The interaction wrap up configuration includes the following information:

- The selected communication channel.
- Additional conditions that apply to the interaction records included in the configuration.
- Whether wrap up is automatically ended by the system and, if automatically ended the duration of the wrap up period.
- Whether a countdown timer that displays the wrap up duration is shown to agents in CSM Configurable Workspace.

The interaction wrap up configuration adds the Wrap Up state to the State field on the Interaction record. For more information about the wrap up state, see Interaction states.

Starting wrap up

The wrap up period begins when either the agent or the customer ends a conversation. The system then does the following:

- Moves the state of the interaction from Work in Progress to Wrap Up.
- Starts a countdown timer for the wrap up duration period.

Manually ending wrap up

Ending the wrap up period can be performed manually by the agent or automatically by the system.

Agents can end the wrap up by clicking End Wrap Up on the Interaction record, which moves the interaction from Wrap Up to Closed Complete.

Agents can also end the wrap up period by closing the interaction record tab.

- If the interaction is in the Wrap Up state, closing the tab ends the wrap up period and moves the interaction to Closed Complete. The system displays a message to the user about ending the wrap up period.
- If the interaction is in the Work in Progress state, closing the tab skips the wrap up period and moves the interaction to Closed Complete.
Automatically ending wrap up
If an agent has not already ended wrap up, the system can automatically end
the wrap up period after a set period of. Automatic wrap up must be enabled in
the interaction wrap up configuration.

• The system starts the wrap up duration timer when the wrap up period starts.
• When the wrap up duration timer reaches zero, the system ends wrap up and
changes the state from Wrap Up to Closed Complete.
• The system sets the System wrap up field on the Interaction record to True.

⚠️ Note: Agents can manually end the wrap up period even if automatic
wrap up is enabled.

Interaction form
The Interaction form displays information about a customer interaction.

The interaction form includes the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>The automatically assigned interaction number.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of customer interaction, such as a chat or phone call.</td>
</tr>
<tr>
<td>Account</td>
<td>The name of the customer contact's company. This field is filled in</td>
</tr>
<tr>
<td></td>
<td>automatically if the information is available in the contact record.</td>
</tr>
<tr>
<td>Contact</td>
<td>The name of the customer contact.</td>
</tr>
<tr>
<td>Consumer</td>
<td>The name of the consumer.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the interaction. For more information, see Interaction</td>
</tr>
<tr>
<td></td>
<td>states.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The name of the assigned user.</td>
</tr>
<tr>
<td>Short description</td>
<td>A brief description of the customer issue.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Work notes</td>
<td>Records information about the interaction and the work being done to resolve the customer issue.</td>
</tr>
</tbody>
</table>
| Wrap up duration      | If using the Interaction wrap up feature, the system administrator can configure the Interaction form and add the **Wrap up duration** field. This field records the length of time that the Interaction record spends in the Wrap Up state. This is a read-only field. If a duration is not calculated, this field is set to 0. Duration is calculated as the time an interaction is in the Wrap Up state before moving to either Closed Complete or Closed Abandoned.  

  **Note:** If an agent closes the tab and ends the interaction, the wrap up duration is recorded as 0 seconds. |
| System wrap up        | If using the Interaction wrap up feature, the system administrator can configure the Interaction form and add the **System wrap up** field.  

The system determines if the interaction wrap up was performed manually by an agent (by clicking **End Wrap Up**) or automatically by the system and sets this field accordingly.  

- **Set to True** when automatic wrap up is enabled and the system moves an interaction from the Wrap Up state to either Closed Complete or Closed Abandoned at the end of the wrap up duration.  
- **Set to False** when an agent manually wraps up an interaction. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The default value for this field is false.</td>
</tr>
</tbody>
</table>

**Interaction wrap up timer**

The interaction wrap up timer displays a countdown of the wrap up duration period in CSM Configurable Workspace.

The system administrator can configure the display of the wrap up timer by enabling the **Show duration to agent** field on the Interaction Wrap Up Configuration form.

The read-only timer appears in an interaction record's secondary values. Depending on the configuration of the secondary values, these values can be displayed either in the form header or in the contextual side panel.

**Note:** The interaction wrap up timer works in both CSM Configurable Workspace and CSM Agent Workspace but the timer display is only available in CSM Configurable Workspace.

The timer counts down the amount of time specified in the **Duration in seconds** field on the Interaction Wrap Up Configuration form. The background color of the timer changes as it counts down the duration.

<table>
<thead>
<tr>
<th>Timer color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Time remaining is between 100% to 50% of duration.</td>
</tr>
<tr>
<td>Yellow</td>
<td>Time remaining is between 50% and 25% of duration.</td>
</tr>
<tr>
<td>Orange</td>
<td>Time remaining is between 25% and 0% of duration.</td>
</tr>
<tr>
<td>Red</td>
<td>When the timer reaches 0.00, the display turns red and then disappears. The system updates the state of the interaction record to Closed Complete.</td>
</tr>
</tbody>
</table>

**Interaction wrap up scheduled job**

The interaction wrap up feature includes a scheduled job to close any interactions in the Wrap Up state that were not closed either manually by an agent or automatically by the system.

Ending the wrap up period is typically performed in the following ways:
• Manually by the agent.
• Automatically by the system, if the Enforce wrap up duration setting is enabled in the interaction wrap up configuration.
• By closing the workspace tab.

While most interaction records are automatically closed when the configured wrap up period ends, the interaction wrap up feature also includes a scheduled job to close any remaining records. For example, if the Enforce wrap up duration setting is not enabled in the configuration and agents close interactions by closing the browser, these interactions can remain in the Wrap Up state.

The Fallback Timeout for Interactions in Wrap Up scheduled job functions as a fail-safe method for closing interaction records that remain in the Wrap Up state. This scheduled job:

• Evaluates interaction records in the Wrap Up state.
• Closes those records that have been in the Wrap Up state longer than the time specified in the Max Wrap Up system property.

The Max Wrap Up system property (com.glide.interaction.max_wrapup_duration) defines the length of time that an interaction record can be in the Wrap Up state. The default value for this property is 15 minutes.

The time value set in the Max Wrap Up system property must be greater than the time value set in the Enforce wrap up duration field on the Interaction Wrap Up Configuration form.

The default run interval for this scheduled job is five minutes. The system administrator can configure this time interval.

⚠️ Note: This scheduled job is inactive by default.

Create an interaction wrap up configuration

Create a configuration for each type of interaction that uses the interaction wrap up feature.

Before you begin
Role required: admin

About this task
Creating a configuration automatically enables the interaction wrap up feature and adds the Wrap Up state for interactions that match the configuration settings.
The Interaction > Wrap Up module includes a list of wrap up configuration records. These configurations are stored in the Interaction Wrap Up Configuration (interaction_wrap_up_configuration) table.

Procedure
2. Click New.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the interaction wrap up configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicates whether the configuration is active. The default value is true.</td>
</tr>
<tr>
<td>Table</td>
<td>Read only. The table that stores the interaction records to which this configuration applies.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions that apply to the interaction records included in this configuration.</td>
</tr>
<tr>
<td>Enforce wrap up duration</td>
<td>Enables the system to automatically end the wrap up period. The default value is false. If enabled, the system automatically ends the wrap up period at the end of the wrap up duration (set in the Duration in seconds field) and moves the state of the interaction record from Wrap Up to Closed Complete.</td>
</tr>
<tr>
<td>Duration in seconds</td>
<td>The duration of the wrap up period. The system displays this field when you enable the Enforce wrap up duration field.</td>
</tr>
</tbody>
</table>

• The default value is 60 seconds.
• The value must be greater than 0.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show duration to agent</td>
<td>Enables a duration countdown timer for the agent. The default value is false. The system displays this field when you enable the Enforce wrap up duration field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The interaction wrap up timer works in both CSM Configurable Workspace and CSM Agent Workspace but the timer display is only available in CSM Configurable Workspace.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of the configuration, which is used in evaluation processing of wrap up configuration records. If there are multiple records, the lower order number takes precedence over higher numbers. The default value is 100.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Knowledge Management**

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

The Knowledge Management Service Portal enables users to access a portal view of knowledge bases and articles. It is available by default for new customers on the Madrid and later releases. If required, existing and upgrade customers can activate the Knowledge Management Service Portal plugin.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.
To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.

Additional plugins for Knowledge Management

After Knowledge Management is activated, you can activate additional plugins that provide access to various additional Knowledge Management features.

You must have the admin role to activate these additional plugins. For details, see Activate a plugin.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Core [com.glideapp.knowledge]</td>
<td>Installs the core Knowledge Management items used to allow other Knowledge-related plugins to work, such as Knowledge V3, Knowledge Advanced, and Knowledge Service Portal. This plugin is activated by default.</td>
</tr>
<tr>
<td>Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer]</td>
<td>Installs the Knowledge Management Advanced plugin. Activating/upgrading to this plugin validates the knowledge articles and knowledge bases to make sure that the Knowledge Advanced plugin can be successfully installed. If validation fails, check the Plugin Activation logs and follow instructions given to fix any errors. Once you fix all the issues, re-run this plugin.</td>
</tr>
<tr>
<td>Knowledge Management Advanced [com.snc.knowledge_advanced]</td>
<td>Adds advanced features to Knowledge Management such as version control and subscriptions. This plugin requires that all knowledge bases are version Knowledge V3. Use the Knowledge Management Advanced Installer plugin to activate this plugin.</td>
</tr>
<tr>
<td>Predictive Intelligence for Knowledge Management [com.snc.knowledge_ml]</td>
<td>Provides various Knowledge Management capabilities driven by machine-learning solutions. For example, capabilities such as similar articles and knowledge demand insights. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.</td>
</tr>
<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Knowledge Management</td>
<td>Enables the Performance Analytics content pack for the Analytics and Reporting Knowledge Management Solution. Activation of this plugin on production instances might require a separate Performance Analytics license. Contact ServiceNow for details.</td>
</tr>
<tr>
<td>[com.snc.pa.knowledge_v2]</td>
<td></td>
</tr>
<tr>
<td>Knowledge Management V3</td>
<td>Enables support for Knowledge Management V3. Activate this plugin when you upgrade from Eureka or earlier versions.</td>
</tr>
<tr>
<td>[com.snc.knowledge3]</td>
<td></td>
</tr>
<tr>
<td>I18N: Knowledge Management Internationalization Plugin v2</td>
<td>Helps create and maintain translations of an article in various languages in a way that is easy to manage translations while authoring as well as viewing articles. Activating internationalization plugins for any of the available languages automatically activates this plugin.</td>
</tr>
<tr>
<td>[com.glideapp.knowledge.i18n2]</td>
<td></td>
</tr>
<tr>
<td>Knowledge Document</td>
<td>Adds knowledge-based functionalities to the Managed Documents plugin. You can create a knowledge article from a document or update a knowledge document to a newer revision.</td>
</tr>
<tr>
<td>[com.snc.knowledge_document]</td>
<td></td>
</tr>
<tr>
<td>Knowledge Management - External Content Integration</td>
<td>Adds external content search capabilities to the Knowledge Management application. Once configured, this feature creates a copy of the external content on ServiceNow as knowledge articles, and then indexes the articles through Zing Search. You must have appropriate reuse and copy privileges before you configure an external source to be searchable using this feature.</td>
</tr>
<tr>
<td>[com.snc.knowledge.external_integration]</td>
<td></td>
</tr>
<tr>
<td>Knowledge Management Wiki Support</td>
<td>Enables support for wiki type Knowledge articles.</td>
</tr>
</tbody>
</table>

**Note:** When you install and activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml), the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) is also activated.
### Components installed with Knowledge Management Core

Several types of components are installed with activation of the Knowledge Management Core plugin (com.glideapp.knowledge) including user roles and tables.

ℹ️ **Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available.

#### Roles installed

## Knowledge Management roles (continued)

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain expert</td>
<td>keeps track of the health of knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
<tr>
<td>knowledge_group_manager</td>
<td>Knowledge group managers can add or remove members in ownership groups managed by them. They cannot change the manager assigned in their groups. The manager can only be reassigned by the knowledge administrator. Knowledge group managers are assigned feedback tasks by default. They can reassign tasks to another group member, or group members can assign a feedback task to themselves.</td>
</tr>
<tr>
<td>knowledge_group_member</td>
<td>Knowledge group members are part of an ownership group that can be associated to knowledge articles. They can approve knowledge articles, assign feedback tasks to themselves and work on them as well as edit any knowledge articles that their ownership group is assigned to.</td>
</tr>
<tr>
<td>kcs_candidate</td>
<td>KCS candidates understand the basics of KCS.</td>
</tr>
<tr>
<td>kcs_contributor</td>
<td>KCS contributors have the capability and authority to create or validate knowledge articles in their product areas without being reviewed by a knowledge coach.</td>
</tr>
<tr>
<td>kcs_publisher</td>
<td>KCS publishers are authors who are well versed in KCS standards and create more external-facing articles.</td>
</tr>
</tbody>
</table>

The kcs_candidate, kcs_contributor, and kcs_publisher roles also include the knowledge role. For more information about these KCS-related roles, see [KCS v6 Practices Guide](#).
Knowledge Management properties

As an administrator, you can configure the look and functionality of many knowledge base features with Knowledge Management properties.

You can access Knowledge Management properties by navigating to Knowledge > Administration > Properties.

Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages</td>
<td>Set the number of columns for arranging topics on the knowledge portal.</td>
</tr>
<tr>

<td>Enter the roles in a comma-separated list that can use the Knowledge subscription feature.</td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature (glide.knowman.enable_km_subscription.workflow_state)</td>
<td>Enter the workflow states for knowledge articles in a comma-separated list that users can subscribe to.</td>
</tr>
</tbody>
</table>
### Article quality index properties

The knowledge administrator can set the pass score for AQI reviews using the knowledge properties page.

**Properties for Article Quality Index**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Pass score for AQI reviews (glide.knowman.aqi_pass_score) | Set the pass score for AQI reviews.  
  - Type: Integer  
  - Default value: 70  
  - Range of values possible: 1-100 |
| List of article workflow states to perform AQI reviews (glide.knowman.aqi.article_workflow_states) | Enter the article workflow states, in a comma-separated list, where users can perform AQI reviews.  
  - Type: String  
  - Default value: draft, review, published |

### External Content Integration Properties

Administrators can configure the properties to add allowed content types and change the UI label for the external content integration feature.
## Properties for External Content Integration

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum limit for total size of external content in Knowledge Management (in GB) (sn_km_intg.glide.knowman.external.max_content_size) | • Type: Integer  
• Default value: 2  
**Note:** This is a read-only field.                                                                                                                   |
| Maximum size of an external article including its attachments (in MB) (sn_km_intg.glide.knowman.external.max_article_size) | • Type: Integer  
• Default value: 8  
**Note:** This is a read-only field.                                                                                                                   |
| An editable, comma-separated list of allowed content types to be processed from the source system (sn_km_intg.glide.knowman.external.allow_content_types) | • Type: Comma separated  
• Default value: application/msword,application/vnd.openxmlformats-officedocument.wordprocessingml.document,application/vnd.ms-excel,application/vnd.openxmlformats-officedocument.spreadsheetml.sheet,application/vnd.ms-powerpoint,application/vnd.openxmlformats-officedocument.presentationml.presentation,application/pdf,text/plain,text/html,image/gif,image/jpeg,image/png  
• Other possible values: application/xml, video/mp4, audio/mpeg                                                                                     |
| List of content types not allowed to be processed from the source system (sn_km_intg.glide.knowman.external.reject_content_types) | • Type: Comma-separated  
• Default value: application/octet-stream,application/x-apple-diskimage,application/vnd.microsoft.portable-executable                                                                 |
| UI Label for indicating external articles in Search Results and Article View Pages (sn_km_intg.glide.knowman.external.ui_label_for_external_content) | • Type: String  
• Default value: External                                                                                                                          |

## Actionable Knowledge Feedback Properties

The Knowledge administrator can set configuration properties that would create actionable feedback tasks.
### Properties for Actionable Knowledge Feedback

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged.</td>
<td>Select the check box to enable actionable feedback task generation when an article is flagged for incorrect or inappropriate content.</td>
</tr>
</tbody>
</table>
| (glide.knowman.feedback.enable_actionable_feedback_for_flag)             | • Type: true | false  
• Default value: true  
• Location: Knowledge > Administration > Properties                                                                                                                                                        |
| Create actionable feedback task when an article is marked as not helpful | Select the check box to enable actionable feedback task generation when an article is marked as not helpful.                                                                                                  |
| (glide.knowman.feedback.enable_actionable_feedback_for_helpful)          | • Type: true | false  
• Default value: false  
• Location: Knowledge > Administration > Properties                                                                                                                                                        |
### Properties for Actionable Knowledge Feedback (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback *(glide.knowman.feedback.enable_actionable_feedback_for_rating)* | An actionable feedback task is created when an article is rated at or lower than this value. The article is rated on a scale of 1-5.  
- **Type:** Integer  
- **Default value:** none  
- **Location:** Knowledge > Administration > Properties |

### Group ownership properties

The knowledge administrator can set group ownership properties that enable the use of ownership groups for knowledge articles and decide who can edit and approve a published knowledge article.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable ownership group for Knowledge articles <em>(glide.knowman.ownership_group.enabled)</em></td>
<td>Select the check box to enable associating ownership groups with knowledge articles.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Retain contribute access for author or reviser of knowledge article linked to ownership group (glide.knowman.ownership_group.override)</td>
<td>Select the check box to enable the author and reviser of a knowledge article to retain contribute access to the article even when an ownership group is associated with the article.</td>
</tr>
</tbody>
</table>

**Note:** Once you have set this property to **true**, try not to change it to **false**. Before setting this property back to **false**, manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

- Type: true | false
- Default value: false
- Location: **Knowledge > Administration > Properties**
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow approval of self-authored article as ownership group member</td>
<td>Select the check box to allow ownership group members to approve self-authored articles for publication.</td>
</tr>
<tr>
<td>(glide.knowman.ownership_group.enable_self_approval)</td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

---

**Scoped knowledge bases**

To protect knowledge bases containing sensitive articles, use a scoped knowledge base. Even system administrators and knowledge administrators can’t administer scoped knowledge bases unless explicitly authorized through user criteria.

For example, say you have a knowledge article with sensitive payroll information that should be seen only by the Payroll department and not by a system administrator or knowledge administrator. You could create a knowledge article with the sensitive information in a scoped knowledge base within the Human Resources: Core application.

Only users with the admin role of an application and the knowledge_admin role can administer a scoped knowledge base. You control access to knowledge bases of an application with application administration enabled, such as HR, through the ACLs of the knowledge tables in the application instead of global ACLs. To define access to a scoped knowledge base, specify appropriate user criteria for users, including system administrators and knowledge administrators.

You can’t modify the scope of existing knowledge bases. They remain in the global scope. However, you can create a scoped knowledge base to protect sensitive knowledge articles.

To create a scoped knowledge base for an application, in addition to the knowledge_admin or admin role, you must have access to view and select that application in the application picker (see Application picker). For example, before you create a knowledge base in the Human Resources: Core application, you must select the Human Resources: Core application in the application picker, and then create the knowledge base. Then, when you create a knowledge base, on the Knowledge base form, the application scope of the knowledge base is set in the Application field.
Related information

- Create a knowledge base
- Select an application from the application picker
- Application administration
- Control access at the knowledge base level through user criteria

Knowledge Management setup guide for admins

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

Requirements

Role required: admin

Before you begin

Meet with the stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>Responsibilities</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do you want to translate knowledge articles into other languages?

What to do

**Assign knowledge roles to users and groups**

Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

**Create custom Knowledge workflows**

If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for your knowledge bases, create custom workflows for those knowledge bases.

**Configure Knowledge properties**

If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

**Activate support for other languages besides English**

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.

**Coordinate with knowledge managers for knowledge base setup**

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the Knowledge base setup guide for knowledge admins and managers.
Next steps
Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Using guided setup to implement Knowledge Management
Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to Knowledge > Administration > Guided Setup.

For more information about using the guided setup interface, see Using guided setup.

Domain separation and Knowledge Management
Domain separation is supported in Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard
• Includes Basic level support.
• Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
• The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview
Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester, and fulfiller access to knowledge bases are domain separated.

How domain separation works in Knowledge Management
In Knowledge Management, the following rules apply:
Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.

**Note:** The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in a domain A using an article template which is not in domain A, the article will not be visible in domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search, view, comment; and rate articles of their domain, any child domain, and global domains, if feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.
- If the `glide.knowman.allow_edit_global_articles` system property is enabled, users from a domain other than the global domain can check out and edit global articles. Otherwise, system administrators and users from a domain other than the global domain cannot check out global articles and are shown a warning message to that effect. Depending on their access, users can change their domain to the global domain to check out and edit the global articles.
- Domains of versioned articles will be maintained as per the latest article version’s domain. This includes updating the domain for `kb_version`, `kb_knowledge`, `kb_feedback`, and `sys_attachment` tables.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• If domains contain another domain: If Domain A contains Domain B, users with access to Domain A can author articles in Domain B by toggling the domain scope. To learn more about toggling domain scope, see Visibility domains and Contains domains.

See Managing access to knowledge bases and knowledge articles to learn how to control contribute and read access to knowledge bases and knowledge articles.

Use cases
This image demonstrates a basic domain hierarchy that is available in the base system.

Requester use cases

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### Known Issues

- The following AQI tables are not domain separated:
  - AQI Checklist [kb_quality_checklist]
  - Checklist Question [kb_checklist_question]
  - Article Checklist Answer [kb_article_checklist_answer]

  **Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article’s domain instead of user domain.

### Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Create multiple knowledge bases for different groups within your organization to share information within and between those groups. Create scoped knowledge bases to enable only application administrators to administer the knowledge bases and restrict unauthorized access to application-specific data.
Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

**Requirements**

Role required: knowledge_administrator, knowledge_manager, or admin

**Before you begin**

Determine the following requirements for each knowledge base that you want to set up:

- Whether to create a scoped knowledge base? For more information, see [Scoped knowledge bases](#).
- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?

**What to do**

**Set up the knowledge base**

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.
**Next steps**

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

**Quick start tests for Knowledge Management**

Validate that Knowledge Management still works after you make any configuration change, such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), the Knowledge Blocks plugin (com.snc.knowledge_blocks), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

**Quick start tests**

### Configure Knowledge Management

Configure various aspects of Knowledge Management based on the specific requirements of your organization.

The following podcast offers additional information on using Knowledge Management.

Knowledge Base Application Podcast

You can also use Knowledge Management capabilities within a website built on Adobe Experience Manager (AEM). For more information, see Integration with Adobe Experience Manager.

### Related information

**Knowledge Management FAQs**
Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Before you begin

Understand the requirements for setting up a knowledge base.

Role required: knowledge_admin or admin

Procedure

1. Navigate to Knowledge > Administration > Knowledge bases.
2. In the Knowledge Bases list, click New.
3. On the Knowledge base form, fill in the following fields as appropriate:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Article Validity</td>
<td>Number of default days articles will be valid for after their created date.</td>
</tr>
</tbody>
</table>

Note: The Article Validity field is configured to set the Valid to date for an article. The Valid to date is the date this knowledge article expires. When you create an article within a knowledge base, the date value in the Valid to field of the article is calculated as follows: Created (sys_created_on) + Article Validity (in days). An article author or editor can select whether to keep or change the Valid to date (see Create a knowledge article). If the Article Validity field is blank, the date in the Valid to field date is set to January 1, 2100.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon</td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>Option to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>Option to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Option to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Enable blocks</td>
<td>Option to enable the knowledge blocks feature. If selected, you can create knowledge blocks to add to knowledge articles within a knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the knowledge base.</td>
</tr>
<tr>
<td>Note: This field is automatically set to the application selected in the application picker. For information about a scoped knowledge base, see Scoped knowledge bases.</td>

This field appears only when the translation management feature and glide.knowman.translation.enable_translation_task property are enabled. For more information, see Translation management and Knowledge Management properties.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

5. In the related list section, view or configure the following items related to the knowledge base:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>List of knowledge articles stored in this knowledge base.</td>
</tr>
<tr>
<td>Can Read</td>
<td>List of user criteria that grants read access and enables user matching the criteria to read articles in a knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure read access. See, Select user criteria for a knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>List of user criteria that grants contribute access and enables user matching the criteria to create and modify articles in a knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure contribute access. See, Select user criteria for a knowledge base.</td>
</tr>
<tr>
<td>Article Templates</td>
<td>If you have activated the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, the <strong>Article Templates</strong> related list is displayed. If there are article templates in the related list, articles in that knowledge base can only be created using one of the article templates listed. If the <strong>Article Templates</strong> related list is empty, articles can be created using any article template. Click <strong>Edit</strong> to map article templates to the knowledge base.</td>
</tr>
</tbody>
</table>
### Name | Description
--- | ---
| **Note:** Admins, knowledge admins, and knowledge managers can edit the article templates for the knowledge base. |  
| Featured Content | List of knowledge articles that appear in the homepage **Featured Content** section based on the corresponding keyword search set for each article.  
| Knowledge Categories | List of knowledge categories associated with this knowledge base.  

6. Click **Submit**.

**Related reference**

- Explicit roles
- Create a custom knowledge homepage
- I18N - Knowledge internationalization

**Create a custom knowledge homepage**

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

**Before you begin**
Role required: admin

**Procedure**

1. In the application navigator, point to the application name and click the edit application icon (�建).  
2. In the **Modules** related list click **New**.  
3. Enter a **Title** for the module.  
4. In the **Link type** field, select **URL (from Arguments)**.
5. In the **Arguments** field, append one or more of the following values to `$_knowledge.do#/search?`.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sysparm_kb=&lt;knowledge base sys_id&gt;</code></td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default. If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td><code>sysparm_category=&lt;knowledge category sys_id&gt;</code></td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default. If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td><code>sysparm_order=&lt;view_count, last_modified, or relevancy&gt;</code></td>
<td>Enter the default sort order for articles to appear in.</td>
</tr>
</tbody>
</table>

**Example:**
To create a homepage for a *Facilities* knowledge base with a **sys_id** of `d582764047022100158b949b6c9a7145` and sorting by last modified date, enter `$knowledge.do#/search?sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified` in the **Arguments** field on the Module form.

**Knowledge workflows**
The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each Knowledge Base.
You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the `getApprovers()` function in the `KBWorkflow` script include.

### Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base. Articles in approval are In Review state before moving to Published state once approved or to Scheduled for publish if set to publish later. If the manager rejects the request, the workflow is canceled and the article remains in Draft state.  &lt;br&gt;  If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval.  &lt;br&gt;  If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval.  &lt;br&gt;  A notification is also sent to authors or revisers of articles to inform them that their article has been approved or rejected.  &lt;br&gt;  To turn on approval email notifications, set the <code>glide.knowman.enable_approval_notification</code> property to <code>true</code>.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article</td>
</tr>
</tbody>
</table>
Default knowledge workflows (continued)

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td></td>
<td>If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval.</td>
</tr>
<tr>
<td></td>
<td>If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval, or publishes on the scheduled publish date if set to publish later.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

**Note:**

- Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see Republish a retired article.
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

**Email notifications for approval workflows**
You can send email notifications for approval workflows.
• Notify approvers about knowledge articles submitted for their approvals.
• Notify authors about the approval status of their knowledge articles.

To send email notifications for approval workflows, enable the **Send notification to approvers and authors in article approval workflow** property (`glide.knowman.enable_approval_notification`). Beginning with New York, the property is enabled by default. Existing customers on release versions prior to New York can enable this property to send email notifications. Disable any custom notifications for article approvals before enabling this property. If the `glide.knowman.enable_approval_notification` property is not available, an administrator can create the property and set its value to `true`. For more information, see Knowledge Management properties.

**Related information**
- Knowledge article states
- Approve an article that is being reviewed
- Retire a versioned article

**Activate the Knowledge Management Advanced plugin**

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to enable advanced features for Knowledge Management.

**Before you begin**
Role required: admin

**About this task**
The Knowledge Management Advanced plugin includes feature code and demo data.
The Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer) is used to activate the Knowledge Management Advanced plugin.

ℹ️ **Note:** The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced Installer plugin performs two validation steps prior to activation.
• Determines if there are any active Knowledge Management v2 knowledge bases.

• Determines if there is a unique database index on the **Number** field. If a unique constraint has been added to the **Number** field, the plugin activation fails. Follow the instructions listed in KB0634959 to perform corrective steps to resolve the issue.

You need access to **HI** to be able to view KB articles.

The Knowledge Management Advanced plugin activates the following features:

• Article versioning: Enables maintaining multiple versions of a knowledge article. For more information, see Article versioning.

  **Note:** Migrate to Knowledge Management v3 completely to use article versioning.

• Article subscriptions: Enables managing knowledge base and knowledge article subscriptions. For more information, see Knowledge subscriptions.

  **Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

• Article quality index: Enables maintaining consistent quality of knowledge articles within a knowledge base where articles are written by various authors. For more information, see Article quality index for knowledge management.

• Article templates: Enables creating article templates for consistent structure of knowledge articles. For more information, see Knowledge article templates.

• Ownership group: Enables creating ownership groups for knowledge articles. For more information, see Ownership groups.

• In-context article creation: Enables creating a knowledge article from a customer service case. For more information, see Enable creating an article from a customer service case.

• Translation management: Enables managing translation tasks created for published knowledge articles. For more information, see Translation management.

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge...
Management Advanced plugin page, click the **Load Demo Data Only** related link, and then click **OK**.

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:
   
   Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

**Knowledge article templates**

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

**Pre-defined knowledge article templates**

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.
Note:

When you upgrade Knowledge Management to Kingston or later releases, all the existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to Knowledge > Administration > Article Templates. Then in the article template list, set the Active field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.

<table>
<thead>
<tr>
<th>Template name</th>
<th>Template fields</th>
<th>Maps to table</th>
<th>SEO Description Tag</th>
</tr>
</thead>
<tbody>

<td>kb_knowledge</td>
<td>Text</td>
</tr>
</tbody>
</table>

Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see Activate the Knowledge Management Advanced plugin.
Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead, you can disable the Knowledge Article Templates feature by clearing the Active check box on the Article Template form.

Note: The Standard template is available by default and can’t be made inactive.

Create an article template and use it to create a knowledge article

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

Before you begin
Role required: knowledge_admin or admin

About this task
For each new article template, a child table of the Knowledge [kb_knowledge] table is created. When you add a new field to the template, a new column is added to that table created for the template.

Procedure
1. Navigate to Knowledge > Administration > Article Templates, and click New.
2. On the Article Template form, fill in fields.

<table>
<thead>
<tr>
<th>Article Template form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>

The Active check box is selected by default making the template available for use.

3. Right-click the form header and click Save.
4. In the Article Templates Field related list, add fields to the template.
**a. Click New.**

**b. On the Article Template Field form, fill in the fields.**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
</tbody>
</table>
| Field Type         | Available field types:  
  - HTML  
  - String  
  - Integer  
  - Date  
  - Date and time |
| Order              | Position of the field in the article page view and the article edit view. |
| Article Template   | (Read-only) Name of the article template associated with this field. |
| Template Table     | (Read-only) Name of the table for this template. |
| Template Field     | (Read-only) Name of the template column associated with this field. |
| Mandatory          | Option to make this field as mandatory. When selected, this field is required to be filled. |
| Expand/Collapse    | Defines whether the template field displays as collapsed or expanded by default. |
| Active             | Option to display the field on the template. |
| Heading style      | CSS formats applied to the template header. For example, to display the background of the template header in red, with a 24-px font size, Arial font family, and white |
c. Click Submit.

The field is added to the template.

5. Optional: In the SEO Description Tag field, search for and add article template field name.

The content in this field is used as meta description tags to search for articles created using this article template.

6. Configure the Knowledge form to display the fields that you added to the template.

   Note: You must have the admin role to configure the form layout. If the field is not available in the form layout, use the form designer to configure the fields.

   a. Navigate to Knowledge > Articles > Create New.
   b. Select a knowledge base, and then the newly added article template.
   c. Right-click the header and select Configure > Form Layout.
   d. Select and move the fields you added to the article template from the Available column to the Selected column.
e. Click the up or down icon to arrange the fields in the order in which you want them to appear in the Knowledge form.

f. Click Save.

Note: Authors who started a session before a template was created or activated will see the newly added template upon their next login.

What to do next
If you want to search for duplicate articles when creating an article from a new template, you must configure the article template table for contextual search. On the Table Configuration form, the Search context field must be set to Knowledge ML Search. For more information, see Configure table for a contextual search.

Restrict access to fields in an article template
Use encryption context to set field-level security in article templates and display the fields based on role permissions.

Before you begin
Activate the Encryption Support plugin to enable field-level security using an encryption context.

Role required: security_admin

Procedure
1. Create an encryption context for the article template field to be encrypted.

   b. On the Encryption Context form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the encryption context.</td>
</tr>
<tr>
<td>Encryption key</td>
<td>Key used to encrypt the data. Leave blank to generate a key randomly. Based on the desired type of encryption, enter the exact number of characters:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
|          | • 16 characters for AES 128-bit  
|          | • 32 characters for AES 256-bit  
|          | **Warning:** You cannot retrieve this key from the instance. If you need access to the key, save it elsewhere before clicking **Submit**. |

**Application**

Defaults to **Global** and cannot be changed.

**Type**

Type of encryption used to encrypt your data:

• **AES 128-bit**: Advanced Encryption Standard  
• **AES 256-bit**: Advanced Encryption Standard using 256-bit encryption

---

**c. Click Submit.**

2. Associate the article template field with the encryption context.

a. Navigate to **System Security > Field Encryption > Encryption Field Configurations** and click **New**.

b. On the Encrypted Field Configuration form, fill in the fields.

**Encrypted Field Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table associated with the article template fields. For example, for the How to article template fields, select <strong>How To [kb_template_how_to]</strong>.</td>
</tr>
</tbody>
</table>
| Column    | Article template field to be encrypted. Only String, Date, Date/Time, and URL fields are supported.  
|           | **String and URL fields**: You can add a new encryption configuration to either a parent table or a child table.  
<p>|           | <strong>Date and Date/Time fields</strong>: You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Encryption context</th>
<th>Encryption context you created for the article template field.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Method</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Single Encryption Context</strong>: Enables data to be encrypted with a single encryption context only. The field is encrypted with the encryption context defined in the Encryption context field. Users that do not have the encryption context cannot view or update field values.</td>
<td></td>
</tr>
<tr>
<td><strong>Multiple Encryption Contexts</strong>: Enables data to be encrypted with more than one encryption context. The field is encrypted by the encryption context of the first user to enter data. If the user has multiple encryption contexts, the context defined in the encryption context selector is used. Because the encryption context is set on a per record basis, fields in a list can have different encryption contexts. However, within a single record, the field can be encrypted by only one context.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Mass encryption is not available when using the Multiple Encryption Contexts method.</td>
</tr>
</tbody>
</table>

After a configuration is created using the single encryption context method, you can update the record to use multiple encryption contexts. However, you cannot change a field using multiple encryption contexts to use a single encryption context.

c. Click **Submit**.

3. Define role permissions for the encrypted field.
a. Navigate to **User Administration > Roles**.

b. In the **Name** column, click the link to the role you want to allow to view this field.

c. In the **Encrypted context** field, search for and select the name of the encryption context for the article template field to apply for the selected role.

   **Note:** You may need to configure the Role form to add the **Encrypted context** field.

d. Click **Update**.

**Results**
Depending on their role permissions defined for the encrypted field, users can view the field on the article template.

**Related information**
- **Encryption support**

**Generate SEO information for articles using article templates**

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template. Search Engine Optimization (SEO) optimise searches in public search engine.

**Before you begin**
Role required: knowledge_admin or admin

**About this task**

   **Note:** If you are using the **Standard** article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the `glide.knowman.seo.pages.meta_description.length` system property.

**Procedure**

1. Navigate to **Knowledge > Article Templates**.
2. Select an article template.
3. In the **SEO Description Tag** field, search for and select an article template field.

4. Click **Update**.

   Note: You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change was made. To apply the update to all existing published articles created using this template, run the `Populate Meta Description on KB Articles` fix script.

**Article versioning**

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the `Initialize Versions on Articles` fix script to enable article checkout and editing.

With the article versioning feature, a knowledge user can:

- Check out a published article and create another version.

  Note: Only an author (who checks out an article for revision), knowledge base owner, and user with knowledge_admin role can edit an article in the draft state.

- Select a previously published (outdated) version of an article and make it current.
- Recall an article that is being reviewed or scheduled for publication.
- Retire the latest published version of an article.

  Note: Only an author (who checks out an article for revision), knowledge base owner, and user with knowledge_admin role can edit an article in the draft state.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has been published and is available to customers.
To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.

**Activation information**

The article versioning feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to be activated and the glide.knowman.versioning.enabled property to be set to true (default value). For more information, see Activate the Knowledge Management Advanced plugin and Article versioning properties.

Knowledge Management FAQs

**Manually update customized files**

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

- Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
- Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
- Update the **Knowledge > My Flagged** and **Self-Service > My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me**.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

**Article versioning changes**

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related
New user actions
As part of creating article versions, users can:

• Check out a published article and create another version by clicking **Checkout** on the Knowledge form.

  ❗ **Note:** Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

• Recall an article that is being reviewed or scheduled for publish by clicking **Recall** on the Knowledge form.

• Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current** in the Knowledge form header.

  ❗ **Note:** To edit a published article without having to create a new version, make sure the `glide.knowman.versioning.enable_minor_edits` property is enabled.

Changes to the Knowledge list
The article versioning feature adds the following to the Knowledge list:

• The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.

• The **Workflow** column includes the new **Outdated** state.

Changes to the Knowledge form
The article versioning feature adds the following to the Knowledge form:

• The **Version** field displays the article version number.

• The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.

• The **Base Version** field displays the knowledge article number and version on which the current article is based.

• The **Revised By** field displays the name of the user who checked out a published article and created a new version.

• The **Article Versions** related list displays a list of all versions for an article. From this list, you can:
Click the **Version** to view a specific version of an article.
Click the **View Article** related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

**Changes to Knowledge modules**
The article versioning feature introduces the following Knowledge module changes:

- **My Knowledge Articles**
  - For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  - For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

- **My Flagged**
  - For a knowledge user, this module includes records for each revision made to articles authored by the user.
  - For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

**Changes to Knowledge Management dashboard reports**
The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

- Articles Flagged in the Last 30 Days
- Articles Marked Not Useful in the Last 30 Days
- Articles Used per Month
- Knowledge use
- Knowledge view
- Knowledge updated in past 30 days
- Knowledge flagged in past 30 days
- Knowledge by Workflow state
- Knowledge created by Author
- Knowledge created in past 30 days
• New Knowledge Articles Created in the Last 30 Days
• Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:

To display the article version number next to the article number in the search results, enable the `glide.knowman.search.show_article_number` property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the `https://<instance name>/sp?id=kb_article&sys_id=KB0000005` as the URL, you must use `https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0` to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

• Click Latest version or the version number and current state to expand the version history section.
• Click the version number to open that particular version of the article.
• When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>

<td>The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.</td>
</tr>
</tbody>
</table>

**Knowledge article version numbers**

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: `<major release number.minor release number>`

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such
as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Scheduled for publish</td>
<td>0.07</td>
</tr>
<tr>
<td>Article is published</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
<tr>
<td>User action</td>
<td>Article state</td>
<td>Version number</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>--------------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Scheduled for publish</td>
<td>1.03</td>
</tr>
<tr>
<td>Article is published</td>
<td>Published</td>
<td>2.0</td>
</tr>
<tr>
<td>When the version 2.0 article is published, the state of the version 1.0 article changes to Outdated.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Any change to the state of an article results in a version increment, except to and from the **Pending retirement**, **Retired**, and **Outdated** states.

**Knowledge article version information**

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

**Knowledge article states**

Knowledge article versions can be in one of several states as it progresses through the creation cycle.
<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

**Related information**

**Knowledge access controls**

**Check out a published article and create a new version**

Create a new version of a knowledge article by checking out the latest published version.

**About this task**

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the Checkout button does not appear on the Knowledge form header.

When you check out an article, the default value of Valid to field of the article is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). If the Article Validity field is blank, the date in the Valid to field date is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date.

When you check out an article, attachments from the article's base version are copied into the new article version and relative paths to these attachments are also updated.

⚠️ **Note:** For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the Fix attachment links on article versions fix script.

**Procedure**

1. Navigate to Knowledge > Articles > Published.
2. Select the desired article from the list.
3. Click Checkout in the Knowledge form header.
The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is increased by 0.01, and the state changes to Draft. The new version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Revert an outdated article to the current state
Use an outdated version of an article to create a new version.

Before you begin
Roles required: knowledge base owner, knowledge_manager, knowledge_admin

About this task
This action is available for earlier published version that have a state of Outdated and only when there is no checked out version. If a version has been checked out, the Make this current button does not appear on the Knowledge form header.

Procedure
1. Navigate to Knowledge > Articles > All.
2. Open an article in the Outdated state.
3. Click Make this current in the Knowledge form header.
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to Draft. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

View all versions of an article
View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

About this task
The list of all available versions for a selected knowledge article is displayed in the Article Versions related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.
Procedure
1. Navigate to Knowledge > Articles > All.
2. Open the desired article.
3. Click the Article Versions tab to display the related list.
4. Click Version to display the desired article version in a new tab.
5. If desired, click the View Version related link to see the article view page.

Compare two versions of an article
Select and compare two versions of a knowledge article.

Before you begin
Role required: knowledge_manager, knowledge_admin

Procedure
1. Navigate to a Knowledge > Articles > All.
2. In the Name column, click the link to a knowledge article with multiple versions.
3. In the Article Versions related list, select the check boxes for the two versions of the article to compare.
4. Scroll down to the Actions on related rows menu and choose Compare. The Compare versions page opens and lists the fields for the selected article versions in a side-by-side format. Differences between the two article versions are highlighted.

5. When you are finished comparing the two versions, click Done to return to the Knowledge form.
Retire a versioned article

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as Retired.

About this task
This action is available only when there is no checked out version. If a version has been checked out, the Retire button does not appear on the Knowledge form header.

Note: For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

• knowledge owner
• latest publisher of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

Procedure
1. Navigate to Knowledge > Articles > Published.
2. Open the desired article.
3. Click Retire in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to Pending retirement and the state of previously published versions change to Outdated.

Note: You cannot check out or edit a retired article.

Disable the article versioning feature
Users with the system administrator role can disable the article versioning feature by setting a property.
Before you begin
Role required: admin

About this task
The **Enable article versioning feature** property controls the article versioning feature. Setting this property to **false** disables the article versioning feature. Once disabled:

- The **Version** field is removed from the Knowledge form. The **Version** column remains on the Knowledge list and can be removed manually.
- The **Article Versions** related list is removed from the Knowledge form.
- The **Recall**, **Checkout**, and **Make this current** buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

Procedure
1. Navigate to **Knowledge > Administration > Properties**.
2. Locate the **Enable article versioning feature** property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click **Save**.

Knowledge manager
Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases.
The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. The owner and all managers of a knowledge base automatically receive the knowledge_manager role. If the knowledge base is made inactive later, the knowledge_manager role is not automatically removed for these users.

Related information
- Configure Knowledge Management
- Migrate to Knowledge Management v3

Add a knowledge article to featured content
Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Before you begin
Role required: knowledge_manager, knowledge_admin, or admin

About this task
Adding an article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

Note: The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

• To display articles in the Featured content section, add a default keyword in the glide.knowman.default_keyword property Value field and add the same keyword to all articles you want to display in that section.
• To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

Procedure
1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article.
   If you know the article number, you can search for the article directly.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.
7. Select the keyword to add for this article.
   • Add the default keyword to display this article in the Featured content section during search.
   • Add all related keywords for the article to display it at the top of the knowledge search results page during search.

   Note: You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click Submit.

Define a knowledge article category
Each knowledge base has a hierarchy of categories that organizes the articles.

Before you begin
You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

About this task
Define a hierarchy for categories by creating parent-child relationships. Each hierarchy consists of a top-level category and a structure of subcategories, which are also named the child categories. The category hierarchy is saved in the Full category field in the Knowledge Category [kb_category] table.

You can create and edit categories separately for each knowledge base.

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Select a knowledge base you manage.
3. Create a top-level category.
   a. In the Knowledge Categories related list, click New.
   b. On the Knowledge Category form, fill in the fields.
### Knowledge Category form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Label for the category. The label appears as the name of the category.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the category you use when referencing the category in scripts.</td>
</tr>
<tr>
<td>Parent ID</td>
<td>Top-level component associated with the category. This field is automatically set to the top-level component ID.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the category.</td>
</tr>
</tbody>
</table>

4. **Optional:** Create a child category.
   a. Expand an existing category and click **New** within the expanded section.
   b. Fill in the **Knowledge Category form**.
   c. Click **Submit**.

### What to do next
In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

### Related information
- Select a knowledge article category

### Assign a knowledge base manager
You can assign users as managers of a knowledge base.

**Before you begin**
Role required: knowledge_admin, or admin

**Procedure**
1. Navigate to **Knowledge > Knowledge Bases**.
2. Select a knowledge base you manage.
3. In the **Managers** field, click the unlock icon.
4. Add one or more users.
5. Click **Update**.
   After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

**What to do next**
You can remove a knowledge base manager by removing that user from the **Managers** field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

**Managing access to knowledge bases and knowledge articles**
Determine whether certain users or categories of users can access knowledge bases and knowledge articles by controlling contribute and read access.

As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you can assign user criteria to control contribute and read access at the knowledge base level, where:

- Read access determines the ability to view knowledge articles in a knowledge base.
- Contribute access determines the ability to create, modify, and retire knowledge articles in a knowledge base.

As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you can assign user criteria and roles, or both, to control read access at the knowledge article level.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2.

ℹ️ **Note:** By default, when contribute access isn’t provided for a knowledge base, a user must meet both roles and user criteria conditions for read access. However, you can override roles set for a knowledge article and provide access through user criteria only by setting the `glide.knowman.search.apply_role_based_security` system property to `false`. Because this property isn’t available by default, you must add it. For more information, see [Add a system property](#).

**User criteria for knowledge access**
As a knowledge administrator, manager of a knowledge base, or owner of a knowledge base, you control access to knowledge bases or knowledge articles for a user through user criteria, which are described in the following table.
### User criteria definitions

<table>
<thead>
<tr>
<th>User criteria</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot Contribute</td>
<td>Cannot contribute (that is can't create, modify, or retire) knowledge articles within a knowledge base. The Cannot Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>Can contribute (that is can view, create, modify, or retire) knowledge articles within a knowledge base. The Can Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>At the knowledge base level, cannot view knowledge articles within a knowledge base. At the knowledge article level, cannot view a knowledge article.</td>
</tr>
<tr>
<td>Can Read</td>
<td>At the knowledge base level, can view knowledge articles within a knowledge base. At the knowledge article level, can view a knowledge article.</td>
</tr>
</tbody>
</table>

The access to knowledge base and its articles are defined based on the user criteria status for a user as described in the following table.

### Combining knowledge base and knowledge article user criteria

<table>
<thead>
<tr>
<th>Status</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user matches both Can Contribute and Cannot Contribute at the knowledge base level</td>
<td>The user is denied contribute access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches both Can Read and Cannot Read at the knowledge base level</td>
<td>The user is denied read access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches Can Read at the knowledge base level and Cannot Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
<tr>
<td>The user matches Cannot Read and Can Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
</tbody>
</table>
Users with special knowledge privileges

Users with special knowledge privileges aren’t evaluated based on user criteria and have knowledge bases and knowledge articles access as described in the following table.

### Access of users with special privileges to knowledge bases and knowledge articles

<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge administrator</td>
<td>• Contribute to and read all knowledge bases and their articles.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Modify the definition of all knowledge bases and assign user criteria to them.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This access doesn’t apply to scoped knowledge bases. For more information, see <a href="#">Scoped knowledge bases</a>.</td>
<td></td>
</tr>
<tr>
<td>Owner of a knowledge base</td>
<td>• Contribute to and read that knowledge base.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Modify the definition of that knowledge base and assign user criteria to it.</td>
<td></td>
</tr>
<tr>
<td>Manager of a knowledge base</td>
<td>• Contribute to and read that knowledge base.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Modify the definition of that knowledge base and assign user criteria to it.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the article versioning feature is enabled, the manager of a knowledge base can’t modify knowledge articles of other authors that are in the <strong>Draft</strong> state. For more information, see <a href="#">Article versioning</a>.</td>
<td></td>
</tr>
<tr>
<td>Members of an ownership group associated with a knowledge article</td>
<td>Read, modify, approve, and retire that knowledge article (see <a href="#">Ownership groups</a>).</td>
<td></td>
</tr>
</tbody>
</table>

### Explicit roles and user criteria

Explicit roles (snc_external and snc_internal) are added to your instance when your administrator installs a plugin, such as the Customer Service plugin (com.sn_customerservice), that also activates the Explicit Roles plugin.
If you create a knowledge base with the Explicit Roles plugin (com.glide.explicit_roles) activated, the application automatically adds the following predefined user criteria at the knowledge base level:

- **Users with 'snc_internal' role** – Added to the Can Read user criteria enabling only users with the snc_internal role have read access to the knowledge base.
- **Users with snc_internal' and another role** – Added to the Can Contribute user criteria enabling only users with the snc_internal role and at least one additional role have contribute access to the knowledge base.

When you upgrade to product versions that offer the Explicit Roles plugin (com.glide.explicit_roles), the predefined user criteria **Users with 'snc_internal' role** and **Users with 'snc_internal' and another role** aren't automatically added to any existing knowledge bases created prior to the activation of the Explicit Roles plugin. To add these predefined user criteria to an existing knowledge base, run the **Fix unsecured knowledge bases** fix script. For more information about explicit roles and fix scripts, see **Explicit Roles** and **Fix scripts**.

**Determining contribute access to a knowledge base and its articles using user criteria**
The flowchart in this section illustrates the user criteria checks that determine contribute access at the knowledge base and article levels.

ℹ️ **Note:** In order for an unauthenticated user to view knowledge articles within the knowledge base, ensure that the audience for the Knowledge Management Service Portal pages is set to public; that is, the page can be accessed without the need for authentication. For more information, see **Create and edit a page using the Service Portal Designer**.
Contribute access to a knowledge base and its article flowchart

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has contribute access to the knowledge base except <strong>users with special knowledge privileges</strong>.</td>
</tr>
<tr>
<td>false</td>
<td>All users, including unauthenticated users, with at least one role can contribute to the knowledge base. If the Explicit Roles plugin (com.glide.explicit_roles) is activated, users who have at least one role other than snc_internal can contribute to the knowledge base. To check knowledge bases accessible to unauthenticated users, use the User Criteria Diagnostics feature. For more information, see <strong>Configure access to knowledge bases for unauthenticated users</strong>.</td>
</tr>
</tbody>
</table>
When a user has contribute access to a knowledge base, the `glide.knowman.apply_article_read_criteria` property is evaluated to determine contribute access to an article in the knowledge base, as explained in the following table.

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>Article-level read access overrides the default contribute permission granted by contribute access at the knowledge base level.</td>
</tr>
<tr>
<td>false</td>
<td>Contribute access at the knowledge base level takes precedence over article-level user criteria and the user has contribute access to every article in the knowledge base.</td>
</tr>
</tbody>
</table>

**Determining read access to articles in a knowledge base using user criteria**

The following flowchart illustrates the user criteria checks that determine read access to a knowledge article.
When either Cannot Read isn’t set or a user doesn’t match Cannot Read and additionally Can Read is not set, the `glide.knowman.block_access_with_no_user_criteria` property value is further evaluated to determine read access, as explained in the following table.

### Read access when user criteria for a knowledge base aren’t set

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has read access except users with special knowledge privileges and users who have contribute access to the knowledge base.</td>
</tr>
</tbody>
</table>
| false          | All users, including unauthenticated users, have read access to the knowledge base and the article-level user criteria are further evaluated.

To check knowledge bases accessible to unauthenticated users, use the User Criteria Diagnostics feature. For more information, see Configure access to knowledge bases for unauthenticated users.
When a user has contribute access to a knowledge base, the `glide.knowman.apply_article_read_criteria` property is evaluated to determine read access to an article in the knowledge base, as explained in the following table.

