId</td>
<td>String</td>
<td>Sys_id of the signature image in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add the signature mapping. For a complete example, see `processRequest()`.

```javascript
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;

// For the purpose of this example, set signature sizes and page number for signature placement
var page = 2;
var leftMargin = 48;
var topMargin = 60;
var signatureWidth = 96;
var signatureHeight = 36;

requestor.addSignatureMapping(page, leftMargin, topMargin, signatureWidth, signatureHeight, "<signatureSysId>");
```

**PdfMergeSignRequestor - createRequest(String targetSysId, String targetTable, String tableSysId, String targetFileName)**

Creates a signature request with source and target inputs.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetSysId</td>
<td>String</td>
<td>Sys_id of a PDF in the Attachments [sys_attachment] table. Use this value as the target PDF on which to add a signature.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>tableSysId</td>
<td>String</td>
<td>Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetFileName</td>
<td>String</td>
<td>Name of the target PDF without extension.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to create a signature request. For a complete example, see `processRequest()`.

```javascript
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;
requestor.createRequest("<sys_id>", "tableName", "<tableSysId>", "pdfFileName");
```

**PdfMergeSignRequestor -processRequest()**

Processes requests and adds the signatures.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing the size of each page if successful, error message otherwise.</td>
</tr>
</tbody>
</table>

```json
{
    "attachment_id": "String",
    "message": "String",
    "status": "String"
}
```

**<Object>.attachment_id**

If the request is successful, sys_id of the signed and attached PDF. The file is listed in the Attachments [sys_attachment] table.

Data type: String

**<Object>.message**

Possible values:

- Request cannot proceed as the attachment with sys_id [{0}] did not pass security scan – The PDF did not pass the antivirus scan.

- No signature mapping specified. Cannot process this request – Provide signature mapping using the addSignatureMapping() method.

- Request completed successfully.

- Request failure. Exceptions while trying to add signatures to document. Please check again.

- This request cannot be completed as the requested page does not exist. page No: <page number> 

Data type: String

**<Object>.status**

Status indicating whether the operation is successful. Possible values:

- success - Operation was successful.

- failure – Operation was not successful. The message provides details.

Data type: String
The following example shows how to process the signature request.

```javascript
var requestor = new sn_pdfgeneratorutils.PdfMergeSignRequestor;

requestor.createRequest("<sys_id>", "tableName", "<tableSysId>", pdfFileName);

// For the purpose of this example, set signature sizes and page number for signature placement
var page = 6;
var leftMargin = 40;
var topMargin = 50;
var signatureWidth = 188;
var signatureHeight = 44;

requestor.addSignatureMapping(page, leftMargin, topMargin, signatureWidth, signatureHeight,
   "<signatureSysId>" OTHERWISE

var result = requestor.processRequest();
gs.info(JSON.stringify(result));
```

### PdfPage - Scoped, Global

Creates a PdfPage object representing a PDF page and its attributes; such as size, width, and color.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

#### PdfPage - PdfPage(String pageSize, String orientation)

Instantiates a new PdfPage object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>pageSize</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
The following example shows how to create a `PdfPage` object.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
```

**PdfPage – getBottom()**

Gets the Y-coordinate of the lower edge of a PDF page.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Decimal value of the Y-coordinate at the lower edge of the PDF page.</td>
</tr>
</tbody>
</table>

The following example shows how to get the Y-coordinate of the lower edge of a PDF page.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var bottom = pdfpage.getBottom();
```

**PdfPage – getLeft()**

Gets the X-coordinate of the left edge of a PDF page.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Decimal value of the X-coordinate on the left edge of the page.</td>
</tr>
</tbody>
</table>

The following example shows how to get the X-coordinate of the left edge of a PDF page.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var left = pdfpage.getLeft();
```

**PdfPage – getPdfPageSize()**

Gets the size of a PDF page

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to get the PDF page size.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var size = pdfpage.getPdfPageSize();
```

**PdfPage – getRight()**

Gets the X-coordinate of the right edge of a PDF page.
The following example shows how to get the X-coordinate of the right edge of a PDF page.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var right = pdfpage.getRight();
```

**PdfPage – getTop()**

Gets the Y-coordinate of the upper edge of a PDF page.

The following example shows how to get the Y-coordinate of the upper edge of a PDF page.

```javascript
var pdfpage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var top = pdfpage.getTop();
```

**PdfPage – getWidth()**

Gets the width of a PDF page.
The following example shows how to retrieve the width of a PDF page.

```javascript
var pdfPage = new sn_pdfgeneratorutils.PdfPage("A4", "LANDSCAPE");
var width = PdfPage.getWidth();
```

### PlaybookExperience API - Scoped

Provides methods for handling playbook executions.

The PlaybookExperience API requires the Playbook Experience Core plugin (com.glide.playbook_experience.config) and is provided within the sn_playbook namespace.

This API requires at least one playbook in the Process Definition [sys_pd_process_definition] table. To use this API, you must have the roles required to view and cancel a running process in Process Automation Designer. For more information, see Process Automation Designer.

#### PlaybookExperience - cancelPlaybooksByParentRecord(GlideRecord parentRecord, String cancellationReason, String scopedName, String playbookExperienceId)

Cancels playbook executions for a given parent record.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentRecord</td>
<td>GlideRecord</td>
<td>The parent record to cancel playbook executions for. The parent record can be any record that has playbook executions, such as an interaction record or an onboarding case record.</td>
</tr>
<tr>
<td>cancellationReason</td>
<td>String</td>
<td>The reason for cancelling the playbook executions.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedName</td>
<td>String</td>
<td>Optional. The scoped name of the playbook to cancel. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format <code>scope.name</code>. If provided, only executions of this playbook are cancelled for the given parent record. If not provided, all executions of all playbooks are cancelled for the given parent record.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing the cancelled playbook executions and any skipped playbook executions that were unable to be cancelled.</td>
</tr>
<tr>
<td></td>
<td>{ &quot;canceledPlaybookContext&quot;: [Array], &quot;skippedPlaybookContext&quot;: [Array] }</td>
</tr>
</tbody>
</table>

Object `.canceledPlaybookContext` is an array of cancelled playbook executions. Each playbook execution is an object in the array. Data type: Array

```json
"canceledPlaybookContext": [ 
  { 
    "can_read": Boolean, 
    "canceled_by": "String", 
    "cancellation_reason": "String", 
    "errors": [Array],
  }
]```
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
|                                    | ```
|                                   | "parent_record": "String",
|                                   | "parent_table": "String",
|                                   | "playbook_id": "String",
|                                   | "playbook_table": "String",
|                                   | "scoped_name": "String",
|                                   | "state": {Object},
|                                   | "sys_id": "String",
|                                   | "title": "String"
|                                   | ```

---

<Object>.canceledPlaybookContext.can_read
Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record.

Valid values:

- true: Current user has read access to the playbook execution record.
- false: Current user doesn’t have read access to the playbook execution record.

Data type: Boolean

<Object>.canceledPlaybookContext.canceled_by
User ID of the user who cancelled the playbook execution.
Data type: String

<Object>.canceledPlaybookContext.cancellation_reason
The cancellation reason input by the user who cancelled the playbook execution.
Data type: String

<Object>.canceledPlaybookContext.errors
List of cancellation errors. Each error is an object in the array.
Data type: Array

 ```
<table>
<thead>
<tr>
<th>errors</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
| ```

Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.errors.message</td>
<td>The error message. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.errors.type</td>
<td>The type of error. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.parent_record</td>
<td>Sys_id of the parent record that playbook executions were cancelled for. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.parent_table</td>
<td>The name of the table that the parent record is from. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.playbook_table</td>
<td>The name of the table that the playbook is from, generally the Process Definitions [sys_pd_process_definition] table. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.playbook_context</td>
<td>The playbook from the Process Definitions [sys_pd_process_definition] table in the format scope.name. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.playbook_execution</td>
<td>The playbook execution from the Process Executions [sys_pd_context] table. Data type: Object</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.state.displayValue</td>
<td>The display value of the playbook execution state. Data type: String</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.state.value</td>
<td>The value of the playbook execution state. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.sys_id</td>
<td>Sys_id of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.canceledPlaybookContext.title</td>
<td>The label of the playbook execution from the Process Executions [sys_pd_context] table. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.skippedPlaybookContext</td>
<td>List of the skipped playbook executions. Each playbook execution is an object in the array. For descriptions of the object properties, see the <code>canceledPlaybookContext</code> array. Data type: Array</td>
</tr>
</tbody>
</table>

This example shows how to cancel all executions of a specific playbook (in this case, the Playbook Experience Demo) for a given interaction record. To use this method in a UI action or business rule, pass the `current` object as the `parentRecord` instead.

```javascript
var parentRecord = new GlideRecordUtil().getGR("interaction", "d91742531b343010a26c98a1b24bcbe0");
```
```javascript
var cancellationReason = "Cancelling this playbook";

// demo playbook from Process Automation Experience Demo store app
var scopedName = "sn_pad_demo.playbook_experience_demo";

// demo playbook experience from Process Automation Experience Demo store app
var playbookExperienceId = "a56d8d93ff311010cc0853ea793bf1a6";

var cancelPlaybookReturn = 
    sn_playbook.PlaybookExperience.cancelPlaybooksByParentRecord(parentRecord, 
    cancellationReason, scopedName, playbookExperienceId);

gs.info(JSON.stringify(cancelPlaybookReturn, null, 2));

Output:

{
    "canceledPlaybookContext": [
    {
        "can_read": true,
        "sys_id": "d02782533d343010ac50ee17e75d3466",
        "scoped_name": "sn_pad_demo.playbook_experience_demo",
        "canceled_by": "admin",
        "playbook_table": "sys_pd_process_definition",

        "errors": []
    }
    ],
    "skippedPlaybookContext": []
}
```

**PlaybookExperience - getPlaybooksForParentRecord(GlideRecord parentRecord)**

Gets a list of playbook executions for a given parent record.
# Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentRecord</td>
<td>GlideRecord</td>
<td>The parent record to get playbook executions for. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.</td>
</tr>
</tbody>
</table>

# Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of playbook executions for the parent record. Each playbook execution is an object in the array.</td>
</tr>
<tr>
<td>&lt;Array&gt;.can_read</td>
<td>Flag that indicates whether the current user can read the playbook execution record. The current user must have read access to the parent record to be able to read the playbook execution record.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Current user has read access to the playbook execution record.</td>
</tr>
<tr>
<td></td>
<td>• false: Current user doesn’t have read access to the playbook execution record.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Returns (continued)</td>
</tr>
</tbody>
</table>
| <Array>.canceled_by | The User ID of the user who cancelled the playbook execution. Empty if the playbook is not cancelled.  
Data type: String |
| <Array>.cancellation_reason | The cancellation reason input by the user who cancelled the playbook execution. Empty if the playbook is not cancelled.  
Data type: String |
| <Array>.errors | List of errors. Each error is an object in the array.  
Data type: Array |
| <Array>.errors.message | The error message.  
Data type: String |
| <Array>.errors.type | The type of error.  
Data type: String |
| <Array>.parent_record | Sys_id of the parent record.  
Data type: String |
| <Array>.parent_table | The name of the table that the parent record is from.  
Data type: String |
Data type: String |
| <Array>.playbook_table | The name of the table that the playbook is from, generally the Process Definitions [sys_pd_process_definition] table.  
Data type: String |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Array&gt;.scoped_name</td>
<td>The scoped name of the playbook from the Process Definitions [sys_pd_process_definition] table in the format scope.name.</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Array&gt;.state</td>
<td>The state of the playbook execution from the Process Executions [sys_pd_context] table.</td>
</tr>
<tr>
<td></td>
<td>Data type: Object</td>
</tr>
<tr>
<td></td>
<td>&quot;state&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;displayValue&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>&lt;Array&gt;.state.displayValue</td>
<td>The display value of the playbook execution state.</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Array&gt;.state.value</td>
<td>The value of the playbook execution state.</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Array&gt;.title</td>
<td>The label of the playbook execution from the Process Executions [sys_pd_context] table.</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
</tbody>
</table>

This example shows how to get playbook executions for a given interaction record. To use this method in a UI action or business rule, pass the current object as the parentRecord instead.

```javascript
var parentRecord = new GlideRecordUtil().getGR("interaction", "148776e5818d7410f87701eb89fdc824");
var playbook = sn_playbook.PlaybookExperience.getPlaybooksForParentRecord(parentRecord);
gs.info(JSON.stringify(playbook, null, 2));
```

**Output:**

```javascript
[
]
```
PlaybookExperience - parentRecordContainsPlaybook(GlideRecord parentRecord, String scopedName)

Checks whether a parent record has playbook executions.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentRecord</td>
<td>GlideRecord</td>
<td>The parent record to check for playbook executions. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.</td>
</tr>
<tr>
<td>scopedName</td>
<td>String</td>
<td>Optional. The scoped name of the playbook to check for. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format scope.name. If provided, only executions of this playbook are checked for. If not provided, executions of all playbooks are checked for.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the parent record has playbook executions.</td>
</tr>
</tbody>
</table>
This example shows how to check if a given interaction record has executions of a specific playbook (in this case, the Playbook Experience Demo). To use this method in a UI action or business rule, pass the `current` object as the `parentRecord` instead.

```javascript
var parentRecord = new GlideRecordUtil().getGR("interaction", "148776e5818d7410f87701eb89fdc824");

// demo playbook from Process Automation Experience Demo store app
var scopedName = "sn_pad_demo.playbook_experience_demo";

var hasPlaybooks = sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(parentRecord, scopedName);
gs.info(hasPlaybooks);
```

Output:

```
true
```

**PlaybookExperience - triggerPlaybook(String scopedName, GlideRecord parentRecord)**

Initiates a playbook for a parent record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedName</td>
<td>String</td>
<td>The scoped name of the playbook to initiate. The scoped name is from the Process Definition [sys_pd_process_definition] table in the format scope.name.</td>
</tr>
<tr>
<td>parentRecord</td>
<td>GlideRecord</td>
<td>The parent record to initiate a playbook for. The parent record can be any record that can have playbook executions, such as an interaction record or an onboarding case record.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Sys_id of the playbook execution from the Process Executions [sys_pd_context] table that was created for the parent record. Null if a playbook execution wasn't successfully created.</td>
</tr>
</tbody>
</table>

This example shows how to initiate a playbook for a given interaction record. To use this method in a UI action or business rule, pass the current object as the parentRecord instead.

```javascript
var parentRecord = new GlideRecordUtil().getGR("interaction", "148776e5818d7410f87701eb89f0dc824");

// demo playbook from Process Automation Experience Demo store app
var scopedName = "sn_pad_demo.playbook_experience_demo";

var playbookExecution = sn_playbook.PlaybookExperience.triggerPlaybook(scopedName, parentRecord);
gs.info(playbookExecution);
```

Output:

```
f059958267c02d410952864f0fed358cc
```

**PredictabilityEstimate - Global**

Scriptable object used in Predictive Intelligence stores. This object provides estimation of how predictable fields of a dataset can be, and which features can be useful for predicting those fields.

The **PredictabilityEstimate** API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the **sn_ml** namespace.

The predictability estimate setup-to-training flow is as follows:

1. Create a dataset using the **DatasetDefinition** API.
2. Use the **constructor** to create a predictability estimate object.
3. Add the predictability estimate object to the predictability estimate store using the **PredictabilityEstimateStore - add()** method.
4. Train the predictability estimate using the `submitTrainingJob()` method. This creates a version of the object that you can manage using the `PredictabilityEstimateVersion` API.

5. Get estimated predictive values using the `PredictabilityEstimateVersion - getResults()` method.

ℹ️ **Note:** This API runs with full privileges. To restrict user access, include an access control mechanism in the script.

For usage guidelines, refer to **Using ML APIs**.

**PredictabilityEstimate - PredictabilityEstimate(Object config)**

Creates a predictability estimate.

To get new predictability estimates on the same dataset, use this constructor to create a new `PredictabilityEstimate` object with a unique name.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Object</td>
<td>JavaScript object containing configuration properties of the predictability estimate.</td>
</tr>
<tr>
<td>config.dataset</td>
<td>Object</td>
<td><code>DatasetDefinition</code> name.</td>
</tr>
<tr>
<td>config.domainName</td>
<td>String</td>
<td>Optional. Domain name associated with this dataset. See <strong>Domain separation and Predictive Intelligence</strong>. Default: Current domain, for example, &quot;global&quot;.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config.inputFieldNames</td>
<td>Array</td>
<td>List of candidate input fields as strings to be considered for estimation.</td>
</tr>
<tr>
<td>config.label</td>
<td>String</td>
<td>Identifies the prediction task.</td>
</tr>
<tr>
<td>config.minRowCount</td>
<td>String</td>
<td>Optional. Minimum number of records required in the dataset for training. Default: 10000</td>
</tr>
<tr>
<td>config.predictedFieldName</td>
<td>String</td>
<td>Identifies a field to be trained for predictability.</td>
</tr>
<tr>
<td>config.trainingFrequency</td>
<td>String</td>
<td>Optional. The frequency to retrain the model. Possible values: every_30_days, every_60_days, every_90_days, every_120_days, every_180_days, run_once. Default: run_once</td>
</tr>
</tbody>
</table>

The following example shows how to create an estimation job and add it to the PredictabilityEstimate store.

```javascript
var myIncidentData = new sn_ml.DatasetDefinition({
  'tableName' : 'incident',
  'encodedQuery' : 'activeANYTHING'
});

var myEstimate = new sn_ml.PredictabilityEstimate({
  'label': "predictability estimate",
  'dataset' : myIncidentData,
  'inputFieldNames': ['short_description'],
  'predictedFieldName': 'category'
});
```
PredictabilityEstimate - cancelTrainingJob()
Cancels a job for a predictability estimate object that has been submitted for training.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to cancel an existing training job.

```javascript
var myEstimate =
    sn_ml.PredictabilityEstimateStore.get('ml_sn_global_global_predictability_estimate');
myEstimate.cancelTrainingJob();
```

PredictabilityEstimate - getActiveVersion()
Gets the active `PredictabilityEstimateVersion` object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Active <code>PredictabilityEstimateVersion</code> object.</td>
</tr>
</tbody>
</table>

The following example shows how to get an active `PredictabilityEstimate` version from the store and return its training status.
var mlEstimate =
    sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_predictability_estimate');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getStatus()), null, 2));

Output:

```
{
    "state": "predictability_estimate_complete",
    "percentComplete": "100",
    "hasJobEnded": "true"
}
```

**PredictabilityEstimate - getAllVersions()**

Gets all versions of a predictability estimate.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Existing versions of a solution object. See also PredictabilityEstimateVersion API.</td>
</tr>
</tbody>
</table>

The following example shows how to get all PredictabilityEstimate version objects and call the getVersionNumber() and getStatus() estimate version methods on them.

```javascript
var mlEstimate =
    sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_predictability_estimate');

var mlEstimateVersions = mlEstimate.getAllVersions();

for (i = 0; i < mlEstimateVersions.length; i++) {
    gs.print("Version " + mlEstimateVersions[i].getVersionNumber() + " Status: " + mlEstimateVersions[i].getStatus() +"\n");
}
```

Output:
PredictabilityEstimate - getLatestVersion()

Gets the latest version of a predictability estimate.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>PredictabilityEstimateVersion object corresponding to the latest version of a PredictabilityEstimate().</td>
</tr>
</tbody>
</table>

The following example shows how to get the latest version of a predictability estimate and return its training status.

```javascript
var mlEstimate = 
sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_predictability_estimate');
gs.print(JSON.stringify(JSON.parse(mlEstimate.getLatestVersion().getStatus()), null, 2));
```

Output:

```javascript
{
  "state": "predictability_estimate_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

PredictabilityEstimate - getName()

Gets the name of the object to use for interaction with the store.
The following example shows how to update `PredictabilityEstimate` dataset information and print the name of the object.

```javascript
// Update estimate
var myIncidentData = new sn_ml.DatasetDefinition({
  'tableName' : 'incident',
  'fieldNames' : ['category', 'short_description', 'priority'],
  'encodedQuery' : 'activeANYTHING'
});

var myEstimate = new sn_ml.PredictabilityEstimate({
  'label': "my estimate",
  'dataset' : myIncidentData,
  'inputFieldNames':['short_description'],
  'predictedFieldName': 'category'
});

// update estimate
sn_ml.PredictabilityEstimateStore.update('ml_x_snc_global_global_my_definition_4', myEstimate);

// print estimate name
gs.print('Estimate Name: '+myEstimate.getName());
```

Output:

```
Estimate Name: ml_x_snc_global_global_my_definition_4
```

**PredictabilityEstimate - getProperties()**

Gets predictability estimate object properties.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contents of the Dataset and PredictabilityEstimate() object details in the PredictabilityEstimateStore</td>
</tr>
</tbody>
</table>

```json
{
    "datasetProperties": {
        "encodedQuery": "String",
        "fieldDetails": [Array],
        "fieldNames": [Array],
        "tableName": "String"
    }
}
```

```json
<Object>.datasetProperties
```

Lists the properties of the DatasetDefinition() object associated with the estimate.

```json
{
    "encodedQuery": "String",
    "fieldDetails": [Array],
    "fieldNames": [Array],
    "tableName": "String"
}
```

```json
<Object>.datasetProperties$tableName
```

Name of the table for the dataset. For example, "tableName": "Incident".

Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldNames</code></td>
<td>List of field names from the specified table as strings. For example, <code>&quot;fieldNames&quot;: [&quot;short_description&quot;, &quot;priority&quot;]</code>. Data type: Array.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldNames.fieldDetails</code></td>
<td>List of JavaScript objects that specify field properties. Data type: Array.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldNames.fieldDetails.&lt;object&gt;.name</code></td>
<td>Name of the field defining the type of information to restrict this dataset to. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldNames.fieldDetails.&lt;object&gt;.type</code></td>
<td>Machine-learning field type. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldDetails.encodedQuery</code></td>
<td>Encoded query string in standard Glide format. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.domainName</code></td>
<td>Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.inputFieldNames</code></td>
<td>List of candidate input fields as strings to be considered for estimation. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.label</code></td>
<td>Identifies the prediction task.</td>
</tr>
<tr>
<td>{}</td>
<td></td>
</tr>
<tr>
<td><code>&lt;Object&gt;.name</code></td>
<td>System-assigned name. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.predictedFieldName</code></td>
<td>Identifies a field to be trained for predictability. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.scope</code></td>
<td>Object scope. Currently the only valid value is <code>global</code>. Data type: String.</td>
</tr>
</tbody>
</table>
| `<Object>.trainingFrequency` | The frequency to retrain the model. Possible values:  
  • `every_30_days`  
  • `every_60_days`  
  • `every_90_days`  
  • `every_120_days`  
  • `every_180_days`  
  • `run_once`  
  Default: `run_once`  
  Data type: String. |
The following example gets properties of a predictability estimate object in the store.

```javascript
var mySolution = sn_ml.PredictabilityEstimateStore.get('ml_sn_global_global_predictability_estimate');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()), null, 2));
```

Output:

```json
*** Script: { 
  "datasetProperties": { 
    "tableName": "incident", 
    "fieldNames": [ 
      "category", 
      "short_description", 
      "priority", 
      "assignment_group.name"
    ], 
    "fieldDetails": [ 
      { 
        "name": "category", 
        "type": "nominal" 
      }, 
      { 
        "name": "short_description", 
        "type": "text"
      }
    ]
  },

  "predictedFieldname": "category",
  "processingLanguage": "en",
  "scope": "global",
  "stopwords": [ 
    "Default English Stopwords"
  ],
  "trainingFrequency": "run_once"
}
```
**PredictabilityEstimate - getVersion(String version)**

Gets a predictability estimate by provided version number.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Existing version number of a predictability estimate.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Specified version of the <code>PredictabilityEstimate()</code> object on which you can call <code>PredictabilityEstimateVersion</code> API methods.</td>
</tr>
</tbody>
</table>

The following example shows how to get the training status of a predictability estimate by version number.

```javascript
var mlEstimate = 
    sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_predictability_estimate');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getVersion('1').getStatus()), null, 2));
```

**Output:**

```javascript
{
  "state": "predictability_estimate_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

**PredictabilityEstimate - setActiveVersion(String version)**

Activates a specified version of a predictability estimate in the store.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Name of the <code>PredictabilityEstimate()</code> object version to activate. Activating this version deactivates any other version.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to activate a predictability estimate version in the store.

```javascript
sn_ml.PredictabilityEstimate.setActiveVersion("ml_x_snc_global_global_my_estimate_definition");
```

**PredictabilityEstimate - submitTrainingJob()**

Submits a training job.

ℹ️ **Note:** Before running this method, you must first add a predictability estimate to the store using the `PredictabilityEstimateStore - add()` method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td><code>PredictabilityEstimateVersion</code> object corresponding to the <code>PredictabilityEstimate</code> being trained.</td>
</tr>
</tbody>
</table>

The following example shows how to create a dataset, apply it to a predictability estimate, add it to a store, and submit the training job.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
    'tableName': 'incident',
    'fieldNames': ['assignment_group', 'short_description', 'description'],
    'encodedQuery': 'activeANYTHING'
});

// Create an estimate
```
var myEstimate = new sn_ml.PredictabilityEstimate({
  'label': "my estimate definition",
  'dataset': myData,
  'predictedFieldName': 'assignment_group',
  'inputFieldNames': ['short_description']
});

// Add the estimate to the store to later be able to retrieve it.
var my_unique_name = sn_ml.PredictabilityEstimateStore.add(myEstimate);

// Train the estimate - this is a long running job
var myEstimateVersion = myEstimate.submitTrainingJob();

PredictabilityEstimateStore - Global
Enables storing and retrieving predictability estimates.

The PredictabilityEstimateStore API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the sn_ml namespace.

PredictabilityEstimateStore - add(Object mLEstimate)
Adds a new predictability estimate object to the store and returns a unique name.

ℹ️ Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mLEstimate</td>
<td>PredictabilityEstimate()</td>
<td>PredictabilityEstimate() object to add to the store.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>System-generated predictability estimate name.</td>
</tr>
</tbody>
</table>
The following example shows how to add a predictability estimate to the store. Use `PredictabilityEstimate - submitTrainingJob()` to run the training job after adding it to the store.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' : ['assignment_group', 'short_description', 'description'],
    'encodedQuery' : 'activeANYTHING'
});

// Create an estimate
var myEstimate = new sn_ml.PredictabilityEstimate({
    'label': "my estimate definition",
    'dataset' : myData,
    'predictedFieldName' : 'assignment_group',
    'inputFieldNames': ['short_description']
});

// Add the estimate to the store to later be able to retrieve it.
var my_unique_name = sn_ml.PredictabilityEstimateStore.add(myEstimate);
```

**PredictabilityEstimateStore - deleteObject(String name)**

Removes a specified predictability estimate object from the store.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the <code>PredictabilityEstimate()</code> object to be deleted.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to delete a predictability estimate from the store.
PredictabilityEstimateStore - get(String name)

Gets a predictability estimate object from a store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of a predictability estimate in a store.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>PredictabilityEstimate object. Returns an error if the object does not exist.</td>
</tr>
</tbody>
</table>

The following example shows how to get a predictability estimate object from the store using the `get()` method and view its training status using the `PredictabilityEstimate - getActiveVersion()` and `PredictabilityEstimateVersion - getStatus()` methods.

```javascript
// Get status
var mlEstimate = sn_ml.PredictabilityEstimateStore.get('ml_incident_categorization');
gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getStatus(), null, 2)));
```

Output:

```javascript
{
  "state":"solution_complete",
  "percentComplete":"100",
  "hasJobEnded":"true"
}
```

PredictabilityEstimateStore - getAllNames(Object options)

Gets the names of all predictability estimate definition records in the store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Options for restricting results within the specified properties.</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>`{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;label&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;domainName&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;scope&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>);</td>
</tr>
<tr>
<td>options.label</td>
<td>String</td>
<td>Optional. Label of your solution object.</td>
</tr>
<tr>
<td>options.domainName</td>
<td>String</td>
<td>Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.</td>
</tr>
<tr>
<td>options.scope</td>
<td>String</td>
<td>Optional. Name of an application scope for your solution object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of strings representing predictability estimate object names in the store.</td>
</tr>
</tbody>
</table>

In the following example, the `getAllNames()` method returns a list of all names in the store.

```javascript
gs.print(JSON.stringify(JSON.parse(sn_ml.PredictabilityEstimateStore.getAllNames()), null, 2));
```

**Output:**

```
[
  "ml_x_snc_global_global_predictability_estimate_1",
  "ml_x_snc_global_global_predictability_estimate",
  "ml_x_snc_global_global_predictability_estimate_2",
  "ml_x_snc_global_global_my_estimate_definition"
]
```

In the following example, the `getAllNames()` method returns only names associated with values set in the `options` parameter.

```
var options = {
  'label': 'my estimate definition',
  'domainName': 'global',
```
var solNames = sn_ml.PredictabilityEstimateStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));

Output:

```
[
  "ml_x_snc_global_global_my_estimate_definition"
]
```

**PredictabilityEstimateStore - update(String name, Object mlEstimate)**

Updates a predictability estimate object in a store.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the predictability estimate to update.</td>
</tr>
<tr>
<td>mlEstimate</td>
<td>PredictabilityEstimate()</td>
<td>object properties to update.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to update a predictability estimate object in the store.

```javascript
var estimateUpdate = new sn_ml.PredictabilityEstimate({
  'label': 'my estimate definition',
  'dataset': myData,
  'predictedFieldName': 'assignment_group',
  'inputFieldNames': ['short_description']
});

sn_ml.PredictabilityEstimateStore.update('ml_sn_global_global_incident_service',
  estimateUpdate);
```

**PredictabilityEstimateVersion - Global**

Scriptable object used in Predictive Intelligence stores.
The `PredictabilityEstimateVersion` API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

This API is used for working with predictability estimate versions based on `PredictabilityEstimate` API objects in the `PredictabilityEstimate` store.

The system activates the most recent version of the predictability estimate when it completes training, and only allows one version to be active at a time. However, you can activate any previously trained version you want to use to make predictions.

Methods in this API are accessible using the following `PredictabilityEstimate` methods:

- `getActiveVersion()`
- `getAllVersions()`
- `getLatestVersion()`
- `getVersion()`

`PredictabilityEstimateVersion - getProperties()`

Gets predictability estimate object properties and version number.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Object</td>
</tr>
</tbody>
</table>

```json
{
    "datasetProperties": {Object},
    "domainName": "String",
    "inputFieldNames": [Array],
    "label": "String",
    "name": "String",
    "predictedFieldName": "String",
    "scope": "String",
    "trainingFrequency": "String",
}
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>versionNumber</em></td>
<td>&quot;Number&quot;</td>
</tr>
</tbody>
</table>

Properties properties of the `DatasetDefinition()` object associated with the predictability estimate.

```json
{
  "encodedQuery": "String",
  "fieldDetails": [Array],
  "fieldNames": [Array],
  "tableName": "String"
}
```

Data type: Object.

### `<Object>.datasetProperties` properties for the dataset. For example,

```json
{
  "tableName": "Incident"
}
```

Data type: String.

### `<Object>.datasetProperties.fieldNames` fields from the specified table as strings. For example,

```json
"fieldNames": ["short_description", "priority"]
```

Data type: Array.

### `<Object>.datasetProperties.fieldDetails` object fields to specify field properties.

```json
[
  {
    "name": "String",
    "type": "String"
  }
]
```

Data type: Array.

### `<Object>.datasetProperties.fieldDetails.<object>.name` Name of the field defining the type of information to restrict this dataset to.

Data type: String.

### `<Object>.datasetProperties.fieldDetails.<object>.type` Machine-learning field type.

Data type: String.
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.datasetProperties.fieldDetails.encodedQuery</td>
<td>Encoded query string in standard Glide format. See Encoded query strings. Data type: String.</td>
</tr>
<tr>
<td>&lt;Object&gt;.domainName</td>
<td>Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Data type: String.</td>
</tr>
<tr>
<td>&lt;Object&gt;.inputFieldNames</td>
<td>List of candidate input fields as strings to be considered for estimation. Data type: String.</td>
</tr>
</tbody>
</table>
| <Object>.isActive | Flag that indicates whether this version is active. Valid values:  
  - true: Version is active.  
  - false: Version is not active.  
  Data type: String |
| <Object>.label | Identifies the prediction task.  
  ```json  
  {  
    "label": "my first prediction"  
  }  
  ```  
  Data type: String. |
| <Object>.name | System-assigned name. Data type: String. |
| <Object>.predictedFieldName | Field to be trained for predictability. Data type: String. |
| <Object>.scope | Object scope. Currently the only valid value is global. Data type: String |
| <Object>.trainingFrequency | Frequency to retrain the model. Possible values:  
  - every_30_days  
  - every_60_days |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• every_90_days</td>
<td></td>
</tr>
<tr>
<td>• every_120_days</td>
<td></td>
</tr>
<tr>
<td>• every_180_days</td>
<td></td>
</tr>
<tr>
<td>• run_once</td>
<td></td>
</tr>
</tbody>
</table>

Default: run_once  
Data type: String.

<Object>.versionNumber

Version number of the PredictabilityEstimate object.  
Data type: String.

The following example gets properties of the active object version in the store.

```javascript
// Get properties
var mlEstimate = sn_ml.PredictabilityEstimateStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getProperties()), null, 2));
```

Output:

```json
"datasetProperties": {
    "encodedQuery": "activeANYTHING^EQ",
    "fieldNames": [
        "short_description",
        "category"
    ],
    "tableName": "incident"
},
"domainName": "global",
"inputFieldNames": [
    "short_description"
],
"isActive": "true",
"label": "Incident Categorization_Trainer",
"name": "ml_incident_categorization",
"predictedFieldName": "category",
"processingLanguage": "en",
"stopwords": [
PredictabilityEstimateVersion - getResults()
Returns JSON results containing suggested input fields for an output field.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>JSON object results containing suggested input field options for an output field.</td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;output field name&gt;</td>
<td>Output field name, e.g., category, containing suggested input fields.</td>
</tr>
</tbody>
</table>

```json
{
  "<output field name>": {
    "nominalInputFields": [Array],
    "textInputFields": [Array]
  }
}
```

Data type: Object

<table>
<thead>
<tr>
<th>&lt;Object&gt;.&lt;output field name&gt;.nominalInputFields</th>
<th>Nominal input field details.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;nominalInputFields&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;fieldName&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;modelImprovement&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.&lt;output field name&gt;.nominalInputFields.fieldName</code></td>
<td>Nominal input field name. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.&lt;output field name&gt;.nominalInputFields.modelImprovement</code></td>
<td>Score as a relative indication of how likely this field is to improve results. Data type: Number as a string.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.textInputFields</code></td>
<td>Text input field details.</td>
</tr>
<tr>
<td>&quot;textInputFields&quot;: [</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>]</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.textInputFields.fieldName</code></td>
<td>Text input field name. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.textInputFields.density</code></td>
<td>Value between 0 and 1.0 that represents frequency that the field is not empty. A value of 1.0 means that the field is not empty in all rows, and a value of 0 indicates that the field is empty in all rows. Data type: Number as a string.</td>
</tr>
</tbody>
</table>

The following example shows how to get results for a selected version of a predictability estimate in the store.

```javascript
// Get results
var estimateName = "ml_x_snc_global_global_predictability_estimate;"
var mlEstimate = sn_ml.PredictabilityEstimateStore.get(estimateName);
var results = mlEstimate.getActiveVersion().getResults();
```
Output:

```javascript
{
  "category": {
    "nominalInputFields": [
      {
        "fieldName": "number",
        "modelImprovement": "0.167052396325189"
      },
      {
        "fieldName": "task_effective_number",
        "modelImprovement": "0.167052396325189"
      }
    ],
    "textInputFields": [
      {
        "fieldName": "short_description",
        "density": "1.0"
      }
    ]
  }
}
```

**PredictabilityEstimateVersion - getStatus(Boolean includeDetails)**

Gets training completion status.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeDetail</td>
<td>Boolean</td>
<td>Flag that indicates whether to return status details. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Return additional details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Do not return additional details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: False</td>
</tr>
<tr>
<td>Returns</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td><strong>Description</strong></td>
<td></td>
</tr>
<tr>
<td>Object</td>
<td>JavaScript object containing training status information for a <strong>PredictabilityEstimate</strong> object.</td>
<td></td>
</tr>
</tbody>
</table>
| | ```json
{
    "state": "String",
    "percentComplete": "Number as a String",
    "hasJobEnded": "Boolean value as a String",
    "details": {Object}
}
``` |
| **<Object>.state** | Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the **hasJobEnded** property is set to **true**. Possible values: |
| | • *fetching_files_for_training* |
| | • *preparing_data* |
| | • *retry* |
| | • *solution_cancelled* *(terminal)* |
| | • *solution_complete* *(terminal)* |
| | • *solution_error* *(terminal)* |
| | • *solution_incomplete* |
| | • *training_request_received* |
| | • *training_request_timed_out* *(terminal)* |
| | • *training_solution* |
| | • *uploading_solution* |
| | • *waiting_for_training* |
| Data type: String | |
| **<Object>.hasJobEnded** | Flag that indicates whether training is complete. Valid values: |
| | • **true**: Training is complete. |
| | • **false**: Training is incomplete. |
| Data type: Boolean value as a String | |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.percentComplete</td>
<td>Number between zero and 100 representing training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out. Data type: Number as a String</td>
</tr>
<tr>
<td>&lt;Object&gt;.details</td>
<td>Object containing a list of additional training details. Data type: Object</td>
</tr>
</tbody>
</table>

The following example shows a successful result with training complete.

```javascript
// Get status
var mlEstimate = sn_ml.PredictabilityEstimateStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getStatus(true), null, 2)));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true",
  "details": {"stepLabel": "Solution Complete"} // This information is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```javascript
// Get status
var mlEstimate = sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_my_estimate_definition');
var trainingStatus = mlEstimate.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
```
**PredictabilityEstimateVersion - getVersionNumber()**

Gets the version number of a predictability estimate object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Version number.</td>
</tr>
</tbody>
</table>

The following example shows how to get a version number.

```javascript
// Get version number
var mlEstimate =
    sn_ml.PredictabilityEstimateStore.get('ml_x_snc_global_global_predictability_estimate');

gs.print("Version number:
    "+JSON.stringify(JSON.parse(mlEstimate.getActiveVersion().getVersionNumber()), null, 2));
```

Output:

```
Version number: 1
```

**PreferenceDestination - Scoped, Global**

The PreferenceDestination API updates user notification preferences.

A notification destination is somewhere that a notification can be delivered to, such as a specific email address or phone number. This API is based on notifications from the Notification [sys_notification] table. Notifications are sent through channels such as email or Workspace. A channel can be used to send notifications to multiple types of destinations. For example, an email channel could send notifications to both personal email and work email destinations. Destination types are listed in the Notification Destination Type [sys_notif_destination_type] table.

A user can update their own notification preferences, and an admin can update notification preferences for any user. User notification preferences control which destinations will receive which notifications.
Use this API with the `Preferences` API. Before calling any methods in this class, you must call the `Preferences.getDestinations()` or `Preferences.getDestinationsByChannel()` methods to instantiate a `PreferenceDestination` object.

This class uses the sn_notification namespace identifier.

**PreferenceDestination - getChannel()**

Returns the channel that is used to send notifications to the destination.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>GlideRecord</td>
</tr>
</tbody>
</table>

This example prints the channel that is used to send notifications for each of Abel Tuter's destinations.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
    gs.print('Channel for destination '+(i+1)+' is '+dests[i].getChannel().name);
}
```

**Output:**

```
Channel for destination 1 is Workspace
```

**PreferenceDestination - getDeliverTo()**

Returns the identifier for the destination.
This example prints the identifier for each of Abel Tuter's destinations. The output shows that the identifier for Abel's Workspace destination is the user sys_id.

```
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
    gs.print('The identifier for '+recipient.first_name+'\'s '+
       '+dests[i].getDestinationType().name+' destination is '+dests[i].getDeliverTo());
}
```

Output:

```
The identifier for Abel\'s Workspace destination is 62826bf03710200044e0bfc8bcbe5df1
```

PreferenceDestination - getDestinationType()

Returns the type of destination, such as personal email or work email.

```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>GLideRecord</td>
<td>GlideRecord from the Notification Destination Type [sys_notif_destination_type] table for the destination type.</td>
</tr>
</tbody>
</table>
```
This example prints the identifier for each of Abel Tuter's destinations. The output shows that the identifier for Abel's Workspace destination is the user sys_id.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
for (var i=0; i<dests.length; i++) {
    gs.print('The identifier for '+recipient.first_name+'s
    '+dests[i].getDestinationType().name+' destination is '+dests[i].getDeliverTo());
}
```

Output:

```
The identifier for Abel's Workspace destination is 62826bf03710200044e0bfc8bcbe5df1
```

**PreferenceDestination - isActive(GlideRecord notification)**

Checks if the destination has permission to receive a notification.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notification</td>
<td>GlideRecord</td>
<td>Optional. Specify a notification to check if the destination has permission to receive that notification. An exception is thrown if the notification doesn't exist or if the notification isn't readable by the destination's user. If no notification is specified, this method checks if the destination has permission to receive any notifications.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the destination has permission to receive a notification. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: The destination has permission receive a notification.</td>
</tr>
<tr>
<td></td>
<td>• false: The destination doesn't have permission to receive a notification.</td>
</tr>
</tbody>
</table>
This example checks if each of Abel Tuter's destinations has permission to receive the Approval Request notification.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
for (var i=0; i<dests.length; i++) {
    var active = dests[i].isActivenotif) ? 'active' : 'inactive';
    gs.print(dests[i].getDestinationType().name + ' ' + dests[i].getDeliverTo() + ' is ' +
             active + ' for this notification');
}
```

Output:

```
Workspace 62826bf03710200044e0bfc8bcbe5df1 is active for this notification
```

PreferenceDestination - isOverridden(GlideRecord notification)
Checks if a notification overrides a user's preferences for the destination.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notification</td>
<td>GlideRecord</td>
<td>Specify a notification to check if it overrides user preferences for the destination. The notification should be a GlideRecord from the Notification [sys_notification] table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean | Flag that indicates whether the notification overrides user preferences for the destination.  
Valid values:  
• true: User preferences for the destination are ignored for this notification.  
• false: The destination receives or doesn't receive the notification according to the user preference. |
This example checks if the Approval Request notification overrides user preferences for one of Abel Tuter's destinations. If the notification doesn’t override user preferences, the destination is given permission to receive the notification. Otherwise, no preference is set because the notification overrides the preference.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
var firstDest = dests[0];
if (!firstDest.isOverridden(notif)) {
    dests[0].setActive(notif, true);
} else {
    gs.print('This notification overrides user preference, so don’t bother to set a preference.');
}
```

PreferenceDestination - setActive(GlideRecord notification, Boolean active)
Sets the user preference for a destination to receive or not receive notifications.

The isOverridden() method can be called first to check if the user preference will be ignored, but it is not required.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>notification</td>
<td>GlideRecord</td>
<td>Optional. If a notification is specified, the user preference is set for the destination to receive or not receive that notification. The notification should be a GlideRecord from the Notification [sys_notification] table. If no notification is specified, the user preference is set for the destination to receive or not receive all notifications.</td>
</tr>
<tr>
<td>active</td>
<td>Boolean</td>
<td>Flag that indicates whether the destination has permission to receive a notification. Valid values:</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• true</td>
<td>Type</td>
<td>The destination has permission to receive a notification.</td>
</tr>
<tr>
<td>• false</td>
<td>Type</td>
<td>The destination doesn't have permission to receive a notification.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example checks if the Approval Request notification overrides user preferences for one of Abel Tuter's destinations. If the notification doesn't override user preferences, the destination is given permission to receive the notification. Otherwise, no preference is set because the notification overrides the preference.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
var notif = new GlideRecord('sys_notification');
notif.get('name', 'Approval Request');
var firstDest = dests[0];
if (!firstDest.isOverridden(notif)) {
    dests[0].setActive(notif, true);
} else {
    gs.print('This notification overrides user preference, so don’t bother to set a preference.');
}
```

Preferences - Scoped, Global

The Preferences API gets notification destinations for a user.

A notification destination is somewhere that a notification can be delivered to, such as a specific email address or phone number. This API is based on notifications from the Notification [sys_notification] table. Notifications are sent through channels such as email or Workspace. A channel can be used to send notifications to multiple types of destinations. For example, an email channel could send notifications to both personal email and work email.
destinations. Destination types are listed in the Notification Destination Type [sys_notif_destination_type] table.

This API is used with the PreferenceDestination API to update user notification preferences.

This class uses the sn_notification namespace identifier.

**Preferences - getDestinations()**

Returns a user's notification destinations.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of PreferenceDestination objects. If the user doesn't have any destinations, the array is empty.</td>
<td></td>
</tr>
</tbody>
</table>

This example gets all of Abel Tuter's notification destinations. The output shows that Abel has one destination.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var dests = prefs.getDestinations();
gs.print(dests);
```

Output:

[object PreferenceDestination]

**Preferences - getDestinationsByChannel(GlideRecord channel)**

Returns a user's notification destinations that use a specified channel.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel</td>
<td>GlideRecord</td>
<td>GlideRecord from the Notification Channel [sys_notification_channel] table for the channel you want to filter on.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of PreferenceDestination objects. If the user doesn't have any notification destinations that use the channel or if the channel doesn't exist, the array is empty.</td>
</tr>
</tbody>
</table>

This example gets all of Abel Tuter's destinations that use the Workspace channel. The output shows that Abel has one destination that uses the Workspace channel.

```javascript
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);
var channel = new GlideRecord('sys_notification_channel');
channel.get('name', 'Workspace');
var dests = prefs.getDestinationsByChannel(channel);
gs.print(dests);
```

Output:

```
[object PreferenceDestination]
```

### Preferences - Preferences(GlideRecord recipient)

Instantiates a Preferences object for a specified user.

This example instantiates a Preferences object for the user Abel Tuter.
var recipient = new GlideRecord('sys_user');
recipient.get('last_name', 'Tuter');
var prefs = new sn_notification.Preferences(recipient);

**ProbeHandlerCim - Global**
Configures a CIM probe.
Use in any server-side script where you need to configure a CIM probe.

**ProbeHandlerCim - getCimQueries()**
Returns a string containing the CIM fields to fetch

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The CIM fields to fetch</td>
</tr>
</tbody>
</table>

**ProbeHandlerCim - getNamespace()**
Returns the CIM name space.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name space</td>
</tr>
</tbody>
</table>
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A hash map of the parameters</td>
</tr>
</tbody>
</table>

#### ProbeHandlerCim - setProbeParameters(Object params)
Sets the probe parameters.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>params</td>
<td>Object</td>
<td>The parameters to add</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### ProbeHandlerCim - run()
Runs the probe.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
ProbeHandlerMulti - Global

Probe handler for MultiProbes.

This script include does not work with probe parameters that have value_scripts and does not work with JavaScript probes.

Use in any server-side script where you need to configure a MultiProbe.

ProbeHandlerMulti - addParameters(String parent, String sysID, GlideRecord probe)

Adds the probe parameters to the given XML parent element, taken from the given probe's parameter table.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>parent</td>
</tr>
<tr>
<td>sysID</td>
</tr>
<tr>
<td>probe</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ProbeHandlerMulti - addProbes(String parent, String sysID)

Adds the probes for this multiprobe to the document.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>parent</td>
</tr>
<tr>
<td>sysID</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ProbeHandlerMulti - run()**

Runs the probe.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ProbeHandlerMulti - runProbeHandler(String params, String sysID, GlideRecord probe)**

If the given probe’s GlideRecord is present and contains a probe handler, runs the probe handler and adds any parameters it creates to the given parameter element.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>params</td>
<td>String</td>
<td>The XML parameter element to add parameters to.</td>
</tr>
<tr>
<td>sysID</td>
<td>String</td>
<td>The sys_id of the probe to get parameters from.</td>
</tr>
<tr>
<td>probe</td>
<td>GlideRecord</td>
<td>Optional GlideRecord of the probe. If present, and there is a probe handler, it is called.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**ProbeHandlerMulti - setParameter(String parent, String name, String value)**

Sets the value of a given XML parameter element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parent</td>
<td>String</td>
<td>The XML parent element to add the parameter to.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to set the parameter to.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ProbeHandlerSNMP - Global**

Discovery probe handler for SNMP probes, invoked when an SNMP probe is about to be created.

Use in any server-side script where you need to configure an SNMP probe.

**ProbeHandlerSNMP - addBoolean(String dbName, String paramName, String paramMap)**

Adds a boolean value to the parameter map.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbName</td>
<td>String</td>
<td>The database name</td>
</tr>
<tr>
<td>paramName</td>
<td>String</td>
<td>The parameter name</td>
</tr>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
 ProbeHandlerSNMP - addDebug(String paramMap)

Adds debugging to the probe handler.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

 ProbeHandlerSNMP - addJavascriptHandlers(String paramMap)

Adds a JavaScript handler.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

 ProbeHandlerSNMP - addOIDAutoResolve(String paramMap)

Adds OID automatic resolution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ProbeHandlerSNMP - addOIDSpec(String paramMap)

Adds OID specifications to the parameter map.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ProbeHandlerSNMP - addSensorHandler(String paramMap)

Adds a sensor handler.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ProbeHandlerSNMP - addStage(String paramMap)

Adds the stage to the parameter map.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ProbeHandlerSNMP - addTimingSpecs(String paramMap)**

Adds timing specifications to the parameter map.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramMap</td>
<td>String</td>
<td>The parameter map</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ProbeHandlerSNMP - getParameters()**

Returns the parameters added by this probe handler.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A hash map of the parameters added by this probe handler.</td>
</tr>
</tbody>
</table>
**ProbeHandlerSNMP - run()**

Runs the probe.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**ProbeHandlerSNMP - setProbeParameters(String params)**

Sets the value of a given XML parameter element.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>params</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**ProbeHandlerWMI - Global**

Discovery probe handler for WMI probes.

Use in any server-side script where you need to configure an WMI probe.

**ProbeHandlerWMI - getParameters()**

Returns the parameters added by this probe handler.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A hash map of the parameters added by this probe</td>
</tr>
</tbody>
</table>

**ProbeHandlerWMI - getWMIFields()**

Generates a string containing the WMI fields to fetch.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The WMI fields to fetch.</td>
</tr>
</tbody>
</table>

**ProbeHandlerWMI - run()**

Runs the probe.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
ProbeHandlerWMI - setProbeParameters(Object params)
Sets the probe parameters.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>params</td>
<td>Object</td>
<td>The probe parameters</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### Queue - Global

Use the `Queue` API (Advanced Work Assignment) to route a document to a queue.

The `Queue` API is provided within the `sn_awa` namespace.