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>

**Create user criteria for controlling access to knowledge bases and articles**

Control access to knowledge bases and articles by creating user criteria.

**Before you begin**

Role required: user_criteria_admin

**Note:** To create a user criteria record from the Knowledge module, you must have the user_criteria_admin role in addition to the knowledge role. For more information about access, see Managing access to knowledge bases and knowledge articles.

**Procedure**

1. Navigate to **Knowledge > Administration > User Criteria**.
2. Click **New**.
3. On the User Criteria form, fill in the fields.
## User Criteria form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the user criteria.</td>
</tr>
<tr>
<td>Users</td>
<td>Users that must match the user criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups that must match the user criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match the user criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Option to display or hide the advanced option that includes the Script field on the User Criteria form.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to define any additional user criteria that returns true or false. This field is available when the Advanced option is selected on the User Criteria form.</td>
</tr>
</tbody>
</table>

### Note:

- Because the evaluation of a role is cached in the session, any change in the role requires you to log in again.
- User criteria are not applicable for elevated privilege roles.

- A script is evaluated in the scope that the user criteria is created in.
- The evaluation of a script is cached in the session, so any change in the evaluation requires you to log in again. If a scripted user criteria is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session.
- Do not use `gs.getUser()` or other session APIs because they cause conflicts when used in diagnostic tools. Use the predefined `user_id` variable available in the script to get the user ID of the user being used to evaluate the script.
- Scripts are evaluated dynamically. Therefore, including scripts in a user criteria can impact performance.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to activate or deactivate the user criteria.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies that the user record must match.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations that the user record must match.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments that the user record must match.</td>
</tr>
<tr>
<td>Match All</td>
<td>Option to determine whether all elements from each populated user criteria field must match. If selected, only users who match all user criteria are given access. If cleared, the user must meet one or more of the set user criteria to be given access. By default, this check box is cleared so that any condition met provides a match. For example, consider a user criteria record for the following: • Locations A or B • Company C or D With <strong>Match All</strong> selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C. If <strong>Match All</strong> is not selected, users meeting any of these conditions are matched. For example, a user with a location B. <strong>Note:</strong> If you select <strong>Match All</strong>, ensure that you don’t create contradictory conditions that can never be met. For example, if all users in location A work for company G, the conditions in this example can never be met.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Related information**

- Control access at the knowledge base level through user criteria
- Control access at the knowledge article level through user criteria

**Control access at the knowledge base level through user criteria**

You specify user criteria for a knowledge base to control which users are granted access to read and contribute knowledge articles to that knowledge base.
Before you begin
Role required: knowledge_manager, knowledge_admin, or admin

⚠️ Note: To administer a scoped knowledge base, you must have the application-specific admin role in addition to the knowledge_admin or admin role. For more information, see Scoped knowledge bases.

About this task
You can assign user criteria to control read or contribute access. For example, you could enable all users in your Support department to have contribute access to a knowledge base by creating a user criteria record with the required department set to Support, and then including the user criteria record in the Can Contribute user criteria. For more information, see Managing access to knowledge bases and knowledge articles. Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge bases. Roles were used for this purpose in Knowledge Management v2.

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click the link to knowledge base you manage.
3. Add user criteria to the knowledge base.
   a. Depending on the user criteria you want to set, select one or more of the relevant related lists.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users can read knowledge articles in the knowledge base.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users can’t read knowledge articles in the knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>Users can create, modify, and retire knowledge articles in a knowledge base. Contribute access to a knowledge base also provides read access to all articles in the knowledge base.</td>
</tr>
</tbody>
</table>
**Related list** | **Description**
--- | ---
Cannot Contribute | Users can't create, modify, retire, or read knowledge articles in the knowledge base.

Note: If the related lists aren't visible, configure the Knowledge form to display them. For more information, see Add a related list to a form.

b. In the selected related list, add the required user criteria.

- As a user with the admin role, to add a new user criteria record, click New, specify the required fields, and then click Submit.

- As a user with the knowledge_manager, knowledge_admin, or admin role, to add an existing user criteria record, click Edit, move the required user criteria from the Collection column to the Knowledge column, and then click Save.

4. On the Knowledge Base form, click **Update**.

**What to do next**

After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see User criteria diagnostics for Knowledge Management.

**Important:** After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

**Related information**

- Create a knowledge base
- Create user criteria for controlling access to knowledge bases and articles
- Control access at the knowledge article level through user criteria

**Control access at the knowledge article level through user criteria**

You specify user criteria for a knowledge article to control which users are granted read access to the knowledge article.

**Before you begin**

Role required: Users who have Contribute access to the knowledge article

Note: You may need to configure the form to add Can Read and Cannot Read fields.
About this task
Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2. For more information, see Managing access to knowledge bases and knowledge articles.

Procedure
1. Open a knowledge article.

   Note: You can update only the latest version of the knowledge article.

2. Assign access based on user criteria.

<table>
<thead>
<tr>
<th>Access</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow read access</td>
<td>In the Can Read field, search for and add user criteria. For example, to allow read access to a user, search for a user criteria that the user matches and add it to this field.</td>
</tr>
<tr>
<td>Deny read access</td>
<td>In the Cannot Read field, search for and add user criteria. For example, to deny read access to a user, search for a user criteria that user matches and add it to this field.</td>
</tr>
</tbody>
</table>

Note:
- If users have contribute access to the knowledge base, they also have read access to the knowledge article regardless of the Cannot Read setting.
- Users who meet both Can Read and Cannot Read user criteria are denied read access to the knowledge article. The Cannot Read setting overrides the Can Read setting for the knowledge article.
Note: If the Can Read and Cannot Read fields aren't visible, configure the Knowledge form to display them. For more information, see Configuring the form layout.

3. On the Knowledge form, click Update, and then click Publish to apply the changes.

What to do next
After you add user criteria, you can use the user criteria diagnostics feature to verify the access users have to a knowledge base or a knowledge article. For more information, see User criteria diagnostics for Knowledge Management.

Important: After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

Related information
- Create user criteria for controlling access to knowledge bases and articles
- Control access at the knowledge base level through user criteria

User criteria diagnostics for Knowledge Management
Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:
- Domain separation
- Access control list (ACL) rules
- Knowledge workflows
- User criteria set for a knowledge base or an article

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

Activation information
The user criteria diagnostics feature is activated with the Knowledge Management v3 plugin (com.snc.knowledge3). For more information, see Activate a plugin.

Diagnose user access to a knowledge base
Identify which users have access to a knowledge base and what enables that access.
Before you begin
Role required: knowledge_manager, knowledge_admin, or admin

Procedure
1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics</td>
</tr>
<tr>
<td>navigator</td>
<td></td>
</tr>
<tr>
<td>From a knowledge base</td>
<td>a. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>b. Select the knowledge base to diagnose user access.</td>
</tr>
<tr>
<td></td>
<td>c. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>

The User Criteria Diagnostics landing page appears with the Select knowledge base field pre-populated.

2. To diagnose user access:
   a. In the Select user field, select a user.
   b. From the Select record type choice list, select Knowledge base.
   c. In the Select knowledge base field, select a knowledge base.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d. Click Diagnose.
      The page displays these details:
      • Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      • Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of user criteria definition enables this access.
• Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.

• For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

Example:
The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:

• Alena is added to one of the existing user criteria defined in the knowledge base.

• Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
Diagnose user access to an article

Identify which users have access to an article and what enables that access.

Before you begin
Role required: knowledge_manager, knowledge_admin, or admin

Procedure
1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics.</td>
</tr>
</tbody>
</table>
To access | Navigate to
--- | ---
From an article | a. Knowledge > Administration > Knowledge Bases.  
b. Select the knowledge base that has the article to diagnose for user access.  
c. In the Knowledge related list, select the article.  
d. In the Related Links section, click Run User Criteria Diagnostics.  
   The User Criteria Diagnostics landing page appears with the Select article field pre-populated.

2. To diagnose user access:

   a. In the Select user field, select a user.

   b. From the Select record type choice list, select Article.

   c. In the Select article field, select an article.  
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.

   d. Click Diagnose.  
      The page displays these details:

      • Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.

      • Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.

      • Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.

      • For a user with no access to this article, which user criteria may be modified to grant the access.

   i Note: Members of an ownership group are automatically given Can Contribute access to knowledge articles that their ownership group is associated with.
Example:
The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.

Configure access to knowledge bases for unauthenticated users
Identify knowledge bases accessible to unauthenticated users based on the user criteria and the system property settings.

Before you begin
Role required: knowledge_manager, knowledge_admin, or admin

Procedure
1. Navigate to Knowledge > Administration > User Criteria Diagnostics.
2. Click the View knowledge bases accessible to unauthenticated users related link.
3. Review knowledge bases accessible to unauthenticated users.
4. **Optional:** Restrict unauthenticated users to access a knowledge base by selecting the knowledge base and configuring its access settings.
   - Use user criteria to determine access to the knowledge base for unauthenticated users.
     
     (Optional) For more information, see Managing access to knowledge bases and knowledge articles.

   - If no user criteria is specified for the knowledge base, as an administrator, you can set the value of the `glide.knowman.block_access_with_no_user_criteria` system property to `true`.
     
     For more information, see Knowledge Management properties.

**Collect knowledge usage metrics**

Capture metrics such as article views, page views, and portal searches to track aggregated knowledge usage by users.

**Before you begin**

Set the duration over which the metrics are aggregated through the `glide.knowman.usage_metrics_duration` property. For more information, see Other knowledge properties. By default, the property value is set to 60 minutes.

Role required: admin

**About this task**

Monitor the knowledge usage metrics to improve the overall effectiveness of the knowledge usage across the portals.

**Procedure**

1. Navigate to **System Definition > Scheduled Jobs**.

2. Search and open the **Knowledge Usage Metrics** scheduled job.

3. In the **Knowledge Usage Metrics** form, select the **Active** check box to activate the scheduled job.
   
   The scheduled job is inactive by default.

4. In the **Run** field, select **Periodically** as the frequency of the scheduled job.
   
   See the Scheduled jobs topic for other frequency options.

5. In the **Repeat Interval** field, enter the repeated time interval at which the scheduled job should run.
   
   By default, the duration is set to 60 minutes.

6. Click **Update**.
What to do next
Modify the data retention policy for knowledge usage metrics to remove unwanted and older data from the knowledge usage metrics [kb_usage_metrics] table.

Modify the data retention policy for knowledge usage metrics
Remove unwanted and older data from the knowledge usage metrics [kb_usage_metrics] table through the data retention policy.

Before you begin
Role required: admin

About this task
Activating the data retention policy for the kb_usage_metrics table deletes records that you no longer need.

Procedure
1. Navigate to System Maintenance > Table Cleanup.
2. In the Tablename column, search for kb_usage_metrics and click the kb_usage_metrics link.
3. On the Auto Flush form, activate the kb_usage_metrics table cleanup job by selecting the Active check box.
4. Optional: Adjust the duration the system waits before deleting the records by modifying the value in the Age in seconds field. By default, the Age in seconds field value is set to 2,592,000 seconds (equivalent to 30 days). For more information, see Autoflush form.
5. Click Update.

I18N - Knowledge internationalization
Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.
Note: To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the `glide.knowman.search.default_language` system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

To enable search for different languages simultaneously, navigate to Knowledge Administration > Knowledge Search > Properties > Enable multi language search. Select the Yes check box to enable the feature.

Note: If you do not enable this property, you can search in one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Refer to Search using Knowledge Management v3 for information on performing a search on all available languages simultaneously.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). For more information, see Activate a plugin.

- Internationalization plugins for each appropriate language. For more information, see Activate a language

Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Internationalization plugin (com.glide.i18n) that instead activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

Installed components

The I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) installs the following components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.

- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.
• A UI macro named \textit{kb languages}.

• Two fields, named \textit{Language} and \textit{Parent}, in the Knowledge [kb_knowledge] table and the Knowledge form.

\textbf{Knowledge form changes}

The I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) adds the following fields to the Knowledge form:

• \textit{Language}: Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base.

• \textit{Parent}: Number of the article that represents the base language article. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

\textbf{i} \textbf{Note}: The \textit{Parent} field is used for keeping track of translations of articles.

Additionally, the Translated Versions related list is automatically added to the Knowledge form after you save an article.

\textbf{Related information}

Configure Knowledge Management

\textbf{Ownership groups}

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

For the ease of maintenance of knowledge articles, you can assign an ownership group to a knowledge article and shift the ownership of an article from a single person to a group. An ownership group consists of a group of members and a manager who are responsible for knowledge articles. Responsibilities include: approving knowledge articles, performing AQI checks to ensuring article quality, and managing feedback tasks for knowledge articles.

When a knowledge article is assigned to an ownership group:
• Only ownership group members have contribute access to the article even if they don't have contribute access to the knowledge base of the article. They can edit, approve, publish, and retire the knowledge article with which they are associated.

• Users who aren't a member of the ownership group can't contribute to the article even if they have contribute access to the knowledge base of the article.

When creating or editing a knowledge article, you may need to configure the Knowledge form to add the Ownership Group field.

Activation information
To enable the use of ownership groups, enable the glide.knowman.ownership_group.enabled property. This property is available when the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. By default, the property is disabled.

Note: If you use ownership groups, try not to disable the glide.knowman.ownership_group.enabled property later. If you must disable the property later, ensure that you manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

Contribute access to published articles
If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published. You can override this behavior by enabling the glide.knowman.ownership_group.override property. When the property is set to true, the authors or revisers of knowledge articles associated with ownership groups retain contribute access to their published articles. By default, the property is set to false.

Approval of self-authored articles for ownership group members
With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. You can override this behavior by disabling the glide.knowman.ownership_group.enable_self_approval property. By default, the property is set to true. When the property is set to false, ownership group members can't approve self-authored knowledge articles.

Knowledge Management properties

Manage ownership groups
Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

Before you begin
The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.
Role required: Users with the knowledge_domain_expert or knowledge_admin roles can create ownership groups.
Users with the knowledge_group_manager or knowledge_admin roles can edit ownership groups.

About this task
Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.
When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.
Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

Procedure
1. Navigate to Knowledge > Ownership Groups > Manage Group.
2. To create an ownership group, from the Request Type list, select Create Ownership Group.
   Note: To edit an existing ownership group, from the Request Type list, select Edit Ownership Group.
3. Fill in the fields on the form.

Manage Knowledge Ownership Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the ownership group.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Group email| An email address for the ownership group. Emails are sent to group members in these cases.  
  • Activity on articles they are associated with, for example, comments.  
  • Article quality checks (AQI) performed on articles they are associated with.  
  If no group email is defined, emails are sent to individual group member emails. |
| Description| Description that defines the ownership group.                                                                                                                                                        |
| Manager    | Manager for the ownership group.                                                                                                                                                                     |
| Group members | Members of the ownership group.                                                                                                                                                                      |

4. Click **Order Now**.  
The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

> **Note:** You can also create an ownership group from an existing group.  
  a. Navigate to **System Security > Users and Groups > Groups**.  
  b. Click a group.  
  c. In the **Type** field, enter **Knowledge**.

> **Note:** If the **Type** field does not appear on the form, configure the form layout to add it.

  d. In the **Manager** field, enter a manager and add the role **knowledge_group_manager**.  
  e. In the Roles related list, click **Edit** and add the role **knowledge_group_member** to the group.

**Configure the Knowledge Management Service Portal**

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.
• For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.

• For existing customers on release versions prior to Madrid, activate the plugin, if required.

• Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management homepage in the Knowledge Management Service Portal.

• Navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.

• System administrators can configure portal pages and configure widgets for searching, sorting, and filtering knowledge base information. To configure widget instance options and configure search, sort, and filter features, see Knowledge Management Service Portal widgets

• To add knowledge bases to the Knowledge Service Portal, complete the following steps.
  1. Navigate to Service Portal > Portals and click Knowledge Portal.
  2. Click the Knowledge Bases related list.
  3. Click Edit to map one or more knowledge bases to the portal.

  Note: If no knowledge bases are added, all knowledge bases are available in the portal.

  If knowledge bases are mapped, only those knowledge bases are available in the portal. All search results and all widgets display results from the mapped knowledge bases only.

Section 508 compliance features

Users can view and interact with the Knowledge Management article view page in the Knowledge Management Service Portal using Section 508 compliance features. See Enabling accessibility features for more information.

  Knowledge Management FAQs

Enable external or public users to view knowledge articles from the Knowledge Management Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.
Before you begin
The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.
Role required: admin

About this task
If you are using Knowledge Management within the Customer Service Management (CSM) application, you can automatically make knowledge articles public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

Procedure

1. Navigate to Service Portal > Pages.

2. In the Pages list, search for and select kb_home.

   Note: If the application scope isn’t set to Knowledge Management - Service Portal, you cannot edit the form and a warning message appears. To make the form editable, click the word here at the end of the message.

3. Enable public or external users to view knowledge articles from the Knowledge Management Service Portal.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| Make knowledge service portal pages visible to public users | a. On the Page form, select the Public check box.  
b. Click Update. |
| Make knowledge service portal pages visible to external users | a. On the Page form, in the Roles field, click the edit user roles icon.  
b. On the Roles form, move snc_external from the available roles in the Available column to the Selected column.  
c. On the Roles form, click Done.  
d. On the Page form, click Update. |
4. Repeat the steps 2 and 3 for **kb_article_view** and **kb_search** pages.

5. Manage access to the articles for the Knowledge Management Service Portal pages.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public.</td>
<td>After you set the page to public as described in step 3, ensure that the Cannot Read and Can Read user criteria are not set and the glide.knowman.block_access_with_no_user_criteria property is set to false for the knowledge bases you want to give access to public users.</td>
</tr>
<tr>
<td>Enable access to the knowledge base for external users.</td>
<td>After you add the snc_external role to the page as described in step 3, ensure that external users have read access to the knowledge bases for which you want to give access.</td>
</tr>
</tbody>
</table>

For more information about providing access to knowledge bases, see **Managing access to knowledge bases and knowledge articles**.

**Knowledge Management Service Portal properties**

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.enable_redirect</td>
<td>Directs users to the desired Knowledge homepage.</td>
</tr>
<tr>
<td>• Type: true</td>
<td>false</td>
</tr>
<tr>
<td>• Default value: false</td>
<td></td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>sn_km_portal.glide.knowman.serviceportal.portal_url</td>
<td>The URL suffix for the Knowledge Management Service Portal. The default is kb.</td>
</tr>
</tbody>
</table>

The Knowledge Management Service Portal supports the Knowledge Management V3 properties. Configuring widget instance options on the portal pages can override these properties.

**Knowledge Management Service Portal widgets**

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles, related articles, and related items.

In the Knowledge Management Service Portal, the Knowledge Management homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.
Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance. For more information, see Configure widget instance options.

⚠️ Note: Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:

- **Knowledge Homepage Search**
  Customize search features for the homepage.
- **Knowledge Bases Browse**
  Displays knowledge base tiles in the homepage.
- **Knowledge Featured Articles**
  Displays a list of featured articles in the homepage.
- **Knowledge Most Useful Articles**
  Displays a list of most useful articles in the homepage.
- **Knowledge Most Viewed Articles**
  Displays a list of most viewed articles in the homepage.

Search results page widgets:

- **Knowledge Breadcrumbs**
  Displays navigation path to the current page and a search box for users to search the knowledge base.
- **Knowledge Search**
- **Knowledge Facet Header**
  Displays the title for the filter facets.
- **Knowledge Field Facet**
  Display search results filtered by knowledge base, knowledge category, and author.
- **Knowledge Tags Facet**
  Display search results filtered by article tags.
- **Knowledge Resource Facet**
  Display search results filtered by article resource.
• Knowledge Query Facet
  Display search results filtered by article rating, number of article views, and last modified.

• Knowledge Result Sort
  Displays search results filtered by sort options for returned results.

• Knowledge Selected Filter
  Displays the selected facet filters and allows you to clear the selections.

• Knowledge Result
  Displays search results filtered by returned results.

Article view page widgets:

• Knowledge Breadcrumbs
  Displays navigation path to the current page.

• Knowledge Article Content
  Customize what information users can view and what actions they can perform in the article view page.

• Knowledge Article Helpful
  Enables users to mark the article as helpful.

• Knowledge Article Comments
  Enables users to add comments for the article.

• Knowledge Attachments
  Displays article attachments if the Display Attachment field for the article is enabled.

  Note: You must add the Knowledge Attachments widget to any page in addition to Knowledge Article Content widget. After upgrade, if this widget does not get added automatically, you must add it manually.

• Related Catalog Item
  Displays a list of catalog items mapped to the article. The widget appears only when the related catalog items are available for the selected article.

• Knowledge Related Articles
  Displays a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the widget. The widget appears only when the related articles are available for the selected article.
• Affected Products

Displays the products related to the knowledge articles available in the **Affected Products** related list for the article. The widget appears only when the affected products are available for the selected article.

• Most Recent Tasks

Displays the tasks attached to the articles available in the **Attached Tasks** related list for that article. The widget appears only when the related tasks are available for the selected article.

• Most Useful

Displays a list of knowledge articles that users found most useful.

### Activate the Knowledge Management Service Portal plugin

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

**Before you begin**

Role required: admin

**About this task**

This plugin requires the following plugins:

• Knowledge Management V3 (com.snc.knowledge3)

• Service Portal for Enterprise Service Management (com.glide.service-portal.esm)

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Configure search widget instance options**

Configure widget instance options for the search widgets on the Knowledge Management Service Portal homepage and search results page.

**Before you begin**

Role required: sp_admin or admin

**About this task**

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

**Procedure**

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click **Instance Options**.
4. Configure the search widgets settings.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Page(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Knowledge Management Service Portal homepage</td>
<td>The title of the search widget. The default for the homepage is Welcome to Knowledge.</td>

5. Click **Save**.

### Configure knowledge base tile widget instance options

Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

**Before you begin**

Role required: sp_admin or admin

**About this task**

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

**Procedure**

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title that appears above the knowledge base tiles. The default is <strong>Explore our Knowledge Bases</strong>.</td>
</tr>
<tr>

<td>The color of the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.</td>
</tr>
<tr>
<td>Order By</td>
<td>The order in which the knowledge base tiles appear on the homepage. Use any field on the Knowledge</td>
</tr>
</tbody>
</table>
Configure the home page widget instance options

Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Before you begin
Role required: sp_admin or admin

About this task
The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see Pin a knowledge article. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

Procedure
1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.

5. Click Save.
3. Click **Instance Options**.
4. Configure the desired settings for the widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Custom configurations that determine the look and feel of the elements in the widget. For more information, see Service Portal SCSS Primer.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the <strong>Source Field</strong> used to provide the featured, most viewed, and most useful articles widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Display Field</td>
<td>The title displayed for each article in the list. By default, this is the article short description.</td>
</tr>
<tr>
<td>Secondary Fields</td>
<td>Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.</td>
</tr>
<tr>
<td>Max number of records to show</td>
<td>The maximum number of articles to include in the list.</td>
</tr>
<tr>
<td>Show even when empty</td>
<td>Enable this check box to display the widget even if there are no articles in the list.</td>
</tr>
<tr>
<td>Show Secondary Fields Label</td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
</tbody>
</table>
Configure sort widget instance options

Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

**Before you begin**

Role required: sp_admin or admin

**About this task**

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

**Procedure**

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click **Instance Options**.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>

Configure filter facet widget instance options

Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Before you begin
Role required: sp_admin or admin

About this task
The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

• Simple field facets based on the Knowledge table fields
• Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

• Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
• Knowledge Tags Facet (for filtering by tag)
• Knowledge Resource Facet (for filtering by resource, such as articles)
• Knowledge Query Facet (for filtering by rating, last modified, and number of views)

Note: Query facets are displayed when there's at least one knowledge field facet added to the page.

Procedure
1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click Instance Options.
4. Configure the desired settings for the selected type of facet widget.

5. Click Save.

<table>

</table>
| Show category hierarchy (valid for kb_category only)      | If enabled, shows categories with their hierarchy list up to the fourth-
<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>level. When you enable this option, you can select only one category at a time. Any articles that are included in the subcategories beyond the fourth-level also appear in the fourth-level of category. The search results filtered on a selected parent category include articles within that category and all the associated child categories.</td>
</tr>
</tbody>
</table>

**Note:** If the number of knowledge articles returned in search results is greater than the search facet depth, all categories are displayed in this facet. Therefore, some categories shown in this facet might not be associated with any knowledge articles in the search results. By default, the facet depth is set to 300 and configured by an administrator in the `glide.knowman.search.facet_depth` property.

5. Click **Save**.

Knowledge Management properties

**Configure a user action for the article view page**

Configure a user action for the Knowledge Management article view page in the Knowledge Management Service Portal.

**Before you begin**

Role required: sp_admin or admin

**About this task**

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.
Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (…) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

**Procedure**

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>

Configure article helpful widget instance options

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

**Before you begin**
Role required: sp_admin or admin

**About this task**
The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

**Procedure**
1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click Helpful?
3. Click Instance Options.
4. Configure the desired settings for the Knowledge Article Helpful widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

If no URL is specified, the system uses the URL in the `glide.knowman.create_incident_link` system property.

Redirects the article view page to the latest accessible version of the article, if available. Disable the **Show Version Information** option to hide the version information on the article view page because any version link will redirect to the latest version only.
## Configure article comments instance options

Configure the Knowledge Article Comments widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

### Before you begin

**Role required:** sp_admin or admin

### About this task

The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

### Procedure

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click the comments section.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Comments widget.

### Instance option and Description

<table>

**Configure related catalog item widget instance options**

Configure the Related Catalog Item widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of catalog items mapped to an article.

**Before you begin**

Role required: sp_admin or admin
About this task
The knowledge article view page displays the Related Items section when an article has related catalog items. Use the widget instance options to customize the Related Items section on the article view page.

Procedure
1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding /kb to the end of your instance URL.

   Note: Your administrator might have changed this default navigation.

2. Search for and click the article for which you want to modify the instance options for the Related Catalog Item widget.

3. Press Control and right-click the Related Items section.

4. Click Instance Options.

5. Configure settings for the Related Catalog Item widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table</td>
<td>Source table containing related catalog items. The source table specified in the base system is Related Catalog Items (kb_2_sc).</td>
</tr>
<tr>
<td>Source Column</td>
<td>Field in the source table referring to the source record. The source column specified in the base system is Knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears on the widget header. The default title is Related Items.</td>
</tr>
<tr>
<td>Max Number</td>
<td>Maximum number of catalog items to include in the Related Items section on the article view page. The maximum number specified in the base system is 5.</td>
</tr>
<tr>
<td>Use Full Width</td>
<td>Option for displaying the widget in a 12-column grid at 100% of the available width. If you clear the check box, the widget displays at 75% of the available width.</td>
</tr>
</tbody>
</table>
## Instance option | Description
--- | ---
Target Column | Field in the source table referring to the target record. The target column specified in the base system is Catalog item (sc_cat_item).
Source Id | URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.

6. Click **Save**.

### Related information

**Map catalog items related to an article**

**Configure knowledge related articles widget instance options**

Configure the Knowledge Related Articles widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of related articles mapped to an article.

**Before you begin**

Role required: sp_admin or admin

**About this task**

The knowledge article view page displays the Related Articles section when an article has related articles. Use the widget instance options to customize the Related Articles section on the article view page.

**Procedure**

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding `/kb` to the end of the URL for your instance.

   ![Note]
   You can change the default navigation by configuring the property `sn_km_portal.glide.knowman.serviceportal.portal_url`.

2. Search for and click the article for which you want to modify the instance options for the Knowledge Related Articles widget.

3. Press Control and right-click the Related Articles section.

4. Click **Instance Options**.
5. Configure settings for the Knowledge Related Articles widget.

<table>
<thead>

Knowledge Management Service Portal properties

Related information

Map related articles
Search using the Knowledge Management Service Portal

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

Enable multi-language search

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   Note: Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to Knowledge > Administration > Knowledge Search Properties > Enable multi language search.

3. Select the Yes check box to enable the feature.

   Note: If this property is not enabled, you can only search for one language at a time.

Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to System Properties > Text Search.

2. Set the following properties to true:
- Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
- Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).

3. Click **Save**.

**Integrating Knowledge Management features with the Service Portal**

To create a consistent user experience for Knowledge Management, integrate Knowledge Management Service Portal in your end-user facing Service Portal. The Knowledge Management Service Portal includes the following features:

- Multiple knowledge bases
- A Knowledge Management article view page with feedback options
- A Knowledge Management search results page with options to filter and sort search results
- A number of widgets to enable searches, display search results, display knowledge articles, and so on

By default, all knowledge articles in the Service Portal are redirected to the Knowledge Management article view page using the **Knowledge Article View** page route map. If upgrading from a previous release, a system administrator can activate the **Knowledge Article View** page route map to take advantage of the features of the Knowledge Management article view page. For more information, see **Activate the Knowledge Article View page on upgrade**.

System administrators perform the following tasks to integrate the Knowledge Management Service Portal features with the Service Portal:

- Integrate the Knowledge Management homepage with the Service Portal homepage.
- Integrate the Knowledge Management search results page with the Service Portal search results page.
- Add the Knowledge Management Service Portal widgets to quickly access knowledge articles from the Service Portal homepage (Optional).

**Note:** These configurations apply to the base system pages within the Service Portal only.

Integrate the Knowledge Management homepage with the Service Portal homepage

Use a page route map to access the enhanced Knowledge Management homepage from the Service Portal homepage.

Before you begin

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is activated.

Note: This plugin is activated by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid must activate the plugin to perform this configuration task. For more information, see Activate the Knowledge Management Service Portal plugin.

Role required: admin

About this task

The Knowledge Management homepage displays knowledge articles organized by knowledge base and category, featured content, and popular articles. You use a page route map to access the Knowledge Management homepage from the Service Portal homepage.

Procedure

1. Navigate to Service Portal > Page Route Maps.
2. Click New.
3. On the Page Route Map form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Portal(s)</td>
<td>Service Portal</td>
</tr>
<tr>
<td>Route from</td>
<td>kb_view2</td>
</tr>
<tr>
<td>Route to</td>
<td>kb_home</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
</tbody>
</table>
Note: On the Page Route Map form, you can fill in the **Short Description** and **Order** fields as appropriate.

4. Click **Submit**.

**Results**

You can now open the Knowledge Management homepage from the Service Portal homepage by clicking the Knowledge link or Knowledge Base icon link.

**Integrate the Knowledge Management search results page with the Service Portal search results page**

Use a custom knowledge search widget to access the enhanced Knowledge Management search results page from the Service Portal search results page.

**Before you begin**

Role required: admin

**About this task**

The Knowledge Management search results page in the Knowledge Management Service Portal includes options to filter and sort search results and a number of widgets to enable searches, display search results, display articles, and so on. In this procedure, to access the Knowledge Management search results page from the Service Portal search results page, you create a custom knowledge search widget named Search Within and add it to the Service Portal search results page.

**Procedure**

1. Create a custom knowledge search widget named Search Within.

   a. Navigate to **Service Portal > Service Portal Configuration**.

   b. On the Service Portal page, click **Widget Editor**.

   c. Click **Create a new widget**.

   d. In the Add a Widget dialog box, in the **Widget Name** field, enter **Search Within**. The **Widget ID** field is automatically populated based on the widget name.

   e. Click **Submit**.

   The widget HTML template, client script, and server script display in the widget editor.
f. In the widget editor, enter the following field values to replace any existing text.

- In the **HTML Template** field, enter the following code to add a link to the Knowledge Management search results page in the Search Within widget from the Service Portal.

```html
<div role="list" class="list-group">
    <span class="list-group-item active">${Search Within}</span>
    <a role="link" class="list-group-item" ng-href="{{data.url}}">${Knowledge}</a>
</div>
```

- In the **Server Script** field, enter the following code to set the URL parameters for the Knowledge Management search results page:

```javascript
(function()
    var q = encodeURIComponent($sp.getParameter('q'));
    var kb = $sp.getValue('kb_knowledge_base') || "";
    data.url = '/sp?id=kb_search';
    if(q)
        data.url += "&keyword="+q;
    if(kb)
        data.url += "&kb_knowledge_base="+kb;
})();
```

**Note:** For more information about these fields, see [Widget developer guide](#).

g. Click **Save**.

2. Add the custom knowledge search widget to the Service Portal search results page.

   a. Navigate to **Service Portal > Service Portal Configuration**.

   b. Click **Designer**.

   c. In the **Filter by title or Id** field, enter `sp_search`, the ID for the Service Portal search results page, and then select **Search**.

   d. In the **Filter Widget** field, search for the Search Within widget and drag it onto the container where you want the widget to appear on the Service Portal search results page.
Tip: To verify the location and appearance of the newly added Search Within widget on the Service Portal search results page, click the Preview tab.

The Search Within knowledge search widget is added to the Service Portal search results page. Clicking Knowledge in the widget and searching for a keyword will redirect you to the Knowledge Management search results page in the Knowledge Management Service Portal.

Add widgets to access knowledge articles from the Service Portal homepage

Add the Knowledge Management Service Portal widgets Featured Articles, Most Useful Articles, and Most Rated Articles to the Service Portal homepage to quickly access knowledge articles.

Before you begin
Role required: admin

About this task
For more information about Knowledge Management Service Portal widgets, see Knowledge Management Service Portal widgets.

Procedure
1. Navigate to Service Portal > Service Portal Configuration.
2. Click Designer.
3. Select the Service Portal homepage.
4. In the Filter by title or Id field, enter index, the ID for the Service Portal homepage, and then select Service Portal.
5. In the Filter Widget field, search for the following Knowledge Management Service Portal widgets, and then drag them onto the container where you want them to appear on the Service Portal homepage.

<table>
<thead>
<tr>
<th>Widget Name</th>
<th>Widget Display Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Featured Articles</td>
<td>Featured Articles</td>
</tr>
<tr>
<td>Widget Name</td>
<td>Widget Display Name</td>

<td>------------------------</td>
</tr>
<tr>
<td>Knowledge MostUseful Articles</td>
<td>Most Useful Articles</td>
</tr>
<tr>
<td>Knowledge MostViewed Articles</td>
<td>Most Viewed Articles</td>
</tr>
</tbody>
</table>

**Tip:** To verify the location and appearance of the added widgets on the Service Portal, click the Preview tab.

**Results**

Clicking a knowledge article link from one of the added widgets on the Service Portal homepage opens the Knowledge Management article view page in the Knowledge Management Service Portal.

- Contextual search in the Incident form
- Connect

Configure custom SEO tags for canonical URLs and localized knowledge articles

Discover relevant knowledge articles through search engines by adding custom SEO tags for canonical URLs and `hreflang` tags to the knowledge article view page.

**Before you begin**

Role required: admin
**About this task**

Update the `SPSEOHeaderTagsArticleView` script include to add canonical URLs and `hreflang` tags to the knowledge article view page. You can also add custom header tags to the knowledge article view page by implementing the `generateCustomTagsForSEO` function.

**Note:** The tags are added to the Knowledge Article View [kb_article_view] page only when audience is set to public; that is, the page can be accessed without the need for authentication. For more information, see Create and edit a page using the Service Portal Designer.

For information about the default behavior of canonical URLs and `hreflang` tags for the knowledge article view page, see SEO for canonical URLs and localized versions of knowledge articles.

**Procedure**

1. Navigate to **System Definitions > Script Includes**.
2. Search for `SPSEOHeaderTagsArticleView`.
3. In the **Name** column, click the `SPSEOHeaderTagsArticleView` link.
4. On the Script Include form, modify the functions for knowledge articles.

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return a canonical URL for a knowledge article</td>
<td>Modify the <code>generateCanonicalURL</code> function to return the fully qualified canonical URL of a knowledge article as a string. For example, use the following URL format for a knowledge article in the customer service portal: &quot;https://&lt;instance name&gt;.servicenow-com/csp?id=kb_article_view&amp;sysparm_article=&lt;article number&gt;&quot;</td>
</tr>
<tr>
<td>Return an <code>hreflang</code> tag for translated versions of a knowledge article</td>
<td>Modify the <code>generateHrefLangArray</code> function to return an <code>hreflang</code> array for the current language and the available translations for a knowledge article. For example, use the following format for a knowledge article translated in French in the customer service portal: <code>[{locale:'fr', href: 'https://&lt;instance name&gt;.servicenow-com/csp/fr?id=kb_article_view&amp;sysparm_article=&lt;article number&gt;'}]</code></td>
</tr>
<tr>
<td>Return a custom header for a knowledge article</td>
<td>Modify the <code>generateCustomTagsForSEO</code> function to return any custom header tags as an array of strings used for the knowledge article view page.</td>
</tr>
</tbody>
</table>
## Functionality

| knowledge article | For example, use the following format for a custom tag for a knowledge article: ['<meta custom-tag="" property="og:title" content="Service Portal">'] |

For more information about configuring script includes, see [Script includes](#).

5. Click **Update**.

### SEO for canonical URLs and localized versions of knowledge articles

Improve the searchability of knowledge articles by adding tags for canonical URLs and **hreflang** tags for translated knowledge articles.

You can add the default tags for canonical URLs and **hreflang** tags by selecting the **Use SEO script** check box on the Knowledge Article View [kb_article_view] page record. For more information, see [Enable SEO for canonical URLs and localized versions of a portal page](#).

When the **Use SEO script** option is selected:

- The canonical URLs for a knowledge article are added to the knowledge article view page.

  Example canonical URL: `https://<instance name>.servicenow-com/csp?id=kb_article_view&sysparm_article=<article number>`

- The **hreflang** tags for the translated versions of a knowledge article are added to the knowledge article view page.

  Example URL with an **hreflang** tag: `<link rel="alternate" href="https://<instance name>.servicenow-com/csp/fr?id=kb_article_view&sysparm_article=<article number>" hreflang="fr"/>

  **Note:** A self-referencing **hreflang** URL is also added for the language of current knowledge article.

  For example, an English knowledge article is viewed by visiting a URL with the following format:

  `https://<instance name>.servicenow-com/csp/?id=kb_article_view&sys_kb_id=<sys_id>`

  In addition to the **hreflang** tags added for translations, the English language self-referencing **hreflang** tag is added:

  `<link rel="alternate" href="https://<instance name>.servicenow-com/csp/?id=kb_article_view&sys_kb_id=<sys_id>" hreflang="en"/>

**Script includes for canonical URLs and hreflang tags**

By default, the knowledge article view page uses the `SPSEOHeaderTagsArticleViewSNC` script include to add the SEO tags for canonical URLs and **hreflang** tags.

The following table describes the script includes for adding canonical URLs and **hreflang** tags to Service Portal pages, including the knowledge article view page.

<table>

</tr>
</tbody>
</table>
As an administrator, you can add canonical URLs, hreflang tags, and any custom headers for knowledge articles by updating the SPSEOHeaderTagsArticleView script include. For more information, see Configure custom SEO tags for canonical URLs and localized knowledge articles.

**Configure knowledge bases for a portal**

Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to Service Portal > Portals.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click Edit.
4. On the Edit Members form, move the desired knowledge bases from the available items in the Collection column to the Knowledge Bases List column.
5. Click Save.

**Related information**

Create a knowledge base

**Configure knowledge subscriptions**

Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.

**Before you begin**
Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

⚠️ **Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin
**Procedure**

1. Navigate to **Knowledge > Administration > Properties**.

2. In the **KM Subscription Properties** section, configure the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM [glide.knowman.enable_km_subscription]</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature [glide.knowman.enable_km_subscription.roles]</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature [glide.knowman.enable_km_subscription.workflow_state]</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

**Knowledge subscription email notification templates**

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to **System Notifications > Email > Notifications**. For more information about customizing a template, see **Create an email notification**.
Subscription notifications include a link at the bottom of the email to the user's Notification Preferences page.

**Knowledge Management Analytics and Reporting Solutions**

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

**Analytics and Reporting Solutions**

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

**Important:** Set up and test Analytics and Reporting Solutions on a non-production instance before enabling them in production.

**Note:** Analytics and Reporting Solutions provide all the configuration records required to analyze default applications. Customize these records for use in your production environment. For more information, see Configure Analytics and Reporting Solutions.

To enable the solution for Knowledge Management, an admin can navigate to **Performance Analytics > Guided Setup.** Click **Get Started** then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.

**Domain separation and 'Run As' user**

By default, System Administrator is the *Run As* user for data collection jobs in the Analytics and Reporting Solutions. Verify that this user exists on the instance, and whether this user has the appropriate level of access. An inappropriate *Run As* user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

**New and deprecated versions of this solution**

In London, this Solution was replaced with a new version, `com.snc.pa.knowledge_v2`. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate any new indicators and breakdowns.
Add Self-Service Analytics to Knowledge Management dashboards

If you have Self-Service Analytics activated on an instance, you can add Self-Service analytics widgets to your Performance Analytics dashboards or a Service Portal. To obtain a ready-made set of indicators and breakdowns, activate the Self-Service Analytics PA (com.snc.pa.self_service_analytics) plugin. Find the Self-Service indicators through the Performance Analytics Admin Console, then create widgets and add them to your dashboard or portal. Also activate the [SSA] Self-Service Analytics data collection job.

CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

% of Knowledge Articles Published
A daily calculation using the formula \[
\frac{\text{[Number of knowledge articles published]}}{\text{[Number of knowledge articles active]}}
\]

Monthly Average Article Rating
A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

Average Click Rank
A monthly calculation using the formula \[
\frac{\text{[Sum of knowledge search ranks]}}{\text{Number of knowledge searches with rank}}
\]

Click Through Rate
A monthly calculation using the formula \[
\frac{\text{Number of knowledge searches with rank}}{\text{[Number of knowledge searches]}}
\]
Average Time to Publish

The average time to publish is recalculated daily, as a number of
days. The goal of the indicator is for scores to minimize.

Number of Active Users Who Performed Searches - Monthly

The number of authenticated users who performed at least one
search of the knowledge base in the preceding month. The goal is
for the number to maximize.

Number of Active Users Who Viewed Articles - Monthly

The number of authenticated users who viewed at least one
knowledge article in the preceding month. The goal is for the
number to maximize.

Number of Knowledge Searches with Rank - Monthly

The number of knowledge searches in a month where the Highest
Click Rank has a value higher than zero. The goal is for the number
to maximize.

Number of Knowledge Searches - Monthly

The number of knowledge searches in a month. The goal is for the
number to maximize.

Number of Knowledge Articles Rated - Monthly

The number of knowledge feedback records created in a month,
excluding records where the Rating field is empty. The goal is for the
number to maximize.

Number of Knowledge Articles Published

A daily count of the total number of knowledge articles that have
entered the Published state. The goal is for the number to maximize.

Number of Knowledge Articles Active

A daily count of the number of active knowledge articles with up-
to-date workflows. The goal is for the number to maximize.

Sum of Knowledge Article Rating - Monthly

The monthly sum of all knowledge article ratings. This indicator is
used only to calculate the average monthly article rating.

Sum of Knowledge Search Ranks - Monthly

The sum of feedback rankings of knowledge searches made in a
month, excluding empty Highest Click Rank values. The goal is for
the number to maximize.

Average Click Rank for Unauthenticated Users
A monthly calculation of the average click rank for the unauthenticated user activity. The score is calculated according to the formula \[
\frac{\text{Sum of Knowledge Search Ranks by Unauthenticated Users - Monthly}}{\text{Number of Knowledge Searches by Unauthenticated user with Rank - Monthly}}\]. A lower value is better.

**Click Through Rate for Unauthenticated Users**

A monthly calculation of the percentage of click through rate for the unauthenticated user activity. The score is calculated according to the formula \[
\frac{\text{Number of Knowledge Searches by Unauthenticated user with Rank - Monthly}}{\text{Number of Knowledge Searches by Unauthenticated user - Monthly}} \times 100\]. A higher value is better.

**Number of Knowledge Searches by Unauthenticated Users - Monthly**

A monthly count of the knowledge searches by unauthenticated users.

**Number of Article Views by Unauthenticated Users - Monthly**

A monthly count of the knowledge articles viewed by unauthenticated users.

**Sum of Knowledge Search Ranks by Unauthenticated Users - Monthly**

A monthly sum of the knowledge search ranks for the unauthenticated user activity.

**Number of Knowledge Searches with Rank for Unauthenticated Users - Monthly**

A monthly count of the knowledge searches with click rank for the unauthenticated user activity.

**Breakdowns**

The following breakdowns apply to the indicators on the dashboard:

- Time to Publish Groups
- Knowledge Base
- Knowledge Category

**Reports**

The dashboards include the following reports:
<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Articles with Inactive Authors</td>
<td>Column</td>
<td>Active = true and Author.Active = False</td>
</tr>
<tr>
<td>Invalid Articles</td>
<td>Column</td>
<td>Active = true and Workflow is one of Draft, Review, Published, or Pending Retirement and Valid to is before today and latest = true</td>
</tr>
<tr>
<td>Articles Created Over 1 Year</td>
<td>Column</td>
<td>Active = true and Created = before 1 year ago</td>
</tr>
<tr>
<td>Articles not Published</td>
<td>Column</td>
<td>Active = true and Workflow is Draft or Review</td>
</tr>
</tbody>
</table>

**Dashboards**

**View knowledge logs**

Knowledge logs display information about which users have viewed knowledge articles, what they looked for, and where.

**Before you begin**

Role required: knowledge_admin, knowledge_manager

**About this task**

Knowledge logs capture information from all the available sources where users can access knowledge articles, such as Customer Service Portal, Knowledge Management Service Portal, Now Mobile, Agent Workspace, and Knowledge Management v3.

**Procedure**

1. Navigate to **Knowledge > Administration > Search Log** or **View Log**.
2. View the Search or View logs.
Knowledge logs

<table>
<thead>
<tr>
<th>Log</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Log</td>
<td>View records of the search source, search terms, the highest click rank, and the number of search results of knowledge searches from all the available sources where users can access knowledge articles. The Search log displays data from the Knowledge Searches [ts_query_kb] table. For more information about the search source, see View the source of a knowledge article search.</td>
</tr>
<tr>
<td>View Log</td>
<td>View records showing who has viewed which knowledge articles, who has attached a knowledge article to a task and when, and identify final search terms when the type-ahead search suggestions feature is enabled. The View log displays data from the Knowledge Use [kb_use] table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• An administrator can activate the kb_use table cleanup job to delete any older records from the Knowledge Use [kb_use] table and improve the table performance. For more information, see Modify the data retention policy for View logs.</td>
</tr>
<tr>
<td></td>
<td>• The View log record doesn't display information for a knowledge article accessed and viewed from the global search results.</td>
</tr>
</tbody>
</table>

View the source of a knowledge article search

Analyze knowledge searches by finding the source used for searching a knowledge article.

**Before you begin**

Role required: knowledge_admin, knowledge_manager

**Procedure**

1. Navigate to Knowledge > Administration > Search Log.
2. View the following data for a search record in the corresponding column of the Search log.
Search source details

<table>
<thead>
<tr>
<th>Column</th>
<th>Search record data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Doc</td>
<td>Source record in the source table.</td>
</tr>
<tr>
<td></td>
<td>For example, Problem: problem_number, Case: case_number, Incident: incident_number, Service Portal: Customer Support</td>
</tr>
<tr>
<td>Source Table</td>
<td>Label and name of the source table.</td>
</tr>
<tr>
<td></td>
<td>For example, Knowledge [kb_knowledge], Service Portal [sp_portal], Case [sn_customerservice_case], Incident [incident], Problem [problem], KCS Article [kb_template_kcs_article]</td>
</tr>
<tr>
<td>Source Type</td>
<td>Application where the knowledge article search was performed.</td>
</tr>
<tr>
<td></td>
<td>The Source Type column is set to one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• Portal: Service Portal application</td>
</tr>
<tr>
<td></td>
<td>• Classic: Now Platform application</td>
</tr>
<tr>
<td></td>
<td>• Workspace: Agent assist in Workspace</td>
</tr>
<tr>
<td></td>
<td>• Knowledge Classic: Knowledge Management v3 or v2</td>
</tr>
<tr>
<td></td>
<td>• Other: Unidentifiable source</td>
</tr>
<tr>
<td>Source URL</td>
<td>URL of the searched text query.</td>
</tr>
</tbody>
</table>

Related information

- View knowledge logs

Modify the data retention policy for View logs

Remove unwanted and older data from the Knowledge Use [kb_use] table through the data retention policy.

Before you begin
Role required: admin

About this task
The View log displays data from the Knowledge Use [kb_use] table. By default, all the records in the Knowledge Use [kb_use] table are retained. Activating the data retention policy for the kb_use table deletes records that you no longer need. The deleted data is not visible on the reports used in dashboards such as Self-Service Analytics for customer service and Knowledge Management dashboards.
Procedure

1. Navigate to **System Maintenance > Table Cleanup**.

2. In the **Tablename** column, search for `kb_use` and click the `kb_use` link.

3. On the Auto Flush form, activate the `kb_user` table cleanup job by selecting the **Active** check box.

4. **Optional:** Adjust the amount of time the system waits before deleting the records by modifying the value in the **Age in seconds** field. By default, the **Age in seconds** field value is set to 31,536,000 seconds (equivalent to 365 days). For more information, see **Autoflush form**. If the `glide.knowman.view_age.days` property, which sets the number of days used when summing article views, is active, the **Age in seconds** field value must be larger than that property's value. For more information, see **Knowledge Management properties**.

5. Click **Update**.

Integration with external knowledge sources

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

Activate the External Content Integration plugin

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

**Before you begin**
- **Role required:** admin
- The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:
• Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
• Knowledge Management V3 plugin (com.snc.knowledge3)
• Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)

The Knowledge > Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.
   - Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Define an external knowledge source
Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Before you begin
Define basic authentication credentials and create an HTTP connection to the external source.

⚠️ CAUTION: This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

Role required: admin
About this task
Only basic authentication is supported for the external content integration feature.

Procedure
1. Define the connection from the external source and the target knowledge base.

   a. Navigate to Knowledge > Administration > External Knowledge Sources.

   b. Click New.

   c. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

   d. Right-click the form header and click Save.

2. Set import parameters for the external content.

   a. In the Parameter related list, click New.

   b. In the Name field, select the name of the parameter from the drop-down list.

   c. In the Value field, enter the desired value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to <strong>true</strong> to open search results in the external source system. Set value to <strong>false</strong> to open search results in the target knowledge base. Default value is set to <strong>false</strong>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

*d. Click **Submit**.*
Import content from an external knowledge source
Run an import job manually or set up a schedule to process the integrated external content.

Before you begin
Role required: admin or knowledge_admin

About this task
Each external source is associated with two handlers: the Acquire handler and the Process handler, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

Procedure
1. Navigate to Knowledge > Administration > External Knowledge Sources.
2. Select the external knowledge source from which you would like to import content.
3. In the Handler tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click Run Scheduled Job.
5. To view all jobs scheduled to run to import content for the external source, click the Jobs.
   You can open the most recent job to monitor the status.

Results
For each file in the external content source, a blank knowledge article is created and the external file is added as an attachment to the article. The short description of the article is derived from the file name of the external content source.

Note: If the externally imported content is infected, a notification about each infected file is sent to the users with the knowledge_admin role and Knowledge Base owners. The notified users can then take required actions on the infected files.

Open knowledge search results in source system
While search results are aggregated within your instance, your users can also utilize features available in the source system (being able to edit in Microsoft SharePoint, for example). To open knowledge search results in a host system, configure the URL to the external source system to open articles from search results directly in the source system.
Before you begin
Make sure the Open search results in the original source system import parameter for the external knowledge source is set to true.

You can follow this procedure when you have a file as a knowledge article in Microsoft SharePoint, for example.

Role required: admin

Procedure

1. Navigate to System Definition > Script Includes.
2. Open KBWebDAVContentHandler.
3. In the Script window, override the function `getFileURL` using script shown below.

The `getFileURL` function is shown below.

```
//fileObj.getName() - Returns name of the file
//fileObj.getPath() - Returns path to the file from root folder
//fileObj.getAbsolutePath() - Returns Absolute WebDAV URL of the file
//fileObj.getCreationDate() - Returns creation date of the file as GlideDateTime object
//fileObj.getModifiedDate() - Returns last modified date of the file as GlideDateTime object
//fileObj.getContentType() - Returns content type of the file as GlideDateTime object
//fileObj.getSize() - Returns size of the file

getFileURL: function(fileObj) {
   //write your logic here
},
```

4. Click Update.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV- compliant.
Integrate external knowledge sources into the Knowledge Management application

Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Before you begin
Role required: admin

Procedure
1. Enable basic authentication on your external account.
   