Requires the following:
- Advanced Work Assignment plugin (com.glide.awa)
- Role: awa_integration_user or admin

#### Queue - get(String queue_id)

Gets a queue record by sys_id.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_id</td>
<td>String</td>
<td>Represents sys_id of queue record from awa_queue table</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if queue record exists, false otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var queue = sn_awa.Queue.get("<queue_id>");
var workItem = queue.route(
    document_sys_id: "<sys_id>",
```
Queue – route(Object options)

Routes an active work item to the queue object.

If an active work item does not exist for the specified document, this method creates a work item and set its fields accordingly.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Contains document sys_id and table associated with work item:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>document_sys_id: &quot;&lt;sys_id&gt;&quot;</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>document_table: &quot;&lt;table&gt;&quot;, e.g., interaction</code></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if successful, error message otherwise.</td>
</tr>
</tbody>
</table>

```javascript
var queue = sn_awa.Queue.get("<queue_id>"));
var workItem = queue.route({
    document_sys_id: "<sys_id>",
    document_table: "<table>
});
```

Queue - Scoped

The Queue API allows you to retrieve or join a Connect Support chat queue.

To use this class in a scoped application, use the `sn_connect` namespace identifier. The Connect Scriptable APIs plugin (ID: com.glide.connect.scriptable) should be enabled to access the Queue API.

**Scoped Queue - get(String sysID)**

Retrieves a specified chat queue.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SysID</td>
<td>String</td>
<td>Sys_id of a queue from the Chat Queue [chat_queue] table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Returns a conversation queue object.</td>
</tr>
</tbody>
</table>

```javascript
var queue = sn_connect.Queue.get("ab73be7dc09a4300964f336ee6b74361");
```

 Scoped Queue - join(String question)
 Adds the current user to an existing Connect Support chat queue and posts the specified question.

Before calling this method, you must call the Scoped Queue - get(String sysID) method to retrieve the chat queue to which to attach the current user.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>String</td>
<td>Question to add to the chat queue.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>GlideRecord object for the Chat Queue Entry.</td>
</tr>
</tbody>
</table>

```javascript
var queue = sn_connect.Queue.get("ab73be7dc09a4300964f336ee6b74361");
queue.join("How do I access my email?");
```

QuickRanges - Global

Generates IP network, range, and address entries from a convenient comma-separated input field using conventional CIDR network notation, hyphenated range entries, or individual IP addresses.

Use with any server-side discovery script.
QuickRanges - createItem(String table, String id, String type)
Creates a new discovery range item.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>String</td>
<td>The table where the item will be created.</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>The identifier to use for the new item.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>The type of entries to generate: IP address, IP network, or IP range.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The created entry</td>
</tr>
</tbody>
</table>

QuickRanges - onMakeRanges()
Returns the IP network, range, and address information to use when generating the entries.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

RecordToHTML - Global
A utility class to turn a record into HTML.
The RecordToHTML class is available to server-side scripts.
RecordToHTML - RecordToHTML(String table, String sys_id, String pattern, Boolean link)

Creates an instance of RecordToHTML class.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>String</td>
<td>The record's table name</td>
</tr>
<tr>
<td>sys_id</td>
<td>String</td>
<td>The sys_id of the record</td>
</tr>
<tr>
<td>pattern</td>
<td>String</td>
<td>The pattern of the string to generate. The pattern may include ${} escapes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>for fields whose values should be included. For example, the pattern</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;sys_id: ${sys_id}&quot; would substitute the actual sys_id for the escape.</td>
</tr>
<tr>
<td>link</td>
<td>Boolean</td>
<td></td>
</tr>
</tbody>
</table>

```
var r2html = new RecordToHTML("incident","e8e875b0c0a80164009dc852b4d677d5",
    "incident: ${number}-${short_description} (${user})", true);
gs.print(r2html.toString());
```

Output: incident: INC00005-CPU load high for over 10 minutes

RecordToHTML - setValue(String fieldName, String value)

Sets the specified field to the specified value.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fieldName</td>
<td>String</td>
<td>Name of the field to change.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to set the field to.</td>
</tr>
</tbody>
</table>

```
var r2html = new RecordToHTML("incident","e8e875b0c0a80164009dc852b4d677d5", "incident: ${number}-${short_description} (${user})", true);
```
r2html.setValue("user", gs.getUserName());
gs.print(r2html.toString());

Output: incident: INC00005-CPU load high for over 10 minutes (john.roberts)

**RecordToHTML - toString()**
Converts the record to a string.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

```javascript
var r2html = new RecordToHTML("incident","e8e875b0c0a80164009dc852b4d677d5",
            "incident: ${number}-${short_description}", true);
gs.print(r2html.toString());
```

Output: incident: INC00005-CPU load high for over 10 minutes

**RegressionSolution - Global**
Scriptable object used in Predictive Intelligence stores.

The `RegressionSolution` API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. Create a dataset using the `DatasetDefinition` API.
2. Optional. Build an encoder using the `Encoder` API.
3. Use the constructor to create a regression solution object.
4. Add the solution object to the regression solution store using the `RegressionSolutionStore - add()` method.
5. Train the solution using the `submitTrainingJob()` method. This creates a version of the object that you can manage using the `RegressionSolutionVersion` API.
**Note:** This API runs with full privileges. To restrict user access, include an access control mechanism in the script.

For usage guidelines, refer to [Using ML APIs](#).

**RegressionSolution - RegressionSolution(Object config)**

Creates a regression solution.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Object</td>
<td>JavaScript object containing configuration properties of the solution.</td>
</tr>
<tr>
<td>config.dataset</td>
<td>Object</td>
<td>DatasetDefinition name.</td>
</tr>
<tr>
<td>config.domainName</td>
<td>String</td>
<td>Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, &quot;global&quot;.</td>
</tr>
<tr>
<td>config.encoder</td>
<td>Object</td>
<td>Optional. Trained encoder object to assign to this solution. See Encoder - Encoder(Object config).</td>
</tr>
<tr>
<td>config.inputFieldNames</td>
<td>Array</td>
<td>List of input field names as strings. The model uses these fields used to make predictions.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>config.label</td>
<td>String</td>
<td>Identifies the prediction task.</td>
</tr>
<tr>
<td>config.minRowCount</td>
<td>String</td>
<td>Optional. Minimum number of records required in the dataset for training. Default: 10000</td>
</tr>
<tr>
<td>config.predictedFieldName</td>
<td>String</td>
<td>Mandatory unless setting <strong>predictedInterval</strong>. Identifies a field to be trained for predictability.</td>
</tr>
<tr>
<td>config.predictedInterval</td>
<td>Array</td>
<td>Mandatory unless setting <strong>predictedFieldName</strong>. Sets a range of fields to train your solution for confidence. Supports providing 2 non-numeric date fields. For example, 'predictedInterval': ['sys_updated_on', 'sys_created_on'].</td>
</tr>
<tr>
<td>config.processingLanguage</td>
<td>String</td>
<td>Optional. Processing language in two-letter ISO 639-1 language code format. Default: &quot;en&quot;</td>
</tr>
<tr>
<td>config.stopwords</td>
<td>Array</td>
<td>Optional. Preset list of strings that the system automatically generates based on the <strong>language</strong> property setting. For details, see <a href="#">Create a custom stopwords list</a>. Default: English Stopwords</td>
</tr>
<tr>
<td>config.trainingFrequency</td>
<td>String</td>
<td>The frequency to retrain the model. Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_30_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_60_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_90_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_120_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_180_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• run_once</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
<th>Default: run_once</th>
</tr>
</thead>
</table>

The following example shows how to create an object and add it to the RegressionSolution store.

```javascript
var myNewData = new sn_ml.DatasetDefinition({
    'tableName': 'incident',
    'fieldNames': ['category', 'short_description', 'priority'],
    'fieldDetails': [
        {'name': 'category', 'type': 'nominal'},
        {'name': 'short_description', 'type': 'text'}
    ],
    'encodedQuery': 'activeANYTHING'
});

var mySimSolution = new sn_ml.SimilaritySolution({
    'label': 'my solution definition',
    'dataset': myNewData,
    'predictedFieldName': 'category',
    'inputFieldNames': ['short_description']
});

var mySimilarityName = sn_ml.SimilaritySolutionStore.add(mySimSolution);
```

The following example shows how to create an object to train using the `predictedInterval` property.

```javascript
var myIncidentData = new sn_ml.DatasetDefinition({
    'tableName': 'incident',
    'fieldNames': ['short_description', 'sys_updated_on', 'sys_created_on'],
    'encodedQuery': 'activeANYTHING'
});

var mySolution = new sn_ml.RegressionSolution({
    'label': 'reg assinGroup',
});
```
_regressionSolution - cancelTrainingJob()

Cancels a job for a solution object that has been submitted for training.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to cancel an existing training job.

```javascript
var mySolution = sn_ml.RegressionSolutionStore.get('ml_sn_global_global_regression');
mySolution.cancelTrainingJob();
```

_regressionSolution - getActiveVersion()

Gets the active RegressionSolutionVersion object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Active RegressionSolutionVersion object.</td>
</tr>
</tbody>
</table>
The following example shows how to get an active `RegressionSolution` version from the store and return its training status.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regression');
gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getStatus()), null, 2));
```

Output:

```
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

**RegressionSolution - getAllVersions()**

Gets all versions of a `RegressionSolution` object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Existing versions of a solution object. See also <code>RegressionSolutionVersion</code> API.</td>
</tr>
</tbody>
</table>

The following example shows how to get all `RegressionSolution` version objects and call the `getUrlVersionNumber()` and `getStatus()` solution version methods on them.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regression');
var mlSolutionVersions = mlSolution.getAllVersions();

for (i = 0; i < mlSolutionVersions.length; i++) {
gs.print("Version " + mlSolutionVersions[i].getUrlVersionNumber() + " Status: " + mlSolutionVersions[i].getStatus() +"\n");
}
```

Output:
RegressionSolution - getLatestVersion()

Gets the latest version of a solution.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>RegressionSolutionVersion object corresponding to the latest version of a RegressionSolution().</td>
</tr>
</tbody>
</table>

The following example shows how to get the latest version of a solution and return its training status.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regression');
gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion().getStatus()), null, 2));
```

Output:

```json
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

RegressionSolution - getName()

Gets the name of the object to use for interaction with the store.
The following example shows how to update `RegressionSolution` dataset information and print the name of the object.

```javascript
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
    'tableName' : 'incident',
    'fieldNames' : ['category', 'short_description', 'priority'],
    'encodedQuery' : 'activeANYTHING'
});

var eligibleFields = JSON.parse(myIncidentData.getEligibleFields('regression'));

var myRegression = new sn_ml.RegressionSolution({
    'label': "my regression solution",
    'dataset' : myIncidentData,
    'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
    'predictedFieldName': 'category'
});

// update solution
sn_ml.RegressionSolutionStore.update('ml_x_snc_global_global_my_solution_definition_4',
    myRegression);

// print solution name
gs.print('Solution Name: ' + myRegression.getName());
```

Output:

```
Solution Name: ml_x_snc_global_global_my_solution_definition_4
```

**RegressionSolution - getProperties()**

Gets solution object properties.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contents of the Dataset and RegressionSolution() object details in the RegressionSolutionStore object.</td>
</tr>
</tbody>
</table>

```json
{
  "datasetProperties":
  {Object},
  "domainName": "String",
  "encoder": {Object},
  "inputFieldNames": [Array],
  "label": "String",
  "name": "String",
  "predictedFieldName": "String",
  "predictedInterval": [Array],
  "processingLanguage": "String",
  "scope": "String",
  "stopwords": [Array],
  "trainingFrequency": "String"
}
```

```json
<Object>.datasetProperties
```

Lists the properties of the DatasetDefinition object associated with the solution.

```json
{
  "encodedQuery": "String",
}
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>&quot;fieldDetails&quot;:</strong></td>
</tr>
<tr>
<td></td>
<td>[Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;fieldName&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;tableName&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Data type: Object.

**<Object>.datasetProperties.tableName**

Name of the table for the dataset. For example, "tableName" : "Incident".

Data type: String.

**<Object>.datasetProperties.fieldNames**

List of field names from the specified table as strings. For example, "fieldNames" : ["short_description", "priority"].

Data type: Array.

**<Object>.datasetProperties.fieldNames.fieldDetails**

List of JavaScript objects that specify field properties.

```
[
  {
    "name": "String",
    "type": "String"
  }
]
```

Data type: Array.

**<Object>.datasetProperties.fieldNames.fieldDetails.<object>.name**

Name of the field defining the type of information to restrict this dataset to.

Data type: String.

**<Object>.datasetProperties.fieldDetails.<object>.type**

Machine-learning field type.
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.datasetProperties.fieldDetails.encodedQuery</code></td>
<td>Encoded query string in standard Glide format. See <a href="#">Encoded query strings</a>. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.domainName</code></td>
<td>Domain name associated with this dataset. See <a href="#">Domain separation and Predictive Intelligence</a>. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.encoder</code></td>
<td>Encoder object assigned to this solution. See <a href="#">Encoder</a>. Object.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.inputFieldNames</code></td>
<td>List of input field names as strings. The model uses these fields used to make predictions. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.label</code></td>
<td>Identifies the prediction task. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.name</code></td>
<td>System-assigned name. Data type: String.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.predictedFieldName</code></td>
<td>Identifies a field to be trained for predictability. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.predictedInterval</code></td>
<td>Range of values specifying the prediction confidence level. Data type: Array</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.processingLanguage</code></td>
<td>Processing language in two-letter ISO 639-1 language code format. Data type: String</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.scope</code></td>
<td>Object scope. Currently the only valid value is <code>global</code>. Data type: String</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.stopwords</code></td>
<td>Optional. Preset list of strings that the system automatically generates based on the <code>language</code> property setting. For details, see Create a custom stopwords list. Data type: Array.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.trainingFrequency</code></td>
<td>The frequency to retrain the model. Possible values:</td>
</tr>
<tr>
<td></td>
<td>* every_30_days</td>
</tr>
<tr>
<td></td>
<td>* every_60_days</td>
</tr>
<tr>
<td></td>
<td>* every_90_days</td>
</tr>
<tr>
<td></td>
<td>* every_120_days</td>
</tr>
</tbody>
</table>
The following example gets properties of a solution object in the store.

```javascript
var mySolution = sn_ml.RegressionSolutionStore.get('ml_sn_global_global_regression_solution');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()), null, 2));
```

Output:

```json
*** Script: {
  "datasetProperties": {
    "tableName": "cloudinfratext",
    "fieldNames": [
      "short_description",
      "sourcedc",
      "targetdc",
      "dbsize",
      "duration"
    ],
  },
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wc_regression"
  },
  "inputFieldNames": [
    "short_description",
    "sourcedc",
    "targetdc",
    "dbsize"
  ],
  "label": "Regression Test for DB Restore",
  "name": "ml_x_snc_global_global_regression",
  "predictedFieldNames": "duration",
}***
```
RegressionSolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Existing version number of a solution.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Specified version of the RegressionSolution() object on which you can call</td>
</tr>
<tr>
<td></td>
<td>RegressionSolutionVersion API methods.</td>
</tr>
</tbody>
</table>

The following example shows how to get the training status of a solution by version number.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_x_snc_global_global_regression');
gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').getStatus()), null, 2));
```

Output:

```json
{
    "state": "solution_complete",
    "percentComplete": "100",
    "hasJobEnded": "true"
}
```

RegressionSolution - setActiveVersion(String version)

Activates a specified version of a solution in the store.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Name of the <code>RegressionSolution()</code> object version to activate. Activating this version deactivates any other version.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to activate a solution version in the store.

```javascript
sn_ml.RegressionSolution.setActiveVersion("ml_incident_categorization");
```

**RegressionSolution - submitTrainingJob()**

Submits a training job.

⚠️ **Note:** Before running this method, you must first add a solution to the store using the `RegressionSolutionStore - add()` method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td><code>RegressionSolutionVersion</code> object corresponding to the <code>RegressionSolution</code> being trained.</td>
</tr>
</tbody>
</table>

The following example shows how to create a dataset, apply it to a solution, add the solution to a store, and submit the training job.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
  'tableName' : 'incident',
});

```
RegressionSolutionStore - Global

Enables storing and retrieving solutions.

The `RegressionSolutionStore` API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

`RegressionSolutionStore - add(Object mlSolution)`

Adds a new solution object to the store and returns a unique name.

⚠️ **Note:** Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mlSolution</td>
<td>RegressionSolution</td>
<td>object to add to the store.</td>
</tr>
</tbody>
</table>
The following example shows how to add a solution to the store. Use `RegressionSolution: submitTrainingJob()` to train the Solution after adding it to the store.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
  'tableName': 'incident',
  'fieldNames': ['assignment_group', 'short_description', 'description'],
  'encodedQuery': 'activeANYTHING'
});

// Create an solution
var mySolution = new sn_ml.RegressionSolution({
  'label': 'my solution definition',
  'dataset': myData,
  'predictedFieldName': 'assignment_group',
  'inputFieldNames': ['short_description']
});

// Add the solution to the store to later be able to retrieve it.
var my_unique_name = sn_ml.RegressionSolutionStore.add(mySolution);
```

**RegressionSolutionStore - deleteObject(String name)**

Removes a specified solution object from the store.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the RegressionSolution() object to be deleted.</td>
</tr>
</tbody>
</table>
The following example shows how to delete a solution from the store.

```javascript
sn_ml.RegressionSolutionStore.deleteObject("ml_sn_global_global_solution");
```

**RegressionSolutionStore - get(String name)**

Gets a solution object from the store.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of a solution in the store.</td>
</tr>
</tbody>
</table>

The following example shows how to get a solution object from the store using the `get()` method and view its training status using the `RegressionSolution - getActiveVersion()` and `RegressionSolutionVersion - getStatus()` methods.

```javascript
// Get status
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getStatus(), null, 2)));
```

Output:

```json
{
  "state":"solution_complete",
  "percentComplete":"100",
  "hasJobEnded":"true"
}
```

**RegressionSolutionStore - getAllNames(Object options)**

Gets the names of all solution definition records in the store.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Options for restricting results within the specified properties.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>`{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;label&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;domainName&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;scope&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>`};</td>
</tr>
<tr>
<td>options.label</td>
<td>String</td>
<td>Optional. Label of your solution object.</td>
</tr>
<tr>
<td>options.domainName</td>
<td>String</td>
<td>Optional. Name of the domain for your solution object. Refer to <a href="#">Domain separation and Predictive Intelligence</a>.</td>
</tr>
<tr>
<td>options.scope</td>
<td>String</td>
<td>Optional. Name of an application scope for your solution object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of strings representing solution object names in the store.</td>
</tr>
</tbody>
</table>

In the following example, the `getAllNames()` method returns a list of all names in the store.

```js
gs.print(JSON.stringify(JSON.parse(sn_ml.RegressionSolutionStore.getAllNames()), null, 2));
```

**Output:**

```json
[
  "ml_x_snc_global_global_my_solution_definition_3",
  "ml_incident_assignment",
  "ml_x_snc_global_global_my_solution_definition",
  "ml_x_snc_global_global_my_solution_definition_2",
  "ml_sn_global_global_incident_service"
]
```

In the following example, the `getAllNames()` method returns only names associated with values set in the `options` parameter.
var options = {
    'label': 'my solution definition',
    'domainName': 'global',
    'scope': 'global'
};
var solNames = sn_ml.RegressionSolutionStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));

Output:

```
[
    "ml_x_snc_global_global_my_solution_definition"
]
```

**RegressionSolutionStore - update(String name, Object mlsolution)**

Replaces an existing object in the store with the object passed as a parameter. The object name provided must be empty or match.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the solution to update.</td>
</tr>
<tr>
<td>mlsolution</td>
<td>RegressionSolution()</td>
<td>object properties to update.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to update a solution object in the store.

```
var solutionUpdate = new sn_ml.RegressionSolution({
    'label': 'my solution definition',
    'dataset': myData,
    'predictedFieldName': 'assignment_group',
    'inputFieldNames': ['short_description']
});

sn_ml.RegressionSolutionStore.update('ml_sn_global_global_incident_service',
    solutionUpdate);
```
RegressionSolutionVersion - Global

Scriptable object used in Predictive Intelligence stores.

The RegressionSolutionVersion API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the sn_ml namespace.

This API is used for working with solution versions based on RegressionSolution API objects in the RegressionSolution store.

The system creates a solution version each time you train a solution definition. Most versions are created during scheduled solution training.

Methods in this API are accessible using the following RegressionSolution methods:

• `getActiveVersion()`
• `getAllVersions()`
• `getLatestVersion()`
• `getVersion()`

RegressionSolutionVersion - getProperties()

Gets solution object properties and version number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contents of the Dataset and RegressionSolution version details. Results vary by object property setup.</td>
</tr>
</tbody>
</table>

```json
{
    "datasetProperties": {Object},
    "domainName": "String",
    "encoder": {Object},
    "inputFieldNames": [Array],
    "isActive": "Boolean",
    "label": "String",
    "name": "String",
    "predictedFieldName": "String",
```
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;predictedInterval&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;processingLanguage&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;scope&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;stopwords&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td>&quot;versionNumber&quot;: &quot;Number&quot;</td>
</tr>
</tbody>
</table>

### <Object>.datasetProperties properties of the DatasetDefinition() object associated with the solution.

```json
{
   "encodedQuery": "String",
   "fieldDetails": [Array],
   "fieldNames": [Array],
   "tableName": "String"
}
```

### <Object>.datasetProperties tableName property of the dataset. For example, "tableName" : "Incident".

Data type: String.

### <Object>.datasetProperties fieldNames property specifies field names from the specified table as strings. For example, "fieldNames" : ["short_description", "priority"].

Data type: Array.

### <Object>.datasetProperties fieldDetails property specifies field properties.

```json
[
   {
      "name": "String",
      "type": "String"
   }
]
```

Data type: Array.

### <Object>.datasetProperties fieldDetails.type property of the FieldDefinition object inform you to restrict this dataset to.

Data type: String.

### <Object>.datasetProperties fieldDetails.type property of the FieldDefinition object inform you to restrict this dataset to.

Data type: String.
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Object&gt;.datasetProperties.fieldDetails.encodedQuery</td>
<td>String encoded query string in standard Glide format. See Encoded query strings.</td>
</tr>
<tr>
<td>&lt;Object&gt;.domainName</td>
<td>Domain name associated with this dataset. See Domain separation and Predictive Intelligence.</td>
</tr>
<tr>
<td>&lt;Object&gt;.encoder</td>
<td>Encoder object assigned to this solution. See Encoder - Encoder(Object config).</td>
</tr>
<tr>
<td>&lt;Object&gt;.inputFieldNames</td>
<td>List of input field names as strings. The model uses these fields used to make predictions.</td>
</tr>
</tbody>
</table>
| <Object>.isActive | Flag that indicates whether this version is active. Valid values:  
  - true: Version is active.  
  - false: Version is not active. |
| <Object>.label | Identifies the prediction task.  
  ```json  
  {  
    "label": "my first prediction"  
  }  
  ``` |
| <Object>.name | System-assigned name. |
| <Object>.predictedFieldName | Field to be trained for predictability. |
| <Object>.predictedInterval | Range of values specifying the prediction confidence level. |
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.processingLanguage</code></td>
<td>Processing language in two-letter ISO 639-1 language code format. Data type: String.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.scope</code></td>
<td>Object scope. Currently the only valid value is <code>global</code>. Data type: String</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.stopwords</code></td>
<td>Optional. Preset list of strings that the system automatically generates based on the <code>language</code> property setting. For details, see Create a custom stopwords list. Data type: Array.</td>
</tr>
<tr>
<td><code>&lt;Object&gt;.versionNumber</code></td>
<td>Version number of the RegressionSolution object.</td>
</tr>
</tbody>
</table>

The following example gets properties of the active object version in the store.

```javascript
// Get properties
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getProperties()), null, 2));
```

Output:

```json
{
  "datasetProperties": {
    "encodedQuery": "",
    "fieldNames": ["short_description", "sourcedc", "targetdc", "dbsize", "duration"],
    "tableName": "cloudinfratext"
  },
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wc_regression"
  }
}
```
RegressionSolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| includeDetails | Boolean  | Flag that indicates whether to return status details. Valid values:  
|              |          | • true: Return additional details.  
|              |          | • false: Do not return additional details. Default: False |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Object | JavaScript object containing training status information for a RegressionSolution object.  

```javascript
{
  "state": "String",
  "percentComplete": "Number as a String",
  "hasJobEnded": "Boolean value as a String",
}
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;details&quot;: {Object}</td>
<td></td>
</tr>
<tr>
<td>&lt;Object&gt;.state</td>
<td>Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the hasJobEnded property is set to true. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• fetching_files_for_training</td>
</tr>
<tr>
<td></td>
<td>• preparing_data</td>
</tr>
<tr>
<td></td>
<td>• retry</td>
</tr>
<tr>
<td></td>
<td>• solution_cancelled (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solution_complete (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solution_error (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solution_incomplete</td>
</tr>
<tr>
<td></td>
<td>• training_request_received</td>
</tr>
<tr>
<td></td>
<td>• training_request_timed_out (terminal)</td>
</tr>
<tr>
<td></td>
<td>• training_solution</td>
</tr>
<tr>
<td></td>
<td>• uploading_solution</td>
</tr>
<tr>
<td></td>
<td>• waiting_for_training</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.hasJobEnded</td>
<td>Flag that indicates whether training is complete. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Training is complete.</td>
</tr>
<tr>
<td></td>
<td>• false: Training is incomplete.</td>
</tr>
<tr>
<td></td>
<td>Data type: Boolean value as a String</td>
</tr>
<tr>
<td>&lt;Object&gt;.percentComplete</td>
<td>Number between zero and 100 representing training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out.</td>
</tr>
<tr>
<td></td>
<td>Data type: Number as a String</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;Object&gt;.details</code></td>
<td>Object containing a list of additional training details.</td>
</tr>
<tr>
<td></td>
<td>Data type: Object</td>
</tr>
</tbody>
</table>

The following example shows a successful result with training complete.

```javascript
// Get status
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getStatus(true), null, 2)));
```

Output:

```
{
    "state": "solution_complete",
    "percentComplete": "100",
    "hasJobEnded": "true",
    "details": {"stepLabel": "Solution Complete"} // This information is only returned if getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```javascript
// Get status
var solutionName = 'ml_x_snc_global_global_regression_solution';
var mlSolution = sn_ml.RegressionSolutionStore.get(solutionName);
var trainingStatus = mlSolution.getLatestVersion().getStatus();

gs.print(JSON.stringify(JSON.parse(trainingStatus), null, 2));
```

Output:

```
{
    "state": "solution_error",
    "percentComplete": "100",
    "hasJobEnded": "true"
}
```

RegressionSolutionVersion - getVersionNumber()

Gets the version number of a solution object.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Version number.</td>
</tr>
</tbody>
</table>

The following example shows how to get a version number.

```javascript
// Get version number
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');

gs.print("Version number:");
+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVersionNumber()), null, 2));
```

Output:

Version number: 1

RegressionSolutionVersion - predict(Object input, Object options)

Gets the input data for a prediction.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Object</td>
<td>GlideRecord or array of JSON objects containing field names and values as key-value pairs.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional values for filtering prediction results.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;apply_threshold&quot;: Boolean,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;top_n&quot;: Number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td>options.apply_threshold</td>
<td>Boolean</td>
<td>Flag that indicates whether to check the threshold value for the solution and apply it to the result set. Valid values:</td>
</tr>
</tbody>
</table>

Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• true: Return results in which confidence is greater than threshold.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Return all results.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: True</td>
</tr>
</tbody>
</table>

options.top_nNumber   | Number | If provided, returns the top results, up to the specified number of predictions.                                                              |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>JSON object containing the prediction results sorted by sys_id or record_number.</td>
</tr>
<tr>
<td></td>
<td>{&lt;identifier&gt;: [Array]}</td>
</tr>
</tbody>
</table>

<Object>.<identifier>  | List of objects with details for each prediction result.                                                                                     |
|                      | <identifier>: [                                                                                                                        |
|                      |   {                                                                                                                                      |
|                      |     "confidence": Number,                                                                                                                |
|                      |     "predictedSysId": "String",                                                                                                         |
|                      |     "predictedValue": "String",                                                                                                          |
|                      |     "threshold": Number                                                                                                                 |
|                      |   }                                                                                                                                       |
|                      | ]                                                                                                                                         |

Data type: Array

<Object>.<identifier>.object | Value associated with the prediction.                                                                                                       |
|                           | For example, 53.84.                                                                                                                        |
|                           | Data type: Number                                                                                                                         |

<Object>.<identifier>.predictedSysId | The sys_id of the predicted value. Results can be from any table on which information is being predicted.                                 |
|                                   | Data type: String                                                                                                                          |

<Object>.<identifier>.predictedValue | Value representing the prediction result.                                                                                                  |
|                                   | Data type: String                                                                                                                          |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: String</td>
<td>&lt;Object&gt;.&lt;identifier&gt;.&lt;object&gt;.threshold</td>
</tr>
<tr>
<td>Value of the configured threshold associated with the prediction.</td>
<td></td>
</tr>
<tr>
<td>Data type: Number</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to display prediction results for a `predict()` method that takes a GlideRecord by `sys_id` for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');

// single GlideRecord input
var input = new GlideRecord("incident");
input.get("<sys_id>");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.getVersion(1).predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));
```

```javascript
{
    "<sys_id/now_GR>": [
    {
        "confidence": 62.10782320780268,
        "threshold": 20.36,
        "predictedValue": "Clone Issues",
        "predictedSysId": ""
    },
    {
        "confidence": 6.945237375770391,
        "threshold": 16.63,
        "predictedValue": "Instance Administration",
        "predictedSysId": ""
    },
    {
        "confidence": 5.321061076300759,
```
The following example shows how to display prediction results for a `predict()` method that takes an array of field names as key-value pairs for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```javascript
var mlSolution = sn_ml.RegressionSolutionStore.get('ml_incident_categorization');
// key-value pairs input
var input = ["short_description":"my email is not working"], 
{short_description:"need help with password"});
// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));

{
"i": [
{
"confidence": 37.5023032262591,
"threshold": 10.72,
"predictedValue": "Authentication",
"predictedSysId": ""
},
{
"confidence": 24.439964862166583,
"threshold": 23.7,
"predictedValue": "Administration",
"predictedSysId": ""
},
{
"confidence": 11.736320486031047,
"threshold": 100,
"predictedValue": "Security",
"predictedSysId": ""
}
```
The RenderProperties API provides methods about the current page and is available in Jelly scripts and in UI-action conditions and scripts.

Access RenderProperties methods using the static variable `RP`.

### RenderProperties - getEncodedQuery()

Returns the encoded query from the URL sent to the page.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>
**RenderProperties - getListControl()**

Returns the list control object for the page.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SysListControl object</td>
<td>The list control object for the page.</td>
</tr>
</tbody>
</table>

**RenderProperties -getParameterValue(String parameterName)**

Returns the value of the specified URL parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>String</td>
<td>Name of the parameter passed on the URL.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter's value.</td>
</tr>
</tbody>
</table>

**RenderProperties - getReferringURL()**

Returns the URL where the request originated.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL of the page where the request originated.</td>
</tr>
</tbody>
</table>

**RenderProperties - getViewID()**

Returns the view the page is using.

This method is not available in scoped applications.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the view being used.</td>
</tr>
</tbody>
</table>

**RenderProperties - getViewName()**

Returns the name of the view in use.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the view being used.</td>
</tr>
</tbody>
</table>

**RenderProperties - getWindowProperties()**

Returns the window's properties.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The window's properties</td>
</tr>
</tbody>
</table>

**RenderProperties - isInDevStudio()**

Returns true if the page is part of Studio.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the page is part of Studio.</td>
</tr>
</tbody>
</table>

**RenderProperties - isInteractive()**

Returns true if this is an interactive session. An interactive session is when a user has logged in as opposed to a REST request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if this is an interactive session.</td>
</tr>
</tbody>
</table>
RenderProperties - isManyToMany()

Returns true when the `sysparm_collection_related_file` URL parameter is set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true when the <code>sysparm_collection_related_file</code> URL parameter is set.</td>
</tr>
</tbody>
</table>

RenderProperties - isRelatedList()

Returns true when the `sys_is_related_list` URL-parameter is true. Returns false if the parameter is not present.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the URL parameter <code>sys_is_related_list</code> is true.</td>
</tr>
</tbody>
</table>

RenderProperties - Scoped

The RenderProperties API provides methods about the current page and is available in Jelly scripts and in UI-action conditions and scripts.

Access `RenderProperties` methods using the static variable `RP`.

Scoped `ScopedRenderProperties - getEncodedQuery()`

Returns the encoded query from the URL sent to the page.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Returns the encoded query from the URL sent to the form.</td>
</tr>
</tbody>
</table>

Scoped ScopedRenderProperties - getListControl()

Returns the list control object for the page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScopedSysListControl object</td>
<td>The list control object for the page.</td>
</tr>
</tbody>
</table>

Scoped ScopedRenderProperties - getParameterValue(String parameterName)

Returns the value of the specified URL parameter.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>String</td>
<td>Name of the parameter passed on the URL.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter's value.</td>
</tr>
</tbody>
</table>
**Scoped ScopedRenderProperties - getReferringURL()**

Returns the URL where the request originated.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL of the page where the request originated.</td>
</tr>
</tbody>
</table>

**Scoped ScopedRenderProperties - getViewName()**

Returns the name of the view in use.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the view being used.</td>
</tr>
</tbody>
</table>

**Scoped ScopedRenderProperties - getWindowProperties()**

Returns the window's properties.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The window's properties</td>
</tr>
</tbody>
</table>

**Scoped ScopedRenderProperties - isInDevStudio()**

Returns true if the page is part of Studio.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the page is part of Studio.</td>
</tr>
</tbody>
</table>

**Scoped ScopedRenderProperties - isInteractive()**

Returns true if this is an interactive session. An interactive session is when a user has logged in as opposed to a REST request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if this is an interactive session.</td>
</tr>
</tbody>
</table>

**Scoped ScopedRenderProperties - isManyToMany()**

Returns true when the `sysparm_collection_related_file` URL parameter is set.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true when the <code>sysparm_collection_related_file</code> URL parameter is set.</td>
</tr>
</tbody>
</table>

Scoped `ScopedRenderProperties - isRelatedList()`

Returns true when the `sys_is_related_list` URL-parameter is true. Returns false if the parameter is not present.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the URL parameter <code>sys_is_related_list</code> is true.</td>
</tr>
</tbody>
</table>

RequestAuthAPI - Scoped

The `RequestAuthAPI()` API provides methods to apply a signature to a REST request.

Generate outbound signing requests using these APIs in the following order:

1. `HttpRequestData`: Build the API request.
2. `AuthCredential`: Create a credential object or update an existing one. Use the credential to sign the request through the `RequestAuthAPI` class.
3. `RequestAuthAPI`: Sign the request and return an `HttpRequestAuthedData` object.
4. **HttpRequestAuthedData**: Get information about the signed request.

5. **GlideHTTPRequest**: Send the signed request.

Before using these APIs, you must configure an authentication algorithm to sign the request and associate it with the credential used to authenticate the request.

Use this API in scoped scripts with the `sn_auth` namespace identifier.

**RequestAuthAPI - RequestAuthAPI(Object data, Object credential)**

Instantiates a RequestAuthAPI object using a REST request and a credential.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>HttpRequestData object that contains the unsigned REST request. Use the HttpRequestData class to build this object. See HttpRequestData API.</td>
</tr>
<tr>
<td>credential</td>
<td>Object</td>
<td>Object that represents a record from the Credentials [discovery_credentials] table. Retrieve this object using the AuthCredential class. See AuthCredential API.</td>
</tr>
</tbody>
</table>

```javascript
// Define the HttpRequestData object
var endpoint= "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl' , 'public-read' );

// Get a credential record
var credential = new
    sn_cc.StandardCredentialsProvider().getAuthCredentialByID("88772d0d40990010f8772fdd9ebc8075");

// Instantiate a RequestAuthAPI object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
```
RequestAuthAPI - generateAuth()

Signs the HttpRequestData object and returns an HttpRequestAuthedData object to use to send in the REST request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HttpRequestAuthedData</td>
<td>Object. Data to use to obtain information about the signed result. Use the methods in the HttpRequestAuthedData class to interact with the signed result. See HttpRequestAuthedData API.</td>
</tr>
</tbody>
</table>

This example creates a request and gets a credential record to pass to the RequestAuthAPI API. The generateAuth() method then signs the request.

```javascript
// Define the HttpRequest object
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');

// Get a credential record
gs.info("date:" + httpRequestData.getDate());
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cff8af6a74bb");

// Create the RequestAuthAPI object and sign the request
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var output = signingAPI.generateAuth();
```
RequestAuthAPI - getAuthCredential()  
Returns the credential record used to sign the request.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AuthCredential</td>
<td>Object. Data to use to obtain information about the credential record used to sign the request. Use the methods in the AuthCredential class to interact with the credential. See AuthCredential API.</td>
</tr>
</tbody>
</table>

// Define the HttpRequestData object
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');

// Get a credential record
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("5b61c16f73533300f662cff8faf6a74b");

// Return the AuthCredential object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var signingCredential = signingAPI.getAuthCredential();

RequestAuthAPI - getHttpRequestData()  
Returns the HttpRequestData object that was used to instantiate the RequestAuthAPI Class.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HttpRequestData</td>
<td>Object. Contains the unsigned REST request. Use the methods in the HttpRequestData class to interact with the request. See HttpRequestData API.</td>
</tr>
</tbody>
</table>

```javascript
// Define the HttpRequestData object
var endpoint = "https://third-party-endpoint";
var httpRequestData = new sn_auth.HttpRequestData();
httpRequestData.setEndpoint(endpoint);
httpRequestData.setService('s3');
httpRequestData.setRegion('us-east-1');
httpRequestData.setHttpMethod("PUT");
var content = "Action=SendMessage&MessageBody=This is a test message";
httpRequestData.setContent(content);
httpRequestData.addHeader('x-amz-acl', 'public-read');

// Get a credential record
var credential = new sn_cc.StandardCredentialsProvider().getAuthCredentialByID("88772d0d40990010f8772fdd9ebc8075");

// Return the HttpRequestData object
var signingAPI = new sn_auth.RequestAuthAPI(httpRequestData, credential);
var unsignedRequest = signingAPI.getHttpRequestData();
gs.info("Endpoint is: " + unsignedRequest.getEndpoint());
```

Output:

```
Endpoint is: https://third-party-endpoint
```

**RequestAuthAPI - resetAuthCredential()**

Generates a temporary, limited privilege token that you can use to provide trusted users with temporary security credentials to control third-party resources.
To use this method, the third-party service must include an API or SDK that processes and manages limited access tokens.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// Creates a temporary token
function(authAPI) {
    var requestData = authAPI.getHttpRequestData();
    var credential = authAPI.getAuthCredential();
    credential.setAttribute('Action', 'aws_sessionToken');
    authAPI.resetAuthCredential();

    // Returns status information
    var status = credential.getAttribute('credential_reset_status');
}
```

**ResponseTemplate - Scoped, Global**

Provides methods for managing response templates.

Response templates are reusable messages that agents can copy to case or task forms. They provide quick and consistent messages to users and display standard chat response messages to requesters in Agent Chat. This API requires the Templated Responses plugin (com.sn_templated_snip), which is activated by default. This API is provided within the `sn_templated_snip` namespace.

For additional information on response templates, see [Response templates](#).

**ResponseTemplate - ResponseTemplate()**

Instantiates a new ResponseTemplate object.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td>None</td>
</tr>
</tbody>
</table>

### Example

```python
new
    sn_templated_snip.ResponseTemplate().query("incident","ef4225a40a0b5700d0b8a790747812", 
    ",", 0, 0, true, ");
```

---

**ResponseTemplate - query(String tableName, String recordId, String searchTerm, Number limit, Number offset, Boolean includeEvaluatedBody, String errorFormat, Object opts)**

Returns all response templates from a specified table that match the passed in query criteria.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table to use to search the sn_templated_snip_note_template table to locate corresponding response templates. For example, incident or sn_hr_core_case.</td>
</tr>
<tr>
<td>recordId</td>
<td>String</td>
<td>Sys ID of the record to use to render the variables in the response template.</td>
</tr>
<tr>
<td>searchTerm</td>
<td>String</td>
<td>Optional. Text to use to filter the list of matching response templates. The method performs a CONTAINS search of this text on the name and body fields and a STARTS WITH search on the short name field. For example, if the search term is &quot;crash&quot;, the method returns any response template that matches the query criteria and has crash in the name or body or the short name starts with crash. Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name.</td>
</tr>
</tbody>
</table>

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Number</td>
<td>Optional. Maximum number of response templates to return. Default: 50</td>
</tr>
<tr>
<td>offset</td>
<td>Number</td>
<td>Optional. For pagination, the index at which to start the search. Default: 0</td>
</tr>
</tbody>
</table>
| includeEvaluatedBody | Boolean    | Optional. Flag that indicates whether to render the template variables. Valid values:  
  • false: Do not render the template variables. The response contains the message variables. For example:  
    ```
    Please note that your case ${number} has been escalated to ${assignment_group}.
    ```  
  • true: Renders the template variables and returns `evaluated_response` in the return results. For example:  
    ```
    Please note that your case INC100001 has been escalated to Facilities.
    ```  
  Default: false |
| errorFormat        | String     | Optional. HTML formatting to use for errors. For example:  
  ```
  "<span style='color:#fff000'>${%s}</span>"
  ```  
  Default: "<span style='color:#ff0000'>${%s}</span>" |

### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opts</td>
<td>Object</td>
<td>Optional. Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see <a href="#">Using extension points to extend application functionality</a>.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of all templates that match the specified search criteria. Response templates with exact matches on short name appear first in the return results. All other returned response templates are sorted by name. Each node in the Array may contain the following parameters:</td>
</tr>
</tbody>
</table>

- **sys_id**: String. Unique identifier of the response template.
- **name**: String. Name of the response template.
- **short_name**: String. Short name of the response template.
- **body**: HTML. Body of the response template.
- **short_name_match**: Boolean. Flag that indicates whether an exact match occurred on the short name of the response template.
- **evaluated_response**: Array. Results of the template evaluation.
  - **success**: Boolean. Flag that indicates whether all variables rendered properly.
  - **evaluated_body**: HTML. Rendered response template body.
  - **error**: Array. Entry for each evaluation error that occurred.
    - **inAccessibleVariables**: String. Variables in the response template body that could not be resolved.
    - **unEvaluatedVariables**: String. Variables in the response template body that were not evaluated.
    - **message**: String. Error message. |
This example shows how to query for response templates associated with the incident table.

query("incident","ef4225a40a0a0b5700d0b8a790747812","",0,0,false,"");

Successful response:

```
[
  {
    "sys_id": "5fc1d65993003300a9bc1d1e867ffbf9c",
    "name": "Incident escalation",
    "short_name": "escalation",
    "template_body": "<p>Dear ${caller_id.first_name},</p>
    <p>Please note that your incident ${number} has been escalated to ${assignment_group}. An agent will be assigned on your case and will keep you updated. If you have more questions please reach out to our team.</p>
    <p>Regards,</p>
    <p>${sys_updated_by}</p>
  }
]
```

Same query with an error response.

query("incident","fe4225a40a0a0b5700d0b8a790747812","",0,0,false,"");

Error response:

```
[
  {
    "sys_id": "5fc1d65993003300a9bc1d1e867ffbf9c",
    "name": "Incident escalation",
    "short_name": "escalation",
    "template_body": "<p>Dear ${caller.first_name},</p>
    <p>Please note that your incident INC0000049 has been escalated to Hardware. An agent will be assigned on your case and will keep you updated. If you have more questions please reach out to our team.</p>
    <p>Regards,</p>
    <p>${sys_updated_by}</p>
    
    "evaluated_response": {
      "success": false,
      "error": {
        "unEvaluatedVariables": "caller.first_name",
        "message": "Cannot evaluate following variables: caller.first_name"
      },
      "evaluated_body": "<p>Dear <span style="color:#ff0000">${caller.first_name}</span></p>
    </span>,
    <p>Please note that your incident INC0000049 has been escalated to Hardware. An agent will be assigned on your case and will keep you updated. If you have more questions please reach out to our team.</p>
    <p>Regards,</p>
    <p>${sys_updated_by}</p>
  }
]
```
ResponseTemplate - render(String templateId, String tableName, String recordId, String errorFormat, Object opts)

Renders the HTML body of a specified response template.

During rendering, all variables are resolved using the information from the specified table and record. If variables cannot be resolved, or any other problem occurs during rendering, the method returns an error message in the results.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>templateId</td>
<td>String</td>
<td>Sys ID of the response template to render.</td>
</tr>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table to use when rendering the variables on the response template.</td>
</tr>
<tr>
<td>recordId</td>
<td>String</td>
<td>Sys ID of the record to use when rendering the variables on the response template. This record must be in the table specified by tableName.</td>
</tr>
<tr>
<td>errorFormat</td>
<td>String</td>
<td>Optional. HTML formatting to use for errors. For example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;&lt;span style='color:#ffff00'&gt;${%s}&lt;/span&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: &quot;&lt;span style='color:#ff0000'&gt;${%s}&lt;/span&gt;&quot;</td>
</tr>
<tr>
<td>opts</td>
<td>Object</td>
<td>Optional. Parameters to pass to the sn_templated_snip.response_template extension point. The format and content of these parameters are dependent on the implementation of the extension point. For additional information on extension points, see Using extension points to extend application functionality.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Results of the render.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• success</td>
<td>Flag that indicates whether the render was successful.</td>
</tr>
<tr>
<td>• evaluated_body</td>
<td>String. For success, rendered response template body. For error, response template body which includes both rendered and non-renderable variables.</td>
</tr>
<tr>
<td>• error</td>
<td>Object. Error message if render was unsuccessful.</td>
</tr>
<tr>
<td>◦ unEvaluatedVariables</td>
<td>Variables that could not be rendered.</td>
</tr>
<tr>
<td>◦ message</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

This code example shows how to request a rendered response template for the incident table.

render("5fc1d65993003300a9bcl1d1e867ff9b9c","incident","ef4225a40a0a0b57000d0b8a790747812","")

Successful response:

{
  "success": true,
  "evaluated_body": "Dear Beth,
  
  Please note that your incident INC0000049 has been escalated to Hardware. An agent will be assigned on your case and will keep you updated. If you have more questions please reach out to our team.
  
  Regards,
  
  admin",
}

Same render request but returning an error response.

render("5fc1d65993003300a9bcl1d1e867ff9b9c","incident","ef4225a40a0a0b57000d0b8a790747812","")

Error response:

{
  "success": false,
  "error": {
    "unEvaluatedVariables": "caller.first_name",
    "message": "Cannot evaluate following variables: caller.first_name"
  },
  "evaluated_body": "Dear <span style='color:#ff0000'>${caller.first_name}</span>,
  
  Please note that your incident INC0000049 has been escalated to Hardware. An agent will be assigned on your
RESTAPIRequest - Scoped, Global

A RESTAPIRequest object allows you to access scripted REST API request details in scripts.

⚠️ **Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIRequest - body

The body of the request.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>RESTAPIRequestBody</td>
<td>The body of the request. You can access data from the body object using the RESTAPIRequestBody API.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body // Returns instance of RESTAPIRequestBody
```

RESTAPIRequest - getHeader(String header)

Returns the value of a specific header from the web service request.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>header</td>
<td>String</td>
</tr>
<tr>
<td>The name of the header, such as <code>accept</code> or <code>content-type</code>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>
var acceptHeader = request.getHeader('accept');

**RESTAPIRequest - getSupportedResponseContentTypes()**

Get the content types specified in the request Accept header.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of string values where each string is a content type, such as application/json.</td>
</tr>
</tbody>
</table>

**RESTAPIRequest - headers**

All headers from the request.

### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headers</td>
<td>object</td>
<td>All headers from the request, and their values.</td>
</tr>
</tbody>
</table>

var headers = request.headers;
var acceptHeader = headers.Accept;
var myCustomHeader = headers.myCustom;
var specialHeader = headers['special - header'];

**RESTAPIRequest - pathParams**

The path parameters passed in the request URI.
Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathParams</td>
<td>Object</td>
<td>The path parameters as a script object. Available path parameters depend on the web service configuration.</td>
</tr>
</tbody>
</table>

In this example, the scripted REST API endpoint follows this format: https://instance.service-now.com/api/now/myservice/{tableName}/{id}. The request being processed uses this URL: https://instance.service-now.com/api/now/myservice/myApp_table/1234.

```javascript
var pathParams = request.pathParams;
var tableName = pathParams.tableName; //’myApp_table’
var id = pathParams.id; //’1234’
```

**RESTAPIRequest - queryParams**

The query parameters from the web service request.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryParams</td>
<td>Object</td>
<td>The query parameters from the web service request.</td>
</tr>
</tbody>
</table>

In this example, the request being processed uses this URL: https://<instance_rest_endpoint>?active=false&name=now. Note the active and name parameters.

```javascript
var queryParams = request.queryParams;
var isActiveQuery = queryParams.active; //false
var nameQueryVal = queryParams.name; //’now’
```

**RESTAPIRequest - queryString**

The entire query added to the endpoint URI.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryString</td>
<td>String</td>
<td>The entire query for the request.</td>
</tr>
</tbody>
</table>
In this example, the request being processed uses this URL: https://<instance_rest_endpoint>?active=false&name=now. Note the query active=false&name=now.

```javascript
var query = request.queryString; //"active=false&name=now"
```

**RESTAPIRequest - uri**

The request URI, excluding domain information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>The request URI, excluding domain information.</td>
<td></td>
</tr>
</tbody>
</table>

In this example, the request being processed uses this URL: https://instance.service-now.com/api/now/table/myTable?active=false&name=now.

```javascript
var query = request.uri; //"api/now/table/myTable"
```

**RESTAPIRequest - url**

The entire request URL.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>The entire request URL.</td>
<td></td>
</tr>
</tbody>
</table>

In this example, the request being processed uses this URL: https://instance.service-now.com/api/now/table/myTable?active=false&name=now.

```javascript
var query =
request.url; //"https://instance.service-now.com/api/now/table/myTable?active=false&name=now"
```

**RESTAPIRequestBody - Scoped, Global**

A RESTAPIRequestBody object allows you to access the body content of a scripted REST API request in scripts.

The format of a RESTAPIRequestBody object may be JSON or XML, depending on the content-type header value from the request.
Note: You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

Single entry example-request-body in JSON format.

```
{
    "name": "user1",
    "id": 1234,
    "roles": [
    {
        "name": "admin"
    },
    {
        "name": "itil"
    }
    ]
}
```

Multiple entry example-request-body in JSON format.

```
[{  
    "name": "user1",
    "id": 1234,
    "roles": [  
    {
        "name": "admin"
    },  
    {
        "name": "itil"
    }
    ]
 },
{
    "name": "user2",
    "id": 9876,
    "roles": [  
    {
        "name": "admin"
    }
    ]
}]
```
Important: If the request body format is not of a json or xml subtype, use only the request body dataStream field to access the request body. Using request body data, dataString, nextEntry(), or hasNext() with a non-json or non-xml format results in a 500 error response.

RESTAPIRequestBody - data

The content of the request body.

⚠️ Note: REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object or Array</td>
<td>The request content. This can be a single object or an array of objects depending on the request.</td>
</tr>
</tbody>
</table>

```javascript
var entry;
var id;
var requestBody = request.body;
var requestData = requestBody.data; //May be an array or a single object
if (requestData instanceof Array) {
  entry = requestData[0].name; // 'user1'
  id = requestData[0].id; // '1234'
} else {
  entry = requestData.name; // 'user1'
  id = requestData.id; // '1234'
}
```

RESTAPIRequestBody - dataStream

The content of the request body, as a stream.

⚠️ Note: REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.
### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataStream</td>
<td>Object</td>
<td>The content of the request body. You can pass the stream to a separate API, such as to create an attachment from the request or forward the request to a different endpoint.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
var requestStream = requestBody.dataStream;
```

### RESTAPIRequestBody - dataString

The content of the request body, as a String.

> **Note:** REST web services consume data, datastream, and dataString via stream. Because streams are only consumed once, only one can be called. For example, if calling both data and dataString, the second call will return empty.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dataString</td>
<td>String</td>
<td>The content of the request body.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
var requestString = requestBody.dataString;
```

### RESTAPIRequestBody - hasNext()

Determines if there are additional entries in the request body.

Use this method with the `nextEntry()` method to iterate over multiple request body entries.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Flag indicating whether there are additional entries in the request body. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• true: Additional entries are available. As <code>nextEntry()</code> is called, <code>hasNext()</code> continues to be true until the last matching record is loaded.</td>
</tr>
<tr>
<td></td>
<td>• false: No additional entries.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
requestBody.hasNext(); // returns true if the request contains a single entry or multiple entries
requestBody.nextEntry(); // returns next available entry

// calling second time
requestBody.hasNext(); // returns false if the request contains a single entry, or true if the request contains multiple entries
```

**RESTAPIRequestBody - nextEntry()**

Retrieve one entry from the request body as a script object.

Use this method with the `hasNext()` method to iterate over multiple request body entries.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>A single entry from the request body.</td>
</tr>
</tbody>
</table>

```javascript
var requestBody = request.body;
var requestEntry = requestBody.nextEntry(); // returns available entry if there is only one entry, or the first entry if there are multiple.
```
```javascript
var name = requestEntry.name; // ‘user1’

// Calling second time
requestEntry = requestBody.nextEntry(); // returns undefined if there is only one entry, or
the second entry if there are multiple.
```

This example demonstrates using hasNext() with nextEntry().

```javascript
var requestBody = request.body;
while(requestBody.hasNext()){
    var entry = requestBody.nextEntry();
}
```

**RESTAPIResponse - Scoped, Global**

A RESTAPIResponse object allows you to build a RESTful response to a scripted REST API request.

> **Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

**RESTAPIResponse - getStreamWriter()**

Returns the ResponseStreamWriter for this response, allowing you to write directly to the response stream.

Set the content type and status code using the `setHeaders` and `setStatus` functions prior to calling the `getStreamWriter` function.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTAPIResponseStream - Scoped, Global</td>
<td>The ResponseStreamWriter for this response. You can use this object to write directly to the response stream.</td>
</tr>
</tbody>
</table>
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getWriter();

**RESTAPIResponse - setBody(Object body)**
Sets the body content to send in the web service response.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>Object</td>
<td>The response body, as a JavaScript object. The body content is automatically serialized to JSON or XML depending on the value of the <code>Accept</code> header passed in the request.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id": "user1"};
response.setBody(body);
```

```javascript
var bodyArray = [];
var body = {};
body.name = "incident";
body.number = "1234";
body.caller = {"id": "user1"};
bodyArray.push(body);
response.setBody(bodyArray);
```

**RESTAPIResponse - setContentType(String contentType)**
Assigns a value to the Content-Type header in the web service response.
You must set a response content type before writing the response. The content type is set automatically for string responses, based on the request Accept header value.

Setting an invalid content type causes the response to default to JSON. Failing to set a content type results in a status code 500 error when sending a binary response.

See the W3 Content-Type header documentation for more information about this header.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contentType</td>
<td>String</td>
<td>The content type of the response body, such as application/json.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
response.setContentType('application/json');
```

**RESTAPIResponse - setError(Object error)**

Configures the REST response to return an error.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Object</td>
<td>Error object.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to return an error from within a scripted REST resource.
var queryParams = request.queryParams;
var userId = String(queryParams.user_id || '');
var fileId = String(queryParams.file_id || '');
if (!userId || !fileId){
    response.setError(new sn_ws_err.BadRequestError('Missing required parameters.'));
    return;
}

RESTAPIResponse - setHeader(String header, String value)
Assign a value to a REST service response header.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>String</td>
<td>The header you want to set.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign the specified header.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

response.setHeader("Location","<URI>");

RESTAPIResponse - setHeaders(Object headers)
Sets the headers for the web service response.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headers</td>
<td>Object</td>
<td>A JavaScript object listing each header and the value to assign that header.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```
var headers = {};
headers.X-Total-Count=100;
headers.Location='https://instance.service-now.com/<endpoint_to_resource>';
response.setHeaders(headers);
```

RESTAPIResponse - `setLocation(String location)`

Assigns a value to the Location header in the web service response.

See the [W3 Location header documentation](#) for more information about this header.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>String</td>
<td>An absolute URI to redirect the response recipient to.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

RESTAPIResponse - `setStatus(Number status)`

Sets the status code number for the web service response.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Number</td>
<td>The status code to send in the response, such as 200 to indicate success. Passing a non-numerical value, such as a string, causes the status code to default to 0.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
response.setStatus(200);
```

RESTAPIResponseStream - Scoped, Global

A RESTAPIResponseStream object allows you to write directly to the scripted REST API response stream.

Use RESTAPIResponseStream methods to build web service APIs in the Scripted REST API feature.

ℹ️ **Note:** You cannot instantiate objects of this type. Objects of this type are created automatically and are accessible only in scripted REST API resource scripts.

RESTAPIResponseStream - writeStream(Object stream)

Write an input stream to the response stream.

You must set the content type and status code before calling the `writeStream()` method or the response will fail. You cannot modify these values after calling the `writeStream()` method.

ℹ️ **Note:**

It is the responsibility of the script author to obtain the stream from a third-party service.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stream</td>
<td>Object</td>
<td>An attachment or a response stream from a third-party service.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
The following example is for scoped applications:

```javascript
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
    response.setContentType('application/json');
    response.setStatus(200);

    var gsa = new GlideSysAttachment();
    var attachmentStream = new gsa.getContentStream(<sys_id of attachment>);
    var writer = response.getWriter();
    writer.writeStream(attachmentStream);

})(request, response);
```

The following example is for global applications:

```javascript
(function process(/*RESTAPIRequest*/ request, /*RESTAPIResponse*/ response) {
    response.setContentType('application/json');
    response.setStatus(200);

    var attachmentStream = new GlideSysAttachmentInputStream(<sys_id of attachment>);
    var writer = response.getWriter();
    writer.writeStream(attachmentStream);

})(request, response);
```

**RESTAPIResponseStream - writeString(String data)**

Write string data to the response stream.

You must set the content type and status code before calling the `writeString()` method or the response will fail. You cannot modify these values after calling the `writeString()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>String</td>
<td>The string to add to the response data.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
response.setContentType('application/json');
response.setStatus(200);
var writer = response.getWriter();
var body = {
    name: user1,
    id: 1234,
    roles: [
        { name: admin },
        { name: itil }
    ]
}
writer.writeString(JSON.stringify(body));
```

RESTMessageV2 - Scoped, Global

The RESTMessageV2 API allows you to send outbound REST messages using JavaScript.

Use the RESTResponseV2 API to manage the response returned by the REST provider.

You can use this API in scoped applications, or within the global scope.

RESTMessageV2 -disableForcedVariableSubstitution()

Disables forced variable substitution in outbound REST messages.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**RESTMessageV2 - execute()**

Sends the REST message to the endpoint.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESTResponse</td>
<td>The response returned by the REST provider.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute(); //Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
```

**RESTMessageV2 - executeAsync()**

Sends the REST message to the endpoint asynchronously. The instance does not wait for a response from the web service provider when making asynchronous calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>RESTResponse</td>
<td>The response returned by the REST provider.</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance. When using `executeAsync`, consider processing the response body in a separate business rule to take advantage of the asynchronous call.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync(); //Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
```

**RESTMessageV2 - getEndpoint()**

Gets the URL of the endpoint for the REST message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The URL of the REST web service provider.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getEndpoint();
```

**RESTMessageV2 - getRequestBody()**

Gets the content of the REST message body.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>the REST message body.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var body = sm.getRequestBody();
```

`RESTMessageV2 - getRequestHeader(String headerName)`

Gets the value for an HTTP header specified in the REST message.

By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property `glide.http.log_debug` to true.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>Request header you want to get the value for.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the specified header.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.
```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if
message doesn't exist or not visible due to scope.
var header = sm.getRequestHeader("Accept");
```

**RESTMessageV2 - getRequestHeaders()**

Gets HTTP headers that were set by the REST client and the associated values.

This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>An Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if
message doesn't exist or not visible due to scope.
var headers = sm.getRequestHeaders();
```

**RESTMessageV2 - RESTMessageV2()**

Instantiates an empty RESTMessageV2 object.

When using an object instantiated this way, you must manually specify an HTTP method and endpoint.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
var sm = new sn_ws.RESTMessageV2();

**RESTMessageV2 - RESTMessageV2(String name, String methodName)**

Instantiates a RESTMessageV2 object using information from a REST message record.

You must have a REST message record defined before you can use this constructor.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the REST message record.</td>
</tr>
<tr>
<td>methodName</td>
<td>String</td>
<td>The name of the HTTP method to use, such as GET/get or PUT/put - case insensitive.</td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); // Might throw exception if message doesn't exist or not visible due to scope.
```

**RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName)**

Configures the REST message to save the returned response body as an attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the `tableName` parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call `getErrorMessage()` on the related RESTResponseV2 object for error details.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Specify the table that contains the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>recordSysId</td>
<td>String</td>
<td>Specify the sys_id of the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>fileName</td>
<td>String</td>
<td>Specify the file name to give to the saved file.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

(function sampleRESTMessageV2() {
  try{
    var request = new sn_ws.RESTMessageV2();
    request.setHttpMethod('get');

    var attachment_sys_id = '<attachment_record_sys_id>',
    tablename = 'incident',
    recordSysId = '<incident_sys_id>',
    response,
    httpResponseStatus,
    filename = '<filename>';

    //endpoint - ServiceNow REST Attachment API
    request.setEndpoint('https://<instance_name>.service-now.com/api/now/attachment/' +
    attachment_sys_id + '/file');
    request.setBasicAuth('<username>', '<password>');

    //RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName)
    request.saveResponseBodyAsAttachment(tablename, recordSysId, filename);

    response = request.execute();
    httpResponseStatus = response.getStatusCode();

    gs.info(" http response status_code: " + httpErrorResponseStatus);
  }
})
catch(ex){
    var message  = ex.getMessage();
    gs.info(message);
}

RESTMessageV2 - saveResponseBodyAsAttachment(String tableName, String recordSysId, String fileName, String encryptContext)

Configures the REST message to save the returned response body as an encrypted attachment record.

When you use this function with a REST message that is sent through a MID server, the MID server user must have any roles required to read and write attachment records, as well as any roles required to read and write records on the table specified in the **tableName** parameter.

The response body does not need to be a binary file to be saved as an attachment. Response bodies using text formats, such as JSON or XML can also be saved. If the instance fails to save the attachment, call **getErrorMessage()** on the related RESTResponseV2 object for error details.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Specify the table that contains the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>recordSysId</td>
<td>String</td>
<td>Specify the sys_id of the record you want to attach the saved file to.</td>
</tr>
<tr>
<td>fileName</td>
<td>String</td>
<td>Specify the file name to give to the saved file.</td>
</tr>
<tr>
<td>encryptContext</td>
<td>String</td>
<td>Specify the sys_id of an encryption context. The saved file is encrypted using this context.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
**RESTMessageV2 - setAuthenticationProfile(String type, String profileId)**

Sets the credentials for the REST message using an existing basic auth or OAuth 2.0 profile.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>String</td>
<td>The type of authentication profile to use. Valid values are 'basic' to use basic authentication, or 'oauth2' to use OAuth 2.0.</td>
</tr>
<tr>
<td>profileId</td>
<td>String</td>
<td>The sys_id of an authentication profile record. When using basic auth, specify the sys_id of a Basic Auth Configuration [sys_auth_profile_basic] record. When using OAuth 2.0, specify the sys_id of a OAuth Entity Profile [oauth_entity_profile] record.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var requestBody;
var responseBody;
var status;
var sm;
try{
    // Might throw exception if message doesn't exist or not visible due to scope.
    sm = new sn_ws.RESTMessageV2("<REST_message_record>", "get");

    //set auth profile to an OAuth 2.0 profile record.
    sm.setAuthenticationProfile('oauth2', '1234adsf123212131123qasdsf');

    sm.setStringParameter("symbol", "NOW");
    sm.setStringParameterNoEscape("xml_data","<data>test</data>");

    //In milliseconds. Wait at most 10 seconds for response from http request.
    sm.setHttpTimeout(10000);
    // Might throw exception if http connection timed out or some issue
} catch(exception) {
    status = sm.getStatus();
    console.log(sm.getResponseBody());
    console.log(sm.getErrorBody());
    console.log(sm.getErrorMsg());
    throw("Error occurred while request", exception);}
```
//with sending request itself because of encryption/decryption of password.
response = sm.execute();
responseBody = response.haveError() ? response.getErrorMessage() : response.getBody();
status = response.getStatusCode();
} catch(ex) {
responseBody = ex.getMessage();
status = '500';
} finally {
requestBody = sm ? sm.getRequestBody():null;
}

### RESTMessageV2 - setBasicAuth(String userName, String userPass)

Sets basic authentication headers for the REST message.

Setting security values using this method overrides basic authentication values defined for the REST message record.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userName</td>
<td>String</td>
<td>Username you want to use to authenticate the REST message.</td>
</tr>
<tr>
<td>userPass</td>
<td>String</td>
<td>Password for the specified user.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace REST_message_record with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setBasicAuth("username","password");
```
RESTMessageV2 - setEccCorrelator(String correlator)

Associates outbound requests and the resulting response record in the ECC queue. This method only applies to REST messages sent through a MID Server.

The correlator provided populates the **Agent correlator** field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>correlator</td>
<td>String</td>
<td>Unique identifier</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccCorrelator("unique_identifier");
```

RESTMessageV2 - setEccParameter(String name, String value)

Overrides a value from the database by writing to the REST message payload. This method only applies to REST messages sent through a MID Server.

Use this method when a value from the REST message in the database is invalid, such as when the endpoint URL is longer than the maximum REST endpoint field length. You can set only the endpoint URL using this method by passing source as the name parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the parameter, such as source.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The value to assign to the specified parameter.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```java
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccParameter("source","http://very.long.endpoint.url");
```

**RESTMessageV2 - setEndpoint(String endpoint)**

Sets the endpoint for the REST message.

By default, the REST message uses the endpoint specified in the REST message record. Use this method to override this default. You must call this method when using the `RESTMessageV2 - RESTMessageV2()` constructor with no parameters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>String</td>
<td>The URL of the REST provider you want to interface with.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.RESTMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

**RESTMessageV2 - setHttpMethod(String method)**

Sets the HTTP method this REST message performs, such as GET or PUT.

You must set an HTTP method when using the `RESTMessageV2 - RESTMessageV2()` constructor with no parameters.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>String</td>
<td>HTTP method to perform.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var sm = new sn_ws.RESTMessageV2();
sm.setHttpMethod("post");

**RESTMessageV2 - setHttpTimeout(Number timeoutMs)**

Sets the amount of time the REST message waits for a response from the web service provider before the request times out.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutMs</td>
<td>Number</td>
<td>Amount of time, in milliseconds, before the call to the REST provider times out.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setHttpTimeout(6000);

**RESTMessageV2 - setLogLevel(String level)**

Sets the log level for this message and the corresponding response.
Setting a log level using the RESTMessageV2 API overrides the log level configured on the REST message record. This log level may not apply if the endpoint domain is excluded, or if the property `glide.outbound_http_log.override` is true. To view outbound web service logs, navigate to System Logs > Outbound HTTP Requests.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>String</td>
<td>The log level. Valid values are basic, elevated, and all.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var rm = new sn_ws.RESTMessageV2();
rm.setLogLevel('all');
```

**RESTMessageV2 - setMIDServer(String midServer)**

Configures the REST message to communicate through a MID Server.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midServer</td>
<td>String</td>
<td>Name of the MID Server to use. Your instance must have an active MID Server with the specified name.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>", "get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setMIDServer("mid_server_name");
```
RESTMessageV2 - setMutualAuth(String profileName)

Sets the mutual authentication protocol profile for the REST message.

Setting a protocol profile using this method overrides the protocol profile selected for the REST message record.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>profileName</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace *REST_message_record* with the name of the REST message record from your instance.

```java
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setMutualAuth("mutual_auth_profile_name");
```

RESTMessageV2 - setQueryParameter(String name, String value)

Appends a parameter to the end of the request URL with the form name=value.

For example, the code

```java
setQueryParameter("sysparm_query","active=true^ORDERBYnumber^ORDERBYDESCcategory");
```

appends the text

```
sysparm_query=active=true^ORDERBYnumber^ORDERBYDESCcategory
```

to the request URL.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>name</td>
</tr>
<tr>
<td>value</td>
</tr>
</tbody>
</table>
var sm = new sn_ws.RESTMessageV2();
//Set up message, including endpoint and authentication
sm.setQueryParameter("sysparm_query","active=true^ORDERBYnumber^ORDERBYDESCcategory");

### RESTMessageV2 - setRequestBody(String body)

Sets the body content to send to the web service provider when using PUT or POST HTTP methods.

When you set the body content using this method, variables in the body are not substituted for parameters from the REST message function record. You must explicitly define all values within the REST message body.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>String</td>
<td>Request body to send.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var sm = new sn_ws.RESTMessageV2("Update user","post"); //Might throw exception if message doesn't exist or not visible due to scope.
var body = "<Message body content>";
sm.setRequestBody(body);

### RESTMessageV2 - setRequestBodyFromAttachment(String attachmentSysId)

Sets the request body using an existing attachment record.

When you use this function with a REST message that is sent through a MID Server, the MID Server user must have any roles required to read attachment records.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachmentSysId</td>
<td>String</td>
<td>Sys_id of the Attachment [sys_attachment] record you want to send in this REST message.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

(function sampleRESTMessageV2() {
    try {
        var request = new sn_ws.RESTMessageV2();
        request.setHttpMethod('post');
        request.setEndpoint('<web service endpoint URL>');
        request.setRequestBodyFromAttachment('<attachment sys_id>');

        var response = request.execute();
        var httpResponseStatus = response.getStatusCode();

        gs.info("http response status_code: "+ httpResponseStatus);
    }
    catch (ex) {
        var message = ex.getMessage();
        gs.info(message);
    }
})();

RESTMessageV2 - setRequestHeader(String name, String value)
Sets an HTTP header in the REST message to the specified value.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the header.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign to the specified header.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```java
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setRequestHeader("Accept","Application/json");
```

**RESTMessageV2 - setRequestorProfile(String requestorContext, String requestorId)**

Overides the default requestor profile for the REST message in order to retrieve an OAuth access token associated with a different requestor.

This method applies only to REST messages configured to use OAuth 2.0 authentication. This method is optional and is unnecessary in most configurations.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorContext</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>requestorId</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**RESTMessageV2 - setStringParameter(String name, String value)**

Sets a REST message function variable with the specified name from the REST message record to the specified value.

XML reserved characters in the value are converted to the equivalent escaped characters. Use `setStringParameterNoEscape` to set a variable without escaping XML reserved characters.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign the variable.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, replace `REST_message_record` with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameter("s","NOW");
```

**RESTMessageV2 - setStringParameterNoEscape(String name, String value)**

Sets a REST message function variable with the specified name from the REST message record to the specified value.

This method is equivalent to `setStringParameter` but does not escape XML reserved characters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the REST message variable. This parameter must be defined in the REST message record before you can assign a value to it.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign the variable.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
In the following example, replace REST_message_record with the name of the REST message record from your instance.

```javascript
var sm = new sn_ws.RESTMessageV2("<REST_message_record>","get"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameterNoEscape("s","NOW");
```

**RESTResponseV2 - Scoped, Global**

The RESTResponseV2 API allows you to use the data returned by an outbound REST message in JavaScript code.

A RESTResponseV2 object is returned by the RESTMessageV2 methods `execute()` and `executeAsync()`.

You can use this API in scoped applications, or within the global scope.

**RESTResponseV2 - getAllHeaders()**

Returns all headers contained in the response, including any duplicate headers.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>List&lt;GlideHTTPHeader&gt;</td>
</tr>
</tbody>
</table>

The follow code example shows how to call the REST Table API and then lists out all of the headers found in the response.

```javascript
var request = new sn_ws.RESTMessageV2();
request.setEndpoint('http://<SN_Instance_host>/api/now/table/incident');
request.setHttpMethod('GET');
request.setRequestHeader("Accept", "application/json");
var res = request.execute();
if (res.getStatusCode() != 200) {
    gs.info('Bad Request');
}
```
var headers = res.getAllHeaders();
for(var i in headers){
    gs.info(headers[i].name + ': ' + headers[i].value);
}

RESTResponseV2 - getBody()

Gets the content of the REST response body.

Use this function when you want to get the request body as text content. Do not use this method when saving the response as a binary attachment. If a RESTMessageV2 object called the saveResponseBodyAsAttachment(...) function, using getBody() on the associated RESTResponseV2 object will cause an error. When saving the response as an attachment, if the outbound REST message fails, call getErrorMessage() on the response to retrieve the body content.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>REST response body.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var responseBody = response.getBody();
```

RESTResponseV2 - getCookies()

Returns all cookies included in the response.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of strings representing cookies. Iterate through the array to perform operations on each cookie.</td>
</tr>
</tbody>
</table>

Display individual cookies from the response.

```javascript
var cookies = response.getCookies();
for (var i = 0; i < cookies.length; i++) {
  gs.info('cookie: ' + cookies.get(i));
}
```

Output:

```
cookie: JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAF8D8.node20; Path=/; Secure; HttpOnly
cookie: SABASESSIONID=370152970.36895.0000; path=/
```
**RESTResponseV2 - getErrorCode()**

Gets the numeric error code if there was an error during the REST transaction.

This error code is specific to the Now Platform, it is not an HTTP error code. Provide this error code if you require assistance from ServiceNow Customer Support.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Numeric error code, such as 1 for socket timeout.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var errorCode = response.getErrorCode();
```

**RESTResponseV2 - getErrorMessage()**

Gets the error message if there was an error during the REST transaction.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Error message.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var errorMsg = response.getErrorMessage();
```
**RESTResponseV2 - getHeader(String name)**

Gets the value for a specified header.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the header that you want the value for, such as Set-Cookie.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message
doesn't exist or not visible due to scope.
var response = sm.execute();
var headerVal = response.getHeader("Content-Type");
```

**RESTResponseV2 - getHeaders()**

Gets all headers returned in the REST response and the associated values.

⚠️ **Note:** If a header is present more than once in the response, such as a Set-Cookie header, this function returns only the last of the duplicate headers. To return all headers including duplicates, use the `getAllHeaders()` function.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message
doesn't exist or not visible due to scope.
```
```javascript
var response = sm.execute();
var headers = response.getHeaders();

var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var queryString = response.getQueryString();
```

**RESTResponseV2 - getQueryString()**

Gets the fully-resolved query sent to the REST endpoint.

This query contains the endpoint URL as well as any values assigned to variables in the REST message. Use this method only with responses to direct requests. This method is not supported for requests sent asynchronously, or requests sent using a MID server.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Fully-resolved query.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var queryString = response.getQueryString();
```

**RESTResponseV2 - getResponseAttachmentSysid()**

Gets the sys_id value of the attachment created from the response body content.

If the RESTMessageV2 object associated with this response called the `saveResponseBodyAsAttachment(...) function, use getResponseAttachmentSysid()` to get the sys_id of the created attachment record. Use this function when you want to perform additional operations with the new attachment record.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Sys_id of the new attachment record.</td>
</tr>
</tbody>
</table>

**RESTResponseV2 - getStatusCode()**

Gets the numeric HTTP status code returned by the REST provider.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Numeric status code returned by the REST provider, such as 200 for a successful response.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var statusCode = response.getStatusCode();
```

**RESTResponseV2 - haveError()**

Indicates if there was an error during the REST transaction.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if there was an error, false if there was no error.</td>
</tr>
</tbody>
</table>
var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var error = response.haveError();

**RESTResponseV2 - waitForResponse(Number timeoutSecs)**

Set the amount of time the instance waits for a response from the web service provider.

This method overrides the property glide.rest.outbound.ecc_response.timeout for this REST response.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutSecs</td>
<td>Number</td>
<td>The amount of time, in seconds, to wait for this response.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var sm = new sn_ws.RESTMessageV2("Yahoo Finance","get"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync();
response.waitForResponse(60);

**RoundingInterval - Global**

Handles all the details of rounding intervals for CPU speed and RAM size.

Use in any server-side Discovery script.

**RoundingInterval - getRoundedValue(Number value)**

Returns the value after applying the rounding interval.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number</td>
<td>The value to round off</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The value after rounding</td>
</tr>
</tbody>
</table>

RoundingInterval - RoundingInterval(String type)

Creates an instance of the RoundingInterval class.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>String</td>
<td>Can be either CPU or RAM.</td>
</tr>
</tbody>
</table>

ScopedSessionDomain - Client

The ScopedSessionDomain API is a script include that contains client-side methods that provide functionality related to the current session domain.

This API is only available if the Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions) plugin has been activated in the instance. In addition, the caller must have the admin role to access this API.

ScopedSessionDomain - getCurrentDomainID()

Returns the sys_id of the current domain for the logged-in user session.

The identifier that is returned depends on the domain type and the instantiation of that domain.

- If the user is configured in the global domain, and does not use the domain picker to switch domains, the method returns null.
- If the user uses the domain picker to switch to the global domain, the method returns the string "global".
- For all other domains, the method returns the sys_id of that domain.
To access this method from a client-side script, you must use GlideAjax() to invoke it. To invoke this method from a server-side script, use something similar to the following to instantiate the object and access the method.

```javascript
var ssg = new global.ScopedSessionDomain();
domainID = ssg.getCurrentDomainID();
```

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Sys_id of the session domain of the current logged-in user. This is the same information that appears in the domain picker.</td>
</tr>
</tbody>
</table>

This example shows how to call the `getCurrentDomainID()` method from a client-side script.

```javascript
function onLoad() {
  var ga = new GlideAjax("global.ScopedSessionDomain"); // Set the script include
  ga.addParam("sysparm_name", "getCurrentDomainID"); // Set the getCurrentDomainID method
  ga.getXML(getResponse);

  function getResponse(response) {
    var answer = response.responseXML.documentElement.getAttribute('answer');
    alert(answer); // Pops up the sys_id of the domain record
  }
}
```

**ScriptableDataStream - Scoped, Global**

Provides methods to interact with a stream of data.

This class can only be used in a server-side script after retrieving a ScriptableDataStream object using one of these APIs:

- The `executeDataStreamAction()` method in the `FlowAPI` class. See `FlowAPI`.
- The `getDataStream()` method in the `ScriptableFlowRunnerResult` class. See `ScriptableFlowRunnerResult`.

After retrieving a ScriptableDataStream object, call the methods in this specific order:

1. Use the `hasNext()` method to determine whether there are more items in the data stream.
2. Use the `next()` method to access the next item in the stream.
3. Use the `getItemIndex()`, `getItemInPageIndex()`, and `getPageIndex()` methods to get information from the stream.
4. Use the `close()` method to close the stream.

⚠️ **Note:** Always wrap data stream logic in a `try/catch` block to catch errors. Always include a `finally` statement that ends with the `close()` method from the `ScriptableDataStream` class to close the data stream and prevent performance issues.

**ScriptableDataStream - close()**

Closes the connection to a data stream. Always call this method after performing any desired operations on a data stream.

You can only call this method on a ScriptableDataStream object returned from the `executeDataStreamAction()` method in the `FlowAPI` class. See `FlowAPI`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

(function() {

try {
    // Execute Data Stream Action.
    var stream = sn_fd.FlowAPI.executeDataStreamAction('x_snc_my_scope.data_stream_name');
    // Process each item in the data stream
    while (stream.hasNext()) {
        // Get a single item from the data stream.
        var user = stream.next();

        // Only log the first item in each page
        if (stream.getItemInPageIndex() == 0) {
            gs.info('first user on page is ' + user.name);
        }
    }
} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
} finally {
    stream.close();
}
})();

**ScriptableDataStream - getItemIndex()**

Returns the current index of an item in a data stream.

You can only call this method on a ScriptableDataStream object returned from the `executeDataStreamAction()` method in the FlowAPI class. See `FlowAPI`.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Current index of an item in a data stream using zero-based indexing.</td>
</tr>
</tbody>
</table>

(function() {

    try {

        // Execute Data Stream Action.
        var stream = sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_name');

        // Process each item in the data stream
        while (stream.hasNext()) {

            // Get a single item from the data stream.
            var User = stream.next();

            // Use the item. Example:
            // var now_GR = new GlideRecord(<table_name>);
            // now_GR.<field_name> = User.<field_name>;
            // now_GR.insert();

            // By default, this code snippet will terminate after 10 items.
            // Remove or modify this limit after your code has been tested.
            if (stream.getItemIndex() >= 9) {
                break;
            }
        } catch (ex) {
            var message = ex.getMessage();
            gs.error(message);
        } finally {
            stream.close();
        }
    }
})();

**ScriptableDataStream - getItemInPageIndex()**

Returns the current index of an item within the current page in a data stream.
You can only call this method on a ScriptableDataStream object returned from the `executeDataStreamAction()` method in the FlowAPI class. See `FlowAPI`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Current index of an item within the current page in the data stream using zero-based indexing.</td>
</tr>
</tbody>
</table>

```javascript
(function() {
  try {
    // Execute Data Stream Action.
    var stream = sn_fd.FlowAPI.executeDataStreamAction('x_snc_my_scope.data_stream_name');
    // Process each item in the data stream
    while (stream.hasNext()) {
      // Get a single item from the data stream.
      var user = stream.next();

      // Only log the first item in each page
      if (stream.getItemInPageIndex() == 0) {
        gs.info('first user on page is ' + user.name);
      }
    }
  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  } finally {
    stream.close();
  }
})();
```

**ScriptableDataStream - getPageIndex()**

Returns the current index of a page in a data stream.
You can only call this method on a ScriptableDataStream object returned from the `executeDataStreamAction()` method in the FlowAPI class. See `FlowAPI`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Current index of a page in a data stream using zero-based indexing.</td>
</tr>
</tbody>
</table>

```javascript
(function() {
    try {

        // Execute Data Stream Action.
        var stream = sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_name');

        // Process each item in the data stream
        while (stream.hasNext()) {

            // Get a single item from the data stream.
            var item = stream.next();

            // Use the item.
            var now_GR = new GlideRecord('incident');
            now_GR.setValue('number', item.id);
            now_GR.setValue('short_description', item.name);
            now_GR.insert();

            // By default, this code snippet will terminate after 5 pages.
            // Remove or modify this limit after testing your code.
            if (stream.getPageIndex() >= 4) {
                break;
            }
        }
    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    } finally {
```
stream.close();
}
})

**ScriptableDataStream - hasNext()**

Returns true if there are more items in the data stream.

You can only call this method on a ScriptableDataStream object returned from the `executeDataStreamAction()` method in the FlowAPI class. See FlowAPI.

ℹ️ **Note:** By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the `datastream_alternative_env_fetch_page_timeout_seconds` system property.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean    | Flag that determines whether there are more items in the data stream. Values include:  
  - true: There are more items to iterate through in the data stream.  
  - false: There are no more items in the data stream. |

This example creates an incident record for each item returned in the data stream.

```javascript
(function() {
  try {
    // Execute Data Stream Action.
    var stream = sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_name');

    // Process each item in the data stream
    while (stream.hasNext()) {
```
// Get a single item from the data stream.
var item = stream.next();

// Use the item.
var now_GR = new GlideRecord('incident');
own_GR.setValue('number',item.id);
own_GR.setValue('short_description',item.name);
own_GR.insert();

// By default, this code snippet will terminate after 10 items.
// Remove or modify this limit after testing your code.
if (stream.getItemIndex() >= 9) {
    break;
}
}
}

}()

ScriptableDataStream - next()
Returns the next item in a data stream.

You can only call this method on a ScriptableDataStream object returned from the executeDataStreamAction() method in the FlowAPI class. See FlowAPI.

💡 Note: By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the datastream_alternative_env_fetch_page_timeout_seconds system property.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The next item in the data stream. This object contains the outputs defined by the Data Stream action. To view the Data Stream action outputs, navigate to the Outputs section of the Data Stream action in the Flow Designer interface.</td>
</tr>
</tbody>
</table>

This example creates an incident record for each item returned in the data stream.

```javascript
(function() {
    try {

        // Execute Data Stream Action.
        var stream = sn_fd.FlowAPI.executeDataStreamAction('x_my_scope.data_stream_name');

        // Process each item in the data stream
        while (stream.hasNext()) {

            // Get a single item from the data stream.
            var item = stream.next();

            // Use the item.
            var now_GR = new GlideRecord('incident');
            now_GR.setValue('number', item.id);
            now_GR.setValue('short_description', item.name);
            now_GR.insert();

            // By default, this code snippet will terminate after 10 items.
            // Remove or modify this limit after testing your code.
            if (stream.getItemIndex() >= 9) {
                break;
            }
        }
    }
}
```
**ScriptableFlowRunner - Scoped**

Create a builder object used to define parameters for flow, subflow, and action execution. You can specify a flow to execute in a particular domain. Start the flow, subflow, or action execution directly from the builder and view the results in a ScriptableFlowRunnerResult object.

Use these methods in your server-side scripts with the `sn_fd` namespace identifier.

**API call order**

Build and execute flows, subflows, and actions using these APIs in the following order:

1. **FlowAPI**: Creates a builder object
   
   Use `getRunner()` to instantiate the ScriptableFlowRunner builder object.

2. **ScriptableFlowRunner**: Specify Flow Designer content to run
   
   Use these methods in the following order to create the builder pattern:
   
   1. Use one of the methods `action()`, `datastream()`, `flow()`, or `subflow()` to specify what type of Flow Designer object to build.
   
   2. Use one or more methods such as `addInput()`, `inDomain()`, or `quick()` to specify execution parameters.
   
   3. Use the `run()` method to run the action, flow, or subflow with the provided parameters and return a ScriptableFlowRunnerResult object.

3. **ScriptableFlowRunnerResult**: Retrieve Flow Designer execution details
   
   Use one or more methods such as `getContextId()`, `getOutputs()`, and `getDomainId()` to view execution details.

**Example**

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```javascript
(function() {
})();
```

try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c'; // Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner() // Create a ScriptableFlowRunner builder object.
    .action('global.markapproved') // Run the global scope action named markapproved.
    .inForeground()
    .inDomain('TOP/ACME') // Run the action from the TOP/ACME domain.
    .withInputs(inputs)
    .run(); // Run the action and return a FlowRunnerResult object.

    var contextId = result.getContextId(); // Retrieve the context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
    var newApprovalStatus = outputs['approval']; // Echo back the approval status for verification.

} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

)}();

**ScriptableFlowRunner - action(String scopedActionName)**

Identifies the scope and name of the action to execute.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedActionName</td>
<td>String</td>
<td>Scope and name of the action to execute. For example, <code>global.actionName</code>.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunnerBuilder</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```javascript
(function() {
    try {

        var inputs = {};
        inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c'; // Pass the record’s sys_id in as input.

        var result = sn_fd.FlowAPI.getRunner() // Create a ScriptableFlowRunner builder object.
            .action('global.markapproved') // Run the global scope action named markapproved.
            .inForeground()
            .inDomain('TOP/ACME') // Run the action from the TOP/ACME domain.
            .withInputs(inputs)
            .run(); // Run the action and return a FlowRunnerResult object.

        var contextId = result.getContextId(); // Retrieve the context ID from the result
        var dateRun = result.getDate();
        var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
        var flowName = result.getFlowObjectName();
        var flowObjectType = result.getFlowObjectType();
    }
})();
```
var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
var newApprovalStatus = outputs['approval']; // Echo back the approval status for verification.

} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

());

ScriptableFlowRunner - datastream(String scopedDatastreamName)
Identifies the scope and name of the data stream action to execute.

To learn more about data stream actions, see Data Stream actions and pagination.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedDatastreamName</td>
<td>String</td>
<td>Scope and name of the Data Stream action to execute. For example, global.dataStreamActionName.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a Data Stream action.

(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .datastream('global.test_dsa')
            .inForeground()
            .run();

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})();
Output:

*** Script: FlowRunnerResult
Flow Object Name: global.test_dsa
Flow Object Type: datastream
Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0

ScriptableFlowRunner - flow(String scopedFlowName)
Identifies the scope and name of the flow to execute.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedFlowName</td>
<td>String</td>
<td>Scope and name of the flow to execute. For example, global.flowName.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a flow that logs a message.

```javascript
(function() {
  try {
    var result = sn_fd.FlowAPI.getRunner()
    .flow('global.test_flow')
    .inForeground()
    .run();
  }

  catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

  })();
```
gs.info(result.debug());

} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

})

Output:

*** Script: FlowRunnerResult
Flow Object Name: global.test_flow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0

ScriptableFlowRunner - subflow(String scopedSubflowName)
Identifies the scope and name of the subflow to execute.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopedSubflowName</td>
<td>String</td>
<td>Scope and name of the subflow to execute. For example, global.subflowName.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .subflow('global.test_subflow')
            .inForeground()
            .run();

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})();
gs.info(result);

}) catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
}

})();

Output:

Flow Designer: Cloning a new session to run as as user id: [user_name] from original user session: [user_name]
Flow Designer: Message to log
Flow Designer: Reverting cloned session to original user session: [user_name]
*** Script: FlowRunnerResult
Flow Object Name: global.test_subflow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 16:41:13
ContextId: null
Output count: 0

ScriptableFlowRunner - inForeground()

Runs the flow, subflow, or action synchronously. Script execution pauses while the flow object is running.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A
ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```javascript
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c'; // Pass the record's sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner() // Create a ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
    var newApprovalStatus = outputs['approval']; // Echo back the approval status for verification.

    } catch (ex) {
      var message = ex.getMessage();
      gs.error(message);
    }
  }()
});
```
ScriptableFlowRunner - inBackground()

Runs the flow, subflow, or action asynchronously. Once the flow object starts running, script execution resumes immediately.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a flow asynchronously.

```javascript
(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .flow('global.test_flow')
            .inBackground()
            .run();

        gs.info(result.debug());

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})(function);
```

Output:

Flow Designer: Cloning a new session to run as as user id: [user_name] from original user session: [user_name]
Flow Designer: Message to log
Flow Designer: Reverting cloned session to original user session: [user_name]
*** Script: FlowRunnerResult
Flow Object Name: global.test_flow

ScriptableFlowRunner - inDomain(String domainId)

Runs the flow, subflow, or action in the specified domain. Checks to ensure the domain exists and is available.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainId</td>
<td>String</td>
<td>The sys_id or name for the domain of execution for the flow.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```
(function() {
    try {
        var inputs = {};

        inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  // Pass the record’s sys_id as input.

        var result = sn_fd.FlowAPI.getRunner()  // Create a ScriptableFlowRunner builder object.
            .action('global.markapproved')        // Run the global scope action named markapproved.
            .inForeground()
    }
}
```

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
inDomain('TOP/ACME') // Run the action from the TOP/ACME domain.

.withInputs(inputs)
.run(); // Run the action and return a FlowRunnerResult object.

var contextId = result.getContextId(); // Retrieve the context ID from the result
var dateRun = result.getDate();
var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
var flowName = result.getFlowObjectName();
var flowObjectType = result.getFlowObjectType();

var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
var newApprovalStatus = outputs['approval'] // Echo back the approval status for verification.

} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

ScriptableFlowRunner - withInputs(Map inputs)
Adds a collection of inputs. If a name in one of the name-value pairs already exists, the new value replaces the pre-existing value.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputs</td>
<td>Object</td>
<td>Map object containing the name-value pairs that define inputs for the flow, subflow, or action.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

Creates an input object and passes the value to the withInputs() method.
(function() {
  try {

    var inputs = {}; 

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c'; // Pass the record’s sys_id in 
    as input.

    var result = sn_fd.FlowAPI.getRunner() // Create a ScriptableFlowRunner builder 
    object.
      .action('global.markapproved') // Run the global scope action named 
    markapproved.
      .inForeground()
      .inDomain('TOP/ACME') // Run the action from the TOP/ACME domain.
      .withInputs(inputs)
      .run(); // Run the action and return a FlowRunnerResult 
    object.

    var contextId = result.getContextId(); // Retrieve the context ID from the result 
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
    var flowName = result.getFlowObjectName();
    var flowObjectType = result.getFlowObjectType();

    var outputs = result.getOutputs(); // Retrieve any outputs from the action 
    execution.
    var newApprovalStatus = outputs['approval']; // Echo back the approval status for 
    verification.

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();

**ScriptableFlowRunner - addInput(String name, Object value)**

Adds a single input. If the name passed as an argument already exists as a 
separate input, the new value replaces the pre-existing value.
This method adds a single input. To create an object and add multiple inputs, use the `withInputs()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The name of the input for the flow, subflow, or action.</td>
</tr>
<tr>
<td>value</td>
<td>Object</td>
<td>The value of the input for the flow, subflow, or action.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ScriptableFlowRunner</code></td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example runs an action that takes a single input called `table_name`.

```javascript
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .action('global.test_action')
      .addInput('table_name', 'incident')
      .inForeground()
      .run();

    gs.info(result.debug());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

### Output:

```
Flow Designer: TableName
*** Script: FlowRunnerResult
Flow Object Name: global.test_action
Flow Object Type: action
```
**ScriptableFlowRunner - timeout(Number timeout)**

Sets a timeout for a flow, subflow, or action execution.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Number</td>
<td>Timeout in milliseconds.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a flow and sets a timeout for two minutes.

```javascript
(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .flow('global.test_flow')
            .inForeground()
            .timeout(120000)
            .run();

        gs.info(result.debug());

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})();
```

**Output:**

```
Flow Designer: Cloning a new session to run as as user id: [user_name] from original user session: [user_name]
```
Flow Designer: Reverting cloned session to original user session: [user_name]

*** Script: FlowRunnerResult
Flow Object Name: global.test_flow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 18:22:35
ContextId: null
Output count: 0

ScriptableFlowRunner - withConnectionAliasOverride(String aliasName, String overrideName)

Overrides the Connections and Credentials alias associated with the flow, action, or subflow.

To learn more about overriding a Connections and Credentials alias, see Supporting multiple connections.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aliasName</td>
<td>String</td>
<td>The name of the alias to override.</td>
</tr>
<tr>
<td>overrideName</td>
<td>String</td>
<td>The name of the alias to use when running the flow, subflow, or action.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a flow using a different alias than the default associated with the flow.

```javascript
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .withConnectionAliasOverride('sn_original_alias.spoke', 'x_new_alias.spoke')
      .inForeground()
      .run();

```
ScriptableFlowRunner - quick()

Runs a flow, subflow, or action from a server-side script synchronously or asynchronously without creating execution details or other related records. Improves performance by eliminating record-keeping overhead. Use this API to increase the speed of high-volume processing, for example multiple executions per second, in a production environment.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunner</td>
<td>Builder object used to run a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to run a flow without creating any related records.

```javascript
(function() {
  try {
    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .quick()
      .run();

    gs.info(result);
  }

  catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }
})();
```
Output:

Flow Designer: Message to log.
*** Script: [object FlowRunnerResult]

**ScriptableFlowRunner - run()**

Runs the flow, subflow, or action with the specified parameters.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScriptableFlowRunnerResult</td>
<td>Object containing the execution details of a Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to create a ScriptableFlowRunner builder object and uses it to execute an approval action on a specific record. A ScriptableFlowRunnerResult object captures the execution arguments and action outputs.

```javascript
(function() {
  try {
    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  // Pass the record’s sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a ScriptableFlowRunner builder object.
    .action('global.markapproved')        // Run the global scope action named markapproved.
    .inForeground()
```
inDomain('TOP/ACME') // Run the action from the TOP/ACME domain.

.withInputs(inputs)
.run(); // Run the action and return a FlowRunnerResult object.

var contextId = result.getContextId(); // Retrieve the context ID from the result
var dateRun = result.getDate();
var domainUsed = result.getDomainId(); // Retrieve the Domain ID from the result.
var flowName = result.getFlowObjectName();
var flowObjectType = result.getFlowObjectType();

var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
var newApprovalStatus = outputs['approval']; // Echo back the approval status for verification.

} catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
}
}}();

**ScriptableFlowRunnerResult - Scoped**

Captures the result of using ScriptableFlowRunner to execute a flow, subflow, or action. Includes data such as the context ID, domain, and any outputs from the flow execution.

Use these methods in your server-side scripts with the `sn_fd` namespace identifier.

**API call Order**

Build and execute flows, subflows, and actions using these APIs in the following order:

1. **FlowAPI**: Creates a builder object
   
   Use `getRunner()` to instantiate the ScriptableFlowRunner builder object.

2. **ScriptableFlowRunner**: Specify Flow Designer content to run
   
   Use these methods in the following order to create the builder pattern:
1. Use one of the methods `action()`, `datastream()`, `flow()`, or `subflow()` to specify what type of Flow Designer object to build.

2. Use one or more methods such as `addInput()`, `inDomain()`, or `quick()` to specify execution parameters.

3. Use the `run()` method to run the action, flow, or subflow with the provided parameters and return a `ScriptableFlowRunnerResult` object.

**3. ScriptableFlowRunnerResult: Retrieve Flow Designer execution details**

Use one or more methods such as `getContextId()`, `getOutputs()`, and `getDomainId()` to view execution details.

**Example**

This example shows how to create a `ScriptableFlowRunner` builder object and uses it to execute an approval action on a specific record. A `ScriptableFlowRunnerResult` object captures the execution arguments and action outputs.

```javascript
(function() {
  try {

    var inputs = {};

    inputs['sys_id'] = '57af7aec73d423002728660c4cf6a71c';  // Pass the record’s sys_id in as input.

    var result = sn_fd.FlowAPI.getRunner()  // Create a ScriptableFlowRunner builder object.
      .action('global.markapproved')        // Run the global scope action named markapproved.
      .inForeground()
      .inDomain('TOP/ACME')                 // Run the action from the TOP/ACME domain.
      .withInputs(inputs)
      .run();                               // Run the action and return a FlowRunnerResult object.

    var contextId = result.getContextId();  // Retrieve the context ID from the result
    var dateRun = result.getDate();
    var domainUsed = result.getDomainId();  // Retrieve the Domain ID from the result.
    var flowName = result.getFlowObjectName();
  }
});
```
var flowObjectType = result.getFlowObjectType();

var outputs = result.getOutputs(); // Retrieve any outputs from the action execution.
var newApprovalStatus = outputs['approval']; // Echo back the approval status for verification.

} catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

());

**ScriptableFlowRunnerResult - getOutputs()**

Returns the outputs of a completed Flow Designer action, flow, or subflow.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing the output of a completed Flow Designer action, flow, or subflow.</td>
</tr>
</tbody>
</table>

This example shows how to retrieve the outputs from a Flow Designer action, flow, or subflow run with the `ScriptableFlowRunner` API.

(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .action('global.test_action')
            .inForeground()
            .timeout(12000)
            .run();

        gs.info(result.getOutputs());
    }

})();
Output:
Flow Designer: Warning. This is an important log message.

**ScriptableFlowRunnerResult - getFlowObjectType()**

Returns the type of Flow Designer object run.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>FlowObjectType</td>
</tr>
</tbody>
</table>

This example shows how to retrieve the flow object type from the ScriptableFlowRunnerResult API.

```javascript
(function() {
  try {

    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .timeout(12000)
      .run();

    gs.info(result.getFlowObjectType());

  } catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```
ScriptableFlowRunnerResult - getFlowObjectName()

Returns the scope and internal name of the Flow Designer action, flow, or subflow run.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The scope and internal name of the Flow Designer action, flow, or subflow run. For example, <code>global.emailflow</code>.</td>
</tr>
</tbody>
</table>

This example shows how to retrieve the name of the flow, subflow, or action name from a ScriptableFlowRunnerResult object.

```javascript
(function() {
    try {

        var result = sn_fd.FlowAPI.getRunner()
            .flow('global.test_flow')
            .inForeground()
            .timeout(12000)
            .run();

        gs.info(result.getFlowObjectName());

    } catch (ex) {
        var message = ex.getMessage();
        gs.error(message);
    }

})();
```
Output:

```
global.test_flow
```

**ScriptableFlowRunnerResult - getDomainId()**

Returns the sys_id of the domain that the Flow Designer action, flow, or subflow ran in.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the domain that the Flow Designer action, flow, or subflow ran in.</td>
</tr>
</tbody>
</table>

This example shows how to retrieve a domain ID from a ScriptableFlowRunnerResult object.

```
(function() {
  try {
    var result = sn_fd.FlowAPI.getRunner()
      .flow('global.test_flow')
      .inForeground()
      .inDomain('TOP/ACME')
      .timeout(12000)
      .run();

    gs.info(result.getDomainId());
  }
  catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

Output:

```
4ecead85a4da1110598d0c7d6bf75554
```
### ScriptableFlowRunnerResult - `getDate()`

Returns the date and time when a Flow Designer action, flow, or subflow ran as a GlideDateTime object.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideDateTime</td>
<td>The execution date and time for the flow, subflow, or action.</td>
</tr>
</tbody>
</table>

This example shows how to retrieve the date and time of a flow execution from a ScriptableFlowRunnerResult object.

```javascript
(function() {
  try {
    var result = sn_fd.FlowAPI.getRunner()
    .flow('global.test_flow')
    .inForeground()
    .timeout(12000)
    .run();

    gs.info(result.getDate());
  }
  catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
  }

})();
```

**Output:**

```
2020-05-22 18:45:42
```

### ScriptableFlowRunnerResult - `getDataStream()`

Returns the stream of data from a data stream action.
If the `datastream()` method was used in the `ScriptableFlowRunner` builder class, this returns the stream of data as a `ScriptableDataStream` object. Use the `ScriptableDataStream` class to iterate over items in the stream. See `ScriptableDataStream`.

For more information about data stream actions, see Data Stream actions and pagination.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ScriptableDataStream</code></td>
<td>A <code>ScriptableDataStream</code> object you can use to iterate through items in a data stream. Use the methods in the <code>ScriptableDataStream</code> class to interact with this object. See <code>ScriptableDataStream</code>.</td>
</tr>
</tbody>
</table>

This example shows how to retrieve a data stream from a `ScriptableFlowRunnerResult` object.

```javascript
var datastream = result.getDataStream();
```

### `ScriptableFlowRunnerResult - getContextId()`

Returns the context ID of the flow, subflow, or action.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>String</code></td>
<td>The <code>sys_id</code> of the Flow Designer execution details record for the action, flow, or subflow.</td>
</tr>
</tbody>
</table>
This example shows how to retrieve a context ID from a ScriptableFlowRunnerResult object.

```javascript
var contextId = result.getContextId();
```

Output:

```
4ecead85c4da1110598d0c7d6bf73554
```

**ScriptableFlowRunnerResult - debug()**

Returns information about the executed flow, subflow, or action, including the context ID, domain ID, and execution outputs.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String | Execution details about the Flow Designer action, flow, or subflow run.  
- flow object name: Name of the flow, subflow, or action.  
- flow object type: Flow, subflow, action, or datastream action.  
- domain ID: ID of the domain that the flow, subflow, or action ran in.  
- result time: Amount of time it took to run.  
- context ID: Sys_id of the Flow Designer execution details record for the action, flow, or subflow.  
- output count: Number of action or subflow outputs. |

This example shows how to retrieve information about the executed flow, subflow, or action from the ScriptableFlowRunnerResult object.

```javascript
(function() {
  try {
    
    var result = sn_fd.FlowAPI.getRunner()
    .flow('global.test_flow')
  }

  catch (err) {
    console.log(err);
  }
}
```
.inForeground()
.timeout(12000)
.run();

gs.info(result.debug());

} catch (ex) {
  var message = ex.getMessage();
  gs.error(message);
}

})();

Output:

*** Script: FlowRunnerResult
Flow Object Name: global.test_flow
Flow Object Type: flow
Domain: null
Result Time: 2020-06-08 18:28:41
ContextId: null
Output count: 0

ScriptLoader - Client
Provides the ability to load scripts asynchronously.

You can use the ScriptLoader API in client-side scripts for a platform/desktop UI using ListV2 and ListV3 APIs. It is not available for Service Portal, Mobile, or Agent Workspace.

You access the ScriptLoader methods by using the global object ScriptLoader.

ScriptLoader - getScripts(String filePath, Function callback)
Gets scripts asynchronously.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filePath</td>
<td>String</td>
<td>Path, including the file name, that contains one or more scripts.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>Function to call after the scripts have been loaded. This callback function should not have arguments.</td>
</tr>
</tbody>
</table>
This example shows how load a utility script and then run the `getDepartment()` function.

```javascript
// Client script to load a utility script and run the getDepartment callback function
ScriptLoader.getScripts('sn_ui_script_util.Utilities.jsdbx', getDepartment);

function getDepartment() {
  var req = sn_ui_script_util.Utilities.rest('json');
  req.addParam("sysparm_query", "sys_id=" + newValue);
  req.addParam("sysparm_fields", "department");
  req.addParam("sysparm_display_value", true);
  req.success(updateNotes);
  req.get("/api/now/table/sys_user");
}

function updateNotes(data) {
  g_form.setValue("work_notes", data.result[0].department.display_value);
}
```

**ScriptLoader - getScripts(Array scripts, Function callback)**

Loads scripts asynchronously.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scripts</td>
<td>Array</td>
<td>Array of scripts to load.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>Function to call when the scripts have been loaded. The callback function must not have any arguments.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
SentimentAnalyser - Scoped

The SentimentAnalyser API performs sentiment analysis on a string value.

The Sentiment Analysis API should be used in a script that is treated as an admin-executing script. For example, we should use the Sentiment Analysis API in Script Action or Scheduled Job.

To use this class in a scoped application, use the sn_nlp_sentiment namespace identifier. The Sentiment Analysis plugin (com.snc.sentiment_analysis) must be enabled to access the SentimentAnalyser API.

SentimentAnalyser - SentimentAnalyser()

Creates an instance of the SentimentAnalyser class with the default connector configuration that is used for sentiment analysis.

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
```

SentimentAnalyser - SentimentAnalyser(GlideRecord configGR)

Creates an instance of the SentimentAnalyser class with the specified connector configuration that is used for sentiment analysis.