   Note: Your external account password is not affected when you enable basic authentication.

2. Create the connection to your external account using the basic authentication credentials.
   
   a. Navigate to Connections and Credentials > Credentials.
   
   b. Click New.
   
   c. Click Basic Auth Credentials. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the credential. For example, Demo_Auth.</td>
</tr>
<tr>
<td>User name</td>
<td>The external account user name created for basic authentication.</td>
</tr>
<tr>
<td>Password</td>
<td>The external account password for the user name.</td>
</tr>
</tbody>
</table>

   d. Click Submit.

3. Create an HTTP connection to your external account.
   
   
   b. Select New.
c. In the **Name** field, enter the name of the connection alias.

**Example**
For example, `Demo_Account`.

d. Right-click the form header and click **Save**.

e. In the **Connections** related list, click **New**.
   Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the HTTP connection. For example, <code>Demo_Connection</code>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential created to connect to the external account. For example, <code>Demo_Auth</code>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>WebDAV URL to your external account. This is the WebDAV end point of your external account.</td>
</tr>
</tbody>
</table>

**Note:** You can also import contents from a specific folder by appending the folder path to the URL. For example, `https://<web link to your external_account>/KnowledgeIT`.

f. Click **Submit**.

4. Configure the external knowledge source for importing content.

   a. Navigate to **Knowledge > Administration > External Knowledge Sources**.

   b. Click **New** and fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, <code>Demo_knowledge</code>.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, <code>IT</code>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

c. Right-click the form header and select **Save**.

d. In the Parameter related list, click **New**.

e. On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Parameter name</td>
<td>Value</td>
</tr>
<tr>
<td>--------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have <code>.docx</code> and <code>.pdfextensions</code>, enter <code>.*\.docx,.*\.pdf</code>.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have <code>.docx</code> and <code>.pdfextensions</code>, enter <code>.*\.docx,.*\.pdf</code>.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.</td>
</tr>
</tbody>
</table>

**What to do next**

Import content from an external knowledge source.

**Related information**

- Open knowledge search results in source system
- Knowledge Management Service portal search results page

**Use extension points for Knowledge Management**

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

**Before you begin**

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Role required: admin
About this task
Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.

An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

Procedure
1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:
   
   
   b. Click the UI extension point you want to use.
   
      Note:
   
      • Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to the knowledge article view pages (kb_view.do) in Knowledge Management v3.
      
      • Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.
   
   c. Click Create Implementation.
   
   d. Change the data as required.
   
   e. Click Update.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:
a. Navigate to **System Extension Points > Scripted Extension Points**.

   > **Note:** Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

b. In the **API Name** column, click `global.KMFeedbackObject`.

c. In the **Implementations** related list, click the `KMFeedbackObjectBaseImpl` class.

d. Change the data and add additional fields, as required.

e. Click **Update**.

**Related information**

- Using extension points to extend application functionality
- Using scripted extension points in server-side scripts
- Using UI extension points in server-side UI macros
- Using client extension points in client-side UI scripting

**Duplicate knowledge article numbers**

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge **Number** field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the **Number** field is 10,000. To customize this number:

1. Navigate to **System Definition > Number Maintenance**.
2. In the **Table** column, search for and select **Knowledge**.
3. In the Controls related list, in the **Number** field, enter a new number.
4. Click **Update**.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge **Number** field is not uniquely indexed, the import completes without error.
With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: `kb_view.do?sysparm_article=KB0000033`. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

**Avoiding duplicate Knowledge article numbers**

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge **Number** field so that newly created articles do not conflict with existing articles.

1. Navigate to **System Definition > Number Maintenance**.
2. In the **Table** column, search for and select **Knowledge**.
3. In the Controls related list, in the **Number** field, update the count to a number greater than the largest value already in the system.
4. Click **Update**.

**Configure Knowledge Management - Add-in for Microsoft Word**

Configure the Knowledge Management - Add-in for Microsoft Word to author and access knowledge articles in Microsoft Word.

**Before you begin**

Complete the following tasks to use the Knowledge Management - Add-in for Microsoft Word.

**Procedure**

1. **Activate Knowledge Management - Add-in for Microsoft Word.**
2. **Deploy Knowledge Management - Add-in for Microsoft Word.**
3. **Configure the security for Knowledge Management add-in for Microsoft Word.**
4. **Optional:** Enable downloading of the source Microsoft Word document for a knowledge article.
Related information

Knowledge article authoring in Microsoft Word

Activate Knowledge Management - Add-in for Microsoft Word

Activate the Knowledge Management - Add-in for Microsoft Word plugin (com.snc.knowledge.ms_word) if you have the admin role. This plugin activates related plugins if they are not already installed.

Before you begin
Role required: admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Deploy Knowledge Management - Add-in for Microsoft Word

Deploy the Knowledge Management - Add-in for Microsoft Word for authoring knowledge articles from within the Microsoft Word.

Before you begin
In addition to having one of the following roles on the ServiceNow instance, you must be an Office365 administrator to deploy the Knowledge Management - Add-in for Microsoft Word.

Role required: admin, sn_outlook_addin.outlook_addin_setup

Procedure
1. Navigate to ServiceNow Add-Ins for Office > Office Add-In-Manifests.
2. In the Add-In Name column, click Knowledge Management.
3. Click Download Manifest to download the add-in manifest file to your desktop.
4. Deploy the Knowledge Management - Add-in for Microsoft Word. For more information, see Publish Office Add-ins using Centralized Deployment via the Office 365 admin center.

Configure the security for Knowledge Management add-in for Microsoft Word

Use the `sn_km_word.glide.knowman.word.xframe` property to specify all the parent domains in the Microsoft Word Online application in which Knowledge Management - Add-in for Microsoft Word is embedded.

Before you begin

Ensure that you have activated the Knowledge Management - Add-in for Microsoft Word plugin and the application scope is set to Knowledge Management - Add-in for Microsoft Word.

Role required: admin

About this task

The domains you specify for the Microsoft Word application in the `sn_km_word.glide.knowman.word.xframe` property are used for setting the `x-frame-options` and `content-security-policy` headers. These settings securely display the Knowledge Management add-in for Microsoft Word in the online version of Microsoft Word documents.

Note: If you don’t set the `sn_km_word.glide.knowman.word.xframe` correctly, the Knowledge Management - Add-in for Microsoft Word fails to load in the Word document. For more information about resolving such errors, see the Knowledge Word Office Manifest fails validation [KB0860916] article in the HI knowledge base.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. Search for the `sn_km_word.glide.knowman.word.xframe` property.
3. In the **Value** field, enter a domain.
   - For multiple entries, separate the domains with commas.

4. Click Update.

Enable downloading of the source Microsoft Word document for a knowledge article

Set the `sn_km_word.glide.knowman.enable_document_download` property to enable users to download the source Microsoft Word document of a knowledge article from the knowledge article view page in a portal or workspace.

Before you begin
Role required: admin

About this task
When a knowledge article is created using Microsoft Word, users accessing the knowledge article view page in a portal or workspace can download the source Microsoft Word document when the `sn_km_word.glide.knowman.enable_document_download` property is set to true.

Note: After you enable the `sn_km_word.glide.knowman.enable_document_download` property, the Microsoft Word source document of a knowledge article also might appear in search results as an attachment to the article. Therefore, enabling this property might affect the search relevancy of a knowledge article.

Procedure
1. In the navigation filter, enter `sys_properties.list`.
2. Search for the `sn_km_word.glide.knowman.enable_document_download` property.
3. In the Value field, enter `true`.
4. Click Update.

Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign
tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

 tanggal: The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map.

Beginning with New York, the Knowledge Article View page route map is activated by default. Existing customers on release versions prior to New York can activate the Knowledge Article View page route map. For more information, see Activate the Knowledge Article View page on upgrade.

Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Before you begin
Role required: admin

About this task
The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map. For new customers, the Knowledge Article View page route map is activated by default.

A feedback task is created for an article when the article is flagged. For generating feedback tasks when an article is marked as not helpful or rated below a set value, you must set the following associated properties.

Procedure
1. Navigate to Knowledge > Administration > Properties.
2. In the Actionable Feedback Properties section, configure the following properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged</td>
<td>By default, the property is set to <strong>Yes</strong> and feedback tasks are created when the article is flagged.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful</td>
<td><strong>Select Yes.</strong></td>
</tr>
</tbody>
</table>
| Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback | **Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task.**  
For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article. **Note:** If you enter '0', a negative article feedback does not generate a feedback task. |

3. Click **Save**.

**Related reference**

*Actionable Knowledge Feedback Properties*

**Work on a feedback task**

You can change the state of a task and resolve or reassign tasks generated by article feedback.

**Before you begin**

Role required: knowledge

**About this task**

- If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.

- If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in **All Open Tasks**. As a group member, you can reassign the task to yourself to appear in **My Assigned Tasks**.
Procedure

1. Navigate to Knowledge > Feedback Management > My Assigned Tasks.
2. Select a feedback task.
3. Review the feedback given by the submitter.
   When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The selected reason for the feedback.</td>
</tr>
<tr>
<td>Description</td>
<td>Text in the Details field.</td>
</tr>
</tbody>
</table>

**Note:** If feedback is negative and the Details field is left blank, this field indicates whether the article was not helpful or rated poorly.

4. To work on the feedback task:

<table>
<thead>
<tr>
<th>Change the feedback task state to</th>
<th>If you want to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work in progress</td>
<td>Start working on the feedback task.</td>
</tr>
<tr>
<td></td>
<td>You can save the feedback task and edit the article or create a new article if the information in the existing article is irrelevant or obsolete.</td>
</tr>
<tr>
<td>Awaiting information</td>
<td>Request clarification from the feedback submitter.</td>
</tr>
<tr>
<td></td>
<td>In the Additional Comments field, enter information you need from the submitter and click Update. This triggers an email notification for the feedback task submitter.</td>
</tr>
<tr>
<td>Resolved</td>
<td>Resolve the feedback task.</td>
</tr>
<tr>
<td></td>
<td>In the Resolution Code field, select the code for resolving the article. In the Resolution notes field, enter the reason for the resolution and click Update. An email notification is sent to the feedback submitter. The email...</td>
</tr>
<tr>
<td>Change the feedback task state to</td>
<td>If you want to</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Closed</td>
<td>notification includes the portal URL for the article from where the feedback submitter can accept or reject the feedback.</td>
</tr>
<tr>
<td></td>
<td>Close the feedback task without the submitter having to accept the feedback resolution.</td>
</tr>
</tbody>
</table>

**Note:** If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to **Closed**. You can view all closed feedback tasks in your queue by navigating to Knowledge > Feedback Management > My Closed Tasks.

**Track the progress on a feedback task**
Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

**Before you begin**
Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

**Procedure**
1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>View open feedback tasks</td>
<td><strong>Knowledge &gt; Feedback Management &gt; All Open Tasks</strong> and select a feedback task.</td>
</tr>
<tr>
<td>View closed feedback tasks</td>
<td><strong>Knowledge &gt; Feedback Management &gt; All Closed Tasks</strong> and select a feedback task.</td>
</tr>
</tbody>
</table>
2. In the **Knowledge Feedback Task Metrics** related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

**Note:** If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.

**Knowledge-Centered Service configuration**

Knowledge-Centered Service (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

ServiceNow Knowledge Management is a KCS (V6) verified product. As a KCS (V6) verified product, Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.

**Article quality index for knowledge management**

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

The average AQI scoring is displayed on the Content Quality tab of the Knowledge Management dashboard (see Knowledge Management dashboard).
Activating article quality index

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, Activate the Knowledge Management Advanced plugin.

Create an AQI checklist

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Before you begin

Role required: knowledge_admin or admin

Procedure

1. Navigate to Knowledge > Article Quality Index > AQI checklists, and click New.

2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.

4. In the Checklist Questions related list, add questions to the checklist.
   Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

   Note: The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a. Click New.

b. Fill in the following fields:
## Checklist Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist. The lower the value in the Order field, the higher the question displays in the checklist.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.

<p>| Weight | A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to true. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Note: | • The combined weight of all questions cannot exceed 100.  
• The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base. |

c. Click **Submit**.

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

**What to do next**

After you create a checklist, **assign it to a knowledge base**.

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

**Before you begin**

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin

**About this task**

**Procedure**

1. Navigate to **Knowledge > Administration > Knowledge Bases**.

2. Click a knowledge base to which you want to assign a checklist.

3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.

4. Click **Update**.
What to do next
After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

Remove an AQI checklist from a knowledge base
Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

Before you begin
A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.
Role required: knowledge_admin or admin

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the Checklist field.
4. Click Update.

Delete questions from an AQI checklist
Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

Before you begin
You can delete questions from a checklist if the following conditions are met:

• The checklist is not attached to a knowledge base. For more information, see Remove an AQI checklist from a knowledge base.
• There are no AQI reviews using the checklist in progress.

Role required: admin

Procedure
1. Navigate to Knowledge > Article Quality Index > AQI checklists.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the Actions on Selected Rows choice list, select Delete.
5. In the Confirmation window, click Delete.

Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

Before you begin
The knowledge base must have an assigned AQI checklist.
Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

About this task
Configure the glide.knowman.aqi.article_workflow_states property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If you perform several AQI reviews for the same version of the article, the latest AQI score appears in the Latest AQI field in the article.

Procedure
1. Navigate to Knowledge > Articles and click Published.
2. Click an article link.
   
   Note: To read the article and perform the AQI review simultaneously, open the article in two separate tabs or window in your browser. You can then read the article from one tab or window and perform the AQI from another tab or window.
3. Perform the AQI review.

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click <strong>Perform AQI</strong> in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click <strong>Continue AQI</strong> in the form header.</td>
</tr>
</tbody>
</table>
4. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select **true**, and click the green check mark.
Note: The associated **Weighted Score** is applied to the AQI score when the answer is set to **true**.

5. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
</table>
| **Submit the completed AQI review.** | Click **Submit**. The form refreshes and the total score of the AQI review is displayed in the **AQI score** field. The system sends an email notification as follows:  
- If the AQI review was performed on the first version of the article, the system sends an email notification to the author of the article.  
- If the AQI review was performed on subsequent versions of the article, the system sends an email notification to the author and creator of the article versions. |
| **Save the pending review to complete later.** | Click **Update** and return to the **Article Checklist Summaries** list. |

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The checklist with pending reviews is added to the <strong>My Pending AQI Checklists</strong> queue. When you want to complete the AQI reviews, navigate to <strong>Knowledge &gt; My Pending AQI Checklists</strong> and complete the reviews.</td>
</tr>
</tbody>
</table>

**What to do next**

To view all the AQI reviews you completed, navigate to **Knowledge > My Completed AQI Checklists**.

**View all pending and completed AQI reviews**

View checklists of all users to monitor the pending and completed reviews.

**Before you begin**

Role required: knowledge_admin or admin

**Procedure**

1. Navigate to **Knowledge > Article Quality Index**
2. Do one of the following:
   - To view all completed AQI checklists, select **All Completed AQI Checklists**.
   - To view all pending AQI checklists, select **All Pending AQI Checklists**.

**Delete AQI reviews**

Delete an AQI review that was created by mistake or is no longer required.

**Before you begin**

Roles required:
- To delete an AQI in a submitted state: admin or knowledge admin
- To delete an AQI not in a submitted state: knowledge admin or the reviewer who initiated the AQI
Procedure
1. Navigate to **Knowledge > Articles > My Pending AQI Checklists**.
2. Select all checklist reviews you would like to delete.
3. Click **Delete**.

**Activate Knowledge Management KCS Capabilities**
You can activate the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) to enable the use of certain KCS roles and KCS article states.

**Before you begin**
Role required: admin

Procedure
1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Managing KCS article states**
Manage the readiness of KCS articles and comply with regulated information using KCS article states.
For information about the KCS article states, see **KCS v6 Practices Guide**.

**Activation information**
Activate the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) to enable the use of KCS roles (kcs_contributor, kcs_publisher, and kcs_candidate) and metadata fields for the KCS article state (governance and confidence). For more information, see **Activate Knowledge Management KCS Capabilities**.
**Article confidence**

The confidence state of an article indicates where the article is in its life cycle. Only users with the knowledge_coach, knowledge_admin, kcs_contributor or kcs_publisher role can modify the value of the Confidence field.

For articles existing before the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) was activated, the Confidence field is automatically set to None.

If an article is created after the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated, the Confidence field is automatically set based on the workflow state of the article.

<table>
<thead>
<tr>
<th>Workflow state</th>
<th>Confidence field value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft, Review, or Scheduled for publish</td>
<td>Work in Progress</td>
</tr>
</tbody>
</table>
| Published                       | • Validated: For articles published by users with the knowledge_coach, kcs_contributor, or kcs_publisher role.  
                                       • Not Validated: For articles published by users with a role other than knowledge_coach, kcs_contributor, or kcs_publisher. |
| Pending retirement or Outdated  | Same as in the Published workflow state.      |
| Retired                         | Archived                                      |

**Article governance**

The governance state of an article indicates which users can manage articles specific to a regulatory requirement, either experience based or compliance based. Users with contribute access to a knowledge article can modify the value of the Governance field.

**Related information**

Create a knowledge article
Create a knowledge article in Agent Workspace
Enable creating an article from a customer service case

You can enable authors to reuse information in a case by copying case details into an article template. Use the pre-defined customer service source case table to article template target table configuration or create custom configurations between the two tables to copy information from a case to an article.

Before you begin

• The Knowledge Management Advanced plugin must be active.
• The KCS for Customer Services Management property must be enabled
• The pre-defined KCS article template or a newly created article template must be active.

Note: You can do one of the following to create an article from a case:

◦ Use the pre-defined Case KCS Article mapping as is or modify the field mappings between the case source table and article template target table.

◦ Create a new article template target table and map it to the case source table and customize the field mappings between them. For information on creating article templates, refer to Create an article template.

• Knowledge users use the Create Knowledge button in a case form to create an article from a case and must have "can contribute" permission for at least one active knowledge base to create an article from a case. For information on user permissions, see Knowledge Management roles.

Role required: sn_customerservice.customer_admin or admin

About this task

The pre-defined Case KCS Article mapping is stored in the CSM Table Map [csm_table_map] table. This configuration has the sn_customerservice_case source case table configured to the kb_template_kcs_article target article template table with the four field mappings pre-configured between the tables. You can customize the existing field mappings or map additional fields between the tables.

Procedure

1. In the application filter navigator, type csm_table_map.list.
2. Click Case KCS Article.
3. From the **Target Table** list, use the pre-defined KCS article template table or select the newly created article template table.

4. Map each customer service case field that must be used to create knowledge articles.

a. In the **Basic Field Mapping** related list, click **New**. To map fields, fill in the following fields:

<table>
<thead>
<tr>
<th>Customer service case table to article template target table field mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Source Field</td>
</tr>
<tr>
<td>Target Field</td>
</tr>
</tbody>
</table>

b. Click **Submit**.

c. To map fields using advanced scripts, select the **Advanced Field Mapping** check box and then map the fields between the source and the target table using advanced scripts in the **Advanced Field Mapping** tab.

ℹ️ **Note:**

If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.
d. To customize when and how the Create Knowledge button is displayed, use the condition builder in the Condition tab or select Use Advanced Condition check box and configure using advanced scripts.

ℹ️ Note: If you change the target table in the Case KCS Article mapping, also update the scripts with the configuration changes for display of this button.

5. Click Update.

Enable creating a knowledge article from an incident
Enable users to quickly and easily reuse information from an incident in a knowledge article.

Before you begin
Role required: admin
Perform the following steps to enable creating a knowledge article from an incident. You can also create a knowledge article from an incident using an article template. For more information, see Create a knowledge article from an incident using an article template.

ℹ️ Note: Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the Incident form to create an article from an incident. They must have Can Contribute access to at least one active knowledge base to create an article.

Create field mapping from an incident to a knowledge article
Copy information from an incident into a knowledge article by creating custom mapping between the Incident table and the KCS article table.

Before you begin
Role required: admin

- Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
- Ensure that the KCS Article template is active.

1. Navigate to Knowledge > Administration > Article Templates.
2. Set the Active field to true for the KCS Article template.
Procedure

1. In the filter navigator, type `csm_table_map.list`.
2. Click **New**.
3. In the **Mapping Name** field, enter **Incident KCS Article**.
4. In the **Source Table** field, enter **Incident**.
5. In the **Target Table** field, enter **KCS Article**.
6. Right-click the form header and **Save**.
7. In the **Basic Field Mapping** related list, click **New**.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Resolution notes</td>
<td>Resolution</td>
</tr>
</tbody>
</table>

**Note**: You can create field mappings for more fields, as required.

- In the **Source** field, select the field in the source Incident table that contains the information to be copied to the field in the article template target table.
- In the **Target** field, select the field in the article template target table to which you need information copied from the field in the source Incident table.

9. To customize when and how the **Knowledge** check box is displayed, click the **Condition** tab.

10. To map fields using advanced scripts, select the **Advanced Field Mapping** check box.

11. On the **Advanced field Mapping** tab, paste in the following code.

```javascript
(function (source,target) {
    // Get the first comments from incident and use it as Issue description for article
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]){
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf("\n");
```
if (part != -1) {
    comment = comment.toString().substring(part + 2).replaceAll("\r\n", "<br/>"));
}
}if (comment)
    target.kb_issue = comment;
}
)(source, target);

The first comment on an incident is mapped to the **Issue Description** field in the knowledge article.

⚠️ **Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

**Add a property to enable creating knowledge article from incidents**

Add a property, which is required to allow users to create a knowledge article from an incident.

**Before you begin**

Role required: admin

**Procedure**

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

**System Property form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>enable_kcs_incident</code></td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for Incident Management.</td>
</tr>
<tr>
<td>Type</td>
<td>`true</td>
</tr>
<tr>
<td>Value</td>
<td><code>true</code></td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Create a UI action to enable creating knowledge articles from incidents
Create a UI action to add the Knowledge check box to the Incident form.

Before you begin
Role required: admin

Procedure
1. Navigate to System UI > UI Actions.
2. Click New.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the Client check box.
5. Select the List v3 Compatible check box.
6. Select the Form button check box.
7. In the Onclick field, enter createKnowledgeClient().
8. In the Condition field, enter gs.getProperty("enable_kcs_incident") == 'true' && new global.CSMTableMapUtil(current).findMapByName("incident_kcs_article") && new global.KBKnowledge().canCreate().
9. In the Script field, enter the following code.

```javascript
function createKnowledgeClient() {
  if (g_form.modified) {
    alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to continue.'));
  } else{
    //Call the UI Action again but skip the 'onclick' function
    gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
    //MUST call the 'Action name' set in this UI Action
  }
}
```

//Code that runs without 'onclick'
Enable creating a knowledge article from an HR case

Enable users to quickly and easily reuse information from an HR case in a knowledge article.

Before you begin
Role required: admin

• Ensure that the Human Resources Scoped App: Core (com.sn_hr_core) plugin is active.

• Ensure that the Developer Application is set to Human Resources: Core.

Note: To check, navigate to the Settings icon and then Developer > Application.

Perform the following steps to enable creating a knowledge article from an HR case.

Note: Once you have performed the configuration steps, knowledge users can select the Knowledge check box on the HR Case form to create an article from an HR case. They must have Can Contribute access to at least one active knowledge base to create an article.

Create field mapping from an HR case to a knowledge article

Copy information from an HR case into a knowledge article by creating custom mapping between the HR case table and the KCS article table.

Before you begin
Role required: admin
• Ensure that the Knowledge Advanced plugin (com.snc.knowledge_advanced) is active.
• Ensure that the Developer Application is set to Human Resources: Core.
• Ensure that the KCS Article template is active.

1. Navigate to Knowledge > Administration > Article Templates.
2. Set the Active field to true for the KCS Article template.

Procedure
1. In the filter navigator, type csm_table_map.list.
2. Click New.
3. In the Mapping Name field, enter HR Case KCS Article.
4. In the Source Table field, enter HR Case.
5. In the Target Table field, enter KCS Article.
6. Right-click the form header and Save.
7. In the Basic Field Mapping related list, click New.
8. Create mappings for the following fields.

<table>
<thead>
<tr>
<th>Source Field</th>
<th>Target Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sys ID</td>
<td>Source Task</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description</td>
</tr>
<tr>
<td>Close notes</td>
<td>Resolution</td>
</tr>
<tr>
<td>Description</td>
<td>Cause</td>
</tr>
</tbody>
</table>

ℹ️ Note: You can create field mappings for more fields, as required.
- In the Source field, select the field in the source HR Case table that contains the information to be copied to the field in the article template target table.
- In the Target field, select the field in the article template target table to which you need information copied to from the field in the source Incident table.

9. To customize when and how the Knowledge check box is displayed, click the Condition tab.
10. To map fields using advanced scripts, select the Advanced Field Mapping check box.
11. On the **Advanced field Mapping** tab, paste in the following code.

```
(function (source) {
    // Get the first comments from HR case and use it as Issue description for article
    target.short_description = source.short_description + "";
    target.kb_resolution = source.close_notes + "";
    target.kb_cause = source.description + "";
    var notes = source.comments.getJournalEntry(-1);
    var entries = notes.split("\n\n");
    var comment = "";
    if(entries[entries.length-2]) {
        comment = entries[entries.length-2];
        var part = comment.toString().indexOf("\") + 1;
        if(part != -1) {
            comment = comment.toString().substring(part).replaceAll("\r\n", "\n") + "<br/>");
        }
    }
    if(comment)
        target.kb_issue = comment;

    //Only if selected article type is active
    var tem = new GlideRecord("kb_article_template");
    tem.addQuery("child_table", "kb_template_kcs_article");
    tem.addActiveQuery();
    tem.query();
    if(!tem.hasNext())
        return false;

    //Do not allow to create the knowledge again
    var now_GR = new GlideRecord("kb_knowledge");
    gr.addQuery("source", source.sys_id);
    gr.query();
    if(gr.next())
        return false;

    return true;
})(source);
```
The first comment on an HR case is mapped to the **Issue Description** field in the knowledge article.

**Note:** If the same source or target field is configured in both the basic and advanced field mappings, the advanced field mapping overrides the basic field mapping.

If the fields configured in the basic and advanced field mapping are different, the field configurations in the advanced field mapping are appended to the field configurations in the basic field mapping.

**Add a property to enable creating knowledge articles from HR cases**

Add a property, which is required to allow users to create a knowledge article from an HR case.

**Before you begin**

Role required: admin
Ensure that the Developer Application is set to **Human Resources: Core**.

**Procedure**

1. In the Filter navigator, enter `sys_properties.list`.
2. Click **New**.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>enable_kcs_hr</code></td>
</tr>
<tr>
<td>Description</td>
<td>Enable Knowledge Centered Services (KCS) for HR Service Delivery.</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Create a UI action to enable creating knowledge articles from HR cases**

Create a UI action to add the Knowledge check box to the HR case form.

**Before you begin**

Role required: admin
Ensure that the Developer Application is set to **Human Resources: Core**.
Procedure
1. Navigate to System UI > UI Actions.
2. Click New.
3. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Knowledge</td>
</tr>
<tr>
<td>Table</td>
<td>HR Case</td>
</tr>
<tr>
<td>Action name</td>
<td>create_knowledge</td>
</tr>
</tbody>
</table>

4. Select the Client check box.
5. Select the List v3 Compatible check box.
6. Select the Form button check box.
7. In the Onclick field, enter createKnowledgeClient().
8. In the Condition field, enter gs.getProperty("sn_hr_core.enable_kcs_hr") == 'true' && new global.CSMTTableMapUtil
   (current).findMapByName("sn_hr_core.hr_case_kcs_article") && new
   global.KBKnowledge().canCreate().
9. In the Script field, enter the following code.

```javascript
function createKnowledgeClient() {
    if (g_form.modified) {
        alert(new GwtMessage().getMessage('You have unsaved changes. Please save them to
    continue.'));
    }else{
        //Call the UI Action again but skip the 'onclick' function
        gsftSubmit(null, g_form.getFormElement(), 'create_knowledge');
        //MUST call the 'Action name' set in this UI Action
    }
}

//Code that runs without 'onclick'
//Ensure call to server-side function with no browser errors
if (typeof window == 'undefined')
    CreateKnowledgeServer();

function CreateKnowledgeServer(){
    current.update();
}
```
var map = new global.CSMTableMapUtil (current);
map.findMapByName("sn_hr_core.hr_case_kcs_article");
var targetURL = map.getTargetURL();
var referenceLink =
"&sysparm_collection=sn_hr_core_case&sysparm_collectionID="+current.sys_id+
"&sysparm_collection_key=task&sysparm_link_collection=m2m_kb_task&sysparm_collection_related_field=kb_knowledge&sysparm_referring_url=sn_hr_core_case.do%3fsys_id%3d"+current.sys_id;
if(targetURL)
    action.setRedirectURL(targetURL[0]+referenceLink);
}

10. Click **Submit**.

**Use Knowledge Management**

Share your ideas and experience by creating a knowledge article. Search and find information such as self-help, troubleshooting, and task resolution in knowledge bases. Review, provide feedback on knowledge articles, and resolve issues yourselves rather than contacting customer service or an internal helpdesk.

**Before you begin**
Role required: none

**Procedure**
Use Knowledge Management in one or more of the following ways.

**Related information**
Knowledge Management FAQs

**Knowledge Management guide for users**
After knowledge bases are set up, you can start searching and creating articles.

**Requirements**
Role required

All users can read knowledge articles. Users with the knowledge or any other fulfiller role, such as sn_customerservice_agent, can create and edit knowledge articles in a knowledge base, unless the knowledge manager has restricted access to the knowledge base or knowledge articles.

If you need these permissions, contact the knowledge manager or knowledge administrator for the knowledge base.
What to do

Create knowledge articles

If you have the required permissions for a knowledge base, you can create articles for it. You can create articles from the Self-Service application menu or by importing Word documents.

You can also create knowledge articles from incidents and problems.

Search for knowledge articles

From the Knowledge homepage, you can select a knowledge base to search for articles and answers. You can view only the knowledge bases to which you have access.

Access to knowledge using your mobile device is supported.

Next steps

After articles are created, you can perform the following tasks to make sure that articles are organized in the right knowledge bases and retired when appropriate. If existing knowledge bases do not fit your needs, you can request a new knowledge base.

• Move a knowledge article
• Retire a knowledge article
• Request a knowledge base

Knowledge Management Service Portal homepage features

The Knowledge Management Service Portal homepage displays knowledge articles organized by knowledge base and category, as well as featured content and popular articles. Learn how to navigate the homepage to search for and find useful and relevant information quickly.

To use the Knowledge Management Service Portal, the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) must be activated.

Note: It is active by default for customers on the Madrid and later releases. Existing or upgrade customers must activate the plugin and enable the glide.knowman.serviceportal.enable_redirect property.

Your organization can customize the homepage, so it may look different to the following image. You must be logged in to view the knowledge homepage.

</thead>
<tbody>
<tr>
<td>automatically predicted, or both. The manually mapped articles appear first in the section. The section appears only when the related articles are available for the selected article.</td>
<td></td>
</tr>
<tr>
<td>Affected Products</td>
<td>View a list of which products were affected.</td>
</tr>
<tr>
<td>Most Recent tasks</td>
<td>View a list of tasks, such as incidents, cases, problems, and so on, recently associated with the article.</td>
</tr>
<tr>
<td>Most Useful</td>
<td>View a list of knowledge articles that users found most useful.</td>
</tr>
<tr>
<td>Search bar</td>
<td>Use the search bar to start a new search. The search is executed in the current portal where you are viewing the article.</td>
</tr>
</tbody>
</table>

Note:

- If enabled, users can subscribe to articles, view article versions, and create feedback for articles that are rated as not helpful.
- The dynamic titles don’t apply to the knowledge article view page in the Knowledge Management Service Portal.

Knowledge article URL parameters

You can add parameters to an article URL to view the latest version and an existing translation.

Knowledge article URL structure

The knowledge article URL appears in the following structures:

- **Accessed from Service Portal:** `https://<instance-name>.service-now.com/kb?id=kb_article_view&sysparm_article=<article number>&sysparm_language=<language code>`
  
  For example, the URL `https://yourbusiness.service-now.com/kb?id=kb_article_view&sysparm_article=KB0010053&sysparm_language=EN` returns the article with the most recent version in the selected language, if the translation for the selected language exists.

- **Accessed from Knowledge Base View (kb_view) UI page:** `kb_view.do?sysparm_article=<article number>&sysparm_language=<language code>’
For example, the URL `https://yourbusiness.service-now.com/kb_view.do?sysparm_article=KB0010044&sysparm_language=en` returns the article with the most recent version in the selected language, if the translation for the selected language exists.

**Note:** The listed parameters can include the `sys_id` in the `url` parameter.

### Parameters

The following parameters are available for knowledge article URLs.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sysparm_article</code></td>
<td>Returns the most recent article version. For example, <code>https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_article=KB0010053</code>.</td>
</tr>
<tr>
<td><code>sysparm_language</code></td>
<td>Returns the most recent article version in the input language if a translation exists. For example, <code>https://yourbusiness.service-now.com/kb?id=kb_article_view&amp;sysparm_language=EN</code>.</td>
</tr>
</tbody>
</table>

### Knowledge article validity

Knowledge article validity is the date a knowledge article expires and is no longer available to the users. Articles do not appear in search results after the `Valid to` date or if the `Valid to` date is blank.

Decide when to expire a knowledge article by using the `Valid to` field in the Knowledge form. The Knowledge form is available when creating or editing a knowledge article.

When you create or edit a knowledge article, a default value appears in the `Valid to` field. As an article author or editor, you can select whether to keep or change the default `Valid to` date.

**Note:** If the system date format or user preferences is set to use `yy` year format, you might face issues when the `Valid to` date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the `yyyy` year format. For more information, see Global date and time field format and Personalize the system date format topics.
Default article validity when creating a knowledge article

The default value of the **Valid to** field is derived from the **Article Validity** field configured for the knowledge base (see Create a knowledge base). The **Valid to** date starts from the date the article was created until the number of days specified in the **Article Validity** field. If the **Article Validity** field is blank, the default date in the **Valid to** field for the knowledge article is set to January 1, 2100.

Default article validity when editing a knowledge article

If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set as described in the following table.

<table>
<thead>
<tr>
<th>Article Validity value in the associated knowledge base</th>
<th>Valid to default value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blank</td>
<td>Earlier version Valid to date value</td>
<td>If the <strong>Article Validity</strong> field in the knowledge base associated with the article is blank, the <strong>Valid to</strong> date value from the earlier version of the article is retained.</td>
</tr>
<tr>
<td>Is not blank</td>
<td>Article updated date + article validity</td>
<td>If the <strong>Article Validity</strong> field in the knowledge base associated with the article is not blank, the <strong>Valid to</strong> date is automatically updated to start from the date the article was updated until the number of days specified in the <strong>Article Validity</strong> field.</td>
</tr>
</tbody>
</table>

If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set as described in the following table.
Valid to date when moving a knowledge article to another knowledge base

<table>
<thead>
<tr>
<th>Article Validity value in the updated knowledge base</th>
<th>Valid to default value</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blank</td>
<td>Earlier Valid to date value</td>
<td>If the Article Validity field in the selected knowledge base is blank, the earlier Valid to date value is retained for the knowledge article.</td>
</tr>
<tr>
<td>Is not blank</td>
<td>Article updated date + article validity</td>
<td>If the Article Validity field in the selected knowledge base isn’t blank, the Valid to date is automatically updated to start from the date the article was updated until the number of days specified in the Article Validity field.</td>
</tr>
</tbody>
</table>

⚠️ Note: If the dictionary value of the Valid to field is modified, this dictionary value overrides the default value of the Valid to field calculated according to the Article Validity field.

Email notifications for expiring knowledge articles

On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the Valid to date to continue using the article. For more information, see Knowledge Management email notifications.

Create a knowledge article

Knowledge contributors can create and edit knowledge articles within a knowledge base to share information across your organization.

Before you begin
You must have contribute access to at least one active knowledge base. To view an article template, you must activate the article templates feature and enable the desired templates.
About this task

Users with at least one role can create and edit knowledge articles. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot create or edit articles.

Some knowledge bases may allow only certain users to contribute. For example, a member of the IT department can create knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

Procedure

1. There are three ways of creating knowledge articles.
   - Navigate to Self-Service > Knowledge and click the Create an Article icon.
   - Navigate to Knowledge > Articles > Create New.
   - From the Knowledge Management homepage, click the more icon (…) and then select Create Article.

2. On the Create new article page, select a knowledge base.
   The list of article templates to select in the next step is filtered according to the article templates available for the selected knowledge base.

   Note:
   On the Create new article page, you can select to Switch to older version of this page or Switch to updated version of this page (recommended).

3. Select an article template.

4. Click Next.
   The Knowledge form is displayed based on the article template selected.

5. On the Knowledge form, fill in the fields.

   Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number of the article. This field is automatically set to a number. For more information see Duplicate knowledge article numbers.</td>

<td>Option for downloading an attached file automatically when a user accesses the article, instead of opening the article view. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td></td>
<td>✋ <strong>Note:</strong> You may attach multiple files, but most web browsers permit users to download only the first one. To ensure download of all the files, bundle them into an archive, such as with WinZip, and attach the archive. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Display attachments</td>
<td>Option for displaying attachments to users viewing this knowledge article. Attachments appear below the article text. Add one or more attachments to the article to use this option.</td>
</tr>
<tr>
<td>Governance</td>
<td>An attribute of an article that allows you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of those who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).</td>
</tr>
<tr>
<td>Short description</td>
<td>The title of the article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.</td>
</tr>
<tr>
<td></td>
<td>✋ <strong>Note:</strong> If contextual search is enabled, the knowledge articles similar to the entered short description text appear in the Knowledge results section.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the article. A preview of the content appears when browsing and searching for knowledge article. Use the editing functions in the HTML editor to create content. For more information, see Editing functions for knowledge articles in the HTML editor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Meta</td>
<td>Tags for optimizing search from external search engines. Separate each multiple entries by commas. You may need to configure the form to add this field. For more information, see Configuring the form layout.</td>
</tr>
</tbody>
</table>

Note: If AI Search is enabled for the Knowledge Management Service Portal, the tags you add to the Meta field aren’t indexed. To fine-tune AI Search results, your administrator can configure result improvement rules. For more information, see AI Search in Service Portal.

| Note: The Confidence and Governance fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing KCS article states. |

6. Optional: To search for similar articles, enter the text in the Related Search field or continue with the default text in the Knowledge results section. If the Knowledge results section is not displayed on the Knowledge form, a system administrator can configure the form layout to add the Contextual Search Results field to the form.

- To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

  Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

- To find knowledge articles that match the entered search text, choose Search Articles.

7. Optional: To view the entire article in a pop-up window, click the link to the article title.

8. Click Submit to create the article.

9. Optional: Either add to or modify the article details or publish the article.

- Add to or modify the article details.
  (Optional) For more information, see Edit a knowledge article.

- Publish the article by clicking Publish.
A knowledge article is published depending on the workflow setting of its knowledge base:

- **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
- **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

**Note**: With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see Ownership groups.

For more information, see Schedule a knowledge article for publishing.

When published, the knowledge article appears in the Published and All lists. To view the Published list, navigate to Knowledge > Articles > Published. To view the All list, navigate to Knowledge > Articles > All.

If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

**What to do next**

After saving the article record, you can add tags to further organize the article. After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request missing translations for available languages.
- Retire the knowledge article. Click Retire to enable the retirement workflow. For more information, see Retire a knowledge article.
- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article.
- Delete the published knowledge article. Click Delete. If the Delete button isn't displayed, click the more actions icon (…), and then click Delete.

**Note**: Only users with the admin role can delete a published knowledge article.

Related information
- Map related articles
- Predictive Intelligence for Knowledge Management

**Edit a knowledge article**

Edit knowledge articles within a knowledge base to update information shared across your organization.

**Before you begin**
Role required: knowledge

**About this task**

Users with at least one role can edit knowledge. These users are known as knowledge contributors. Users without any role can read articles and submit feedback, but cannot edit articles.

However, knowledge managers can configure User Criteria to restrict access to certain knowledge bases. For example, only members of the IT department can create or edit knowledge articles in the IT knowledge base, such as desktop support information or articles describing company IT processes.

**Note:**

- If the article versioning feature is enabled, only the knowledge administrator, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the `glide.knowman.versioning.enabled` property (from the System Property [sys_properties] table) to `false`.

- If an ownership group is associated with a knowledge article, the author or reviser of the article can't contribute to the article after the article is published. An administrator can override this behavior by enabling the `glide.knowman.ownership_group.override` property. For more information, see Ownership groups.

- If the `glide.knowman.translation.enable_translation_task` property is enabled, you can't modify the knowledge base of existing articles.

**Procedure**

1. Navigate to Knowledge > Articles.
2. Select an article from the Published or Unpublished category.
3. On the Knowledge form, click Edit.
Note: If the knowledge article was created using Microsoft Word, you can edit the article only in Microsoft Word. In this case, click **Open in Word** to open the article in Word Online. For more information, see Edit a knowledge article in Microsoft Word.

If you want to edit the article using the HTML editor, you can unlink the article from Word. For more information, see Unlink knowledge articles from linked Microsoft Word documents.

4. If the article versioning feature is enabled, click **Checkout** for a published knowledge article.
   You can only edit the latest version of a knowledge article.

5. Click **Update**.
   When you edit a knowledge article, a default value appears in the **Valid to** field. You can select whether to keep or change the default **Valid to** date.

Note: If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria:

- If the **Article Validity** field in the knowledge base associated with the article is blank, the **Valid to** date value from the earlier version of the article is retained.

- If the **Article Validity** field in the knowledge base associated with the article is not blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria:

- If the **Article Validity** field in the selected knowledge base is blank, the earlier **Valid to** date value is retained for the knowledge article.

- If the **Article Validity** field in the selected knowledge base isn’t blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Knowledge article validity.
The article is saved. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers

6. **Optional:** Publish the article by clicking **Publish**. The knowledge article is published depending on the workflow setting of its knowledge base:

   • **Knowledge - Instant Publish:** The knowledge article is immediately published unless it is scheduled to be published at a later date.

   • **Knowledge - Approval Publish:** The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

   **Note:** With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see Ownership groups.

For more information, see Schedule a knowledge article for publishing.

When published, the knowledge article appears in the Published and All lists. To view the Published list, navigate to Knowledge > Articles > Published. To view the All list, navigate to Knowledge > Articles > All.

If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Article versioning changes

**Editing functions for knowledge articles in the HTML editor**

Improve the readability and usefulness of knowledge articles by formatting the article text using the HTML editor.

The HTML editor available in knowledge articles uses the built-in TinyMCE editor. The text formatting is preserved when the content is displayed on a portal.

The HTML toolbar within the HTML editor contains an array of icons that enable you to edit and format the body text of your knowledge article. You can also use the HTML Editor to add images, links, audio, and video to the knowledge article.

**Note:** Your administrator can configure the HTML toolbar within the HTML editor. For more information, see Customize TinyMCE attributes.
You can perform the following functions using the HTML editor:

- Spell check as you type in the Article body section of a knowledge article. The HTML editor automatically checks spelling as you type and underlines spelling and grammar mistakes in red.
- View the style applied to the selected text and the word count from the bottom pane of the HTML editor.
- Apply formatting.
- Paste without formatting.
- Insert tables and modify cells, rows and columns of a table.
- Include HTML content.
- Insert or edit a code snippet.
- Insert a basic table of contents at the cursor’s current position.
- Find and replace text.
- Revert changes that you have made during the current session of content editing.

**Managing HTML content in knowledge articles**

You can manage HTML content in knowledge articles by using the HTML editor. You can perform the following functions for HTML content in knowledge articles:

- Insert a hyperlink by using the insert/edit link icon (🔗) available on the HTML toolbar. For more information, see *Link to a website in HTML fields*.
- Insert an image by using the insert/edit image icon (🏞️) available on the HTML toolbar. For more information, see *Embed images in HTML fields*.
- Embed a video from the video library, an attachment, or URL by using the insert/edit video icon (🎬) available on the HTML toolbar. You can also add videos to the video library. For more information, see *Embed videos in HTML fields*.
- Copy content from external sources and paste them as simple text into the editor. For more information, see *Paste content into the HTML editor*.
- View and edit the HTML source code by using the source code icon (<textarea>) available on the HTML toolbar. For more information, see *Extended functions*.
Note: To insert or edit a code snippet, see Format a code snippet automatically in knowledge articles.

- Expand the HTML field to use the full form view for easier editing by using the fullscreen icon (fullscreen). For more information, see Extended functions.

### Formatting options for knowledge articles

You can apply formatting to a knowledge article using the HTML editor.

You can use the icons on the HTML toolbar to apply the following formatting in knowledge article text:

- Change the font or font size of knowledge articles.
- Format text as bold, italicized, underlined, or strikethrough.
- Change the text color and text background color.
- Create bulleted and numbered lists.
- Change paragraph indentation.
- Apply styles to text.

For more information, see Formatting icons for HTML fields.

### Paste content without formatting into the knowledge article

Paste content into the body of a knowledge article without copying the content formatting.

#### Before you begin

Open the knowledge article in which you want to use the HTML editor.

#### About this task

You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the Now Platform interface or in Agent Workspace. To create or edit a knowledge article in the Now Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

#### Procedure

1. Copy your text from a content source.
2. Click the paste as text icon (paste as text) on the HTML toolbar.
3. In the Article body section, place your cursor at the point where you want to paste the content, right-click, and select Paste from the context menu.
Adding tables to knowledge articles

You can insert tables and modify the cells, rows, and columns of a table in a knowledge article.

You can add tables to your knowledge articles by clicking the table icon (​) on the HTML toolbar and selecting your desired table options. For example, you can adjust the height and width of rows and columns, the spacing between cell text and cell borders, and change the colors of cells.

For more information, see Add a table to the HTML field.

Format a code snippet automatically in knowledge articles

Add syntax highlighting to a code snippet in knowledge articles using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the Now Platform interface or in Agent Workspace. To create or edit a knowledge article in the Now Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure
1. In the Article body section, place the cursor where you want to insert the code snippet.
2. Click the insert/edit code sample icon (​) on the HTML toolbar.
3. In the Insert/Edit code sample dialog box, select a markup or programming language from the Language list.
4. In the text box after the Language list, enter your code. Alternatively, you can copy the code from an external source and paste it.
5. Click Ok.
6. Optional: Edit the code by clicking the code snippet, and then clicking the insert/edit code sample icon (​).

Insert a table of contents in knowledge articles

Insert a hierarchical table of contents (toc) based on the headings in your knowledge article.
Before you begin
Open the knowledge article in which you want to use the HTML editor.

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the Now Platform interface or in Agent Workspace. To create or edit a knowledge article in the Now Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

You can generate a table of contents only if your article uses heading levels from Heading 1 to Heading 3 and is a standard article.

Procedure
1. In the Article body section, place the cursor where you want to insert the table of contents.
2. Click the table of contents icon ( ) on the HTML toolbar.
   If you do not see the table of contents icon on the toolbar, add it using steps available in Customize TinyMCE attributes.
3. Optional: Update an existing table of contents by selecting it and then clicking the update icon ( ) on the HTML toolbar.

Results
The HTML editor searches for the headings in your content including their levels (such as Heading 2 or Heading 3). It then automatically generates a table of contents that contains links to the heading levels from Heading 1 to Heading 3 only. The links to heading levels are indented to show the heading hierarchy.

Find and replace text in knowledge articles
Make global changes to the content of a knowledge article by finding and replacing specific text using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.

About this task
You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the Now Platform interface or in Agent Workspace. To create or edit a knowledge article in the Now Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. In the Article body section, place the cursor anywhere.

2. Click the find and replace icon (i) on the HTML toolbar.

3. In the Find and Replace dialog box, in the Find field, enter the search term you want to find.

4. Enter replacement text for the search term in the Replace with field. If you want to delete repeated occurrences of the search text, leave the Replace with field blank.

5. Optional: Refine the scope of the search.
   • To limit the search to text that exactly matches the case of the search term, select the Match case check box.
   • To limit the search to text that matches one or more complete words only, select the Whole words check box.

6. Find or replace the search term.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Find instances of the search text</td>
<td>Click Find.</td>
</tr>
<tr>
<td>Replace individual instances of the found text with the replacement text entered in the Replace with field</td>
<td>Click Replace. Use the Prev and Next buttons to navigate to the previous and next instance of the search term, respectively.</td>
</tr>
<tr>
<td>Replace all instances of the search text automatically</td>
<td>Click Replace all.</td>
</tr>
</tbody>
</table>

Results
When no more occurrences of the term can be found or if the search term is not found at all in the content, a message appears indicating that the specified string wasn't found.

Undo or redo typing actions or formatting while authoring knowledge articles
Quickly revert typing actions or formatting that you made during the current session of editing a knowledge article using the HTML editor.

Before you begin
Open the knowledge article in which you want to use the HTML editor.
About this task

You can also use the HTML editor when creating or editing a knowledge article using the Knowledge Management application in the Now Platform interface or in Agent Workspace. To create or edit a knowledge article in the Now Platform interface, see Create a knowledge article or Edit a knowledge article. To create or edit a knowledge in Agent Workspace, see Create a knowledge article in Agent Workspace or Edit a knowledge article in Agent Workspace.

Procedure

1. Place the cursor in the Article body section.
2. Undo or redo a typing action or format change.
   • To undo the previous change, click the undo icon (_undo_icon_).
   • To redo a change that has been undone, click the redo icon (redo_icon).

Note: The undo (_undo_icon_) and redo (_redo_icon_) icons are available based on the number of actions that are saved to be undone or certain actions that can’t be undone.

Map related articles

Discover similar information across articles on a topic while viewing an article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

Before you begin

Role required: knowledge
To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

About this task

If you have manually mapped related articles when editing an article, those articles are listed in the Related Articles section on the knowledge article view page before the related articles that are predicted thorough the Knowledge Management similarity solution.

Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

This task provides steps to manually map related articles when editing an article.
Procedure

1. On the Now Platform, open the knowledge article for which you want to map related articles.
2. On the Knowledge form, click the Related Articles related list.
3. Click Edit.
4. On the Edit Members form, move the desired articles from the available articles in the Collection column to the Related Articles List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Articles section on the article view page, and then click Save.

Note: Knowledge administrators can configure the number of articles shown in the Related Articles section using the instance options.

Related information

Edit a knowledge article
Train the similarity solution for Knowledge Management to find related articles
Configure knowledge related articles widget instance options

Map catalog items related to an article

Manually map catalog items related to a knowledge article to enable employees to request the related product or service.

Before you begin
Role required: knowledge
To edit the article, you must have knowledge contributor access for the associated Knowledge Base.

Procedure

1. On the Now Platform, open the knowledge article for which you want to map related catalog items.
2. On the Knowledge form, click the Related Catalog Items related list.
3. Click Edit.
4. On the Edit Members form, move the desired catalog items from the available catalog items in the Collection column to the Related Catalog Items List column.
5. Click the up or down icon to arrange the articles in the order in which you want them to appear in the Related Items section on the article view page, and then click Save.

⚠️ Note: Knowledge administrators can configure the number of catalog items shown in the Related Items section using the instance options.

Related information
- Edit a knowledge article
- Service catalog items
- Configure related catalog item widget instance options

Schedule a knowledge article for publishing
Set a specific time and day for a knowledge article to be published automatically.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing. Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.
- The article versioning feature is enabled. For more information, see Article versioning.

Role required: knowledge

Procedure
1. Navigate to Knowledge > Articles and click Unpublished.
2. Click an article link.
3. In the Scheduled publish date field, click the select date and time icon 📆.
4. Select any future date from the calendar.
5. In the Time field, enter a time in the format hh:mm:ss.
6. Click the save (enter) icon ✅.
7. Click Publish to enable the publishing workflow.
The article is available in the All list. Go to Knowledge > Articles > All.

Tip: If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click Recall.

Results
The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to Knowledge - Instant Publish, the knowledge article is automatically published on the scheduled publish date. The Workflow field on the Knowledge form of the article is updated to Scheduled for publish.