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser(configGR);
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configGR</td>
<td>GlideRecord</td>
<td>GlideRecord object of a connector configuration.</td>
</tr>
</tbody>
</table>
SentimentAnalyser - analyze(String inputText)
Performs sentiment analysis on the specified text.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputText</td>
<td>String</td>
<td>Text on which sentiment analysis should be performed.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSON object</td>
<td>Result of the sentiment analysis specifying the status, score, normalised score, sys_id of the relevant connector configuration, and error message.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyze("Example string");
```

Output:

```json
{"status": "Success", "score": "0.7", "normalizedScore": "0.7", "connectorConfig": "10932aa773101300734e234fff6a777", "errorMessage": ""}
```

SentimentAnalyser - analyzeWithLanguage(String inputText, String language)
Performs sentiment analysis on a specified text and language.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputText</td>
<td>String</td>
<td>Text on which to perform sentiment analysis.</td>
</tr>
<tr>
<td>language</td>
<td>String</td>
<td>Language for the input text. This can very for different sentiment services.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSON object</td>
<td>Result of the sentiment analysis specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyze("Example string", "en");
```

Output:

```javascript
{"status": "Success", "score": "0.7", "normalizedScore": "0.7", "connectorConfig": "10932aa773101300734e234fff6a777", errorMessage:""}
```

**SentimentAnalyser - analyzeMultiple(Array inputTextArray)**

Performs sentiment analysis on an array of strings.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputTextArray</td>
<td>Array</td>
<td>Array of text (string) on which to perform sentiment analysis.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSON Array</td>
<td>An array that gives the result of the sentiment analysis performed on multiple texts specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyzeMultiple ("["Example string1","Example string2"]");
```

Output:

```javascript
[{"text": "I am happy","result": {"status": "Success", "score": "0.7", "normalizedScore": "0.7", "connectorConfig": "10932aa773101300734e234fff6a777", errorMessage:""}},{"text": "I am not happy","result": {"status": "Success", "score": "-0.7", "normalizedScore": "-0.7", "connectorConfig": "10932aa773101300734e234fff6a777", errorMessage:""}}]
```
SentimentAnalyser - analyzeMultipleWithLanguage(Array inputTextArray, String language)

Performs sentiment analysis on an array of strings in the specified language.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputTextArray</td>
<td>Array</td>
<td>Array of text (string) on which to perform sentiment analysis.</td>
</tr>
<tr>
<td>language</td>
<td>String</td>
<td>Language for the input text. This can vary for different sentiment services.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSON</td>
<td>An array with the result of the sentiment analysis performed on multiple texts of the mentioned language, specifying the status, score, normalized score, sys_id of the relevant connector configuration, and error message.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var result = sa.analyzeMultipleWithLanguage ("Example string1","Example string2", "en");
```

Output:

```json
[{
  "text": "I am happy",
  "result": {Success", "score": "0.7", "normalizedScore": "0.7",
    "connectorConfig": "10932aa773101300734e234fff6a777", "errorMessage":""}},
{
  "text": "I am not happy",
  "result": {Success", "score": "-0.7", "normalizedScore": "-0.7",
    "connectorConfig": "10932aa773101300734e234fff6a777", "errorMessage":""}}
```

SentimentAnalyser - getConnectorByName(String connectorName)

Returns the GlideRecord of the specified connector configuration.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connectorName</td>
<td>String</td>
<td>Name of the connector configuration.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>GlideRecord of the specified connector configuration.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var connector = sa.getConnectorByName("xxx");
```

Output:

GlideRecord object of the connector configuration with name "xxx", null if no connector is named as "xxx".

**SentimentAnalyser - getDefaultConnector()**

Returns the GlideRecord of the default connector configuration.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>GlideRecord of the default connector configuration.</td>
</tr>
</tbody>
</table>

```javascript
var sa = new sn_nlp_sentiment.SentimentAnalyser();
var defaultConnector = sa.getDefaultConnector();
```

**SerialNumberManager - Global**

Manages the serial numbers for discovery devices.
Use with a discovery script where you need to manage serial numbers.

**SerialNumberManager - add(Number sType, Number value)**

Adds the specified serial number.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sType</td>
<td>Number</td>
<td>The serial number type</td>
</tr>
<tr>
<td>value</td>
<td>Number</td>
<td>The serial number</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### SerialNumberManager - get()

Returns the serial number.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The serial number</td>
</tr>
</tbody>
</table>

### SerialNumberManager - getSerialsForCIData()

Returns serial number information for CI Data, including the type, serial number, and validity.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array with the serial number information in the following order: serial number type, serial number, and validity flag.</td>
</tr>
</tbody>
</table>

**SerialNumberManager - isValid(Number value)**

Checks if the number is a valid serial number.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number</td>
<td>The number to check</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the number is valid; otherwise, false.</td>
</tr>
</tbody>
</table>

**ServiceRegistryQuery - Global**

Maps Shazzam service registry query results against a port probe. Child classes provide specifics on mapping.

Use this API during the discovery scanning phase.

**ServiceRegistryQuery - findForPortProbe(PortProbe portProbe)**

Parses an array of IDs for the given port probe.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portProbe</td>
<td>PortProbe</td>
<td>The port probe</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
ServiceRegistryQuery - get(Object source)
Retrieves a registry service by id, regardless of child class.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Object</td>
<td>The registry service GlideRecord or sys_id.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The registry service</td>
</tr>
</tbody>
</table>

ServiceRegistryQuery - getShazzamQuerierClassname()
Returns the Shazzam! querier class name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The class name</td>
</tr>
</tbody>
</table>

ServiceRegistryQuery - toPortProbeMap()
Retrieves the port probe XML and creates a map.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The port probe map</td>
</tr>
</tbody>
</table>

**ServiceRegistryQuery - toPortProbeXml()**

Creates XML output for Shazzam! port probes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The XML output for the probe.</td>
</tr>
</tbody>
</table>

**ServiceRegistryQuery - ServiceRegistryQuery(Object source)**

Creates an instance of the ServiceRegistryQuery class.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Object</td>
<td>A GlideRecord or sys_id of the registry service.</td>
</tr>
</tbody>
</table>

**ShazzamLaunch - Global**

Handles the details of launching a Shazzam probe for a given discovery.

Use this API to launch a Shazzam probe during the discovery scanning phase.

**ShazzamLaunch - addPortProbe(String midPPs, String portProbes, IPIncludeExcludeCollection ipiec)**

Adds a single port probe to our MID services collection.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midPPs</td>
<td>String</td>
<td>A hashmap with two properties.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• midServer: a MIDServer instance</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances.</td>
</tr>
<tr>
<td>portProbes</td>
<td>String</td>
<td>A hashmap (by MIDServer name) that contains these properties.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• range: An IPMetaCollection containing the ranges to be probed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• midserver: A MIDServer instance for the MID server to be probed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed.</td>
</tr>
<tr>
<td>ipiec</td>
<td>IPIncludeExcludeCollection</td>
<td>The range to be probed.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**ShazzamLaunch - addRange(IPCollection ipc, String portProbes, Boolean samePhase)**

Adds the specified range and this discovery’s port probes to scan (as defined by behavior) to the collection of MID servers and port probes that need to be probed.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipc</td>
<td>IPCollection</td>
<td>The range to be discovered</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| portProbes | String | A hashmap (by MID server name) of hashmaps containing these properties.  
• range: an IPMetaCollection containing the ranges to be probed.  
• midServer: a Mid server instance for the MID server to be probed.  
• portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed. |
| samePhase  | Boolean| True if this should use the same phase as is currently running. |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### ShazzamLaunch - fireShazzamProbe(String portProbe, String ip, String sensor)

Fires a Shazzam probe for the MID server and services in the given hash map.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| portProbe  | String | A hashmap containing these properties.  
• range: an IPMetaCollection containing the ranges to be probed.  
• midServer: a MIDServer instance for the MID server to be probed. |
<p>| ip         | String | A comma-separated list of IPs to fire probes for. |
| sensor     | String | The sys_id of the sensor that launched this probe (network discovery only). |</p>
<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**ShazzamLaunch - launch(String ip, Boolean samePhase, String sensor)**

Launches Shazzam probes as necessary, depending on the current phase of each behavior used.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>String</td>
<td>A comma-separated list of IPs to fire probes for.</td>
</tr>
<tr>
<td>samePhase</td>
<td>Boolean</td>
<td>True if this launch should use the same phase as is currently running.</td>
</tr>
<tr>
<td>sensor</td>
<td>String</td>
<td>The sys_id of the sensor that launched this (only in network discovery).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>Boolean</td>
</tr>
</tbody>
</table>

**ShazzamLaunch - makeProbeSpec(String portProbe)**

Makes an XML port probe spec for the given port probe hashmap.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portProbe</td>
<td>String</td>
<td>A hashmap containing these properties.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• range: an IPMetaCollection containing the ranges to be probed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• midServer: a MIDSserver instance for the MID server to be probed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• portProbes: a hashmap (by port probe name) of DiscoveryPortProbe instances to be probed.</td>
</tr>
</tbody>
</table>
### ShazzamLaunch - ShazzamLaunch(DiscoveryStatus status, DiscoverySchedule schedule)

Creates an instance of the ShazzamLaunch class.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>DiscoveryStatus</td>
<td>The DiscoveryStatus instance for this discovery.</td>
</tr>
<tr>
<td>schedule</td>
<td>DiscoverySchedule</td>
<td>The DiscoverySchedule instance for this discovery.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

### ShazzamResult - Global

Encapsulates a Shazzam result.

Use this API during the discovery scanning phase.

### ShazzamResult - active

Property that shows if the IP address is active

#### Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>Boolean</td>
<td>True if this IP address is active, which means at least one port is open.</td>
</tr>
</tbody>
</table>
ShazzamResult - alive

Property is true if this IP address is alive, which means no ports are open, but at least one responded.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alive</td>
<td>Boolean</td>
<td>True if the IP address is alive, meaning no ports are open, but at least one port responded.</td>
</tr>
</tbody>
</table>

ShazzamResult - domainName

The Windows domain name for the IP.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>The Windows domain name for the IP if one was resolved by the scanner.</td>
</tr>
</tbody>
</table>

ShazzamResult - hostName

Host name for the IP.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostName</td>
<td>String</td>
<td>Host name of the IP if one was resolved by the scanner.</td>
</tr>
</tbody>
</table>

ShazzamResult - ip

IP address of the results.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>String</td>
<td>IP address of the results</td>
</tr>
</tbody>
</table>
ShazzamResult - scanners
A JavaScript array of ShazzamScanner instances.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scanners</td>
<td>Array</td>
<td>Array of ShazzamScanner instances</td>
</tr>
</tbody>
</table>

ShazzamScanner - Global
Encapsulates a Shazzam scanner.
Use this API during the discovery scanning phase.

ShazzamScanner - contents
A hash map of any nodes contained within the scanner, by name.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contents</td>
<td>Hash map</td>
<td>A hash map of any nodes contained within the scanner, by name.</td>
</tr>
</tbody>
</table>

ShazzamScanner - domainName
The Windows domain name, if one was resolved by the scanner.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domainName</td>
<td>String</td>
<td>The Windows domain name, if one was resolved by the scanner.</td>
</tr>
</tbody>
</table>

ShazzamScanner - hostName
The IP hostname, if one was resolved by the scanner.
<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>hostName</td>
<td>String</td>
<td>The IP hostname, if one was resolved by the scanner.</td>
</tr>
<tr>
<td>ShazzamScanner - name</td>
<td>name</td>
<td>String</td>
<td>The scanner name.</td>
</tr>
<tr>
<td>Field</td>
<td>name</td>
<td>String</td>
<td>The scanner name.</td>
</tr>
<tr>
<td>ShazzamScanner - port</td>
<td>port</td>
<td>String</td>
<td>The port being scanned.</td>
</tr>
<tr>
<td>Field</td>
<td>port</td>
<td>String</td>
<td>The port being scanned.</td>
</tr>
<tr>
<td>ShazzamScanner - portProbe</td>
<td>portProbe</td>
<td>String</td>
<td>The port probe name.</td>
</tr>
<tr>
<td>Field</td>
<td>portProbe</td>
<td>String</td>
<td>The port probe name.</td>
</tr>
<tr>
<td>ShazzamScanner - protocol</td>
<td>protocol</td>
<td></td>
<td>The scanner protocol.</td>
</tr>
<tr>
<td>Field</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>--------</td>
<td>-------</td>
<td>------------------------------</td>
</tr>
<tr>
<td></td>
<td>protocol</td>
<td>String</td>
<td>The scanner protocol.</td>
</tr>
</tbody>
</table>

**ShazzamScanner - result**

The scanner result.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>result</td>
<td>String</td>
<td>The scanner result.</td>
</tr>
</tbody>
</table>

**ShazzamScanner - service**

The scanner service name.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>service</td>
<td>String</td>
<td>The scanner service name.</td>
</tr>
</tbody>
</table>

**SimilaritySolution - Global**

Scriptable object used in Predictive Intelligence stores.

The `SimilaritySolution` API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

The solution setup-to-training flow is as follows:

1. **Build an encoder using the** `Encoder` **API.**
2. **Use the** `constructor` **to create a similarity solution object.**
3. **Add the solution object to the similarity solution store using the**
   `SimilaritySolutionStore - add()` **method.**
4. **Train the solution using the** `submitTrainingJob()` **method.** This creates a version of the object that you can manage using the `SimilaritySolutionVersion` API.
5. **Get predictions using the** `SimilaritySolutionVersion - predict()` **method.**

**Note:** This API runs with full privileges. To restrict user access, include an access control mechanism in the script.
For usage guidelines, refer to Using ML APIs.

**SimilaritySolution - SimilaritySolution(Object config)**

Creates a similarity solution.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Object</td>
<td>JavaScript object containing configuration properties of the solution.</td>
</tr>
<tr>
<td>config.domainName</td>
<td>String</td>
<td>Optional. Domain name associated with this dataset. See Domain separation and Predictive Intelligence. Default: Current domain, for example, &quot;global&quot;.</td>
</tr>
<tr>
<td>config.encoder</td>
<td>Object</td>
<td>Trained encoder object to assign to this solution. See Encoder - Encoder(Object config).</td>
</tr>
<tr>
<td>config.label</td>
<td>String</td>
<td>Identifies the prediction task.</td>
</tr>
<tr>
<td>config.lookupDataset</td>
<td>Object</td>
<td>Name of the DatasetDefinition to use as the lookup set.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>config.minRowCount</td>
<td>String</td>
<td>Optional. Minimum number of records required in the dataset for training.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: 10000</td>
</tr>
<tr>
<td>config.processingLanguage</td>
<td>String</td>
<td>Optional. Processing language in two-letter ISO 639-1 language code format.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: &quot;en&quot;</td>
</tr>
<tr>
<td>config.stopwords</td>
<td>Array</td>
<td>Optional. Preset list of strings that the system automatically generates based on the language property setting. For details, see Create a custom stopwords list. Default: English Stopwords</td>
</tr>
<tr>
<td>config.testDataset</td>
<td>Object</td>
<td>Name of the DatasetDefinition to scan for similarities with lookupDataset results.</td>
</tr>
<tr>
<td>config.trainingFrequency</td>
<td>String</td>
<td>Optional. The frequency to retrain the model. Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_30_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_60_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_90_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_120_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• every_180_days</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• run_once</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: run_once</td>
</tr>
</tbody>
</table>
| config.updateFrequency   |         | The frequency at which the model for the solution definition must be rebuilt.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• do_not_update</td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td>Default: do_not_update</td>
</tr>
</tbody>
</table>

The following example shows how to create an object and add it to the SimilaritySolution store.

```javascript
var incidentData = new sn_ml.DatasetDefinition({
    'tableName': 'incident',
    'fieldNames': ['category', 'short_description']
});

var kbData = new sn_ml.DatasetDefinition({
    'tableName': 'kb_knowledge',
    'fieldNames': ['short_description'],
    'encodedQuery': 'active=true'
});

var encoder = sn_ml.EncoderStore.get('GloVe');

var mySolution = new sn_ml.SimilaritySolution({
    'label': "similarity solution",
    'lookupDataset': kbData,
    'testDataset': incidentData,
    'encoder': encoder
});

// add solution
var solutionName = sn_ml.SimilaritySolutionStore.add(mySolution);
```

**SimilaritySolution - cancelTrainingJob()**

Cancels a job for a solution object that has been submitted for training.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to cancel an existing training job.

```javascript
var mySolution = sn_ml.SimilaritySolutionStore.get('ml_sn_global_global_similarity');
mySolution.cancelTrainingJob();
```

**SimilaritySolution - getActiveVersion()**

Gets the active `SimilaritySolutionVersion` object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Active <code>SimilaritySolutionVersion</code> object.</td>
</tr>
</tbody>
</table>

The following example shows how to get an active `SimilaritySolution` version from the store and return its training status.

```javascript
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_similarity');
gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getStatus()), null, 2));
```

Output:

```json
{
  "state": "solution_complete",
  "percentComplete": "100",
}
SimilaritySolution - getAllVersions()

Gets all versions of a SimilaritySolution object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Existing versions of a solution object. See also SimilaritySolutionVersion API.</td>
</tr>
</tbody>
</table>

The following example shows how to get all SimilaritySolution version objects and call the getVersionNumber() and getStatus() solution version methods on them.

```javascript
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_Similarity');
var mlSolutionVersions = mlSolution.getAllVersions();
for (i = 0; i < mlSolutionVersions.length; i++) {
    gs.print("Version "+ mlSolutionVersions[i].getVersionNumber() + " Status: " +
               mlSolutionVersions[i].getStatus() +"\n");
}
```

Output:

Version 3 Status:
  ("state":"solution_complete","percentComplete":"100","hasJobEnded":"true")

Version 2 Status:
  ("state":"solution_complete","percentComplete":"100","hasJobEnded":"true")

Version 1 Status: ("state":"solution_cancelled","percentComplete":"0","hasJobEnded":"true")

SimilaritySolution - getLatestVersion()

Gets the latest version of a solution.
The following example shows how to get the latest version of a solution and return its training status.

```javascript
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_Similarity');

gs.print(JSON.stringify(JSON.parse(mlSolution.getLatestVersion().getStatus()), null, 2));
```

Output:

```
{
    "state": "solution_complete",
    "percentComplete": "100",
    "hasJobEnded": "true"
}
```

**SimilaritySolution - getName()**

Gets the name of the object to use for interaction with the store.

The following example shows how to update `SimilaritySolution` dataset information and print the name of the object.
// Update solution
var myIncidentData = new sn_ml.DatasetDefinition({
  'tableName': 'incident',
  'fieldNames': ['category', 'short_description', 'priority'],
  'encodedQuery': 'activeANYTHING'
});

var eligibleFields = JSON.parse(myIncidentData.getEligibleFields('Similarity'));

var mySimilarity = new sn_ml.SimilaritySolution({
  'label': "my Similarity solution",
  'dataset': myIncidentData,
  'inputFieldNames': eligibleFields['eligibleInputFieldNames'],
  'predictedFieldName': 'category'
});

// update solution
sn_ml.SimilaritySolutionStore.update('ml_x_snc_global_global_my_solution_definition_4', mySimilarity);

// print solution name
gs.print('Solution Name: '+mySimilarity.getName());

Output:

Solution Name: ml_x_snc_global_global_my_solution_definition_4

SimilaritySolution - getProperties()

Gets solution object properties.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Contents of the Dataset and SimilaritySolution object details in SimilaritySolutionStore.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>}</td>
<td></td>
</tr>
</tbody>
</table>

**<Object>.domainName**

Domain name associated with this dataset. See [Domain separation and Predictive Intelligence](#).

Data type: String.

**<Object>.encoder**

Encoder object assigned to this solution. See [Encoder](#).

Data type: Object.

**<Object>.label**

Identifies the prediction task.
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

<td>Encoded query string in standard Glide format. See Encoded query strings.</td>
</tr>
<tr>
<td></td>
<td>Data type: String.</td>
</tr>
<tr>
<td>&lt;Object&gt;.trainingFrequency</td>
<td>The frequency to retrain the model. Possible values: every_30_days, every_60_days, every_90_days, every_120_days, every_180_days, run_once</td>
</tr>
<tr>
<td></td>
<td>Default: run_once.</td>
</tr>
<tr>
<td></td>
<td>Data type: String.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| `<Object>.updateFrequency` | The frequency at which the model for the solution definition must be rebuilt. Possible values:  
  - `do_not_update`
  - `every_1_day`
  - `every_1_hour`
  - `every_6_hours`
  - `every_12_hours`
  - `every_1_minute`
  - `every_15_minutes`
  - `every_30_minutes`

Default: `do_not_update`  
Datatype: String |

The following example gets properties of a solution object in the store.

```javascript
var mySolution =  
sn_ml.SimilaritySolutionStore.get('ml_sn_global_global_similarity_solution');

gs.print(JSON.stringify(JSON.parse(mySolution.getProperties()), null, 2));
```

Output:

```json
*** Script: {
  "domainName": "global",
  "encoderProperties": {
    "datasetsProperties": [],
    "name": "wordCorpusA"
  },
  "label": "similarity",
  "lookupDatasetProperties": {
    "tableName": "incident",
    "fieldNames": [  
```
SimilaritySolution - getVersion(String version)

Gets a solution by provided version number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Existing version number of a solution.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Specified version of the SimilaritySolution() object on which you can call</td>
</tr>
<tr>
<td></td>
<td>SimilaritySolutionVersion API methods.</td>
</tr>
</tbody>
</table>

The following example shows how to get the training status of a solution by version number.

```javascript
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_x_snc_global_global_similarity');

gs.print(JSON.stringify(JSON.parse(mlSolution.getVersion('1').getStatus()), null, 2));
```

Output:
SimilaritySolution - setActiveVersion(String version)
Activates a specified version of a solution in the store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>String</td>
<td>Name of the SimilaritySolution() object version to activate. Activating this version deactivates any other version.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to activate a solution version in the store.

```
sn_ml.SimilaritySolution.setActiveVersion("ml_incident_categorization");
```

SimilaritySolution - submitTrainingJob()
Submits a training job.

ℹ️ Note: Before running this method, you must first add a solution to the store using the SimilaritySolutionStore - add() method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>SimilaritySolutionVersion object corresponding to the SimilaritySolution being trained.</td>
</tr>
</tbody>
</table>

The following example shows how to create a dataset, apply it to a solution, add the solution to a store, and submit the training job.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
    'tableName': 'incident',
    'fieldNames': ['assignment_group', 'short_description', 'description'],
    'encodedQuery': 'activeANYTHING'
});

// Create a solution
var mySolution = new sn_ml.SimilaritySolution({
    'label': "my solution definition",
    'dataset': myData,
    'predictedFieldName': 'assignment_group',
    'inputFieldNames': ['short_description']
});

// Add the solution to the store to later be able to retrieve it.
var my_unique_name = sn_ml.SimilaritySolutionStore.add(mySolution);

// Train the solution - this is a long running job
var mySimilarityVersion = mySolution.submitTrainingJob();
```

**SimilaritySolutionStore - Global**

Enables storing and retrieving solutions.

The `SimilaritySolutionStore` API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the `sn_ml` namespace.

**SimilaritySolutionStore - add(Object mlSolution)**

Adds a new solution object to the store and returns a unique name.
Note: Label values do not need to be unique. For example, if you run this method with the same label 10 times, this method adds 10 different uniquely-named objects to the store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mlSolution</td>
<td>SimilaritySolution</td>
<td>object to add to the store.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>System-generated solution name.</td>
</tr>
</tbody>
</table>

The following example shows how to add a solution to the store. Use to run the training job after adding it to the store.

```javascript
// Create a dataset
var myData = new sn_ml.DatasetDefinition({
  'tableName': 'incident',
  'fieldNames': ['assignment_group', 'short_description', 'description'],
  'encodedQuery': 'activeANYTHING'
});

// Create a solution
var mySolution = new sn_ml.SimilaritySolution({
  'label': "my solution definition",
  'dataset': myData,
  'predictedFieldName': 'assignment_group',
  'inputFieldNames': ['short_description']
});

// Add the solution to the store to later be able to retrieve it.
var my_unique_name = sn_ml.SimilaritySolutionStore.add(mySolution);
```

**SimilaritySolutionStore - deleteObject(String name)**

Removes a specified solution object from the store.
The following example shows how to delete a solution from the store.

```
sn_ml.SimilaritySolutionStore.deleteObject("ml_sn_global_global_solution");
```

**SimilaritySolutionStore - get(String name)**

Gets a solution object from the store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of a solution in the store.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>SimilaritySolution object. Returns an error if the object does not exist.</td>
</tr>
</tbody>
</table>

The following example shows how to get a solution object from the store using the `get()` method and view its training status using the `SimilaritySolution - getActiveVersion()` and `SimilaritySolutionVersion - getStatus()` methods.

```
// Get status
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getStatus(), null, 2)));
```

Output:

```
{
  "state":"solution_complete",
```
SimiliarSolutionStore - getAllNames(Object options)

Gets the names of all solution definition records in the store.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>Options for restricting results within the specified properties.</td>
</tr>
<tr>
<td>options.label</td>
<td>String</td>
<td>Optional. Label of your solution object.</td>
</tr>
<tr>
<td>options.domainName</td>
<td>String</td>
<td>Optional. Name of the domain for your solution object. Refer to Domain separation and Predictive Intelligence.</td>
</tr>
<tr>
<td>options.scope</td>
<td>String</td>
<td>Optional. Name of an application scope for your solution object.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>List of strings representing solution object names in the store.</td>
</tr>
</tbody>
</table>

In the following example, the `getAllNames()` method returns a list of all names in the store.

```javascript
gs.print(JSON.stringify(JSON.parse(sn_ml.SimilaritySolutionStore.getAllNames()), null, 2));
```

**Output:**

```
[
  "ml_x_snc_global_global_my_solution_definition_3",
  "ml_incident_assignment",
  "ml_x_snc_global_global_my_solution_definition",
]```
In the following example, the `getAllNames()` method returns only names associated with values set in the `options` parameter.

```javascript
var options = {
    'label' : 'my solution definition',
    'domainName' : 'global',
    'scope' : 'global'
};
var solNames = sn_ml.SimilaritySolutionStore.getAllNames(options);
gs.print(JSON.stringify(JSON.parse(solNames), null, 2));
```

**Output:**

```
[ "ml_x_snc_global_global_my_solution_definition"
]
```

---

**SimilaritySolutionStore - update(String name, Object mlSolution)**

Replaces an existing object in the store with the object passed as a parameter. The object name provided must be empty or match.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the solution to update.</td>
</tr>
<tr>
<td>mlSolution</td>
<td>SimilaritySolution()</td>
<td>object properties to update.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to update a solution object in the store.

```javascript
var solutionUpdate = new sn_ml.SimilaritySolution({
    'label': 'my solution definition',
    'dataset' : myData,
    'predictedFieldName' : 'assignment_group',
});
```
**SimilaritySolutionVersion - Global**

Scriptable object used in Predictive Intelligence stores.

The **SimilaritySolutionVersion** API requires the Predictive Intelligence plugin (com.glide.platform_ml) and is provided within the **sn_ml** namespace.

This API is used for working with solution versions based on **SimilaritySolution** API objects in the **SimilaritySolution store**.

The system creates a solution version each time you train a solution definition. Most versions are created during scheduled solution training.

Methods in this API are accessible using the following **SimilaritySolution** methods:

- **getActiveVersion()**
- **getAllVersions()**
- **getLatestVersion()**
- **getVersion()**

**SimilaritySolutionVersion - getProperties()**

Gets solution object properties and version number.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Object</td>
</tr>
</tbody>
</table>

```javascript
sn_ml.SimilaritySolutionStore.update('ml_sn_global_global_incident_service', solutionUpdate);
```
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
|      | "isActive": "String",
|      | "label": "String",
|      | "lookupDatasetProperties": {Object},
|      | "name": "String",
|      | "predictedFieldName": "String",
|      | "processingLanguage": "String",
|      | "scope": "String",
|      | "stopwords": [Array],

|      | "updateFrequency": "String",
|      | "versionNumber": "String"

 responseObject.domainName

- Domain name associated with this dataset. See [Domain separation and Predictive Intelligence](#).
- Data type: String.

responseObject.encoder

- Encoder object assigned to this solution. See [Encoder - Encoder(Object config)](#).
- Data type: Object.

responseObject.isActive

- Flag that indicates whether this version is active. Valid values:
  - true: Version is active.
  - false: Version is not active.
- Data type: String

responseObject.label

- Identifies the prediction task.

```json
{
  "label": "my first prediction"
}
```

- Data type: String.

responseObject.lookupDatasetProperties

- Details of the [DatasetDefinition()](#) object used as the lookup set.

```json
{
  "encodedQuery": "String",
```
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>

|      | "fieldDetails": [Array],  
|      | "fieldNames": [Array],  
|      | "tableName": "String"
|      | }  

Data type: Object.

<Object>.lookupDatasetProperties.tableName  
Name of the table for the dataset. For example,  
"tableName" : "Incident".
Data type: String.

<Object>.lookupDatasetProperties.fieldNames  
List of field names from the specified table as strings.  
For example, "fieldNames" : ["short_description",  
"priority"].
Data type: Array.

<Object>.lookupDatasetProperties.fieldDetails  
List of field properties.

[  
|  
|  "name": "String",  
|  "type": "String"  
|}

Data type: Array.

<Object>.lookupDatasetProperties.fieldDetails.<object>.name  
Name of the field defining the type of information to  
restrict this dataset to.
Data type: String.

<Object>.lookupDatasetProperties.fieldDetails.<object>.type  
Machine-learning field type.
Data type: String.

<Object>.lookupDatasetProperties.encodedQuery  
Encoded query string in standard Glide format. See  
Encoded query strings.
Data type: String.

<Object>.name  
System-assigned name.
Data type: String.

<Object>.predictedFieldName  
Identifies a field to be trained for predictability.

<Object>.versionNumber

Version number of the SimilaritySolution object. Data type: String.

The following example gets properties of the active object version in the store.

```javascript
// Get properties
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_incident_categorization');

gs.print(JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getProperties()), null, 2));
```

Output:

```json
*** Script: {
    "domainName": "global",
    "encoderProperties": {
        "datasetsProperties": [],
        "name": "wordCorpusA"
    },
    "isActive": "true",
    "label": "similarity",
    "lookupDatasetProperties": {
        "encodedQuery": "",
        "fieldNames": [
            "short_description"
        ],
        "tableName": "incident"
    },
    "name": "ml_x_snc_global_global_similarity",
    "processingLanguage": "en",
    "stopwords": [
        "Default English Stopwords"
    ],
```
SimilaritySolutionVersion - getStatus(Boolean includeDetails)

Gets training completion status.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>includeDetails</td>
<td>Boolean</td>
<td>Flag that indicates whether to return status details. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: Return additional details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: Do not return additional details.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: False</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>JavaScript object containing training status information for a SimilaritySolution object.</td>
</tr>
<tr>
<td>&lt;Object&gt;.state</td>
<td>Training completion state. If the training job reaches a terminal state, the job does not leave that state. If the state is terminal, the hasJobEnded property is set to true. Possible values:</td>
</tr>
</tbody>
</table>
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• fetching_files_for_training</td>
</tr>
<tr>
<td></td>
<td>• preparing_data</td>
</tr>
<tr>
<td></td>
<td>• retry</td>
</tr>
<tr>
<td></td>
<td>• solution_cancelled (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solution_complete (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solution_error (terminal)</td>
</tr>
<tr>
<td></td>
<td>• solutionIncomplete</td>
</tr>
<tr>
<td></td>
<td>• training_request_received</td>
</tr>
<tr>
<td></td>
<td>• training_request_timed_out (terminal)</td>
</tr>
<tr>
<td></td>
<td>• training_solution</td>
</tr>
<tr>
<td></td>
<td>• uploading_solution</td>
</tr>
<tr>
<td></td>
<td>• waiting_for_training</td>
</tr>
</tbody>
</table>

Data type: String

```
<Object>.hasJobEnded
```

Field that indicates whether training is complete.

Valid values:
- true: Training is complete.
- false: Training is incomplete.

Data type: Boolean value as a String

```
<Object>.percentComplete
```

Number between zero and 100 representing training percent complete. If the completion percentage is less than 100, the job might be in a terminal state. For example, if training times out.

Data type: Number as a String

```
<Object>.details
```

Object containing a list of additional training details.

Data type: Object

The following example shows a successful result with training complete.

```javascript
// Get status
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_incident_categorization');
```
Output:

```javascript
{
  "state": "solution_complete",
  "percentComplete": "100",
  "hasJobEnded": "true",
  "details": {"stepLabel": "Solution Complete"} // This information is only returned if getActiveVersion().getStatus(true);
}
```

The following example shows an unsuccessful result with training complete.

```javascript
// Get status
var solutionName = 'ml_x_snc_global_global_similarity_solution';
var mlSolution = sn_ml.SimilaritySolutionStore.get(solutionName);
var trainingStatus = JSON.parse(mlSolution.getLatestVersion().getStatus());

gs.print(JSON.stringify(trainingStatus, null, 2));
```

Output:

```javascript
{
  "state": "solution_error",
  "percentComplete": "100",
  "hasJobEnded": "true"
}
```

**SimilaritySolutionVersion - getVersionNumber()**

Gets the version number of a solution object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Version number.</td>
</tr>
</tbody>
</table>
The following example shows how to get a version number.

```javascript
// Get version number
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_incident_categorization');

gs.print("Version number:
  "+JSON.stringify(JSON.parse(mlSolution.getActiveVersion().getVersionNumber()), null, 2));
```

Output:

Version number: 1

**SimilaritySolutionVersion** - predict(Object input, Object options)

Gets the input data for a prediction.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Object</td>
<td>GlideRecord or array of JSON objects containing field names and values as key-value pairs.</td>
</tr>
<tr>
<td>options</td>
<td>Object</td>
<td>Optional values for filtering prediction results.</td>
</tr>
<tr>
<td>options.apply_threshold</td>
<td>Boolean</td>
<td>Flag that indicates whether to check the threshold value for the solution and apply it to the result set. Valid values:</td>
</tr>
<tr>
<td>options.top_n</td>
<td>Number</td>
<td>If provided, returns the top results, up to the specified number of predictions.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Object</td>
<td>JSON object containing the prediction results sorted by sys_id or record_number.</td>
<td><code>{&lt;identifier&gt;: [Array]}</code></td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;identifier&gt;</td>
<td>List of objects with details for each prediction result.</td>
<td>&lt;identifier&gt;: [</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;identifier&gt;.&lt;object&gt;.confidence</td>
<td>Value of the confidence associated with the prediction. For example, 53.84.</td>
<td>Data type: Number</td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;identifier&gt;.&lt;object&gt;.predictedSysId</td>
<td>The sys_id of the predicted value. Results can be from any table on which information is being predicted.</td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;identifier&gt;.&lt;object&gt;.predictedValue</td>
<td>Value representing the prediction result.</td>
<td>Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.&lt;identifier&gt;.&lt;object&gt;.threshold</td>
<td>Value of the configured threshold associated with the prediction.</td>
<td>Data type: Number</td>
</tr>
</tbody>
</table>

The following example shows how to display prediction results for a `predict()` method that takes a GlideRecord by sys_id for input and includes optional parameters to restrict to top three results and exclude the threshold value.

```javascript
var mlSolution = sn_ml.SimilaritySolutionStore.get('ml_incident_categorization');

// single GlideRecord input
```
var input = new GlideRecord("incident");
input.get("<sys_id>");

// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;

var results = mlSolution.getVersion(1).predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));

{  
    "<sys_id/now_GR>": [
        {
            "confidence": 62.10782320780268,
            "threshold": 20.36,
            "predictedValue": "Clone Issues",
            "predictedSysId": ""
        },
        {
            "confidence": 6.945237375770391,
            "threshold": 16.63,
            "predictedValue": "Instance Administration",
            "predictedSysId": ""
        },
        {
            "confidence": 5.321061076300759,
            "threshold": 23.7,
            "predictedValue": "Administration",
            "predictedSysId": ""
        }
    ]
}

The following example shows how to display prediction results for a predict() method that takes an array of field names as key-value pairs for input and includes optional parameters to restrict to top three results and exclude the threshold value.

var mlSolution = sn_ml.SimilaritySolutionStore.get("ml_incident_categorization");
// key-value pairs input
var input = [{"short_description":"my email is not working"}, {short_description:"need help with password"}];
// configure optional parameters
var options = {};
options.top_n = 3;
options.apply_threshold = false;
var results = mlSolution.predict(input, options);
// pretty print JSON results
gs.print(JSON.stringify(JSON.parse(results), null, 2));

{
  "1": [
    {
      "confidence": 37.5023032262591,
      "threshold": 10.72,
      "predictedValue": "Authentication",
      "predictedSysId": ""
    },
  ],
  "2": [
    {
      "confidence": 99,
      "threshold": 17.77,
      "predictedValue": "Email",
      "predictedSysId": ""
    },
    {
      "confidence": 2.8773826570713514,
      "threshold": 10.72,
      "predictedValue": "Authentication",
      "predictedSysId": ""
    },
    {
      "confidence": 2.8773826570713514,
      "threshold": 10.72,
      "predictedValue": "Authentication",
      "predictedSysId": ""
    }
  ]
}
SkillDeterminationUtils - Scoped

Provides utility methods to get or set work item skill data.

The SkillDeterminationUtils API requires the Skill Determination (com.snc.skill_determination) plugin and is provided within the sn_skill_rule namespace.

SkillDeterminationUtils - assignSkillsToWorkItem(Array skills, GlideRecord now_GR)

Assigns an array of active skill objects to a work item.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>skills</td>
<td>Array</td>
<td>Array of active skill objects to be assigned.</td>
</tr>
<tr>
<td>skill.skillName</td>
<td>String</td>
<td>Name of the skill.</td>
</tr>
<tr>
<td>skill.skillSysId</td>
<td>String</td>
<td>Sys ID of the skill.</td>
</tr>
<tr>
<td>skill.mandatory</td>
<td>Boolean</td>
<td>True if the skill is mandatory, false otherwise.</td>
</tr>
<tr>
<td>skill.skillLevelName</td>
<td>String</td>
<td>Optional skill level name.</td>
</tr>
<tr>
<td>skill.skillLevelSysId</td>
<td>String</td>
<td>Optional skill level Sys ID.</td>
</tr>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord of the work item on which to assign skills.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
The examples below create an Interaction record using the table name (interaction) and show how to assign skills to the interaction work item, creating a record in the Interaction Skills [interaction_m2m_skill] table.

Use case 1: Use returned results from determineWorkItemSkills() to assign skills to a work item from the Interaction table.

```javascript
// Create an interaction record
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

// Get interaction skills interaction
// and specify if any are mandatory
var result = util.determineWorkItemSkills(now_GR);

// Assign skills determined by result and
// assign them to the interaction work item
util.assignSkillsToWorkItem(result, now_GR);
```

Use case 2: Manually insert skills array. In this case, assign IT skills to the Interaction work item.

```javascript
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

var skills = [
    {"skillSysId":"2eb1c2029f100200a3bc1471367fcfe4", "skillName":"IT",
    "mandatory":true, "skillLevelName":"", "skillLevelSysId":null}
];

util.assignSkillsToWorkItem(skills, now_GR);
```

**SkillDeterminationUtils - determineWorkItemSkills(GlideRecord now_GR)**

Gets skills for a specified work item, indicates if the skills are mandatory, and lists any skill levels.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>GlideRecord of a work item from any interaction or task table extension.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>One or more skill objects.</td>
</tr>
<tr>
<td>• <code>skillSysId</code>: String. Sys ID of the skill from the Skills [cmn_skill] table.</td>
<td></td>
</tr>
<tr>
<td>• <code>skillName</code>: String. Name of the skill.</td>
<td></td>
</tr>
<tr>
<td>• <code>mandatory</code>: Boolean. True if mandatory, false otherwise.</td>
<td></td>
</tr>
<tr>
<td>• <code>skillLevelName</code>: If skill exists, name of the skill level.</td>
<td></td>
</tr>
<tr>
<td>• <code>skillLevelSysId</code>: If skill exists, Sys ID of the skill level from the Skill Levels [cmn_skill_level] table.</td>
<td></td>
</tr>
</tbody>
</table>

The following script creates an interaction record, gets skills for the interaction work item, and indicates if the skills are mandatory.

```
// Create an interaction record
var now_GR = new GlideRecord('interaction');
now_GR.insert();

var util = new sn_skill_rule.SkillDeterminationUtils();

var result = util.determineWorkItemSkills(now_GR);
gs.info(JSON.stringify(result));
```

Output:

```
[{
"skillSysId":"6c0f025c7f672300a8b1bdc8adfa917f",
"skillName":"Premier Support Certified",
"mandatory":false,"skillLevelName":"
"skillLevelSysId":null}
```

**SkillDeterminationUtils - SkillDeterminationUtils()**

Constructor to create an instance of SkillDeterminationUtils.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```
var util = new sn_skill_rule.SkillDeterminationUtils();
```
SLARepair - Global

The SLARepair API first deletes the existing SLAs and then recreates them from each task’s history.

SLARepair - repairByFilter(String filter, String sourceTable)

Repair the task SLAs associated with the passed-in filter and source table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter</td>
<td>string</td>
<td>Specify an encoded query that is used to retrieve a set of records from the source table.</td>
</tr>
<tr>
<td>sourceTable</td>
<td>string</td>
<td>Specify the name of a table that is (or extends) contract_sla, task_sla, or task.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Repair SLAs for problems created last month with a priority of 2.

```javascript
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfLastMonth()";)
now_GR.addQuery("priority", "2");
now_GR.query();

var repair = new SLARepair();
while (now_GR.next())
  repair.repairByFilter(now_GR.getEncodedQuery(), now_GR.getRecordClassName());
```

SLARepair - repairByGlideRecord(GlideRecord now_GR)

Repair the task SLAs associated with the passed in GlideRecord.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>now_GR</td>
<td>GlideRecord</td>
<td>Specify a GlideRecord for a table that is (or extends) contract_sla, task_sla, or task.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Repair SLAs for problems created last month with a priority of 2.

```javascript
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfLastMonth()";)
now_GR.addQuery("priority", "2");
now_GR.query();

var repair = new SLARepair();
while (now_GR.next())
   repair.repairByGlideRecord(now_GR);
```

**SLARepair - repairBySysId(String sysId, String sourceTable)**

Repair the task SLAs associated with the passed in sys_id and source table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysId</td>
<td>string</td>
<td>Specify the ID of a table that is (or extends) contract_sla, task_sla, or task.</td>
</tr>
<tr>
<td>sourceTable</td>
<td>string</td>
<td>Specify the name of a table that is (or extends) contract_sla, task_sla, or task.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
Find problems created last month with a priority of 2

```javascript
var now_GR = new GlideRecord("problem");
now_GR.addQuery("sys_created_on", "ON", "Last Month@javascript:gs.beginningOfLastMonth()@javascript:gs.endOfLastMonth()" paranoia="true");
now_GR.addQuery("priority", "2");
now_GR.query();
```

```javascript
var repair = new SLARepair();
while (now_GR.next())
  repair.repairBySysId(now_GR.sys_id + ",", now_GR.getRecordClassName());
```

**SLARepair - setAuditEnabled(Boolean onOrOff)**

Enables or disables auditing when running a repair.

By default, auditing is set to the value in the property `com.snc.sla.repair.audit`. You can override this with passing in true to enable or false to disable auditing.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onOrOff</td>
<td>Boolean</td>
<td>Determines whether to enable or disable auditing.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this</td>
<td>A self-reference to allow for method chaining.</td>
</tr>
</tbody>
</table>

```javascript
var builder = new SLARepair();
builder.setAuditEnabled(true);
```

**SLARepair - setRunWorkflow(Boolean onOrOff)**

Enables or disables running a workflow for each of the Task SLA records being repaired.

By default, when a Task SLA is repaired the workflow will be run during the repair process. To override this, you can pass in false to disable running of the workflow or true to enable it.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onOrOff</td>
<td>Boolean</td>
<td>Determines whether to enable or disable workflow.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this</td>
<td>A self-reference to allow for method chaining.</td>
</tr>
</tbody>
</table>

```javascript
var repair = new SLARepair();
repair.setRunWorkflow(false);
```

### SLARepair - setValidateOnly(Boolean onOrOff)

Validates the repair request.

If false is passed in, the task SLAs will be repaired. If true is passed in, calls to repair will not alter any task SLAs but only validate the supplied parameters and generate a count of records to be repaired.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onOrOff</td>
<td>Boolean</td>
<td>Determines whether to enable or disable validation.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this</td>
<td>A self-reference to allow for method chaining.</td>
</tr>
</tbody>
</table>

```javascript
var repair = new SLARepair();
repair.setValidateOnly(true);
```

### SLPServiceRegistryQuery - Global

Maps Shazzam! SLP query results to port probes.

Use this API during the discovery scanning phase.
SLPServiceRegistryQuery - getShazzamQuerierClassname()

Returns the Shazzam querier class name.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The class name</td>
</tr>
</tbody>
</table>

SLPServiceRegistryQuery - toPortProbeMap()

Creates a scalar map for port probes to use in XML output to Shazzam!.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>

<tbody>
<tr>
<td>Object</td>
<td>The scalar map</td>
</tr>
</tbody>
</table>

SMSPreferenceHandler - Scoped, Global

The SMSPreferenceHandler API provides methods to manage SMS configurations. This API is implemented as the script include SMSPreferenceHandlerSNC and resides in the `sn_sms_pref` namespace. To use this API you must install the Notify plugin (com.snc.notify) which requires a separate subscription. You can activate this plugin if you have the admin role.

SMSPreferenceHandler - getConfig()

Returns the preferences configuration record for the current telephony service provider.
The method queries all preference configuration records from the SMS Preference Configuration [sn_sms_pref_configuration] table for the current telephony service provider, sorts the results by the Order field (lowest to highest), and then returns the first record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>Preference configuration record for the current telephony service provider. If no record exists, then null.</td>
</tr>
</tbody>
</table>

**Example**

```javascript
var handler = new sn_sms_pref.SMSPreferenceHandler('TwilioDirect'); // Pass the provider name
var config = handler.getConfig();
```

**SMSPreferenceHandler - SMSPreferenceHandler(String provider)**

Instantiates the SMSPreferenceHandler script include object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>provider</td>
<td>String</td>
<td>Name of the telephony service provider.</td>
</tr>
</tbody>
</table>

```javascript
var handler = new sn_sms_pref.SMSPreferenceHandler('TwilioDirect'); // Pass the provider name
var config = handler.getConfig();
```

**SNAnalytics - Client**

The SNAnalytics API provides methods to push custom analytics data (events, pages, and user properties) to the User Experience Analytics for Service Portal dashboard.
User Experience Analytics for Service Portal provides dashboard views for monitoring the key performance indicators (KPIs) of web applications built on Service Portal. You can use these insights to optimize your portal. For example, User Experience Analytics tracks when a user orders a catalog item or views a knowledge article. You can use this data to infer which items or articles are the most popular among users.

To access this API, the Service Portal Analytics (com.glide.service-portal.analytics) plugin must be activated on the instance. In addition, within your application, you must import the snAnalytics Angular service, such as:

```html
<client_script><![CDATA[function($rootScope, $scope, $window, $timeout, spUtil, $sce, spModal, $uibModal, $location, cabrillo, snAnalytics)
</client_script>]

For additional information, see User Experience Analytics for Service Portal.

**SNAnalytics - addEvent(Object payload)**

Stores the specified event information in the analytics data store.

Events are actions performed by a user, such as clicking a button or submitting a form. Call this method within your web-page widget whenever you want to capture a user action. These events then automatically appear on the associated user session timeline and User Experience Analytics dashboard.

The following is an example of a payload passed in an `addEvent()` call:

```javascript
var payload = {}; 
payload.name = "Manage Account";
payload.data = {}; 
payload.data["Function Name"] = c.data.function_name; 
payload.data["User Type"] = c.data.user_type; 
payload.data["Company"] = c.data.company_name; 
snAnalytics.addEvent(payload);
```

The screen capture below shows the information that appears on the analytics dashboard for the event "Manage Account." The timeline at the top represents the number of times that the event occurred. The pie charts below the
timeline reflect the properties that were captured in the `addEvent()` call.

If you want to capture when users access a web page, use the `SNAnalytics-startPage(String name, String description)` method instead of this method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>payload</td>
<td>Object</td>
<td>Event to store in the analytics data store. Data type: Object</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;payload&quot;: {</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;data&quot;: [Array],</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;name&quot;: String</td>
</tr>
<tr>
<td>payload.data</td>
<td>Array</td>
<td>Optional. Name-value pairs of custom event properties. These properties can be any values that you want to track and see on the analytics</td>
</tr>
<tr>
<td></td>
<td></td>
<td>dashboard. They appear under the associated event timeline on the analytics dashboard. The <strong>Page Id</strong> property always appears first on</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the dashboard for all base system events, and all other properties are sorted alphabetically. If no properties are required for an event,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>only an event timeline appears on the analytics dashboard. Properties can be added at a later time. Default value: Null</td>
</tr>
<tr>
<td>payload.name</td>
<td>String</td>
<td>Descriptive name of the event. Special characters are not allowed.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum length:</td>
<td></td>
<td>The length of the event name and value cannot exceed 300 bytes.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to call the addEvent() method during initialization of a widget.

```javascript
function initialize() {
  c.options.glyph = c.options.glyph || 'search';
  c.options.title = c.options.title || c.data.searchMsg;
  c.options.color = c.options.color || "default";
  c.searchTerm = c.data.q;
  c.searchQuery = "";
  c.pageID = $scope.page && $scope.page.id;
  c.showSuggestions = c.data.searchTypeBehavior === "suggestions" &&
                      c.data.isSuggestionsEnabled === "true";
  c.suggestionsLimit = c.options.limit || "";
  c.latitude = null;
  c.longitude = null;
  c.isLocationTrackerDisabled = c.data.isLocationTrackerDisabled === "true";
  c.isTypeAheadEnabled = c.data.isTypeAheadEnabled === "true";

  c.sendAnalytics = function(type){
    var payload = {};
    payload.name = "Initiate Search";
    payload.data = {};
    payload.data["Keyword"] = (type == 'User Entered' ? c.searchTerm : c.searchQuery);
    payload.data["Type"] = type;
    snAnalytics.addEvent(payload);
  }
}
```

**SNAnalytics - appendToUserProperty(String name, String value)**

Appends the specified string to the specified user string property in the analytics data store.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| name   | String or String[][] | Name of the property to append the specified string to. Special characters are not allowed.  

**Note:** The associated property must be a string or string[].

Maximum length: The length of the property name and property value cannot exceed 300 bytes.

| value  | String       | Value to append to the string property.                                    |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to add television to the `tags` property.

```javascript
snAnalytics.setUserProperties({
    level: 7,
    lastPurchase: new Date(),
    lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
    isPremium: true,
    tags: ['chair', 'table'],
});

// Append television to the tags property (now 'tags' will have 'chair', 'table', and 'television')
snAnalytics.appendToUserProperty('tags', 'television');
```

**SNAnalytics - incUserProperty(String name, Number value)**

Increments or decrements the specified user property value with the specified number value in the analytics data store.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the property to increment. Value is case-sensitive.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Number</td>
<td>Amount to increment the property by. If you enter a negative number, the value is decremented.</td>
</tr>
</tbody>
</table>

**Note:** The associated property must be a number.

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to increment the property `Grace days` by 5.

```javascript
snAnalytics.incUserProperty('Grace days', 5)
```

**SNAntics - removeUserProperty(String name)**

Removes the specified property for the current user from the analytics data store.

In addition, the property no longer appears on the analytics dashboard.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the property to remove. Value is case-sensitive.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to remove the `IsAdmin` property.

```javascript
snAnalytics.removeUserProperty('IsAdmin');
```
SNAalytics - setUserProperties(Object properties)

Sets the specified properties with the specified values for the current user in the analytics data store.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.

Parameter Table

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Object</td>
<td>Object that contains the name-value pairs of the user properties to set, such as:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{ level: 7, lastPurchase: new Date(), lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23', isPremium: true, tags: ['chair', 'table'], }</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string[], or null</td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set multiple properties for the current user.

```javascript
snAnalytics.setUserProperties({
    level: 7,
    lastPurchase: new Date(),
    lastPurchaseId: '41563cd2-1666-4855-8c0d-b9ca778aed23',
    isPremium: true,
    tags: ['chair', 'table'],
});
```

**SNAnalytics - setUserProperty(String name, UserProperty value)**

Sets the specified property with the specified value for the current user in the analytics data store.

These properties are saved in the analytics data store and appear on the user session details page as illustrated below. If a property already exists in the analytics data store, the current value is overwritten with the new value.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the property to update. This name appears as the label for the property. For example, in the prior screenshot, Domain, Instance Name, Company, Role, and User Type are all name parameters. Special characters are not allowed. Maximum length: The length of the property name and property value cannot exceed 300 bytes.</td>
</tr>
<tr>
<td>value</td>
<td>UserProperty</td>
<td>Value to set in the specified property. This value can be a string, boolean, number, date, string[], or null.</td>
</tr>
</tbody>
</table>
The following example shows how to set the property `Company`.

```java
snAnalytics.setUserProperty('Company', "ABC Company")
```

### SNAnalytics - startPage(String name, String description)

Saves the name and description of a page in the analytics data store.

This information appears in the user session timeline and on the analytics dashboard. Call this method within your custom widgets to track the pages visited by a user. You can also use this method to track user navigation within an individual page. For more information, see [Use User Experience Analytics](#).

> **Note:** In general, portal pages are automatically tagged with this tracking capability. Use this method for custom scenarios, such as a single page custom widget in a wizard scenario.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Descriptive name of the page or page section. Special characters are not allowed.</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Optional. Description of the page to appear in the timeline and analytics dashboard. Default: name parameter value</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to call the `startPage()` method.

```javascript
snAnalytics.startPage('login_view', 'Login');
```

**SNEventSenderProvider - Global**

The `SNEventSenderProvider` API provides the method to instantiate an `IEventSender` instance.

Use this API when writing scripts that will run on MID Servers to instantiate the object to send an event to your ServiceNow instance.

Use the `IEventSender` API to send the event to the ServiceNow instance. Use the `Event` API to add/update fields within an event.

You must activate the Event Management (com.glideapp.itom.snac) plugin before attempting to access this API. The Event Management plugin requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

For additional information on event management, see Event Management.

**EventSender - getEventSender()**

Returns an `IEventSender` object to use to send events from a MID Server to a ServiceNow instance.

You must call this method before calling any `IEventSender` API methods.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEventSender</td>
<td>IEventSender object to use to send an event to a ServiceNow instance.</td>
</tr>
</tbody>
</table>

```javascript
var eventSender = SNEventSenderProvider.getEventSender();
```

### SNMPGatherDocParts - Global

Handles gathering the parts of an SNMP response document for JavaScript SNMP sensors.

Use with a discovery script when you need to gather the parts of an SNMP response document.

#### SNMPGatherDocParts - gather(String doc, Object probe)

Returns the given XML document with any data gathered by prior SNMP probes.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>String</td>
<td>The XML document for this sensor</td>
</tr>
<tr>
<td>probe</td>
<td>Object</td>
<td>The probe instance</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The XML document with the gathered data.</td>
</tr>
</tbody>
</table>

### SNMPNetworkInterfaces - Global

Creates network interfaces for JavaScript SNMP sensors.

Use with a discovery script when you need to create network interfaces for JavaScript SNMP sensors.
SNMPNetworkInterfaces process(String cmdb_ci, String doc, Boolean isComputer, String agentName, String ecc_sys_id)

Analyzes the SNMP data and reconciles the discovered NICs to the CMDB’s NICs.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_ci</td>
<td>String</td>
<td>The sys_id of the CI</td>
</tr>
<tr>
<td>doc</td>
<td>String</td>
<td>The SNMP data in XML form</td>
</tr>
<tr>
<td>isComputer</td>
<td>Boolean</td>
<td>If true, this is a computer; otherwise, false.</td>
</tr>
<tr>
<td>agentName</td>
<td>String</td>
<td>Name of the MID server</td>
</tr>
<tr>
<td>ecc_sys_id</td>
<td>String</td>
<td>The sys_id of the ECC queue record with the input.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

SNMPResponse - Global

Wraps an SNMP payload response instance with methods to safely and easily retrieve SNMP singleton fields or tables.

Use to retrieve SNMP singleton fields or tables.

SNMPResponse - buildIndex(Object cur, String name, String extName)

Builds an index to all SNMP entities in the current object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cur</td>
<td>Object</td>
<td>The current object</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>The index name</td>
</tr>
<tr>
<td>extName</td>
<td>String</td>
<td>The index extension</td>
</tr>
<tr>
<td>Returns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>void</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**SNMPResponse - buildReferences()**

Builds references to actual instances for all identified indexes (in the discovery_snmp_ref table) that can be resolved.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>void</td>
</tr>
</tbody>
</table>

**SNMPResponse - getAmbiguousOIDs(String refBase, String refLeaf)**

Returns an array of OIDs that match the given ref_base and which have a defined, non-null ref_leaf.

The last character of ref_base may be a question mark; in that case, if the parent node is a table then all table entries are returned.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>refBase</td>
<td>String</td>
<td>The reference base</td>
</tr>
<tr>
<td>refLeaf</td>
<td>String</td>
<td>The reference leaf</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Array</td>
</tr>
</tbody>
</table>
**SNMPResponse - getOIDInt(String name)**

Returns the integer contained in the OID object with the given MIB name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The MIB name</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The integer contained in the OID object, or zero if the object could not be found or is empty.</td>
</tr>
</tbody>
</table>

**SNMPResponse - getOIDObj(String name)**

Retrieves the OID object with the given MIB name from the response.

This method does not work with numeric OID strings, only MIB names.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The MIB name</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OID object</td>
<td>The OID object with the given MIB name, or null if the object could not be found or if any table entries are encountered while walking down the named elements.</td>
</tr>
</tbody>
</table>

**SNMPResponse - getOIDTable(String parentName, String entryName)**

Returns a hashmap of table entries under the given parent MIB name, with the given entry MIB names.
### SNMPResponse - getOIDText(String name)

Returns the text contained in the OID object with the given MIB name.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>The MIB name</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The text contained in the OID object. Returns null if the object could not be found, or if it has no text.</td>
</tr>
</tbody>
</table>

### SNMPResponse - normalize(Object cur)

Resolves SNMP tables into hashmaps and OID values into primitives.

All SNMP numeric types convert to a JavaScript number. An SNMP null type converts to a JavaScript null. An SNMP IP Address value converts to a Java IPAddressV4 instance. All other values convert to a JavaScript string.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cur</td>
<td>Object</td>
<td>The SNMP table or OID value.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

SOAPMessageV2 - Scoped, Global

The SOAPMessageV2 API allows you to send an outbound SOAP message using JavaScript.

Use the SOAPResponseV2 API to manage the response returned by the SOAP provider.

You can use this API in scoped applications, or within the global scope.

See also:
- Direct SOAPMessageV2 example
- Recordless SOAPMessageV2 example
- Asynchronous SOAPMessageV2 example
- SOAPMessageV2 MID server example

SOAPMessageV2 - execute()

Sends the SOAP message to the endpoint.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAPResponseV2 - Scoped, Global</td>
<td>Response returned by the SOAP provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute(); // Might throw exception if http connection timed out or some issue with sending request itself because of encryption/decryption of password.
```
SOAPMessageV2 - executeAsync()

Sends the SOAP message to the ECC queue.

SOAP messages in the ECC queue are processed by the SOAPClient business rule.

By default, this business rule does not run asynchronously. To configure this business rule to run asynchronously, set the When value to Async and add current.update() to the end of the Script. The instance does not wait for a response from the web service provider when sending a message through the ECC queue.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAPResponseV2 - Scoped, Global</td>
<td>Response returned by the SOAP provider.</td>
</tr>
</tbody>
</table>

Note: Attempting to use the SOAP response object before the response has been processed may result in a timeout error.

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.executeAsync();
```

SOAPMessageV2 - getEndpoint()

Gets the endpoint for the SOAP message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>URL of the SOAP web service provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var endpoint = sm.getEndpoint();
```

**SOAPMessageV2 - getRequestBody()**

Returns the content of the SOAP message body.

ℹ️ **Note:** Before calling the `getRequestBody()` method, you must call the `execute()` method to obtain the response object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>SOAP message body.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","StockQuoteSoap.GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var response = sm.execute();
var requestBody = response.getRequestBody();
```

**SOAPMessageV2 - getRequestMethod(String headerName)**

Gets the value for an HTTP header specified by the SOAP client.

By default, this method cannot return the value for a header set automatically by the system. To grant this method access to all headers, set the property `glide.http.log_debug` to true.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>Request header you want to get the value for.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var header = sm.getRequestHeader("Accept");
```

### SOAPMessageV2 - getRequestHeaders()

Gets HTTP headers that were set by the SOAP client and the associated values.

This method does not return headers set automatically by the system. To configure this method to return all headers, set the property glide.http.log_debug to true.

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
var requestHeaders = sm.getRequestHeaders();
```

### SOAPMessageV2 - setBasicAuth(String userName, String userPass)

Sets basic authentication headers for the SOAP message.
Setting basic authentication headers using this method overrides basic authentication values defined in the SOAP message record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userName</td>
<td>String</td>
<td>Username to use when authenticating the SOAP message.</td>
</tr>
<tr>
<td>userPass</td>
<td>String</td>
<td>Password for the specified user.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setBasicAuth("username","password");
```

**SOAPMessageV2 - setEccCorrelator(String correlator)**

Associates outbound requests and the resulting response record in the ECC queue.

This method only applies to SOAP messages sent through a MID Server. The correlator provided populates the **Agent correlator** field on the ECC queue record for the response. Provide a unique correlator for each outbound request to associate the correct results in the ECC queue with the request when designing asynchronous automation through a MID Server.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>correlator</td>
<td>String</td>
<td>Unique identifier</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccCorrelator("unique_id");

SOAPMessageV2 - setEccParameter(String name, String value)

Overrides a value from the database by writing to the SOAP message payload.

This method only applies to SOAP messages sent through a MID Server. Use this method when a value from the SOAP message in the database is invalid, such as when the endpoint URL is longer than the maximum SOAP endpoint field length.

These are valid values for the name parameter.
- **source**: The endpoint URL.
- **name**: The SOAP message function to run.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the ECC parameter.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign to the specified ECC parameter.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setEccParameter("source","http://very.long.endpoint");

SOAPMessageV2 - setEndpoint(String endpoint)

Sets the endpoint for the SOAP message.

By default, the SOAP message uses the endpoint specified in the SOAP message record. Use this method to override the default. You must call this method when using the SOAPMessageV2() constructor with no parameters.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endpoint</td>
<td>String</td>
<td>URL of the SOAP web service provider you want to interface with.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2();
sm.setEndpoint("http://web.service.endpoint");
```

**SOAPMessageV2 - setHttpTimeout(Number timeoutMs)**

Sets the amount of time the SOAP message waits for a response from the web service provider before the request times out.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutMs</td>
<td>Number</td>
<td>Amount of time to wait for a response from the web service provider, in milliseconds.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setHttpTimeout(6000);
```

**SOAPMessageV2 - setLogLevel(String level)**

Sets the log level for this message and the corresponding response.

Setting a log level using the SOAPMessageV2 API overrides the log level configured on the SOAP message record. This log level may
not apply if the endpoint domain is excluded, or if the property `glide.outbound_http_log.override` is true. To view outbound web service logs, navigate to **System Logs > Outbound HTTP Requests**.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>String</td>
<td>The log level. Valid values are basic, elevated, and all.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**SOAPMessageV2 - setMIDServer(String midServerName)**

Configures the SOAP message to be sent through a MID Server.

By default, the SOAP message uses the MID Server specified in the SOAP message function record. Use this method to override the default.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>midServerName</td>
<td>String</td>
<td>Name of the MID Server you want to send the SOAP message through. Your instance must have an active MID Server with the specified name.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**SOAPMessageV2 - setMutualAuth(String profileName)**

Sets the mutual authentication protocol profile for the SOAP message.

Setting a protocol profile using this method overrides the protocol profile selected for the SOAP message record.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profileName</td>
<td>String</td>
<td>Name of the protocol profile to use for mutual authentication.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setMutualAuth("auth_profile_name");
```

### SOAPMessageV2 - setRequestBody(String requestBody)

Sets the body content to send to the web service provider.

When you set the body content using this method, variables in the body are not substituted for parameters from the SOAP message function record. You must explicitly define all values within the SOAP message body.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestBody</td>
<td>String</td>
<td>Body of the SOAP message.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
var body = "<SOAP message body>";
sm.setRequestBody(body);
```
**SOAPMessageV2 - setRequestHeader(String headerName, String headerValue)**

Sets an HTTP header in the SOAP message to the specified value.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerName</td>
<td>String</td>
<td>Name of the header.</td>
</tr>
<tr>
<td>headerValue</td>
<td>String</td>
<td>Value to assign to the specified header.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); // Might throw exception if message doesn't exist or not visible due to scope.
sm.setRequestHeader("Accept","Application/json");
```

**SOAPMessageV2 - setSOAPAction(String soapAction)**

Defines the SOAP action this SOAP message performs.

The WSDL for your web service provider lists SOAP actions you can perform. You must call this method when using the `SOAPMessageV2()` constructor with no parameters.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>soapAction</td>
<td>String</td>
<td>SOAP action this SOAP message performs.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var sm = new sn_ws.SOAPMessageV2();
sm.setSOAPAction("GetQuote");
```
//construct SOAP message by specifying endpoint and auth
sm.execute();

SOAPMessageV2 - setStringParameter(String name, String value)
Sets a variable with the specified name from the SOAP message record to the specified value.

XML reserved characters in the value are converted to the equivalent escaped characters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the SOAP message variable.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign to the specified variable.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameter("symbol","NOW");
```

SOAPMessageV2 - setStringParameterNoEscape(String name, String value)
Sets a variable with the specified name from the SOAP message record to the specified value.

This method is equivalent to setStringParameter but does not escape XML reserved characters.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the SOAP message variable.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value to assign to the specified variable.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setStringParameterNoEscape("symbol","NOW");
```

SOAPMessageV2 - setWSSecurity(String keystoreId, String keystoreAlias, String keystorePassword, String certificateId)

Sets web service security values for the SOAP message.

Setting security values using this method overwrites web service security values defined for the SOAP message record.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keystoreId</td>
<td>String</td>
<td>Sys_id of the Java or PKCS12 key store to use.</td>
</tr>
<tr>
<td>keystoreAlias</td>
<td>String</td>
<td>Alias that identifies the public and private keys.</td>
</tr>
<tr>
<td>keystorePassword</td>
<td>String</td>
<td>Password assigned to the key store record.</td>
</tr>
<tr>
<td>certificateId</td>
<td>String</td>
<td>Sys_id of the trusted server certificate.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
sm.setWSSecurity("70d65e074f3812001f6eac118110c71a","Quote keys","UXr82cqX75z7MaSa+EyjGA==","ba969a074f3812001f6eac118110c76d");
```

SOAPMessageV2 - SOAPMessageV2()

Instantiates an empty SOAPMessageV2 object.
When using an object instantiated this way, you must manually specify a SOAP action and endpoint.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2();
```

**SOAPMessageV2 - SOAPMessageV2(String soapMessage, String soapFunction)**

Instantiates a SOAPMessageV2 object from a SOAP message record and a function associated with that record.

Values such as the endpoint, authentication, or MID Server settings from the SOAP message record apply to this object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>soapMessage</td>
<td>String</td>
<td>SOAP message record you want to use as the base for this object.</td>
</tr>
<tr>
<td>soapFunction</td>
<td>String</td>
<td>SOAP function you want to execute. Available SOAP functions depend on the WSDL supplied by the web service provider.</td>
</tr>
</tbody>
</table>

```javascript
var sm = new sn_ws.SOAPMessageV2("StockQuote","GetQuote"); //Might throw exception if message doesn't exist or not visible due to scope.
```

**SOAPResponseV2 - Scoped, Global**

The SOAPResponseV2 API allows you to use the data returned by an outbound SOAP message in JavaScript code.

A SOAPResponseV2 object is returned by the SOAPMessageV2 methods `execute()` and `executeAsync()`.

You can use this API in scoped applications, or within the global scope.

• SOAPMessageV2 MID server example

SOAPResponseV2 - getAllHeaders()
Returns all headers contained in the response, including any duplicate headers.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List&lt;GlideHTTPHeader&gt;</td>
<td>List of headers contained in the response. Each header is represented as a GlideHTTPHeader object which contains the header name and value.</td>
</tr>
</tbody>
</table>

```javascript
var r = new sn_ws.SOAPMessageV2('<A SOAP message>', 'get');
var response = r.execute();
var headers = response.getAllHeaders();
for(var i in headers){
    gs.info(headers[i].name + ': ' + headers[i].value);
}
```

SOAPResponseV2 - getBody()
Gets the content of the SOAP response body.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>SOAP response body.</td>
</tr>
</tbody>
</table>
var body = response.getBody();

SOAPResponseV2 - get_cookies()

Returns all cookies included in the response.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of strings representing cookies. Iterate through the array to perform operations on each cookie.</td>
</tr>
</tbody>
</table>

Display individual cookies from the response.

```javascript
var cookies = response.getCookies();
for (var i = 0; i < cookies.length; i++) {
    gs.info('cookie: ' + cookies.get(i));
}
```

Output:

```
cookie: JSESSIONID=4135AA97A5D12DA22EF614AA2B0CAF8.node20; Path=/; Secure; HttpOnly
cookie: SABASESSIONID=370152970.36895.0000; path=/
```

SOAPResponseV2 - get_error_code()

Gets the numeric error code if there was an error during the SOAP transaction.

This error code is specific to the Now Platform, it is not an HTTP error code. Provide this error code if you require assistance from Customer Service and Support.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Numeric error code, such as 1 for a socket timeout.</td>
</tr>
</tbody>
</table>

```javascript
var errorCode = response.getErrorCode();
```

**SOAPResponseV2 - getErrorMessage()**

Gets the error message if there was an error during the SOAP transaction.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Error message</td>
</tr>
</tbody>
</table>

```javascript
var errorMsg = response.getErrorMessage();
```

**SOAPResponseV2 - getHeader(String name)**

Gets the value for a specified HTTP header.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the header that you want the value for, such as Set-Cookie.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the specified header.</td>
</tr>
</tbody>
</table>

```javascript
var headerVal = response.getHeader("Accept");
```
SOAPResponseV2 - getHeaders()

Gets all HTTP headers returned in the SOAP response and the associated values.

ℹ️ **Note:** If a header is present more than once in the response, such as a Set-Cookie header, this function returns only the last of the duplicate headers. To return all headers including duplicates, use the `getAllHeaders()` function.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object that maps the name of each header to the associated value.</td>
</tr>
</tbody>
</table>

```javascript
var headers = response.getHeaders();
```

SOAPResponseV2 - getStatusCode()

Gets the numeric HTTP status code returned by the SOAP provider.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Numeric status code returned by the SOAP provider, such as 200 for a successful response.</td>
</tr>
</tbody>
</table>

```javascript
var statusCode = response.getStatusCode();
```

SOAPResponseV2 - haveError()

Indicates if there was an error during the SOAP transaction.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Returns true if there was an error, false if there was no error.</td>
</tr>
</tbody>
</table>

```javascript
var error = response.haveError();
```

### SOAPResponseV2 - waitForResponse(Number timeoutSecs)

Sets the amount of time the instance waits for a response from the web service provider.

This method overrides the property glide.soap.outbound.ecc_response.timeout for this SOAP response.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeoutSecs</td>
<td>Number</td>
<td>Amount of time, in seconds, to wait for this response.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
response.waitForResponse(60);
```

### spAriaUtil - Client

Show messages on a screen reader.

spAriaUtil is an angular service that you can use in Service Portal widget client scripts.
spAriaUtil - sendLiveMessage(String message)

Announce a message to a screen reader.

The sendLiveMessage() method injects text into an aria-live region on the page. The default setting for an aria-live region is assertive, which means that messages are announced immediately. This can annoy and confuse users if used too frequently.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be shown.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
function(spAriaUtil) {
  /* widget controller */
  spAriaUtil.sendLiveMessage('Hello world!');
}
```

spContextManager - Client

Make data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.

spContextManager is an AngularJS service that you can use in Service Portal widget client scripts.

Keys passed to this API are unique per page. For example, if the 'agent-chat' key is already initialized by another widget on the page through the addContext() method, you must use the updateContextForKey() method to update the key's data. Available keys include:

- **agent-chat**: Sends widget data to Agent Chat when it opens in a Service Portal page.

For more information about passing data to Agent Chat, see Configure Agent Chat in Service Portal.
**spContextManager - addContext(String key, Object context)**

Initializes a key and adds widget data as the value. For example, add data to the 'agent-chat' key to make it available to Agent Chat.

Use this method the first time data is added to a specific key on a Service Portal page. If the key is already used by another widget on the page, use the `updateContextForKey()` method instead.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the key to send the data. Available keys include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>agent-chat</strong>: Sends widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>context</td>
<td>Object</td>
<td>Widget data in JSON format to send to the application or service specified in the key parameter. For example, <code>{approval_count': 5}</code>.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat iframe URL.

```javascript
def function ($scope, spContextManager) {
    spContextManager.addContext('agent-chat', {
        'approval_count': 5
    });
}
```

**spContextManager - getContext()**

Returns each key and associated data object defined by any widget on the page.

Using this method may affect performance. Use this method to understand which keys are initialized on the page and to get their current values. If you
know which key you need to access, use the `getContextForKey()` method instead.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Each key and associated data object defined on the page.</td>
</tr>
</tbody>
</table>

```javascript
function ($scope, spContextManager) {
  spContextManager.getContext();
}
```

### `spContextManager - getContextForKey(String key, Boolean returnPromise)`

Returns the widget data associated with a key.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the key to get context from. Available keys include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>agent-chat</strong>: Sends widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>returnPromise</td>
<td>Boolean</td>
<td>Flag that determines whether to return the data associated with a key as a promise or an object. Values include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• True: return the data as a promise. Use this option if another widget on the page uses the <code>addContext()</code> method to initialize the same key. Returning a promise prevents returning an undefined object when the key is not yet initialized.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• False: returns an object containing the data associated with the key.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Promise</td>
<td>If <code>returnPromise</code> is true, returns a promise that is fulfilled when another widget on the page initializes the key.</td>
</tr>
<tr>
<td>Object</td>
<td>If <code>returnPromise</code> is false, returns an object containing the data associated with the key. For example, <code>{approval_count: 5}</code>.</td>
</tr>
</tbody>
</table>

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat iframe URL.

```javascript
function ($scope, spContextManager) {
  spContextManager.getContextForKey('agent-chat', true).then(function(context) {
    context = context || {};
    context.approval_count = 5;
    spContextManager.updateContextForKey('agent-chat', context);
  });
}
```

**spContextManager - updateContextForKey(String key, Object context)**

Sends data to an existing key. For example, if another widget on the page uses the 'agent-chat' key to pass data to the Agent Chat configuration, you must update the context of the key rather than using the `addContext()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>key</td>
<td>String</td>
<td>Name of the key to send the data. Available keys include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>agent-chat</strong>: Sends widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>context</td>
<td>Object</td>
<td>Widget data in JSON format to send to the application or service specified in the key parameter. For example, <code>{approval_count: 5}</code>.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Pass `approval_count` to Agent Chat. When a user initiates an Agent Chat conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat iframe URL.

```javascript
function ($scope, spContextManager) {
    spContextManager.getContextForKey('agent-chat', true).then(function(context) {
        context = context || {};
        context.approval_count = 5;
        spContextManager.updateContextForKey('agent-chat', context);
    });
}
```

**spModal - Client**

Show alerts, prompts, and confirmation dialogs in Service Portal widgets. The SPModal class is available in Service Portal client scripts.

You can use `spModal.open()` to display a widget in a modal dialog. The spModal class is a lightweight wrapper for Angular UI bootstrap's `$uibModal`.

**spModal - alert(String message).then(fn)**

Displays an alert.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>The promise contains a single argument that contains true or false.</td>
</tr>
</tbody>
</table>

```html
// HTML template
<button ng-click="c.onAlert()" class="btn btn-default">
    Alert
</button>
```
// Client script
function(spModal) {
    var c = this;
    c.onAlert = function () {
        spModal.alert('How do you feel today?').then(function (answer) {
            c.simple = answer;
        });
    }
}

spModal - confirm(String message).then(fn)
Displays a confirmation message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>The promise contains a single argument that contains true or false.</td>
</tr>
</tbody>
</table>

// HTML template
<button ng-click="c.onConfirm()" class="btn btn-default"> Confirm </button>
<span>{{c.confirmed}}</span>

// Client script
function(spModal) {
    var c = this;
    c.onConfirm = function () {
        c.confirmed = "asking";
        spModal.confirm("Can you confirm or deny this?").then(function(confirmed) {
            c.confirmed = confirmed; // true or false
        })
    }
}

Confirm with HTML message
// HTML template
<button ng-click="c.onConfirmEx()" class="btn btn-default">
  Confirm - HTML message
</button>
<span>{{c.confirmed}}</span>

// Client script
function(spModal) {
  var c = this;
  // more control, passing options
  c.onConfirmEx = function() {
    c.confirmed = "asking";
    var warn = '<i class="fa fa-warning" aria-hidden="true"></i>';
    spModal.open({
      title: 'Delete this Thing?',
      message: warn + ' Are you <b>sure</b> you want to do that?'
    }).then(function(confirmed) {
      c.confirmed = confirmed;
    })
  }
}

**spModal - open(Object options).then(fn)**

Opens a modal window using the specified options.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Object</td>
<td>An object that may have these properties.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• title - a string that can be HTML that goes in the header. The default is empty.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• message - a string that can be HTML that goes in the header. The default is empty.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• buttons - an array that contains the buttons to show on the dialog. The default is Cancel and OK.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• input - a Boolean. When true shows an input field on the dialog. The default is false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• value - a string containing the value of the input field. The default is empty.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• widget</td>
<td>string</td>
<td>a string that identifies the widget ID or sys_id to embed in the dialog. The default is empty.</td>
</tr>
<tr>
<td>• widgetInput</td>
<td>object</td>
<td>an object to send the embedded widget as input. The default is null.</td>
</tr>
<tr>
<td>• shared</td>
<td>object</td>
<td>a client-side object to share data with the embedded widget client script.</td>
</tr>
<tr>
<td>• size</td>
<td>string</td>
<td>a string indicating the size of the window. Can be 'sm' or 'lg'. The default is empty.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Example of a prompt with a label

```html
//HTML template
<button ng-click="c.onOpen()" class="btn btn-default">
    Prompt with label
</button>
<div ng-show="c.name">
    You answered <span>{{c.name}}</span>
</div>
```

```javascript
//Client code
function(spModal) {
    var c = this;
    c.onOpen = function() {
        //ask the user for a string
        spModal.open({
            title: 'Give me a name',
            message: 'What would you like to name it?',
            input: true,
            value: c.name
        }).then(function(name) {
            c.name = name;
        })
    }
}
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Example of agree with custom buttons.

//HTML template
<button ng-click="c.onAgree()" class="btn btn-default">
  Agree
</button>
<div ng-show="c.agree">
  You answered {{c.agree}}
</div>

//Client script
function(spModal) {
  var c = this;
  c.onAgree = function() {
    // ask the user for a string
    // note embedded html in message
    var h = '<h4>Apple likes people to agree to lots of stuff</h4>'
    // Line feeds added to the following lines for presentation formatting.
    var m = 'Your use of Apple software or hardware products is based on the software license and other terms and conditions in effect for the product at the time of purchase. Your agreement to these terms is required to install or use the product.'
    spModal.open({
      title: 'Do you agree?',
      message: h + m,
      buttons: [
        {label:'✘ ${No}', cancel: true},
        {label:'✔ ${Yes}', primary: true}
      ]
    }).then(function() {
      c.agree = 'yes';
    }, function() {
      c.agree = 'no';
    })
  }
}

Example of embedded widget

//HTML template
<button ng-click="c.onWidget('widget-cool-clock')" class="btn btn-default">
  Cool Clock
</button>
//Client script
function(spModal) {
    var c = this;
    c.onWidget = function(widgetId, widgetInput) {
        spModal.open({
            title: 'Displaying widget ' + widgetId,
            widget: widgetId,
            widgetInput: widgetInput || {}
        }).then(function(){
            console.log('widget dismissed');
        })
    }
}

spModal - prompt(String message, String default).then(fn)
Displays a prompt for user input.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to display.</td>
</tr>
<tr>
<td>default</td>
<td>String</td>
<td>A default value to use if the user does not provide a response.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The promise contains the user's response, or the default value if the user does not enter a response.</td>
</tr>
</tbody>
</table>

//HTML template
<button ng-click="c.onPrompt()" class="btn btn-default">
    Prompt
</button>
<div ng-show="c.name">
    You answered <span>{{c.name}}</span>
</div>
// Client script
function(spModal) {
    var c = this;
    c.onPrompt = function() {
        spModal.prompt("Your name please", c.name).then(function(name) {
            c.name = name;
        });
    }
}

SPScriptedFacet - Scoped

Define facet items, filters, or mapped queries for a facets object.

The SPScriptedFacet API can only be used in a facet generation script in a Service Portal search source. The facet generation script is only visible when Is scripted source is selected.

There is no constructor for this class. Instead, use the createFacet() or createMultiChoiceFacet() methods of the SPScriptedFacetService class to generate a facets object.

Scoped SPScriptedFacet - addFacetItem(String label, Object valueObj)

Adds facet items or mapped queries to a facets object.

Before adding facet items to a facets object, create the facets object using the createFacet() or createMultiChoiceFacet() methods of the SPScriptedFacetService class.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>The display label for the facet item or mapped query.</td>
</tr>
<tr>
<td>valueObj</td>
<td>Object</td>
<td>The facet item or mapped query for the facet. Can only contain types String, Number, Boolean, and Double.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
```javascript
function createMultiChoiceFacetFromKB(label, variable, values, orderBy){
    if(!values || values.length == 0)
        return;
    var kbFacet = facetService.createMultiChoiceFacet(label, variable);
    var kbMap = {};
    for(var i in values) {
        var key = values[i].label;
        var value = values[i].id;
        var parent = new KBParentData().getParentCategory(value, key);
        key = parent.join(' > ');
        kbMap[key] = value;
    }
    var labels = Object.keys(kbMap).sort();
    for (i = 0; i < labels.length; i++) {
        var currentLabel = labels[i];
        kbFacet.addFacetItem(currentLabel, kbMap[currentLabel]);
        //adds facet search options for each kbMap entry
    }
}
```

**SPScriptedFacetService - Scoped**

Generate a multi choice or single choice facets object for an advanced search source.

The `SPScriptedFacetService` API can only be used in a facet generation script in a Service Portal search source. The facet generation script is only visible when **Is scripted source** is selected.

There is no constructor for this class. Instead, use the `createFacet()` or `createMultiChoiceFacet()` methods to generate a facets object.

**Scoped SPScriptedFacetService - createFacet(String label, String id)**

Creates a single choice facets object.

After creating the facets object, add facet items or mapped queries to the facet using the `addFacetItem()` method of the `SPScriptedFacet` class.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>Label for the facet.</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID for the facet.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Single choice facets object.</td>
</tr>
<tr>
<td></td>
<td>Returns an error when:</td>
</tr>
<tr>
<td></td>
<td>• A duplicate label or ID is found.</td>
</tr>
<tr>
<td></td>
<td>• A label or ID is not defined.</td>
</tr>
</tbody>
</table>

Can only be used in a facet generation script in a Service Portal advanced search source.

```javascript
var stateFacet = facetService.createFacet("State", "state");
```

Scoped SPScriptedFacetService - createMultiChoiceFacet(String label, String id)

Creates a multi choice facets object.

After creating the facets object, add facet items or mapped queries to the facet using the `addFacetItem()` method of the SPScriptedFacet class.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>Label for the facet.</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>ID for the facet.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Multi choice facets object.</td>
</tr>
<tr>
<td></td>
<td>Returns an error when:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• A duplicate label or ID is found.</td>
</tr>
<tr>
<td></td>
<td>• A label or ID is not defined.</td>
</tr>
</tbody>
</table>

```javascript
function createMultiChoiceFacetFromKB(label, variable, values, orderBy){
    if(!values || values.length == 0)
        return;

    var kbFacet = facetService.createMultiChoiceFacet(label, variable);
    var kbMap = {};
    for(var i in values) {
        var key = values[i].label;
        var value = values[i].id;
        var parent = new KBParentData().getParentCategory(value, key);
        key = parent.join(' > ');
        kbMap[key] = value;
    }

    var labels = Object.keys(kbMap).sort();
    for (i = 0; i < labels.length; i++) {
        var currentLabel = labels[i];
        kbFacet.addFacetItem(currentLabel, kbMap[currentLabel]);
        //adds facet search options for each kbMap entry
    }
}
```

**spUtil - Client**

Utility methods to perform common functions in a Service Portal widget client script.

**spUtil - addErrorMessage(String message)**

Displays a notification error message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Error message to display.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

spUtil.addErrorMessage("There has been an error processing your request")

spUtil - addInfoMessage(String message)
Displays a notification info message.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Message to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

spUtil.addInfoMessage("Your order has been placed")

spUtil - addTrivialMessage(String message)
Displays a trivial notification message.

Trivial messages disappear after a short period of time.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>Message to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
spUtil.addTrivialMessage("Thanks for your order")

**spUtil - createUid()**

Create a unique ID.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>A unique 32 character id.</td>
</tr>
</tbody>
</table>

**spUtil - get(String widgetId Object data)**

Returns a widget model by ID or sys_id.

Use this method to embed a widget model in a widget client script. The callback function returns the full widget model.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>widgetId</td>
<td>String</td>
<td>Widget ID or sys_id of the widget to embed.</td>
</tr>
<tr>
<td>data</td>
<td>Object</td>
<td>(Optional) Name/value pairs of parameters to pass to the widget model.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Model of the embedded widget.</td>
</tr>
</tbody>
</table>

Without data passed

```javascript
spUtil.get("widget-cool-clock").then(function(response) {
  c.coolClock = response;
});
```
With data passed

```javascript
spUtil.get('pps-list-modal', {title: c.data.editAllocations,
    table: 'resource_allocation',
    queryString: 'GROUPBYuser^resource_plan=' + c.data.sysId,
    view: 'resource_portal_allocations' }).then(function(response) {
    var formModal = response;
    c.allocationListModal = response;
});
```

**spUtil - getHost()**

Get complete host domain.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The complete host domain, for example <code>hi.servicenow.com</code></td>
</tr>
</tbody>
</table>

**spUtil - getHeaders()**

Retrieve all headers to be used for API calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>All headers to be used for API calls.</td>
</tr>
</tbody>
</table>
spUtil - getPreference(String preference, Function callback)
Execute callback with User Preference response by passing Preference name.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preference</td>
<td>String</td>
<td>The name of the preference.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>Define the callback function.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

spUtil - getURL()
Get current service portal url information.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current service portal url.</td>
</tr>
</tbody>
</table>

spUtil - format(String template, Object data)
Formats a string as an alternative to string concatenation.

Use this method to build a string with variables.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>String</td>
<td>String template with values for substitution.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Object</td>
<td>Object containing variables for substitution.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A formatted string.</td>
</tr>
</tbody>
</table>

```
spUtil.format('An error occurred: {error} when loading {widget}', {error: '404', widget: 'sp-widget'})
```

Output:

'An error occurred: 404 when loading sp-widget'

**spUtil - isMobile()**

Check if current client is a mobile device.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the current client is a mobile device; otherwise, false</td>
</tr>
</tbody>
</table>

**spUtil - parseAttributes(String attributes)**

Brief description of the method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attributes</td>
<td>String</td>
<td>String containing comma separated attributes, such as the Attributes field of a dictionary record.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array object containing the parsed attributes.</td>
</tr>
</tbody>
</table>

[Working to add example script with example output]

**spUtil - recordWatch(Object $scope, String table, String filter, Function callback)**

Watches for updates to a table or filter and returns the value from the callback function.

Allows a widget developer to respond to table updates in real-time. For instance, by using `recordWatch()`, the Simple List widget can listen for changes to its data table. If records are added, removed, or updated, the widget updates automatically.

ℹ️ **Note:** When passing the `$scope` argument into the `recordWatch()` function, inject `$scope` into the parameters of your client script function.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$scope</td>
<td>Object</td>
<td>Scope of the data object updated by the callback function.</td>
</tr>
<tr>
<td>table</td>
<td>String</td>
<td>Watched table.</td>
</tr>
<tr>
<td>filter</td>
<td>String</td>
<td>Filter for fields to watch.</td>
</tr>
<tr>
<td>callback</td>
<td>Function</td>
<td>Optional. Parameter to define the callback function.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Promise</td>
<td>Return value of the callback function.</td>
</tr>
</tbody>
</table>

```javascript
//A simple recordWatch function.
spUtil.recordWatch($scope, "live_profile", "sys_id=" + liveProfileId);

//In a widget client script
function(spUtil, $scope) {
    /* widget controller */
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
var c = this;

// Registers a listener on the incident table with the filter active=true,
// meaning that whenever something changes on that table with that filter,
// the callback function is executed.
// The callback function takes a single parameter 'response', which contains
// the property 'data'. The 'data' property contains information about the changed
// record.
spUtil.recordWatch($scope, "incident", "active=true", function(response) {

    // Returns the data inserted or updated on the table
    console.log(response.data);

});

spUtil - refresh(Object $scope)

Calls the server and replaces the current options and data with the server
response.

Calling spUtil.refresh() is similar to calling server.refresh(). However, when you
call spUtil.refresh(), you can define the $scope object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>$scope</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Object</td>
</tr>
</tbody>
</table>

spUtil - scrollTo(String selector, Number time)

Scroll to element with specified selector, over specified period of time.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>selector</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>Number</td>
<td>The time, in milliseconds, taken to scroll to the specified selector.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

spUtil - setBreadCrumb()

Update the header breadcrumbs.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$scope</td>
<td>Object</td>
<td>The scope defined for the table.</td>
</tr>
<tr>
<td>breadcrumbs</td>
<td>Array</td>
<td>An array of conditions used to create the breadcrumb filter.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

spUtil - setPreference(String preference, String value)

Set a user preference.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>preference</td>
<td>String</td>
<td>The preference name</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>The preference value</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**spUtil - setSearchPage(String searchPage)**

Update the search page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>searchPage</td>
<td>String</td>
<td>The name of the search page.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**spUtil - update(Object $scope)**

Updates the data object on the server within a given scope.

This method is similar to `server.update()`, but includes a `$scope` parameter that defines the scope to pass over.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$scope</td>
<td>Object</td>
<td>The scope defined for the update.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>The updated data object.</td>
</tr>
</tbody>
</table>

**StandardCredentialsProvider - Scoped, Global**

Use the `StandardCredentialsProvider` API to retrieve credential information.
You can use this API in scoped applications, or within the global scope. In scoped scripts, use the `sn_cc` namespace identifier.

This API provides methods to retrieve credential information by sys_id and by specified credential attributes.

```javascript
//Get a single credential
var provider = new sn_cc.StandardCredentialsProvider();
var credential = provider.getCredentialByID("f43c6d40a0a0b5700c77f9bf387afe3");
var userName = credential.getAttribute("user_name");
var password = credential.getAttribute("password");
//using getAttribute for new keys in extended tables, for example
//cloud management credential has the "user_public_key" attribute
var userPublicPublicKey = credential.getAttribute("user_public_key");

//Get a list of SSH credentials
var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentials(['ssh']);
for (var i = 0; i < credentials.length; i++) {
    var credential = credentials[i];
    gs.info(credential.getAttribute("name"));
}
```

**StandardCredentialsProvider - StandardCredentialsProvider()**

Instantiates a credentials provider object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentialByID("ef43c6d40a0a0b5700c77f9bf387afe3");
```

**StandardCredentialsProvider - getCredentials(String types, String tags)**

Returns an array of all credentials that match the specified types and tags.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tags</td>
<td>String</td>
<td>Optional. Comma-separated list of tag names. For example, &quot;ssh, jdbc&quot;. Examples of valid calls:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• var credentials = provider.getCredentials(null, null);</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• var credentials = provider.getCredentials([&quot;ssh&quot;], &quot;&quot;);</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• var credentials = provider.getCredentials(new ArrayList&lt;String&gt;(), &quot;ssh, admin&quot;);</td>
</tr>
<tr>
<td>types</td>
<td>Array</td>
<td>Optional. Credential type names. For example, [&quot;ssh&quot;, &quot;windows&quot;] Note: If types is null or empty, any match returns a credential. If types is specified, the credentials whose type matches one of the types is returned.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StandardCredential</td>
<td>Credential record object.</td>
</tr>
</tbody>
</table>

This code example shows how to get the provider credentials for "ssh" credential types.

```java
var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentials(["ssh"]);
```

This code example shows how to get the provider credentials for "ssh" and "windows" credential types that have tags of "admin".

```java
var provider = new sn_cc.StandardCredentialsProvider();
ArrayList<String> types = new ArrayList<>();
types.add("ssh");
types.add("windows");
JSONArray jsonArray = provider.getCredentials(types, "admin");
```

**StandardCredentialsProvider - getCredentialBysys_id(String sys_id)**

Returns the credential record object identified by the specified sys_id.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StandardCredential</td>
<td>Credential record object.</td>
</tr>
</tbody>
</table>

```plaintext
var provider = new sn_cc.StandardCredentialsProvider();
var credentials = provider.getCredentialByID("ef43c6d40a0b5700c77f9bf387afe3");
gs.info("User name: " + credentials.getAttribute("user_name"));
```

### StartDiscovery - Global

Starts discovery jobs.

Use this API during the discovery scanning phase.

### StartDiscovery - addAdditionalIP(String status, String ip, String sensor)

Adds an IP (or comma-separated list of IPs) to an existing discovery (used by networks discovery).

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>String</td>
<td>The discovery status</td>
</tr>
<tr>
<td>ip</td>
<td>String</td>
<td>An IP address, or a comma-separated list of IP addresses.</td>
</tr>
<tr>
<td>sensor</td>
<td>String</td>
<td>The discovery sensor</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
StartDiscovery - discoverFromSchedule(String ip, Boolean samePhase, String sensor)

Handles discovery of devices (whether basic or advanced) from a schedule.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>String</td>
<td>An IP address, or a comma-separated list of IP addresses.</td>
</tr>
<tr>
<td>samePhase</td>
<td>Boolean</td>
<td></td>
</tr>
<tr>
<td>sensor</td>
<td>String</td>
<td>The discovery sensor</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

StartDiscovery - getCancelScript()

Returns the cancel script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The cancel script</td>
</tr>
</tbody>
</table>

StartDiscovery - scheduleCancelJob()

If the schedule specifies a cancel time, schedules a job to cancel if necessary.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**StartDiscovery - startFromIP(DiscoverySchedule schedule, String ip)**

Starts a discovery for a single IP using the specified schedule to get information such as MID servers and behaviors.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule</td>
<td>DiscoverySchedule</td>
<td>A DiscoverySchedule instance for the schedule to use.</td>
</tr>
<tr>
<td>ip</td>
<td>String</td>
<td>The IP address to discover in a dot-formatted string.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The sys_id of the status record created.</td>
</tr>
</tbody>
</table>

**StartDiscovery - startFromSchedule(GlideRecord schedule, GlideRecord job)**

Invoked by the discovery script include to kick off a scheduled (or discover now) discovery.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule</td>
<td>GlideRecord</td>
<td>The instance of discovery_schedule that this discovery is based on.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>GlideRecord</td>
<td>The instance of sys_trigger that triggered this discovery.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - Global**

Provides a set of methods for manipulating CI operational states and applying CI actions.

The StateManagementScriptableApi methods adhere to restrictions and allowances specified by not allowed CI actions, compatible CI actions, and not allowed operational transitions. If a method attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is created if appropriate.

The StateManagementScriptableApi methods are static methods. You access the methods using the `SNC.StateManagementScriptableApi` global object.

**StateManagementScriptableApi - addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime)**

Add a CI action to a list of CIs.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the <code>registerOperator()</code> method.</td>
</tr>
<tr>
<td>sysIdList</td>
<td>String</td>
<td>A list comma separated list of CI sys_ids.</td>
</tr>
<tr>
<td>ciActionName</td>
<td>String</td>
<td>The CI action name.</td>
</tr>
<tr>
<td>ciActionListOld</td>
<td>String</td>
<td>(Optional) A comma separated list of old CI actions that all CIs should be in.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>leaseTime</td>
<td>String</td>
<td>(Optional) Time duration for which the lease is valid for specified CI Action. In the format HH:MM:SS.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• result - true if the action is set for all CIs in the list; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime)**

Extend the CI-action-lease time for the registered user. If the previous lease has expired, the new lease time starts now.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the registerOperator() method.</td>
</tr>
<tr>
<td>ciSysId</td>
<td>String</td>
<td>The CI's sys_id.</td>
</tr>
<tr>
<td>ciActionName</td>
<td>String</td>
<td>The CI action name.</td>
</tr>
<tr>
<td>leaseTime</td>
<td>String</td>
<td>Time duration for which the lease is valid for specified CI Action. In the format HH:MM:SS.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• result - true if the lease time has been set.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>
**StateManagementScriptableApi - getCIActions(String ciSysId)**

Returns a list of active CI actions for the specified CI.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciSysId</td>
<td>String</td>
<td>The sys_id of the CI</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• ciActions - a comma separated list of active CI actions for the CI, or</td>
</tr>
<tr>
<td></td>
<td>NO_ACTIVE_ACTION.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - getOperationalState(String ciSysId)**

Returns the CI's operational state.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciSysId</td>
<td>String</td>
<td>Sys_id of the CI</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• operationalStates - one of the string choice values of the operational_status field, or UNKNOWN.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - isCompatibleCIAction(String actionName, String otherActionName)**

Determines if the two specified actions are compatible.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actionName</td>
<td>String</td>
<td>A CI action name</td>
</tr>
<tr>
<td>otherActionName</td>
<td>String</td>
<td>A CI action name</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the two specified CI actions are compatible.</td>
</tr>
</tbody>
</table>

StateManagementScriptableApi - isLeaseExpired(String requestorId, String ciSysId, String ciActionName)

Determines if the lease has expired for the requestor of a specified CI Action.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the registerOperator() method.</td>
</tr>
<tr>
<td>ciSysId</td>
<td>String</td>
<td>The CI's sys_id.</td>
</tr>
<tr>
<td>ciActionName</td>
<td>String</td>
<td>Name of the CI action.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• result - true if the user’s lease has expired.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>

StateManagementScriptableApi - isNotAllowedAction(String ciType, String opsLabel, String actionName)

For a type of CI, determine if a CI action is not allowed for an operational state.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciType</td>
<td>String</td>
<td>The CI type</td>
</tr>
<tr>
<td>opsLabel</td>
<td>String</td>
<td>The operational state</td>
</tr>
<tr>
<td>actionName</td>
<td>String</td>
<td>The CI action name</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if the action is not allowed on the specified CI type in the specified operational state.</td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel)**

For a type of CI, determine if an operational state transition is not allowed.

## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ciType</td>
<td>String</td>
<td>The CI type</td>
</tr>
<tr>
<td>opsLabel</td>
<td>String</td>
<td>The label of the beginning operational state.</td>
</tr>
<tr>
<td>transitionOpsLabel</td>
<td>String</td>
<td>The label of the ending operational state.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Returns true if specified operational state transition is not allowed on the specified CI type.</td>
</tr>
</tbody>
</table>

**StateManagementScriptableApi - isValidRequestor(String requestorId)**

Determine if the specified requestor is a valid active workflow user or a registered user.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the <code>registerOperator()</code> method.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String   | A JSON formatted string with name-value pairs for  
• result - true if the requestorId is valid.  
• errors - list of errors. |

### `StateManagementScriptableApi - registerOperator()`

Register an operator for a non-workflow user.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| String   | A JSON formatted string with name-value pairs for  
• requestorId - Registered user GUID that is used to set CI Action/operational states.  
• result - true if successfully registered.  
• errors - list of errors. |

```javascript
var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;
```
StateManagementScriptableApi - removeBulkCiAction(String requestId, String sysIdList, String ciActionName)

Removes a CI action for a list of CIs.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the registerOperator() method.</td>
</tr>
<tr>
<td>sysIdList</td>
<td>String</td>
<td>A comma separated list of CI sys_ids</td>
</tr>
<tr>
<td>ciActionName</td>
<td>String</td>
<td>The CI action name</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• result - true if the action is removed for all CIs in the list; otherwise,</td>
</tr>
<tr>
<td></td>
<td>false.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>

StateManagementScriptableApi - setBulkCiOperationalState(String requestId, String sysIdList, String opsLabel, String opsStateListOld)

Set the operational state for list of CIs.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the registerOperator() method.</td>
</tr>
<tr>
<td>sysIdList</td>
<td>String</td>
<td>A comma separated list of CI sys_ids</td>
</tr>
<tr>
<td>opsLabel</td>
<td>String</td>
<td>This is the string label of an operational_status choice.</td>
</tr>
<tr>
<td>opsStateListOld</td>
<td>String</td>
<td>(Optional) A comma separated list of old CI states that all CIs should be in.</td>
</tr>
</tbody>
</table>

var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUtil = new JSON();
var result = jsonUtil.decode(output);
var requestorId = result.requestorId;

// list of sys_ids to update
var sys_ids;

// Set list of sys_ids's Operational State to 'Repair in Progress'
output = SNC.StateManagementScriptableApi.setBulkCIOperationalState(requestorId,
    sys_ids,'Repair in Progress');
gs.print(output);

**StateManagementScriptableApi - unregisterOperator( String requestorId)**

Unregister an operator for non-workflow users.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestorId</td>
<td>String</td>
<td>A sys_id of a workflow context, or the GUID returned from the registerOperator() method.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>A JSON formatted string with name-value pairs for</td>
</tr>
<tr>
<td></td>
<td>• result - true if successfully unregistered.</td>
</tr>
<tr>
<td></td>
<td>• errors - list of errors.</td>
</tr>
</tbody>
</table>
The StopWatch API can be used in client-side scripts using ListV2 and ListV3 APIs.

**StopWatch - getTime()**

Returns the number of milliseconds since the timer started.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The number of milliseconds since the timer started.</td>
</tr>
</tbody>
</table>

**StopWatch - restart()**

Resets the timer to the current time.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**StopWatch - StopWatch()**

Creates an instance of the StopWatch class.

Uses the current time as the start time.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**StopWatch - StopWatch(Date initialDate)**

Creates an instance of the StopWatch class using the specified date as the initial value.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialDate</td>
<td>Date</td>
<td>The initial date for the object.</td>
</tr>
</tbody>
</table>

**StopWatch - toString()**

The elapsed time as HH:MM:SS.SSS.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The elapsed time formatted as HH:MM:SS.SSS.</td>
</tr>
</tbody>
</table>

**Style - Scoped, Global**

Creates a style for defining properties such as font size, border, and alignment. You can apply the same style to multiple objects simultaneously.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.

You can apply custom styles to the following API elements:
• Cell
• Paragraph
• Table

**Style - Style()**

Instantiates a new `Style` object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

The following examples shows how to create a `Style` object that you can add to a `Cell`, `Paragraph` or `Table` element.

```javascript
var style = new sn_pdfgeneratorutils.Style();
```

**Style – setBackgroundColor(Color color)**

Specifies a background color of an element.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>color</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

The following example shows how to set element background color. For a document usage example, see [Document API](#).

```javascript
var style = new sn_pdfgeneratorutils.Style();

var color = new sn_pdfgeneratorutils.Color([1, 0.9, 0.9]); // provided as array of RGB float values

style.setBackgroundColor(color);
```
**Style – setBold()**

Sets a style to bold font.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Parameters**

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style to bold font.

```javascript
var style = new sn_pdfgeneratorutils.Style();
style.setBold();
```

**Style – setBorder(Number width)**

Sets the style border on all four sides of an element.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
</tbody>
</table>

**Parameters**

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border. For a document usage example, see [Document API](#).