- If the knowledge base workflow is set to Knowledge - Approval Publish, the knowledge article is published on approval completion. The Workflow field on the Knowledge form of the article is updated to Review. The approval completion affects the scheduled publishing as follows:
  ◦ If the approvals are completed before the scheduled publish date, the Workflow field on the Knowledge form of the article is updated to Scheduled for publish and the article is published on the scheduled publish date.
  ◦ If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

Related information
Edit a knowledge article

Recall an article that is being reviewed
Recall an article that is being reviewed to make additional changes.

About this task
If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the Review state results in a minor version increment.

When a revised article is in Review state, only the corresponding versions reviser can recall the article to make additional changes.
Procedure
1. Navigate to Knowledge > Articles > All.
2. Open an article in the Review state.
3. Click Recall in the Knowledge form header.
   The system returns the state of the article to Draft, increments the version number by 0.01, and displays a message to the user.

Approve an article that is being reviewed
Approve an article that is being reviewed and create a new published version.

About this task
When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

Procedure
1. Navigate to Knowledge > Articles > Unpublished.
2. Open an article in the Review state and review the text.
3. In the Approvals related list, click Requested in the State column to display the Approval form for the article.
4. Click Approve.

Results
The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to Published. The new published version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

Retire a knowledge article
You can initiate the retirement workflow to retire a knowledge article. Only administrators and knowledge administrators can view articles after they are retired.

A knowledge article has an associated retirement workflow, similar to the publishing workflow. This allows administrators to configure these workflows, defining an approval and review process for retiring knowledge if appropriate.

When editing an article, click Retire to launch the retirement workflow associated with that article. If the article requires approval prior to retirement,
the article goes to a pending approval state, and the workflow either finishes upon approval or cancels if rejected by a required approver. The article number associated with the retired article is not available for reuse.

**Note:**

- Retired knowledge articles are not available to users except for administrators and knowledge administrators who can view them. To reuse a retired article, administrators and knowledge administrators can republish the article. For more information, see Republish a retired article.
- An article and its translations have a parent-child relationship. Retiring a parent article does not automatically retire all its translated child articles.

**Instant retire and Approval retire workflows**

**Republish a retired article**

Instantly republish a retired article.
Before you begin
Role required: admin or knowledge admin

Note: User also need a scoped admin role to republish a retired article in the Scoped knowledge bases.

About this task
There may be cases where you'll need to republish a retired article. For example, an admin may want to temporarily retire an article when its information doesn't currently apply, but will at a later date. An administrator or knowledge administrator who can view retired articles can instantly republish these without having to go through an approval workflow.

Procedure
1. Navigate to Knowledge > Articles > Retired.
2. Select a retired article and click Republish.

Results
The article is instantly published as the previous last published version.

Move a knowledge article
You can move articles between knowledge bases.

Before you begin
Role required: User must have contributor access to the knowledge base.

Note: When versioning is enabled, and you move an article from one knowledge base to another, the latest version of an article is moved to the new knowledge base. However, the previous versions of the article remain in the old knowledge base. It is recommended to retire the article from the old knowledge base. For more information, see Retire a knowledge article.

Procedure
1. Edit a knowledge article.
2. Change the Knowledge Base field value.
   After moving an article, the Apply Default Values dialog box prompts you to populate certain fields in the article with default values from the new knowledge base. If the new knowledge base has no default values, the dialog box does not appear.
3. Click OK to overwrite fields with the default values, or Cancel to leave all fields unchanged.
A knowledge manager can define default values for articles in knowledge bases you manage using the **Set default knowledge field values** field on the Knowledge Base form.

4. Click **Update**.

**Comment on a knowledge article**

Comment on a knowledge article or reply to a comment.

**Before you begin**

Role required: Admin

**Procedure**

1. Navigate to the Knowledge Management Service Portal.
2. Click the article you want to comment or reply to a comment on.
3. Click **Click here to comment on this article** or **Reply**.
4. Enter your comment or reply and add links, images, and attachments as required.

⚠️ **Note:** Attachments to comments posted in the Knowledge Management Service Portal are not displayed in the Live Feed. If attachments to comments are posted in Live Feed, they are displayed in the Knowledge Management Service Portal.

If antivirus protection is enabled, all attachments are automatically scanned for viruses once the comment is posted. Attachments are only displayed once the scan is finished and successful.

If you are the author of the comment, you can delete it. All comments and replies underneath are automatically deleted.

5. Click **Submit**.

⚠️ **Note:** You can only view comments in the Live Feed if the Use Live Feed for Knowledge feedback property is active. It is inactive by default.

Comments posted in Live Feed before upgrading to release version New York are not shown hierarchically in the Knowledge Management Service Portal. Comments posted in Live Feed after upgrading to release version New York are shown hierarchically in the Knowledge Service Portal.

The following table illustrates how comments and replies to comments are displayed depending on where you are viewing them.
Create knowledge from incident or problem

Create a knowledge article, so the next time the issue comes up the resolution is easy to find.

About this task
Depending on the value of the glide.knowman.submission.workflow property, knowledge created from an incident or problem may require additional approval. When this property is true, a submission record is created instead of a knowledge article. A user with the knowledge role must approve the submission to create a knowledge article. To create a knowledge article from a case, see Enable creating an article from a customer service case.

Procedure
1. Open a resolved incident or problem.
2. Select the Knowledge check box on the form.
3. Close the incident or problem.
   A new draft knowledge article is created.
4. If additional approval is required, navigate to Knowledge > Open Submissions.
5. Select a submission record.
6. Review the submission to ensure the content and settings are correct.
7. Click Create Article.
   A new draft knowledge article is created. Articles created this way are added to the knowledge base specified in the property glide.knowman.task_kb.
Knowledge feedback
You can view and contribute to feedback on knowledge articles.

Feedback options
You can submit feedback for knowledge articles in these ways:

• Flag an article as incorrect or inappropriate.
• Provide a rating value for the article.
• Mark an article as helpful or not helpful.
• View comments, add a new comment, or reply to existing comments.

Users can view comments directly on the article. Knowledge managers can view the other types of feedback by navigating to Knowledge > Feedback. Administrators and knowledge managers can disable some feedback options using fields on the Knowledge Base form. Administrators can configure feedback options using properties.

Flagging articles
You can flag an article for incorrect or inappropriate content. Click Flag Article in the article header to open a new window, allowing you to enter suggested changes.

• Flagged comments do not appear on the Article View page. Users with the admin, knowledge_admin, and knowledge_manager roles can access flagged articles by navigating to Knowledge > Articles > All Flagged. Users with the knowledge role can access their flagged articles by navigating to Knowledge > Articles > My Flagged.

• If disabled, the author of the article and users with the admin, knowledge_admin, and knowledge_manager roles can see all flagged comments. Other users can see only their own flagged comments.

Note: You cannot disable flagging for an article until you have disabled the flagging for all feedback comments for that article.

Flagged comments are stored in the Knowledge Feedback (kb_feedback) table but not the Live Feed Messages (live_message) table.

Rating articles
The five stars below the article title allow you to indicate the article's effectiveness on a scale of 1 to 5.
Marking articles

The question Helpful? at the bottom of the article allows you to indicate the usefulness of the article with a simple Yes or No answer. The Yes and No options are always available on the knowledge article view page even when you had selected an option earlier.

Comments

Knowledge comments at the bottom of the article use live feed to enable a conversation around a knowledge article. For example, you can post replies to comments, add attachments, or Like comments. The glide.knowman.use_live_feed property controls the display of knowledge article comments. If enabled, the system uses live feed to manage and display feedback on knowledge articles.

Note: Unauthenticated users and users with only the snc_external role can’t add or view attachments for comments.

Automating feedback management to improve content
Request a knowledge base
Create a knowledge article

Import a Word document to a knowledge base

Import a Word document to create a knowledge article.

Before you begin

You must have Can Contribute access to at least one active knowledge base.

Role required: knowledge

About this task

Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3 homepage. To enable the Import a Word document feature for existing customers prior to Madrid, an administrator must first disable the Import Articles option on the Knowledge Management v3 homepage by setting the glide.knowman.import.hide_import_functionality property to true and adding the Import Articles module to the application navigator.
These styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings

  Note: Only default heading settings are supported. For any headings and subheadings with numbers, the numbers are not imported.

- Images

  Note: Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

  Note: After import, the bullets in an unordered list are replaced with dots.

- Tables

  Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

Procedure

1. Navigate to Knowledge > Articles > Import Articles.
2. Enter the knowledge base to add the article to.
3. Optional: Select a Category from within the knowledge base.

  Note: Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

4. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.
5. Select one or more Word files to import.

6. Click Import.
   An article is created in the selected knowledge base and category using the content from the uploaded document.
   • If you uploaded multiple documents, one article is created for each.
   • If you use knowledge internationalization, the language of the article is set to the system language selected.
   • When the upload completes, a pop-up window displays the number and short description of the articles. Click an article to view the full record.
   • If any errors occur during the upload, a pop-up window displays the error.
   • If the Publish check box is activated, knowledge articles go into Review or Published state, depending on the workflow attached to the knowledge base.
   • If the Publish check box is not activated, the knowledge articles go into Draft state and are then reviewed before publishing.

Related information
Import a Word document to a knowledge base using Knowledge Management V3

Create an article version by importing a Word document
Import a Word document to a knowledge article to create a new version.

Before you begin
• Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is installed.
• You can only upload new versions to articles that are in Draft or Published state.
• You cannot upload new versions to articles that are created using an article template or if the article type is Wiki.

Role required: admin
Procedure
1. Navigate to Knowledge > Articles.
2. Click an article.
3. Click the Upload New Version related link.

   Note: Any text written in TinyMCE is overwritten once the file is imported.
4. Add the file you want to import.
5. Optional: Select the Copy Attachments check box to copy all attachments to the knowledge article.

   Note: If the article is published, the attachments are added to a new article version. If the article is in draft, the attachments are added to the existing knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.
6. Click Import.
   A draft version is created and sent to approvers to approve or reject. Once the article is approved, it is displayed in the Article Versions related list.

Knowledge article authoring in Workspace
Complete your job efficiently by creating, editing, and publishing knowledge articles in Agent Workspace.

Knowledge Management features specific to agents and authors are available in Workspace. Perform any knowledge administration-related tasks such as creating a knowledge base, managing access to knowledge articles, enabling an article template, and so on using the Now Platform interface.

You can perform the following Knowledge-related tasks in Workspace:
- Create a knowledge article using a default or custom article template.
- Manage all unpublished and published knowledge articles authored by you.
- Address feedback tasks assigned to you.
- Compare two knowledge article versions.
- Request translations for published untranslated knowledge articles.
- Complete translation tasks assigned to you.
- Map related articles and related catalog items to a knowledge article.
- Add affected products to a knowledge article.
- Use Agent assist to avoid creating knowledge articles with duplicate content.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The authoring experience for knowledge articles in Workspace is similar to the one in Now Platform with the following exceptions:

- Knowledge blocks can't be created or associated with knowledge articles. However, you can view articles containing knowledge blocks.
- Knowledge articles of type Wiki aren't supported.
- Knowledge article categories can't be created.

**Activation Information**

The Knowledge list in Workspace is available with the activation of the Agent Workspace plugin (com.glide.core-ui-components). When you install and activate the Agent Workspace plugin, the sn-component-workspace-knowledge plugin for using Knowledge Management in Workspace is also installed and activated.

**Related information**

**View a knowledge article in Agent Workspace**

View a knowledge article in Agent Workspace, including the article number, short description, and article content.

**Before you begin**

You must have read access to the knowledge article. Role required: agent_workspace_user

**Procedure**

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. View knowledge articles authored by you or by other people.
   - View all articles by navigating to **Lists > Knowledge > All Articles**.
   - View articles authored by you by navigating to either **Lists > Knowledge > My Articles - Published** or **Lists > Knowledge > My Articles - Unpublished**.
3. Click the link to the knowledge article that you want to view.

4. **Optional:** View the knowledge article in another language by selecting a language in the Language list.
   
   ⚠️ **Note:** The Language list is populated based on the available translated versions of the article.

5. **Optional:** Copy the link to the knowledge article to your clipboard by clicking the more actions icon (…) and then clicking **Copy link**.

6. **Optional:** Download the article as a Microsoft Word document to your computer by clicking the more actions icon (…) and then clicking **Download as Word**.
   
   ⚠️ **Note:** This option appears only when the article was originally created using Microsoft Word and the system administrator has enabled the `sn_km_word.glide.knowman.enable_document_download` property.

7. **Optional:** View another version of the knowledge article by selecting the version of the knowledge article in the Version list.
   
   ⚠️ **Note:** The Version list appears only when the article versioning feature is enabled.

**Results**

The selected version of the article opens in a knowledge article view page displayed in another tab within Agent Workspace. The tab name includes the knowledge article number and its version number.

Create a knowledge article in Agent Workspace to share information across your organization.

**Before you begin**
You must have contribute access to the knowledge base within which you want to create the knowledge article.
Role required: agent_workspace_user

**About this task**
You can also create a knowledge article when adding a knowledge block. For more information, see Add a knowledge block to a knowledge article in Agent Workspace.
**Procedure**

1. **Navigate to Agent Workspace > Agent Workspace Home.**

2. **Optional:** Check whether a knowledge article on this subject is already available by going to Lists > Knowledge > All Articles and setting a filter to search for possible matching articles.

3. **Click New.**

4. Create the knowledge article by either selecting an article template or using the default template.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Selected article template** | Select an article template to create a knowledge article using defined fields and values.  
In the Create Article dialog box:  
  a. From the Knowledge Base list, select a knowledge base.  
  b. From the Article Template list, select the desired article template.  
  ⚠️ **Note:** The Article Template list is populated based on the article templates configured for the selected knowledge base.  
  c. Click Create Article.  
  The Create Article dialog box is available if the article versioning and the Knowledge Article Templates features are enabled. For more information, see Article versioning and Knowledge article templates. |
| **Default Standard template** | Create a knowledge article using the default Standard template. |

5. On the Knowledge form, fill in the fields.

⚠️ **Note:** If you are using an article template, the fields that are available will vary.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only. If you are using an article template, you can modify this value only if the template is available in the other knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <code>glide.knowman.ownership_group.enabled</code> property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.</td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available if the article versioning feature has been enabled.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Language</td>
<td>Language in which you are creating the knowledge article. The list is populated based on the languages enabled for the selected knowledge base. This field appears only when the I18N:Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated. For more information, see I18N - Knowledge internationalization.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field. <strong>Note:</strong> Knowledge articles similar to the entered short description text will appear in Agent assist.</td>
</tr>
<tr>
<td>Article body</td>
<td>Content for the knowledge article. Use the editing functions in the HTML editor to create content. For more information, see Editing functions for knowledge articles in the HTML editor.</td>
</tr>
<tr>
<td>Source Task</td>
<td>Task this knowledge article was created from. This field is set automatically when you create the knowledge article from a task, such as an incident or a customer service case, or from a submission record.</td>
</tr>
<tr>
<td>Scheduled publish date</td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Agent Workspace.</td>
</tr>
<tr>
<td>Valid to</td>
<td>The date this knowledge article expires. Articles do not appear in search results after the Valid to date or if the Valid to date is blank. The default value of the Valid to field is derived from the Article Validity field configured for the knowledge base (see Create a knowledge base). The Valid to date starts from the date the article was created until the number of days specified in the Article Validity field. If the Article Validity field is blank, the default date in the Valid to field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default Valid to date. For more information, see Knowledge article validity. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the Valid to date to continue using the article. For more information, see Knowledge Management email notifications.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Confidence</td>
<td>Maturity of an article based on its completeness and reusability.</td>
</tr>
<tr>
<td>Article type</td>
<td>Type of the article, which is automatically set to HTML. This field is available in the Standard template only.</td>
</tr>
<tr>
<td>Display</td>
<td>Option to display attachments in the knowledge article. If the article has attachments, they are listed below the text of a knowledge article on the knowledge article view page.</td>
</tr>
<tr>
<td>attachments</td>
<td>Option to automatically download an attached article when a user access an article instead of opening the article. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Attachment link</td>
<td>Option to automatically download an attached article when a user access an article instead of opening the article. The Attachment link option applies to articles accessed from search links only. Articles accessed from links within other knowledge articles will not automatically download an attached file.</td>
</tr>
<tr>
<td>Governance</td>
<td>An attribute of an article that allows you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of those who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).</td>
</tr>
<tr>
<td>Issue</td>
<td>Brief description about an issue.</td>
</tr>
</tbody>
</table>

**Note:** Although you may attach multiple files, most web browsers permit users to download only the first attachment. To ensure download of all the files, bundle them into an archive and attach the archive.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment</td>
<td>Details of the environment in place when the issue occurred.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Cause</td>
<td>The cause of the issue.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Resolution</td>
<td>Method used to resolve the issue.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the KCS Article template only.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as a question.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the FAQ template only.</td>
</tr>
<tr>
<td>Answer</td>
<td>Text to display as an answer to an included question.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the FAQ template only.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introduction to the topic.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the How To and What Is templates only.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Instructions for a how-to topic.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the How To template only.</td>
</tr>
<tr>
<td>Explanation</td>
<td>Explanation of a what-is topic.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available in the What Is template only.</td>
</tr>
</tbody>
</table>

**Note:** The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see [Managing the KCS article state](#).

6. **Optional:** Research for content related to knowledge article you’re authoring using Agent assist.

   a. In the contextual side panel, click the Agent Assist icon (💡). The search results in Agent assist display default content based on the text-based search.
b. Click the select a search resource icon (🔍), and then select a search resource.
   For example, to view knowledge articles, select Knowledge Articles.

c. Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   ❓ Tip: For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

7. Optional: Check whether your content matches content in an existing article.

   a. Enter search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

   b. Click the lookup icon (🔍).

   c. Select a search resource by clicking the Select a search resource icon (🔍).

      • To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

         ❗ Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

      • To find knowledge articles that match the entered search text, choose Knowledge Articles.

8. Optional: Attach a file with supporting information by clicking the attachments icon (첨부) in the contextual side panel and selecting the file.

9. Optional: Add a knowledge block. For more information, see Add a knowledge block to a knowledge article in Agent Workspace.

10. Click Save.
    The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

11. Optional: Either add to or modify the article details or publish the article.
• Add to or modify the article details.
  (Optional) For more information, see Edit a knowledge article in Agent Workspace.

• Publish the article by clicking Publish.
  A knowledge article is published depending on the workflow setting of its knowledge base:
  
  ◦ **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.
  ◦ **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

  Note: With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the glide.knowman.ownership_group.enable_self_approval property. For more information, see Ownership groups.

  For more information, see Schedule a knowledge article for publishing in Agent Workspace.

  When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

What to do next
After you create and publish a knowledge article, you can perform the following actions related to the article:

• Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.

• Retire the knowledge article. Click Retire to enable the retirement workflow. For more information, see Retire a knowledge article.

• Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.

• Delete the published knowledge article. Click Delete. If the Delete button isn’t displayed, click the more actions icon (…), and then click Delete.

  Note: Only users with the admin role can delete a published knowledge article.

Publish a knowledge article in Agent Workspace
Publish a knowledge article to make it available to users.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article you want to publish.
Role required: agent_workspace_user

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished.
3. Click a knowledge article link.
4. On the Knowledge form, click Publish.

Results
A knowledge article is published depending on the workflow setting of its knowledge base:
• **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

**Note:** With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see [Ownership groups](#).

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version of the article is incremented based on the version number pattern.

**Related reference**

**Edit a knowledge article in Agent Workspace**

Edit knowledge articles within a knowledge base in Agent Workspace to update information shared across your organization.

**Before you begin**

You must have contribute access to the knowledge base that stores the knowledge article you want to edit.
Note:

- If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the glide.knowman.versioning.enabled property (from the System Property [sys_properties] table) to false.

- If an ownership group is associated with a knowledge article, the author or reviser of the article can’t contribute to the article after the article is published. An administrator can override this behavior by enabling the glide.knowman.ownership_group.override property. For more information, see Ownership groups.

- If the glide.knowman.translation.enable_translation_task property is enabled, you can’t modify the knowledge base of existing articles.

Role required: agent_workspace_user

Procedure

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click a knowledge article link.
4. On the Knowledge form, click Edit.

Note: If the knowledge article was created using Microsoft Word, you can edit the article only in Microsoft Word. In this case, click Open in Word to open the article in Word Online. For more information, see Edit a knowledge article in Microsoft Word.

If you want to edit the article using the HTML editor, you can unlink the article from Word. For more information, see Unlink knowledge articles from linked Microsoft Word documents.

5. If the article versioning feature is enabled, click Checkout for a published knowledge article.
   You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.
## Knowledge form related lists

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Knowledge article content and its metadata.</td>
</tr>
</tbody>
</table>

**Note:** If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria:

- If the **Article Validity** field in the knowledge base associated with the article is blank, the **Valid to** date value from the earlier version of the article is retained.

- If the **Article Validity** field in the knowledge base associated with the article is not blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria:

- If the **Article Validity** field in the selected knowledge base is blank, the earlier **Valid to** date value is retained for the knowledge article.

- If the **Article Validity** field in the selected knowledge base isn't blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Knowledge article validity.

<p>| Feedback Tasks | Details about the feedback task created for a knowledge article version. |
| Feedback       | Feedback received on the published versions of the article. To view more details about the feedback, in the <strong>Comments</strong> column, click a link for the desired version of an article. |
| Approvals      | Approval history of the knowledge article. |</p>
<table>
<thead>
<tr>
<th>Related list</th>

</tr>
</thead>
<tbody>
<tr>
<td>Article Versions</td>
<td>Version history of the knowledge article.</td>
</tr>
</tbody>
</table>
| Translated Versions | Translated versions of the knowledge article.  
This related list appears only when the translation management feature is enabled. To translate a knowledge article, click **New**. The **New** button on this related list appears when the `glide.knowman.translation.enable_translation_task` property is disabled. |
| Translation Tasks | Tasks submitted for translating the article.  
This related list appears when the Translation Management feature and the `glide.knowman.translation.enable_translation_task` property to enable creation of translation tasks are enabled. For more information, see Knowledge Management properties. |
| Related Articles   | Related articles mapped to the knowledge article. For more information, see Map a related article in Agent Workspace. |
| Related Catalog Items | Related catalog items mapped to the knowledge article. For more information, see Map a related item in Agent Workspace. |
| Affected Products  | Products mapped to the knowledge article. For more information, see Add an affected product to a knowledge article in Agent Workspace. |

**7. Optional:** Research for content related to knowledge article you’re authoring using Agent assist.

- **a.** In the contextual side panel, click the Agent Assist icon (🔍).  
The search results in Agent assist display default content based on the text-based search.

- **b.** Click the select a search resource icon (🔍), and then select a search resource.  
For example, to view knowledge articles, select **Knowledge Articles**.
c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

**Tip:** For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, click **Full View.** The resource item content opens in another tab within the Agent Workspace.

8. **Optional:** Check whether your content matches content in an existing article.

a. Enter search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

b. Click the lookup icon (смотрите).

c. Select a search resource by clicking the Select a search resource icon (смотрите).

   • To find knowledge articles that have high text similarity with the entered search text, choose **Similar Articles (ML).**

   **Note:** This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see **Train the similarity solution for Knowledge Management to find related articles.**

   • To find knowledge articles that match the entered search text, choose **Knowledge Articles.**

9. **Optional:** Work with attachments.

   • Attach a file with supporting information by clicking the attachments icon (смотрите) in the contextual side panel and selecting the file.

   • Download, remove, or rename an existing attachment by clicking the menu icon (смотрите) displayed for the attachment.

10. **Click Save.**

    The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see **Knowledge article version numbers.**

11. **Optional:** Publish the article by clicking **Publish.**

    The knowledge article is published depending on the workflow setting of its knowledge base:
• **Knowledge - Instant Publish:** The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish:** The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

**Note:** With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the `glide.knowman.ownership_group.enable_self_approval` property. For more information, see [Ownership groups](#).

For more information, see [Schedule a knowledge article for publishing in Agent Workspace](#).

When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see [Knowledge article version numbers](#).

### Related information
- Create a knowledge article in Agent Workspace
- View a knowledge article in Agent Workspace
- Using Agent Assist in Agent Workspace
- Create knowledge from incident or problem
- Map a related article in Agent Workspace

Discover similar information across articles on a topic while viewing a knowledge article. You can manually map related articles or have the application automatically present related articles using machine learning (ML) algorithms.

**Before you begin**
You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.

Role required: agent_workspace_user

**About this task**
If you have manually mapped related articles when editing an article in Agent Workspace, those articles are listed in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal before the related articles that are predicted thorough the Knowledge Management similarity solution.
Note: An administrator can train the solution definition for Knowledge Management within the Predictive Intelligence feature to find related articles. For more information, see Train the similarity solution for Knowledge Management to find related articles.

This task provides steps to manually map related articles when editing an article in Agent Workspace. You can also manually map related articles when editing an article from the Knowledge Management application in the Now Platform interface. For more information, see Map related articles.

Procedure

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the knowledge article for which you want to map related articles.
4. In the Related Articles related list, click New.
5. On the Related Articles form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related knowledge article.</td>
</tr>
<tr>
<td>Related knowledge article</td>
<td>Knowledge article that contains related information.</td>
</tr>
<tr>
<td></td>
<td>You can click the search for record icon (Q), to access the list of available knowledge articles.</td>
</tr>
<tr>
<td>Knowledge article</td>
<td>Number of the knowledge article for which you are adding the related knowledge article.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which you want the article to appear in the Related Articles section on the Knowledge Management article view page.</td>
</tr>
<tr>
<td></td>
<td>A lower value means that a knowledge article has the greater priority to appear in the Related Articles section. The default value is 100.</td>
</tr>
</tbody>
</table>

6. Click Save.
Results
The mapped articles are available in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal. See Knowledge Management Service Portal article view page features.

⚠️ Note: Because system administrators can configure the number of knowledge articles shown in the Related Articles section, not all mapped related articles might appear in the Related Articles section. For more information, see Configure knowledge related articles widget instance options.

Related information
Edit a knowledge article in Agent Workspace

Map a related item in Agent Workspace
Manually map catalog items related to a knowledge article in Agent Workspace to enable employees to request the related catalog item.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article for which you want to add related articles.
Role required: agent_workspace_user

About this task
This task provides steps to map related catalog items when editing an article in Agent Workspace. You can also map related catalog items when editing an article from the Knowledge Management application in the Now Platform interface. For more information, see Map catalog items related to an article.

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > Published for a published article or Lists > Knowledge > Unpublished for an unpublished article.
3. Click the link to the knowledge article for which you want to map a related item.
4. On the Knowledge form, click the Related Catalog Items related list.
5. Click New.
6. On the Related Catalog Items form, fill in the fields.
Related Items form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to enable the mapping to the related catalog item.</td>

</tr>
</tbody>
</table>

7. Click **Save**.

**Results**

The mapped catalog items are listed in the Related Items section on the Knowledge Management article view page in Knowledge Management Service Portal.

**Note:** Because system administrators can configure the number of catalog items shown in the Related Items section, not all mapped related catalog items might appear in the Related Items section. For more information, see Configure related catalog item widget instance options.

**Related information**

- **Edit a knowledge article in Agent Workspace**
- **Service catalog items**

**Add an affected product to a knowledge article in Agent Workspace**

Add affected products to a knowledge article to view the products associated with the knowledge article.

**Before you begin**

The Knowledge Product Entitlements plugin (com.snc.kb_product_entitlements) must be activated to use the Knowledge Product Entitlements application.
Installing this plugin adds the Affected Products related list to the Knowledge form. For more information, see Knowledge product entitlements.

You must have contribute access to the knowledge base that stores the knowledge article for which you want to add affected products.

Role required: agent_workspace_user

About this task
This task provides steps to add affected products to a knowledge article in Agent Workspace. You can also add affected products to a knowledge article using the Knowledge Management application in the Now Platform interface. For more information, see Add a related product to a knowledge base or knowledge article.

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the knowledge article for which you want to add a related product.
4. On the Knowledge form, in the Affected Products related list, click New.
5. On the Knowledge Related to Products form, in the Configuration item field, click the search for record icon (🔍).
6. In the Configuration item dialog box, click the related product.
7. Click Save.

Related information
Edit a knowledge article in Agent Workspace

Schedule a knowledge article for publishing in Agent Workspace
Set a specific time and day for a knowledge article to be published in Agent Workspace automatically.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.
Ensure that the system administrator verifies the following settings:
• Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.

• The article versioning feature is enabled. For more information, see Article versioning.

Note: You can also schedule a knowledge article for publishing from the Knowledge Management application in the Now Platform interface. For more information, see Schedule a knowledge article for publishing.

Role required: agent_workspace_user

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished Articles.
3. Click an article link.
4. In the Scheduled publish date field, click the show calendar icon (📅).
5. Select any future date in the calendar.
6. In the Select Time field, enter a time in the format hh:mm:ss.
7. Click OK.
8. Click Publish to enable the publishing workflow.

Tip: If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click Recall.

Results
The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

• If the knowledge base workflow is set to Knowledge - Instant Publish, the knowledge article is automatically published on the scheduled publish date. The Workflow field on the Knowledge form of the article is updated to Scheduled for publish.

• If the knowledge base workflow is set to Knowledge - Approval Publish, the knowledge article is published on approval completion. The Workflow field on the Knowledge form of the article is updated to Review.

The approval completion affects the scheduled publishing as follows:
If the approvals are completed before the scheduled publish date, the **Workflow** field on the Knowledge form of the article is updated to **Scheduled for publish** and the article is published on the scheduled publish date.

If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

</tr>
<tr>
<td>Note:</td>
<td>When you upgrade your instance, for any existing records that don’t have any feedback task type set or don’t match with supported types, the feedback task type is automatically set to Other.</td>
</tr>
</tbody>
</table>

Procedure

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Click **Lists > Knowledge > My Tasks - Feedback**.
3. Click the link to a feedback task number.
4. On the Knowledge Feedback Task form, review the feedback given by the submitter.
5. Work on the feedback task.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start working on the feedback task</td>
<td>From the State list, select <strong>Work in progress</strong>. You can save the feedback task, edit the knowledge article for which the feedback task was added, or create another knowledge article from a feedback task if the information in the existing article is irrelevant or obsolete. For more information, see Create a knowledge article from a feedback task in Agent Workspace and Edit a knowledge article from a feedback task in Agent Workspace.</td>
</tr>
</tbody>
</table>
| Request clarification from the feedback submitter | a. From the State list, select **Awaiting information**.  
   b. In the **Additional comments** field, enter the information you need from the submitter of the feedback task.  
   When you save the feedback task form, an email notification is sent to the feedback task submitter. |
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Resolve the feedback task</strong></td>
<td></td>
</tr>
</tbody>
</table>
- a. From the State list, select **Resolved**.  
- b. From the Resolution Code list, select a code for resolving the feedback task.  
- c. In the **Resolution notes** field, enter the reason for the resolution.  

When you save the feedback task form, an email notification is sent to the feedback submitter to accept or reject the feedback.  

Note: If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to **Closed**. |
| **Close the feedback task without the submitter having to accept the feedback resolution** |  
- From the State list, select **Closed**. |
| 6. **Optional:** | In the Compose section, enter comments, which all viewers can see, or work notes, which only internal users can see. |
| 7. **Optional:** | Track the time spent on each state for a feedback task by clicking the **Knowledge Feedback Task Metrics** tab and then clicking a link to the state in the **Value** column. |
| 8. **Click Save.** |  

**Results**  
The feedback task is updated.

- View a knowledge article in Agent Workspace  

**Create a knowledge article from a feedback task in Agent Workspace**  
When working on a knowledge article feedback task, if the current knowledge article doesn’t address the issue, you can create another knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.
Before you begin
You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user

About this task
A feedback task is created in the following ways:

- When a user provides a feedback for the knowledge article. For more information, see Provide feedback for a knowledge article in Agent Workspace.
- When knowledge gap feedback tasks are created on a topic from a demand insights dashboard. For more information, see Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks.

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to Knowledge > My Tasks - Feedback.
   - For tasks created when an article was flagged, go to Knowledge > My Tasks - Flagged.
3. In the Number column, click the link to a feedback task assigned to you or your ownership group.
4. Click Create Article.
5. Create the knowledge article by either selecting an article template or using the default template.

<table>

<td></td>
</tr>
</tbody>
</table>

Note: The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing the KCS article state.

7. Optional: Research for content related to knowledge article you’re authoring using Agent assist.

   a. In the contextual side panel, click the Agent Assist icon (🔍).
      The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon (🔍), and then select a search resource.
      For example, to view knowledge articles, select **Knowledge Articles**.

   c. Optional: In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   ⚫ Tip: For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, click **Full View**. The resource item content opens in another tab within the Agent Workspace.

8. Optional: Check whether your content matches content in an existing article.
a. Enter search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

b. Click the lookup icon (🔍).

c. Select a search resource by clicking the Select a search resource icon (🔍).
   - To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

   **Note:** This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

   - To find knowledge articles that match the entered search text, choose Knowledge Articles.

9. Click **Save**.
   The article is saved and appears in the My Articles - Unpublished list and additional functionality becomes available on the form.

10. **Optional:** Either add to or modify the article details or publish the article.
    - Add to or modify the article details.
      (Optional) For more information, see Edit a knowledge article in Agent Workspace.
    - Publish the article by clicking **Publish**.
      A knowledge article is published depending on the workflow setting of its knowledge base:
      - **Knowledge - Instant Publish:** The knowledge article is immediately published unless it is scheduled to be published at a later date.
      - **Knowledge - Approval Publish:** The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

   **Note:** With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the glide.knowman.ownership_group.enable_self_approval property. For more information, see Ownership groups.

   For more information, see Schedule a knowledge article for publishing in Agent Workspace.
When published, your knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see Knowledge article version numbers.

**What to do next**
After you create and publish a knowledge article, you can perform the following actions related to the article:

- Request translations for the knowledge article. For more information, see Request translations for missing languages in Agent Workspace.
- Retire the knowledge article. Click **Retire** to enable the retirement workflow. For more information, see Retire a knowledge article.
- Translate the knowledge article directly from the knowledge article. For more information, see Translate a knowledge article in Agent Workspace.
- Delete the published knowledge article. Click **Delete**. If the **Delete** button isn't displayed, click the more actions icon (⋯), and then click **Delete**.

⚠ **Note:** Only users with the admin role can delete a published knowledge article.

**Related information**
- View a knowledge article in Agent Workspace
- Using Agent Assist in Agent Workspace
- Edit a knowledge article from a feedback task in Agent Workspace

When working on a knowledge article task, you can edit the knowledge article from within the task. A feedback task is created for a knowledge article when the article is flagged, marked as not helpful, or rated low, or a knowledge gap feedback task is created on a topic.

**Before you begin**
Role required: You must have contribute access to the knowledge base that stores the knowledge article.

⚠ **Note:** If the article versioning feature is enabled, only the knowledge administrator, knowledge managers, and author can edit the checked-out version of an article. If the feature is disabled, any users with contribute access to an article can edit the draft version of the article. An administrator can disable the article versioning feature by setting the `glide.knowman.versioning.enabled` property (from the System Property [sys_properties] table) to `false`. 
Role required: agent_workspace_user

Procedure
1. Navigate to **Agent Workspace** > **Agent Workspace Home**.
2. Go to your tasks list.
   - For feedback tasks created through knowledge gaps or if a knowledge article was marked as not helpful or rated low, go to **Knowledge** > **My Tasks** - **Feedback**.
   - For tasks created when an article was flagged, go to **Knowledge** > **My Tasks** - **Flagged**.
3. In the **Number** column, click the link to a feedback task assigned to you or your ownership group.
4. Click **Edit Article**.
5. If the article versioning feature is enabled, click **Checkout** for a published knowledge article.
   You can only edit the latest version of a knowledge article.
6. Access the relevant related lists to modify the information.

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Knowledge article content and its metadata.</td>
</tr>
</tbody>
</table>
**Note:** If the article versioning feature is enabled, the default value of the **Valid to** date in the updated article version is automatically set based on the following criteria:

- If the **Article Validity** field in the knowledge base associated with the article is blank, the **Valid to** date value from the earlier version of the article is retained.

- If the **Article Validity** field in the knowledge base associated with the article is not blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If you move a knowledge article to another knowledge base, the default value of the **Valid to** date in the updated article is automatically set based on the following criteria:

- If the **Article Validity** field in the selected knowledge base is blank, the earlier **Valid to** date value is retained for the knowledge article.

- If the **Article Validity** field in the selected knowledge base isn't blank, the **Valid to** date is automatically updated to start from the date the article was updated until the number of days specified in the **Article Validity** field (Article updated date + article validity).

If the dictionary value of the **Valid to** field is modified, this dictionary value overrides the default value of the **Valid to** field calculated according to the **Article Validity** field. For more information, see Knowledge article validity.

</tbody>
</table>

7. **Optional:** Research for content related to knowledge article you’re authoring using Agent assist.

   a. In the contextual side panel, click the Agent Assist icon (🔍).
   The search results in Agent assist display default content based on the text-based search.

   b. Click the select a search resource icon (🔍), and then select a search resource.
   For example, to view knowledge articles, select Knowledge Articles.

   c. **Optional:** In the search results, you can click a resource item, such as a knowledge article, to view its content in Agent assist.

   ✨ **Tip:** For better readability, you can resize the contextual side panel for Agent assist. For a full view of the selected resource item content, click Full View. The resource item content opens in another tab within the Agent Workspace.

8. **Optional:** Check whether your content matches content in an existing article.

© 2021 ServiceNow, Inc. All rights reserved.
a. Enter search text in the text box available in Agent assist or retain the default text, which is the short description of the knowledge article.

b. Click the lookup icon (🔍).

c. Select a search resource by clicking the Select a search resource icon (🔍).

• To find knowledge articles that have high text similarity with the entered search text, choose Similar Articles (ML).

  Note: This option is available only when the Predictive Intelligence feature is enabled and your system administrator has trained the similarity solution for Knowledge Management. For more information, see Train the similarity solution for Knowledge Management to find related articles.

• To find knowledge articles that match the entered search text, choose Knowledge Articles.

9. Click Save.
The article is saved and appears in the My Articles - Unpublished list. If the article versioning feature is enabled, the version of the knowledge article is incremented by 0.01. For more information, see Knowledge article version numbers.

10. Optional: Publish the article by clicking Publish.
The knowledge article is published depending on the workflow setting of its knowledge base:

• Knowledge - Instant Publish: The knowledge article is immediately published unless it is scheduled to be published at a later date.

• Knowledge - Approval Publish: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

  Note: With an ownership group associated with a knowledge article, ownership group members can approve self-authored articles for publication. An administrator can override this behavior by disabling the glide.knowman.ownership_group.enable_self_approval property. For more information, see Ownership groups.

For more information, see Schedule a knowledge article for publishing in Agent Workspace.

When published, the knowledge article appears in the My Articles - Published and All Articles lists. If the article versioning feature is enabled, the version
number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see Knowledge article version numbers.

Compare knowledge article versions in Agent Workspace

Select and compare two versions of a knowledge article in Agent Workspace to view the differences between them.

Before you begin

You must have contribute access to the knowledge base that stores the knowledge article.

Role required: agent_workspace_user

Procedure

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > All Articles.
3. Click the link to a knowledge article for which you want to compare two versions.
4. Click Edit to open the Knowledge article form.
5. In the Article Versions related list, select the two versions of the article to compare.
6. Click Compare.

Results

The Compare versions tab opens within Agent Workspace and lists the fields for the selected versions in a side-by-side format. Any differences between the two versions are highlighted as shown in the following example image.
Example: Compare article versions

Recall an article that is being reviewed in Agent Workspace

Recall an article that is being reviewed to stop the approval process.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article you want to recall.
Ensure that the article versioning feature is enabled. For more information, see Article versioning.

Role required: agent_workspace_user

About this task
The author of a knowledge article, knowledge administrators, and system administrators can recall the article. If an ownership group is assigned to a knowledge article, the ownership group manager and ownership group members can also recall the knowledge article.

If a version of a knowledge article is in the Review workflow state, you can recall only the corresponding version to make additional changes. Recalling the article results in a minor version increment.
Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > All Articles.
3. Click the link to the article in Review workflow state that you want to recall.
4. On the Knowledge form, click Recall.

Results
The article opens in edit mode and the workflow state of the article is changed to Draft. The version number of the article increments by 0.01.

Related information
Knowledge workflows
Edit a knowledge article in Agent Workspace

Approve a knowledge article in Agent Workspace
Approve a knowledge article that is awaiting your review in Agent Workspace.

Before you begin
Role required: agent_workspace_user

About this task
If the article versioning feature is enabled, only users who are assigned as approvers can modify a knowledge article that is in the Review state. If you are not an approver but need to modify the article, consider recalling the article. For more information, see Recall an article that is being reviewed in Agent Workspace.

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge > My Articles - Unpublished.
3. Click an article link in Review workflow state.
4. Click Edit.
5. In the Approvals related list, in the State column, click Requested.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select Approved.
7. Click Save.
The approved knowledge article is published immediately or on the scheduled publish date, if the article is scheduled for publishing. If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge form of the article, the workflow state changes to Published. The new published version of the article is added to the Article Versions related list on the Knowledge form. The version is also available in the All Articles list in Agent Workspace, go to Knowledge > All Articles.

Related information
View a knowledge article in Agent Workspace

Request translations for missing languages in Agent Workspace
Request to translate a published knowledge article in available languages by creating a translation task in Agent Workspace.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article.
Ensure that the system administrator verifies the following settings:

• Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
• I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

⚠️ Note: The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

• The glide.knowman.translation.enable_translation_task property is set to true in the Now Platform interface. For more information, see Knowledge Management properties.

Role required: agent_workspace_user

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > All Articles.
3. Click the link to a knowledge article for which you want to create a translation task.
4. On the Knowledge form, click Edit.
5. Click Request translations.
6. In the Request translation dialog box, select one or more available languages in the Select languages list. If a language appears grayed out, a translation is already in progress or has been completed for that language. Some languages might not be available if the system administrator has configured only specific languages for the knowledge base in which the article is contained.

7. Click **Submit**.

**Results**
The translation task is created for the article in the selected languages and assigned to a group or user based on assignment rules, if configured.

**Related information**
- Create translation assignments
- Translate a knowledge article from a translation task in Agent Workspace

**Translate a knowledge article in Agent Workspace**
Translate published knowledge articles to make them available in other languages.

**Before you begin**
You must have contribute access to the knowledge base that stores the knowledge article.
Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
- I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

**Note:** The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.
• The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge Management properties.

<i>Note:</i> When the `glide.knowman.translation.enable_translation_task` property is set to `false`, translate the knowledge article by clicking <b>New</b> in the Translated version related list of a Knowledge form. The Knowledge form that is displayed to translate the article is based on the article template of the source knowledge article. You can enter your translation content in the Knowledge form. For more information about the Knowledge form, see <a>Create a knowledge article in Agent Workspace</a>.

Role required: agent_workspace_user

**About this task**
If you have contribute access to a knowledge article, you can translate a knowledge article directly from the knowledge form. If your system administrator has configured languages for the knowledge base, you can translate into those languages only. For more information, see <a>Create a knowledge base</a>.

<i>Note:</i> The translation management feature isn't available for knowledge blocks in Agent Workspace.

**Procedure**
1. Navigate to <b>Agent Workspace > Agent Workspace Home</b>.
2. Click <b>Lists > Knowledge > All Articles</b>.
3. In the <b>Number</b> column, click the link to a knowledge article that you want to translate.
4. Click <b>Edit</b>.
5. Click <b>Translate</b>.

<i>Note:</i> The <b>Translate</b> button is not available if the `glide.knowman.translation.enable_translation_task` property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.

The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. The text in the Translated language section still appears in the original language content.
6. Provide the translation in the Translated language section.

- If dynamic translation is enabled, click **Machine translate** to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language.

  Note: A default translator configuration should be available. For configuring the translation API, see **Dynamic Translation**.

  When you click **Machine translate**, any draft content in the Translated language section is automatically replaced with the machine-translated content.

- If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

7. Click **Create draft article** to create a draft version of the translated article.

8. Click **Publish**.

**Results**

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.

Translate a knowledge article from a translation task in Agent Workspace

Translate a published knowledge article for which you have been assigned a translation task.

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article.
Ensure that the system administrator verifies the following settings:

• Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.
• I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

ℹ️ Note: The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.
• The `glide.knowman.translation.enable_translation_task` property is set to `true` in the Now Platform interface. For more information, see Knowledge Management properties.

Role required: agent_workspace_user

About this task
A translation task is created for a knowledge article when a request for translation is submitted or its knowledge base is configured to automatically create translation tasks. For more information, see Request translations for missing languages in Agent Workspace and Create a knowledge base.

ℹ️ Note: The translation management feature isn’t available for knowledge blocks in Agent Workspace.

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Click Lists > Knowledge > My Tasks - Translation.
3. In the Number column, click the link to a translation task.
4. Click Translate.

ℹ️ Note: The Translate button is not available if the `glide.knowman.translation.enable_translation_task` property is disabled, translations of the knowledge article are available in all available languages, or a translation task has already been created for all the available languages.
The Original language and Translated language sections appear side by side for easy viewing, as shown in the following figure. By default, the Translated language section includes the original language content.

5. Provide the translation in the Translated language section.
   - If dynamic translation is enabled, click **Machine translate** to automatically replace the draft content in the Translated language section with machine-translated content in the targeted language.

   ![Image showing Translate Article](image)

   **Note:** A default translator configuration should be available. For configuring the translation API, see **Dynamic Translation**.

   When you click **Machine translate**, any draft content in the Translated language section is automatically replaced with the machine-translated content.

   - If dynamic translation is not available, replace the draft content in the Translated language section with your translated text.

6. Click **Create draft article** to create a draft version of the translated article.
7. Click **Publish**.

**Results**

When the translated version of the knowledge article is published, a new knowledge number is assigned to the translated version. The translated version is available in the All Articles list in Agent Workspace. Also, the Translated Versions related list on the Knowledge form of the original and translated knowledge article is updated with all the translated versions.

Knowledge article authoring in Microsoft Word

You can author and access knowledge articles in Microsoft Word by deploying the Knowledge Management - Add-in for Microsoft Word.

As a user with contribute access to a knowledge base, you can open, create, edit, publish, and search for knowledge articles from within the Knowledge Management pane in Microsoft Word. A user with read access to a knowledge base, can view the article in Microsoft Word. The Knowledge Management - Add-in for Microsoft Word is available in the online version of Microsoft Word only.

The Knowledge Management - Add-in for Microsoft Word is supported for use only in applications integrated with the online version of Microsoft Word such as Microsoft SharePoint and Microsoft OneDrive.

Note the following points when using the Knowledge Management - Add-in for Microsoft Word to maintain knowledge articles:

- The Knowledge Management - Add-in for Microsoft Word is supported in the Word Online application and not in the Word Desktop app.
- The URL is automatically generated for Word documents created in Microsoft SharePoint and Microsoft OneDrive with business accounts only.

For other applications and account types, you must manually enter the URL in the Document URL field. You enter the document URL in the Document URL field on the Knowledge form in Microsoft Word. For more information, see Create a knowledge article in Microsoft Word.

- The time taken to convert a knowledge article from a Word document is proportional to the document size.
- Headers and footers corresponding to pages in the Word document appear as-is in the knowledge article.

You can remove headers and footers from the pages in the Word document so that they don't appear in the knowledge article.

Activation information

The Knowledge Management - Add-in for Microsoft Word (com.snc.knowledge.ms_word) is required to enable you to interact with knowledge articles from within the Word Online application. For more information, see Activate Knowledge Management - Add-in for Microsoft Word.
Related information

Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word

Author and collaborate on knowledge articles in Microsoft Word by logging in to your ServiceNow instance from the Word Online application.

Before you begin
You must have contribute access to the knowledge base within which you want to create the knowledge article.
The system administrator and Office 365 administrator have configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

About this task
You need to authenticate with your ServiceNow instance credentials for accessing and creating knowledge articles using Microsoft Word. You might also need to re-authenticate if your session has expired.

Procedure
1. Sign in to your Office 365 account.
2. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app.
   For more information, see Use the Office 365 app launcher.
3. In the New section, click New blank document, or open any existing Microsoft Word document.
4. On the Home tab, click the Knowledge icon ( ).
5. In the Knowledge Management pane of the Word document, click Log in to ServiceNow.
   The ServiceNow login page opens in a separate tab of your browser.
6. On the ServiceNow login page, enter your ServiceNow credentials.
Results
After successful authentication, the ServiceNow instance browser tab closes and you are redirected to the Microsoft Word browser tab. On the Microsoft Word document, the Knowledge Management pane displays the welcome screen.

View a knowledge article in Microsoft Word
View a knowledge article in Microsoft Word, including the article number, short description, and article content.

Before you begin

• Ensure that the system administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

• You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.

• You must have read access to the knowledge article.

• You must have signed in to your Office 365 account.

Procedure
1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.

2. In the New section, click New blank document, or open any existing Microsoft Word document.

3. On the Home tab of the Word document, click the Knowledge icon ( )

4. Access the article in the Knowledge Management pane of the Word document.
   • In the Knowledge Management pane, in the Search box, enter the knowledge article number or description.
   • In the Knowledge Management pane, click a knowledge base to view a list of knowledge articles within the knowledge base. All knowledge bases and associated knowledge articles for which you have contribute or read access appear in the Knowledge Management pane.
5. In the Knowledge Management pane, click the link to the knowledge article that you want to view.

**Tip:** To go back to the previous view in the Knowledge Management pane, click the left caret icon (←). To go back to the landing screen, click the home icon (🏠).

**Results**

If a knowledge article was created from the Knowledge Management application in the Now Platform interface, the article content appears in the Document pane and the article details appear in the Knowledge Management pane of the Microsoft Word document.

If a knowledge article was created using another Word document, the document opens in a new browser tab with the content in the Document pane and the article details in the Knowledge Management pane of that document.

**Note:** If the article uses a template, the article opens in the Now Platform interface in a new browser tab. You can’t edit articles with templates in Microsoft Word.

The following article details appear in the Knowledge Management pane.

### Knowledge form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated knowledge article number.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Knowledge base in which the knowledge article is stored. You can associate a knowledge article with one knowledge base only.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the knowledge article. This value helps users find the article within a selected category. You can select only categories available within the selected knowledge base. Articles without a category appear in the (empty) category.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge article. An ownership group consists of a group of members and a manager who are responsible for approvals and feedback tasks. Ownership groups can publish, edit, and retire knowledge articles that they are associated with.</td>
</tr>
</tbody>
</table>
Knowledge form (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>This field is available only if the <code>glide.knowman.ownership_group.enabled</code> property is enabled. If no ownership group is assigned and approvals are required to publish a knowledge article, it is automatically submitted for approval to the knowledge administrator and knowledge manager. For more information, see Ownership groups.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Publishing workflow state of the knowledge article, such as Draft, In Review, or Published. For a new article, the workflow state is set to Draft.</td>
</tr>
<tr>
<td>Short description</td>
<td>Title of the knowledge article. This title appears when browsing and searching for knowledge article, and at the top of the article. You can enter up to 100 characters in this field.</td>
</tr>
<tr>
<td>Document URL</td>
<td>URL of the article for accessing the online version in Microsoft Word. The URL is automatically generated for Word documents created in Microsoft SharePoint and Microsoft OneDrive with business accounts only. For other applications and account types, you must manually enter the URL in the Document URL field.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Avoid copy-pasting the browser URL, because it might not always work. Depending on the collaboration tool for your Word document use the URL generated specifically for sharing with other users.</td>
</tr>
<tr>
<td></td>
<td>When manually entering the URL:</td>
</tr>
<tr>
<td></td>
<td>• For Microsoft SharePoint, use the URL generated by the Word Online application for specific users you want to have access to the document.</td>
</tr>
<tr>
<td></td>
<td>• For Box, use the Box Shared Link. For more information, see Creating Shared Links.</td>
</tr>
<tr>
<td>Version</td>
<td>Automatically generated article version number. This number is incremented when changes are made to a published article.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is available if the article versioning feature has been enabled.</td>
</tr>
</tbody>
</table>
**Knowledge form (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Valid to</strong></td>
<td>The date this knowledge article expires. Articles do not appear in search results after the <strong>Valid to</strong> date or if the <strong>Valid to</strong> date is blank. The default value of the <strong>Valid to</strong> field is derived from the <strong>Article Validity</strong> field configured for the knowledge base (see Create a knowledge base). The <strong>Valid to</strong> date starts from the date the article was created until the number of days specified in the <strong>Article Validity</strong> field. If the <strong>Article Validity</strong> field is blank, the default date in the <strong>Valid to</strong> field for the knowledge article is set to January 1, 2100. An article author or editor can select whether to keep or change the default <strong>Valid to</strong> date. On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are about to expire in the next month. The recipient can then extend the <strong>Valid to</strong> date to continue using the article. For more information, see Knowledge Management email notifications.</td>
</tr>
<tr>
<td><strong>Scheduled publish date</strong></td>
<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Microsoft Word.</td>
</tr>
</tbody>
</table>

**Note:** If the system date format or user preferences are set to use the *yy* year format, you might face issues when the **Valid to** date is set to the default date. Contact your system administrator or modify the user preferences to use a date format with the *yyyy* year format. For more information, see Global date and time field format and Personalize the system date format topics.

**Related information**

**Create a knowledge article in Microsoft Word**

Create a knowledge article in Microsoft Word to author and collaborate on content using Word.
Before you begin

• Ensure that the system administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

• You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.

• You must have contribute access to the knowledge base within which you want to create the knowledge article.

• You must have signed in to your Office 365 account.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app from your Office 365 account and open a Word document. For more information, see Use the Office 365 app launcher.

2. In the New section, click New blank document, or open any existing Microsoft Word document.

3. On the Home tab of the Word document, click the Knowledge icon (Knowledge).

4. In the Knowledge Management pane of the Word document, click Create Article.

5. On the Knowledge form, fill in the fields.

<table>

<td>Future date when the knowledge article will be published automatically. For more information, see Schedule a knowledge article for publishing in Microsoft Word.</td>
</tr>
</tbody>
</table>

6. In the Document pane of the Word document, enter the article content.
7. In the Knowledge Management pane of the Word document, click **Submit**.
8. **Optional:** Publish the article by clicking **Publish**.
   (Optional) A knowledge article is published depending on the workflow setting of its knowledge base:
• **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see [Schedule a knowledge article for publishing in Microsoft Word](#).

If the article versioning feature is enabled, the version number of the knowledge article is updated. For more information, see [Knowledge article version numbers](#).

**What to do next**

You can share the document URL so that users can co-author the document. For more information, see [Document collaboration and co-authoring](#).

**Edit a knowledge article in Microsoft Word**

Use Microsoft Word to edit a knowledge article originally created in Microsoft Word.

**Before you begin**

• Ensure that the system administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see [Configure Knowledge Management - Add-in for Microsoft Word](#).)

• You must have logged in to your ServiceNow instance from the Word Online application. For more information, see [Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word](#).

• You must have contribute access to the knowledge article.

• You must have signed in to your Office 365 account.

**About this task**

ℹ️ **Note**: You can’t edit a knowledge article that uses an article template in Word.

**Procedure**

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app.
   For more information, see [Use the Office 365 app launcher](#).

2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon ().

4. Access the article in the Knowledge Management pane of the Word document.
   - In the Knowledge Management pane, in the Search box, enter the knowledge article number or description.
   - In the Knowledge Management pane, click a knowledge base to view a list of knowledge articles within the knowledge base. All knowledge bases and associated knowledge articles for which you have contribute or read access appear in the Knowledge Management pane. However, you can edit knowledge articles for which you have contribute access.

5. In the Knowledge Management pane, click the link to the knowledge article that you want to edit.

6. If the Document pane of the Word document contains any content, retain or replace the content.
   - To overwrite the existing content in the Word document with content from the article you selected, click Replace.
   - To keep the existing content in the Word document, click Retain.

   ✟ Note: When you save the article, the Word document content will replace the article content.

7. If the article versioning feature is enabled, click Checkout for a published knowledge article.
   You can edit only the latest version of a knowledge article.

8. Edit the content of the article in Microsoft Word.
   - Edit the article content online using Microsoft Word in your browser.
   - Edit the article content using the Word Desktop app on your computer. In this case, after you complete editing the desktop version of the article content, you must return to the online version in your browser to save the article content in your ServiceNow instance.

   ✟ Tip: If multiple people with contribute access to the knowledge article need to co-author the same document, you can share the document URL. For more information, see Document collaboration and co-authoring.

9. In the Knowledge Management pane, click Save.

10. Optional: Publish the article by clicking Publish in the Knowledge Management pane.
    The knowledge article is published depending on the workflow setting of its knowledge base.
• **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see [Schedule a knowledge article for publishing in Microsoft Word](#).

If the article versioning feature is enabled, the version number of the knowledge article increments to the next whole number (for example, from 2.02 to 3.0). For more information, see [Knowledge article version numbers](#).

**Unlink knowledge articles from linked Microsoft Word documents**

Unlink a knowledge article from a linked Microsoft Word document to edit the article directly from the Knowledge form in the Now Platform.

**Before you begin**

Ensure that the article was created using the Knowledge Management - Add-in for Microsoft Word.

Role required: admin

**About this task**

If a knowledge article is created using the Knowledge Management - Add-in for Microsoft Word, you can edit the article using only the linked Word document in the Word Online application. However, if you delete or move the linked Word document, the URL to the Word document and article is broken. Therefore, you will no longer be able to edit the article using the linked Word document. To continue editing such articles:

• Manually enter the new document URL for the Word document in the **Document URL** field on the Knowledge form in Microsoft Word. For more information about the field, see [Create a knowledge article in Microsoft Word](#).

• Unlink the article from its linked Word document by following the steps in this procedure.

**Procedure**

1. Navigate to **Knowledge > Articles**.
2. Select an article from the **Published** or **Unpublished** category.
3. On the Knowledge form, click the **Unlink from Word** related link.
Publish a knowledge article in Microsoft Word

Use the Word Online application to publish a knowledge article originally created in Microsoft Word to make it available to users.

Before you begin

- Ensure that the system administrator has configured the Knowledge Management - Add-in for Microsoft Word. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)
- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.
- You must have contribute access to the knowledge base within which you want to publish the knowledge article.
- You must have signed in to your Office 365 account.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.
2. In the New section, click New blank document, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon (ناقش).
4. Access the article in the Knowledge Management pane of the Word document.
   - In the Knowledge Management pane, in the Search box, enter the knowledge article number or description.
   - In the Knowledge Management pane, click the knowledge base to view a list of knowledge articles within the knowledge base.
5. In the Knowledge Management pane, click the link to the knowledge article that you want to publish.
6. On the Knowledge form, click Publish.

Results
A knowledge article is published depending on the workflow setting of its knowledge base:
• **Knowledge - Instant Publish**: The knowledge article is immediately published unless it is scheduled to be published at a later date.

• **Knowledge - Approval Publish**: The knowledge article is published on approval completion unless it is scheduled to be published at a later date.

For more information, see Schedule a knowledge article for publishing in Microsoft Word.

If the article versioning feature is enabled, the version of the article is incremented based on the version number pattern.

**Schedule a knowledge article for publishing in Microsoft Word**

Set a specific time and day for the draft version of a knowledge article created in Microsoft Word to be published automatically.

**Before you begin**

- You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.

- You must have logged in to your ServiceNow instance from the Word Online application. For more information, see Log in to your ServiceNow instance for authoring knowledge articles in Microsoft Word.

- You must have signed in to your Office 365 account.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see Activate the Knowledge Management Advanced plugin.

- The article versioning feature is enabled. For more information, see Article versioning.

- The Knowledge Management - Add-in for Microsoft Word is enabled. (For more information, see Configure Knowledge Management - Add-in for Microsoft Word.)

**Procedure**

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft Word app. For more information, see Use the Office 365 app launcher.

2. In the New section, click **New blank document**, or open any existing Microsoft Word document.
3. On the Home tab of the Word document, click the Knowledge icon (❑).

4. In the Knowledge Management pane of the Word document, in the Search box, enter the knowledge article short description.

5. Click the link to the knowledge article in the Draft state that you want to schedule for publishing.

   Note: The knowledge article must have been originally created using Microsoft Word.

6. In the Scheduled publish date field, click the show calendar icon (❑).

7. Select any future date from the calendar.

8. In the Select Time field, enter a time in the format hh:mm:ss.

9. Click OK.

10. Click Publish to enable the publishing workflow.

   Tip: If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click Recall.

Results
If approvals are disabled, the state of the knowledge article is changed to Scheduled for Publish and the article is automatically published on the scheduled publish date.

If approvals are enabled, the state of the knowledge article is changed to Review. If the article is approved, the state of the article is changed to Scheduled for Publish. If the article was approved after the scheduled publish date, the article is published immediately.

The version number of the knowledge article increments based on the publishing workflow. For more information, see Knowledge article version numbers.

   Knowledge workflows

Related information
   Approve an article that is being reviewed

Recall an article that is being reviewed in Microsoft Word
Recall a knowledge article that is being reviewed and created using Microsoft Word to stop the approval process.
Before you begin

• You must have contribute access to the knowledge base that stores the
  knowledge article you want to recall.

• You must have logged in to your ServiceNow instance from the Word Online
  application. For more information, see Log in to your ServiceNow instance for
  authoring knowledge articles in Microsoft Word.

• You must have signed in to your Office 365 account.

Ensure that the system administrator verifies the following settings:

• Knowledge Management Advanced plugin (com.snc.knowledge_advanced)
  is activated. For more information, see Activate the Knowledge Management
  Advanced plugin.

• The article versioning feature is enabled. For more information, see Article
  versioning.

• The Knowledge Management - Add-in for Microsoft Word is enabled. (For
  more information, see Configure Knowledge Management - Add-in for
  Microsoft Word.)

About this task
The author of a knowledge article, knowledge administrators, and system
administrators can recall an article. If an ownership group is assigned to a
knowledge article, the ownership group manager and ownership group
members can also recall the knowledge article.
If a version of a knowledge article is in the Review state, you can recall only the
 corresponding version to make additional changes. Recalling the article results
in a minor version increment.

Procedure

1. From the Microsoft 365 app launcher, select the icon to launch the Microsoft
   Word app.
   For more information, see Use the Office 365 app launcher.

2. In the New section, click New blank document, or open any existing Microsoft
   Word document.

3. On the Home tab of the Word document, click the Knowledge icon (KeyId). 

4. In the Knowledge Management pane of the Word document, in the Search
   box, enter the knowledge article title or description.

5. Click the link to the article in Review state that you want to recall.

6. On the Knowledge form, click Recall.
Results
The article opens in edit mode and the state of the article is changed to Draft. The version number of the article increments by 0.01.

Knowledge Management email notifications
Reminders enable relevant users to review knowledge articles and complete tasks associated with them.

By default, the Knowledge Management application includes the following types of email notifications:

- Email notifications for knowledge article feedback tasks.
- Email notifications for knowledge subscriptions.
- Email notifications for knowledge article approval publishing workflow.
- Email notifications for translation tasks.
- Email notifications for expiring knowledge articles.
- Email notifications for article quality index (AQI) reviews.

You can decide if you must receive any knowledge notifications by setting notification preferences. For more information, see Set knowledge notification preferences.

Email notifications for knowledge article feedback tasks
The email notifications for knowledge article feedback tasks are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).

The following table describes the recipient list of notifications for knowledge article feedback tasks and the associated conditions when a notification is sent.

<table>
<thead>
<tr>
<th>Recipient list of the email notification for knowledge article feedback tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Notification</strong></td>
</tr>
<tr>
<td>KM Feedback Task: Commented</td>
</tr>
<tr>
<td>KM Feedback Task: Created</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>KM Feedback Task: Info from Submitter</td>
<td>More information was requested from the submitter of a user feedback task.</td>
<td>User who submitted the feedback task</td>
</tr>
<tr>
<td>KM Feedback Task: Reassigned</td>
<td>A user feedback task was reassigned.</td>
<td>User who was reassigned the feedback task</td>
</tr>
<tr>
<td>KM Feedback Task: Resolution Accepted</td>
<td>A resolution described in a user feedback task was accepted.</td>
<td>User who was assigned the feedback task</td>
</tr>
<tr>
<td>KM Feedback Task: Resolution Rejected</td>
<td>A resolution described in a user feedback task was rejected.</td>
<td>User who was assigned the feedback task</td>
</tr>
<tr>
<td>KM Feedback Task: Resolved</td>
<td>A user feedback task was set as resolved.</td>
<td>User who submitted the feedback task</td>
</tr>
</tbody>
</table>

### Email notifications for knowledge subscriptions

The email notifications for knowledge subscriptions are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge). For notifications associated with ownership groups, your administrator must also activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for knowledge subscriptions and the associated conditions when a notification is sent.

### Recipient list of the email notification for knowledge subscriptions

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
</table>
| KM Subscription Group: Article checkout | A subscribed knowledge article was checked out with the ownership group feature enabled. | • Author  
• Revisers  
• Ownership group  
An email notification is sent to the ownership group alias comprising the ownership group manager and members. |
### Recipient list of the email notification for knowledge subscriptions (continued)

</tbody>
</table>
| KM Subscription: Article checkout | A subscribed knowledge article was checked out with the ownership group feature disabled. | • Author  
• Revisers |
| KM Subscription: Article commented | A comment was added to a subscribed knowledge article with the ownership group feature enabled. | • Author  
• Revisers |
| KM Subscription: Article published | A knowledge article was published in a subscribed knowledge base. | • Knowledge base owner  
• Knowledge base subscribers |
| KM Subscription: Article revised | A subscribed knowledge article was edited. | • Knowledge base owner  
• Knowledge article subscribers  
• Author  
• Revisers |
| KM Subscription: Article revised in KB | A knowledge article in a subscribed knowledge base was edited. | • Knowledge base owner  
• Knowledge article subscribers  
• Author  
• Revisers |

**Note:** An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

### Email notifications for knowledge article approval publishing workflow

The email notifications for knowledge article approval publishing workflow are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge).
The following table describes the recipient list of notifications for the knowledge article approval publishing workflow and the associated conditions when a notification is sent.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM: Approve article for publishing</td>
<td>A knowledge article was approved for publishing with the ownership group feature disabled.</td>
<td>Knowledge base owner and managers</td>
</tr>
<tr>
<td></td>
<td>A knowledge article was approved for publishing with the ownership group feature enabled.</td>
<td>Ownership group manager and members</td>
</tr>
<tr>
<td>KM: Article approved for publish</td>
<td>A knowledge article was approved for publication.</td>

</tr>
<tr>
<td>KM: Article rejected for publish</td>
<td>A knowledge article was rejected for publication.</td>
<td>User (author or reviser) who submitted the article for approval</td>
</tr>
</tbody>
</table>

**Note:** An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

### Email notifications for translation tasks

The email notifications for translation tasks are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) and I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2). The I18N: Internationalization plugin (com.glide.i18n) activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

The following table describes the recipient list of notifications for translation tasks on knowledge articles and the associated conditions when a notification is sent.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Translation Task: Assigned to me</td>
<td>A translation task was assigned.</td>
<td>User who was assigned the translation task</td>
</tr>
</tbody>
</table>

<td>• User who was assigned the translation task</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• User who submitted the translation task</td>
</tr>
</tbody>
</table>

Email notifications for expiring knowledge articles

The email notifications for expiring knowledge articles are available when your administrator activates the Knowledge Management Core plugin (com.glideapp.knowledge) and sets the value of the glide.knowman.enable_article_expiry_notification property to true. By default, the property value is set to false.

Knowledge articles have an expiration date set using the Valid to field when creating the article. Articles do not appear in search results after the Valid to date.

On the first day of each month, the application sends an email notification to a list of authorized recipients to remind them about articles that are scheduled to expire in the next month. The user can then determine whether to extend the Valid to date to continue providing access to the article.

The content of the email notification is determined by the number of articles expiring in the coming month.

• Up to 10 – The email notification includes a list of article links displayed in a tabular format and arranged in ascending order by their Valid to date. Clicking a link opens the article in Now Platform.

• More than 10 – The email notification includes a View the list of expiring articles link, which when accessed opens a list in Now Platform of all articles expiring in the next month.

The following table describes the recipient list of notifications for expiring knowledge articles and the associated conditions when a notification is sent.
Recipient list of the email notification for expiring knowledge articles

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM: Article Expiry Warning</td>
<td>An article is scheduled to expire in the next month with the ownership group feature disabled.</td>
<td>• Author&lt;br&gt;• Knowledge base owner and managers&lt;br&gt;• Reviser for the updated and checked-out versions</td>
</tr>
<tr>
<td></td>
<td>An article is scheduled to expire in the next month with the ownership group feature enabled.</td>
<td>• Author&lt;br&gt;• Knowledge base owner and managers&lt;br&gt;• Reviser for the updated and checked-out versions&lt;br&gt;• Ownership group manager and members</td>
</tr>
</tbody>
</table>

**Note:** An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

**Email notifications for article quality index (AQI) reviews**

The email notifications for an article quality index review on knowledge articles are available when your administrator activates the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).

The following table describes the recipient list of notifications for an AQI review on knowledge articles and the associated conditions when a notification is sent.
Recipient list of the email notification for AQI reviews

<table>
<thead>
<tr>
<th>Notification</th>
<th>Condition</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM: AQI on Article</td>
<td>An AQI was performed and submitted on a knowledge article with the ownership group feature disabled.</td>
<td>• User (author or reviser) who last updated the article</td>
</tr>
<tr>
<td>KM: AQI on Ownership Group Article</td>
<td>An AQI was performed and submitted on a knowledge article with the ownership group feature enabled.</td>
<td>• User (author or reviser) who last updated the article</td>
</tr>
</tbody>
</table>

Note: An email notification is sent to a reviser of a knowledge article when the article versioning feature is enabled.

Set knowledge notification preferences

Set notification preferences for knowledge bases and knowledge articles.

Before you begin

Role required: knowledge

About this task

Users can set notification preferences from the Knowledge menu or from the Knowledge Management Service Portal.
**Procedure**

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Notification Preferences tab.

3. Click **Knowledge Base** and enable or disable the knowledge base notification options.

4. Click **Knowledge Articles** and enable or disable the knowledge article notification options.

**Knowledge subscriptions**

Subscribe to knowledge bases and knowledge articles and receive email notifications about new articles and article revisions or comments.

- **Subscribed to a knowledge base:**
  - Knowledge base owners are auto-subscribed to all articles in the knowledge bases they own. They receive email notifications when new articles are created or revised (published) in the knowledge base.
  - Users who subscribe to a knowledge base receive email notifications when new articles are created in the knowledge base or if the existing articles are revised (published).

- **Subscribed to a knowledge article:**
  - Knowledge authors are auto-subscribed to the articles they create. They receive email notifications when the articles they created are checked out or revised (published) by other authors, and if the articles receive user comments.
  - Users who subscribe to an article receive email notifications when the article is revised (published).

Users can set their Knowledge notification preferences using **System Settings**.

For more information, see **Knowledge Management email notifications** and **Set knowledge notification preferences**.
The knowledge subscription feature is available for both the Knowledge Management v3 user interface and the Knowledge Management Service Portal.

If the article versioning feature is enabled, the following notifications are also sent:

- An article is checked out
- An article is revised
- A new version of an article is published

**Activation information**

The knowledge subscriptions feature requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced). For more information, see Configure knowledge subscriptions.

**Related information**

- Knowledge article version numbers
- Article versioning

**Subscribe to a knowledge base**

Subscribe to a knowledge base and receive notifications when articles are added to that knowledge base.

**Before you begin**

Role required: knowledge

**About this task**

Users can subscribe to a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

**Procedure**

1. Navigate to Knowledge > Homepage.
2. Click the Subscribe link on the knowledge base tile.
   - The link changes to Subscribed and includes a check mark.

**Unsubscribe from a knowledge base**

Unsubscribe from a knowledge base.

**Before you begin**

Role required: knowledge
About this task
Users can unsubscribe from a knowledge base from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

⚠️ Note: If you subscribe to an article and then subscribe to the knowledge base, unsubscribing from the knowledge base also unsubscribes you from the article.

Procedure
1. Navigate to Knowledge > Homepage.
2. Point to and click the Subscribed link on the knowledge base tile, which toggles to Unsubscribe.
   After unsubscribing you from the knowledge base, the link toggles to Subscribe.

Subscribe to a knowledge article
Subscribe to a knowledge article within a knowledge base.

Before you begin
Role required: knowledge

About this task
Users can subscribe to a knowledge article from either the Knowledge Management V3 user interface or the Knowledge Management Service Portal.

⚠️ Note:
Users who are already subscribed to a knowledge base are also subscribed to the articles within that knowledge base.

To subscribe to articles from the base service portal (https://<instance name>/sp?), you must navigate to the Knowledge Management Service Portal pages (for example, https://<instance name>/sp?id=kb_home) from the base service portal.

Procedure
1. Navigate to Knowledge > Homepage.
2. Click Subscribe at the top of the knowledge article.
   The system shows an information message about the article subscription and the button toggles to Subscribed. If the email notification contains an article link, the link points to the Knowledge Management Service Portal. The email notification for a subscribed article includes the knowledge article ID, short description, and link to the article.
Unsubscribe from a knowledge article

Unsubscribe from a knowledge article.

Before you begin
Role required: knowledge

About this task
Users can unsubscribe from a knowledge article from either the Knowledge Management v3 user interface or the Knowledge Management Service Portal.

Note: If you are subscribed to a knowledge base and you unsubscribe from an article in that knowledge base, you must also unsubscribe from the parent knowledge base.

Procedure
1. Navigate to Knowledge > Homepage.
2. Point to and click Subscribed, which toggles to Unsubscribe.
   If you are subscribed to the knowledge article, this action results in an information message that the article subscription has been removed. If you are also subscribed to the parent knowledge base, proceed to the next step.
3. If you are subscribed to the parent knowledge base, click Yes on the Unsubscribe pop-up window.
   This action results in an information message that the knowledge base subscription has been removed.

Manage knowledge subscriptions

Manage knowledge base and knowledge article subscriptions from the Notification Settings page.

Before you begin
Role required: knowledge

About this task
Users can manage knowledge subscriptions from the Knowledge application or from the Knowledge Management Service Portal.
Procedure

1. Navigate to the Notification Settings page.

<table>
<thead>
<tr>
<th>Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the Knowledge application</td>
<td>Click the Notification Settings module.</td>
</tr>
<tr>
<td>From the Knowledge Management Service Portal</td>
<td>Click the user name in the portal header and then click Notification Settings.</td>
</tr>
</tbody>
</table>

2. Click the Subscriptions tab.

3. Click Knowledge Base or Knowledge Articles to see a list of current subscriptions.

4. To unsubscribe from a knowledge base or knowledge article, click Subscribed. The link toggles to Unsubscribed.

Knowledge blocks

Simplify knowledge authoring for writers and knowledge consumption for readers with knowledge blocks. Knowledge blocks are reusable pieces of content secured by user criteria that you can add to knowledge articles in a knowledge base. The user criteria controls which users can read or not read the block content in an article or search, enabling users to more easily view content that is relevant to them.

Knowledge blocks are available for use in Now Platform only.

How to use knowledge blocks

To use knowledge blocks, a knowledge administrator or manager must enable the knowledge blocks feature for each knowledge base in which the blocks will be used.

- Enable knowledge blocks for each knowledge base

Knowledge contributors can create knowledge blocks and insert them into articles in a knowledge base:

- Create a knowledge block
- Add knowledge blocks to a knowledge article
- Preview a knowledge article with knowledge blocks by user or date

Note: Knowledge blocks are not supported in articles of type wiki.
Knowledge block content can be read or not read in an article or search based on user criteria set at the knowledge base and knowledge block level. See Select user criteria for a knowledge block for more information.

Example: Holiday calendar with location-specific knowledge block content

You are part of an enterprise HR organization that maintains a company knowledge base. You want to create a holiday calendar so that employees know which days of the year are company holidays. Since the company has multiple locations and holiday dates vary based on where the employee is located, there are several ways that you could create the knowledge article.

One way is that you could create a knowledge article for each location, with an article for Location A, Location B, and so on.

- **Pros:** simplified consumption. Employees have a single article to search for and read.
- **Cons:** more work for HR. HR has multiple articles to manage and update for each location where the company has employees.

Another way is that you could create a single knowledge article that includes sections for each location.

- **Pros:** simplified authoring. HR has a single article to manage and update.
- **Cons:** more work for employees. Employee must scroll through and disregard extraneous content to find the section in the article that pertains to them.

With knowledge blocks, you can create a single knowledge article with location-specific block content secured by user criteria. This approach helps to reduce the workload for both HR and employees. As an HR agent, you have a single article to manage and update. Employees have a single article to search for and read, with the user criteria ensuring that they only view content that is relevant to them.

**If you are using a custom search or knowledge article viewer**

If you are using a custom search or knowledge article viewer with your application, you should integrate it with the appropriate knowledge or knowledge blocks API. (Integration is only necessary if you are using a custom search or knowledge article viewer.)

- **Integrating a custom search or knowledge article viewer with knowledge blocks**
Activation information

To use knowledge blocks in your application, you must activate knowledge blocks. For information on what components are installed with the feature, see Components installed with knowledge blocks.

⚠️ Note: Activating knowledge blocks automatically activates Knowledge Management Advanced, which enables advanced features such as article versioning. Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Activate knowledge blocks

You can activate knowledge blocks [com.snc.knowledge_blocks] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task

Knowledge blocks activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Management Advanced</td>
<td>Enables advanced features for Knowledge Management, such as article versioning. For a full list of features, see activate the Knowledge Management Advanced plugin.</td>
</tr>
<tr>
<td>[com.snc.knowledge_advanced]</td>
<td></td>
</tr>
</tbody>
</table>

⚠️ Note: Knowledge blocks can be used with or without the article versioning feature. To disable the feature, see Disable the article versioning feature.

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

⚠️ **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

### Components installed with knowledge blocks

Several types of components are installed with activation of the knowledge blocks plugin, including tables.

⚠️ **Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see **Find components installed with an application**.

Demo data is available for this feature.

#### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Block [kb_knowledge_block]</td>
<td>Knowledge blocks table.</td>
</tr>
<tr>
<td></td>
<td>⚠️ <strong>Note:</strong> This table extends the Knowledge [kb_knowledge] table.</td>
</tr>
<tr>
<td>KB Knowledge to Block [m2m_kb_knowledge_to_block]</td>
<td>KB knowledge to block table.</td>
</tr>
<tr>
<td>KB Knowledge to Block History [m2m_kb_to_block_history]</td>
<td>KB knowledge to block history table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see **Table administration**.

### Enable knowledge blocks for each knowledge base

Enable the knowledge blocks feature for each knowledge base where you plan to use the blocks. Once enabled, you can create knowledge blocks to add to knowledge articles within a knowledge base.
Before you begin
Make sure that the knowledge blocks [com.snc.knowledge_blocks] plugin is activated.
Role required: knowledge_admin or knowledge_manager

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Open the knowledge base record.
3. In the Knowledge Base form, select the Enable blocks check box.

   Note: If the Enable blocks check box is not visible, you can add the field to the form by right-clicking the form header and navigating to Configure > Form Layout.

4. Click Update.

   Note: If you decide to later disable the knowledge blocks feature, all knowledge blocks within the knowledge base must be deleted before you can clear the box.

What to do next
Create knowledge blocks to use within the enabled knowledge base.

Create a knowledge block
Create or modify a knowledge block to define a reusable piece of content that can be inserted into knowledge articles in a knowledge base. The knowledge
block is secured by user criteria, which controls what users, groups, roles, companies, locations, or departments can read or not read the content in an article or search, enabling users to more easily view content that is relevant to them.

**Before you begin**
Role required: user must have contributor access to the knowledge base.

**Procedure**

1. Navigate to **Knowledge > Knowledge Blocks > Create New**.
2. Click **New** or open a record.
3. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>This field is automatically set to a knowledge block number.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Name of the knowledge base. The knowledge blocks feature must be enabled for each knowledge base that you plan to create blocks. See Enable knowledge blocks for each knowledge base.</td>
</tr>
<tr>
<td>Category</td>
<td>Name of the knowledge category or subcategory.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge block. This field appears when the ownership groups feature is enabled. Knowledge blocks can be used with or without the ownership groups feature. To learn more about ownership groups, including how to enable the feature, see Ownership groups.</td>
</tr>
<tr>
<td>Can read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td></td>
<td>User criteria set at the knowledge base and knowledge block level controls which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see Select user criteria for a knowledge block.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cannot read</td>
<td>User criteria to apply for cannot read access at the knowledge block level. User criteria set at the knowledge base and knowledge block level controls which users can read or not read block content within an article. To learn more about selecting user criteria for a knowledge block, see <a href="#">Select user criteria for a knowledge block</a>.</td>
</tr>
</tbody>
</table>
| Valid to      | Date that the knowledge block expires. After the valid to date:  
|               | • Knowledge article viewer will no longer display expired knowledge block content in the associated knowledge article.  
|               | • Search will no longer return knowledge articles if the keywords are contained in the expired blocks. |
| Short Description | Description of the knowledge block.                                                                                                                                 |
| Text          | Text of the knowledge block.                                                                                                                                 |
| Version       | This field is automatically set to a version number when the article versioning feature is enabled.  
|               | Knowledge blocks can be used with or without the article versioning feature. To learn more about article versioning, including how to disable the feature, see [Article versioning](#). |
| Article type  | This field is automatically set to HTML.                                                                                                                                 |
|               | **Note:** Knowledge blocks are only supported with HTML knowledge articles.                                                                                                                                 |
| Workflow      | This field is automatically set to the publication state of the block, such as Draft, Published, or Retired. |
| Source task   | Not applicable.                                                                                                                                 |

4. Click **Save** or **Update** to create or update the block.
5. Click **Publish** to publish the block.

 ¡ **Note:** Any additional steps required to publish the knowledge block, such as approvals, depend on the publishing workflow for the knowledge base. See **Knowledge workflows** for more information.

**What to do next**
After the knowledge block is published, you can add the block to an article within the knowledge base.

**Select user criteria for a knowledge block**
Control which users can read or not read knowledge block content within an article in a knowledge base by setting user criteria at the knowledge base and knowledge block level. As a knowledge contributor, you can apply user criteria at the knowledge block level.

**Before you begin**
Role required: user must have contributor access to the knowledge base.

**Procedure**
1. Navigate to **Knowledge > Knowledge Blocks > All**.
2. Open a knowledge block.
3. Apply the desired user criteria for the **Can Read** and **Cannot Read** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>User criteria to apply for read access at the knowledge block level.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>User criteria to apply for cannot read access at the knowledge block level.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note:

• You can use existing or create new user criteria records. To create a new record, see Create a user criteria record in Knowledge Management.

• If a user meets any Can Contribute criteria at the knowledge base level, they can read all knowledge block content, regardless of the Can read and Cannot read criteria set at the knowledge block level.

• If a user meets any Cannot read criteria at the knowledge block level, they cannot read the block content, regardless of the Can read criteria set at the knowledge block level.
4. Right-click the form header and click **Save**.

**What to do next**

- To finish and publish the block, see **Create a knowledge block**.
- To add the block to an article, as well as preview the article by impersonating different users, see **Add knowledge blocks to a knowledge article**.
Retire a knowledge block
You can retire a published knowledge block so that it is no longer available for users to view or search. A knowledge block can only be retired if it is not being used in any knowledge articles.

Before you begin
Role required: user must have contributor access to the knowledge base.

Procedure
1. Navigate to Knowledge > Knowledge Blocks > Published.
2. Open the applicable record.
3. In the Articles related list, verify that the knowledge block is not being used in any knowledge articles.
   A knowledge block can only be retired or deleted if it is not being used in any knowledge article, including any retired article or previous version of an article.
4. Click Retire to retire the knowledge block.

   Note: Any additional steps required to retire the knowledge block, such as approvals, depend on the workflow for the knowledge base. See Knowledge workflows for more information.

Add knowledge blocks to a knowledge article
You can insert one or more knowledge blocks into a knowledge article within a knowledge base. Each knowledge block is secured by user criteria, which controls who can read or not read the content in an article.

Before you begin
Role required: user must have contributor access to the knowledge base.

Procedure
1. Navigate to Self-Service > My Knowledge Articles.
2. Click New or open a record.
   On clicking New, you are provided options to select an article template. The article templates appear when you activate them in the Knowledge > Article templates.
3. Select an article template.

   Note: You can add or remove knowledge blocks in more than one HTML field of any article template including custom templates.
4. Fill in the fields on the form, as appropriate.
   For further details on creating a knowledge article, see Create a knowledge article.

   **Note:** Knowledge blocks are only supported with HTML knowledge articles. Make sure that the **Article type** field is set to **HTML**.

5. In the article body, click where a block needs to be inserted and then click **Add Blocks**.
   If the **Add Blocks** button is not visible, make sure that the knowledge blocks feature is enabled for the knowledge base that the article is in. See Enable knowledge blocks for each knowledge base for more information.
   In the **Add Blocks** side panel, you can search for, do an advanced search, view, and insert knowledge blocks into the article. To use condition builder with advanced search, see Condition builder. You can also create blocks directly from the side panel.
   
   • You can configure the number of search results displayed in the **Add Blocks** side panel using the `glide.knowman.add_blocks.search_results` property. By default, the minimum number of search results displayed is 6 and the maximum number of search results displayed is 25. See Knowledge properties for more information.

   • If there are knowledge blocks you cannot find, make sure that the blocks are published, in the same language, and in the same knowledge base as an article.

6. **Optional:** Rearrange knowledge block in the article body.
<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are using a mouse</td>
<td>a. Click the block to select it.</td>
</tr>
<tr>
<td></td>
<td>b. Drag and drop the block within the article.</td>
</tr>
<tr>
<td>If you are using a keyboard</td>
<td>a. Place your cursor to the left of the block.</td>
</tr>
<tr>
<td></td>
<td>b. Press the right arrow key to select the block.</td>
</tr>
<tr>
<td></td>
<td>c. Use Ctrl+x and Ctrl+v to cut and paste the block within the article.</td>
</tr>
</tbody>
</table>

**Example**

(Optional) The following GIF shows an example of a user moving a knowledge block within an article using a keyboard.

7. Click **Save** or **Update** to create or update the article.
8. Click **Publish** to publish the article.

**Note:** Any additional steps required to publish the knowledge article, such as approvals, depend on the publishing workflow for the knowledge base. See Knowledge workflows for more information.

**Preview a knowledge article with knowledge blocks**

Preview a knowledge article with knowledge blocks by user or, if published, by date. For an unpublished article, you can preview the article by user by impersonating different users to see how the article displays or hides block content (based on the user criteria set at the knowledge base and knowledge block level). For published articles, you can preview the article by both user and date to see how the article appears in past versions for different users.

**Before you begin**

Role required: user must have contributor access to the knowledge base.

**Procedure**

1. Navigate to **Knowledge > Articles**, and open one of the modules, such as **Unpublished** or **Published**.
2. Open the knowledge article with knowledge blocks.
3. In the **Related Links** section, click **Preview Article with Blocks**.
4. Preview the article as one of the following.

<table>
<thead>
<tr>
<th>Option</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Unpublished article</strong></td>
<td>Preview the article by user. In the <strong>View As</strong> field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
<tr>
<td><strong>Published article</strong></td>
<td>Preview the article by user and date:</td>
</tr>
<tr>
<td></td>
<td>• In the <strong>View As</strong> field, you can search for and impersonate different users to see how the article appears based on the can and cannot read access of the user.</td>
</tr>
<tr>
<td></td>
<td>• In the <strong>View on date</strong> field, you can select different dates to see how the article appears in past versions.</td>
</tr>
</tbody>
</table>

**Knowledge blocks authoring in Agent Workspace**

Reuse content by creating, editing, and publishing knowledge blocks in Agent Workspace.
You can perform the following knowledge blocks-related tasks in Agent Workspace:

- Create a knowledge block for a knowledge base.
- Manage all unpublished and published knowledge blocks authored by you.
- Add knowledge blocks to a knowledge article.
  When adding a knowledge block to a knowledge article, you can also add knowledge blocks to any fields associated with an article template if used for an article.
- Retire a knowledge block not used in any knowledge articles.

View a knowledge block in Agent Workspace

View a knowledge block in Agent Workspace, including the block number, short description, and block content.

Before you begin

You must have read access to the knowledge base that stores the knowledge block you want to view.
Role required: agent_workspace_user and knowledge

Procedure

1. Navigate to Agent Workspace > Agent Workspace Home.
2. View knowledge blocks authored by you or by other people.
   - View all blocks by navigating to Lists > Knowledge Blocks > All.
   - View blocks authored by you by navigating to either Lists > Knowledge Blocks > Published or Lists > Knowledge Blocks > Unpublished.
3. Click the link to the knowledge block that you want to view.
4. Optional: View another version of the knowledge block by selecting the version in the Version list.

  Note: The Version list appears only when the article versioning feature is enabled. For more information, see Article versioning.

Results

The selected version of the knowledge block opens within Agent Workspace. Any earlier version of the knowledge block is indicated as outdated. When viewing an earlier version, click the version number of the knowledge block to view a list of all versions.

Create a knowledge block in Agent Workspace

Create a knowledge block for a knowledge base in Agent Workspace to reuse a piece of content in knowledge articles in that knowledge base.

Before you begin

- Enable the knowledge blocks feature for the knowledge base where you plan to create blocks. For more information, see Enable knowledge blocks for each knowledge base.
- You must have contribute access to the knowledge base within which you want to create the knowledge block.

Role required: agent_workspace_user and knowledge

About this task

You can also create blocks when accessing an article panel. For more information, see Add a knowledge block to a knowledge article in Agent Workspace.

Procedure

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Optional: Check whether a knowledge block on this subject is already available.

   a. Navigate to Lists > Knowledge Blocks > All.

   b. Set a filter to search for possible matching knowledge blocks.

      • Click a column header. Based on the data type included in the column, in the Filter section, select the filter options or enter the filter conditions you want to apply. For example, for the Workflow column, you can select the following states:

         ◦ Draft
         ◦ Review
         ◦ Scheduled for publish
         ◦ Published
         ◦ Pending retirement
- Retired
- Outdated

- Click the show filter panel icon (), and click Advanced view. In the Advanced view dialog box, specify conditions in the All of these conditions must be met field and click Update.

3. Click New in a Knowledge Blocks list.
4. On the Knowledge Block form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique number for identifying the knowledge block. This field is automatically populated.</td>
</tr>
<tr>
<td>Knowledge base</td>
<td>Name of the knowledge base to which you are adding the knowledge block.</td>
</tr>
<tr>
<td>Category</td>
<td>Name of the knowledge category or subcategory associated with the knowledge base.</td>
</tr>
<tr>
<td>Ownership Group</td>
<td>Ownership group for the knowledge block. This field appears when the ownership groups feature is enabled (see Ownership groups).</td>
</tr>
</tbody>
</table>

**Note:** Knowledge blocks can be used without the ownership groups feature.

<table>
<thead>
<tr>
<th>Can Read</th>
<th>User criteria to apply for read access at the knowledge block level.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>User criteria set at the knowledge base and knowledge block level control which users can read block content within an article. (For more information, see Select user criteria for a knowledge block.)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Cannot Read</th>
<th>User criteria to apply for cannot read access at the knowledge block level.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>User criteria set at the knowledge base and knowledge block level controls which users can read block content within an article. (For more information, see Select user criteria for a knowledge block.)</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Valid to     | Date that the knowledge block expires. Once the valid to date has passed:  
• The Knowledge article view page no longer displays expired knowledge block content in the associated knowledge article.  
• Knowledge article searches no longer return knowledge articles if the keywords are contained only in the expired blocks. |
| Short description | Description of the knowledge block.                                                                                                           |
| Article body | Content of the knowledge block.                                                                                                               |
| Version      | Version number of the knowledge block. This field is automatically set to a version number when the article versioning feature is enabled.  
*Note:* Knowledge blocks can be used without the article versioning feature. To learn more about article versioning, including how to disable the feature, see Article versioning. |
| Article type | Markup language used for formatting the block. This field is automatically set to HTML because knowledge blocks are supported only with HTML knowledge articles. |
| Workflow     | Publication state of the block. This field is automatically set to the publication state of the block, such as Draft, Published, or Retired. |

*Note:* You can ignore the Source Task field, which is not used.

5. Click **Save**.
   The knowledge block is saved and appears in the Unpublished list of Knowledge Blocks in Agent Workspace and additional functionality becomes available on the form.

6. **Optional:** Publish the block by clicking **Publish**.
   (Optional) A knowledge block is published depending on the workflow setting of its knowledge base.
• **Knowledge - Instant Publish:** The knowledge block is immediately published.

• **Knowledge - Approval Publish:** The knowledge block is published on approval completion.

When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version number of the knowledge block is incremented.

**Related information**

**Edit a knowledge block in Agent Workspace**

**Edit a knowledge block in Agent Workspace**

Edit knowledge blocks within a knowledge base in Agent Workspace to update the reused content across articles within the knowledge base.

**Before you begin**

You must have contribute access to the knowledge base that stores the knowledge block you want to edit.

Role required: agent_workspace_user and knowledge

**Procedure**

1. Navigate to **Agent Workspace > Agent Workspace Home**.

2. Go to **Lists > Knowledge Blocks > All**.

3. Click a knowledge block link.

4. Modify the fields on the Knowledge Block form.

   • For an unpublished knowledge block, the Knowledge Block form opens when you select the article.

   • For a published knowledge block, click **Edit** to access the Knowledge Block form.

   ![Note](https://example.com) **Note:** If the article versioning feature is enabled, you can edit only the latest version of a knowledge block. Click **Checkout** after you click **Edit**.

5. Click **Save**.

   The knowledge block is saved and appears in the Unpublished list under Knowledge Blocks. If the article versioning feature is enabled, the version of the knowledge block is incremented by 0.01.

6. **Optional:** Publish the knowledge block by clicking **Publish**.

   The knowledge block is published depending on the workflow setting of its knowledge base.
• **Knowledge - Instant Publish**: The knowledge block is immediately published.
• **Knowledge - Approval Publish**: The knowledge block is published on approval completion.

When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version number of the knowledge block is updated to the next whole number (for example, from 2.02 to 3.0).

**Publish a knowledge block in Agent Workspace**

Publish a knowledge block to make it available to add to knowledge articles.

**Before you begin**
You must have contribute access to the knowledge base that stores the knowledge block you want to publish.
Role required: agent_workspace_user and knowledge

**Procedure**
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge Blocks > Unpublished.
3. Click a knowledge block link.
4. On the Knowledge Block form, click **Publish**.

**Results**
A knowledge block is published depending on the workflow setting of its knowledge base.

• **Knowledge - Instant Publish**: The knowledge block is immediately published.
• **Knowledge - Approval Publish**: The knowledge block is published on approval completion.

When published, your knowledge block appears in the Published and All lists under Knowledge Blocks in Agent Workspace. If the article versioning feature is enabled, the version of the block is incremented.

**Related information**
- [View a knowledge block in Agent Workspace](#)
- [Approve a knowledge block in Agent Workspace](#)

Approve a knowledge block that is awaiting your review in Agent Workspace.
Before you begin
Role required: agent_workspace_user and knowledge

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge Blocks > Unpublished.
3. Click a knowledge block link that is in the Review workflow state.
4. Click Edit.
5. In the Approvals related list, in the State column, click Requested.
   The Approval form opens in another tab within Agent Workspace.
6. From the State list, select Approved.
7. Click Save.

Results
The approved knowledge block is published immediately. If the article versioning feature is enabled, the version number of the knowledge block increments to the next whole number (for example, from 2.02 to 3.0). On the Knowledge Block form, the workflow state changes to Published. The new published version of the knowledge block is added to the Block Versions related list on the Knowledge Block form. The version is also available in the All list under Knowledge Blocks in Agent Workspace, go to Knowledge Blocks > All.

Add a knowledge block to a knowledge article in Agent Workspace
Add a knowledge block to a knowledge article in Agent Workspace.

Before you begin
• Both the knowledge article and the knowledge block must be in the same knowledge base.
• You must have contribute access to the knowledge base.
• Ensure that the knowledge blocks feature is enabled for the knowledge base that the article is in. For more information, see Enable knowledge blocks for each knowledge base.

Role required: agent_workspace_user and knowledge

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge Articles > All.
3. Click an existing article link.  
   For more information, see Edit a knowledge article in Agent Workspace.

   Note:  
   • Knowledge blocks are supported only with HTML knowledge articles. Make sure that the Article type field is set to HTML.
   • If a knowledge article uses an article template, you can add knowledge blocks to any fields associated with the article template.

4. In the contextual side panel, click the add blocks icon (＋).

5. Search for the article to which you want to add the knowledge block. To use condition builder with advanced search, see Condition builder.

6. Click Insert to add the knowledge block to the article. If there are no knowledge blocks, click Create New Block and follow the procedure to create another block. For more information, see Create a knowledge block in Agent Workspace.

7. Click Update to save your changes.

   Note: You can preview the article with the blocks. For more information, see Preview a knowledge article with knowledge blocks in Agent Workspace.

8. Click Publish to publish the article.

   The knowledge article is published depending on the workflow setting of its knowledge base. For more information, see Publish a knowledge article in Agent Workspace.

Preview a knowledge article with knowledge blocks in Agent Workspace

Before you begin
You must have contribute access to the knowledge base that stores the knowledge article.
Role required: agent_workspace_user and knowledge

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Go to Lists > Knowledge Articles > All.
3. Select the article in which you want to preview a knowledge block and click Edit.
4. Click Preview with Blocks.
The article edit page refreshes to show options for previewing a knowledge block.

5. Optional: Click Show Blocks to highlight the knowledge blocks added to the article.

6. Click OK.

### Retire a knowledge block in Agent Workspace

Retire a published knowledge block if you no longer want it to be available for users to view or search.

#### Before you begin
You must have contribute access to the knowledge base that stores the knowledge block you want to retire.

Role required: agent_workspace_user and knowledge

#### About this task
You can retire knowledge blocks only if they are not used in any knowledge articles.

#### Procedure
1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Go to **Lists > Knowledge Articles > Published**.
3. Select the knowledge block you want to retire.
4. Click **Edit**.
5. Click **Retire**.

#### Results
The knowledge block is retired depending on the workflow setting of its knowledge base.

- **Knowledge - Instant Retire**: The knowledge block is immediately retired.
- **Knowledge - Approval Retire**: The knowledge block is retired on approval completion.

When retired, your knowledge block no longer appears in the Published list under Knowledge Blocks in Agent Workspace.

#### Integrating a custom search or knowledge article viewer with knowledge blocks

If you are using a custom search or knowledge article viewer with your application, you can integrate that custom search or viewer with the appropriate knowledge or knowledge blocks API.
Note: Integration is only necessary if you are using a custom search or knowledge article viewer.

KBPortalServiceImpl - Global

The KBPortalServiceImpl API is included with Knowledge Management V3 [com.snc.knowledge3] as a script include. It provides methods to use with knowledge, such as integration with a custom search.

KBPortalServiceImpl - KBPortalServiceImpl()

Instantiates a KBPortalServiceImpl object in a global application.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBPortalServiceImpl - getResultData(Object request)

Returns search results based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.

If you have activated the knowledge blocks feature and are using a custom search for knowledge with your application, your search may not return relevant articles when keywords are contained in the blocks. To return search results based on keywords from the article and from relevant block content that the user has access to read, you must call the `getResultData()` method inside your custom search.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>Object</td>
<td>JSON object to refine the search.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Array of search results in JSON format based on keywords from the knowledge article and from relevant knowledge block content that the user has access to read.</td>
</tr>
</tbody>
</table>
Example: Integrating a custom search with knowledge blocks

function doKeywordSearch(queryText, count, queryLocation) {
    var results = [];

    // To set up the request.
    var request = {
        keyword: queryText,
        language: "",

        // To pass data to filter on different metadata.
        variables: {
            kb_knowledge_base: ['Knowledge'],
            kb_category: '',
            author: ['']
        },

        // Provide the following.
        context: gs.getProperty('glide.knowman.sp.search_context', 'Knowledge Search'),
        resource: 'Knowledge',
        order: "relevancy,true",

        // Provide the pagination variables.
        start: queryLocation,
        end: queryLocation+count,

        attachment: false,

        // Provide any additional metadata you want to include in your results.
        knowledge_fields: [
            "number",
            "sys_id",
            "published"
        ]
    };

    // To execute the search.
    var response = new KBPortalServiceImpl();
    response.getResultData(request);

    // To send the search results back to the UI or to store results in your object.
    for (var i = 0; i < response.results.length; i++) {
        result = response.results[i];
        var article = {
            // Additional metadata
        }
    }
KBBlock - Global

The KBBlock API is included with knowledge blocks [com.snc.knowledge_blocks] as a script include. It provides methods to use with the knowledge blocks feature, such as integration with a custom knowledge article viewer.

KBBlock - KBBlock()

Instantiates a KBBlock object in a global application.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

KBBlock - getArticleContent(GlideRecord knowledgeRecord)

Gets knowledge articles with relevant knowledge block content that a user has access to read.

If you have activated the knowledge blocks feature and are using a custom knowledge article viewer with your application, your viewer may not display articles that expand the relevant block content. To expand block content that a user has access to read, you must call the getArticleContent() method inside your custom viewer.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledgeRecord</td>
<td>GlideRecord</td>
<td>GlideRecord of the knowledge article to display.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Knowledge article with relevant knowledge block content that a user has access to read.</td>
</tr>
</tbody>
</table>

Example: Integrating a custom knowledge article viewer with knowledge blocks

```javascript
// This function returns the article text with expanded block content.
function getArticleText(kbSysId) {
    var knowledgeRecord = new GlideRecord('kb_knowledge');
    var kbText='';
    if(knowledgeRecord.get(kbSysId)) {
        if(new GlidePluginManager().isActive('com.snc.knowledge_blocks')) {
            kbText = new KBBlock();
            kbText.getArticleContent(knowledgeRecord);
        } else {
            kbText = knowledgeRecord.getValue('text');
        }
    }
    return kbText;
}

// This is an example of how to call the function defined above.
var kbText = getArticleText('01alca5b6710130038876c3b5685efd3');
```

Knowledge Management v3 homepage

The Knowledge Management v3 homepage displays knowledge articles organized by knowledge base and category, as well as featured content and popular articles.

To view the default knowledge homepage, navigate to Self-Service > Knowledge.
Note:

The knowledge homepage is not compatible with Internet Explorer 9 or earlier. Using one of these browsers will cause you to be redirected to the legacy knowledge portal.

The Knowledge v3 home page is not customizable. Use the Knowledge Management Service Portal for an easily configurable user experience.

If you access knowledge from a service management application, the knowledge homepage for the associate application opens.

Only published and not yet expired knowledge articles (that is the valid do date not yet reached) appear on the homepage.

From the homepage, you can import a Word document to a knowledge base by clicking **Import Articles**.

Note: From Madrid, you can import a word document from the Import Articles module available in the Application Navigator. This feature is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid use the Word import functionality on the Knowledge V3 homepage. Upgrade customers use the Word import functionality on the Knowledge V3 homepage by default. If required, add the Import Articles module to the Application Navigator. If you add the module, the **Import Articles** button does not appear on the Knowledge v3 homepage.

You can also create a new article using the **Create An Article** button.

- Import a Word document
- Create an article

Note: You must have contribute access to at least one active knowledge base, otherwise these buttons do not appear. See **Migrate to Knowledge Management v3** and **Knowledge manager**.

You can select a knowledge base to browse articles within that knowledge base. You can view only knowledge bases you can access.

Articles are organized by category or by tag. Categories are listed alphabetically. You can sort content by most recent update or by number of views.

You can comment on an article. There is no HTML formatting available for comments on the Knowledge V3 homepage.

Existing customers on release versions prior to New York can view knowledge article feedback comments in the following ways.
• On the Knowledge v3 homepage.

• If the Knowledge Management — Service Portal plugin (com.snc.knowledge_serviceportal) is installed, on the Knowledge Service Portal.

• If the Use Live Feed for knowledge feedback property is active, in the Live Feed.

For new customers on New York and later releases, comments can only be viewed in the Knowledge Service Portal.