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 2;
style.setBorder(width);
```
Style – setBorderBottom(Number width)
Sets the style border to the bottom of an element.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border to the bottom of an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 2;
style.setBorderBottom(width);
```

Style – setBorderLeft(Number width)
Sets the style border on the left side of an element.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border on the left side of an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 2;
```
Style – setBorderLeft(Number width)
Sets the style border on the right side of an element.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
</tbody>
</table>

The following example shows how to set a style border on the right side of an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 2;
style.setBorderLeft(width);
```

Style – setBorderRight(Number width)
Sets the style border to the top of an element.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
</tbody>
</table>

The following example shows how to set a style border to the top of an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 2;
style.setBorderRight(width);
```
var style = new sn_pdfgeneratorutils.Style();

var width = 2;

style.setBorderTop(width);

**Style – setColoredBorder(Number width, Color color)**

Sets style border with color on all four sides of an element.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
<tr>
<td>color</td>
<td>Color</td>
<td>Style border color.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border with color. For a document usage example, see [Document API](#).

```javascript
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8, 0.8, 0.8]);

style.setColoredBorder(width, borderColor);
```

**Style – setColoredBorderBottom(Number width, Color color)**

Sets style border with color to the bottom side of an element.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
<tr>
<td>color</td>
<td>Color</td>
<td>Style border color.</td>
</tr>
</tbody>
</table>

The following example shows how to set a style border to the bottom of an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
style.setColoredBorderBottom(width, borderColor);
```

### Style – setColoredBorderLeft(Number width, Color color)
Sets style border with color on the left side of an element.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
<tr>
<td>color</td>
<td>Color</td>
<td>Style border color.</td>
</tr>
</tbody>
</table>

The following example shows how to set a style border. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
style.setColoredBorderLeft(width, borderColor);
```

### Style – setColoredBorderRight(Number width, Color color)
Sets style border with color on the right side of an element.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
<tr>
<td>color</td>
<td>Color</td>
<td>Style border color.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border with color. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();

var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);

style.setColoredBorderRight(width, borderColor);
```

**Style – setColoredBorderTop(Number width, Color color)**

Sets style border with color to the top side of an element.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Style border width in points.</td>
</tr>
<tr>
<td>color</td>
<td>Color</td>
<td>Style border color.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a style border. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
```
var width = 1.0;
var borderColor = new sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
style.setColoredBorderTop(width, borderColor);

**Style – setFontColor(Color color)**

Sets a font color.

**Parameters**

| Name   | Type    | Description 
|--------|---------|-------------
| color  | Color   | Font color. |

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set a font color. For a document usage example, see [Document API](#).

```javascript
var style = new sn_pdfgeneratorutils.Style();
var fontColor = new sn_pdfgeneratorutils.Color([1,0.5,0.5]);
style.setFontColor(fontColor);
```

**Style – setFontSize(Number fontSize)**

Sets a style font size.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fontSize</td>
<td>Number</td>
<td>Font size in points.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
The following example shows how to set a font size.

```javascript
var style = new sn_pdfgeneratorutils.Style();
style.setFontSize(12);
```

**Style – setHorizontalAlignment(String alignment)**

Sets the horizontal alignment for a style.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Horizontal alignment setting. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• center: Align contents to the center.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• left: Align contents to the left.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• right: Align contents to the right.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set horizontal alignment on an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var alignment = "Center";
style.setHorizontalAlignment(alignment);
```

**Style – setItalic()**

Sets a style to italic font.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following example shows how to set an element style to an italic font.

```javascript
var style = new sn_pdfgeneratorutils.Style();
style.setItalic();
```

**Style – setPadding(Number padding)**

Sets the padding of all four sides of an element to the same width.

See also:

- `setPaddingBottom()`
- `setPaddingLeft()`
- `setPaddingRight()`
- `setPaddingTop()`

```
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>padding</td>
<td>Number</td>
<td>Padding width in points as a decimal value.</td>
</tr>
</tbody>
</table>
```

```
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
style.setPadding(padding);
```

**Style – setPaddingBottom(Number padding)**

Sets the value of the bottom padding width of an element.

The following example shows how to set bottom style to 2.5 points. For a document usage example, see Document API.

```
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
style.setPaddingBottom(padding);
```
See also:

- `setPadding()`
- `setPaddingLeft()`
- `setPaddingRight()`
- `setPaddingTop()`

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>padding</td>
<td>Number</td>
<td>Padding width in points as a decimal value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set bottom element padding to 2.5 points. For a document usage example, see [Document API](#).

```javascript
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
style.setPaddingBottom(padding);
```

### Style – `setPaddingLeft(Number padding)`

Sets the value of the left padding width of an element.

See also:

- `setPadding()`
- `setPaddingBottom()`
- `setPaddingRight()`
- `setPaddingTop()`

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>padding</td>
<td>Number</td>
<td>Padding width in points as a decimal value.</td>
</tr>
</tbody>
</table>
The following example shows how to set left element padding to 2.5 points. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
style.setPaddingLeft(padding);
```

**Style – setPaddingRight(Number padding)**

Sets the value of the right padding width of a style.

See also:
- `setPadding()`
- `setPaddingBottom()`
- `setPaddingLeft()`
- `setPaddingTop()`

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>padding</td>
<td>Number</td>
<td>Padding width in points as a decimal value.</td>
</tr>
</tbody>
</table>

The following example shows how to set right element padding to 2.5 points. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
```
**Style – setPaddingRight(Number padding)**

Sets the value of the right padding width of an element.

See also:
- `setPadding()`
- `setPaddingBottom()`
- `setPaddingLeft()`
- `setPaddingRight()`

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>padding</td>
<td>Number</td>
<td>Padding width in points as a decimal value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set right element padding to 2.5 points. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var padding = 2.5;
style.setPaddingRight(padding);
```

**Style – setTextAlignment(String alignment)**

Sets the text alignment for a style.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Text alignment position. Valid values:</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>• text-center: Aligns text to the center.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-justified: Modifies the space between characters to completely fill text between the left and right sides. The final line is left-aligned.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-justified-all: Justifies text alignment including the final line.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-left: Align text to the left.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• text-right: Align text to the right.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the element text to center alignment.

```javascript
var style = new sn_pdfgeneratorutils.Style();
String alignment = "text-center";
style.setTextAlignment(alignment);
```

### Style – setVerticalAlignment(String alignment)

Sets the vertical alignment for this element.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Vertical alignment setting. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• bottom: Aligns contents to the bottom.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• mid: Aligns contents to the center.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• top: Aligns contents to the top.</td>
</tr>
</tbody>
</table>

The following example shows how to set vertical alignment on an element. For a document usage example, see Document API.

```javascript
var style = new sn_pdfgeneratorutils.Style();
var alignment = "Mid";
style.setVerticalAlignment(alignment);
```

### Stream - Scoped, Global

The Stream API interacts with a stream of items such as records. For example, you can use the `forEach()` method to update the state of each record in a stream returned by the GlideQuery API.

You can get a Stream object in these ways:

- Instantiate a Stream object using the constructor.
- Return a Stream object from the `GlideQuery.select()` method. For more information, see GlideQuery.

This method is static and does not require an instance of the class: `fromArray()`.

Use the Stream API in scoped or global server-side scripts. This API requires the GlideQuery [com.sn_glidequery] plugin.

### Implementation

This API can work with the GlideQuery and Optional APIs in a builder pattern where the method calls chain together, each method building on the returned result of the previous method. Use methods to define the attributes of the query. The methods do not execute until you call a terminal method, a method that returns a query result, allowing you to define the requirements of the query before executing it.

If the query returns a single record, the system wraps the result in an Optional object. If the query returns a stream of records, the system wraps the result in a Stream object. These objects let you manage the result using a set of methods in each API.
For example, here's a script that performs a query on the Task table and groups the records by priority and returns groups with total reassignments greater than four.

```javascript
var query = new global.GlideQuery('task')
    .where('active', true) //Returns new GlideQuery object with a "where" clause.
    .groupBy('priority') //Returns new GlideQuery object with a "group by" clause.
    .aggregate('sum', 'reassignment_count') //Returns new GlideQuery object with a "sum(reassignment_count)" clause.
    .having('sum', 'reassignment_count', '>', 4) //Returns new GlideQuery object with a "having reassignment_count > 4" clause.
    .select() //Returns a stream of records wrapped in a Stream object.
    .toArray(10); //Terminal method in the Stream class that executes the query and returns the result.
```

**Terminal methods**

For performance reasons, a query only fetches data when you call a terminal method. These are the terminal methods from the `Stream` class:

- `every()`
- `find()`
- `forEach()`
- `reduce()`
- `some()`
- `toArray()`

**Stream - Stream(Function nextFn)**

Instantiates a Stream object.

Instead of using this constructor, you can return a Stream object based on a query using the `GlideQuery` API.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nextFn</td>
<td>Function</td>
<td>A function that retrieves the next item in the stream.</td>
</tr>
</tbody>
</table>

This example shows you how to create a Stream object based on a random number generator. Make sure to include the `limit()` method to avoid creating an infinite loop.
new Stream(Math.random)
  .map(Math.round)
  .map(function (num) {
    return num === 1 ? 'heads' : 'tails';
  })
  .limit(10)
  .forEach(gs.info)

Output:

*** Script: tails
*** Script: heads
*** Script: tails
*** Script: heads
*** Script: tails
*** Script: heads
*** Script: tails
*** Script: tails
*** Script: tails

Stream - chunk(Number count)

Returns results in batches of arrays, each containing the number of records passed to the method.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>Number of records in each array returned from the stream.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream</td>
<td>Object used to interact with a stream of items such as records.</td>
</tr>
</tbody>
</table>

This example shows how to query a table and chunk the result into batches of arrays.

```javascript
var chunkResult = new GlideQuery('cmdb_ci_hardware')
  .select('asset', 'purchase_date')
  .limit(10)
```
```javascript
.chunk(5) // returns arrays of 5 sys_ids at a time
.toArray(100);

gs.info(JSON.stringify(chunkResult));

Output:

```

```json
[
  {
    "asset": "03clba8837f3100044e0bfc8bcbe5da8",
    "purchase_date": null,
    "sys_id": "10884798c61122750108b095e21e4080"
  },
  {
    "asset": "8fclba8837f3100044e0bfc8bcbe5da9",
    "purchase_date": null,
    "sys_id": "108a9205c61122750786e160f9d343e"
  },
  {
    "asset": "dfc1fa8837f3100044e0bfc8bcbe5d20",
    "purchase_date": null,
    "sys_id": "55b35562c0a8010e01cflf22378e0ae9"
  },
  {
    "asset": "9fclfa8837f3100044e0bfc8bcbe5d22",
    "purchase_date": null,
    "sys_id": "55b37e80c0a8010e00028a1d14e2d7"
  },
  {
    "asset": "d3clfa8837f3100044e0bfc8bcbe5d2e",
    "purchase_date": null,
    "sys_id": "60cc6f8cc0a8010e0016f4f6e55beea"
  }
],
```

```json
[
  {
    "asset": null,
    "purchase_date": null,
    "sys_id": "304481257f701200bee45f19befa915b"
  },
  {
    "asset": null,
    "purchase_date": null,
```

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This example shows how to create a child query using batches of IDs. When you call the `flatMap()` method after using the `chunk()` method, the system iterates over the batch of records instead of each individual record.

```javascript
var chunkResult = new global.GlideQuery('cmdb_ci_hardware')
    .select('sys_id')
    .map(function (device) { return device.sys_id; })
    .chunk(5) // returns arrays of 5 sys_ids at a time
    .flatMap(function (deviceIds) {
        return new GlideQuery('cmdb_sam_sw_install')
            .where('installed_on', 'IN', deviceIds)
            .select('software_model', 'installed_on');
    });

gs.info(JSON.stringify(chunkResult));
```

**Stream - every(Function predicate)**

Applies a predicate function to every item in the Stream object. If the predicate returns true for every item in the stream, the method returns true. If the predicate returns false for any item in the stream, the method returns false.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>predicate</td>
<td>Function</td>
<td>Predicate function to apply to every record or item inside the Stream object. The function must take each item in the stream as input and return a boolean.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the predicate function returns true for every item in the stream.</td>
</tr>
</tbody>
</table>

Valid values:
- **true**: The predicate function returns true for every item in the stream.
- **false**: The predicate function does not return true for every item in the stream.

This example shows how to apply a predicate function to every item in a stream.

```javascript
var hasOnlyShortDescriptions = new global.GlideQuery('task')
  .whereNotNull('description')
  .select('description')
  .every(function (t) {
    return t.description.length < 10;
  });

gs.info(hasOnlyShortDescriptions);
```

**Output:**

```
false
```

### Stream - filter(Function predicate)

Applies a predicate function to each item in the Stream object. If the predicate returns true, the method returns the stream. If the predicate returns false, it returns an empty Stream object.

For better performance, use the `where()`, `whereNotNull()`, and `whereNull()` methods in the `GlideQuery` class instead of this method where possible. See `GlideQuery`. 

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th><strong>Parameters</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>predicate</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Returns</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>Stream</td>
</tr>
</tbody>
</table>

This example shows how to check all records in the Task table against a defined filter. If the records match the filter, the system returns the stream of records. Otherwise, it returns an empty Stream object.

```javascript
var shoutingTasks = new global.GlideQuery('task')
  .whereNotNull('description')
  .select('description')
  .filter(function (task) {
    return task.description.toUpperCase() === task.description;
  });
```

**Stream - find(Function predicate)**

Returns the first record or item in the Stream object that matches the predicate function. If no predicate function is provided, then the method returns the first record or item in the Stream.

<table>
<thead>
<tr>
<th><strong>Parameters</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>predicate</td>
</tr>
</tbody>
</table>
This example shows how to return the first record from the stream.

```javascript
var UserOptional = new global.GlideQuery('sys_user')
  .where('active', true)
  .where('company.name', 'ServiceNow')
  .select()
  .find()
  .map(function (user) {
    return JSON.stringify(user);
  })

gs.info(UserOptional);

Output:

Optional<"sys_id":"babb4639b76233004fbc2089ee11a97f">"}
This example shows you how to query the User table and then create a child query from the result. This example executes an N+1 query, which can cause performance issues. Avoid this use case in a production environment.

```javascript
var records = new global.GlideQuery('sys_user')
  .where('last_login', '>', '2015-12-31')
  .select('first_name', 'last_name')
  .flatMap(function (u) {
    return new global.GlideQuery('task')
      .where('closed_by', u.sys_id)
      .select('closed_at', 'description')
      .map(function (t) {
        return {
          first_name: u.first_name,
          last_name: u.last_name,
          description: t.description,
          closed_at: t.closed_at
        };
      });
  });
  .limit(5)
  .toArray(100);

gs.info(JSON.stringify(records));
```

Output:

```
[
  {
    "first_name":"System",
    "last_name":"Administrator",
    "description":null,
    "closed_at":"2020-08-23 13:14:56"
  },
  {
    "first_name":"System",
    "last_name":"Administrator",
    "description":null,
    "closed_at":"2020-08-23 13:07:43"
  },
  {
    "first_name":"System",
    "last_name":"Administrator",
    "description":null,
    "closed_at":"2020-06-15 06:59:05"
  }
]```
Stream - forEach(Function fn)

Applies the specified function to each record or item in the stream.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to apply to each item in the stream.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows you how to print the result of each item in the stream.

```javascript
var firstNames = new global.GlideQuery('sys_user')
  .select('first_name')
  .forEach(function (u) {
    gs.debug(u.first_name);
  });
```

Output:

### Script: [DEBUG] survey
### Script: [DEBUG] Lucius
### Script: [DEBUG] Jimmie
### Script: [DEBUG] Melinda
### Script: [DEBUG] Jewel
Stream - fromArray(Object arr)

Returns a Stream object that contains the values from the provided array.

ℹ️ Note: This method is static. You do not need an instance of the class to use this method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arr</td>
<td>Array</td>
<td>Array of values to create the stream from.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream</td>
<td>Object used to interact with a stream of items such as records.</td>
</tr>
</tbody>
</table>

This example shows how to create a Stream object containing an array of values.

```javascript
var nameStream = Stream.fromArray(['Bob', 'Sue', 'Sam']
  .map(function (name) {
    return name.toUpperCase();
  })
  .toArray(3);

gs.info(JSON.stringify(nameStream));
```

Output:

```
["BOB","SUE","SAM"]
```

Stream - limit(Number count)

Limits the number of results returned by the stream.
For better performance, use the `limit()` method in the `GlideQuery` class where possible. See `GlideQuery`. You may need to use this method to limit results with the `Stream.flatMap()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>Number of records to return.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream</td>
<td>Object used to interact with a stream of items such as records.</td>
</tr>
</tbody>
</table>

This example shows you how to limit the results returned from the `Stream.flatMap()` method.

```javascript
var records = new global.GlideQuery('sys_user')
    .where('last_login', '>', '2015-12-31')
    .select('first_name', 'last_name')
    .flatMap(function (u) {
        return new GlideQuery('task')
            .where('closed_by', u.sys_id)
            .select('closed_at', 'description')
            .map(function (t) {
                return {
                    first_name: u.first_name,
                    last_name: u.last_name,
                    description: t.description,
                    closed_at: t.closed_at
                };
            });
    })
    .limit(5)
    .toArray(100);

gs.info(JSON.stringify(records));
```

Output:

```json
[
]
```
Stream - map(Function fn)

Applies a function to each item in a stream and returns the updated Stream object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fn</td>
<td>Function</td>
<td>Function to apply to the result of the query that takes the each item in the stream as input.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream</td>
<td>Object containing the stream of records updated after applying the function.</td>
</tr>
</tbody>
</table>

This example shows you how to apply a function to every item in the stream.

```javascript
var users = new global.GlideQuery('sys_user')
    .whereNotNull('first_name')
    .select('first_name')
    .map(function (u) {
        return u.first_name.toUpperCase();
    })
    .toArray(100);

gs.info(JSON.stringify(users));
```

Output:

```
[
    "SURVEY",
    "LUCIUS",
    "JIMMIE",
    "MELINDA",
    "JEWEL",
    "SEAN",
    "JACINTO",
    "KRYSLE",
    "BILLIE",
    "CHRISTIAN",
    ...
]
```

**Stream - reduce(function reducerFn, Any initialValue)**

Executes a reducer function on each item in the stream, resulting in single output value.

This method is similar to the native JavaScript `reduce()` method. For more information, see [w3schools documentation](https://www.w3schools.com/jsref/jsref_reduce.asp).
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| reducerFn | Function | Function to apply to each item in the stream that reduces the stream to a single value. This function must take two arguments:  
  - acc: Accumulator that accumulates all values returned by the function.  
  - cur: Current item being accumulated in the array. |
| initialValue | Any   | Value passed to the function as the initial value. |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any</td>
<td>Accumulated total of all items returned by the reducer function.</td>
</tr>
</tbody>
</table>

This example shows you how to return the record with the longest name from the User table.

```javascript
var longestName = new global.GlideQuery('sys_user')
  .whereNotNull('first_name')
  .select('first_name')
  .reduce(function (acc, cur) {
    return cur.first_name.length > acc.length
    ? cur.first_name
    : acc;
  }, '');

gs.info(JSON.stringify(longestName));
```

**Output:**

"ATF_TestItilUser1"

### Stream - some(Function predicate)

Applies a predicate function, a function that takes a single value and returns true or false, to each item in the stream. If the predicate returns true for any item in the stream, the method returns true.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>predicate</td>
<td>Function</td>
<td>Predicate function to apply to the items inside the Stream object. Must return a Boolean value.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether the predicate function returned true for an item in the stream. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: The predicate function returned true for an item in the stream.</td>
</tr>
<tr>
<td></td>
<td>• false: The predicate function did not return true for an item in the stream.</td>
</tr>
</tbody>
</table>

This example shows how to check whether any descriptions in the Task table are over 1,000 characters long.

```javascript
var hasLongDescriptions = new global.GlideQuery('task')
    .whereNotNull('description')
    .select('description')
    .some(function (t) {
        return t.description.length > 1000;
    });

gs.info(hasLongDescriptions);
```

Output:

false

### Stream - toArray(Number count)

Returns an array containing the given number of items from the stream.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>The maximum number of items from the stream to return in the array.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array containing the given number of items from the stream.</td>
</tr>
</tbody>
</table>

This example shows you how to transform a stream of records into a JavaScript array.

```javascript
var users = new global.GlideQuery('sys_user')
  .limit(10)
  .select('first_name', 'last_name')
  .toArray(50);

gs.info(JSON.stringify(users));
```

Output:

```json
[
  {
    "first_name": "Jewel",
    "last_name": "Agresta",
    "sys_id": "02826bf03710200044e0bfc8bcbe5d64"
  },
  {
    "first_name": "Sean",
    "last_name": "Bonnet",
    "sys_id": "02826bf03710200044e0bfc8bcbe5d6d"
  },
  {
    "first_name": "Jacinto",
    "last_name": "Gawron",
    "sys_id": "02826bf03710200044e0bfc8bcbe5d76"
  },
  {
    "first_name": "Krystle",
    "last_name": "Stika",
```
Subflow - Scoped

Runs published Flow Designer subflows.

This API is deprecated and replaced by the FlowAPI - Scoped, GlobalFlowAPI - Scoped, Global.

The Subflow API can only be used in server scripts.

Use the sn_fd namespace to access the Subflow API.

Before interacting with a subflow using the Subflow API, you must first create and publish the subflow in the Flow Designer interface. Because the Subflow API only interacts with pre-built subflows, there is no constructor for the class.

Note: To optimize instance performance, avoid calling these methods from a script for an asynchronous business rule. Instead, create a scheduled job record within the Flow Designer UI.

Scoped Subflow - startAsync(String scopeName.subflowName, Map inputs)

Runs a published subflow asynchronously.

Asynchronous calls are non-blocking, allowing the client to execute other code in the script without having to wait for the subflow to complete.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopeName.subflowName</td>
<td>String</td>
<td>The application scope for the subflow and the internal name of the subflow to run. If</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scopeName</td>
<td>String</td>
<td>If scopeName is not included, the scope of the user currently logged in is used. Retrieve the internal name of the subflow using the Internal name column on the Flow Designer landing page.</td>
</tr>
<tr>
<td>inputs</td>
<td>Map</td>
<td>Name-value pairs that define subflow inputs. If a subflow includes mandatory inputs, they must be included. For inputs of Reference or Document ID field types, use a GlideRecord object as the value.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>PlanResponse object containing the following properties:</td>
</tr>
<tr>
<td></td>
<td>• contextId: Sys_id of the execution details record for the executed subflow. Access the execution details by navigating to the Flow Executions tab in Flow Designer and filtering by sys_id.</td>
</tr>
<tr>
<td></td>
<td>An exception occurs when the subflow:</td>
</tr>
<tr>
<td></td>
<td>• Does not exist within the specified application scope, or the subflow or scope name has been misspelled.</td>
</tr>
<tr>
<td></td>
<td>• Is not published.</td>
</tr>
<tr>
<td></td>
<td>• Is passed an input object that does not match the subflow inputs.</td>
</tr>
<tr>
<td></td>
<td>• Exceeds the recursion limit set by the com.glide.hub.flow_engine.indirect_recursion_limit system property. The default value is three.</td>
</tr>
</tbody>
</table>

```javascript
//Run a subflow that takes two inputs: user, a sys_user record, and laptop_welcome_message, a string.

(function startSubflowAsync() {
    try {
        var userToProvisionFor = new GlideRecord('sys_user');
        userToProvisionFor.get('62826bf03710200044e0bfc8bcbe5df1');
    }
```

var inputs = {};
inputs['user'] = userToProvisionFor;
inputs['laptop_welcome_message'] = 'Welcome Onboard!!';

var result = sn_fd.Subflow.startAsync('sn_devstudio.provisionlaptop', inputs);

//The Sys ID of a flow execution (contextId)
var contextId = result.contextId;

}) catch (ex) {
    var message = ex.getMessage();
    gs.error(message);
}

})();

SummaryTableWriter - Global
The SummaryTableWriter script include enables the creation of summary sets for reports that can be generated with standard queries and trending.

This script provides methods that enable you to customize the output of the summary sets for reports, such as adding a title, defining a query on which to base the report data, and specifying the stack column and X axis.

SummaryTableWriter - generate()
Creates the summary set of records for reports.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

var opened = new SummaryTableWriter('incident', '');
opened.generate();
SummaryTableWriter - setQuery(String query)
Defines the query to use to load the data for the summary record set.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query</td>
<td>String</td>
<td>Query to use to load the summary data.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.setQuery("active=true");
summarySet.generate();
```

SummaryTableWriter - setStackOn(String column)
Defines the column on which to stack the incident records.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column</td>
<td>String</td>
<td>Column that is used to stack the incident records.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.setQuery("active=true");
summarySet.setStackOn('priority');
summarySet.generate();
```

SummaryTableWriter - setTitle(String title)
Sets the title of the summary set, which is also the chart title.

```javascript
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.setQuery("active=true");
summarySet.setTitle('Summary Title');
summarySet.generate();
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td>String</td>
<td>Title given to the summary set that is used as the chart title. Also used as the key field for chart generators to determine whether the data was generated.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var opened = new SummaryTableWriter('incident', '');
opened.setTitle("Trend of Open Incidents");
opened.setTrend('opened_at', 'month');
opened.generate();
```

### SummaryTableWriter - setTrend(String field, String interval)

Sets the time field used for the X axis or stacking field; can also set the time interval used to calculate the trend.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>String</td>
<td>Time field that is used for X axis values if grouping is not used. If grouping is used, then this is the stacking field.</td>
</tr>
<tr>
<td>interval</td>
<td>String</td>
<td>Time interval that is used to calculate the trend.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var opened = new SummaryTableWriter('incident', '');
opened.setTitle("Trend of Open Incidents");
opened.setTrend('opened_at', 'month');
opened.generate();
```
SummaryTableWriter - SummaryTableWriter(String tableName, String columnName)

Produces a summary set for the COUNT of all incidents grouped by category.

The custom chart definition table contains a field named Table that is hidden by default. If the field is set, which it is in some of the base custom charts, then, no matter what is defined within the custom chart scripts, clicking on the chart points you to this table.

For example, if you create a custom chart against the [task] table through a script, but you copied the custom chart from a custom chart that contains Table = incident, then clicking on any bar in the custom script will go to incident.do rather than to task.do.

To check the value of the Table field, click the additional actions icon and select Configure > Form Layout and move the Table field from Available to Selected. Open the custom chart definition and set the Table field to none.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>tableName</td>
</tr>
<tr>
<td>columnName</td>
</tr>
</tbody>
</table>

```javascript
var summarySet = new SummaryTableWriter('incident', 'category');
summarySet.generate();
```

SVGToPDFConversionAPI API - Scoped, Global

Enables adding an SVG to a PDF and converting an SVG to PDF.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

See also PDFGenerationAPI.

SVGToPDFConversionAPI - SVGToPDFConversionAPI()

Instantiates a new SVGToPDFConversionAPI object.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>
The following examples shows how to create a SVGToPDFConversionAPI object.

```javascript
var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();
```

**SVGToPDFConversionAPI - addSVGToPDF(String svg, String inputPdfSysId, String targetTable, String targetSysId, String nameForPdf, Number pageNo, Number x, Number y, Number svgImgWidth, Number svgImgHeight)**

Adds an SVG image to a PDF on a specified page with image size and location coordinates.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>svg</td>
<td>String</td>
<td>SVG to convert to a PDF document.</td>
</tr>
<tr>
<td>inputPdfSysId</td>
<td>String</td>
<td>Sys_id of the target PDF in which to create a copy of with an SVG. The target PDF is in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table containing the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetTableSysId</td>
<td>String</td>
<td>Sys_id of the record to which the PDF is attached. You can find this value in the same row as the attachment listed in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetTableSysId</td>
<td>String</td>
<td>Name of the table on which to attach the converted PDF.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>pageNo</td>
<td>Number</td>
<td>Page number in the attached PDF on which to place the SVG.</td>
</tr>
<tr>
<td>x</td>
<td>Number</td>
<td>Horizontal position of the SVG in the page. Value is in points.</td>
</tr>
<tr>
<td>y</td>
<td>Number</td>
<td>Vertical position of the SVG in the page. Value is in points.</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>svgImgWidth</td>
<td>Number</td>
<td>Width of the SVG image in pixels.</td>
</tr>
<tr>
<td>svgImgHeight</td>
<td>Number</td>
<td>Height of the SVG image in pixels.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing sys_id of a new PDF attachment with inserted SVG if successful, error message otherwise.</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;attachment_id&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;message&quot;: &quot;String&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: &quot;String&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

<Object>.attachment_id | If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table. |
| Data type: String      |                                                                                                                                               |

<Object>.message | Message confirming success or error. Possible values:                                                                                     |
|                  | - Adding SVG content to PDF failed.                                                                                                          |
|                  | - Adding SVG to PDF and creating new PDF is successful.                                                                                     |
|                  | - Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record. |
|                  | - Input PDF attachment sys id to add the SVG content is null                                                                               |
|                  | - Input SVG content is empty or null                                                                                                         |
|                  | - PdfReader is not opened with owner password                                                                                               |
|                  | - The target table name to attach the modified PDF : <targetTable> is empty or null                                                          |
|                  | - The target table name to attach the modified PDF : <targetTable> is not valid                                                             |
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data type: String</td>
<td></td>
</tr>
<tr>
<td>&lt;Object&gt;.status</td>
<td>Status indicating whether the operation is successful.</td>
</tr>
<tr>
<td></td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>• success - Operation was successful.</td>
</tr>
<tr>
<td></td>
<td>• failure – Operation was not successful. The <strong>message</strong> provides details.</td>
</tr>
<tr>
<td>Data type: String</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how get SVG from the description field of an incident record and add it to page 5 of a PDF attachment. The new PDF with SVG is located in the Attachments [sys_attachment] table.

```javascript
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
    svg = gr.description.toString();
}

var result = new sn_pdfgeneratorutils.SVGToPDFConversionAPI().addSVGToPDF(svg,
    "<inputPdfSysId>", "incident", "<tableSysId>", "AddSVGToPDF", 5, 30, 30, 300, 100);

gs.info(JSON.stringify(result));
```

**Output:**

```json
{"attachment_id": "<sys_id>", "message": "Adding SVG to PDF and creating new PDF is successful.", "status": "success"}
```

**SVGToPDFConversionAPI - convertSVGToPDF(String svg, String pdfName, String targetTable, String targetTableSysId)**

Converts an SVG provided as string to PDF.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>svg</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table on which to attach the converted PDF.</td>
</tr>
<tr>
<td>targetTableSys</td>
<td>String</td>
<td>Sys_id of the record on which to attach the converted PDF.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing sys_id of the PDF attachment converted from SVG if successful, error message otherwise.</td>
</tr>
<tr>
<td>&lt;Object&gt;.attachment_id</td>
<td>If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table.</td>
</tr>
</tbody>
</table>
| <Object>.message | Message confirming success or error. Possible values:  
  * Converting SVG image to PDF document failed.  
  * Exception while reading Source document contents.  
  * Given target record [<tableName> - <targetTableSysId>] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.  
  * SVG to PDF conversion is successful. |
## Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• The Target table name - <code>&lt;tableName&gt;</code> to attach the converted SVG is not valid</td>
</tr>
<tr>
<td></td>
<td>• The Target table name - <code>&lt;tableName&gt;</code> to attach the converted SVG is empty or null</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
</tbody>
</table>

| <Object>.status            | Status indicating whether the operation is successful. Possible values:     |
|                           | • success - Operation was successful.                                       |
|                           | • failure – Operation was not successful. The `message` provides details.   |
|                           | Data type: String                                                           |

The following example shows how get SVG from the description field of an incident record, to convert the SVG to PDF and attach it to a record.

```javascript
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
    svg = gr.description.toString();
}

var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();

var result = v.convertSVGToPDF(svg, "ConvertSVGToPDF", "incident", "<targetTableSysId>");
gs.info(JSON.stringify(result));
```

**Output:**

```json
{"attachment_id":"<pdf_attachment_sys_id>","message":"SVG to PDF conversion is successful.","status":"success"}
```
SVGToPDFConversionAPI - convertSVGToPDFWithSize(String svg, String nameForPDF, String targetTable, String targetTableSysId, Number svgImgWidth, Number svgImgHeight)

Converts an SVG provided as string to PDF with image width and height values.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>svg</td>
<td>String</td>
<td>SVG to convert to a PDF document.</td>
</tr>
<tr>
<td>pdfName</td>
<td>String</td>
<td>Name to give the PDF. Default: Sys_id of the PDF in the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>targetTable</td>
<td>String</td>
<td>Name of the table on which to attach the converted PDF.</td>
</tr>
<tr>
<td>targetTableSysId</td>
<td>String</td>
<td>Sys_id of the record on which to attach the converted PDF.</td>
</tr>
<tr>
<td>svgImgWidth</td>
<td>Number</td>
<td>Width of the SVG image in pixels.</td>
</tr>
<tr>
<td>svgImgHeight</td>
<td>Number</td>
<td>Height of the SVG image in pixels.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Object containing sys_id of the PDF attachment converted from SVG if successful, error message otherwise.</td>
</tr>
<tr>
<td>&lt;Object&gt;.attachment_id</td>
<td>If SVG conversion is successful, sys_id of the attached PDF. The file is listed in the Attachments [sys_attachment] table. Data type: String</td>
</tr>
<tr>
<td>&lt;Object&gt;.message</td>
<td>Message confirming success or error. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Converting SVG image to PDF document failed.</td>
</tr>
<tr>
<td></td>
<td>• Exception while reading Source document contents.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Given target record [&lt;tableName&gt; - &lt;targetTableSysId&gt;] does not exist. – Target table sys_id is not in the table provided. Make sure you include the correct table name for the record.</td>
</tr>
<tr>
<td></td>
<td>• The Target table name - &lt;tableName&gt; to attach the converted SVG is not valid</td>
</tr>
<tr>
<td></td>
<td>• The Target table name - &lt;tableName&gt; to attach the converted SVG is empty or null</td>
</tr>
<tr>
<td></td>
<td>• SVG to PDF conversion is successful.</td>
</tr>
<tr>
<td></td>
<td>Data type: String</td>
</tr>
</tbody>
</table>

<Object>.status  Status indicating whether the operation is successful. Possible values:  
• success - Operation was successful.  
• failure – Operation was not successful. The message provides details.     
Data type: String

The following example shows how get SVG from the description field of an incident record, to convert the SVG to PDF, and attach it to a record.

```javascript
var gr = new GlideRecord("incident");

var svg;

if (gr.get("<tableSysId>")) {
    svg = gr.description.toString();
}

var v = new sn_pdfgeneratorutils.SVGToPDFConversionAPI();

var result = v.convertSVGToPDFWithSize(svg, "ConvertSVGToPDF", "incident", "<targetTableSysId>", 600, 150);
gs.info(JSON.stringify(result));
```

Output:
SystemDocument - Scoped, Global

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the sn_doc_services namespace. For information, see Document Services.

To create a document, use the DocumentService API.

SystemDocument - SystemDocument(String docName)

Instantiates a SystemDocument object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docName</td>
<td>String</td>
<td>Name of the document.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to instantiate a SystemDocument object and set several fields for a document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My document');

// Define the document fields
var reviewers = '62826bf03710200044e0bfc8bcbe5df1,a8f98bb0eb32010045e1a511526fe3a';
d.description('description');
d.classification('restricted');
d.state('review');
d.department('93b25282c0a8000b0b55c8ab34e2f1e6');
d.template(false);
d.type('policy');
d.reviewers(reviewers);
d.audience('external');
```
var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));

Output:
{
    "message": "Create document sysId : 1040420224503410f877a6fed1c2b031 is successful.",
    "request_id": "1040420224503410f877a6fed1c2b031",
    "status": "success"
}

SystemDocument - audience(String audience)
Sets the Audience field of a document record to specify external or internal availability. Represents the Audience field in a Document Management form.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audience</td>
<td>String</td>
<td>String representing the intended audience of the document. Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• external</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• internal</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: internal</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the Audience field in a new document record. See also DocumentService - Scoped, Global.

var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();
d.audience('external');
gs.info(JSON.stringify(s.createDocument(d), null, 2));

Output:
SystemDocument - classification(String classification)

Sets the Classification field of a document record to identify the level of information sensitivity. Represents the Classification field in a Document Management form.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classification</td>
<td>String</td>
<td>Classification of the document. Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• confidential</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• public</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• restricted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: public</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The value of the classification property of a SystemDocument object.</td>
</tr>
</tbody>
</table>

The following example shows how to set the classification field in a new document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My restricted document');
var s = new sn_doc_services.DocumentService();
d.classification('restricted');
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId : d80435c624103410f877a6fed1c2b0d0 is successful."
}
SystemDocument - `createdFromTemplate(String docTemplate)`
Sets the template from which to generate a document. When the document is generated, the specified template is listed in the Created From Template field in the Documents [ds_document_list] table.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docTemplateName</td>
<td>String</td>
<td>Sys_id of a document listed in the Documents [ds_document_list] table. The document must have the Template checkbox selected (true). See also DocumentVersionService API.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to create a new document record from an existing template. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('New doc from template');
var s = new sn_doc_services.DocumentService();
d.createdFromTemplate('<doc_template_sys_id>');
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId: deaef1ce24103410f877a6fed1c2b085 is successful.",
  "request_id": "deaef1ce24103410f877a6fed1c2b085",
  "status": "success"
}
```

SystemDocument - `department(String docDept)`
Sets the Department field of a document record.
The following example shows how to set the department field in a new document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My document');

// Assign the doc to the human resources department
d.department('<dept_sys_id>');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId : 491efbee24187410f877a6fed1c2b0a9 is successful.",
  "request_id": "491efbee24187410f877a6fed1c2b0a9",
  "status": "success"
}
```

**SystemDocument - description(String description)**

Sets the Description field of a document record.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the document.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the description field in a document record. See also: [DocumentService API](#).

```javascript
var d = new sn_doc_services.SystemDocument('My document');
d.description('Information describing the doc.);
var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```json
{
  "message": "Create document sysId : 9acd7fea24587410f877a6fed1c2b060 is successful.",
  "request_id": "9acd7fea24587410f877a6fed1c2b060",
  "status": "success"
}
```

**SystemDocument - name(String docName)**

Sets the Name field of a document record.

**Note:** You can also set the name as a parameter in the `SystemDocument()` constructor.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docName</td>
<td>String</td>
<td>Name of the document.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the Name field in a new document record. See also [DocumentService API](#).
var d = new sn_doc_services.SystemDocument();

d.name('Document named using method instead of constructor');

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));

Output:
```
{
  "message": "Create document sysId : c19d7f2624587410f877a6fed1c2b0eb is successful.",
  "request_id": "c19d7f2624587410f877a6fed1c2b0eb",
  "status": "success"
}
```

**SystemDocument** - owner(String owner)

Sets the Owner field of a document record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>String</td>
<td>Sys_id of a user listed in the Users [sys_user] table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Role required: admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: Current user</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the owner field in a new document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();
d.owner('aa826bf03710200044e0bfc8bcbe5dd6');
gs.info(JSON.stringify(s.createDocument(d), null, 2));

Output:
```
Create document sysId: 8d19f9ca24103410f877a6fed1c2b0aa is successful.

**SystemDocument - reviewers(String reviewers)**

Sets the Reviewers field of a document record.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reviewers</td>
<td>String</td>
<td>List of one or more document reviewers by sys_id. The reviewer must be a user listed in the Users [sys_user] table.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the reviewers field in a new document record. See also [DocumentService API](#).

```javascript
var d = new sn_doc_services.SystemDocument('My document');

var reviewers = '62826bf03710200044e0bfc8bcbe5df1,a8f98bb0eb32010045e1a5115206fe3a';
d.reviewers(reviewers);

var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

**Output:**

```json
{
  "message": "Create document sysId: 8d19f9ca24103410f877a6fed1c2b0aa is successful.",
  "request_id": "8d19f9ca24103410f877a6fed1c2b0aa",
  "status": "success"
}
```

**SystemDocument - state(String state)**

Sets the State field of a document record.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| state | String | State of the document representing where the document is in the workflow. Valid values:  
• draft  
• submit  
• review  
• complete  
Default: draft |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the state field in a new document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My document');
var s = new sn_doc_services.DocumentService();
d.state('submit');
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
  "message": "Create document sysId : 19aab54e24103410f877a6fed1c2b03d is successful.\",
  "request_id": "19aab54e24103410f877a6fed1c2b03d",
  "status": "success"
}
```

**SystemDocument - template(Boolean template)**

Specifies whether a document record is a template.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Boolean</td>
<td>Flag that specifies whether a document record is a template. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• true: The default version of this document is a template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• false: This document is not a template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: false</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to indicate that a document record is a template. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('My document');
d.template(true);
var s = new sn_doc_services.DocumentService();
gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```
{
    "message": "Create document sysId : f7f006ce24103410f877a6fed1c2b053 is successful.",
    "request_id": "f7f006ce24103410f877a6fed1c2b053",
    "status": "success"
}
```

**SystemDocument - type(String docType)**

Sets the Type field of a document record.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docType</td>
<td>String</td>
<td>Type of document. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• contract</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• guideline</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• policy</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• procedure</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: None</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the type field in a new document record. See also DocumentService API.

```javascript
var d = new sn_doc_services.SystemDocument('How to use the document mgmt API');
var s = new sn_doc_services.DocumentService();

d.type('guideline');

gs.info(JSON.stringify(s.createDocument(d), null, 2));
```

Output:

```json
{
    "message": "Create document sysId : 8adfb10224503410f877a6fed1c2b0e4 is successful.",
    "request_id": "8adfb10224503410f877a6fed1c2b0e4",
    "status": "success"
}
```

### SystemDocumentList - Scoped, Global

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the `sn_doc_services` namespace. For information, see Document Services.
To create or manage a document list, use the DocumentListService API.

**SystemDocumentList - SystemDocumentList(String docListName)**

Instantiates a SystemDocumentList object.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docListName</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>Name of the document list.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to instantiate a SystemDocumentList object.

```javascript
var docList = new sn_doc_services.SystemDocumentList();
```

**SystemDocumentList - description(String description)**

Sets the Description field of a new document list record.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>Description of the document list.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add a description to the document list. See also DocumentListService API.

```javascript
var dL = new sn_doc_services.SystemDocumentList('My document list');
// Define the document list field
dL.description('description');
```
var docList = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docList.createDocumentList(dL), null, 2));

Output:
{
"message": "Create List for the given name : My document list, List sysId : b2c021a924683c10f877a6fed1c2b0b1 is successful.",
"request_id": "b2c021a924683c10f877a6fed1c2b0b1",
"status": "success"
}

SystemDocumentList - name(String docListName)
Sets the Name field of a document list record.

Note: You can also set the name as a parameter in the SystemDocumentList() constructor.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docListName</td>
<td>String</td>
<td>Name of the document list.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to rename an existing document list. See also DocumentListService.

```javascript
var docListID = 'b2c021a924683c10f877a6fed1c2b0b1';
var docListUpdate = new sn_doc_services.SystemDocumentList();
docListUpdate.name('name change');

var docListSvc = new sn_doc_services.DocumentListService();
gs.info(JSON.stringify(docListSvc.updateDocumentList(docListID, docListUpdate), null, 2));
```

Output:
{
"message": "Update List for the given sysId : b2c021a924683c10f877a6fed1c2b0b1 is successful.",
"request_id": "b2c021a924683c10f877a6fed1c2b0b1",
"status": "success"
}
SystemDocumentListEntry - Scoped, Global

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the sn_doc_services namespace. For information, see Document Services. Before using the methods in this API, add a document with its version and create a document list. Use the DocumentListEntryService API to add or remove documents from a document list.

Before using the methods in this API, you must add a document with its versions, and create a document list.

- DocumentService – Add, update, or delete a document.
- DocumentVersionService – Add, update, or delete a document version.
- DocumentListService – Add, update, or delete a document list.

SystemDocumentListEntry - SystemDocumentListEntry(String listID)

Instantiates a SystemDocumentListEntry object.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to instantiate a `SystemDocumentListEntry` object.

```javascript
var docList = new sn_doc_services.SystemDocumentListEntry("<docListSysId>");
```

### SystemDocumentListEntry - description(String description)

Sets the Description field of a document list entry record.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the document list entry.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

The following example shows how to add a description to the document list entry provided using the constructor. See also `DocumentListEntryService` API.

```javascript
var docListEntry = new
    sn_doc_services.SystemDocumentListEntry('21afddea2460fc10f877a6fed1c2b0dd');

docListEntry.description('birth');

docListEntry = new
    sn_doc_services.SystemDocumentListEntry /*#__PURE__*/
    Object);

gs.info(JSON.stringify(docListEntry, null, 2));
```

Output:

```json
{
    "message": "Create List Entry , List Entry sysId : d3f0b13624e8fc10f877a6fed1c2b0d9is successful.",
    "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9",
    "status": "success"
}
```

### SystemDocumentListEntry - document(String docSysId)

Specifies the document template to add to a document list.

To define a document as a template:
• Define the document object setting the `SystemDocument – template()` method to true. Create or update the document record with the methods in the `DocumentService` API.

• Select the Template check box of a document in the Documents `[ds_document]` table.

The document record specified must have a version. Use the following APIs to define and add a document version:

• `DocumentVersionService` – Add, update, or delete a document version.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>docSysId</code></td>
<td>String</td>
<td>Sys_id of a document record in the Documents <code>[ds_document]</code> table. The document specified must be a template and have a version.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to add a document template as a document list entry. See also `DocumentListEntryService` API.

```javascript
var docListEntry = new sn_doc_services.SystemDocumentListEntry('21afddea2460fc10f877a6fed1c2b0dd');
docListEntry.document("9acd7fea24587410f877a6fed1c2b060");
docListEntry.description('birth certificate');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docListEntry), null, 2));
```

**Output:**

```json
{
  "message": "Create List Entry , List Entry sysId : d3f0b13624e8fc10f877a6fed1c2b0d9 is successful.",
  "request_id": "d3f0b13624e8fc10f877a6fed1c2b0d9"
}
```
SystemDocumentListEntry - documentList(String listSysId)

Specifies the document list in which to add a document.

Note: You can alternatively set the document list as a parameter in the SystemDocumentListEntry() constructor.

Use the following APIs to define and create a document list:

- DocumentListService – Add, update, or delete a document list.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the document list in which to add a document. See also DocumentListEntryService API.

```javascript
var docListEntry = new sn_doc_services.SystemDocumentListEntry();
docListEntry.documentList('21afddea2460fc10f877a6fed1c2b0dd');
docListEntry.document('deaef1ce24103410f877a6fed1c2b085');
docListEntry.description('passport');

var dlEntrySvc = new sn_doc_services.DocumentListEntryService();
gs.info(JSON.stringify(dlEntrySvc.createDocumentListEntry(docListEntry), null, 2));
```

Output:

```json
{
  "message": "Create List Entry , List Entry sysId : c4ccaa8b24283050f877a6fed1c2b003is successful.",
  "request_id": "c4ccaa8b24283050f877a6fed1c2b003"
}
```
SystemDocumentVersion - Scoped, Global

This API requires the Document Management plugin (com.snc.platform_document_management) and is provided within the sn_doc_services namespace. For information, see Document Services.

To create a document version, use the DocumentVersionService API.

SystemDocumentVersion - SystemDocumentVersion(String docSysId)

Instantiates a SystemDocumentVersion object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to instantiate a SystemDocumentVersion object and create a document version. See also DocumentVersionService.

```javascript
var versionDefinition = new sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fed1c2b0a9');
versionDefinition.type('url');
versionDefinition.url('http://one/1.0');
var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionDefinition), null, 2));
```

Output:
SystemDocumentVersion - document(String docSysId)

Specifies the document record for this version.

Note: You can alternatively set the name as a parameter in the SystemDocumentVersion() constructor.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the name field of a document version. See also DocumentVersionService – createDocumentVersion().

```javascript
var versionDefinition = new sn_doc_services.SystemDocumentVersion();
versionDefinition.document('491efbee24187410f877a6fed1c2b0a9');
var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionDefinition), null, 2));
```

Output:

```javascript
{
    "message": "Adding an entry to DocumentVersion for the given docId : 491efbee24187410f877a6fed1c2b0a9, sysId : 1c504c91242cf810f877a6fed1c2b08b is successful.",
    "request_id": "1c504c91242cf810f877a6fed1c2b08b",
    "status": "success"
}
```
SystemDocumentVersion - type(String docType)

Sets the Type field of a document version.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>docType</td>
<td>String</td>
<td>Document source type. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• url</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• attachment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: attachment</td>
</tr>
</tbody>
</table>

**Note:** An attachment can currently only be added in the Document Versions [ds_document_version] table UI and not with the API.

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the type field and create a document version. See also [DocumentVersionService](#).

```javascript
var versionDefinition = new sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fed1c2b0a9');
versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionDefinition), null, 2));
```

```json
{
  "message": "Adding an entry to DocumentVersion for the given docId : 491efbee24187410f877a6fed1c2b0a9, sysId : d5a340d9242c81f877a6fed1c2b069 is successful."
}
```
SystemDocumentVersion - url(String url)
Sets the URL of a document version.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>String</td>
<td>URL of the source document for this version.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the URL field as the source of a document version. See also DocumentVersionService.

```javascript
var versionDefinition = new sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fed1c2b0a9');
versionDefinition.type('url');
versionDefinition.url('http://one/1.0');

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionDefinition), null, 2));
```

SystemDocumentVersion - versionNumber(Number versionNumber)
Sets the number of a document version.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>versionNumber</td>
<td>Number</td>
<td>Version number for this document.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the version number and create a document version. See also DocumentVersionService.

```javascript
var versionDefinition = new sn_doc_services.SystemDocumentVersion('491efbee24187410f877a6fed1c2b0a9');

versionDefinition.type('url');
versionDefinition.url('http://one/1.0');
versionDefinition.versionNumber(5);

var versionSvc = new sn_doc_services.DocumentVersionService();
gs.info(JSON.stringify(versionSvc.createDocumentVersion(versionDefinition), null, 2));
```

Output:

```json
{
  "message": "Adding an entry to DocumentVersion for the given docId: 491efbee24187410f877a6fed1c2b0a9, sysId: ff47449d242cf810f877a6fed1c2b06c is successful.",
  "request_id": "ff47449d242cf810f877a6fed1c2b06c",
  "status": "success"
}
```

## Table - Scoped, Global

Creates a Table object to add to a PDF document. Defines the data to use in each cell and sets styles, margins, and alignment.

This API is part of the ServiceNow PDF Generation Utilities plugin (com.snc.apppdfgenerator) and is provided within the sn_pdfgeneratorutils namespace. The plugin is activated by default.

This API is a component used with the Document API to generate a PDF.
Build a Table object using the methods in this class. You can use these additional classes to add cells, paragraphs, and styles to your table:

Cell API

Create a cell using the `Cell` API. Then, add the cell to your table using one of these methods:

- `Table.addCell()`
- `Table.addCellWithStyle()`
- `Table.addHeaderCell()`
- `Table.addImageCell()`
- `Table.addParagraphCell()`
- `Table.addTextCell()`

Paragraph API

Create a paragraph using the `Paragraph` API. Add the paragraph to a cell in the table using `Cell.addParagraph()`.

Style API

Set styles, colors, and borders using the `Style` API. Add the styles to the table using one of these methods:

- `Table.setDefaultStyle()`
- `Table.setHeaderStyle()`

You can then apply the Table object to a PDF document using the following class and method.

Document API

Use the `Document.addTable()` method to add your table to a PDF document. You can use the `Document.saveAsAttachment()` method to attach the document to a record.

Table - `Table(Boolean ltr, Array columnWidths, Boolean largeTable)`

Instantiates a new Table object with text direction, column width, and layout settings.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| ltr      | Boolean| Flag that indicates text direction of the language in the table. For information, see [W3C: Script direction and languages](https://www.w3.org/International/questions/qa-script-direction). Valid values:  
  - true: Text direction is left-to-right.  
  - false: Text direction is right-to-left. |
| columnWidths | Array | Numbers specifying the width of each column in a table. Sizes are based proportionally. For example, `var columnWidths = [2, 1, 1];` is a three-column table with a first column twice as large as the other two. Default: Each column is equal width. |
| largeTable | Boolean | Flag that indicates whether 100% width and fixed layout are set implicitly. Valid values:  
  - true: Table uses 100% width with a fixed layout. If true, use the `complete()` method when all content has been added to indicate that the table is complete.  
  - false: Automatic table size. Default: false |

The following example shows how to create a 2-column Table object.

```javascript
var table = new sn_pdfgeneratorutils.Table(true, [70,200], false);
```

### Table – `addCell(Cell cell)`

Adds a cell element to the table.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Cell</td>
<td>Cell element to add to the table.</td>
</tr>
</tbody>
</table>
This example shows how to create a Table object from the incident table and add a Number and a Short Description cell to each row.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [70,200], false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);
table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);
table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;
```
while(gr.next()) {
    var numCell = new sn_pdfgeneratorutils.Cell;
    var sdCell = new sn_pdfgeneratorutils.Cell;

    var numberParagraph = new sn_pdfgeneratorutils.Paragraph(gr.number);
    var sdParagraph = new sn_pdfgeneratorutils.Paragraph(gr.short_description);

    numCell.addParagraph(numberParagraph);
    sdCell.addParagraph(sdParagraph);

    if (row % 2 == 1) {
        table.setDefaultbackGroundColor(greyColor);
    } else {
        table.setDefaultbackGroundColor(whiteColor);
    }

    table.addCell(numCell);
    table.addCell(sdCell);

    row = row + 1;
}

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");

**Table – addCellWithStyle(Cell cell, Style style)**

Adds a cell element with an applied style to the table.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Cell</td>
<td>Cell object to add to the table.</td>
</tr>
<tr>
<td>style</td>
<td>Style</td>
<td>Style to apply to the cell.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to apply a style to a specified Cell object and save the document as an attachment to a record.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor = sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor = sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var cellBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [70,200], false);

var cellStyle = new sn_pdfgeneratorutils.Style;
cellStyle.setBackgroundColor(cellBgColor);
cellStyle.setTextAlignment("text-center");
cellStyle.setBold();
cellStyle.setFontColor(whiteColor);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;

while (gr.next()) {
    var numCell = new sn_pdfgeneratorutils.Cell;
    var sdCell = new sn_pdfgeneratorutils.Cell;

    var numberParagraph = new sn_pdfgeneratorutils.Paragraph(gr.number);
    var sdParagraph = new sn_pdfgeneratorutils.Paragraph(gr.short_description);
}
numCell.addParagraph(numberParagraph);
sdCell.addParagraph(sdParagraph);

if (row % 2 == 1) {
    table.setDefaultbackGroundColor(greyColor);
} else {
    table.setDefaultbackGroundColor(whiteColor);
}

table.addCellWithStyle(numCell, cellStyle);
table.addCell(sdCell);

row = row + 1;

}
document.addTable(table);
document.saveAsAttachment("incident", "sys_id", "filename.pdf");

Table – addHeaderCell(Cell cell)
Adds a header Cell object to the table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cell</td>
<td>Cell</td>
<td>Header cell to add to the table.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to add a header cell to a table that contains a Paragraph object. For more information on Paragraph objects, see the Paragraph API.

var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor = sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor = sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);
// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [70,200], false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var row = 0;

while(gr.next()) {
    var numCell = new sn_pdfgeneratorutils.Cell;
    var sdCell = new sn_pdfgeneratorutils.Cell;

    var numberParagraph = new sn_pdfgeneratorutils.Paragraph(gr.number);
    var sdParagraph = new sn_pdfgeneratorutils.Paragraph(gr.short_description);

    numCell.addParagraph(numberParagraph);
    sdCell.addParagraph(sdParagraph);

    if (row % 2 == 1) {
        table.setDefaultbackGroundColor(greyColor);
    } else {
        table.setDefaultbackGroundColor(whiteColor);
    }

    row++;
}
Table – addImageCell(Image image)

Adds a cell that contains an image to the table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>image</td>
<td>Image</td>
<td>Image object to add to the cell.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a table with two image cells and attach the document to a record.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [70,200], false);

var icon = new sn_pdfgeneratorutils.Image("<sys_id>");
var picture = new sn_pdfgeneratorutils.Image("<sys_id>");

table.addImageCell(icon);
table.addImageCell(picture);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```
Table – addParagraphCell(Paragraph p)
Adds a cell that contains a paragraph to the table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p</td>
<td>Paragraph</td>
<td>Paragraph object to add to the cell.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a table with a single cell containing paragraph content.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var paragraph = new sn_pdfgeneratorutils.Paragraph("Content to add to the cell");

table.addParagraphCell(paragraph);

document.addTable(table);

document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

Table – addTextCell(String text)
Adds a cell that contains a string to the table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>String</td>
<td>Text to add to the cell.</td>
</tr>
</tbody>
</table>
This example shows how to create a table with a single cell containing a string.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");

document.addTable(table);
document.saveAsAttachment("incident", "record_sys_id", "filename.pdf");
```

Table – complete()
Indicates that all the intended content has been added to a large table.

Use with the `Table.flush()` method to add additional content to a table already added to a document. This method only applies when the `largeTable` parameter in the constructor is set to true.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to indicate adding content to a table already added to a document is complete.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor = sn_pdfgeneratorutils.Color([1,1,1]);
```
var greyColor = sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1,2,1,1], true);
var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);
table.setHeaderStyle(headerStyle);

var numberParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var descParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");
var stateParagraph = new sn_pdfgeneratorutils.Paragraph("State");
var assignedParagraph = new sn_pdfgeneratorutils.Paragraph("Assigned to");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
var hdrCell3 = new sn_pdfgeneratorutils.Cell;
var hdrCell4 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(numberParagraph);
hdrCell2.addParagraph(descParagraph);
hdrCell3.addParagraph(stateParagraph);
hdrCell4.addParagraph(assignedParagraph);
table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);
table.addHeaderCell(hdrCell3);
table.addHeaderCell(hdrCell4);

var row = 0;

while(gr.next()) {
    var numCell = new sn_pdfgeneratorutils.Cell;
    var sdCell = new sn_pdfgeneratorutils.Cell;

    row++;
Table – donotSplitRowOnPageBreak(Boolean value)
Prevents splitting a row across two pages, when possible.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| value | Boolean| Flag that indicates whether to split a row across two pages, or move the entire row onto the second page. However, this property does not apply when the row spans more than a single page. Valid values:  
  • true: If the remaining part of a page is not large enough for the row, adds the entire row to a new page.  
  • false: If the remaining part of a page is not large enough for the row, splits the row across two pages.  
  Default: false |

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

This example shows how to prevent splitting a row across two pages.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [25,25,25,75,400], false);

  table.addTextCell("Text to add to the cell");
  table.addTextCell("More text to add to the cell");
  table.addTextCell("Even more text to add to the cell");
  table.addTextCell("Even more text to add to the cell");
  table.addTextCell("Even more text to add to the cell");

  table.donotSplitRowOnPageBreak(true);

  document.addTable(table);

  document.saveAsAttachment("incident", "record_sys_id", "filename.pdf");
```
Table – flush()
Adds additional content to a table that is already added to a document.

Use with the Table.complete() method to indicate that you have added all additional content to the table. This method only applies when the largeTable parameter in the constructor is set to true.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to add a text cell to a table that is already added to a document.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1,2,1,1], true);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);
```
```javascript
var numberParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var descParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");
var stateParagraph = new sn_pdfgeneratorutils.Paragraph("State");
var assignedParagraph = new sn_pdfgeneratorutils.Paragraph("Assigned to");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
var hdrCell3 = new sn_pdfgeneratorutils.Cell;
var hdrCell4 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(numberParagraph);
hdrCell2.addParagraph(descParagraph);
hdrCell3.addParagraph(stateParagraph);
hdrCell4.addParagraph(assignedParagraph);

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);
table.addHeaderCell(hdrCell3);
table.addHeaderCell(hdrCell4);

var row = 0;

while(gr.next()) {
  var numCell = new sn_pdfgeneratorutils.Cell;
  var sdCell = new sn_pdfgeneratorutils.Cell;
  var stateCell = new sn_pdfgeneratorutils.Cell;
  var assignedCell = new sn_pdfgeneratorutils.Cell;

  var numberParagraph = new sn_pdfgeneratorutils.Paragraph(gr.number);
  var sdParagraph = new sn_pdfgeneratorutils.Paragraph(gr.short_description);
  var stateParagraph = new sn_pdfgeneratorutils.Paragraph(gr.state);
  var assignedParagraph = new sn_pdfgeneratorutils.Paragraph(gr.assigned_to);

  numCell.addParagraph(numberParagraph);
  sdCell.addParagraph(sdParagraph);
  stateCell.addParagraph(stateParagraph);
  assignedCell.addParagraph(assignedParagraph);

  if (row % 2 == 1) {
    table.setDefaultbackGroundColor(greyColor);
  } else {
    // Add other code here...
  }
  row++;
}
```

```javascript
  table.setDefaultBackgroundColor(whiteColor);
  
  table.addCell(numCell);
  table.addCell(sdCell);
  table.addCell(stateCell);
  table.addCell(assignedCell);
  
  row = row + 1;
  
}

document.addTable(table);
  
table.addTextCell("A cell added later");
  table.flush();
  table.complete();
  document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

### Table – `getDefaultStyle()`
Retrieves the default style.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Style</td>
<td>Default style.</td>
</tr>
</tbody>
</table>

This example shows how to set and then return the default style.

```javascript
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var style = new sn_pdfgeneratorutils.Style();

style.setItalic();

table.setDefaultStyle(style);

```

var defaultStyle = table.getDefaultStyle();

gs.info(defaultStyle);

Table – getHeaderStyle()

Returns the style applied to the table’s header.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Style</td>
<td>Style applied to the table’s header.</td>
</tr>
</tbody>
</table>

This example shows how to set and return the table's header style.

```javascript
var table = new sn_pdfgeneratorutils.Table(true, [1,1], false);

var whiteColor = sn_pdfgeneratorutils.Color([1,1,1]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var styleObject = table.getHeaderStyle();

gs.info(styleObject);
```
Table – `setBorder(Number width)`

Sets a border of designated width around the outer edges of the table.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Width of the border.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Points</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a table with two-pixel border and attach the table to a record.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

  table.addTextCell("Text to add to the cell");
  table.setBorder(2);

document.addTable(table);
"document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

Table – `setDefaultBackGroundColor(Color color)`

Sets the table’s default background color.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>color</td>
<td>Color</td>
<td>Color object used as the default background color for the table.</td>
</tr>
</tbody>
</table>
This example shows how to set the default background color for the table.

```javascript
// declare table by providing width array with automatic table size
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var color = new sn_pdfgeneratorutils.Color([0.8, 0.8, 0.8]);

table.setDefaultbackGroundColor(color);

table.addTextCell("Text to add to the cell");
```

**Table – setDefaultStyle(Style defaultStyle)**

Sets the default style to apply to the table.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultStyle</td>
<td>Style</td>
<td>Default style to apply to the table.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to apply a default style to a table.

```javascript
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

var style = new sn_pdfgeneratorutils.Style();

style.setItalic();

table.setDefaultStyle(style);

table.addTextCell("Text to add to the cell");

var defaultStyle = table.getDefaultStyle();
```
Table – setFixedPosition(Number pageNumber, Number left, Number bottom, Number width)

Sets the table to a fixed position on the page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pageNumber</td>
<td>Number</td>
<td>Number of the page to add the table to.</td>
</tr>
<tr>
<td>left</td>
<td>Number</td>
<td>Number of pixels from the left margin to add the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Points</td>
</tr>
<tr>
<td>bottom</td>
<td>Number</td>
<td>Number of pixels from the bottom margin to add the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Points</td>
</tr>
<tr>
<td>width</td>
<td>Number</td>
<td>Width of the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Points</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to reposition the table into the bottom left corner of the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setFixedPosition(1, 36, 36, 500);
document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```
Table – setHeaderStyle(Style headerStyle)
Sets the Style object to apply to the table’s header.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>headerStyle</td>
<td>Style</td>
<td>Style object to apply to the table’s header.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set and return the table’s header style.

```javascript
var table = new sn_pdfgeneratorutils.Table(true, [1,1], false);

var whiteColor = sn_pdfgeneratorutils.Color([1,1,1]);
var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);

table.setHeaderStyle(headerStyle);

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;
table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

var styleObject = table.getHeaderStyle();
gs.info(styleObject);
```

Table – setHorizontalAlignment(String alignment)
Sets the horizontal alignment of the table.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alignment</td>
<td>String</td>
<td>Alignment for the table. Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• center: Align contents to the center.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• left: Align contents to the left.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• right: Align contents to the right.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a small table aligned in the center of the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setWidth(90);
table.setHorizontalAlignment("center");

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

**Table – setMargin(Number margin)**

Sets all margins around the table to the same width.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Value of the top, right, bottom, and left margins in points.</td>
</tr>
</tbody>
</table>
This example shows how to set a margin for the entire table.

    var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
    var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

    // declare table by providing width array and Boolean for large table
    var table = new sn_pdfgeneratorutils.Table(true, [1], false);

    table.addTextCell("Text to add to the cell");
    table.setMargin(3);
    document.addTable(table);
    document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");

Table – setMarginBottom(Number margin)

Sets the margin at the bottom of the page.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Height of the bottom margin in points.</td>
</tr>
</tbody>
</table>

This example shows how to set a margin for the bottom of the page to three points.

    var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
    var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

    var whiteColor =  sn_pdfgeneratorutils.Color([1,1,1]);
    var greyColor =  sn_pdfgeneratorutils.Color([0.8,0.8,0.8]);
    var headerBgColor = new sn_pdfgeneratorutils.Color([0.4,0.6,0.8]);

| Returns
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
// Query Incident
var gr = new GlideRecord("incident");
gr.query();

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [70, 200], false);

var headerStyle = new sn_pdfgeneratorutils.Style;
headerStyle.setBackgroundColor(headerBgColor);
headerStyle.setTextAlignment("text-center");
headerStyle.setBold();
headerStyle.setFontColor(whiteColor);
table.setHeaderStyle(headerStyle);

var nParagraph = new sn_pdfgeneratorutils.Paragraph("Number");
var sParagraph = new sn_pdfgeneratorutils.Paragraph("Short Description");

var hdrCell1 = new sn_pdfgeneratorutils.Cell;
var hdrCell2 = new sn_pdfgeneratorutils.Cell;

hdrCell1.addParagraph(nParagraph);
hdrCell2.addParagraph(sParagraph);
table.addHeaderCell(hdrCell1);
table.addHeaderCell(hdrCell2);

// set the bottom margin to three points
table.setBottomMargin(3);

var row = 0;

while(gr.next()) {
    var numCell = new sn_pdfgeneratorutils.Cell;
    var sdCell = new sn_pdfgeneratorutils.Cell;

    var numberParagraph = new sn_pdfgeneratorutils.Paragraph(gr.number);
    var sdParagraph = new sn_pdfgeneratorutils.Paragraph(gr.short_description);

    numCell.addParagraph(numberParagraph);
sdCell.addParagraph(sdParagraph);

    if (row % 2 == 1) {
        table.setDefaultBackGroundColor(greyColor);
    }
    row++;
}
```
} else {
    table.setDefaultBackgroundColor(whiteColor);
}

table.addCell(numCell);
table.addCell(sdCell);

row = row + 1;
}

document.addTable(table);
document.saveAsAttachment("incident", ",<record_sys_id>", "filename.pdf");

Table – setMarginLeft(Number margin)
Sets the margin at the left side of the page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Width of the left margin in points.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set a margin for the left side of the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMarginLeft(100);

document.addTable(table);
document.saveAsAttachment("incident", ",<record_sys_id>", "filename.pdf");
```
Table – setMarginRight(Number margin)

Sets the margin at the right side of the page.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Width of the right margin in points.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

This example shows how to set a margin for the left side of the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.setMarginRight(100);
document.addTable(table);
"document.saveAsAttachment("incident", ", record_sys_id", "filename.pdf");
```

Table – setMarginTop(Number margin)

Sets a margin at the top of the page.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>margin</td>
<td>Number</td>
<td>Height of the top margin in points.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>
This example shows how to set a margin at the top of the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

    table.addTextCell("Text to add to the cell");
    table.setMarginTop(100);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```

### Table – setWidth(Number width)
Sets the table's total width.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>Number</td>
<td>Width of the table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unit: Points</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a table 90 points wide and attach the document to a record.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
var document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

    table.addTextCell("Text to add to the cell");
    table.setWidth(90);
    table.setHorizontalAlignment("center");
    table.setMarginTop(100);

document.addTable(table);
document.saveAsAttachment("incident", "<record_sys_id>", "filename.pdf");
```
Table – useAllAvailableWidth()
Expands the table to use the entire width available on the page.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a table that expands to the available width on the page.

```javascript
var pageSize = new sn_pdfgeneratorutils.PdfPage("A4");
document = new sn_pdfgeneratorutils.Document.createDocument(pageSize);

// declare table by providing width array and Boolean for large table
var table = new sn_pdfgeneratorutils.Table(true, [1], false);

table.addTextCell("Text to add to the cell");
table.useAllAvailableWidth();
document.addTable(table);
document.saveAsAttachment("incident", ":<record_sys_id>:", "filename.pdf");
```

TableUtils - Global
TableUtils is a class of shortcuts for accessing table related information. The TableUtils class is available to server-side scripts.

TableUtils - tableExists()
Checks to see if a table exists.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the table exists.</td>
</tr>
</tbody>
</table>

```javascript
var table = new TableUtils("my_table");
gs.print("Does 'my_table' exist? " + table.tableExists());
```

Output: Does 'my_table' exist? false

**TableUtils - drop(String tableName)**

Drops a database table.

**Note:** Use with extreme caution. Dropping a table permanently deletes the table and all its data. If the table is extended, use `dropTableAndExtensions`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table to drop</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var tu = new TableUtils();
tu.drop("table_that_will_be_lost_forever");
```

Output:

dropping table table_that_will_be_lost_forever
Starting cache flush
Cache flush complete
TABLE DROP: admin dropped table table_that_will_be_lost_forever
**TableUtils - dropAndClean(String tableName)**

Drops a database table and cleans up references to the table.

⚠️ **Note:** Use with extreme caution. Dropping a database table permanently deletes the table and all its data. If the table is extended, use `dropTableAndExtensions`.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>Name of the table to drop</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var tu = new TableUtils();
tu.dropAndClean("table_that_will_be_lost_forever");
```

**Output:**

```
dropping table table_that_will_be_lost_forever
Starting cache flush
Cache flush complete
TABLE DROP: admin dropped table table_that_will_be_lost_forever
*** Script: removing gauges for table_that_will_be_lost_forever
*** Script: removing forms for table_that_will_be_lost_forever
*** Script: removing styles for table_that_will_be_lost_forever
*** Script: removing forms sections for table_that_will_be_lost_forever
*** Script: removing lists for table_that_will_be_lost_forever
*** Script: removing related lists for table_that_will_be_lost_forever
*** Script: removing references to table_that_will_be_lost_forever
*** Script: removing dictionary entries for table_that_will_be_lost_forever
Background message, type:info, message: Table deleted
```

**TableUtils - dropTableAndExtensions(String tableName)**

Drops a database table, all of it’s extended tables, and cleans up references to the tables.
Note: Use with extreme caution. Dropping a database table permanently deletes the table and all of its data.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table to drop</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var tu = new TableUtils();
tu.dropTableAndExtensions("table_that_will_be_lost_forever");
```

Output:

dropping table parent_table_that_will_be_lost_forever
Starting cache flush
Cache flush complete
TABLE DROP: admin dropped table ext_table_that_will_be_lost_forever
removing gauges for ext_table_that_will_be_lost_forever
removing forms for ext_table_that_will_be_lost_forever
removing styles for ext_table_that_will_be_lost_forever
removing forms sections for ext_table_that_will_be_lost_forever
removing lists for ext_table_that_will_be_lost_forever
removing related lists for ext_table_that_will_be_lost_forever
removing references to ext_table_that_will_be_lost_forever
removing dictionary entries for ext_table_that_will_be_lost_forever
Background message, type:info, message: Table deleted
removing gauges for parent_table_that_will_be_lost_forever
removing forms for parent_table_that_will_be_lost_forever
removing styles for parent_table_that_will_be_lost_forever
removing forms sections for parent_table_that_will_be_lost_forever
removing lists for parent_table_that_will_be_lost_forever
removing related lists for parent_table_that_will_be_lost_forever
removing references to parent_table_that_will_be_lost_forever
removing dictionary entries for parent_table_that_will_be_lost_forever
Background message, type:info, message: Table deleted

TableUtils - getAbsoluteBase()
Returns the base table name from which the table was extended.

ℹ️ **Note:** For any table under the cmdb_ci hierarchy, this method returns cmdb_ci and not cmdb, which is the actual base table.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<tr>
<td>String</td>
</tr>
</tbody>
</table>

```javascript
var table = new TableUtils("cmdb_ci_server");
gs.print(table.getAbsoluteBase());
```

Output: cmdb_ci

TableUtils - getAllExtensions()
Returns the list of tables that extend a table, includes the base table.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>ArrayList</td>
</tr>
</tbody>
</table>
```javascript
var table = new TableUtils("task");
gs.print(table.getAllExtensions());
```

Output:
```javascript
[task, incident, issue, kb_submission, sysapproval_group, change_request,
  change_request_imac, sc_task,
  problem, sc_req_item, ticket, ast_transfer_order, planned_task, change_task, change_phase,
  sc_request]
```

**TableUtils - getHierarchy()**

Returns a list of all classes participating in the hierarchy of the specified table.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ArrayList</td>
<td>A list of all classes in the specified table's hierarchy.</td>
</tr>
</tbody>
</table>

```javascript
var table = new TableUtils("cmdb_ci_server");
gs.print(table.getHierarchy());
```

Output: `[cmdb_ci_server, cmdb_ci_computer, cmdb_ci_hardware, cmdb_ci,
    cmdb_ci_mainframe, cmdb_ci_linux_server, cmdb_ci_mainframe_lpar,
    cmdb_ci_esx_server, cmdb_ci_unix_server, cmdb_ci_solaris_server,
    cmdb_ci_hpux_server, cmdb_ci_aix_server, cmdb_ci_osx_server,
    cmdb_ci_netware_server, cmdb_ci_win_server]

**TableUtils - getTables()**

Returns the table hierarchy.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ArrayList</td>
<td>A list of table names in the parent hierarchy.</td>
</tr>
</tbody>
</table>

// Get the hierarchy of tables
var table = new TableUtils("cmdb_ci_computer");
var tableArrayList = table.getTables();

// Use the j2js method to convert the Java ArrayList to JavaScript
gs.include("j2js");
var tableArray = j2js(tableArrayList);

// Write the value of each element in the JavaScript array
var i = 0;
while (i < tableArray.length) {
    gs.print("Table with index "+ i + ": " + tableArray[i]);
    i++;
}

Output:
Table with index 0: cmdb_ci_computer
Table with index 1: cmdb_ci_hardware
Table with index 2: cmdb_ci
Table with index 3: cmdb

TableUtils - getTableExtensions()
Returns a list of tables that extend a table.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ArrayList</td>
<td>A list of table names that extend the table.</td>
</tr>
</tbody>
</table>
This example shows that 58 tables in this instance extend the Computer [cmdb_ci_computer] table. (Output condensed below.)

```javascript
// Get the tables that extend the table
var table = new TableUtils("cmdb_ci_computer");
var tableArrayList = table.getTableExtensions();

// Use the j2js method to convert the Java ArrayList to JavaScript
gs.include("j2js");
var tableArray = j2js(tableArrayList);

// Write the value of each element in the JavaScript array
var i = 0;
while ( i < tableArray.length ) {
    gs.print("Table with index "+i+: "+tableArray[i]);
    i++;
}
```

Output:

- Table with index 0: cmdb_ci_mainframe_hardware
- Table with index 1: cmdb_ci_handheld_computing
- Table with index 2: cmdb_ci_ucs_blade
- Table with index 3: cmdb_ci_storage_switch
- Table with index 4: cmdb_ci_server
- Table with index 5: cmdb_ci_hmc_server
- ...
- Table with index 56: cmdb_ci_pc_hardware
- Table with index 57: cmdb_ci_ucs_rack_unit

**TableUtils - hasExtensions()**

Determines if a table has been extended.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Boolean</td>
<td>True if the table has extensions.</td>
</tr>
</tbody>
</table>
var table = new TableUtils("cmdb_ci_server");
go.print(table.hasExtensions());

Output:
true

**TableUtils - isBaseClass()**

Determines if a table is a base class, meaning it has no parents and has extensions.

For example, Task is a base class since it is not extended from another table and has tables extended from it. Sys_user is not a base class because it has no parents, but does not have extensions.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| Boolean     | Flag that indicates whether a table is a base class table meaning it has no parents but has extensions. Valid values:  
  • true: Table is a base class.  
  • false: Table is not a base class. |

### Example

```javascript
var table = new TableUtils("task");
go.print("Task is base class: " + table.isBaseClass());

var table = new TableUtils("sys_user");
go.print("User is base class: " + table.isBaseClass());
```

Output:

```
Task is base class: true
User is base class: false
```
**TableUtils - isSoloClass()**

Determines if the table has no parents and no extensions.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the table has no parent and no table is extended from it.</td>
</tr>
</tbody>
</table>

```javascript
var table = new TableUtils("task");
gs.print("task is solo class: " + table.isSoloClass());

var table = new TableUtils("cmdb_ci_win_server");
gs.print("cmdb_ci_win_server is solo class: " + table.isSoloClass());

var table = new TableUtils("sys_user");
gs.print("sys_user is solo class: " + table.isSoloClass());
```

**Output:**

```
task is solo class: false
cmdb_ci_win_server is solo class: false
sys_user is solo class: true
```

**TableUtils - TableUtils(String tableName)**

Creates an instance of a TableUtils class.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name</td>
</tr>
</tbody>
</table>

```javascript
var tu = new TableUtils("incident");
```
Scoped TemplatePrinter handles printing from a mail script to the email message.

There is no constructor for the scoped TemplatePrinter API. The methods are called in mail scripts using the `template` global variable.

**Scoped TemplatePrinter - print(String string)**

Prints the string to the email body.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String</td>
<td>The string to print</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
template.print("Incident number - " + current.number + "\n");
```

**Scoped TemplatePrinter - space(Number spaces)**

Adds non-breaking spaces to the email body.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spaces</td>
<td>Number</td>
<td>The number of non-breaking spaces to output to the email body.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
template.space(4);
```
**TimelineSpan - Global**

This class defines a set of properties that describe the characteristics and interactive behavior of an element rendered within a `TimelineItem`.

Since it is extremely important for all of a `TimelineItem`'s collection of spans to be unique, the creation of a new instance should be performed via the `createTimelineItem` method of an existing `TimelineItem` instance.

**TimelineSpan - addPredecessor(Object Array objArray)**

Adds multiple relationships between the current instance and other `TimelineSpan` objects by enumerating through the array of JavaScript objects.

Each object should have an internal property `relationship_sys_id` and `predecessor_sys_id` specified.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objArray</td>
<td>Object Array</td>
<td>JavaScript object array that contains two internal properties: <code>relationship_sys_id</code> and <code>predecessor_sys_id</code>.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - addPredecessor(String strPredecessorSysId, String strRelationshipSysId, String strTableName)**

Adds the specified relationship between the current instance and another `TimelineSpan` and allows the relationship to open a `GlideWindow` to display information about the relationship.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPredecessorSysId</td>
<td>String</td>
<td>The sys ID of the planned task that is the predecessor of the relationship.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strRelationshipSysId</td>
<td>String</td>
<td>The sys ID of the relationship of the relationship.</td>
</tr>
<tr>
<td>strTableName</td>
<td>String</td>
<td>The name of the table for the relationship.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

TimelineSpan - addPredecessor(String strPredecessorSysId, String strRelationshipSysId)

Adds the specified relationship between the current instance and another TimelineSpan with sys ID `strPredecessorSysId`.

The drawn line will not have any double click handlers associated with it.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strPredecessorSysId</td>
<td>String</td>
<td>The sys ID of the planned task that is the predecessor of the relationship.</td>
</tr>
<tr>
<td>strRelationshipSysId</td>
<td>String</td>
<td>The sys ID of the relationship of the relationship.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

TimelineSpan - getAllowXDragLeft()

Returns the boolean value of the `AllowXDragLeft` property.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the object’s start time can be adjusted; False otherwise.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getAllowXDragRight()**

Returns the boolean value of the `AllowXDragRight` property.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the object’s end time can be adjusted; false otherwise.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getAllowXMove()**

Returns the boolean value of the `AllowXMove` property.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the object can be moved; false otherwise.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getAllowYMove()**

Returns the boolean value of the `AllowYMove` property.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the object can be moved vertically; false otherwise.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getAllowYMovePredecessor()**

Returns the boolean value of the `AllowYMovePredecessor` property.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the a dashed relationship line can be drawn from the current object to a new successor; false otherwise.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getInnerSegmentClass()**

Returns the name of the current inner segment class for the TimelineSpan.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the class for the current inner segment style.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getInnerSegmentEndTimeMs()**

Returns the time in milliseconds of the end time of the inner segment portion of the *TimelineSpan*.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The end time of the TimelineSpan inner segment portion in milliseconds.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getInnerSegmentStartTimeMs()**

Returns the time in milliseconds of the start time of the inner segment portion of the *TimelineSpan*.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The start time of the TimelineSpan inner segment portion in milliseconds.</td>
</tr>
</tbody>
</table>
**TimelineSpan - getIsChanged()**

Returns a boolean that specifies whether or not the current timeline item has been modified after initialization.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the current span has been marked as changed; otherwise false.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getPointIconClass()**

Returns a string that specifies the name of the icon class to use for displaying the element on the timeline if the current instance has zero duration.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The name of the icon class to use for displaying the current TimelineSpan if the duration is zero.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getPredecessors()**

Returns an array of all the predecessor objects associated with the current instance. Each array object is a HashMap that contains a predecessor_sys_id and relationship_sys_id property.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>List of HashMaps that contain two internal properties: predecessor_sys_id and relationship_sys_id.</td>
</tr>
<tr>
<td>Array</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - getSpanColor()**

Returns the string name of the color specified for displaying this span.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The HTML color name to use as the background color for the element.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getSpanText()**

Returns the string that specifies the text to display adjacent to the time element.

**Note:** This text will only display if the GlideTimeline object has enabled timeline text via glideTimeline.showTimelineText(true).

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>---------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>String</td>
<td>Text displayed adjacent to the element.</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - getStartTimeMs()**

Returns the start time in milliseconds of the current `TimelineSpan` object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The start time of the element in milliseconds.</td>
</tr>
</tbody>
</table>

**TimelineSpan - getSysId()**

Returns the sys ID of the current object.

This method is useful for returning the sys Id when the current object instance was created without a specific sys Id to obtain the dynamically generated GUID.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The unique system ID of the current element.</td>
</tr>
</tbody>
</table>
**TimelineSpan - getTable()**

Returns the name of the table where the sys ID is referenced.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>none</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**TimelineSpan - getTooltip()**

Returns the text/html to display in the tooltip when the **TimelineSpan** element is being hovered over.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>none</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**TimelineSpan - setAllowXDragLeft(Boolean bFlag)**

Sets a flag that determines whether the element’s start date can be dragged left or right therefore adjusting the duration of the task.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is **false**.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bFlag</td>
<td>Boolean</td>
<td><strong>True</strong> to enable the element's start date to be adjusted; <strong>false</strong> otherwise.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### TimelineSpan - `setAllowXDragRight(Boolean bFlag)`

Sets a flag that determines whether the element's end date can be dragged left or right therefore adjusting the duration of the task.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is **false**.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bFlag</td>
<td>Boolean</td>
<td><strong>True</strong> to enable the element's end date to be adjusted; <strong>false</strong> otherwise.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### TimelineSpan - `setAllowXMove(Boolean bFlag)`

Sets a flag that determines whether the element can be moved to start at a different time.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is **false**.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bFlag</td>
<td>Boolean</td>
<td>True to enable the element to be moved horizontally; false otherwise.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setAllowYMove(Boolean bFlag )**

Sets a flag that determines whether the element can be dragged vertically on the timeline.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is **false**.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bFlag</td>
<td>Boolean</td>
<td>True to enable the element to be moved vertically; false otherwise.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setAllowYMovePredecessor(Boolean bFlag)**

Sets a flag that determines whether a dashed relationship line can be drawn from this element interactively on the timeline.

The effect of this behavior is controlled by the script include that handles the appropriate event. The default value for this property is false.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bFlag</td>
<td>Boolean</td>
<td><strong>True</strong> to enable a relationship line to be drawn from this element; <strong>false</strong> otherwise.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

TimelineSpan - setInnerSegmentClass(String styleClass)

Specifies the name of the class to use for stylizing the inner segment if it exists.

The default value is **green**.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>styleClass</td>
<td>String</td>
<td>One of the following values: <strong>green</strong>, <strong>blue</strong>, or <strong>silver</strong>.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

TimelineSpan - setInnerSegmentTimeSpan(Number startTimeMs, Number endTimeMs)

Creates an inner segment to show within the current timespan defined by the range specified.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startTimeMs</td>
<td>Number</td>
<td>The start time in milliseconds.</td>
</tr>
<tr>
<td>endTimeMs</td>
<td>Number</td>
<td>The end time in milliseconds.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setPointIconClass(String iconClassName)**

Sets the icon class to use for displaying the current element on the timeline if the current instance has zero duration.

⚠️ Note: This only affects the current TimelineSpan object and will take precedence over the defaultPointIconClass specified by the GlideTimeline.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iconClassName</td>
<td>String</td>
<td>String that specifies one of the following values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• milestone</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• blue_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• sepia_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• green_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• red_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• black_square</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• blue_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• sepia_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• green_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• red_circle</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• black_circle</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setSpanColor(String strColor)**

Sets the color for displaying this span.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strColor</td>
<td>String</td>
<td>The HTML color name for the color of this span.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### TimelineSpan - setSpanText(String strSpanText)

Sets the text to display adjacent to the time element.

**Note:** This text will only be displayed if the GlideTimeline object has enabled timeline text via `glideTimeline.showTimelineText(true)`.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strSpanText</td>
<td>String</td>
<td>The text to display next to the time element.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

#### TimelineSpan - setTimeSpan(Number nStartTime, Number nEndTimeMs)

Sets the start and end dates for the current span.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nStartTime</td>
<td>Number</td>
<td>The start time in milliseconds.</td>
</tr>
<tr>
<td>nEndTimeMs</td>
<td>Number</td>
<td>The end time in milliseconds.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setTimeSpan(String strStartTime, String strEndTimeMs)**

Sets the start and end times for the current span.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strStartTime</td>
<td>String</td>
<td>The start time in milliseconds.</td>
</tr>
<tr>
<td>strEndTimeMs</td>
<td>String</td>
<td>The end time in milliseconds.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**TimelineSpan - setTooltip(String strTooltipText)**

Sets the text to display in the tooltip when the `TimelineSpan` element is being hovered over.

**Note:** You can specify valid HTML in the string that sets the tooltip.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>strTooltipText</td>
<td>String</td>
<td>The text to display in the tooltip.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
TaskStateUtil - Global

The TaskStateUtil API is in the task state management utility script include and is used for working with task-type table state attributes.

The TaskStateUtil API is primarily used by the Task Active State Management business rule to set the active field based on state changes. Configurations are defined in the task.state dictionary element, usually using dictionary overrides since state values vary by table.

The TaskStateUtil API can be called by any server script to determine inactive states, default work, or default close states for a table.

The required attributes are defined on the planned_task table so all planned task types are supported. We will eventually add the attributes to other task types and eventually the base task table. You are free to do this if you want to leverage this feature now.

These attributes can be defined on the task.state dictionary element or a dictionary override for extended task tables.

### Related Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>close_states</td>
<td>Semicolon delimited list of state values that are inactive, used to identify whether the task should be set to active or inactive. This is a required attribute to use the TaskStateUtil functionality.</td>
</tr>
<tr>
<td>default_close_state</td>
<td>Optional attribute to define the state value of the default close state if you want to define business rules that automatically close a task. Defaults to 3, typically Closed Complete if attribute is not defined.</td>
</tr>
<tr>
<td>default_work_state</td>
<td>Optional attribute to define the state value of the default working state if you want to define business rules that automatically set a task for working. Defaults to 2, typically Work in Progress if the attribute is not defined.</td>
</tr>
</tbody>
</table>
TaskStateUtil - ATTR_DEFAULT_WORK
The name of the attribute that identifies default work state.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR_DEFAULT_WORK</td>
<td>String</td>
<td>Identifies default work state. Value: default_work_state</td>
</tr>
</tbody>
</table>

TaskStateUtil - ATTR_DEFAULT_CLOSE
The name of the attribute that identifies the default close state.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR_DEFAULT_CLOSE</td>
<td>String</td>
<td>Identifies the default close state. Value: default_close_state</td>
</tr>
</tbody>
</table>

TaskStateUtil - ATTR_INACTIVE_STATES
The name of the attribute that identifies inactive states.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR_INACTIVE_STATES</td>
<td>String</td>
<td>Identifies inactive states. Value: close_states</td>
</tr>
</tbody>
</table>

TaskStateUtil - getDefaultCloseState
Returns the value for the default closed state.

The default closed state value is 3 if the default_close_state attribute has not been specified.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>State value representing the closed state.</td>
</tr>
</tbody>
</table>

```javascript
var stateUtil = new TaskStateUtil(current);
// get the close state
var defaultCloseState = stateUtil.getDefaultCloseState();
current.state = defaultCloseState;
```

**TaskStateUtil - getDefaultWorkState()**

Returns the value for the default work state.

The default work state value is 2 if the default_work_state attribute has not been specified.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The state value representing the working state.</td>
</tr>
</tbody>
</table>

```javascript
var stateUtil = new TaskStateUtil(current);
// get the work state
var defaultWorkState = stateUtil.getDefaultWorkState();
current.state = defaultWorkState;
```

**TaskStateUtil - getInactiveStates**

Returns a list of the inactive state values.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Array of state values that are inactive.</td>
</tr>
</tbody>
</table>

```javascript
var stateUtil = new TaskStateUtil(current);
//get the inactive state values
var inactiveStates = stateUtil.getInActiveStates();
```

**TaskStateUtil - isStateInactive(String state)**

Returns the active status of the specified state.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>String</td>
<td>The state value to check.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the state is inactive.</td>
</tr>
</tbody>
</table>

```javascript
var stateUtil = new TaskStateUtil(current);
var previousStateInactive = stateUtil.isStateInactive(previous.state);
var currentStateInactive = stateUtil.isStateInactive(current.state);
```

**TaskStateUtil - runMarkClosed**

Decides whether the **mark closed** business rule should be run or not.
### TaskStateUtil - runTaskCloser

Decides whether the task closer business rule should be run or not.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the business rule should be allowed to run or not.</td>
</tr>
</tbody>
</table>

### TaskStateUtil - runTaskReopener

Decides whether the task reopener business rule should be run or not.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the business rule should be allowed to run or not.</td>
</tr>
</tbody>
</table>
TaskStateUtil - setDefaultWorkState(String defaultWorkState)

Enables the user to specify their own default work state.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>defaultWorkState</td>
<td>String</td>
<td>The value to use for the default work state.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TaskStateUtil</td>
<td>A self-reference to allow for method chaining.</td>
</tr>
</tbody>
</table>

TaskStateUtil - SYSTEM_DEFAULT_CLOSE

The value of the default close state is Closed Complete on the Task table.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTEM_DEFAULT_CLOSE</td>
<td>Integer</td>
<td>Value of the default close state is Closed Complete on the Task table. Value: 3</td>
</tr>
</tbody>
</table>

TaskStateUtil - SYSTEM_DEFAULT_WORK

The value of the default work state is Work in progress on the Task table.

Field

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTEM_DEFAULT_WORK</td>
<td>Integer</td>
<td>Value of the default work state is Work in progress on the Task table. Value: 2</td>
</tr>
</tbody>
</table>

TaskStateUtil - SYSTEM_INACTIVE_STATES

The values of the default inactive states: Closed Complete, Closed Incomplete, Closed Skipped on the Task table.
### TaskStateUtil - TaskStateUtil(GlideRecord task)

Creates a TaskStateUtil object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task</td>
<td>GlideRecord</td>
<td>This must be a GlideRecord from a task table.</td>
</tr>
</tbody>
</table>

```javascript
var stateUtil = new TaskStateUtil(current);
```

### Transformer - Scoped, Global

Manipulate time-series data to prepare the data for evaluation and analysis.

The Transformer class can be used in scoped and global server scripts. When using the Transformer class, use the `sn_clotho` namespace identifier.

The general use case is to determine the period to be evaluated, select the records from the table with the metric field, define the type of transform to run, and then execute the transform.

```javascript
// create the start and end time
var start = new GlideDateTime();
start.addSeconds(-1 * 60 * 60);
var end = new GlideDateTime();

//mb_demo_drone is a table with metric fields.
var drones = new GlideRecord("mb_demo_drone");
drones.addQuery("model", "Kingfisher Phantom");
drones.query();

//build a transform that returns a simple average
var builder = new sn_clotho.Transformer(drones);
builder.metric("mb_demo_mt_rem_battery").avg().label("Original");
```
This class is part of the MetricBase application.

**Scoped Transformer - `execute(GlideDateTime start, GlideDateTime end)`**

Run the transform.

Use the `metric()` and `groupBy()` methods before calling `execute()`. The `execute()` method can only be called once for each Transformer object.

Actions performed as part of the transform do not change the data in the MetricBase database.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>GlideDateTime</td>
<td>The beginning of the period to be evaluated.</td>
</tr>
<tr>
<td>end</td>
<td>GlideDateTime</td>
<td>The end of the period to be evaluated.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformResult</td>
<td>The transformed data.</td>
</tr>
</tbody>
</table>

```javascript
var minutesAgoStart = 60;
var end = new GlideDateTime();
var start = new GlideDateTime(end);
start.addSeconds(-1 * 60 * minutesAgoStart);

// query subject records
var grDrone = new GlideRecord('mb_demo_drone');
grDrone.query();

// building transform; get the average transforms of a metric, grouping by model
var transformer = new sn_clotho.Transformer(grDrone);
transformer.groupBy("fleet").metric("mb_demo_mt_altitude").avg().label('avg - %g:fleet:');

// execute and return result for visualization
var tfrmResult = transformer.execute(start, end);
```
Scoped Transformer - `groupBy(String field)`

Specify a field to be used to group the data.

If you are going to use the `groupBy()` method, it must be called before the `execute()` method.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>field</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify the transform characteristics.</td>
</tr>
</tbody>
</table>

```javascript
var transformer = new sn_clotho.Transformer(grDrone);
var trnsfrm = transformer.groupBy("fleet");
```

Scoped Transformer - `metric(String metricName)`

Specify the metric field to be used in the transform.

You can specify multiple metrics to be used in the transform. The `metric()` method cannot be called after the `execute()` method is called.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>metricName</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify the transform characteristics.</td>
</tr>
</tbody>
</table>

```javascript
var transformer = new sn_clotho.Transformer(grDrone);
var trnsfrm = transformer.metric("mb_demo_mt_altitude");
```
Scoped Transformer - Transformer(GlideRecord sourceRecords)

Create a Transformer object.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceRecords</td>
<td>GlideRecord</td>
<td>Contains the records for which metrics are to be evaluated. Can be one record or many.</td>
</tr>
</tbody>
</table>

```java
//where drones is a GlideRecord created from a table with a metric field
var builder = new sn_clotho.Transformer(drones);
```

TransformerDefinition - Scoped, Global

Provides methods to instantiate and manage the TransformerDefinition object, which associates a transformation rules list and a record path.

The TransformerDefinition API works along with the Transformer and TransformerRuleList APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

- The TransformerRuleList API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.

- The TransformerDefinition API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.

In addition, this object provides methods that enable you to obtain the record path of the TransformerDefinition object. It can also validate whether the definition has a valid TransformerRuleList associated with it.

The Transformer API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

You can use the TransformerDefinition Class in both scoped and global server scripts. When using this class, use the `sn_tfrm` namespace identifier. Also, before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).
TransformerDefinition - recordPath()

If set when the TransformerDefinition object was instantiated, returns the record path for the source data file associated with the TransformerDefinition object.

A record path (JSONPath for JSON, XPath for XML) identifies the container (parent) of nodes to parse as records in the source document.

For JSON documents, these nodes can be any object, array, or JSON primitive (string, number, boolean). For XML documents, these nodes are the child elements of the container.

If recordPath is unspecified, the entire document is inferred as a single record. For JSON documents, if the top node is an array and recordPath is unspecified, then the top array is the record's container, and each of its entries is a record.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>If set, the record path associated with the transformer definition. If not set, returns null.</td>
</tr>
</tbody>
</table>

```javascript
var path = '$.records';
var transformerDefinition = new sn_tfrm.TransformerDefinition(transformerRuleList, recordPath);
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);
```

```javascript
var recordPath = transformerDefinition.recordPath();
```

```javascript
var results = [];
while (transformer.transform()) {
    results.push(transformer.getRow());
}
```
TransformerDefinition - TransformerDefinition(Object transformerRuleList, String recordPath)

Instantiates a TransformerDefinition object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transformerRuleList</td>
<td>Object</td>
<td>TransformerRuleList to associate with this transformer definition.</td>
</tr>
<tr>
<td>recordPath</td>
<td>String</td>
<td>Optional. The path (JSONPath for JSON, XPath for XML) that identifies the container (parent) of nodes to parse as records in the source document. For JSON documents, these nodes can be any object, array, or JSON primitive (string, number, boolean). For XML documents, these nodes are the child elements of the container. If recordPath is unspecified, the entire document is inferred as a single record. For JSON documents, if the top node is an array and recordPath is unspecified, then the top array is the record's container, and each of its entries is a record.</td>
</tr>
</tbody>
</table>

```javascript
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default GET');
var response = stockAPI.execute();
var responseBody = response.getBody();

var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .addSymbol('ticker', 'quote.symbol')
  .addSymbol('change_percentage', 'quote.change_change')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addSymbol('close_price', 'quote.close')
  .thenAdaptCurrency('USD', false)
  .addSymbol('summary')
  .thenConcat('Shares of ')  
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')  
  .thenConcatSymbol('close');
```
var path = '$.*'; // Transform all objects in the JSON document
var transformerDefinition = new sn_tfrm.TransformerDefinition(transformerRuleList,
    recordPath);
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);

var results = [];
while (transformer.transform()) {
    results.push(transformer.getRow());
}

TransformerDefinition - validate()
Validates whether a valid TransformerRuleList is associated with the TransformerDefintion object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether a valid TransformerRuleList is associated with</td>
</tr>
<tr>
<td></td>
<td>the specified TransformerDefintion object.</td>
</tr>
<tr>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• true: Valid TransformerRuleList associated</td>
</tr>
<tr>
<td></td>
<td>• false: Invalid or no TransformerRuleList associated</td>
</tr>
</tbody>
</table>

if (transformerDefinition.validate()) {
    var results = [];

while (transformer.transform()) {
    results.push(transformer.getRow());
}

TransformerRuleList - Scoped, Global

Enables you to create a list of rules for transforming various types of JSON and XML data into name-value pair output.

The TransformerRuleList API works along with the Transformer and TransformerDefinition APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

- The TransformerRuleList API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.

- The TransformerDefinition API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.

- The Transformer API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

When you instantiate the TransformerRuleList object, you must define whether it describes a JSON or XML source document using the .fromJSON() or .fromXML() methods. For example:

```javascript
var trl = sn_tfrm.TransformerRuleList().fromJSON(); or var trl = sn_tfrm.TransformerRuleList().fromXML();
```

Then use the addRule() method to define a transformation rule for each element in the source document that you want to include as a name-value pair in the output.

Use "adapter methods", such as setName() or thenAdd(), to define how to manipulate data elements when the transformation is performed. Adapter methods work along with the addRule() method. They define adaptations to apply to the output field defined by the addRule() method such as formatting, rounding, and applying patterns. You can apply one or more adapter methods to each data transformation. Adapter methods enable you to do things such as:
• Concatenate text.
• Perform mathematical functions, such as add, subtract, divide, and multiply.
• Round values up or down (round up/down, ceiling/floor).
• Define whether to use the minimum or maximum value when comparing a source data element to a specified value.
• Apply a currency code.
• Convert between different units of measure.
• Format data elements.
• Apply patterns.
• Replace specified data elements with a specified value.
• Split and rearrange strings.

You can use the TransformerRuleList class in both scoped and global server scripts. When using this class, use the sn_tfrm namespace identifier. Also, before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).

**TransformerRuleList - addRule(String rule, String path)**

Creates an entry in the associated transformation rules list which defines a field to create in the output.

You can create rules for any element in a source document. For example, `.addRule('ticker', '$.quote.symbol')` creates the field "ticker" in the output and copies over the value in quote.symbol of the source.

Once you define a rule using `addRule()`, you then use adaptor methods, such as `thenAdd()`, `thenReplace()`, and `thenFloor()` to manipulate the rule's output data. You can define as many adaptor methods as needed for a single rule. All adapter methods directly after an `addRule()` call, until the next `addRule()` call, apply to that rule. Adapter methods are cumulative with the result of all adapter methods being the final value saved in the output field.

For example, in the following code snippet, `thenMultiply()` and `thenRoundDown()` apply to `addRule('change_percentage', '$.quote.changePercent')`; `addRule('close_price', '$.quote.close')` starts a new rule. If the value in `$quote.changePercent` is .011, then the final output value is "1" (.011 * 100 rounded down to the ones position).
The `addRule()` method also supports the parameter `summary`: `addRule('summary')`. This implementation creates the name field "summary:" in the output, but does not correlate it to any field in the source. You can then use the adaptor methods `thenConcat()` and `thenConcatSymbol()` to modify the contents of the summary field.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule</td>
<td>String</td>
<td>Name of the element in the destination output.</td>
</tr>
<tr>
<td>path</td>
<td>String</td>
<td>Optional. JSONPath or XPath to the data element in the source document.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The adapter methods <code>thenConcat()</code> and <code>thenConcatSymbol()</code> do not require you to define this parameter if no other adapter methods are defined for the rule. All other adapter methods require this parameter.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('close_price', '$.quote.close')
    .thenAdaptCurrency('USD', false)
    .addRule('summary')
    .thenConcat('Shares of ')  
    .thenConcatSymbol('ticker')
    .thenConcat(' closed at ')  
    .thenConcatSymbol('close_price');
```
TransformerRuleList - setName(String name)

Defines a name for the associated TransformerRuleList object for logging purposes.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name to use to identify the associated TransformerRuleList object.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Although the API does not force this name to be unique, it is helpful if</td>
</tr>
<tr>
<td></td>
<td></td>
<td>they are unique within an instance.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')  
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')  
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenAdaptCurrency(String currencyCode, Boolean outputNumericCurrencyValue)

Adds an adapter to the current rule that ties the specified currency code to the output field defined in the associated addRule() call.
Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>currencyCode</td>
<td>String</td>
<td>Currency code to tie to the destination data element, such as USD, EUR, and GBP.</td>
</tr>
</tbody>
</table>
| outputNumericCurrencyValue        | Boolean   | Optional. Flag that indicates whether to display the currency code. Valid values:
|                                  |           | • true: do not display the country code; numeric value only
|                                  |           | • false: display the country code
|                                  |           | Default: false                                                             |

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('close_price', '$.quote.close')
    .thenAdaptCurrency('USD', false)
    .addRule('summary')
    .thenConcat('Shares of ')  
    .thenConcatSymbol('ticker')
    .thenConcat(' closed at ')  
    .thenConcatSymbol('close_price');
```
TransformerRuleList - thenAdaptDuration(String inputDuration, String outputDuration)

Adds an adapter to the current rule that converts the source field from one unit of measure to another, such as from minutes to seconds or weeks to days.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the addRule() method. They define adaptations to apply to the output field defined by the addRule() method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputDuration</td>
<td>String</td>
<td>Current unit of measure of the source field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NANosecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MICROsecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MILLisecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SECOND</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MINUTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HOUR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DAY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• WEEK</td>
</tr>
<tr>
<td>outputDuration</td>
<td>String</td>
<td>Unit of measure to convert the source field to in the output.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• NANosecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MICROsecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MILLisecond</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• SECOND</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MINUTE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• HOUR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• DAY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• WEEK</td>
</tr>
</tbody>
</table>
### TransformerRuleList - thenAdd(Number operand)

Adds an adapter to the current rule that adds the passed in value to the source field.