An administrator can configure the knowledge homepage to display the number of articles within each category. This count includes articles from subcategories. To display the article count, set the glide.knowman.show_number_on_categories property to true.

Search using Knowledge Management v3

Search for knowledge articles from the knowledge homepage using the search bar on the Knowledge Management v3 homepage.

Search results include only articles and questions you are authorized to read. The search results count do not take into consideration any security rules set for the articles. The number of articles you can access may be lower than the count displayed in the search results page. Documents that are attached to articles are also listed in the search results.

Note: To change how the attachments are displayed in the search results, set the How to display attachments in Knowledge Search Results glide.knowman.search.attachment property. Attachments can be displayed with a snippet, link only, or not at all.

To use wildcards in your search, navigate to Contextual Search > Search Contexts > Knowledge Base Search and select Enable wildcard searches.

Sort knowledge content by relevancy, most recent update, or number of views.
Filter results using the check boxes that appear. Filtering options appear depending on the search text. Knowledge homepage; browsing and searching for articles; viewing articles, providing feedback; posting questions; importing/creating articles

Filtering options

Knowledge Management properties

Import a Word document to a knowledge base using Knowledge Management v3

Import a Microsoft Word document using Knowledge Management v3 homepage to create a knowledge article.

Before you begin

You must have contribute access for at least one active knowledge base. The Import Articles button does not appear in the following conditions:

• The Import Articles module is available in the application navigator.

Note: Beginning with Madrid, the Import a Word document feature is enabled by default and the Import Articles module is displayed in the application navigator. The Import a Word document feature isn’t enabled automatically for the existing customers who can continue using the Import Articles option on the Knowledge Management v3 page. For more information, see Import a Word document to a knowledge base.

• You cannot contribute to any knowledge base.

Note: An administrator can control the visibility of the Import Articles button by setting the other knowledge property Hide the 'Import' functionality (button and drag-n-drop) for all users (`glide.knowman.import.hide_import_functionality`) to true.
Role required: None

About this task
You can import Microsoft Word documents in the .doc and .docx file formats.

ℹ️ Note: The file extension must be lowercase.

When you import a document, text content from the document is used to create the knowledge article. The articles support all editing functions supported by the TinyMCE editor. All HTML supported by TinyMCE such as tables, lists, and links, as well as styling such as bold and italics, are preserved. Images from the document are added as attachments to the knowledge article and embedded in the article body.

ℹ️ Note:
You can import multiple files at a time. Closing the browser or navigating away cancels any in-progress uploads but does not delete articles created from completed imports.

You cannot import documents to knowledge from mobile devices.

The following styles and elements are preserved when importing a .doc or .docx file into a knowledge base. Styles and elements not included in this list may not be preserved when importing a document.

- Titles
- Headings

ℹ️ Note: Only default heading settings are supported. For any headings and subheadings with numbers, the numbers are not imported.

- Images

ℹ️ Note: Images may not be aligned exactly as in the Word document you import.

- Links
- Bold text
- Italic text
- Underlined text
- Ordered and unordered lists

ℹ️ Note: After import, the bullets in an unordered list are replaced with dots.
• Tables

⚠️ Note: Only default heading settings are supported. Custom heading styles are imported using the default settings for those styles. Table styling and borders are not supported.

Procedure

1. Navigate to Self-Service > Knowledge.

2. Perform one of the following actions.
   • Click Import Articles and select one or more document files.
   • Drag one or more document files onto the knowledge homepage.

3. Select the Knowledge base to add the new article to.
   You can select only knowledge bases you can contribute to.

4. Optional: Select a Category from within that knowledge base.

   ⚠️ Note: Use the category picker to add a category. The picker does not differentiate between the different category levels. You can select a category or sub category and add it to the Category field.

5. Optional: Select the Publish check box to start the publishing workflow for each imported article immediately after the import finishes.
   This check box applies only when importing to v3 knowledge bases and only if the Show publish checkbox on the knowledge import pop-up property is set to Yes on the Knowledge Management properties form. You cannot automatically publish articles imported to v2 knowledge bases.
   Knowledge v2 articles go into Draft state. Knowledge v3 articles go into Review or Published state, depending on the workflow attached to the knowledge base (Approval Publish or Instant Publish).

6. Click Import.

   A new article is created in the selected knowledge base and category using the content from the uploaded document. If you uploaded multiple documents, one article is created for each. If you use knowledge internationalization, the language of the new article is set to the currently selected system language.

   After the upload completes, a popup window appears displaying the number and short description of the newly-created articles. Click an article to view the full record.

   If any errors occur during the upload, a popup window appears to display the error.

Import a Word document to a knowledge base

Associate a knowledge article with a taxonomy category

Associate a knowledge article with a taxonomy category to create a uniform classification structure across different kinds of content.

Before you begin
You must have contribute access to the knowledge base that contains the knowledge article.
Role required: knowledge

About this task
The taxonomy feature enables you to link an article to one or more topics from multiple taxonomies. It helps you maintain a unified content categorization across content types such as catalog items, knowledge articles, and community posts.

Note: You can associate only articles in the Draft, Review, or Published state.

Procedure
1. Navigate to Knowledge > Articles.
2. On the article page, click the article you want to associate to a taxonomy topic.
3. In the Assigned Topics related list, click Add.
4. Select a Taxonomy category from the list in the topic picker dialog box.
5. Select a topic from a topic picker list and click OK.

Results
The selected article is associated with a taxonomy category for better content browsing.

Select a knowledge article category

Knowledge articles within a knowledge base are grouped by category. These groups can help you define the knowledge base taxonomy, and can help users find articles within that knowledge base.
About this task
As a knowledge contributor, when editing a knowledge article you can select categories using the Category picker, and add or edit categories if enabled for the knowledge base.

Procedure
1. Click the reference lookup icon beside the Category field.
2. Select an existing category, or click the add category icon (+) to add a new category.
   After you select a category, you can click the pen icon to rename that category. Press the enter key or click outside the selected category to save the change.
   ❓ Note: Clicking Cancel while selecting a category cancels selecting a new category, but does not revert any changes you make to the categories such as renaming or adding new categories.
3. Fill in the fields on the form, as appropriate.
4. Optional: Select or add a subcategory.
5. Click OK.

Create a knowledge article from a customer service case
Reuse information from a customer service case by creating knowledge articles from cases.

Before you begin
Your administrator must enable creation of articles from customer service cases.
Role required: sn_customerservice_agent or knowledge

Procedure
1. Navigate to Customer Service > Cases > All.
2. Select a case from which you want to create a knowledge article.
3. Click Create Knowledge.
   The relevant fields are automatically copied from the case to the record that opens.
4. In the Knowledge base field, enter the name of the knowledge base in which you want this article to display.
5. Click Submit.
Request a knowledge base

If existing knowledge bases do not fit your needs, you can request a new knowledge base through the service catalog. If the request is approved, you are added as the owner of the new knowledge base.

Before you begin
Role required: none

About this task
If no knowledge base exists that fit your needs, all users can request a new knowledge base.

Procedure
1. Navigate to Self-Service > Service Catalog.
2. Select Can We Help You?.
3. Select the Request Knowledge Base catalog item.
4. Enter the reason you want the knowledge base, and a name for the knowledge base.
5. Click Submit.

What to do next
You are notified when the request is approved or rejected. If the request is approved, you are added as the owner of the new knowledge base. You can then assign managers and manage articles in the new knowledge base.

Knowledge bases created through this request process are inactive by default, so you must activate the knowledge base to make it available for users.

Related information
- Assign a knowledge base manager

Use knowledge on mobile devices
All users can access knowledge from mobile devices to search for and view knowledge articles.

Browse knowledge on mobile devices
You can browse knowledge bases using a mobile device.
Navigate to **SELF-SERVICE > Knowledge Base.**

Browse Knowledge by tapping on a category and browsing articles or subcategories.
Mobile Knowledge Categories

Select the desired category and click the close icon (×) for the selected category to reflect in the search results.

View knowledge articles on mobile devices

You can read knowledge content using a mobile device.

Tap a title to view the article.

(×) Note: You cannot edit or add comments to knowledge articles on the mobile interface.
Mobile Knowledge Article View

SAP troubleshooting techniques

1. Using transaction SE11, create a table (ZTABLE) with the same fields as the table in the external database, make sure that the type and lengths of the fields are identical.
2. Using transaction SE11, create a view (ZTABLE_VIEW, projection view) using BASIS table ZTABLE
3. Using SVRMGR>

create dblink REMOTE_DB as connect to remote_user identified by password; (database link created)
drop table ZTABLE; (table dropped)
create synonym ZTABLE for ZTABLE@REMOTE_DB; (synonym created)

- Using transaction SE16, type in ZTABLE_VIEW and hit RETURN
- Enter value in key fields and hit execute

Search knowledge on mobile devices

Find a specific article by searching on a particular term.

Machine learning solutions for Knowledge Management

Machine learning in Knowledge Management helps improve knowledge governance and quality of your knowledge base.

Machine learning in Knowledge Management has the following benefits:

• Improves the quality of your knowledge base by avoiding duplicate articles and makes the knowledge base more Knowledge-Centred Service (KCS) compliant.
• Suggests related articles to help you solve an issue or resolve a question.
• Identifies knowledge gaps and improves content of your knowledge base using the Knowledge Demand Insights feature.

Predictive Intelligence for Knowledge Management

The Predictive Intelligence for Knowledge Management capability uses machine-learning algorithms to provide various Knowledge Management capabilities, such as similar articles and knowledge demand insights.

Solution definitions for Predictive Intelligence for Knowledge Management

The solution definitions for Predictive Intelligence for Knowledge Management capability are available in the Predictive Intelligence for Knowledge
Management plugin (com.snc.knowledge_ml). For more information about the plugin, see Additional plugins for Knowledge Management.

Train the similarity solution for Knowledge Management to find related articles

Train the Knowledge Similar Articles solution definition included within the Predictive Intelligence for Knowledge Management capability to find related knowledge articles when creating or viewing a knowledge article.

Before you begin

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) and Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) are activated.

Role required: admin

Procedure

1. Navigate to Predictive Intelligence > Similarity > Solution Definitions.
2. In the Similarity Definitions list, search for and select the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
3. On the Similarity Definition form, verify the default field values for knowledge articles. For more information about the Similarity Definition form fields, see .

   Note: If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word here at the end of the message.

4. Click Update & Retrain.
5. Open the Similarity Definition form for the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
6. In the ML Solutions related list, view the training solution progress in the Progress column.
   When Progress is 100%, in the ML Solutions related list, you can include more useful related articles by reviewing the similarity examples based on the similarity score and updating the similarity score threshold value.
7. Optional: Update the similarity score threshold.
   a. In the Active column, click the link for the solution.
   b. Review the similarity examples by clicking the Similarity Examples related link on the ML Solution form.
      For more information, see Review solution similarity examples.
c. In the Solution Statistics related list on the ML Solution form, enter the required value in the **Similarity Score Threshold** field, right-click the ML Solution form, and then click **Save**. For more information, see Update your similarity score threshold.

**Results**
When the solution is complete, the related knowledge articles appear in the Knowledge results section on the Knowledge form in the Now Platform, in the Related Articles section on the knowledge article view page in the Knowledge Management Service Portal, and in Agent assist when the **Similar Articles (ML)** option is selected.

**Knowledge demand insights**
Identify knowledge gaps and improve content of your knowledge base using the Knowledge Demand Insights feature.

The Knowledge Demand Insights feature automates the discovery of knowledge gaps in your knowledge bases. Knowledge gaps are topics on which knowledge bases are missing knowledge articles.

Addressing knowledge gaps has the following benefits:

- Improve effectiveness of self-service: Self-service users get more relevant information for research, troubleshooting, and how to queries.
- Increase case or incident resolutions: Having relevant information available helps you deflect future cases.
- Improved case resolution: Agents can find more relevant knowledge articles to solve cases, incidents, problems, and so on.

**Activation information**
The Knowledge Demand Insights feature requires the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more
Demand insights dashboards

You can use a demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks. By default, the Knowledge Demand Insights feature includes Demand Insights for Incidents, Demand Insights for Cases, and Demand Insights: Similar HR Cases and Knowledge dashboards for incidents, customer service cases, and HR cases, respectively. For other tasks, you can create a dashboard. To access a demand insights dashboard, you must have read access to the tasks and the sn_km_ml.knowledge_curation_user role. For more information, see Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks.

Configure Knowledge Demand Insights

Configure the Knowledge Demand Insights feature to identify which topics are missing knowledge articles and creating actionable knowledge gaps for missing topics.

Before you begin

Activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml). For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

About this task

To configure the Knowledge Demand Insights feature, use the Knowledge Management guided setup. The guided setup takes you through the entire setup and configuration process.

This task provides general steps to configure the Knowledge Demand Insights feature. For more information about the feature, see Knowledge demand insights.
Procedure

1. Configure similarity and clustering solution definitions to enable comparing knowledge bases with a task type.

2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type.

3. Configure scheduled jobs for each task.

4. Configure assignment rules to automatically assign feedback tasks of type Knowledge gap.

⚠️ Note: If no assignment rules are configured, a knowledge admin or knowledge manager can later use the Feedback Management feature in the Knowledge module to manually assign a feedback task.

Related information

Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Configure solution definitions to find gaps in a knowledge base

The Knowledge Demand Insights feature finds knowledge gaps by comparing knowledge bases with existing tasks. To enable comparing knowledge bases with a task type, you must first configure similarity and clustering solution definitions.

Before you begin

This task describes the process for configuring a solution definition. Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.

Role required: admin

About this task

Configure one similarity type and one clustering type solution definitions for each task type: incidents, customer service cases, or other tasks. A similarity solution definition collects and compares your existing records to new similar records. A clustering solution definition groups similar records into clusters so you can address them collectively or identify patterns.
Procedure

1. Navigate to **Knowledge Demand Insights > Solution Definitions**.

2. In the Solution Definitions (ML view) list, search for and select the similarity solution definition for the task type.
   - For customer service cases, select **Demand Insights: Similar Cases and Knowledge (ml_sn_global_similar_cases_and_kbs)**.
   - For incidents, select **Demand Insights: Similar Incidents and Knowledge (ml_sn_global_similar_incidents_and_kbs)**.
   - For HR cases, select **Demand Insights: Similar HR Cases and Knowledge (ml_x_sn_hr_core_global_demand_insights_similar_hr_cases_and_knowledge)**.
   - For tasks other than customer service cases, incidents, and HR cases, click **New** to create another similarity solution definition.

3. On the Similarity Definition form, verify the default field values for customer service cases or incidents, or fill in the values for a custom configuration.

**Note:** If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

- Create and train a clustering solution
- Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

**Configure the mapping of solution definitions with task tables**

Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. You can create another demand insights configuration or modify an existing configuration to define a scheduled job for demand insights.
Before you begin
This task describes the process for configuring a scheduled job. Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.

Ensure that you have configured a similarity type and clustering type solution definitions for a task type. For more information, see Configure solution definitions to find gaps in a knowledge base.

Role required: admin

About this task
A scheduled job for each task type runs business rules and then executes the similarity and clustering solution definitions. In the Demand Insights Configuration module, you configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job for a task type. This configuration is optional for customer service cases and incidents.

Note: For task types other than customer service cases and incidents, a user with the admin role must also perform the following tasks:

• Assign the sn_km_ml.knowledge_curation_user role and the appropriate roles for the task type to the users performing the knowledge gap analysis. To assign roles, perform the Assign knowledge curator roles guided setup task, which are available in the Knowledge Demand Insights section of the Knowledge Management guided setup.

• Create a demand insights dashboard for the task type. To create a dashboard, see Create or configure a responsive dashboard.

Procedure
1. Navigate to Knowledge Demand Insights > Demand Insights Configuration.

2. Configure the combination of the task table and similarity and clustering solution definitions that are processed in a scheduled job.

• For customer service cases, select sn_customerservice_case.

• For incidents, select incident.

• For HR cases, select sn_hr_core_case.

• For tasks other than customer service cases, incidents, and HR cases, click New to create another combination.

3. On the KB curation configuration form, verify the default field values for customer service cases or incidents or fill in the values for a custom configuration.
## KB curation configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curation table</td>
<td>Name of the table you want the data to pull information from. For example, for customer service cases, select Case [sn_customerservice_case] and for incidents select Incident [incident].</td>
</tr>
<tr>
<td>Fields</td>
<td>Fields in the curation table that include the ID of knowledge articles, for example, the knowledge article ID KB07276660 in the field resolution notes.</td>
</tr>
<tr>
<td>Query condition</td>
<td>Conditions for filtering the number of tasks from the curation table. You can create conditions using the condition builder (see Condition builder).</td>
</tr>
<tr>
<td>Similarity solution definition</td>
<td>Similarity solution definition for your task type. For example, for customer service cases, select Demand Insights: Similar Cases and Knowledge.</td>
</tr>
<tr>
<td>Clustering solution definition</td>
<td>Clustering solution definition for your task type. For example, for customer service cases, select Demand Insights: Case Clusters Need Knowledge.</td>
</tr>
</tbody>
</table>

4. Click **Update** for incidents or customer service cases or **Submit** to save a custom configuration.

### What to do next

Set the frequency of the scheduled job for your task. For more information, see Set the frequency of knowledge gap analysis.

### Related information

Configure solution definitions to find gaps in a knowledge base

### Set the frequency of knowledge gap analysis

Set the frequency of the scheduled job for your task to automatically run knowledge gap analysis.

### Before you begin

This task describes the process for setting the frequency of knowledge gap analysis.

Instead of doing the configuration through this procedure, consider using a guided setup. Navigate to Knowledge > Administration > Guided Setup, click Get Started, and then scroll to the Knowledge Demand Insights section.
Role required: admin

**Procedure**

1. Navigate to **Knowledge Demand Insights > Scheduled Jobs**.

2. In the Scheduled Jobs list, select the scheduled job for your tasks in the **Name** column.
   - For customer service cases, select **[Knowledge Curation]: Generate Case Clusters**.
   - For incidents, select **[Knowledge Curation]: Generate Incident Clusters**.
   - For HR cases, select **[Knowledge Curation]: Generate HR Case Clusters**.
   - For tasks other than customer service cases, incidents, and HR cases, create another scheduled job. For more information, see **Create a scheduled job**.

3. On the Scheduled Script Execution form, either accept the default value of running the analysis once a quarter (every 90 days) or change the frequency.
   
   1. **Note:** For best performance results, try not to perform knowledge gap analysis more frequently than once a month.

4. Click **Update**.
   
   1. **Note:** If the application scope is not set to Knowledge Management - Machine Learning, a warning message appears and the **Update** button is not available. Click the word **here** at the end of the message to change the scope and click **Update**.

5. **Optional:** To run the job immediately, click **Execute Now**.

**Results**

The knowledge gap analysis is repeatedly run at the duration as configured in the scheduled job.

**What to do next**

Create assignment rules to assign knowledge gap feedback tasks. For more information, see **Assign knowledge gap feedback tasks to content authors**.

**Related information**

- **Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks**

**Assign knowledge gap feedback tasks to content authors**

Create assignment rules to assign knowledge gap feedback tasks to authors or groups of content creators.
Before you begin
Role required: admin or assignment_rule_admin

About this task
Knowledge gap feedback tasks created through the Knowledge Demand Insights feature create feedback tasks of type Knowledge gap.

Procedure
1. Navigate to Knowledge Demand Insights > Knowledge Gap Assignment.
2. In the Assignment Rules list, click New.
3. On the Assignment rule form, fill in the fields.

Assignment rule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

Create an assignment rule
Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks

Analyze knowledge gaps from a demand insights dashboard and create knowledge gap feedback tasks
Use the demand insights dashboard for your tasks to analyze candidate knowledge gaps and create knowledge gap feedback tasks.

Before you begin
You must have read access to the tasks that you want to analyze and the sn_km_ml.knowledge_curation_user role.

About this task
A demand insights dashboard displays tasks as topics for which your knowledge bases do not have adequate knowledge coverage. You can create and assign knowledge gap feedback tasks for a topic so your knowledge bases can better be used to solve and deflect any issues described in a task. Tasks represent customer service cases, incidents, problems, and so on.

Procedure

1. Navigate to Knowledge Demand Insights and select the demand insights dashboard for your tasks, or navigate to Self-Service > Dashboards.
   - For customer service cases, select Demand Insights for Cases.
   - For incidents, select Demand Insights for Incidents.
   - For HR cases, select Demand Insights for HR cases.

   Note: For tasks other than customer service cases, incidents, and HR cases, you can create another dashboard or update an existing dashboard. For more information, see Create and use dashboards.

2. To view similar tasks grouped together, click a bar in the Pareto chart. Each bar represents a collection of similar tasks grouped together because they are likely to be on the same topic. The bars covering the largest number of tasks start from the left in a descending order. The blue line indicates how many bars you must analyze to cover 80% of all tasks that don’t have good knowledge coverage. For more information, see Pareto chart for Knowledge Demand Insights.

3. Optional: To generate a representative sample to see a smaller list, in the Knowledge Curation Tasks list, click Generate Representative Sample.
If the Knowledge Curation Tasks list is large, you can generate a representative sample subset of a Knowledge Curation Tasks list. This smaller list aims to accurately reflect the characteristics of the tasks included in the main list.

4. Analyze the sample to create a knowledge gap feedback task or ignore the tasks within a collection.

<table>
<thead>
<tr>
<th>Action</th>
<th>Procedure</th>
</tr>
</thead>
</table>
| **Report a knowledge gap to create a feedback task** | a. In the Knowledge Curation Tasks list, select tasks for which you want to create a knowledge gap.  

**Note:** Any selected tasks already reported as knowledge gaps are automatically skipped.  
b. Click **Report Knowledge Gap**.  
c. In the **Description** field, describe the knowledge gap.  
The **Description** field is automatically populated with frequently appearing words in the associated collection. You can overwrite the default description and enter a summary of your analysis so that knowledge authors have the necessary information to create an article from the feedback task.  
d. Click **Submit**. |

| Ignore a collection to avoid its tasks from being reported as knowledge gaps | a. In the Knowledge Curation Tasks list, click **Ignore Collection**.  
b. Click **OK** in the warning message that appears. |

**Results**

If tasks within a collection are reported as knowledge gaps, a common feedback task for all the selected tasks is created and appears in the Knowledge Management application. You can use the assignment rules to assign a feedback task to an ownership group or author. In the Knowledge |
Curation Tasks list, the **Is knowledge gap created** column value for the selected tasks is set to **true**.

If you select an ignored collection from the demand insights dashboard, you can no longer report tasks within the collection as knowledge gaps.

**Pareto chart for Knowledge Demand Insights**

The Pareto chart for Knowledge Demand Insights enables you to visualize candidate knowledge gaps and prioritize the order in which knowledge gaps should be resolved.

The following information is available in the Pareto chart for Knowledge Demand Insights:

- The left Y axis is the count of tasks with no or insufficient knowledge coverage.
- The right Y axis is the cumulative percentage of the total number of tasks evaluated.
- Each bar represents a collection of similar tasks that don’t have good knowledge coverage. The bars are arranged in a descending order such that the collection with most number of tasks appears in the left. This order enables you to resolve the largest collection first. When you point to a bar, you view the number of tasks included within the bar and the cumulative percentage.
- The line graph shows the cumulative percentage of tasks that are included in each collection.
- The blue line indicates the 80% of total number of tasks that have no or insufficient knowledge coverage. The intersection of the blue line and the line graph indicates the minimum number of collections that need to be resolved so that 80% of tasks can be covered.

**Example: Pareto chart for demand insights**

The following figure displays a Pareto chart for identifying candidate knowledge gaps for incidents.
The Demand Insights for Cases dashboard enables you as a customer service case manager to identify which cases have no or insufficient knowledge coverage. You can then create feedback tasks for knowledge gaps to deflect such cases.

The Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) includes the Demand Insights for Cases dashboard. For more information, see Predictive Intelligence for Knowledge Management and Additional plugins for Knowledge Management.

Self-Service Analytics

The Self-Service Analytics framework enables you to gather information about user activities and deflection outcomes related to those activities.

Display the effectiveness of self-service channels by using reports and dashboards based on the data generated by the Self-Service Analytics framework. This Self-Service Analytics data is used by the Self-Service Analytics dashboard for customer service. You can also use the Self-Service Analytics framework in dashboards of other applications that use the Subscriptions and Activity Feed Framework. For more information, see Self-Service Analytics dashboard for customer service.

Analyzing self-service deflection metrics has the following benefits:

- Measure self-service effectiveness through self-service KPIs.
- Quantify successful self-service engagements to take corrective actions.
- Define custom self-service KPIs tailored to your organization.

Activation information

The Self-Service Analytics framework requires the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core). For more information, see Activate Self-Service Analytics.

Note: The data for the Communities and Virtual Agent channels are generated when the Communities plugin (com.sn_communities) and Glide Virtual Agent plugin (com.glide.cs.chatbot) are activated respectively.
Related information

Self-Service Analytics concepts

Analytics and Reporting Solutions for Self-Service Analytics for Customer Service

Self-Service Analytics concepts

You can quantify your self-service effectiveness by measuring case deflections. The Self-Service Analytics framework enables you to measure case deflection by defining user activity patterns for a deflection outcome. A case deflection is when you are able to provide a resolution using one of the self-service channels, such as Knowledge, Communities, Catalog, and Virtual Agent, to a user who intended to create a case and as a result, no case is created.

By default, the Self-Service Analytics framework is used by the Self-Service Analytics dashboard for customer service. The framework can also be used in dashboards of other applications that use the Subscriptions and Activity Feed Framework.

The system includes predefined configurations for the Self-Service Analytics framework components associated with consumers and customer contacts. You can also configure these components for other user entities.

Self-service analytics components

Self-service analytics is based on the activity pattern associated with a deflection outcome. It consists of the following main components:

- Activity pattern (see Activity pattern components)
- Deflection outcome (see Deflection outcome components)

Activity pattern components

Activity pattern

A combination of pattern element, pattern element group, or both for a user entity such as consumers or customer contacts that is linked to an outcome. Each pattern element or pattern element group is implemented as regular expressions.

Example: The activity pattern Contacts: Case: Confirmed Deflection is a combination of pattern element groups Self-Service: Helpful and Self-service actions: Optionally Many.

Deflection outcome

An activity pattern can lead to a deflection outcome. See Deflection outcome components.
Primary activity

The final activity that determines the outcome associated with an activity pattern based on whether it happens or not.

Example: For the primary activity Customer created a case if the system does not find a match (that is a case was not created), the outcome Confirmed deflection is associated with the activity pattern Contacts: Case: Confirmed Deflection.

Pattern element group

A logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. For more information, see Pattern element group components.

The following figure illustrates the components of the activity pattern Contacts: Case: Confirmed Deflection.

Pattern element group components

Pattern element group

A logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. Each pattern element group is implemented as regular expressions.
The occurrence of the logical combination result is one of the following types:

- Once
- Optionally Once
- Optionally Many
- At Least Once
- Range

Example 1: In the following table, the Knowledge engagements once pattern element group is true when it occurs only once and either Article viewed once is true or Article marked with positive feedback once is true.

<table>
<thead>
<tr>
<th>Pattern element group</th>
<th>First Element</th>
<th>Second Element</th>
<th>Operator</th>
<th>Occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge engagements</td>
<td>Article viewed once</td>
<td>Article marked with positive feedback once</td>
<td>Or</td>
<td>Once</td>
</tr>
</tbody>
</table>

Example 2: In the following table, the Self-service engagements optionally many pattern group is true when engagements either have not occurred or have occurred multiple times and either the Knowledge or catalog engagements once is true or the Communities or virtual agent engagements once is true.

<table>
<thead>
<tr>
<th>Pattern element group</th>
<th>First Element</th>
<th>Second Element</th>
<th>Operator</th>
<th>Occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge or catalog</td>
<td>Knowledge engagements</td>
<td>Catalog engagements</td>
<td>Or</td>
<td>Once</td>
</tr>
<tr>
<td>engagements once</td>
<td>once</td>
<td>once</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Communities or virtual</td>
<td>Communities</td>
<td>Virtual agent engagements</td>
<td>Or</td>
<td>Once</td>
</tr>
<tr>
<td>agent once</td>
<td>once</td>
<td>once</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Pattern element group example 2 (continued)

<table>
<thead>
<tr>
<th>Pattern element group</th>
<th>First Element</th>
<th>Second Element</th>
<th>Operator</th>
<th>Occurrence</th>
</tr>
</thead>
<tbody>
<tr>
<td>engagements once</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Self-service engagements optionally many</td>
<td>Knowledge or catalog engagements once</td>
<td>Communities or virtual agent engagements once</td>
<td>Or</td>
<td>Optionally Many</td>
</tr>
</tbody>
</table>

**Pattern element**

Denotes a single activity type and how many times it occurs. Each pattern element is implemented as regular expressions.

Example: The pattern element Article viewed once denotes that the activity Viewed a knowledge article must occur once.

**Activity type**

An action that a user (consumer or customer contact) performs.

Example: The activity type Viewed knowledge article occurs when a user views a knowledge article.

The following figure illustrates the components of the pattern element group Knowledge engagements once.
Activity context components

**Activity context**

A collection of activity groups a user might perform such as Catalog, Knowledge, Case, Communities, and Virtual Agent.

Example: The activity context Contact is a collection of activity groups Catalog, Knowledge, Case, Communities, and Virtual Agent associated with the customer contact.

**Activity group**

A logical grouping of activity types performed on the same object type such as a knowledge article, community answer, or customer service case.

Example: The activity group Knowledge is a logical grouping of the activities Viewed knowledge article and Marked the article helpful performed on a knowledge article.

**Activity context group**

An activity group that has been added to a context.
The following figure illustrates the components of the activity context Contact.

**Deflection outcome components**

**Deflection outcome**

In the context of deflection, an activity pattern can lead to one of the following three outcomes:

- **Confirmed deflection**
  
  The self-service content definitely prevented a case from getting created.

- **Potential deflection**
  
  The self-service content was viewed and no case was created, but it’s unclear whether the content is the factor that prevented the case from getting created.

- **No deflection**
  
  A case was created after the self-service content was viewed.

**Deflection configuration**

Associates a window (duration) with an activity context. The window defines how long a system will wait for a case to be created to match with a deflection pattern.

Example: To track the create case activity for a consumer within a day, set the window as 1 day.

- If the consumer created a case within that window, the deflection pattern matched is a No deflection.
- If the consumer did not create a case within that window, the deflection pattern matched is a Potential deflection.
• If the consumer did not create a case and the last activity is submitted positive feedback for any self-service channel content within that window, the deflection pattern matched is a Confirmed deflection.

**Deflection metrics**

A transactional table that stores the outcome of matched patterns. By default, the scheduled job for Self-Service Analytics captures data and stores the generated data in the Deflection Metric [ssa_deflection_metric] table.

**Deflection pattern**

Associates deflection configuration with an activity pattern. A deflection pattern is implemented as a table.

**Related information**

Configure Self-Service Analytics

**Configure Self-Service Analytics**

Configure the Self-Service Analytics framework so you can use the generated metrics in a dashboard.

**Before you begin**

Role required: admin

**About this task**

Complete the following tasks to use the metrics generated by the Self-Service Analytics framework in a dashboard of an application:

**Procedure**

1. Activate Self-Service Analytics.
2. Configure activity contexts for Self-Service Analytics.
3. Configure pattern elements for Self-Service Analytics.
4. Configure pattern element groups for Self-Service Analytics.
5. Configure activity patterns for Self-Service Analytics.
6. Set up the deflection configuration for Self-Service Analytics.
7. Configure scheduled jobs for Self-Service Analytics.
Activate the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core) if you have the admin role. This plugin activates related plugins if they are not already active.

**Before you begin**
Role required: admin

**About this task**
The Self-Service Analytics Core plugin provides the Self-Service Analytics framework for configuring deflection contexts and activity patterns to collect the case reduction (deflection) metrics. The metrics are used in the Self-Service Analytics dashboard. The Self-Service Analytics Core plugin activates these related plugins if they are not already active.

**Plugins for Self-Service Analytics Core**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscriptions and Activity Feed Framework</td>
<td>Provides a generic set of artifacts to handle subscriptions for any defined subscribable object. Any entity can be defined as a subscribable object and a set of subscribers can subscribe to the objects. When a event occurs related to the subscribable object, activities can be tracked and subscribers can be notified.</td>
</tr>
</tbody>
</table>

**Note:** The Self-Service Analytics Core plugin is also installed when you activate the Analytics and Reporting Solution for Self-Service Analytics for Customer Service. For more information, see Activate the Analytics and Reporting Solution for Self-Service Analytics for Customer Service.

**Procedure**

1. Navigate to [System Applications > All Available Applications > All](#).
2. Find the plugin using the filter criteria and search bar.
You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

⚠️ Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Configure activity contexts for Self-Service Analytics

Define the type of activities you want to collect as Self-Service Analytics data for a user entity such as consumers and customer contacts.

Before you begin
Role required: self_service_manager

About this task
The activity types you add to an activity context are already predefined for use in applications that use the Subscriptions and Activity Feed Framework. This framework is available when you install the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions). The plugin is activated when you activate the Self-Service Analytics Core plugin (com.snc.self_service-analytics_core).

Procedure
1. Navigate to Self-Service Analytics > Configuration > Activity Context.
2. In the Activity Contexts list, search for and select the activity context for your user entity.
   - For consumers, select Consumer.
   - For customer contacts, select Contact.
   - For user entities other than consumers and customer contacts, click New to create another activity context.
3. On the Activity Context form, verify the default field values for consumers and customer contacts, or fill in the values for a custom configuration.
### Activity Context form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for your activity context.</td>
</tr>
<tr>
<td>Context Table</td>
<td>Table that includes the user entity whose actions need to be tracked and displayed on the Self-Service Analytics dashboard. For example, if you want to track all actions for a customer contact, select the Contact [customer_contact] table. Similarly, if you want to track all actions for a consumer, select the Consumer [csm_consumer] table.</td>
</tr>
<tr>
<td>Module</td>
<td>Module associated with the application that stores the activities data.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the application. This field is automatically set based on the application scope selected in the application picker.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain in which the activities records exist.</td>
</tr>
</tbody>
</table>

4. If you are creating a new activity context, click **Submit** and then select the newly created activity context link from the Activity Contexts list.

5. In the Activity Context Groups related list, map an activity context with activity groups.
   - For consumers and customer contacts, verify the default field values for an existing configuration.
   - For user entities other than consumers and customer contacts, click **New** to create another activity group or map with an existing activity group. For a new activity group mapping, on the Activity Group form, fill in the fields and click **Submit**. In the Activity Context Groups related list, you then have to select the newly created activity group and add available activity types to the activity group.

### Activity Group form

<table>
<thead>
<tr>

<tr>
<td></td>
<td>• <strong>Once</strong>: An activity must have occurred only once. For example, an article was marked with positive feedback only once.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Optionally Once</strong>: An activity might not have occurred, but if it has, then it has occurred only once. For example, either no catalog request was created or only one was created.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Optionally Many</strong>: An activity might not have occurred but if it has, then it has occurred multiple times. For example, either no catalog request has been created or multiple requests have been created.</td>
</tr>
<tr>
<td></td>
<td>• <strong>At Least Once</strong>: An activity has occurred at least once. For example, a community blog was viewed one or more times.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Range</strong>: An activity has occurred as many times as is specified in a range. You specify a range using the <strong>Minimum</strong> and <strong>Maximum</strong> fields. For example, if you specify a range of 2 to 4 Virtual Agent interactions, only 2, 3, or 4 interactions can have occurred.</td>
</tr>
<tr>
<td>Minimum</td>
<td>Minimum occurrence of an activity. This field appears only when <strong>Range</strong> is selected from the Occurrence list.</td>
</tr>
<tr>
<td>Maximum</td>
<td>Maximum occurrence of an activity. This field appears only when <strong>Range</strong> is selected from the Occurrence list.</td>
</tr>
</tbody>
</table>

4. Submit or update the pattern element.

- Click **Submit** if you created a new pattern element.
- Click **Update** if you modified an existing pattern element.

**What to do next**
Configure pattern element groups for Self-Service Analytics.
Configure pattern element groups for Self-Service Analytics

Define a logical combination of two pattern elements, pattern element group, or both and how many times the combination occurs. Each pattern element group is implemented as regular expressions.

Before you begin
Configure pattern elements for Self-Service Analytics.

Role required: self_service_manager

About this task
By default, the system includes pattern element groups for analyzing activity patterns within the Knowledge, Catalog, Communities, and Virtual Agent self-service channels.

Procedure

1. Navigate to Self-Service Analytics > Configuration > Pattern Element Group.

2. Either configure an existing group or create a new group.
   - Select an existing group in the Pattern Element Groups list.
   - Create a new group by clicking New.

3. On the Pattern Element Group form, fill in the fields.

Pattern Element Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the pattern element group.</td>
</tr>
<tr>
<td>First Element</td>
<td>Conditional regular expression consisting of a pattern element or pattern element group.</td>

</tr>
<tr>
<td></td>
<td>• <strong>Or</strong>: Either the first or second element is true.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
Occurrence | Frequency with which a pattern element or pattern element group must occur. An occurrence is one of the following types:  
• **Once**: Must have occurred only once.  
• **Optionally Once**: Might not have occurred but if it has, then it has occurred only once.  
• **Optionally Many**: Might not have occurred but if it has, then it has occurred multiple times.  
• **At Least Once**: Has occurred at least once.  
• **Range**: Has occurred within a range. You specify a range using the Minimum and Maximum fields.
Minimum | Minimum occurrence of the result of the logical combination of the first and second elements. This field appears only when Occurrence is set to Range.
Maximum | Maximum occurrence of the result of the logical combination of the first and second elements. This field appears only when Occurrence is set to Range.

4. Save the pattern element group settings.  
   • Save a new pattern element group by clicking **Submit**.  
   • Save the changes to an existing pattern element group by clicking **Update**.

**What to do next**  
Configure activity patterns for Self-Service Analytics.

**Configure activity patterns for Self-Service Analytics**

Configure an activity pattern to combine the pattern element, pattern element group, or both for a user entity and link them to an outcome.

**Before you begin**  
Configure pattern element groups for Self-Service Analytics.

Role required: self_service_manager

**About this task**  
By default, the system includes activity patterns for the activities Consumer created a case and Customer created a case.
Procedure

1. Navigate to Self-Service Analytics > Configuration > Activity Pattern.

2. Either configure an existing activity pattern for your user entity or create a new one.
   - Select an existing activity pattern in the Activity Patterns list.
   - Create a new activity pattern by clicking New.

3. On the Activity Pattern form, verify the default field values for an existing activity pattern or fill in the values for a custom configuration.

<table>
<thead>
<tr>
<th>Field</th>

<tr>
<td>Match If</td>
<td>Pattern recognition using the Match If function to associate the pattern with an outcome. For example, you can indicate that if the activity Consumer created a case is not found, you want to match it with the Confirmed Deflection outcome.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain in which the activities records exist.</td>
</tr>
</tbody>
</table>

4. Click Submit and then select the newly created activity pattern link from the Activity Patterns list.

5. In the Elements related list, select elements to map with the primary activity and use the Order column to decide the order of each element mapping.
   - To use an existing element, select an element, modify the fields and click Update.
   - To create another pattern element or pattern element group, click New and select the type of element, fill in the fields on the form, and then click Submit.
An element can be a pattern element or pattern element group. For more information, see Configure pattern elements for Self-Service Analytics and Configure pattern element groups for Self-Service Analytics.

In the **Order** column, the following conditions apply:

- If there is only one matching table map, the system uses that map.
- If there are multiple matching table maps with the same order, the system uses the map with the older created date.
- If there are multiple matching table maps with different orders, the system uses the map with the highest order.

6. On the Activity Pattern form, click **Update**.

**What to do next**

Set up the deflection configuration for Self-Service Analytics.

**Set up the deflection configuration for Self-Service Analytics**

Associate a period of time with an activity context that defines how long a system will wait for a case to be created to match a deflection pattern.

**Before you begin**

Configure activity patterns for Self-Service Analytics.

Role required: self_service_manager

**Procedure**

1. Navigate to **Self-Service Analytics > Configuration > Deflection Configuration**.
2. In the Deflection Configurations list, search for and select the deflection configuration for your activity context.
   - For customer contacts, select **Contact Case Deflection Configuration**.
   - For consumers, select **Consumer Case Deflection Configuration**.
   - For user entities other than consumers and customer contacts, click **New** to create another deflection configuration or modify an existing configuration.
3. On the Deflection Configuration form, verify the default field values for an existing configuration or fill in the values for a custom configuration.

### Deflection Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for your deflection configuration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------------------------------</td>
</tr>
<tr>
<td>Activity Context</td>
<td>Type of activities for which you want to collect data. For more information, see <a href="#">Configure activity contexts for Self-Service Analytics</a>.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary of the configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the application that contains the user entity. This field is automatically set based on the application scope selected in the application picker.</td>
</tr>
</tbody>
</table>
| Window            | Activity context window (duration) for tracking activities that match a deflection pattern.  
Example: To track the create case activity for a consumer within a day, set the window as 1 day.  
- If the consumer created a case within that window, the deflection pattern matched is not a deflection.  
- If the consumer did not create a case within that window, the deflection pattern matched is a potential deflection.  
- If the consumer did not create a case and the last activity is submitted positive feedback for any self-service channel content within that window, the deflection pattern matched is a confirmed deflection. |

4. In the Deflection Patterns related list, add or modify existing deflection patterns to associate them with the deflection configuration or add a new pattern.  
This related list appears only if a deflection configuration exists.

5. In the Deflection Metrics related list, add or modify an existing deflection metric table that stores the deflection data for an activity pattern associated with a deflection type.  
This related list appears only if a deflection configuration exists. Alternatively, you can also configure a deflection metric table by navigating to [Self-Service Analytics > Deflection Metric](#).

6. On the Deflection Configuration form, click **Update**.

**What to do next**

Configure scheduled jobs for Self-Service Analytics.
Configure scheduled jobs for Self-Service Analytics

Schedule when to run the deflection configuration to generate the activities that match an activity pattern within an activity window.

Before you begin
Set up the deflection configuration for Self-Service Analytics.
Role required: admin

About this task
You configure the duration of processing the deflection configuration for a user entity. This configuration is optional for consumers and customer contacts. The scheduled job captures data for Self-Service Analytics and stores the generated data in the Deflection Metric [ssa_deflection_metric] table.

Procedure
1. Navigate to System Definition > Scheduled Jobs.
2. Configure the scheduled script processed for a user entity in a scheduled job.
   - For consumers, select Deflection Analytics for Consumers.
   - For customer contacts, select Deflection Analytics for Contacts.
   - For user entities other than consumers and customer contacts, click New and select Automatically run a script of your choosing to create another scheduled job or modify an existing schedule job.
3. On the Scheduled Script Execution form, verify the default field values for consumers and customer contacts or fill in the values for a custom configuration.

Scheduled Script Execution form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the scheduled script execution.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the script at the scheduled date and time. By default the job is inactive.</td>
</tr>
<tr>
<td>Run</td>
<td>Type of schedule to execute the script on. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Daily</td>
</tr>
<tr>
<td></td>
<td>• Weekly</td>
</tr>
<tr>
<td></td>
<td>• Monthly</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>• Periodically</td>
</tr>
<tr>
<td></td>
<td>• Once</td>
</tr>
<tr>
<td>Day</td>
<td>• If you select <strong>Weekly</strong> as the <strong>Run</strong> value, the day of the week.</td>
</tr>
<tr>
<td></td>
<td>• If you select <strong>Monthly</strong> as the <strong>Run</strong> value, the day of the month.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>If you select <strong>Periodically</strong> as the <strong>Run</strong> value, the duration</td>
</tr>
<tr>
<td></td>
<td>between each script execution.</td>
</tr>
</tbody>
</table>

**Note:** This setting does not account for Daylight Savings Time changes. For example, if you select a period of one day, this adds 24 hours to the starting time of the job. If the start time was configured during a period with Daylight Savings Time, the job executes with a one hour offset on days when that time zone is not in Daylight Savings Time.

| Time        | If you select **Daily**, **Weekly**, or **Monthly** as the **Run** value, the |
|            | time of day, based on a 24-hour clock.                                      |
| Starting    | Date and time of the first scheduled script execution.                      |
| Application | Application that contains the script.                                       |
| Conditional | Option to run a scheduled job if certain conditions are met in the          |
|             | associated script.                                                         |
| Condition   | Conditional script that determines whether a scheduled job must run. The    |
|             | last expression of the script should evaluate to a Boolean (true or false)  |
|             | value. This field appears only when the **Condition** check box is selected.|
| Run this    | Script to run at the scheduled date and time.                               |
| script      | For a new scheduled script, copy the script from the existing script (Deflection Analytics for Consumers or Deflection Analytics for Contacts) and modify the `deflectionAnalyticsService.captureDeflectionAnalytics('sys_ID')` field value to include the `sys_id` of your deflection configuration record. For information about identifying the `sys_id`, see [The unique record identifier (sys_id)](https:// servicenow .com/). |

4. Click **Update** for consumers and customer contacts or **Submit** to save a custom configuration.
Translation management

Translation management enables you to manage translation tasks created for published knowledge articles. You can manage multi-language knowledge bases by using automated translation tasks and translation APIs. You can also configure required languages for a knowledge base and ensure users can create articles only in the configured languages.

You can choose a default language when you log in to an instance. The list of languages are listed based on the internationalization language plugins you have installed.

The translation management feature enables you to perform the following translation activities:

• Translate published knowledge articles that are missing translations manually or use the machine translation option to automatically translate them
• Create translation tasks automatically for the languages you have specified
• Configure assignment rules and auto-assign tasks for a language, knowledge base, or category to a translator or a group of translators

The translation management feature is available only if you have installed required plugins and set a system property.

The required plugins are:

• Knowledge Management Advanced plugin
• I18N:Knowledge Management Internationalization Plugin v2 or Internationalization language plugins

Enable the glide.knowman.translation.enable_translation_task property for using the translation management feature which displays the following menu options:

• All Open Tasks
• My Assigned Tasks
• Translator Mapping

Related information

Translate a knowledge article
I18N - Knowledge internationalization
Activate the knowledge management internationalization plugin
Enable languages for a knowledge base

You can select the languages you want enabled at a knowledge base level. Users can then create articles only for selected languages.

Before you begin
Role required: knowledge_admin or admin

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Click New to create a knowledge base or select an existing knowledge base.
3. Click the lock icon to unlock the Languages field.
4. Select the languages from the list.

   Note:
   You can also remove languages from the list if you decide that you do not want to create a translation task in that language.

5. Click Submit or Update.

Create translation assignments

Assign knowledge articles to language experts to ensure accurate translations. Identify the language experts and create assignment rules to automatically assign translation tasks to language experts and groups.

Before you begin
Role required: knowledge_admin or admin

About this task
Assignment rules are applied only if the task is not already assigned to another user or group.

Procedure
1. Navigate to Knowledge > Translation Management > Translator Mapping.
2. Click New to create a new assignment rule or select an existing rule to modify.
3. Enter a name for the assignment rule in the Name field.
4. In the Applies To tab, perform the following.
a. Select a table from the Table dropdown for example, Knowledge Translation Task [kb_translation_task].

b. Specify the conditions that must be met before the task is assigned to the user or group.

5. Click the Assign To tab and select the user or group you want to assign the task to.
   An email notification is sent to the translator with a link to the translation task and source article.

6. Click the Script tab to enter a script to further customize the assignment rule.

7. Click Submit.

   Note: To cancel a task, add an appropriate reason for cancellation in the Cancellation notes field and click Cancel.

Auto-create translation tasks

Manage multi-language knowledge bases by using automated translation tasks and translation APIs. Translate published knowledge articles in languages configured for the knowledge base containing the articles.

Before you begin
Role required: knowledge_admin or admin

About this task
You can auto-create translation tasks in specified languages. The available languages are determined by the language plugins that have been installed on your instance.

Procedure
1. Navigate to Knowledge > Administration > Knowledge Bases.

2. Click New and fill out the Knowledge Base form to create a knowledge base or select an existing knowledge base.

3. Unlock the Languages field and select the languages for which you want to create tasks from the dropdown.

   Note: Unlocking the Languages field displays the languages you have installed.

   If Auto-create translation tasks is not selected, you would have to create the tasks manually after the article is published.
5. Click **Submit** or **Update**.

**Note:**
- Open a knowledge article and click **Knowledge Translation Tasks** related list to view the associated translation tasks.
- To cancel a task, add an appropriate reason for cancellation in the **Cancellation notes** field and click **Cancel**.

**Translate a knowledge article**

You can start translating articles once they are published and assigned to you for translation.

**Before you begin**

Role required: admin, knowledge_admin, or knowledge admin

**Procedure**

1. Navigate to **Knowledge > Translation Management > My Assigned Tasks**.

2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you.

3. Click **Translate**.

**Note:** If you want to do a translation directly from an article, use the **Translate** related link on the article page.

The **Translate from** and **Translate to** panes are side-by-side for easy viewing, as shown in the following figure.
4. Click **Machine translate**, which automatically translates to the targeted languages.

   **Note:** A default translator configuration should be available. For information about how admins configure the translation API, see **Dynamic Translation**.

5. Click **Create draft article** to create a draft version of the translated article. If a translated article is already present for that language, a new draft version overwrites the existing translated content.

6. Click **Publish**. The newly created draft is listed in the **Translated Versions** tab.

**Translate knowledge blocks within an article**

If a selected article indicates that a knowledge block is missing a translation, you must translate the knowledge block before you can translate the article.

**Before you begin**

Role required: translator

**Procedure**

1. Navigate to **Knowledge > Translation Management > My Assigned Tasks**.

2. In the Knowledge Translation Task page, select a translation task and click **Translate**.

   **Note:** A message stating that the knowledge article contains one or more knowledge blocks that have missing translations is displayed.

3. Click on the link in the message to view the list of blocks that require translation.

4. Click the block that requires translation and click **Translate**. The newly translated blocks appears in the **Translated Block Versions** related list.

**Related information**

- Add knowledge blocks to a knowledge article

**Request missing translations for available languages**

If a translation task does not have tasks created for all the languages you have configured, you can manually create tasks for the missing languages.
Before you begin
Role required: admin
Verify that the glide.knowman.translation.enable_translation_task property is set to true.

Procedure
1. Navigate to Knowledge > Articles > Published.
2. Select an article from the list of published articles.
3. Click Request translations in Related Links.
4. Select the languages from the list that are unselected and do not have associated translation tasks.
5. Click Submit.

Note: If a task is already open for a particular language, you cannot select the same language again.

The translation tasks for the languages are created and listed in the Knowledge Translation Tasks tab.

Now Mobile for Knowledge Management
Access knowledge articles from anywhere using the Information applet on the Now Mobile app. You can view recently viewed and most popular articles, search for articles, browse articles by category, and provide feedback for articles.

To access articles from the Information applet on the Now Mobile app, you must first download the ServiceNow mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.
Make sure your administrator has activated the Now Mobile app. For more information, see Now Mobile app.

After you access an article, you can view the author, published date, number of views, and the overall rating details of the article. In addition, you can respond to and evaluate articles and view related items, related articles, and attachments.

**Activation information**

The Information applet is available on the Now Mobile app. The ServiceNow Mobile Request - Knowledge Management Screens and Applet Launcher plugin (com.glideapp.knowledge.mobile_requestor) activates the Information applet. The Information applet is activated by default for both new and upgrade customers.

**Related information**

- Configure knowledge bases
- Now Mobile app
View the most popular or recently viewed articles in the Now Mobile Information applet

View an article in the Now Mobile Information applet

Provide feedback for a knowledge article in the Now Mobile Information applet

**View the most popular or recently viewed articles in the Now Mobile Information applet**

The Information applet on the Now Mobile app enables you to access knowledge articles from a mobile device.