⚠️ **Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value to add to the source field.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('close_price', '$.quote.close')
    .thenAdaptCurrency('USD', false)
    .addRule('daily', '$.quote.weekly')
    .thenAdaptDuration('WEEK', 'DAY');
```

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList().fromJSON()
    .setName('Stock Report 05182019 JSON')
    .addSymbol('ticker', '$.symbol')
    .addSymbol('change_percentage', '$.changePercent')
```
TransformerRuleList - thenApplyMap(Object map)

Adds an adapter to the current rule that searches the associated source field for a list of strings and replaces them in the output with the specified replacement values.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the addRule() method. They define adaptations to apply to the output field defined by the addRule() method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>map</td>
<td>Object</td>
<td>Name/value pairs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• name: text to locate in the source data element</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• value: text to replace it with in the output</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

In this example, the thenApplyMap() call searches the source text in the company_info field for Inc. and St. and replaces them with Incorporated and Street in the company_info field in the output.

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('close_price', '$.quote.close')
```
TransformerRuleList - thenApplyPattern(String matchPattern, String outputPattern)

Adds an adapter to the current rule that matches a specified regex pattern to content in the source field and then replaces/reformats that content with a second regex pattern and stores that value in the output.

⚠️ Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the addRule() method. They define adaptations to apply to the output field defined by the addRule() method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matchPattern</td>
<td>String</td>
<td>Regex pattern to use to locate the text to replace/reformat.</td>
</tr>
<tr>
<td>outputPattern</td>
<td>String</td>
<td>Regex pattern to use to update the located text.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

In this example, any company name that ends with "Inc." is transformed to "Incorporated", such as Company Inc. to Company Incorporated.

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('close_price', '$.quote.close')
    .thenAdaptCurrency('USD', false)
    .addRule('company', '$.quote.company')
    .thenApplyPattern('(.+)(\w{3}\.)', '$1Incorporated');
```
TransformerRuleList - thenCeiling(Number operand)

Adds an action to the current rule to round the source field up at the decimal position specified by the passed in value.

Unlike straight rounding where the number is rounded based on the value of the digit in the specified decimal position (0-4 round down, 5-9 round up), ceiling always rounds up. For example, the ceiling value for 2.156 and 2.152 is always 2.16 for the passed in decimal position of 2; whereas for straight rounding the values would be 2.16 and 2.15 respectively. For negative numbers, the ceiling operation makes the number more positive, as in the ceiling value of -2.156 is -2.15; whereas the same number rounded up makes the value more negative, -2.16.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Decimal position to the right of the decimal point at which to round the number up (apply ceiling). For example, if this value is 2 and the source data element is 6.421, the resulting value is 6.43.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Mortgage Rates 05022019 JSON')
    .addRule('interest_rate', '$.quote.interest_rate')
    .thenCeiling('2') // Always round the interest rate up to the hundredths place
    .addRule('monthly_payment', '$.quote.total_loan_amount')
    .thenDivideBy('180');```
TransformerRuleList - thenConcat(String value)

Adds an adapter to the current rule that concatenates the passed in string to the output field.

Unlike other adapter methods, this method does not have to be applied to a source field. You can use this method to create completely new data strings in the output.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>Text to concatenate to the end of the current data element.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')  
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')  
  .thenConcatSymbol('close_price');
```

TransformerRuleList - thenConcatSymbol(String symbol)

Adds an adapter to the current rule that concatenates the value of a field previously defined in the rules list to the current output field.
Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>symbol</td>
<td>String</td>
<td>Name of the rules list element to append to the output field.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')  
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')  
  .thenConcatSymbol('close_price');
```

**TransformerRuleList - thenDivideBy(Number operand)**

Adds an adapter to the current rule that divides the source field by the passed in value.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.
TransformerRuleList - thenDivideInto(Number operand)

Adds an adapter to the current rule that divides the passed in value by the source field.

Note: This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value into which to divide the source field.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>
var transformerRuleList = new sn_tfrm.TransformerRuleList()
    .fromJSON()
    .setName('Stock Report 05022019 JSON')
    .addRule('ticker', '$.quote.symbol')
    .addRule('change_percentage', '$.quote.changePercent')
    .thenMultiply('100')
    .thenRoundDown('0')
    .addRule('dividend_per_share', '$.quote.total_shares')
    .thenDivideInto('$.quote.total_dividends');

TransformerRuleList - thenFloor(Number operand)

Adds an adapter to the current rule that rounds the source field down at the
decimal position specified by the passed in value and stores it in the output.

Unlike straight rounding where the number is rounded based on the value of
the digit in the specified decimal position (0-4 round down, 5-9 round up), floor
always rounds down. For example, the floor value for 2.156 and 2.152 is always
2.15 for the passed in decimal position of 2; whereas for straight rounding the
values would be 2.16 and 2.15 respectively. For negative numbers, the floor
operation makes the number more negative, as in the floor value of -2.156 is
-2.16; whereas the same number rounded down makes the value more positive,
-2.15.

ℹ️ Note: This is an adapter method and cannot be used on its own. Adapter
methods work in conjunction with the addRule() method. They define
adaptations to apply to the output field defined by the addRule() method
such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Decimal position to the right of the decimal point at which to round the number down (apply floor).</td>
</tr>
</tbody>
</table>

For example, if this value is 2 and the source data element is 6.427, the resulting value is 6.42.

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenFloor('2') // Always round the interest rate down to the hundreths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');

TransformerRuleList - thenFormat(String matchPattern, String outputPattern)

Adds an adapter to the current rule that reformats the content in the source field that matches the specified match pattern, with the specified output pattern.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matchPattern</td>
<td>String</td>
<td>Pattern to match against the source field. Valid values: • @: any character • #: decimal digit • : literal escape (@ for the @ symbol)</td>
</tr>
<tr>
<td>outputPattern</td>
<td>String</td>
<td>Pattern to replace the content with in the output. Valid values: • @: any character • #: decimal digit • : literal escape (@ for the @ symbol)</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>
This example reformats the quote date from YYYY/MM/DD to YYYY MM-DD.

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('date', '$.quote.date')
  .thenFormat('####/##/##', '#### ##-##');
```

### TransformerRuleList - thenMax(Number operand)

Adds an adapter to the current rule that compares the passed in value against the source field and copies the greater of the two values to the output field.

⚠️ **Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value to compare to the source field.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('lowest_interest_rate', '$.quote.interest_rate')
  .thenMax('3.5') // Interest rate cannot be less than 3.5%
  .addRule('dividend_per_share', '$.quote.total_shares')
  .thenDivideInto('$quote.total_dividends');
```
TransformerRuleList - thenMin(Number operand)

Adds an adapter to the current rule that compares the passed in value against the source field and copies the lower of the two values to the output field.

ℹ️ **Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value to compare to the source field.</td>
</tr>
</tbody>
</table>

TransformRuleList - thenMultiply(Number operand)

Adds an adapter to the current rule that multiplies the source field by the passed in value.

ℹ️ **Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value by which to multiply the source field.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addSymbol('broker_fee_percentage', '$.quote.broker_fee')
  .thenMin('10') // Maximum of 10% broker fee
  .addSymbol('dividend_per_share', '$.quote.total_shares')
  .thenDivideInto('$quote.total_dividends');
```
**TransformerRuleList - thenReplace(String matchString, String replaceString)**

Adds an adapter to the current rule that finds all text within the source field that matches a specified string and replaces it with an updated string.

ℹ️ **Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matchString</td>
<td>String</td>
<td>String to match against the source field to identify the text to replace.</td>
</tr>
<tr>
<td>replaceString</td>
<td>String</td>
<td>String with which to replace the matching text.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')
  .thenConcatSymbol('close_price');
```
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

In this example, any company name that ends with "Inc." is transformed to "Incorporated", such as Company Inc. to Company Incorporated.

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('company', '$.quote.company')
  .thenReplace('Inc.', 'Incorporated');
```

TransformerRuleList - thenRoundDown(Number operand)

Adds an adapter to the current rule that rounds the source field down at the decimal position specified by the passed in value.

For negative numbers, the thenRoundDown() method makes the number more positive; the round down value of -2.156 is -2.15. The thenFloor() method makes the same number more negative, -2.16.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the addRule() method. They define adaptations to apply to the output field defined by the addRule() method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Decimal position to the right of the decimal point at which to round the number down. For example, if this value is 2 and the source data element is 6.427, the resulting value is 6.42.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList90
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenRoundDown('2') // Always round the interest rate down to the hundredths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');
```

### TransformerRuleList - thenRound Up(Number operand)

Adds an adapter to the current rule that rounds the source data element up at the decimal position specified by the passed in value.

For negative numbers, the `thenRoundUp()` method makes the number more negative; the round up value of -2.156 is -2.16. The `thenCeiling()` method makes the same number more positive, -2.15.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Decimal position to the right of the decimal point at which to round the number up.</td>
</tr>
</tbody>
</table>

  For example, if this value is 2 and the source data element is 6.422, the resulting value is 6.43.

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>
```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .setName('Mortgage Rates 05022019 JSON')
  .addRule('interest_rate', '$.quote.interest_rate')
  .thenRoundUp('2') // Always round the interest rate up to the hundredths place
  .addRule('monthly_payment', '$.quote.total_loan_amount')
  .thenDivideBy('180');
```

**TransformerRuleList - thenSplit(String splitPattern, String replaceString)**

Adds an adapter to the current rule that splits, reorganizes, and replaces strings within the source field and saves them in the output field.

The `splitPattern` parameter denotes how to divide the source text string into segments. This parameter can be a typical word separator such as a space (" "), comma (','), or semicolon (';'), and can also be any string, such as 'name'. For example, if the source text is "Smith John Michael" and the `splitPattern` is a space, then the available segments are "Smith", "John", and "Michael". To reference a segment, use $#, where # is the number of the order of the segment in the source text string. For example, if the method call is `thenSplit(' ', '$2 $3 $1')`, then the output is "John Michael Smith". In addition, you can add constants within the output pattern, such as `thenSplit(' ', 'First name: $2 Middle name: $3 Last name: $1')`.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>splitPattern</td>
<td>String</td>
<td>String that denotes how to split the text into segments.</td>
</tr>
<tr>
<td>replaceString</td>
<td>String</td>
<td>String that defines the output string, including segment references and constants. Not all segments need to be referenced. Reference the segments defined by the <code>splitPattern</code> using $#, where # is the number of the order of the segment in the source data element. Reference the entire source data element using $0.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

In this example, the CEO name is last name, first name in the source data and in the output it will be transformed to first name last name.

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJson()
  .setName('Stock Report 05022019 JSON')
  .addRule('ticker', '$.quote.symbol')
  .addRule('change_percentage', '$.quote.changePercent')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', '$.quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('CEO', '$.quote.CEO')
  .thenSplit(',', '$2 $1');
```

TransformerRuleList - `thenSubtract(Number operand)`

Adds an adapter to the current rule that subtracts the passed in value from the source field and stores it in the output field.

**Note:** This is an adapter method and cannot be used on its own. Adapter methods work in conjunction with the `addRule()` method. They define adaptations to apply to the output field defined by the `addRule()` method such as formatting, rounding, and applying patterns.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operand</td>
<td>Number</td>
<td>Value to subtract from the source data element.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Current TransformerRuleList object.</td>
</tr>
</tbody>
</table>

```javascript
var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJson();
```
.setName('Stock 05182019 JSON')
.addRule('ticker', '$.quote.symbol')
.addRule('change_percentage', '$.quote.changePercent')
.thenMultiply('100')
.thenRoundDown('0')
.addRule('close_price', '$.quote.close')
.thenAdaptCurrency('USD', false)
.addRule('trade_price', '$.quote.current_price')
.addMultiply('$quote.trade_quantity')
.thenSubtract('$quote.discount_dollars');

Transformer - Scoped, Global

Parses and transforms structured JSON or XML source content into structured key/value pair output, using a defined set of rules.

The scripted Transformer API works along with the TransformerDefinition and TransformerRuleList APIs. Together, these APIs transform XML nodes or any entity in a structured JSON document into an output of name-value pairs. Supported JSON entities including objects and elements within an array, such as strings, numbers, and other arrays.

- The TransformerRuleList API enables you to create transformation rule lists that define what data in the source document to include in the output and how to transform the source data.

- The TransformerDefinition API associates a transformation rule list with a JSON/XML record path to define reusable transform definition objects. You can use a transform definition object to transform one or more source documents.

- The Transformer API performs the actual data transformation, one data entity at a time, using the specified transformation rule list to create the desired output data.

You can use the Transformer class in both scoped and global server scripts. When using this class, use the sn_tfrm namespace identifier. Before this API is available in an instance, you must activate the Transformation Service plugin (com.glide.transform).

The following example illustrates how to use the TransformerRuleList API to define the transformation rules, the TransformerDefinition API to define the transformation criteria, and the Transformer API to actually perform the transformation.
This code example retrieves an external JSON-based stock details document, creates rules for transforming that data into a tabular table, and then transforms the source document, one row at a time. The following is a snippet of the JSON source document being transformed:

```
{
  "NOW": {
    "quote": {
      "symbol": "NOW",
      "companyName": "ServiceNow Inc.",
      "primaryExchange": "New York Stock Exchange",
      "sector": "Technology",
      "open": 166.78,
      "openTime": 1522935000556,
      "close": 165.77,
      "changePercent": 0.00656,
      ...
    },
    ...
  }
}
```

```javascript
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default GET');
var response = stockAPI.execute();
var responseBody = response.getBody(); // obtain the source JSON document

/* Define the list of rules to use to transform the acquired JSON stock detail information into a tabular table */

var transformerRuleList = new sn_tfrm.TransformerRuleList() // instantiate the rule list object .fromJSON() // indicate that the source document is JSON .addRule('ticker', '$.quote.symbol') // add a rule to copy the value in the "symbol" field of the source document to the ticker field in the output document (no changes) .addRule('change_percentage', '$.quote.changePercent') // copy the "changePercent" field from source into the change_percentage field of output document .thenMultiply('100') // multiply the change_percentage value by 100 .thenRoundDown('0') // add then round it down to a whole number .addRule('close_price', '$.quote.close') // copy the "close" field to the close_price field in the 21--[';output .thenAdaptCurrency('USD', false) // attach the US dollar code to the close_price field, but do not display the symbol .addRule('summary') // add a blank "summary" field to the output (no corresponding source field) .thenConcat('Shares of ') // in the summary field concatenate the string "Shares of "
```
.thenConcatSymbol('ticker') // then concatenate the "ticker" field from the source document
.thenConcat(' closed at ') // then concatenate the string " closed at "
.thenConcatSymbol('close_price'); // then concatenate the "close_price" field from the source document

// Create a transformer definition that associates the rule list to use and the record path of the set of records in the source document to transform.
var path = '$.*';
var transformerDefinition = new sn_tfrm.TransformerDefinition(transformerRuleList, path);

// Instantiate the transformer object.
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);

// Transform the source data, one row at a time, until all rows are processed.
var results = [];
while (transformer.transform()) {
    results.push(transformer.getRow());
}

Output:

```json
{ticker: "Now", change_percentage: "0", close_price: "165.77 USD", summary: "Shares of Now closed at 165.77" }
```

**Transformer - getRow()**

Returns the row resulting from the last transformation (or null if no row exists).

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Object</td>
</tr>
</tbody>
</table>

```javascript
var results = [];
while (transformer.transform()) {
    results.push(transformer.getRow());
}:
```
Output:

```javascript
var results = [];
while (transformer.transform()) {
    results.push(transformer.getRow());
}
```

Transformer - `transform()`

Transforms the next available row/node in the source document.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Flag that indicates whether there is a valid next row to transform.</td>
</tr>
<tr>
<td></td>
<td>• true: Valid next row</td>
</tr>
<tr>
<td></td>
<td>• false: No additional rows</td>
</tr>
</tbody>
</table>

Transformer - `Transformer(Object transformerDefinition, String document)`

Instantiates a Transformer object (constructor).

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transformerDefinition</td>
<td>Object</td>
<td>Object that describes the content transformation; includes rule list and JSONPath/XPath record path.</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>document</td>
<td>String</td>
<td>Source document to translate.</td>
</tr>
</tbody>
</table>

### Example

```javascript
var stockAPI = new sn_ws.RESTMessageV2('Stock Details', 'Default GET');
var response = stockAPI.execute();
var responseBody = response.getBody();

var transformerRuleList = new sn_tfrm.TransformerRuleList()
  .fromJSON()
  .addRule('ticker', 'quote.symbol')
  .addRule('change_percentage', 'quote.change')
  .thenMultiply('100')
  .thenRoundDown('0')
  .addRule('close_price', 'quote.close')
  .thenAdaptCurrency('USD', false)
  .addRule('summary')
  .thenConcat('Shares of ')  
  .thenConcatSymbol('ticker')
  .thenConcat(' closed at ')  
  .thenConcatSymbol('close')

var path = '$.*';
var transformerDefinition = new sn_tfrm.TransformerDefinition(transformerRuleList, path);
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);

var results = [];
while (transformer.transform()) {
  results.push(transformer.getRow());
}
```

### TransformPart - Scoped, Global

Use the `TransformPart` class to specify details of the transform to be done.

The `TransformPart` class can be used in scoped and global server scripts. When using the `TransformPart` class, use the `sn_clotho` namespace identifier.
There is no constructor for this class. TransformPart objects are returned by many Transformer and TransformPart methods.

The methods of this class define the transforms to be done. The actual transformation is done when the execute() method is called on the Transformer object.

The order the TransformPart methods are called is important.

• You must call the metric() method before calling a transform method.
• You cannot use the metric() or groupBy() methods after calling a transform method.
• Intermediate transforms are not returned in a result unless the collect() method is called for the intermediate result you want.

```java
// where tp is a TransformPart object
// example 1
tp.avg().add(2);
var tr = tp.execute();
// tr contains avg+2, but not avg

// example 2
tp.avg().add(2);
tp.avg();
var tr = tp.execute();
// tr contains both avg and avg + 2

// example 3
tp.avg().collect().add(2);
var tr = tp.execute();
// tr contains both avg and avg + 2
```

This class is part of the MetricBase application.

**TransformPart - add(Number constant)**

Add the specified number to the value in each time stamp.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constant</td>
<td>Number</td>
<td>The number to add to the value in each time stamp.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - avg()**

Aggregate the selected metric series into one series containing the average value for each time stamp.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - bottom(Number count)**

Create a result set that for each time stamp returns specified number of bottom values. This method results in 'count' number of series. Each value retains the label of its source series.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>The number of series to return. The series are labeled 0 to count - 1.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>
**TransformPart - ceil(Number ceiling)**

Replace the value in any time stamp that is greater than the specified value with the specified value.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ceiling</td>
<td>Number</td>
<td>The maximum allowed value for any time stamp.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - collect()**

Mark this transform for collection.

Transforms that are part of a chain, but not the last transform, are by default not collected. A collected transform is returned as part of the transform result.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - count()**

Aggregate the selected metric series into one series containing the number of values for each time stamp.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - div(Number constant)**

Divide the value in each time stamp by the specified number.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constant</td>
<td>Number</td>
<td>The number by which to divide the value of each time stamp.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - filter(Object aggregator, Object duration)**

Create a series using the specified aggregator for the specified time.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregator</td>
<td>Object</td>
<td>Can be:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AVG</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• CHISQUARE</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• LAST</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• MAX</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• MEDIAN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• MIN</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• STDDEV</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For definitions of these options, see MetricBase transforms.

<table>
<thead>
<tr>
<th>duration</th>
<th>Object</th>
<th>Time period for the series.</th>
</tr>
</thead>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>TransformPart object that you can use to specify transform characteristics.</td>
</tr>
</tbody>
</table>

#### TransformPart - floor(Number floor)

Replace the value in any time stamp that is less than the specified value with the specified value.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>floor</td>
<td>Number</td>
<td>The minimum value for any time stamp.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

#### TransformPart - fractiles(Array fractions)

Create series made up of the value that the specified percentage of values is below. Returns a series for each fraction in the specified array.
The value in a time stamp in a returned series is the value at which the specified fraction of the samples for that time stamp is below. For example, if the fraction is 0.5, then the value in the time stamp is the value where half the values in the input series are below (median).

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fractions</td>
<td>Array of numbers</td>
<td>The fractions to use on the input series.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics. Contains one series for each fraction specified.</td>
</tr>
</tbody>
</table>

```java
// returns a single series containing the median for each time stamp, which means that half a time stamp's values are below the returned value
fractiles([.5])
// returns four series, one series for each of the 25%, 50%, 75%, and 100% quartiles
fractiles([.25, .5, .75, 1])
// returns the median, 95% percentile, the max value
fractiles([.50, .95, 1])
```

### TransformPart - getResult()

Return the part of the result relevant to this transform.

The `collect()` method must be called before the `execute()` method, and the `execute()` method must be called before calling the `getResult()` method.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformResult</td>
<td>Contains the transform results associated with this part of the transform.</td>
</tr>
</tbody>
</table>

```javascript
var t = new sn_clotho.Transformer(drones);
t.metric("mb_demo_mt_altitude");
var avgTform = t.avg();
t.execute();
var avgTformResult = avgTform.getResult();
```

**TransformPart - `groupBy(String field)`**

Specify a field to be used to group the data.

The `groupBy()` method cannot be called after a transform has been run.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field</td>
<td>String</td>
<td>A field in the table to be used to group the transform results.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - `interpolate(Object count)`**

Create a data value for a NaN data item by interpolating from adjacent data values.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Object</td>
<td>Specifies the number of data samples in each direction to check for a non NaN value. If a non NaN value is not found, NaN is used.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

### TransformPart - iqr()

Perform an Interquartile range transform.

Creates a result set of four series.

- IQR, the median of all entries
- IQR range, below Q1-1.5IQR, or above Q3+1.5IQR
- Q1, the median of the smallest half of entries
- Q3, the median of the largest half of entries

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

### TransformPart - label(String label)

Add a label for the resulting series.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>The label for the transform results.</td>
</tr>
<tr>
<td>Returns</td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>----------------------------------</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>----------------------------------</td>
<td></td>
</tr>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
<td></td>
</tr>
</tbody>
</table>

**TransformPart - limit(Object count)**

Returns at most the specified number of values, starting at the most recent non-NaN value.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Object</td>
<td>A number of time stamps.</td>
</tr>
</tbody>
</table>

<p>| Returns |
|---------|----------------------------------|</p>
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - log(Number base)**

Run a logarithm on the value in each time stamp where the result is the log of the specified base for the time stamp value.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base</td>
<td>Number</td>
<td>The base for the logarithm calculation.</td>
</tr>
</tbody>
</table>

<p>| Returns |
|---------|----------------------------------|</p>
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>
TransformPart - max()

Returns a series with the maximum value for each time stamp.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

TransformPart - median()

Create a series containing the median of values for each time stamp across a set of series.

If there are n series in the TransformPart object, then if n is odd, the \((n / 2 + 1)\) value for a time stamp is the median. If n is even, the average of the \((n / 2)\) and \((n / 2 + 1)\) values for a time stamp is the median.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

TransformPart - metric(String metric)

Specify the metric field to be used in the transform.

You can specify multiple metrics to be used in the transform. The \(\text{metric()}\) method cannot be called after the transform has been run.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metric</td>
<td>String</td>
<td>Name of the metric field.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

### TransformPart - `min()`

Returns a series with the minimum value for each time stamp.

### TransformPart - `mul(Number constant)`

Multiply the value in each time stamp by the specified number.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constant</td>
<td>Number</td>
<td>The number by which to multiply the value of each time stamp.</td>
</tr>
</tbody>
</table>
TransformPart - partition(String aggregator, GlideDateTime duration, GlideDateTime base)
Partition the series into intervals of the same duration.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregator</td>
<td>String</td>
<td>The aggregator to use. Can be min, max, avg, or last.</td>
</tr>
<tr>
<td>duration</td>
<td>GlideDateTime or an ISO 8601 formatted string</td>
<td>The interval length.</td>
</tr>
<tr>
<td>base</td>
<td>GlideDateTime or an ISO 8601 formatted string</td>
<td>The zero offset for partitioning. For example, if you partition by day (24h), then set the base to Monday at midnight in your time zone. If you partition by 30 days, then set the base to 1st day of the most recent month.</td>
</tr>
</tbody>
</table>

TransformPart - resample(Number count)
Specify the number of data points to include in the result.

Aligns a series with a fixed number of data points in the given range. If the original series has more data points than specified, multiple values are averaged. If the original series has fewer data points than specified, data points are added by interpolating data points between existing data points.
You can use the `resample()` method to reduce the number of samples in the result to more closely match the number of samples you are going to display.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>The number of samples to include in the result.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - resample(Number min, Number max)**

Specify the minimum and maximum number of samples to include in the result.

This method is useful when you are showing series with different time periods (granularities).

This method determines the average number of points per series and if that fits between the specified minimum and maximum, each series is resampled to that average number of points. If the calculated average is greater than the maximum specified or smaller than the minimum specified, the specified maximum or minimum is used.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min</td>
<td>Number</td>
<td>The minimum number of samples to include in the result. If not enough samples are available, interpolation is used to create samples.</td>
</tr>
<tr>
<td>max</td>
<td>Number</td>
<td>The maximum number of samples to include in the result.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>
**TransformPart - resample(String aggregator, Number numValues)**

Specify an aggregator to use to create a result set of the specified size. The aggregator can be LAST, AVG, MIN, or MAX.

You can use the `resample()` method to reduce the number of samples in the result to more closely match the number of samples you are going to display.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregator</td>
<td>String</td>
<td>Can be LAST, AVG, MIN, or MAX.</td>
</tr>
<tr>
<td>numValues</td>
<td>Number</td>
<td>The number of samples to include in the result set. When the number of values requested is greater than the number of values in the data for the requested time period, <code>interpolate()</code> is used to add values between existing points to reach the requested number of values.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - resample(String aggregator, GlideDuration duration)**

Specify an aggregator to use to create a result set over the specified duration. The aggregator can be LAST, AVG, MIN, or MAX.

Resamples the underlying data to the requested period.

- When the time series is stored at a 1 minute interval and `resample(AVG, new GlideDuration("1:00"))` is called, the result will have one data point at every hour reflecting the average of the previous 60 values.
- When the period requested is smaller than the period of the data, interpolation is used to calculate the intervening data points.

You can use the `resample()` method to reduce the number of samples in the result to more closely match the number of samples you are going to display.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregator</td>
<td>String</td>
<td>Can be LAST, AVG, MIN, or MAX.</td>
</tr>
<tr>
<td>duration</td>
<td>GlideDuration</td>
<td>The time period for the result set.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - round(Number precision)**

Round the value in each time stamp to the specified precision.

Performs this calculation on each value.

\[(v / \text{precision}) \times \text{precision}\]

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>precision</td>
<td>Number</td>
<td>The value to be used in the rounding calculation.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - stddev()**

Create a series containing the standard deviation of values for each time stamp across a set of series.
TransformPart - sub(Object constant)
Subtract the specified number from the value in each time stamp.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constant</td>
<td>Object</td>
<td>The number to subtract from the value in each time stamp.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

TransformPart - sum()
Aggregate the selected metric series into one series containing the sum of all values for each time stamp.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformPart - top(Number count)**

Create a result set that for each time stamp returns the specified number of top values. This method results in 'count' number of series. Each value retains the label of its source series.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number</td>
<td>The number of series to return. The series are labeled 0 to count - 1.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TransformPart</td>
<td>A TransformPart object that can be used to specify transform characteristics.</td>
</tr>
</tbody>
</table>

**TransformResult - Scoped, Global**

Provides the result of a transformation run on time-series data.

The TransformResult class can be used in scoped and global server scripts. When using the Transformer class, use the `sn_clotho` namespace identifier.

There is no constructor for this class. TransformResult objects are returned by many TransformPart methods.

This class is part of the MetricBase application.

**TransformResult - byGroup()**

Returns an array of Data objects. Returns an error if no group was specified for the transform.
**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>An array of Data objects, with each object corresponding to a group.</td>
</tr>
</tbody>
</table>

**TransformResult - getByLabel(String label)**

Returns the transformed data with the specified label.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>String</td>
<td>The label that identifies the data to be retrieved.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>The Data object with the transform results.</td>
</tr>
</tbody>
</table>

**TransformResult - getData()**

Returns a single Data object, or null if the result is empty.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>The Data object with the transform results.</td>
</tr>
</tbody>
</table>
TransformResult - toArray()

Returns the transformed data as an array. This method turns a Data object into an array.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>The Data object formatted as an array.</td>
</tr>
</tbody>
</table>

UniversalRequestUtilsSNC API - Scoped

Enables handling universal request lifecycles. Provided as a script include record.

The UniversalRequestUtilsSNC API requires the Universal Request (com.snc.universal_request) plugin and is provided within the sn_uni_req namespace.

For information, refer to Universal Request.

UniversalRequestUtilsSNC - createUniversalRequest(Object copyFields)

Creates a universal request and returns the sys_id of the newly created universal request record.

This method is called using the UniversalRequestUtils prototype in the sn_uni_req namespace. For example, `sn_uni_req.UniversalRequestUtils().createUniversalRequest(<copyFields>)`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>copyFields</td>
<td>Object</td>
<td>JSON object containing field names and values to set on a new record in the Universal Requests [universal_request] table. Provide details by field name and field value in the format <code>{ '&lt;field_name&gt;': '&lt;field_value&gt;' }</code>.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>The following fields are considered the most useful details to assign to a primary ticket.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'assignment_group': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'assigned_to': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'contact_type': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'description': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'opened_by': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'opened_for': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'priority': 'String',</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'restricted': Boolean,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'short_description': 'String'</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Other fields not listed might be eligible for your use case. For a list of table fields and related fields in the system, view the data dictionary.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>🔄 Note: Do not include the primary_ticket or sys_id fields in the copyFields JSON object.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: Default assignment group is set per assignment rules.</td>
</tr>
<tr>
<td>copyFields.contact_type</td>
<td>String</td>
<td>Optional. Method by which the resource was initially reported. Possible values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• chat</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• email</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• phone</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• social</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• web</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Maximum length: 40</td>
</tr>
</tbody>
</table>
## Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>copyFields.description</td>
<td>String</td>
<td>Optional. Detailed description of the problem associated with the resource. Maximum length: 4,000</td>
</tr>
<tr>
<td>copyFields.opened_by</td>
<td>String</td>
<td>Optional. Sys_id of the person that initially opened the resource. Located in the User [sys_user] table.</td>
</tr>
<tr>
<td>copyFields.opened_for</td>
<td>String</td>
<td>Optional. Required for HR Service Delivery cases. The sys_id of the user for whom the resource was opened.</td>
</tr>
</tbody>
</table>
| copyFields.priority | String | Optional. Priority of the resource. Specified as a number. Possible values:  
  - 1: Critical  
  - 2: High  
  - 3: Moderate  
  - 4: Low  
  Default: 3 |
| copyFields.restricted | Boolean | Optional. Flag that indicates if the universal request has restricted access. Refer to Universal Request roles and groups. Valid values:  
  - true: Universal request is only accessible to users with the sn_uni_req.sensitiveinfo_agent role. Users with this role have permissions to view sensitive information, such as payroll details.  
  - false: Universal request access is unrestricted.  
  Default: false |
| copyFields.short_description | String | Concise description of the resource. Maximum length: 160 |
The following example shows how to set fields on a new universal request. In this use case, this code is added to the beginning of the Inbound Email Actions [sysevent_in_email_action] scoped Create HR Case script. If the case doesn’t apply to HR, agents can transfer the case to the appropriate department.

```javascript
var copiedFields = {
  'opened_for': '<user_sys_id>',
  'short_description': email.subject,
  'restricted': false,
  'priority': '1'
};

// createUniversalRequest() must be called to create the universal request prior to creating the child case
var ur = new sn_uni_req.UniversalRequestUtils().createUniversalRequest(copiedFields);
current.universal_request = ur;
```

**UniversalTaskUtils API - Scoped, Global**

The `UniversalTaskUtils` class provides methods for managing universal tasks. With the ServiceNow Universal Task application, agents can create tasks for employees. For example, agents can ask for additional information or request an action to resolve a parent ticket or request. Universal tasks are available for any ticket type that extends the Task [task] table.

Using this API you can change the state of active universal tasks to "Complete" or "Cancelled", obtain all active universal tasks for a specified parent task, check whether a parent universal task has any children, and apply templates to a universal task record. You can use these methods in scripts and in the Visable condition builders on the Tab configuration form to manage the data that appears on the Universal Task tab. For additional information, see Add a Task tab on the Standard Ticket page.
You can use this API in both scoped and global applications. The Universal Task application (sn_uni_task) must be installed on the associated instance to have access to this API. You must always specify the sn_uni_task namespace when calling methods in this API.

For additional information on the Universal Task application, see Universal Task.

*UniversalTaskUtils - applyTemplate(String templateSysId, GlideRecord uniTaskGr)*

Applies the specified universal task template to the specified universal task record.

Before you can use this method, there must be universal task templates configured in your instance. For details, see Universal Task templates.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>templateSysId</td>
</tr>
<tr>
<td>uniTaskGr</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

This code example shows a function that acquires, and then applies, the Feedback Template.
UniversalTaskUtils - getActiveChildTasks(String parentSysId)

Returns the active child task records, in the form of a GlideRecord, for the specified parent ticket.

You can then use the GlideRecord API, scoped or global depending on the calling application's scope, to access the returned data, such as using the getRowCount() method to count active tasks.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentSysId</td>
<td>String</td>
<td>Sys_id of the parent ticket whose active child tickets to return.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>GlideRecord that contains all active child task records for the specified parent task.</td>
</tr>
</tbody>
</table>

The following example shows a function that obtains all active child tasks for the current sys_id and then uses getRowCount() to obtain the number of active child tasks.

```
(function executeRule(current, previous /*null when async*/) {
  var gr_ActiveTasks = new sn_uni_task.UniversalTaskUtils().getActiveChildTasks(current.sys_id);
  var count = gr_ActiveTasks.getRowCount();
})(current, previous);
```

UniversalTaskUtils - hasTasksToShow(GlideRecord current)

Checks whether the specified parent ticket has any universal tasks that are in the work-in-progress or complete state.
You can use this method to determine whether to show the Universal Task tab to a requester in a standard ticket configuration only if there are tasks that are work-in progress or complete.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>GlideRecord of the parent ticket to check.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| sys_id | If universal tasks are associated with the parent ticket, the sys_id of the parent ticket; otherwise null.  
Data type: String |

The following example shows a function that calls this method to check for universal tasks.

```javascript
(function executeRule(current, previous /*null when async*/) {
  var sysId = new sn_uni_task.UniversalTaskUtils().hasTasksToShow(current);
})(current, previous);
```

**UniversalTaskUtils - markActiveChildTasksCancelled(String parentSysId)**

Changes the state of all active universal tasks under the specified parent ticket to "Cancelled".

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentSysId</td>
<td>String</td>
<td>Sys_id of the parent ticket whose active child universal tasks' state should be changed to &quot;Cancelled&quot;.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>
This code example shows how to use this method to update the states of all universal tasks associated with the specified parent task to cancelled.

```
(function executeRule(current, previous /*null when async*/) {
   new sn_uni_task.UniversalTaskUtils().markActiveChildTasksCancelled(current.sys_id);
})(current, previous);
```

**UniversalTaskUtils - markActiveChildTasksCompleted(String parentSysId)**

Changes the state of all active child universal tasks associated with the specified parent ticket to "Complete".

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentSysId</td>
<td>String</td>
<td>Sys_id of the parent ticket whose active child universal tasks' state should be changed to &quot;Complete&quot;.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

This code example shows how to use this method to update the states of all universal tasks associated with the specified parent task to completed.

```
(function executeRule(current, previous /*null when async*/) {
   new sn_uni_task.UniversalTaskUtils().markActiveChildTasksCompleted(current.sys_id);
})(current, previous);
```

**UPSHandler - Global**

Handles SNMP classification and identification for UPSs.

Use this API for SNMP-related discovery.

**UPSHandler - classifyAndIdentify()**

Classifies and identifies the UPSs.
### UserCriteria - Scoped

The UserCriteria API enables you to create, modify, or delete user criteria records using scripts.

To use this class in a scoped application, use the `sn_uc` namespace identifier. The User Criteria Scoped API plugin (ID: com.glideapp.user_criteria.scoped.api) should be enabled to access the UserCriteria API.

**Scoped UserCriteria - create(Object columnValues, Boolean standardUpdate)**

Creates a user criteria with specified values in the user_criteria table. Values specified in columnValues override the values provided via setters.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValues</td>
<td>Object</td>
<td>Key and value pairs for a column and its value.</td>
</tr>
<tr>
<td>standardUpdate</td>
<td>Boolean</td>
<td>Set to true to enable the running of engines and workflow.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>sys_id of the created user criteria.</td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setCompanies("31be3d53792000044e0bfc8bcbe5dec,0c441abb6112275000025157c651c89");
uc.setActive(true);
uc.setUsers("31be3d53792000044e0bfc8bcbe5dec,0c441abb6112275000025157c651c89");
```
var UserCriteriaId = uc.create();
gs.info(UserCriteriaId);

Output:
41bea3d53790200044e0bfc8bcbe5dec

Scoped UserCriteria - deleteRecord()
Deletes the current user criteria.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If true, the user criteria is deleted.</td>
</tr>
<tr>
<td></td>
<td>If false, no user criteria is found to delete.</td>
</tr>
</tbody>
</table>

var uc = new sn_uc.UserCriteria("31bea3d53790200044e0bfc8bcbe5dec");
uc.deleteRecord();

Output:
true

Scoped UserCriteria - read(String columns)
Displays the mapping for the attribute and value pairs of the catalog item.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns</td>
<td>String</td>
<td>Array of catalog item attributes.</td>
</tr>
</tbody>
</table>
**Scope UserCriteria - setActive(Boolean active)**

Specifies if the user criteria is active.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| active| Boolean | If true, the user criteria is active.  
If false, the user criteria is inactive. |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setActive(true);
```

**Scope UserCriteria - setAdvanced(boolean advanced)**

Specifies if the user criteria has an advanced script.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advanced</td>
<td>Boolean</td>
<td>If true, the user criteria has an advanced script. If false, the user criteria does not have an advanced script.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setAdvanced(true);
```

### Scoped UserCriteria - setCompanies(String companies)

Sets the company property for the user criteria.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>companies</td>
<td>String</td>
<td>Comma-separated list of the company sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setCompanies("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc611227500025157c651c89");
```

### Scoped UserCriteria - setDepartments(String departments)

Sets the department property for the user criteria.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>departments</td>
<td>String</td>
<td>Comma-separated list of the department sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setDepartments("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

Scoped UserCriteria - setGroups(String groups)

Sets the group property for the user criteria.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groups</td>
<td>String</td>
<td>Comma-separated list of the group sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setGroups("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

Scoped UserCriteria - setLocations(String locations)

Sets the location property for the user criteria.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>locations</td>
<td>String</td>
<td>Comma-separated list of the location sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setLocations("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

### Scoped UserCriteria - setMatchAll(Boolean match_all)

Sets the match_all property for the user criteria.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>match_all</td>
<td>If true, all conditions set as properties for the user criteria should be fulfilled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If false, at least one condition set as a property for the user criteria should be fulfilled.</td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setMatchAll(true);
```

### Scoped UserCriteria - setName(String name)

Sets the name property for the user criteria.

```javascript
var uc = new sn_uc.UserCriteria();
uc.setName("My UserCriteria");
```
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the user criteria.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setName("Property1");
```

#### Scoped UserCriteria - setRoles(String roles)

Sets the role property for the user criteria.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roles</td>
<td>String</td>
<td>Comma-separated list of the role sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.setRoles("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

#### Scoped UserCriteria - setScript(String script)

Sets the script for the user criteria.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>script</td>
<td>String</td>
<td>Script to be set for the advanced user criteria.</td>
</tr>
</tbody>
</table>
**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var uc = new sn_uc.UserCriteria();
uc.setScript("function scriptTest() {
    var rval;
    if (gs.getUser().getRecord().getDisplayValue('department') == 'Product Management') {
        rval = true;
    } else {
        rval = false;
    }
    return rval;
}"");
```

**Scoped UserCriteria - setUsers(String users)**

Sets the user property for the user criteria.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>users</td>
<td>String</td>
<td>Comma-separated list of the user sys_ids to be set for the user criteria.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
var uc = new sn_uc.UserCriteria();
uc.setUsers("31bea3d53790200044e0bfc8bcbe5dec,0c441abbc6112275000025157c651c89");
```

**Scoped UserCriteria - update(Object columnValues, String reason)**

Updates the current catalog item with the specified values.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>columnValues</td>
<td>Object</td>
<td>Mapping for the column name and the value pairs.</td>
</tr>
<tr>
<td>reason</td>
<td>String</td>
<td>Reason for updating the catalog item.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Returns the sys_id of the created user criteria.</td>
</tr>
</tbody>
</table>

```javascript
var uc = new sn_uc.UserCriteria();
uc.update("name": "Updated name", "The existing name is not relevant. Setting a relevant name");
```

Output:

31bea3d53790200044e0bfc8bcbe5dec

Scoped UserCriteria - UserCriteria()

Creates an instance of the UserCriteria class.

```javascript
var uc = new sn_uc.UserCriteria();
```

Scoped UserCriteria - UserCriteria(String sys_id)

Creates an instance of the UserCriteria class with the specified sys_id.

```javascript
var uc = new sn_uc.UserCriteria("31bea3d53790200044e0bfc8bcbe5dec");
```

UserSkillAnalyzer - Global

Analyzes user skills against skills required to complete work items.

Requires the Skills Management plugin (com.snc.skills_management), which you can activate if you have the admin role.
See Qualify and rank users based on skills and skill levels.

**UserSkillAnalyzer - analyzeUserByID(String requiredSkillsJson, String userID, Boolean isSkillLevelEnforced)**

Analyzes user skills against the required skills and sets the number of matching skills, skill level gap, and qualification that can be collected from an instance.

Analyzes whether an agent is qualified to work on a task by verifying if the agent has the skills and skill levels required to complete the task. If an agent is qualified to work on a task, the API analyzes the level gap between required skills and user’s skill level which can be further used by the application to choose the best agent based on level gap. It also analyzes the total number of skills with and without skill levels the agent has to execute that task.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requiredSkillsJson</td>
<td>String</td>
<td>List of required skills to compare with user. Each skill is listed as a JSON entry in the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• is_mandatory: Boolean. Flag that indicates whether the skill is mandatory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• level: String. Sys ID from the Skill Levels [cmn_skill_level] table.</td>
</tr>
<tr>
<td>userID</td>
<td>String</td>
<td>Sys ID from the User [sys_user] table.</td>
</tr>
<tr>
<td>isSkillLevelEnforced</td>
<td>Boolean</td>
<td>True if user must have a minimum skill level for all required mandatory skills, false otherwise. Default: false.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>JSON that contains all the required information about the user based on the analyzer skills map as follows:</td>
</tr>
<tr>
<td></td>
<td>• sys_id: String. Sys ID from the User [sys_user] table.</td>
</tr>
<tr>
<td></td>
<td>• is_qualified: Boolean. Flag that indicates whether the user is qualified for the required skills.</td>
</tr>
</tbody>
</table>
Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>◦ True if user has all the mandatory skills and skill level is enforced.</td>
<td></td>
</tr>
<tr>
<td>◦ False if user does not have all mandatory skills or does not meet level</td>
<td></td>
</tr>
<tr>
<td>requirements.</td>
<td></td>
</tr>
<tr>
<td>• num_skills: Number. Skills matched against the required skills.</td>
<td></td>
</tr>
<tr>
<td>• num_skills_matching_level: Number. User skills matching the required level.</td>
<td></td>
</tr>
<tr>
<td>• total_skill_level_gap: Number. Skill level gap helps ranking algorithm</td>
<td></td>
</tr>
<tr>
<td>find optimal user meeting minimum skill level requirements. Calculated</td>
<td></td>
</tr>
<tr>
<td>based on overall gap between task skill level and user skill level. User</td>
<td></td>
</tr>
<tr>
<td>must have required skill level for mandatory skills.</td>
<td></td>
</tr>
<tr>
<td>• optional_skill_level_gap: Number. Provides skill level gap for optional</td>
<td></td>
</tr>
<tr>
<td>only. Assists the end points in distinguishing between total skill level</td>
<td></td>
</tr>
<tr>
<td>and optional skill level gap.</td>
<td></td>
</tr>
</tbody>
</table>

Error if inaccurate parameters or malformed JSON provided.

```javascript
var skills = [{"sys_id":"48c9f873c0a8018b65c3814608b201e6", "is_mandatory": true,
    "level":"4e0ac4d6b3332300290ea943c6a8dc4e"},
    {"sys_id":"48c9fdddc0a8018b04bd8d7914c82c9d", "is_mandatory": false,
    "level":"4e0ac4d6b3332300290ea943c6a8dc4e"}];
var userSysID = "a8f98bb0eb32010045e1a5115206fe3a";
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
var result = userSkillAnalyzer.analyzeUserById(JSON.stringify(skills), userSysID, true);
gs.info('Results: ' + result);
```

Output:

Calling user analyzer
*** Script: Results:
{"sys_id":"a8f98bb0eb32010045e1a5115206fe3a","is_qualified":false,"num_skills":0,"num_skills_matching_level":0,"total_skill_level_gap":0,"optional_skill_level_gap":0}

**UserSkillAnalyzer - analyzeUserBySkills(String requiredSkillsJson, String userSkillsJson, Boolean isSkillLevelEnforced)**

Analyzes user skills against the required skills and sets the number of matching skills, skill-level gap, and qualification that can be collected from an instance.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requiredSkillsJson</td>
<td>String</td>
<td>List of required skills to qualify the users against. Each skill is listed as a JSON entry in the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>is_mandatory</code>: Boolean. Flag that indicates whether the skill is mandatory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>level</code>: String. Sys ID from the Skill Levels [cmn_skill_level] table.</td>
</tr>
<tr>
<td>userSkillsJson</td>
<td>String</td>
<td>List of user skills to determine qualification for required skills. Each skill is listed as a JSON entry in the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>is_mandatory</code>: Boolean. Flag that indicates whether the skill is mandatory.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <code>level</code>: String. Sys ID from the Skill Levels [cmn_skill_level] table.</td>
</tr>
<tr>
<td>isSkillLevelEnforced</td>
<td>Boolean</td>
<td>True if user must have minimum skill level for all required mandatory skills, false otherwise. Default: false.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>JSON that contains all the required information about the user based on the analyzer skills map as follows:</td>
</tr>
<tr>
<td></td>
<td>• <code>sys_id</code>: String. Sys ID from the User [sys_user] table.</td>
</tr>
<tr>
<td></td>
<td>• <code>is_qualified</code>: Boolean. Flag that indicates whether the user is qualified for the required skills.</td>
</tr>
<tr>
<td></td>
<td>◦ True if user has all the mandatory skills and skill level is enforced.</td>
</tr>
<tr>
<td></td>
<td>◦ False if user does not have all mandatory skills or does not meet level requirements.</td>
</tr>
<tr>
<td></td>
<td>• <code>num_skills</code>: Number. Skills matched against the required skills.</td>
</tr>
</tbody>
</table>
### Returns (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• num_skills_matching_level: Number.</td>
<td>User skills matching the required level.</td>
</tr>
<tr>
<td>• total_skill_level_gap: Number.</td>
<td>Skill level gap helps ranking algorithm find optimal user meeting minimum skill level requirements. Calculated based on overall gap between task skill level and user skill level. User must have required skill level for mandatory skills.</td>
</tr>
<tr>
<td>• optional_skill_level_gap: Number.</td>
<td>Provides skill level gap for optional skills only. Assists the end points in distinguishing between total skill level and optional skill level gap.</td>
</tr>
</tbody>
</table>

Error if inaccurate parameters or malformed JSON provided.

```javascript
var skills = ["sys_id":"48c9f873c0a8018b65c3814608b201e6","is_mandatory":true,"level":"4e0ac4d6b3332300290ea943c6a8dc4e"],{"sys_id":"48c9fddcc0a8018b04bd8d7914c82c9d","is_mandatory":false,"level":"4e0ac4d6b3332300290ea943c6a8dc4e"};
var userSkills = ["sys_id":"48c9f873c0a8018b65c3814608b201e6","is_mandatory":true,"level":"4e0ac4d6b3332300290ea943c6a8dc4e"],{"sys_id":"k, th","is_mandatory":false,"level":"4e0ac4d6b3332300290ea943c6a8dc4e"};
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
var result = userSkillAnalyzer.analyzeUserBySkills(JSON.stringify(skills),JSON.stringify(userSkills));
gs.info('Results: ' + result);
```

### UserSkillAnalyzer - UserSkillAnalyzer()

Instantiates a new UserSkillAnalyzer object.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var userSkillAnalyzer = new SNC.UserSkillAnalyzer();
```
**UserSkillRanking - Global**

Used to configure options for choosing the right user and getting a sorted list of qualified users based on number of matching skills and skill-level gap.

Requires the Skills Management plugin (com.snc.skills_management), which you can activate if you have the admin role.

See Qualify and rank users based on skills and skill levels.

**UserSkillRanking - UserSkillRanking()**

Instantiates a UserSkillRanking object.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**UserSkillRanking - getQualifiedRankedUsers(String requiredSkillsJson, String usersJson, String rankType, Boolean isSkillLevelEnforced)**

Provides a list of qualified users based on matching mandatory skills and levels if the isSkillLevelEnforced parameter is true).

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requiredSkillsJson</td>
<td>String</td>
<td>List of required skills to qualify users. Each skill is listed as a JSON entry in the following format: • sys_id: String. Sys ID of skill from the Skills [cmn_skill] table. • is_mandatory: Boolean. Flag that indicates whether the skill is mandatory. • level: String. Sys ID from the Skill Levels [cmn_skill_level] table.</td>
</tr>
<tr>
<td>usersJson</td>
<td>String</td>
<td>List of user Sys IDs from sys_user table (in JSON format representing users to be qualified against required skills).</td>
</tr>
<tr>
<td>rankType</td>
<td>String</td>
<td>Enables sorting qualified users based on ranking. Possible values are comparators to provide sorted list of qualified users based on number of matching skills and skill level gap:</td>
</tr>
</tbody>
</table>
### Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_RANKING</td>
<td></td>
<td>(default) – Used if empty value provided.</td>
</tr>
<tr>
<td>NUM_SKILLS</td>
<td></td>
<td>Number of skills matched against required skills.</td>
</tr>
<tr>
<td>NUM_SKILL_MATCHING_LEVEL</td>
<td></td>
<td>Number of user skills matching the required skill level.</td>
</tr>
<tr>
<td>LEAST_SKILL_LEVEL_GAP</td>
<td></td>
<td>Finds user skill that most closely meets minimum skill level requirements.</td>
</tr>
<tr>
<td>MOST_SKILL_LEVEL_GAP</td>
<td></td>
<td>Finds user that least meets minimum skill level requirements.</td>
</tr>
<tr>
<td>BEST_OPTIMUM_USER</td>
<td></td>
<td>Finds optimum user for all skill levels.</td>
</tr>
</tbody>
</table>

| isSkillLevelEnforced | Boolean   | True if user must have minimum skill level for all required mandatory skills, false otherwise. Default: false. |

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>List of qualified users as JSON. Error if inaccurate parameters or malformed JSON provided.</td>
</tr>
</tbody>
</table>

```javascript
var skills = [
  {"sys_id": "48c9f873c0a8018b65c3814608b201e6", "is_mandatory": true,
   "level": "4e0ac4d6b3332300290ea943c6a8dc4e"},
  {"sys_id": "48c9fdddc0a8018b04bd8d7914c82c9d", "is_mandatory": false,
   "level": "4e0ac4d6b3332300290ea943c6a8dc4e"}];
var users = ["a8f98bb0eb32010045e1a515206fe3a", "62826bf03710200044e0bfc8bcbe5df1"];
var userSkillRanking = new SNC.UserSkillRanking();
var qualifiedUsers = userSkillRanking.getQualifiedRankedUsers(JSON.stringify(skills),
  JSON.stringify(users), "BEST_OPTIMUM_USER", true);
```

### v_query – Scoped, Global

Scriptable object that represents a query running against a remote table.

This API requires the Remote Tables plugin (com.glide.script.vtable) to be activated. Retrieving external data using remote tables and scripts.
Remote table rows are created using the `v_table` API.

**v_query - getCondition(String field)**