**Before you begin**
You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

**Procedure**
1. Access your instance using the mobile application.
2. On the Now Mobile app, tap **Information**.
3. Access your recently viewed or the most popular knowledge articles

<table>
<thead>
<tr>
<th>Information applet article views</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recently Viewed</td>
<td>Up to five of the articles you viewed within the last 30 days.</td>
</tr>
<tr>
<td>Popular</td>
<td>Up to five of the most popular knowledge articles. The Now Mobile app homepage includes a similar section that displays up to three of the most popular articles.</td>
</tr>
</tbody>
</table>

**Note:** Tap **See All** to view the complete list of articles within the selected section.
Related information

- Browse articles in the Now Mobile Information applet
- Search for an article in the Now Mobile Information applet
- Control access at the knowledge article level through user criteria

**Browse articles in the Now Mobile Information applet**

You can browse articles within a category in the Now Mobile Information applet to see articles related to a particular subject or grouping.

**Before you begin**

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

**Procedure**

1. Access your instance using the mobile application.
2. On the Now Mobile app, tap **Information**.
3. In the Browse section, tap a category from the categories list to view articles and child categories associated with the selected category.

   ✉️ **Note:** Tap **See All** to view the complete categories list.

4. Tap further categories until you view the articles list associated with the desired category.
   The articles associated with a parent category are grouped under a dummy child category labeled as **Other**.

5. To view an article, tap the article in the articles list.

**Related information**

- View an article in the Now Mobile Information applet
- Control access at the knowledge article level through user criteria
Search for an article in the Now Mobile Information applet

You can search for an article in the Now Mobile Information applet.

Before you begin

You can specify user criteria for an article to control which users can read the article. If no user criteria is defined for an article, all users can read the article.

Procedure

1. On the Now Mobile app, tap Information.

2. Tap Search for Services, Articles or People, and enter a search term related to the article.

3. Tap the search icon on your app keyboard.
   The app displays search results.

4. Tap Articles to view only articles in the search results.

5. Tap an article in the search results to view the article content.

Related information

**Migrate to Knowledge Management v3**

Knowledge Management has significantly changed with the introduction of knowledge v3 starting with the Fuji release.

Knowledge Management v3 has several key differences from Knowledge Management v2, the version of Knowledge Management that was available until Eureka release. The knowledge v3 plugin is activated by default starting with the Fuji release.

The following podcast provides more information on what is new in Knowledge Management v3.

**Episode 26: Knowledge Management Version 3**

When upgrading from Eureka or earlier versions, if you intend to use the new features available in knowledge v3, you have to migrate legacy knowledge content and any customizations you have made to the Knowledge Base applications.

The following video provides more information on how to migrate from Knowledge Management v2 to v3.

**Migrating from Knowledge Management v2 to v3**

**Key differences**

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>One knowledge base.</td>
<td>Multiple knowledge bases.</td>
</tr>
<tr>
<td>A single lifecycle workflow shared by all articles.</td>
<td>Separate, customizable workflows available for each knowledge base.</td>
</tr>
</tbody>
</table>
# Key differences (continued)

<table>
<thead>
<tr>
<th>Legacy Knowledge</th>
<th>Knowledge v3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two-level organizational structure with <strong>Topic</strong> and <strong>Category</strong>. A single</td>
<td>Category structure with any number of levels. Each knowledge base has</td>
</tr>
<tr>
<td>organizational taxonomy shared by all articles.</td>
<td>a unique category taxonomy.</td>
</tr>
<tr>
<td>Permissions defined per article using roles and ACLs.</td>
<td>Permissions defined per knowledge base or article using user criteria.</td>
</tr>
</tbody>
</table>

## Knowledge Management v3 migration process

When you upgrade from Eureka or earlier, consider a multi-step migration process. This process ensures you can access existing knowledge content and allows you to fully migrate at your own pace.

Review automatic changes before upgrading. These changes are applied immediately when upgrading and may impact existing functionality.

1. Migrate knowledge functionality to use your customized functionality with the Knowledge Management v3 enhancements.
2. Migrate knowledge content to use the Knowledge Management v3 enhancements with your existing knowledge articles.

## After migration to Knowledge Management v3

These items are relevant to getting the full range of new functionality after you migrate.

- You must configure knowledge access controls based on user criteria to ensure that users can access existing knowledge content. Since access control in knowledge v3 is intended to be based on user criteria alone, users may be unable to access v2 or v3 knowledge articles, or have restricted access, with preexisting ACLs.
- If the home page was customized in knowledge v2, custom layout and links are not saved in knowledge v3.
- Images added using the **Image** field in a knowledge article form do not display in the Knowledge v3 or Knowledge Service Portal pages. The article search results page displays the knowledge base icon next to all articles from the knowledge base.
Automatic changes after Knowledge Management v3 migration

Upgrading to Knowledge Management v3 automatically changes knowledge functionality including the knowledge user interface and security model.

Default knowledge base

When you upgrade from Eureka or earlier, a default knowledge base is created, titled Knowledge, that contains all knowledge articles from the previous version.

After the upgrade, you can add and edit articles in this knowledge base.

Articles in the default knowledge base continue to use legacy functionality, such as role-based access controls. Any customizations you made to knowledge functionality before the upgrade are preserved in the default knowledge base.

Knowledge search changes

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options.

You can filter results only by knowledge base. Search results include only those articles the current user can view based on user criteria. ACLs do not restrict search results.

Knowledge security changes

Knowledge v3 manages access to articles with user criteria rather than roles and ACLs.

Existing ACLs on the Knowledge [kb_knowledge] table are preserved, but with the following changes.

• A version of 3 indicates that a knowledge base uses the knowledge v3 functionality.
• A version of 2 indicates that a knowledge base uses legacy functionality.

New ACLs introduced by knowledge v3, such as field-level controls, apply to all knowledge bases.

When you upgrade from Eureka or earlier, any custom ACLs you implemented for the Knowledge table still apply to any knowledge records in the default knowledge base. Knowledge v3 updates ACLs that exist before upgrade so they only apply to Knowledge [kb_knowledge] records where this field value is 2.
Note: These changes affect the default knowledge base. Even if you are not using the new knowledge functionality, the legacy knowledge behavior may change if you have made customizations to ACLs on the Knowledge [kb_knowledge] table. Ensure you configure knowledge access controls after upgrading to prevent unexpected behavior.

To control access to knowledge articles, try to use user criteria, which were introduced in Knowledge Management v3. For more information, see Managing access to knowledge bases and knowledge articles.

Knowledge article view changes
The Knowledge application uses the kb_view UI page to display knowledge articles.

UI page
The following changes apply automatically when you upgrade from Eureka or earlier:

• The existing kb_view page is renamed to kb_view_customer. The kb_view_customer page is used to display articles in the default knowledge base, preserving the legacy user experience.

  Note: By default, the kb_view_customer page is publicly accessible. As an administrator, you can change this behavior by modifying the sys_public table record for this page and clearing the Active field in the record.

• A new kb_view page is used. This becomes the primary page used to display articles that are not in the default knowledge base.

You should review all customizations introduced around the legacy kb_view UI page.

• URLs should not be updated as the new kb_view page redirects to the correct page depending on the article.

• Customizations made to the kb_view UI page are automatically copied to the kb_view_customer page on upgrade.

• Other customizations that affect kb_view may need to be copied or modified to apply to kb_view_customer. For example, an ACL defined for kb_view may need to be duplicated to provide security coverage for kb_view_customer.

Feedback
Legacy feedback functionality is retained for knowledge articles displayed in the legacy article view. Users can continue to use the feedback options to view,
add, and reply to comments on these legacy articles. Legacy comments are retained in the Knowledge Feedback [kb_feedback] table.

To retain the legacy comment functionality with new knowledge articles, set the Use Live Feed for Knowledge feedback property (glide.knowman.use_live_feed) to false. This property is set to false by default.

**Related information**

Make UI pages public or private

**Knowledge portal changes**

While the legacy knowledge portal, kb_home, has not changed in Knowledge v3, we strongly recommend that you consider moving to the new Knowledge v3 home page, $knowledge.do.

**UI page**

You can search articles from the knowledge portal and filter search results by knowledge base, and by language if the instance uses knowledge management internationalization. This portal also appears for users on older browsers, such as Internet Explorer 9, instead of the knowledge homepage.

Navigation add-ons are available in the legacy knowledge portal. Navigation add-ons of the Link type appear in the top-right of the portal. To add navigation add-ons of the Search type, you must customize the kb_home UI page.

**Search**

By default, the legacy knowledge portal uses knowledge v3 search with limited filtering options. You can filter results only by knowledge base. Search results include only those articles the current user can view.

**Knowledge submissions**

Knowledge submissions created from tasks continue to work in knowledge v3 with minor changes.

By default, the Topic and Category fields no longer appear on the Submission form due to the knowledge v3 category changes.

The property glide.knowman.submission.workflow no longer appears on the knowledge properties UI page. To enable knowledge submissions, set this property to true on the System Properties [sys_properties] table.

See creating knowledge from incidents and problems for instructions on using knowledge submission in knowledge v3.

Migrating Knowledge access controls

Access to knowledge articles is controlled based on the user criteria for the knowledge base.

**Important:** If you do not migrate existing knowledge ACLs to user criteria, users may be unable to access knowledge articles, or may be able to access restricted articles.

User criteria records, rather than ACLs, control basic create, read, update, and delete operations for knowledge articles as well as which search results appear. This may lead to unexpected behavior if your configuration depends on ACLs to control access.

To ensure users are able to access the correct knowledge articles, migrate any ACL-based security settings to user criteria. This process may include creating additional knowledge bases and moving existing content to these knowledge bases, depending on your security model. For a detailed explanation and migration examples, refer to KB0550924 Understanding User Criteria and ACLs in Knowledge v3.

This video demonstrates how to manage article-level access controls during migration from Knowledge Management v2 to v3.

Managing Article-Level Access Controls During Migration from KM v2 to v3

**Related reference**

Knowledge functionality migration

**Knowledge functionality migration**

You can migrate knowledge functionality to use your customized functionality with the knowledge v3 enhancements.

**Replaced knowledge modules**

When you are ready to migrate to knowledge v3, you can activate the v3 modules and deactivate the legacy modules.

Use the tables below to identify which knowledge v3 modules to activate and which legacy modules to deactivate. When activating a knowledge v3 module, deactivate the knowledge v2 module with the same name to ensure users access the correct module.

You can use the `enablev3anddisablev2menus.txt` backup script to enable knowledge v3 menus and disable knowledge v2 menus.

Knowledge article publish and retire workflows

With knowledge v3, article state is controlled by workflows.

In the legacy knowledge base, article state was controlled by UI actions. UI actions from previous versions are available only in the default knowledge base.

To preserve your article publishing and retirement process in new knowledge bases, create workflows that follow these processes. To create these workflows, copy the default workflow that best matches your process and modify that copy. After creating workflows that use your article publishing and retirement processes, use these workflows as the Publish workflow and Retire workflow for the new knowledge bases.

Knowledge article category structure

With knowledge v3, all knowledge articles are organized by category and subcategory within knowledge bases.
The default knowledge base uses the legacy category structure; knowledge articles are organized by topics and categories.

Before you migrate articles, create a category structure for these articles in the destination knowledge bases. This structure can reproduce your legacy topic and category structure or can be extended to take advantage of the knowledge v3 category functionality.

### Knowledge content migration

To use the new functionality available in knowledge v3 with legacy articles, you must migrate these articles out of the default knowledge base.

To migrate knowledge content, move articles out of the default knowledge base by changing the **Knowledge Base** value for each article. The state of the article remains unchanged when moving articles. After selecting a new knowledge base, assign a category to each article using the category structure defined in the new knowledge base.

After you migrate a knowledge article, the legacy feedback functionality is automatically replaced with the new knowledge feedback mechanisms. Legacy feedback is copied to the Live Feed Message [live_message] table to ensure previously submitted feedback is available for knowledge v3 articles.

### Legacy: Chat

Chat is deprecated in the Istanbul release.

> **Note:** The **Connect** feature provides an updated instant messaging platform, which is activated by default for new instances. The legacy chat and Connect features should not be used concurrently. There is no migration path from legacy chat to Connect.

Chat a provides real-time communication via instant messaging between users in a ServiceNow instance. Features include:

- One-to-one chats (instant messaging) between users.
- Chat rooms for conversations with multiple users. Chat rooms may be public (any user can join) or private (only invited users can join).
- Chat rooms linked to task records. Users can work together to solve issues, and conversation history can be shared by everyone who needs to reference it.
- Help desk chat. End users can access live support via instant messaging. Service desk staff can resolve basic issues in real-time or create incidents directly from chat requests for more extensive issues.
Legacy: Get started with Chat

Get started with legacy chat.

Before you begin
Role required: admin

Procedure

1. Establish use guidelines. Social media can improve communication and aid productivity. To get the most out of these tools, establish clear and simple social media guidelines that foster information sharing and a comfortable work environment.

2. Activate the Chat plugin to enable the legacy chat and legacy Help Desk Chat features.

3. Configure security settings. Users must log in to use the legacy chat features in the base system. The standard system security settings and Social IT-specific security settings are available. To learn more about setting up these features, refer to the plugin activation pages.
Chat rooms may be Public (any user can join) or Private (only invited users can join).

Administrators can limit who can read chat messages on tasks and who can create chat rooms.

**Legacy: Installed with Chat**

What components are installed with legacy chat.

Demo data is available for legacy chat. The demo data creates a chat queue called Help Desk Chat that is supported by the assignment group Chat Support. Additionally, the Help Desk Chat link is added to the header of the Employee Self-Service portal. To learn more, see [Set Up Chat Queues for Help Desk Chat](#).

**Other:**

- Event: A new event called `chat.invite` is registered to trigger an email notification when users are invited into a chat room.
- Email Notification: An email notification called Chat Room Invite is added to send when users are invited to a chat room.

**Legacy: Fields installed with legacy chat**

Legacy chat adds fields.

Legacy: Chat use

Legacy chat allows you to interact and collaborate through real-time instant messages with other users in an instance.

Use legacy chat to:
- Initiate or participate in chat conversations with one or multiple users.
- Initiate or participate in chat conversations that are attached to task records (such as an incident).
- See when other users are available to chat.

To open the chat desktop, navigate to Social IT > Chat.

💡 Note: Service desk staff may also provide live support to other users via help desk chat.
Legacy: Update your profile

Your profile identifies your contributions to legacy chat conversations.

About this task

Your profile identifies your contributions to conversations. It is created automatically the first time you use chat and consists of:

<table>
<thead>
<tr>
<th>Profile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>From your user account in ServiceNow. Your name appears on your messages and in the member list of any chat room you join.</td>
</tr>
<tr>
<td>Picture</td>
<td>Select any picture. Your picture appears beside your name in other users' favorites list and at the top of your favorites list.</td>
</tr>
</tbody>
</table>

To update your profile picture:
**Procedure**

1. Click your picture in the top of the favorites list.
2. Browse to the desired picture file and click **Open**.

   **Note:** Changes to your profile picture affect legacy chat and live feed if the Live Feed plugin is activated.

### Chat profile picture

![Chat profile picture](image)

**Legacy: Update your status**

In legacy chat, your status lets other users know whether you are available to chat.

**About this task**

Your status lets other users know whether you are available to chat. Your current status is indicated by the color of the icon in the upper right of your favorites list, beside your name. View the status of other users in your favorites list.

To change your status:

**Procedure**

1. Click the status icon beside your name.
2. Select a status (see table).
### Change status

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Appears to others</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Online</strong></td>
<td>Indicates that you are available to chat.</td>
<td>Green icon:</td>
</tr>
<tr>

</tbody>
</table>
Legacy: Use your favorites list

In legacy chat, your favorites list appears on your chat desktop and provides certain functions.

**Favorites list**

### My stuff

- **Users:**
  - Add another user in the system to your favorites list.
  - See if your favorite users are available to chat. Users are organized alphabetically and in sections by status.
  - Start a conversation by double-clicking a name.
  - Expand or collapse a section by clicking **Online** or **Offline**.

- **Rooms:**
  - See the list of your favorite chat rooms.
  - Join a chat room by double-clicking its name.

- **Favorites list toolbar:**
  - Options (Chat window menu)
    - access a menu with options to add a favorite user, view online users, create a chat room, and view chat rooms.
  - Add User (Add friend)
    - add a favorite user.
  - Create Room (Add room)
    - create a chat room.
  - Invitations (}
To expand or collapse a section in the favorites list, click the section header or click the arrows (â†œ) on the section header.

Legacy: Add a favorite user
How to add a user to your favorite users list in legacy chat.

Procedure
1. Click the Add User button.

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

3. Click OK.

Legacy: Remove a favorite user
How to remove a favorite user in legacy chat.

Procedure
To remove a user from your favorite users list, right-click the user's name and select Remove From List.

Legacy: View an online user
How to view a list of all users who are available to chat (status of Online) in legacy chat.
Procedure
1. Right-click the Users section header or click Options on the toolbar.

Chat window menu

2. Select Show Online Users.
   • Start a one-to-one chat with a user on the list by double-clicking a name.
   • Send Message or Add To Friend List by right-clicking a name.

Legacy: View a room
How to view a list of all public chat rooms in legacy chat.

Procedure
1. Right-click the Rooms section header or click Options on the toolbar.

Chat window menu

2. Select Public Rooms.
• To join a room, double-click a name or right-click and select **Join Room.** See **Joining Chat Rooms.**

<table>
<thead>
<tr>
<th>Rooms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Public Rooms</strong></td>
</tr>
<tr>
<td>Search:</td>

Showing 2 of 2 matches.

**Legacy: Start a one-to-one chat**

How to start a one-to-one chat in legacy chat.

**Procedure**

- To start a chat with one user in your favorites list, double-click the user's name or right-click and select **Send Message.**
- To start a chat with one available user, double-click the user’s name on the online users list. See **Viewing Online Users.**

Send a message to start a conversation.

**Legacy: Create a chat room**

How to start a chat with multiple users from the legacy chat desktop.

**About this task**

To start a chat with multiple users from the chat desktop (requires access rights):

**Procedure**

1. Click **Create Room** on the favorites list toolbar.
2. Enter the room details (see table).

3. Click **Create Room**. An invitation appears in the favorites list of all invited users and a new chat window opens on your chat desktop.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Room name</td>
<td>Enter a name to appear on the chat window header or click the <strong>Generate a unique room name</strong> button (Room name generator) to use a system-generated name. The default name for a room created from a task is Chat Room for &lt;Task Number&gt;.</td>
</tr>
<tr>
<td>Description</td>

</tbody>
</table>

**Legacy: Create a chat room for a task**

How to start a legacy chat with multiple users from a task record.

**About this task**

ℹ️ **Note:** This procedure is not possible if the Connect feature is enabled.

**Procedure**

1. Open the record (example, an incident on which you are working).

2. Click the **Create or Join Chat Room** related link.
3. If a chat room already exists, click a name to join the existing chat room. If no chat room exists, continue to the next step to create a new room.

4. Click the create link at the bottom of the window.

5. Enter the room details as you would for a chat room.

6. Click Create Room. An email notification is sent and appears in the favorites list for all invited users (the assignment group and the watch list, if selected, and additional invited users).

7. In the New Room Created message, click Join Room.
   • A new chat window opens on your chat desktop.
   • All invited users are listed in the chat member list. Invited users that are not currently participating in the chat are listed in gray.

Legacy: Join one-to-one chats
In legacy chat, when another user starts a chat by sending a message to you, a chat window opens on your chat desktop. To join the chat, click the window.

Legacy: Join a chat room
How to join a chat room in legacy chat.

Procedure
1. If another user invites you to join a chat room, an invitation appears in your favorites list.
2. To respond, click the invitation. A window opens that displays the room name, room description, and the name of the user who invited you.

- To join the chat, click Join. When the chat window opens on your chat desktop, click the window.
- To ignore the invitation, click Decline.

View Invitations

To rejoin a favorite chat room that you have left, click the chat room name in the Rooms section of the favorites list.

To join a public chat room without an invitation, right-click the Rooms section header and select Public Rooms. Double-click a room name on the list.

 Legacy: Join a chat room for a task

In legacy chat, if another user invites you to join a chat room from a task record, you receive an email notification.

Procedure
1. Click the link in the email notification.
2. If a prompt for a password appears, enter the password listed in the email notification.
3. When the chat window opens on your chat desktop, click the window.

 Legacy: Join a chat room from a task record without an invitation

How to join a chat room in legacy chat without an invitation.

About this task

Note: This procedure is not possible if the Connect feature is enabled.
Procedure

1. Open the task record.
2. Click the **Create or Join Chat Room** related link.
3. Click a chat room name.
4. If a prompt for a password appears, contact the person who created the chat room for the password.
   
   If a chat room has a password, only users with the password can join the chat.
5. When the chat window opens on your chat desktop, click the window.

Legacy: Chat windows

In legacy chat, a chat window appears on your chat desktop for each chat conversation that you start or join.

Legacy: Send messages in legacy chat

How to send messages in legacy chat.
To chat with other users that have joined the conversation, enter your message in the text field at the bottom of the window and press Enter. The message appears in the other users' chat windows.

To send a link, type the full URL (example, http://www.service-now.com). When the message is sent, the text appears blue and any user in the conversation can click it to follow the link.

To send a smiley face, type a colon followed by a close parentheses (:)'). When the message is sent, a smiley face (😊) appears in place of the text. For more emoticons, see Sending Emoticons in Messages (Smileys).

Chat activity is indicated with the following alerts:

- When a new message is posted to an inactive browser tab, the tab name blinks.
- When a new message is posted to an inactive chat window, the window header appears in yellow and blinks.
- When a user joins or leaves a room, a message appears in the other room members' chat windows.

Legacy: Send emoticons in legacy chat messages (smileys)

How to send emoticons (smileys) in legacy chat.

To send an emoticon (smiley), type text from the following table. When your message is sent, the emoticon appears in place of the text. For example, enter colon followed by a close parentheses (:)') and a smiley face (😊) appears in your message.

<table>

#### Legacy: Change the display

How to change the display of legacy chat.

To view the chat window menu, click the gear button (🔧)

**Chat window menu**

🔧
• To show or hide timestamps, select **Show Timestamps** from the chat window menu or press **F2**.

• To show or hide the chat member list, select **Show Members** from the chat window menu or press **F4**.

To resize the window, point to the lower corner (left or right). When the pointer changes shape, drag the window to the desired size.

To move the window, point to the header. When the pointer changes shape, drag the window anywhere on your chat desktop.

To close a chat window, click the **X** in the upper right corner.

**Legacy: Invite a user into a chat**

How to invite another user into a chat in legacy chat.

**Procedure**

1. Select **Invite User** from the chat window menu.

   Chat window menu

   🌐

2. Begin typing a user name and select a user from the list, or click the reference lookup and select a user from the table.

   Search icon

   🔍

3. Click **OK**.

   An invitation is sent to the selected user. One-to-one chats are automatically converted into temporary chat rooms.

**Legacy: Add a favorite room**

How to add a favorite room in legacy chat.

**Procedure**

To add a room to your favorites, click the chat window and select **Add To Favorites** from the chat window menu.
Legacy: Remove a favorite room

How to remove a favorite room in legacy chat.

Procedure

To remove a room from your favorites, right-click the room name and select Remove From List.

Legacy: Set your chat preferences

Use the Chat Window Preferences to set audio notifications and default chat window display options in legacy chat.

Use the Chat Window Preferences to set audio notifications and default chat window display options. The default display options control how a chat window looks when you first open it. You can still control the display options for an individual window as described in Changing the Display.

To view your chat preferences, click your name in the upper left corner of the chat desktop and select Chat Preferences.

![Chat Window Preferences](image)

To set your preferences, select or clear the check boxes next to the options, then click Update.

**Preferences**

<table>
<thead>
<tr>
<th>Title</th>

</tr>
</tbody>
</table>

**Legacy: Delete a chat room**

You can delete chat rooms in legacy chat.

**Before you begin**
Role required: chat_admin

**About this task**
Note that when you delete a chat room, the system also deletes the records for any chat members and messages.

**Procedure**
1. In the application navigator filter, enter `chat_room.list`.
2. Delete multiple chat rooms from the list or open a chat room record and click **Delete**.

**Legacy chat administration**

Users with the chat_admin role can administer various aspects of legacy chat.

**Define chat room access rights**

Control the access rights for creating a chat room so that not all users can create a chat room.

**Before you begin**
Role required: chat_admin

**About this task**
To define the access rights for creating chat rooms:
**Procedure**

1. Navigate to Social IT > Chat Administration > Properties.
2. Locate the property **Comma-separated list of roles that are allowed to create chat rooms.**
3. Enter user roles. A user must have one of the specified roles to create a chat room.

**Change chat room message read access**

In legacy chat, you can associate a chat room with a record, such as an incident, and add the chat messages to a **Chat Activity** journal field on the form.

**Before you begin**

Role required: admin

**About this task**

By default, a user can read the chat messages for a room if either of the following is true:

- The room is public
- The user is a member of the room

To change chat room message read access:

**Procedure**

Modify the Chat message access control rule or create a new rule.

Read access to the messages displayed is handled by the access control list security operation `chat_messages_read` on the Chat room `[chat_room]` table.

**View a legacy chat message as a journal field**

You can view all chat messages in one place by viewing them as a journal field.

**About this task**

Chat rooms can be linked to any task record in the following ways:

- Create a room from the record.
- Create a record from a chat room, such as creating an incident from a Help Desk Chat.

To view the chat messages as a journal field:
**Procedure**

Configure the task record form to select the **Chat Activity** field. The maximum number of chat messages that are displayed by this field is 1000.

**Example:**

```
<table>
<thead>
<tr>
<th>Date</th>
<th>Time</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>2011-01-21</td>
<td>13:48</td>
<td>Chat Room for INC0010010 - I can't access the shared server</td>
</tr>
<tr>
<td>2011-01-12</td>
<td>15:11</td>
<td>Help Desk Chat - rachel user</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:12:05] rachel user: I can't access the shared server</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:12:05] Help Desk Chat: Thank you for contacting support. Your pr agent will be with you shortly.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:12:49] Fred Luddy: Where are you?</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:12:56] rachel user: I'm at home on the VPN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:13:38] Fred Luddy: I'll open an incident for you to get the update</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[2011-01-12 23:14:03] rachel user: Great, thanks!</td>
</tr>
</tbody>
</table>
```

**Chat actions**

Chat actions are additional items that appear in the chat window menu (requires the Chat plugin). Administrators and users with the chat_admin role can define chat actions.
Add actions to the legacy chat window menu
You can create new actions and add them to the chat window menu.

Procedure
1. Navigate to Social IT > Chat Administration > Actions.
2. Select an action to edit or click New.
3. Enter the chat action details and click Update or Submit.

Example:
The following example demonstrates how to add a chat action that appears only on windows where the user is a Help Desk Agent. The action appears on the menu as Show User Type and opens a popup window that indicates a current user of queue_agent.

• **Action Name**: Show User Type
• **Active**: Select the check box.
• **Order**: 100
• **Client Show Condition**:

```java
answer = g_chat.getChatType() == 'queue_agent';
```

• **OnClick Action Script**:

```javascript
alert('The current user is: ' + g_chat.getChatType());
```
Chat action details
You can define a chat action name and the script that runs when the action is selected.

Chat action details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Name</td>
<td>Enter a label for the action as it appears in the menu.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the action. Only active actions may appear in the menu.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the action appears in the menu. Standard menu items (such as Show Timestamps) always appear at the top of the chat menu, followed by chat actions in order.</td>
</tr>
<tr>
<td>Client Show Condition</td>
<td>Define the conditions under which this menu option appears. The show condition must set the pre-defined answer variable to a boolean value.</td>
</tr>
<tr>
<td>OnClick Action Script</td>
<td>Enter the JavaScript code that runs when the menu item is selected.</td>
</tr>
</tbody>
</table>

**Available methods associated with the g_chat variable**

The g_chat variable is a legacy chat window object that is available in the Client Show Condition and OnClick Action Script of a chat action definition.

**Method Summary**

The following table defines the available methods associated with this object.

<table>
<thead>
<tr>
<th>Return Object</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td><code>getActiveUsers()</code>&lt;br&gt;Returns the active users.&lt;br&gt;Returns:&lt;br&gt;Array - Returns the active users.</td>
</tr>
<tr>
<td>String</td>
<td><code>getChannelJID()</code>&lt;br&gt;Returns the channel JID, which is a sys_id for a record chat_channel table.&lt;br&gt;Returns:&lt;br&gt;String - Returns the channel JID.</td>
</tr>
<tr>
<td>String</td>
<td><code>getChatType()</code>&lt;br&gt;Determines the chat window type.</td>
</tr>
<tr>
<td>Return Object</td>
<td>Details</td>
</tr>
<tr>
<td>---------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>Returns: String - Returns one of the following values that specifies the type of user:</td>
</tr>
<tr>
<td></td>
<td>• queue_agent: Help Desk Chat support agent</td>
</tr>
<tr>
<td></td>
<td>• queue_user: Help Desk Chat end user</td>
</tr>
<tr>
<td></td>
<td>• group_chat: The individual is a member of a chat room (multiple users)</td>
</tr>
<tr>
<td></td>
<td>• conversation: The individual is a member in a private chat with another user</td>
</tr>
</tbody>
</table>

### String getChatQueueAgent()
Returns the sys_id for agent that is administering this thread.
Returns:
String - Returns the sys_id of the chat queue agent.

### String getChatQueueUser()
Returns the sys_id for end user of the chat queue.
Returns:
String - Returns the sys_id of the chat queue user.

### String getThreadID()
Returns the thread ID. This returns the same value as g_chat.getChannelJID().getID().
Returns:
String - Returns the thread ID.

**Legacy: Help desk chat**

Communicate with service desk staff using instant messaging.

**Note:** The Connect Support feature provides an updated messaging platform similar to help desk chat. The help desk chat and Connect Support features should not be used concurrently. There is no migration path from help desk chat to Connect Support.
Users can communicate directly with service desk staff using instant messaging in a ServiceNow instance (requires the Chat plugin.)

- Users access live support from the Employee Self-Service portal.
- Service desk staff provide support from the chat desktop.

**Legacy: Use help desk chat to get support**

You can contact service desk staff.

**Procedure**

2. Log in to your ServiceNow account. Only logged in users can use chat.
3. In the upper right, click the **Service Desk Chat** button. A chat window opens.
4. Enter your question in the text field at the bottom of the window and press **Enter**.
   - A message confirms that you have entered the chat queue and indicates your position and estimated wait time.
   - When a service desk staff member accepts your chat and begins working on your question, another message appears.
5. Chat with your service desk agent via instant messaging.
   - Service desk staff may lead you through troubleshooting, ask clarifying questions, or create an incident record to address your question.

**Results**

**Note:** Administrators can configure Service Desk Chat to be accessible on content management (CMS) pages.
Legacy: Use help desk chat to provide support

Staff who are assigned to chat support can provide live support via instant messaging. Administrators and users with the chat_admin role can assign chat support staff (see Set Up Chat Queues for Help Desk Chat).

About this task
To provide users with live support using chat:

Procedure
1. Navigate to Social IT > Chat to open your chat desktop.
   - A chat queue agent window appears on your chat desktop for each chat queue you are assigned to. If no agent windows appear, ask an administrator to add you as a member of the assignment group for a chat queue.
   - The chat queue agent window displays the number of users in the queue and how long they have been waiting.
   - Every member of the assignment group sees the associated chat queue agent window.

2. Click Answer Next User to answer the next user or click Answer beside a specific user in the queue. A chat window opens.
   - Only the agent and the user can see the chat window.

Results
Provide support via instant messaging. Chat queue agents can access additional support functions in the chat window menu:
• **Invite User**: invite another expert to assist with a support chat. An invitation appears in the favorites list of an invited user.

• **Create Incident from Chat**: create a new incident record with the initial question as the short description and the support chat as a linked chat room (accessible from the Create or Join Chat Room related link on the Incident form).

  ➤ **Note**: Administrators can edit this action or add additional actions to the chat window menu.

### Chat Queue Agent

Legacy: Set up chat queues for help desk chat

Help desk chat allows users to communicate directly with Service Desk staff via instant messaging in an instance.

Chat queues define the schedules, staff, and system messages for help desk chat. Administrators and users with the chat_admin role can set up chat queues.

Define a chat queue for legacy chat

How to define a chat queue for legacy chat.

About this task

➤ **Note**: The Chat Queue [chat_queue] table is also used by Connect Support. Legacy chat and Connect Support should not be used concurrently.
Procedure
1. Navigate to Social IT > Chat Administration > Queues.
2. Select a chat queue to edit or click New.
3. Enter the chat queue details and click Update or Submit.

Chat queue details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name that end users see as a title for the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to activate or clear the check box to deactivate the chat queue.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the group that contains the support staff for the chat queue. Every agent sees the chat queue on their chat desktop and can answer any user that is waiting in the queue. To assign staff members to the group, see Assign Service Desk Staff to a Chat Queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Select a schedule that defines when a queue is available (see Use Schedules). If the queue is always available, clear the field.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the initial question that end users see when they open a new Help Desk Chat. For example, How can I help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>(Optional) Enter the confirmation message that end users see when they enter an initial question. For example, Thank you for contacting support. Your problem has been submitted and an agent will be with you shortly.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>(Optional) Enter the message that end users see when an agent accepts their chat. For example, Thank you for waiting. I am looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Enter the message that end users see when a Help Desk Chat request is not accepted because the queue is outside its scheduled availability (defined by the Schedule field).</td>
</tr>
</tbody>
</table>

Assign service desk staff to a chat queue

Chat queue agents are Service Desk staff that are members of a chat queue’s assignment group.

About this task
To assign agents to a chat queue:
Procedure
1. Navigate to User Administration > Groups.
2. Select an existing assignment group or click New.
3. Enter or modify the group details (see Create a Group).
4. Right-click the header and select Save.
5. In the Group members related list, click Edit.
6. Using the slushbucket, add support staff to the group.
7. Navigate to Social IT > Chat Administration > Queues.
8. Select the chat queue for which the group provides support.
9. In the Assignment Group field, select the group.

Make help desk chat accessible to an end user
Users access live support from the Employee Self-Service Portal (ESS Portal).

About this task
Users access live support from the Employee Self-Service Portal (ESS Portal). To make a Help Desk Chat queue accessible to end users, add a link to the ESS Portal (requires the Content Management Plugin).
To change the default link in the ESS header:
Procedure
1. Navigate to Content Management > Headers.
2. Open Portal - Header.
3. In the Chat queue field, enter the chat queue that users access by clicking the link in the ESS header. Clear the field to remove the chat queue link.
4. Click Update.

Add a custom link elsewhere on the ESS portal
How to add a custom help desk chat link on the ESS portal.

Procedure
1. Navigate to Content Management > Static HTML.
2. Click New.
3. Enter a Name.
4. In the Static content field, click Toggle HTML Source to edit the field in HTML source mode.
5. Create a link to the desired Help Desk Chat queue (see Link Syntax).
6. Click Submit.
7. Add the new content block to the desired location on the portal (see Adding Content to the Page).
Link syntax
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must
call the CustomEvent.fire method using appropriate arguments.
To open a Help Desk Chat queue from a custom link on the ESS Portal, you must
call the CustomEvent.fire method using appropriate arguments. Details of the
API call and an example that generates an anchor link are provided below.
API Call:
CustomEvent.fire(LiveEvents.LIVE_EVENT, LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
CHAT_QUEUE_SYS_ID, CHAT_QUEUE_SYS_NAME);

where the variables are:
• CHAT_QUEUE_SYS_ID: Specifies the sys_id for the chat queue.
• CHAT_QUEUE_SYS_NAME: Specifies the name of the chat queue (must match
the value the Name field of the chat queue record).
Example: This example creates an anchor link that opens the Help Desk Chat
queue.
<a href="#" onclick="CustomEvent.fire(LiveEvents.LIVE_EVENT,
LiveEvents.LIVE_WINDOW_JOIN_QUEUE_QUERY,
'c54f0abf0a0a0b452db84664f409c79c',
'Help Desk Chat'); return false;">
Help Desk Chat
</a>

Monitor chat queues
Chat queues can yield useful Key Performance Indicators (KPI) for evaluating
support effectiveness.
• Queue Wait Time: amount of time a user waits in the queue before a help
desk agent accepts the request.
• Percentage of Chats Abandoned: users that exit the queue before an agent
responds (user stopped waiting).
• Percentage of Chats Accepted: requests that are answered by an agent.
Note: This information is not calculated automatically. Administrators may
calculate these values based on data collected by chat queues.

Monitor help desk chat tasks

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record.

Help Desk Chat requests are tracked in the Chat queue entries table, which appears as a related list on the associated chat queue record. Because this table extends the Task table, administrators can take advantage of core task functionality. For example, administrators can attach Service Level Agreements (SLAs) to chat queue entries to evaluate the response time of Help Desk Chat support.

Legacy Notify

Legacy Notify enables organizations with a Twilio account to send notifications using text and voice messages.

ℹ️ Note: This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Legacy Notify also allows conference calls between ServiceNow users to enable quick communications.

When Legacy Notify is active, you can configure ServiceNow to automatically generate and send notifications to selected contacts, for instance when a new incident communication plan is raised in the incident communications management process.

Users with the notifynow_admin role can set properties and monitor message and conference call activities.

Legacy Notify has been implemented for use within Incident Communications Management. Refer to the Notify API documentation for details on how to implement Legacy Notify for use within other ServiceNow applications.

Working with Legacy Notify

Follow this process to enable and use Notify.

About this task

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
**Procedure**

1. Set up a Twilio account to provide phone connectivity for Notify.
2. Activate Notify.
3. Configure Notify to use Twilio.
4. Begin using Notify immediately within Incident Communications Management.
5. Use the Notify API with other ServiceNow applications to provide SMS, voicemail, email, and conference calls for those applications.

**View a Legacy Notify question**

Questions contain a response action and a set of response choices. Use these questions to simplify communications. Then, you can monitor the resulting communication thread.

**Before you begin**

Role required: notifynow_admin

**About this task**

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

For example, the process can be used to ask members of a specific on-call group to acknowledge or reject an incident. Depending on the answer from the first team member, the incident is assigned to that person or an SMS question is sent to the next on-call member. In this example, the questions are used as part of a workflow.

To see a list of predefined questions both Notify and On-Call Scheduling need to be active.

**Procedure**

1. Navigate to Notify > Questions.
2. Click the question **On-Call responsibility Accept/Reject** to see the question details.
3. Click the **Notify Response Choices** related list to view or edit the choices. The person who receives the SMS question can either choose to accept or reject the assignment. If the assignment is accepted, the **Response action** can be that the incident is actually assigned to that person. The response action is a script that you can modify or replace. If the assignment is rejected, an SMS question may be sent to the next person in the escalation chain, and so on. You can combine questions with a workflow to automate a process like on-call scheduling escalation.

**Create a question in Legacy Notify**

Define a question that can be sent to users.

**Before you begin**

Role required: notifynow_admin

**About this task**

This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

**Procedure**

1. Navigate to **Notify > Questions**.
2. Click **New**.
3. Fill in the fields, as appropriate.
### Notify New Question form

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a description of the question.</td>
</tr>
<tr>
<td>Question</td>
<td>Enter the question you want to send. You can enter variables in the question with the <code>{ }</code> tags, for example, <code>{0}</code>. When using more than one variable, use consecutive numbering. When using multiple variables, reference them by specifying their position in the parameter list, starting from <code>{0}</code>. The variable is picked up by the script and translated into, for example, an incident or a problem number.</td>
</tr>
<tr>
<td>Params</td>
<td>Enter parameters which map to the fields on the record that the workflow was triggered for. This enables the message to show dynamic data. Multiple parameters should be separated by a comma. For example, <code>number</code>, shows the incident number in case the workflow was triggered from an incident. A second parameter could be, for example <code>short_description</code>.</td>
</tr>
<tr>
<td>Response Action</td>
<td>Select the action that must be taken. This is a script that can be modified, or you can create a new script by clicking the search button and selecting New. Several examples of scripts are shown. Write your own script and click Submit.</td>
</tr>
</tbody>
</table>

4. Click Submit.

### Create a new response choice in Legacy Notify

Create a new response choice to allow users to select that response for a Notify question.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

**Procedure**
1. Navigate to Notify > Questions.
2. Open the notify question you have just created.
3. Click New to create a new notify response choice.
4. Fill in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Notify New Response Choice form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Code</td>
</tr>
<tr>
<td>Text</td>
</tr>
<tr>
<td>Order</td>
</tr>
</tbody>
</table>

5. Click Submit.

**View Legacy Notify messages**

Applications implementing Notify, such as Incident Communications Management, can send Short Message Service (SMS) text messages to relevant contacts under predefined conditions, such as when a new incident communication plan has been created.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Procedure

1. Navigate to Notify > Messages.
2. Click a message to see the message details.

**View Legacy Notify conversations**

The Notify Conversation [notifynow_conversation] table tracks bi-directional communications and adds the ability to have more than one active conversation with the same phone number at the same time.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

The thread number is combined with the phone number to link the SMS or email response to the correct conversation. Conversations remain active until a response is received or until they are automatically deactivated after the thread release time runs out. The default thread release time is 10 days. To change this value, add the `nn.thread.release.age` property.

**Procedure**

1. Navigate to Notify > Conversations.
2. Click a conversation record to see the conversation details.
The State of the conversation can have one of the following values:

### Notify Conversation State Descriptions

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ended</td>
<td>The conversation has been completed.</td>
</tr>
<tr>
<td>Failed</td>
<td>The conversation has failed.</td>
</tr>
<tr>
<td>Pending</td>
<td>The SMS or email is waiting to be sent.</td>
</tr>
<tr>
<td>Sent</td>
<td>The SMS or email has been sent.</td>
</tr>
<tr>
<td>Unanswered</td>
<td>The SMS or email has not been answered.</td>
</tr>
</tbody>
</table>

**Note:** The mode of conversation cannot be changed during one conversation thread. For example, you cannot switch between SMS and email during one conversation.

### View Legacy Notify conference calls

Applications that use Notify, such as Incident Communications Management, can launch and maintain conference calls between involved parties.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Procedure

1. Navigate to Notify > Conference Calls. You can also access conference call information from the relevant record, such as the Conference Calls related list in an incident communication plan record.

2. Click a conference call in the list to view details.

3. Click the arrow beside the check box to expand a Participant entry. This shows participant session information, including details of the conference calls that the participant has been involved in.

4. Click a Participant name to see more detailed information about that participant.

Related information

Manage Legacy Notify conference call participants

Legacy public conference calls

A Notify conference call can be public.
The **Private** field on the conference call record indicates if a call is private (selected) or public (not selected). By default, all calls created automatically, such as those created through Incident Communications Management, are public. You can create private calls using the Notify API initiateConferenceCall method.

When created, public conference calls generate an associated **Code** which is sent via SMS to all invited participants. These participants can distribute the code to allow other users to join the public call. An administrator can control the format of the code using the property glide.notifynow.conference_call.code.pattern. Anyone with the code can connect to a public conference call using one of these methods:

- By calling the Twilio phone number and entering the code for that conference call.
- By sending the code in an SMS message to the Twilio phone number. Participants that join a public call this way are considered ad-hoc participants, indicated on the participant record.

**Administering Legacy Notify**

An administrator can set up Notify, manage Notify properties and conference call participants.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

**Configuring legacy Notify to use the Twilio service**

Each ServiceNow instance using Notify requires a valid Twilio account and telephone number. Refer to the Twilio documentation for detailed instructions.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

After the Twilio account is set up, perform the following to use that account with Notify:
• Associate the account with Notify
• Configure Twilio with ServiceNow endpoints

**Associate a Twilio account with Legacy Notify**

Associate a Twilio account with your instance to use that account for legacy Notify.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.
Procedure

1. Navigate to Notify > Administration > Properties.

Notify Properties

<table>
<thead>
<tr>
<th>Account Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Your Twilio AccountSID or AuthToken are not valid.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Twilio AccountSID.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Twilio AuthToken.</th>
</tr>
</thead>
<tbody>
<tr>
<td>........</td>
</tr>
</tbody>
</table>

Twilio SMS and voice enabled phone number.

<table>
<thead>
<tr>
<th>Number of frequent conference call participants to be displayed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
</tr>
</tbody>
</table>

The voice used for Notify communications.

<table>
<thead>
<tr>
<th>Voice Analytics</th>
</tr>
</thead>
<tbody>
<tr>
<td>alice</td>
</tr>
</tbody>
</table>

2. Enter the AccountSID, AuthToken and phone number values. These values can be obtained from the Twilio dashboard:

Twilio Dashboard

When the Twilio account details are entered in the Notify Properties page, the account status is updated.
3. [Optional] To use Notify on multiple ServiceNow instances, activate Notify on each instance and create a separate Twilio account and telephone number for each instance.

**Note:** Some telephone numbers are voice capable, but not SMS capable. This is shown in the Notify properties with relevant messages. Two methods are available to check this: `isSMSCapable` and `isVoiceCapable`.

**Configuring the Twilio service with endpoints in legacy Notify**

In order for the Twilio service to receive Notify commands, the **Request URL** field value for every Twilio telephone number must point to the ServiceNow instance that uses Notify with that Twilio telephone number.

**Note:** This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

To set these values, do one of the following:

- Define them manually in the Twilio service dashboard.
- Ensure the fields are blank in the Twilio service dashboard, then open the Notify Properties page. Notify automatically configures the correct endpoints if the **Request URL** fields are blank.

Set these values from within the Twilio service dashboard.
The notifyusa values underlined in the image should be replaced with your ServiceNow instance name, for:

- **Voice Request URL**: https://notifyusa.service-now.com/NotifyNowCallProcessor.do
- **Status Callback URL**: https://notifyusa.service-now.com/NotifyNowCallStatusProcessor.do
- **Messaging Request URL**: https://notifyusa.service-now.com/NotifyNowSmsProcessor.do

**View and edit legacy Notify properties**

You can view and edit Notify properties.

Manage Legacy Notify conference call participants

As a Notify administrator, you can mute, unmute, and kick participants on a conference call.

**Before you begin**
Role required: notifynow_admin

**About this task**
This content applies only to the Legacy Notify application, available prior to the Geneva release. For information about the Notify application available starting with Geneva, see Notify.

Muting a participant prevents that person from speaking on the conference call but does not notify any participants, including the muted participant. Kicking a participant removes that person from the conference call and sets the **Response** field for the participant session to kicked.

**Procedure**

1. Navigate to **Notify > Conference Calls**.
2. Select an active conference call.
3. In the **Notify Conference Call Participants** related list, select a participant.
4. Click the button for the action you want to perform, such as **Mute** to mute the participant.

You can perform these actions for multiple participants as a single operation using the **Actions on selected rows** choice list on the **Notify Conference Call Participants** related list.

**Related information**

View Legacy Notify conference calls
Installed with Legacy Notify

Activating the Notify plugin adds or modifies tables, user roles, script includes, and other components.

<td>Update Conference Call Finished IA Activity</td>
<td>NotifyNow Conference Call [notifynow_conference_call]</td>
<td>Logs when a conference call ended and what actions the conference call participants took by writing to an incident communication plan's comment field if the source record is from the incident_alert table.</td>
</tr>
</tbody>
</table>

### Workflow Activities

Notify adds the following workflow activities.

#### Workflow Activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Activity Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Notify SMS</td>
<td>Notify</td>
<td>Sends an SMS message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups.</td>
</tr>
<tr>
<td>Send Notify SMS Question</td>
<td>Notify</td>
<td>Sends predefined SMS Question message (maximum 1600 Characters) to an E.164 compliant mobile phone number of the selected recipients and/or groups. This is one of two main activities for workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The same message also contains predefined answers.</td>
</tr>
<tr>
<td>Send Email Question</td>
<td>Notify</td>
<td>Sends email generated from email template containing notification that recipient is the current On-call resource for a newly created task. This is one of two main activities for the workflow On-Call Assign by Acknowledgement. In a predefined message, the recipient is asked to assign himself to a newly created incident. The email contains two links that enable the user to accept or reject assignment.</td>
</tr>
</tbody>
</table>
NotifyNow API (Legacy) - Global

The legacy NotifyNow API provides functionality for sending emails, sending SMS messages, and setting up conference calls.

Use this when you want to use Notify functionality with applications on your system.

⚠️ Note: This API is included with the legacy Notify functionality. For APIs included in the current Notify feature, see the Notify, NotifyAction, NotifyPhoneNumber, and NotifyClient APIs.

NotifyNow - getReadyState()

Indicates whether Notify is set up correctly or not.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message False when trying to run the function in a script.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if Notify is set up correctly, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(((nn.getReadyState()) ? "OK" : "NOT OK"));
```

NotifyNow - getStatus()

Returns the current status of Notify configuration.

This method can only be accessed by administrators or users with the notifynow_admin role. Users with all other roles get the message Unauthorized when trying to run the function in a script.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>One of the possible status messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_NUMBER_MESSAGE</td>
<td>The account does not have a telephone number set up. Ensure that you set up the telephone number for the account.</td>
</tr>
<tr>
<td>NO_ENDPOINTS_MESSAGE</td>
<td>The account does not have its endpoints set up correctly. Ensure that you set up the endpoints for the account.</td>
</tr>
<tr>
<td>ACCOUNT_OK_MESSAGE</td>
<td>The account is active and ready for use.</td>
</tr>
<tr>
<td>ACCOUNT_NO_AUTH</td>
<td>The Twilio AuthToken is not valid.</td>
</tr>
<tr>
<td>ACCOUNT_NOT_CONFIGURED</td>
<td>The Twilio AccountSID or AuthToken is not valid.</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log(nn.getStatus());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle)**

Initiate a new conference call.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The conference call record, or null if there was an error.</td>
</tr>
</tbody>
</table>

This initiates a conference call with E.164-compliant phone numbers for participants, without the optional source record parameter and and does not send any conference call details via SMS or email.

```javascript
var participants = ['+31205655548', '+31205655552', '+31652825393'];
// set up conference call
var nn = new SNC.NotifyNow();
var conferenceCall = nn.initiateConferenceCall(participants, "testing12");
gs.log('started conference call: ' + conferenceCall.getUniqueValue());
```

**NotifyNow - initiateConferenceCall(String[] conferenceCallParticipants, String conferenceCallTitle, GlideRecord sourceRecord, Boolean private)**

Initiate a new conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallParticipants</td>
<td>String</td>
<td>One or more users, conference call participants, identified by the sys_ids from the sys_user table or E.164-compliant phone numbers.</td>
</tr>
<tr>
<td>conferenceCallTitle</td>
<td>String</td>
<td>Title of the conference call. This parameter has a maximum length of 40 characters.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>Source record to associate to the conference call such as an incident or problem number.</td>
</tr>
<tr>
<td>private</td>
<td>Boolean</td>
<td>Value to control if a conference call is private. This value defaults to false.</td>
</tr>
</tbody>
</table>
This initiates a conference call with participants that have a E.164-compliant phone number and participants from the sys_user table and sends conference call details via SMS and email to all participants.

```javascript
// define phone number participants
var participants = ['$+31205655548', '+31205655552', '+31652825393'];

// we also want to add two Dutch sys_user participants
var user = new GlideRecord('sys_user');
user.addNotNullQuery('mobile_phone');
user.addQuery('mobile_phone', 'STARTSWITH', '+316');
user.setLimit(2);
user.query();

// add users to the participant array
while (user.hasNext() && user.next()) {
    gs.log('adding user ' + user.getValue('name') + ' with phone number ' +
           user.getValue('mobile_phone') + ' to the participant array');
    participants.push(user.getUniqueValue());
}

// define a source record to associate with the conference call
var source = new GlideRecord("cmdb_ci");
source.query("asset_tag", "P1000167");
if (source.hasNext() && source.next()) {
    // set up conference call
    var nn = new SNC.NotifyNow();
    var conferenceCall = nn.initiateConferenceCall(participants, "testing 1 2", source);

    // check if the conference call was successfully created
    if (conferenceCall != null) {
        gs.log('started conference call: ' + conferenceCall.getUniqueValue());
    } else {
        gs.log('could not start the conference call :(');
    }
}
```
**NotifyNow - isCallable(String participant)**

Determines whether a user is callable or not.

A user must have a valid phone number to be callable. A user who is already in an active session is not callable.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>participant</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>boolean</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
gs.log('by number: ' + nn.isCallable('+31612345678'));

var user = GlideRecord('sys_user');
user.query('sys_id', '13d39544eb5201003cf587b9d106fea9');
if (user.hasNext() && user.next())
gs.log('by user: ' + nn.isCallable(user));

var participant = GlideRecord('notifynow_participant');
participant.query('sys_id', '33b11430eb1201003cf587b9d106feb9');
if (participant.hasNext() && participant.next())
gs.log('by participant: ' + nn.isCallable(participant));
```

**NotifyNow - isSMSCapable()**

Checks if the telephone number associated with the Twilio account is capable of sending SMS messages.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of sending SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('The twilio number is SMS capable: ' + ((new SNC.NotifyNow().isSMSCapable()) ? 'yes' : 'no'));
```

### NotifyNow - isSMSCapable(String userID)

Checks if a user is able to send SMS messages.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for an SMS-capable phone number.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>If the user can send SMS messages.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' + (new SNC.NotifyNow().isSMSCapable('<user sys_id>') ? 'yes' : 'no'));
```

### NotifyNow - isVoiceCapable()

Checks if the telephone number associated with the Twilio account is capable of setting up phone calls.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Whether the telephone number associated with the Twilio account is capable of setting up phone calls.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the Twilio number is Voice capable: ' + ((new SNC.NotifyNow().isVoiceCapable()) ? 'yes' : 'no'));
```

**NotifyNow - isVoiceCapable(String userID)**

Checks if a user is able to make voice calls.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of the user you want to check for a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>Whether the user has a voice-call capable phone number.</td>
</tr>
</tbody>
</table>

```javascript
gs.log('the user is able to send SMS messages (e.g. has a SMS device): ' +
((new SNC.NotifyNow().isVoiceCapable('someuserid')) ? 'yes' : 'no'));
```

**NotifyNow - kick(GlideRecord participant)**

Removes a participant from a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to remove from the call.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was removed, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // kick participant
    result = new SNC.NotifyNow().kick(participant);
    gs.log('participant kicked: ' + result);
}
```

### NotifyNow - mute(GlideRecord participant)

Mutes a participant on a conference call.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The conference call participant to mute.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was muted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // mute participant
    result = new SNC.NotifyNow().mute(participant);
    gs.log('participant muted: ' + result);
}
```
**NotifyNow - umute(GlideRecord participant)**

Unmutes a participant on a conference call.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>participant</td>
<td>GlideRecord</td>
<td>The muted conference call participant to unmute.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if the participant was unmuted, otherwise false.</td>
</tr>
</tbody>
</table>

```javascript
var participantId = "<participant sys_id>";
var participant = new GlideRecord('notifynow_participant');
participant.get(participantId);
if (participant.isValid()) {
    // unmute participant
    result = new SNC.NotifyNow().unmute(participant);
    gs.log('participant unmuted: ' + result);
}
```

**NotifyNow - sendEmailQuestion(String emailAddress, String question, GlideRecord sourceRecord, String emailSubject)**

Send an email question to an email address.

The sendEmailQuestion method produces a question body and requires users to click a link to indicate their choice.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>Email address to send the question to.</td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>GlideRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
</tr>
</tbody>
</table>
Parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailSubject</td>
<td>String</td>
<td>Optional text to override the default email subject.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id.</td>
</tr>
</tbody>
</table>

This example demonstrates using the default email subject.

```javascript
var user = GlideRecord("sys_user");
user.get("email", "someone@somedomain.com");

new SNC.NotifyNow().sendEmailQuestion(user.getValue('email'),
    "b6b34500bf3111003cf585ce2c0739ce", user);
```

This example uses dot-walking and specifies a source record and email subject.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
    "b6071733bf1111003cf585ce2c07390f", current,
    "Please answer this question");
```

This example uses dot-walking and specifies an email subject but no source record.

```javascript
new SNC.NotifyNow().sendEmailQuestion("someone@somedomain.com",
    "b6071733bf1111003cf585ce2c07390f",
    "Please answer this question");
```

**NotifyNow - sendSMS(String phoneNumber, String smsBody)**

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

```java
new SNC.NotifyNow().sendSMS("+31612345678", "This is a message without source record");
```

### NotifyNow - sendSMS(String phoneNumber, String smsBody, GlideRecord source)

Sends an SMS message to an E.164-compliant mobile phone number.

Notify supports international numbers. Using this method with a number that does not support sending SMS messages results in an error being logged.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The E.164-compliant phone number to send the message to.</td>
</tr>
<tr>
<td>smsBody</td>
<td>String</td>
<td>The message to send, maximum 1600 characters.</td>
</tr>
<tr>
<td>source</td>
<td>GlideRecord</td>
<td>The source record to associate with this SMS message.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
```javascript
var source = new GlideRecord("my_table");
source.query("my_field", "my_value");

if (source.hasNext() && source.next()) {
    // send a text message
    var nn = new SNC.NotifyNow();
    var message = "this is just a test";
    var number = "+31612345678";
    nn.sendSMS(number, message, source);
}
```

This example uses dot-walking and the current record as the source record.

```javascript
new SNC.NotifyNow().sendSMS("+31612345678", "this is a test", current);
```

### NotifyNow - sendSMSQuestion(String phoneNumber, String question, GlideRecord sourceRecord)

Sends an SMS question.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phoneNumber</td>
<td>An E.164-compliant phone number to send the message to.</td>
<td></td>
</tr>
<tr>
<td>question</td>
<td>String or GlideRecord</td>
<td>The question record to send or the sys_id of a question record.</td>
</tr>
<tr>
<td>sourceRecord</td>
<td>An optional source record to associate to the SMS question, such as an incident.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The conversation sys_id, or null if the SMS was not sent successfully.</td>
</tr>
</tbody>
</table>

```javascript
var question = new GlideRecord("notifynow_question");
question.query();

// get the first question
if (question.hasNext() && question.next()) {
```
// send the sms question
var number = "+31612345678";
var nn = new SNC.NotifyNow();
nn.sendSMSQuestion(number, question.getUniqueValue(), current);
}

NotifyNow - addConferenceCallParticipant(String conferenceCall, String participant)

Adds ad-hoc users to an ongoing conference call.

When the method is called with a phone number for the participant parameter and there is exactly one sys_user record that matches the phone number, that sys_user record will be related to the participant. The participant's phone number field will be left blank because the phone number is in the sys_user record. If there are several sys_user records that match the phone number, or if there are no results, the participant's phone number field will be filled in, and there will be no stored reference to sys_user because the user is not known.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCall</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of an active conference call.</td>
</tr>
<tr>
<td>participant</td>
<td>String or GlideRecord</td>
<td>The sys_id or GlideRecord of a user with an E.164-compliant phone number, or an E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participant record of the new participant that was added to the conference call.</td>
</tr>
</tbody>
</table>

// add a new participant by conference call sys_id (string) and phone number (string)
var nn = new SNC.NotifyNow();
gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', '+31612345678'));
// add a new participant by conference call sys_id (string) and user record (GlideRecord)
var user = new GlideRecord('sys_user');
user.query('user_name', 'myUserName');
if (user.hasNext() && user.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39', user));
    // you could have added the user by sys_id as well:
    // nn.addConferenceCallParticipant('d193b242eb020100a04d4910f206fe39',
    // user.getValue('sys_id'));
} else {
    gs.log('no such user');
}

// add a new participant by conference call record (GlideRecord) and phone number (string)
var conferenceCall = new GlideRecord('notifynow_conference_call');
conferenceCall.query('title', 'IA0001001');
if (conferenceCall.hasNext() && conferenceCall.next()) {
    var nn = new SNC.NotifyNow();
    gs.log(nn.addConferenceCallParticipant(conferenceCall, '+31612345678'));
} else {
    gs.log('no such conference call');
}

NotifyNow - convertLocalPhoneNumberToE164(String userID, String phoneNumber)

Converts a local phone number to an E.164-compliant phone number based on a user's location.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>userID</td>
<td>String</td>
<td>The sys_id of a sys_user record to get location information from.</td>
</tr>
<tr>
<td>phoneNumber</td>
<td>String</td>
<td>The phone number.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number.</td>
</tr>
</tbody>
</table>

```javascript
var localPhoneNumber = '01784 221600';
var userName = 'Heath Vanalphen';

var user = new GlideRecord('sys_user');
user.set('name', userName);
var E164Number = new SNC.NotifyNow().convertLocalPhoneNumberToE164(user.getUniqueValue(),
localPhoneNumber);
gs.log('converted: ' + localPhoneNumber + ' to ' + E164Number + ' based on ' +
user.getValue('name') + '
' + user.getValue('location')) + '+');
```

NotifyNow - getConferenceCallParticipants(String conferenceCallId, Boolean isCallable)

Returns all participants for a conference call.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conferenceCallId</td>
<td>String</td>
<td>The ID of the conference call.</td>
</tr>
<tr>
<td>isCallable</td>
<td>Boolean</td>
<td>An optional flag to return either only the users you can call (true) or those you cannot call (false).</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideRecord</td>
<td>The participants</td>
</tr>
</tbody>
</table>

```javascript
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37');

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id')) +
    }
};
```
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants('c2e91710eb120100f34087b9d106fe37', true);

while (user.hasNext() && user.next()) {
    if (user.getValue('participant')) {
        gs.log('user: ' + user.getValue('sys_id'));
    } else {
        gs.log('phone number: ' + user.getValue('phone_number'));
    }
}

var conferenceCallId = '32b11430eb1201003cf587b9d106feb8';

// get all participants
gs.log('all conference call participants:');
var nn = new SNC.NotifyNow();
var user = nn.getConferenceCallParticipants(conferenceCallId);
gs.log(user);

// get all callable participants
gs.log('all conference call participants we can call:');
user = nn.getConferenceCallParticipants(conferenceCallId, true);
gs.log(user);

// get all un callable participants
gs.log('all conference call participants that are already in an active session and whom we cannot call:');
user = nn.getConferenceCallParticipants(conferenceCallId, false);
gs.log(user);

**NotifyNow - getFrequentlyCalledUsers(Number limit)**

Returns a number of frequently-called users, up to the limit parameter, in alphabetical order.
### NotifyNow - getFrequentlyCalledUsers(10)

Returns the frequently called users in alphabetical order.

```javascript
var nn = new SNC.NotifyNow();
var fc = nn.getFrequentlyCalledUsers(10);
while (fc.hasNext() && fc.next()) {
    gs.log("got user " + fc.getValue('name') + ' - ' + fc.getValue('sys_id'));
}
```

### NotifyNow - getPreferredE164VoiceNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for voice calls.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164VoiceNumber(userID);
gs.log('the preferred phone number for setting up voice calls is ' + E164Number + ' for user with id: ' + userID);
```
NotifyNow - getPreferredE164SMSNumber(GlideRecord user)

Returns a user's preferred E.164-compliant phone number for SMS messages.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the E.164-compliant phone number from.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The E.164-compliant phone number or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "<user sys_id>";
var E164Number = new SNC.NotifyNow().getPreferredE164SMSNumber(userID);
gs.log('the preferred phone number for sending SMS notifications is ' + E164Number + ' for user with id: ' + userID);
```

NotifyNow - getPreferredEmailAddress(GlideRecord user)

Returns a user's preferred email address

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>GlideRecord or String</td>
<td>The user record or the sys_id of a user to get the email address from.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The email address or null.</td>
</tr>
</tbody>
</table>

```javascript
var userID = "some user sys id";
var email = new SNC.NotifyNow().getPreferredEmailAddress(userID);
gs.log('the preferred email address for sending email notifications is ' + email + ' for user with id: ' + userID);
```
Live Feed

Live Feed is a social IT application that provides a place to post and share content in a ServiceNow instance.

Live Feed content forms a searchable knowledge source for sharing information within an organization. Main features include the following:

- Users can post, reply to, and rate messages, including links and images.
- Administrators can set up automatic messages that are generated when specific records are updated throughout the system.
- Users can subscribe to receive email notifications when new messages are posted.
- Users who take advantage of the accessibility options in the platform can tab through a live feed to navigate.

Live feed includes different types of feeds.

![My Live Feeds](image)

**Note:** Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate live feed v2 to use these features.
Live feed can be domain separated at the data level only. For more information on live feed and domain separation, see Domain separation in Live Feed.

**Live Feed browser support**

The Live Feed v2 plugin does not support Internet Explorer 7 through 9.

Users who access the instance from those browser versions can use Live Feed v1 functionality. Users who access the instance from browsers that are compatible with HTML5 can use Live Feed v2 functionality.

**Activate Live Feed**

Live Feed is active for all instances. An administrator can activate the Live Feed plugin if it is not already active.

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Administer live feed**

Administrators and users with the live_feed_admin role can configure live feed security and provide access to live feed from content management pages. Administrators can also set up live feed table notifications.

**Document feeds**

A document feed is a live feed group that is associated with a record, such as an incident or change.
Document feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record, if the record has these journal fields.

The benefits of using document feeds include the following.

- Improving communication between users working on the same record.
- Improving visibility into progress for end users.
- Providing a single place to see updates on multiple records.
- Saving conversation history in the record so that knowledge is not lost in an email chain.

To use document feeds, activate the Live Feed Document plugin, which is active by default in new instances. See Use live feed to work on records to learn how to use this feature.

The system automatically creates a document group for the feed when a user follows or shows a record on live feed. The system also creates a document group when a user creates a new record on a table that has live feed enabled.

The following list describes features of the document feed group.

- Is unlisted; it does not appear when users view all groups on live feed.
- Automatically approves membership for every user who can access the record.
- Uses the record number as the group name.
- Uses the record short description as a group description.
- Maintains all messages posted to live feed on the record, if the record has a journal field for comments. If the record has a standard text field for comments, each live post overwrites the field value.
- Maintains all messages posted on the record in live feed if the record has a journal field for comments. When the group is created, existing messages are added to the document feed.

A user who participates in live feed becomes a member of the group.

Activate a plugin

Add a live feed UI action on a table

You can add UI actions on a table to allow users to follow records in live feed.
Before you begin
Role required: ui_action_admin or admin

Procedure
1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI actions, for example, the Follow on Live Feed list UI action.
3. In the Table field, select the table name.
4. Right-click the header and select Insert to create a copy of the UI action for the desired table.
5. Repeat steps 1 – 4 for all live feed UI actions.

Configure document feeds
You can configure a table to support document feeds.

Before you begin
Role required: personalize_dictionary or admin

About this task
Configuring a table to support document feeds includes the following steps:

Procedure
1. Add live feed to a form header.
2. Add Follow on Live Feed and Show Live Feed as list and form UI actions.

Security configuration for document feeds
Document feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the document feed if they have access to the same information on the record.

Consider the following examples.
• If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
• If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.
Note: Access control rules are only checked when a user first accesses the document feed. After users view the feed, an administrator must remove them manually to change their access.

Disable a record feed
You can disable live feed functionality from the form of any table.

Before you begin
Role required: personalize_dictionary or admin

Procedure
1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Add live_feed=false in the Attributes field.
4. Click Update.

Note: If the Collaboration feature is activated, you can remove the show live feed icon (️) from all form headers. Set the glide.live_feed.task_header_button property to collaboration.

Disable a document feed
You can disable a document feed from the form of any table.

Before you begin
Role required: personalize_dictionary or admin

Procedure
1. Navigate to System Definition > Tables.
2. Open the table record.
3. Clear the Live feed check box.
4. Click Update.

Business rule installed with Live Feed Document
This business rule is installed with Live Feed Document. There are no tables, roles, or notifications installed with it.
### Record feeds

A record feed is a live feed group that is associated with a record, such as an incident or change.

Record feeds allow users to work on tasks and other records through the live feed interface. Users can post messages in live feed that are automatically maintained as comments or work notes on the record if the record has these journal fields.

You can use record feeds to:

- Improve communication between users working on the same record.
- Improve visibility into progress for end users.
- Provide a single place to see updates on multiple records.
- Save feed history in the record so that knowledge is not lost in an email chain.

### Live Feed integration

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed integration</td>
<td>Writes journal comments to the live feed if there is a group for this record.</td>
</tr>
</tbody>
</table>

**Note:** Many of these features are part of live feed v2.

### Activate live feed document

The Live Feed Document plugin is active by default.
About this task
Administrators can enable record feeds in an instance by activating the Live Feed Document plugin, which activates the Live Feed plugin, if it is not active. For upgrades, administrators must activate the plugin.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Configure record feeds
Configure a table to support record feeds. You can add the Show Live Feed button in the form header and add the UI actions Follow on Live Feed and Show Live Feed as List and Form.

By default, the Show Live Feed icon appears on the form header for all tables that extend task, including the Incident, Change Request, and Problem tables, and in the list and form context menus for all task tables.

Add live feed to a form header
Add the Live Feed button in the form header for a table.

Procedure
1. Type sys_properties.list in the Application Navigator.
2. Open the record for glide.live_feed.task_header_button.
3. In the Value field, change the value to both.
Note: By default, the value is `collaboration` so that the property is supported in the Collaboration (com.glide.collaboration) plugin. Changing the value to `both` allows the system property to be supported in Collaboration and Live Feed.

4. Click Update.

5. Navigate to System Definition > Tables.

6. Open the table record.

7. If the Live feed check box does not appear on the form, configure the form layout to add the Live feed field.

8. On the form, select the Live feed check box.

9. Click Update. Alternatively, you can add `live_feed=true` to the Attributes field in the dictionary entry for the table.

Results
The Live Feed button appears on the overflow menu of the form header.

Add live feed to a context menu
Add live feed UI actions on a table.

Procedure
1. Navigate to System Definition > UI Actions.
2. Open one of the live feed UI action, for example, Follow on Live Feed.
3. In the Table field, select the table name.
4. Right-click the header and select **Insert** to create a copy of the UI action for the desired table.

5. Repeat steps 1 – 4 for all live feed UI actions.

### Disable a record feed

You can disable live feed functionality from the form of any table.

**Before you begin**

Role required: personalize_dictionary or admin

**Procedure**

1. Navigate to **System Definition > Dictionary**.
2. Open the dictionary entry for the table.
3. Add `live_feed=false` in the **Attributes** field.
4. Click **Update**.

⚠️ **Note:** If the Collaboration feature is activated, you can remove the show live feed icon ( Emblem ) from all form headers. Set the `glide.live_feed.task_header_button` property to **collaboration**.

### Configure security

Record feeds honor the access control rules (ACLs) for the associated record. Users can only view messages on the record feed if they have access to the same information on the record. For example:

- If an ACL allows a user to read and create comments on an incident, then the user can view and add messages posted as comments on the incident feed.
- If an ACL restricts a user from reading work notes, then the user cannot view messages posted as work notes on the incident feed.

⚠️ **Note:** Access control rules are only checked when a user first accesses the record feed. After users view the feed, an administrator must remove them manually to change their access.

### Live feed table notifications

Live feed table notifications generate automatic live feed messages. The Live Feed plugin must be activated to use table notifications.
When a record is inserted or updated on a specific task table and the notification conditions are met, a message is generated and posted to the specified group or to the company feed. Table notifications are supported for all task tables and all task types by default.

Administrators and users with the live_feed_admin or chat_admin roles can set up table notifications for any table in an instance.

**Set up table notifications for task tables**
You can set up a table notification for a task table to enable automatic live feed messages.

**Before you begin**
Role required: live_feed_admin or chat_admin

**Procedure**
1. Navigate to **Live Feed > Feed Administration > Table Notifications**.
2. Click **New** or select a notification to open it.
3. Complete the form.

<table>
<thead>
<tr>
<th>Live Table Notification fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Post to chat rooms</td>
</tr>
<tr>
<td>Post to live feed</td>
</tr>
<tr>
<td>Record Feeds</td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>Insert</td>
</tr>
<tr>
<td>Update</td>
</tr>
<tr>
<td>Feed</td>
</tr>
<tr>
<td>Conditions</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>
| Message   | Construct the automatic message you want to generate. You can include field values as variables and a link to the record. To add a variable, position the cursor in the text and then click the field name in the Select variables field. To add a link to the record, enter `${URI}` in the message text as shown in the following example.  

```plaintext
High priority incident opened: ${URI}  
Short description: ${short_description}
```

⚠️ **Note:** For security reasons, any HTML code is automatically stripped out of a message before it is posted. |
| Before script | Create a script that runs before a notification is generated. The script runs only if the condition evaluates to true or is empty. The following variables are available in the script.  

- `current`: the GlideRecord object that triggered the notification.  
- `changedFields`: an ArrayList of fields changed on submit. Use `changedFields.contains('fieldname')` to check for change.  
- `answer`: set answer to false to cancel the notification. |
### Field Description

- **profileSource**: set to a valid GlideRecord object to define the profile that is posting the message.
- **profileID**: set to a live_profile sys_id to define the profile that is posting the message; by default it is the current record. Overrides profileSource if both are specified.

Any custom variable created in the script is also exposed to the message in the form of `${myVariableName}`.

4. Click **Submit** or **Update**.

---

### Set up table notifications for non-task tables

Table notifications are supported for all task tables by default, and you can set up a table notification for any other table.

#### Before you begin

**Role required**: live_feed_admin or chat_admin

#### Procedure

1. Navigate to **System Definition > Business Rules**.

2. Open the **live feed events** business rule.

3. In the Advanced section, select and copy the text in the **Script** field.

4. Click the back arrow on the top, left to exit the record and return to the Business Rules list.

5. Click **New**.

6. Enter the following values at the top of the form.
   - **Name**: Enter a name, such as `live feed events for my table`.
   - **Table**: Select the table for which you are setting up a notification.
   - **Active** and **Advanced**: Select these check boxes.

7. In the **When to run** section, enter the following values.
   - **When**: Select `before`.
   - **Insert, Update, and Delete**: Select the check boxes.

8. In the **Advanced** section, paste the script from the **live feed events** business rule into the script box.

9. Click **Submit**.
The `live feed events` business rule runs on the non-task table. It fires the `live_feed.update` event, which is associated with the `Live Feed Update` script action. The script action sets up variables and processes the table notifications.

**What to do next**
After saving the business rule, create a `live feed table notification record` for the new table as you would for a task table.

**Live feed table notification examples**
The following examples demonstrate how to set up different types of table notifications that are useful for live feed.

**Workaround posted**
This example demonstrates a table notification that generates an automatic message on live feed whenever a workaround is added to an open problem.

- **Table**: Problem [problem]
- **Active**: Select the check box.
- **Update**: Select the check box.
- **Post to live feed**: Select the check box.
- **Conditions**: [State] [is] [Open]
- **Description**: Workaround Posted
- **Message**:

  ```
  ${sys_updated_by} posted a workaround for ${URI}.
  Short description: ${short_description}
  ```

- **Before script**:
// only post to live feed when the Workaround field changes
answer = changedFields.contains("work_around");

Example workaround message

Live feed table notifications

Problem resolved (advanced)
This advanced example demonstrates a table notification that generates an automatic message on live feed whenever a problem is closed.

It also adds a message about the assigned user and posts the message from the assignment group profile instead of the problem record.

- **Table:** Problem [problem]
- **Active:** Select the check box.
- **Update:** Select the check box.
- **Post to live feed:** Select the check box.
- **Conditions:** [Problem State] [is] [Closed/Resolved]
- **Description:** Problem Resolved
- **Message:**

```plaintext
Problem ${number} - ${short_description} has been resolved. ${fixedByMsg}
```

- **Before script:**

```plaintext
//cancel if we didn't just change the problem state if (!changedFields.contains("problem_state") )
```
answer = false;

//if we have an assigned_to value add a comment about who it was //create a new variable fixedByMsg that we can access from the message
fixedByMsg = "" ; if ( !current. assigned_to. nil() )
fixedByMsg = "Thank you " + current. assigned_to. getDisplayValue() ;

//make the message appear to come from the assignment group if we have one if (( !current. assignment_group. nil() )
profileSource = current. assignment_group. getRefRecord() ; //need GlideRecord object

Example problem resolved message

Live feed table notifications

Opportunity won (non-task)

This example demonstrates a table notification on a non-task table. It generates an automatic message on live feed whenever a sales opportunity is won, if you have activated the Sales Force Automation plugin.

Create a business rule on the Opportunity [sales_opportunity] table that matches the live feed events business rule on the task table.

Create a table notification with the following values:
• **Table:** Opportunity [sales_opportunity]
• **Active:** Select the check box.
• **Update:** Select the check box.
• **Post to live feed:** Select the check box.
• **Conditions:** [State] [is] [Closed Won]
• **Description:** Opportunity won
• **Message:**

```plaintext
${owner} closed a sale with ${account}!
```

• **Before script:**

```plaintext
//make the message appear to come from the assigned salesperson if there is one if
(!current. owner. nil ( ));
profileSource = current. owner. getRefRecord (); //need GlideRecord object
```

---

**Example opportunity won message**

---

**Related information**

**Live feed table notifications**

**Related feeds table notification**

This example demonstrates table notifications to be sent out to related feeds.

For this example, whenever the status of a story changes to **Complete**, a table notification message is sent to the related sprint, release, or epic. Messages are posted only if the related feed already exists; this notification does not create a new feed.
• **Table:** Story [rm_story]
• **Active:** Select the check box.
• **Update:** Select the check box.
• **Post to live feed:** Select the check box.
• **Record feeds:** Move Sprint, Release, and Epic to the Selected column.
• **Conditions:** [State] [changes to] [Complete]
• **Description:** Story is done; message to Epic, Release, and Sprint
• **Message:**

```python
${URI} status changed to ${state}
```

**Live feed security and table access**

By default, administrators and users with the live_feed_admin role can configure live feed security and view all live feed tables.

You can also modify the following live feed tables.

• **Live Table Notification [live_table_notification]:** set up automatic messages that are generated when specific records are updated throughout the system.

• **Live Feed Message [live_message]:** modify only if necessary, such as to delete an inappropriate message or restore a message that a user accidentally deleted. This table is typically managed by system functionality.

Extending or modifying data in any live feed chat table is not recommended.

**Domain separation in Live Feed**

This is an overview of domain separation and Live Feed. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Overview**

**Support: Level 2**

Parent and child domains define the live feed content that can be viewed and shared with other users.
• A user in a parent domain can see users and content within their domain and within all child domains that are lower in the domain hierarchy.

• A user in a child domain can see users and content within their domain but cannot see the parent domain or other child domains at the same level in the domain hierarchy.

Enable domain separation for live feed

Domain separation for the Live Feed application is available starting with the Eureka release. For users upgrading to Eureka, a sys_domain column is added to existing live feed-related database tables. For existing database records, the value of the sys_domain field is set to empty (global). This allows the domain separation feature to work with existing live feed records.

Show or hide the live feed application for a domain

The administrator can live feed visibility for a domain. This includes:

• Displaying live feed in the application navigator.

• Following a document feed for a record.

• Viewing live feed from a record.

Use live feed with domain separation

All of the live feed features are available to users within a domain and work the same way, with some exceptions to visibility.

• Posting and sharing content
  ◦ Users in a child domain can interact with other users in the same domain. This includes posting and replying to messages, deleting messages, attaching files and links, and rating content.
  ◦ Users in a parent domain can interact with other users in the same domain and with users in any child domains. Messages that are added to child threads by parent users are given the visibility of the child domain, not the parent domain.

• Viewing content
• Users in a child domain can view content that resides within their domain. This includes filtering by feed, sorting, searching, and viewing older messages.
• Users in a parent domain can view content that resides within their domain and within any child domains.
• My Feed shows messages, teams, and hashtags based on the user's domain. Showing another user's feed only shows posts visible in the current user's domain.

• Using hashtags
  • Hashtags are separated by domain. Users in a child domain can use all of the hashtag functions within their domain. This includes tagging messages, viewing available hashtags, changing hashtag names, and searching and filtering by hashtag.
  • Users in a parent domain can use all of the hashtag functions within their domain and can see hashtags in any child domains.

• Using teams
  • Teams are separated across domains. Users in a child domain can join and follow teams within their domain, and can invite other users within their domain to join teams.
  • Users in a parent domain can join and follow teams that belong to their domain or to any child domains.

• Exceptions to teams
  • New teams are created in the user's domain. However, if the team has a record associated with it, the team is created in record's domain.
  • New threads in an existing team are created in the domain of the existing team.
  • When a user is creating a new team from a document, if the document domain is not empty or global, the team domain needs to be changed to be the document's domain.
  • For a document-generated team, when the domain of the document changes, the domain of all related live feed records changes as well.

• Subscribing to email notifications
  • Users can subscribe to email notifications from users and teams within their domain only.

Related information
Limit live feed access by role
Manage live feed message content
Domain separation

Limit live feed access by role
All active users in the instance have access to live feed by default.

Before you begin
live_feed_admin and admin

Procedure
1. Complete the following steps to define the roles that allow users to see the Live Feed module.
   a. Perform the appropriate action for your version of the UI:
      • UI16: Navigate to System Definition > Application Menus > Live Feed and select Live Feed.
      • UI15: Right-click the icon beside the Live Feed module and select Edit Module.
   b. Enter the roles that have access in the Roles field.
   c. Click Update.
2. Complete the following steps to define the roles that allow users to see live feed from a mobile device.
   a. Navigate to System Definition > Applications (Mobile).
   b. Click Live Feed.
   c. Enter the roles that have access in the Roles field.
   d. Click Update.
3. Use the following settings in the Access Control form to create access control rules to limit who can view the live_feed pages.
• **Type**: ui page
• **Operation**: read
• **Name**: create one access control rule record for each of the following pages
  ◦ live_feed
  ◦ live_feed_small
  ◦ $live_feed
  ◦ $live_feed_small
• **Requires role**: in this related list, add roles to define who can access the live feed pages. Users who do not have these roles cannot access live feed.

**Manage live feed message content**

Users can remove their own messages from feeds. If necessary, administrators can remove inappropriate messages that are posted by any user.

**Before you begin**
live_feed_admin and admin

**About this task**
For security reasons, any HTML code is automatically stripped out of a message before it is posted. This measure ensures that users cannot modify any page settings by posting a message.

**Procedure**
1. Navigate to **Live Feed > Feed Administration > Messages**.
2. Open the message to be removed.
3. In the **State** field, select **deleted**. You may need to configure the form to add this field.
4. Click **Update**.

**Live feed team security**
You can restrict who can create teams by modifying an access control rule.

Modify the following access control rule.
• **Table**: Live Group Profile [live_group_profile]
• **Operation**: create
Restrict hashtag renaming
You can restrict who can rename hashtags.

You restrict hashtag rename by modifying the following access control rule:
• **Table**: Live Tag [live_tag]
• **Operation**: write

Provide access to live feed from CMS pages
You can provide access to live feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

**Before you begin**
Role required: content_admin or admin

**About this task**
The ESS Portal template includes the **Portal - Live page** and **Live Feed** dynamic blocks. To provide access to live feed from CMS pages, add the Live Feed dynamic block to a CMS page or include **Portal - Live page** in a site.

**Procedure**
1. Navigate to **Content Management > iFrames**.
2. Click **New**.
3. Enter the iFrame block details.

### iFrame block fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name such as <em>Live Frame</em>.</td>
</tr>
<tr>
<td>Frame Name</td>
<td>Enter a frame name, such as <em>live_frame</em>.</td>
</tr>
<tr>
<td>URL</td>
<td><a href="https://INSTANCE/live_feed.do?sysparm_doctype=true">https://INSTANCE/live_feed.do?sysparm_doctype=true</a> where INSTANCE is your instance URL (example, [instance name].service-now.com)</td>
</tr>
<tr>
<td>Application</td>
<td>Displays scoping information.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
---|---
Sizing | Select **Fixed Size** and enter height and width pixel dimensions according to the page where you plan to display the feed (for example, width of 1024 and height of 768).

4. Click **Submit**.
5. Add the block to a page.

### Email notifications installed with Live Feed

Live Feed plugin installs the following email notifications.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Feed Feed Member Accepted</td>
<td>Sends an email to the administrator when a user has accepted to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Declined</td>
<td>Sends an email to the administrator when a user has declined to join the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Invited</td>
<td>Sends an email to a user when they have been invited to join a feed.</td>
</tr>
<tr>
<td>Email notification</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Live Feed Feed Member Left</td>
<td>Sends an email to the administrators when a user has left the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Removed</td>
<td>Sends an email to user when they have been removed from the feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request</td>
<td>Sends an email to administrators when an user requests to join a feed.</td>
</tr>
<tr>
<td>Live Feed Feed Member Request Accepted</td>
<td>Sends an email to the user when their request to join a feed is accepted.</td>
</tr>
<tr>
<td>Live Feed Feed Request Rejected</td>
<td>Sends an email to the user when their request to join a feed has been rejected by an administrator.</td>
</tr>
<tr>
<td>Live Feed MsgReply Subscription</td>
<td>Sends an email when a reply or reply_to_reply message is inserted into the thread of a message in a feed.</td>
</tr>
<tr>
<td>Live Feed Team Member Accepted</td>
<td>Sends an email to administrators when a user accepts an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Declined</td>
<td>Sends an email to administrators when a user declines an invitation to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Invited</td>
<td>Sends an email when a user is invited to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Left</td>
<td>Sends an email when a user leaves a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Removed</td>
<td>Sends an email when an administrator has removed a user from a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request</td>
<td>Sends an email when a user requests to join a team.</td>
</tr>
<tr>
<td>Live Feed Team Member Request Accepted</td>
<td>Sends an email when a user's request to join a team is accepted.</td>
</tr>
<tr>
<td>Live Team Member Request Rejected</td>
<td>Sends an email when a user's request to join a team is rejected.</td>
</tr>
<tr>
<td>Live Message All Subscription</td>
<td>Sends an email to subscribed users when any message (new or reply) is posted.</td>
</tr>
</tbody>
</table>
### Use Live Feed

Live Feed provides many methods you can use to share content with others in your organization.

Depending on your role, there are several different types of feeds you can access, teams you can join and share information with, and hashtags you can use for categorizing messages.

<table>
<thead>
<tr>
<th>Email notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live Message Feed Subscription</td>
<td>Sends an email when a new message is inserted into a feed.</td>
</tr>
<tr>
<td>Live Message Liked</td>
<td>Sends an email to the creator of a message when another user likes the message.</td>
</tr>
<tr>
<td>Live Message Mention</td>
<td>Sends an email to a user when that user is mentioned in a message.</td>
</tr>
<tr>
<td>Live Message New Posts Subscription</td>
<td>Sends an email to subscribed users when a new (not reply) message is posted.</td>
</tr>
<tr>
<td>Live Message Reply</td>
<td>Sends an email to all users in a feed thread when a user posts a reply (live_message.replied event).</td>
</tr>
</tbody>
</table>

#### Example image

**Company Feed**

- **System Administrator**
  - Shared message: "We're considering using Live Feed to replace #Lync for collaboration. Thoughts?"

  - Shared message: "It's working fine."
  - Hashtags: #Copy Link #Comment
Note: Live Feed v2 is active for all new instances by default. If you are upgrading from an earlier version of ServiceNow, you need to activate Live Feed v2 to use these features.

Use hashtags in Live Feed

Hashtags are words marked with a hash symbol (#) in messages. Hashtags are a way to categorize messages by keyword or topic for improved search results.

For example, to identify messages associated with VPN questions, add the hashtag #VPN in the message text.

Note: Many of these features are part of live feed v2. If you are using live feed v1, or have not activated live feed v2, see Legacy Live Feed.

Tag messages

To tag a keyword or topic in a message, enter a # symbol before the word. A link to the hashtag is added beneath the message and all feed users can search and filter by the hashtag to find the message.

Tips for using hashtags effectively include:

• Limit the number of hashtags per message (no more than 3 is a good guideline).

• Use hashtags only in messages that are relevant to the tagged topic.

• Write a message first, and then add hashtags only if they add value. Answer the question, "What are you working on?", rather than "What hashtags apply to what you are working on?"

• Use camel case to create a hashtag that is more than one word long. For camel case, remove the space and use an uppercase letter to start each word. For example, to create a topic about the service desk, use #ServiceDesk.
View an available hashtag
View a hashtag from any feed.

Procedure

1. Navigate to Live Feed > Live Feed.
2. Click Hashtags in the sidebar.
   Any hashtags already defined are displayed. Up to 36 hashtags can be displayed, and options are available for searching and sorting the hashtags. When searching, you do not need to include the hash symbol (#).

3. Click a hashtag to view all messages containing that hashtag.

Change a hashtag name and merge a hashtag
Over time, users may create many hashtags with similar names, such as competitive, competitor, and competition. To combine hashtags for better searching and filtering, change the names of similar hashtags to a standard name.
About this task
Administrators can restrict who can rename hashtags.

Procedure

1. Navigate to Live Feed > Live Feed.
2. Click Hashtags in the sidebar to reveal the currently defined hashtags.
3. Turn off the filter to show all hashtags.
4. Point to the hashtag you want to change. If you have the rights to edit hashtags, an edit tag (📝) appears.
5. Click the edit tag icon.

6. Enter a new hashtag name.
7. Press Enter.

• If the new name is different than the other hashtags, the new hashtag name replaces the old hashtag name on the list and in the text of any messages that include the hashtag.

• If the name is the same as one of the existing hashtags, the hashtags will be merged. For example, if you have two hashtags called Competitive and Competitors, and you change the name of Competitors to Competitive, all of the messages previously tagged Competitors are changed to Competitive and the Competitors hashtag is removed.

Note: If a hashtag is removed from the message, renaming that hashtag does not change the message text.

Add an image to a hashtag
You can add an image at the domain level of already defined hashtags if you have the admin role.
Procedure
1. Click Hashtags in the sidebar.
2. Select the appropriate hashtag.

3. Do one of the following:
   - Locate the image in your file system, and then drag-and-drop the image onto the add an image icon ((icon).
   - Click the add an image icon (icon), select the image file, and click Open.

4. To change the image, simply drag-and-drop a new image onto the old one, or click on the existing one and select a new image.
   When you view a message that contains a hashtag with an image, that image appears in the hashtag heading bar.

Follow and unfollow a hashtag
You can view all postings assigned a specific hashtag by following the hashtag. You can also unfollow the hashtag if you no longer want to view those postings.
Procedure
1. Navigate to Live Feed > Live Feed.
2. Click Hashtags in the sidebar.
3. Select the hashtag you want to follow.
4. Click Follow.

Follow tag

A confirmation message appears.
5. Click X to dismiss the message.
   To unfollow a hashtag, repeat the same steps and click Unfollow.

Bookmark hashtags

The live feed interface uses the standard bookmarking functionality for hashtags.
In UI15, the live feed interface uses the standard bookmarking functionality for hashtags. You can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.
Remove a hashtag from a posted message

As a participant in a conversation, you can remove hashtags from messages that have already been posted.

Procedure

1. Navigate to the posted message.
2. Click Hashtags in the message posting.

Hashtag in post

Pat Hoshaw #Lync is more difficult to use. We need Live Feed for easier tagging and following. Plus, groups in Live Feed rock! Thanks IT!
2 years ago • Like • Reply • Hashtags (1)

The hashtags associated with the message are displayed, along with the removal icon.

Remove tag

Pat Hoshaw #Lync is more difficult to use. We need Live Feed for easier tagging and following. Plus, groups in Live Feed rock! Thanks IT!
2 years ago • Like • Reply • Share • Tags (1)

3. Click the removal icon.

Use teams in Live Feed

Users can be combined into teams for the purpose of subscribing to specifically-focused feeds.
Teams can be created based on any criteria that makes sense for your organization. For example, you can create a team called IT Developers and subscribe the team to feeds such as Coding Standards, AngularJS Development, and ServiceNow Customization Best Practices. When a new developer is added to the IT Developers team, that user automatically has rights to participate in all of the feeds followed by the team.

Create a live feed team
When you create a team, you become the team administrator.

About this task
As team administrator, you can:

• Modify team properties
• Accept or reject membership requests
• Remove members from the team
• Delete the team

Procedure
1. Navigate to Live Feed > Teams.
2. In the sidebar, click your profile picture, then select the Teams tab.

3. Click Create Team.
4. Enter a **Name** to appear at the top of the feed and in messages posted to the team. This name links to the team feed.

5. Enter a **Description** to appear at the top of the feed and under the team name in the list of all teams.

6. Select the access level for the team:

   - **Public Team**: In the list of all teams, any user can see the name of this team. Any user can also see the feed and join the team. Messages in a public team appear in the Company Feed with a link to the team feed.

   - **Private Team**: In the list of all teams, any user can see the name of this team, but not the feed. Messages in private teams do not appear on the Company Feed.

   When **Private Team** is selected, the **Show this team for anyone to find and request to join** check box is displayed. Select this check box to allow any user to search for this team and request to join it. Clear the check box to allow only invited users to see the feed and join the team.

7. Click **Create**.
   The team is created with you as the team administrator.
A team administrator can create one or more group feeds specifically for the members of this team by clicking the Group Feeds tab and Create Group Feed. Additionally, the team can be invited to join a feed. Having multiple feeds for the team facilitates focused discussions on topics of interest to the team and allows the team to selectively invite other teams and members to collaborate on specific feeds.

Automatic team creation
If you create a record on a table that has live feed enabled, such as the Incident table, and click Follow/Show Live Feed for the record, a record feed is created for the record.

The record feed name is based on the table name.

Join a team
You can join a public team, accept an invitation, or request access to a team.

About this task
As a team member, you can:

- View messages posted to the team (team feed). Non-members can also view the feed for a public team.
- View a list of team members.
- Invite another team to join the team.
• Subscribe to team email notifications.
• Leave the team.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click Teams and click All Teams.
   • If you received an invitation, click Accept. You can Decline the invitation if you do not want to join the team.
   • If the team is public, click Join.
   • If the team is private, click Request. The team administrator receives an email notification and must accept your request before you can join the team.

View a team feed
View a team feed to see messages belonging to that team.

Procedure
1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
   • To view a team you belong to, select the team name.
   • To view a public team you do not belong to, select All Teams and then click the team name.
     You must be a member to view the feed for a private team.

View a team member
View a list of members belonging to a live feed team.

Procedure
1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
   You must be a member of the team to view the members.
4. Click **Members**.
   The list of team members appears, organized by team administrators and team members.

**Invite a new member**

You can invite another user to join a team.

**Procedure**

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the **Pending members** tab.
5. In the **Add User** field, enter the name of the user you want to invite. The invited member's picture appears.

**Remove a member**

If you are team administrator, you can remove any member from the team.
Procedure

1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the Members tab.

5. Click Remove below the member name.
6. Click Remove again in the confirmation box that opens.

Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the team or whose membership is pending.

Subscribe to team and email notification

Users can subscribe and unsubscribe to receive email notifications generated by feeds the team participates in.

About this task

Email notifications are generated whenever actions such as posting messages, replies, likes, polls, and @mentions are performed.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message. For example, if the subject of the feed is IT Support, the email notification's subject will be Live Feed IT Support.
Procedure

1. Navigate to **Live Feed > Live Feed**.
2. Click **Teams** and select the team name.
3. Click the subscribe icon ( ).
   
   You can click the unsubscribe icon ( ) to stop receiving email notifications.

Subscribe a team to feed notification

A team administrator can subscribe a team to specific feeds so the members of the team receive email notifications.

Procedure

1. Navigate to **Live Feed > Live Feed**.
2. Click **Teams** and select the team name. You can use the advanced search to locate team of which you are the administrator.
3. Click **Feeds**.
4. Click the subscribe icon ( ) beside the feed name.
   
   You can click the unsubscribe icon ( ) to stop receiving email notifications.

Reply to email notifications using email

After receiving an email about a posted message or a reply, you can reply to live feed with your email client.

The body of the reply email becomes a reply to the live feed message. Any attachments included in your reply email are included in the live feed reply.

Leave a team

You can give up membership to a team by leaving that team.

Procedure

1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. Click **Leave** beside the team name.
Modify a team
If you are team administrator, you can modify an existing team.

Procedure
1. Navigate to Live Feed > Live Feed.
2. In the sidebar, click your profile picture, then select the Teams tab.
3. From the team list, select the team name.
4. Click the edit icon (Edit).
5. Modify the team properties as needed.
6. Click Save.

Manage a membership request
When a user requests membership to a private team, the team administrator receives an email.

About this task
If you are the team administrator, you can manage membership requests.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click Teams and select the team name.
   If one or more users have been invited to the team, the Pending members tab shows the number of invitations sent.

Administrators

System Administrators
3. Click **Pending members**.
This shows the users who have received invitations, but who have not yet accepted.

3. Click **Pending members**.
This shows the users who have received invitations, but who have not yet accepted.

4. You can cancel a user's invitation by clicking **Remove**.

5. You can invite another user to the team by entering their name in the **Add user** field and clicking the Invite member (➕) button.

**Delete a team**
If you are the team administrator, you can delete a team.

**Procedure**
1. Navigate to **Live Feed > Live Feed**.
2. In the sidebar, click your profile picture, then select the **Teams** tab.
3. From the team list, select the team name.
4. Click the edit icon (📝).

5. Click **Delete**.

6. Click **Yes** to confirm deletion.
The team is deleted from live feed. Messages posted to a private team are deleted; messages posted to a public team remain on the company feed without a team link.

If you delete a team that is associated with an active record, such as an incident that has not yet been closed, the team becomes active again when any user modifies that record or follows the record on live feed. The first user who modifies the record becomes the team administrator. The previous messages that existed as part of the record feed are not deleted.

**Use live feed to work on records**

A record feed is associated with a record, such as an incident or change. Record feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.

With record feeds, users can:

- Follow record feeds and post messages in live feed. These messages can also be automatically maintained in the comments or work notes journal fields on records.
- View live feed from records.
- Work on multiple records from **My Feed**.
- Access live feed team functions, such as sending invitations and subscribing to email notifications.

Any users with access to the record can also use the record feed. By default, record feeds are available on the incident, change, and problem tables. Administrators can configure record feeds for additional tables.
How Document Feeds Work
The Live Feed application creates a document group for each document feed. The document group:

• Automatically approves membership for every user who can access the record.
• Uses the record number as the group name.
• Uses the record short description as a group description.
• Maintains all messages posted on the record in live feed (if the record has a journal field for comments). When the group is created, existing messages are added to the document feed.
• Lists the group when users select View all groups on their live feed interface, unless the record associated with the document feed has been closed. When the state of the record is closed, the live feed group becomes inactive and unlisted.
• Automatically adds users to the document group when they view the record.

Document Group Creation
When a user follows or shows a record on live feed, a live feed group is automatically created and associated to the record (if one does not already exist). The user becomes a member of the group and can use live feed to work on the record. If the user can access work notes on the record, the user also becomes a group administrator.
A live feed group is also automatically created when a user creates a record on a table that uses document feeds, such as the Incident table. The user who creates the record becomes the administrator of the group, and any other user who modifies the same record automatically joins the group.

Add Live Feed to a homepage

Add live feed to a homepage so it is the first thing you see when you log in.

Procedure

1. Click Add content at the top of the homepage.
2. Select Live Feed in the left panel.
3. On the bottom of the window, click Add here in the appropriate layout position, then close the window.

Note: Administrators can add live feed to a global homepage to make it available for all homepage users by default. By default, users with any role can add live feed to their homepage. Administrators can restrict this ability.
Modifying and deleting document feeds

The user who creates a record feed becomes the group administrator, which allows the user to modify the following record feed properties.

- **Name**: default value is the record number.
- **Description**: default value is the record short description.
- **Picture**: default value is a thumbnail image of the record.

Feed administrators can also delete the feed. When deleted, the feed is removed from live feed but messages remain in the journal field of the associated record.

Viewing Live Feed from records

Interact with the record feed in any form that has live feed enabled.

The record feed appears in a pop-up window. The record feed also appears on the record form's activity formatter if the administrator enables the record feed system property (glide.ui.show_live_feed_activity).

To access a record feed from the form, do one of the following:

- Click the **Show Live Feed** button in the form header. This displays the live feed pop-up.
- Right-click the form header and select **Show Live Feed**. This also displays the live feed pop-up.
- Scroll down to the activity formatter area on the form. Click one of the following tabs:
Live Feed: click to show a text box to type in the feed.

Activity: click to show the activity summary. The activity filter determines the content in the activity summary.

Live Feed Popup

If the activity formatter or the Live Feed and Activity tabs are not visible, administrators can do the following:

- Configure the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Personalize the form layout and add Activities (filtered) to the form. This adds the activity formatter.
- Go to System Definition > Tables, access the table associated with the record, and verify that the live_feed dictionary attribute is set to true on the form. This adds live feed to the activity formatter.
- Go to Live Feed > Feed Administration > Properties and enable the following property: Toggle the display of the live feed tab in the activity formatter.
Working with record feeds

When a user follows a record, the user becomes a member of a private group for the record.

Team members can:

• View the record feed from live feed.
• View a list of group members (other users who are following the record).
• Invite another user to join the group. Only users who have access to the record have access to the record feed.
• Subscribe to email notifications.
• Leave the team to stop following the record.

Follow a record feed from a form

You can follow records that have a record feed associated with them from within the record form.

Procedure

1. Navigate to the record in a list or form.
2. Click the **Show on Live Feed** icon in the header.
**Follow a record feed from a list**

You can follow records that have a record feed associated with them when viewing a list of records. This method allows you to select multiple records to follow.

**Procedure**

1. Navigate to a list of records (for example, *Assigned to me*).
2. Select the **Action** check box beside each record to follow.
3. In the **Actions** choice list, select **Follow on Live Feed**.

---

**Follow My Tasks**

**Post a message to a record feed**

Use live feed to post a message to a record feed.

**Procedure**

1. Open the record feed in one of the following ways:
   - From your homepage (must already be following the record)
   - As a team in live feed (must already be following the record)
   - From My Live Feed (must already be following the record)
   - From the **Live Feed** pop-up window
• From the **Live Feed** tab on the activity formatter

• Click the **Show Live Feed** button ( ) in the form header.

2. Compose the message and add images and links.

3. [My Live Feed only] In the To list, select the record where you want to post the message.

4. [Optional] Select the **Work Notes** check box to post the message as a work note. Only users with access to work notes on the record can post and see work notes. This option is only available for records that have a journal field.

5. Click **Post**.

   **Note:** If the record has journal fields for comments or work notes, your message is automatically added to the appropriate field on the record. If the record has a standard text field for comments on the activity formatter, each live post overwrites the field value. Comments added through live feed start with #LiveFeed on the activity formatter.

### Use feeds in Live Feed

Feeds allow users to create focused discussions in Live Feed.

Live feed includes different types of feeds. The user who creates a group or record feed becomes the feed administrator. This user configures the access level for the feed:

• **Public:** any user can see the name on the list of all feeds, view the feed, and join it. Messages appear on the company feed with a link to the public feed.

• **Private:** any user can see the name on the list of all feeds, but only invited members can view the feed and join. Messages do not appear on the company feed.

**Note:** The concept of groups has changed in live feed v2 (starting with the Fuji release).

### Create a group feed

Group feeds are created by users so that members with similar interests can find that information in one place. Individual users or teams can join group feeds.
Procedure

1. Navigate to **Live Feed > Live Feed**.
2. Click **Group Feeds** and click **All Feeds**.
3. Click **Create Group Feed**.

![Create group feed](image)

4. Enter the feed name and description. These will appear in the list of group feeds.

5. Indicate how members can join the feed:
   - **Public Feed**: Select this to allow anyone to view and join the group feed.
   - **Private Feed**: Select this to restrict membership to only members invited by the administrator.

   When **Private Feed** is selected, the **Show this feed for anyone to find and request to join** check box is displayed. If it is selected, any user can search for this group feed and join it. If the check box is not selected, only users who are invited can see the feed and join the group feed.

6. Click **Create**.

**Create record feeds**

When a user views a record on a table that has live feed enabled, such as the **Incident [incident]** table, the user can click the **Show live feed** button at the top of the form to automatically create a record feed.

When a user who has write access to a record's **work_notes** journal field clicks the **Show live feed** button, that user becomes the record feed administrator. If, for example, a customer calls technical support to report an incident and the customer clicks **Show live feed** on a record, a record feed is created, but the customer is not the record feed administrator. When a support representative
later opens the incident and participates in the record feed, the user becomes
the feed administrator.

Record feeds are, by default, private unlisted. That is, only invited members can
see the name of the record feed in the list of feeds, and join it. Record feed
administrators, however, have the ability to change the access level at any
time. This can be helpful if, for example, a user is working on a sales opportunity
and wants customers to be able to participate in a record feed without granting
them access to the records.

**Control how live feed is enabled for records**

A property called `glide.ui.show_live-feed_activity` controls whether live feed is
automatically enabled for all records.

This glide record is disabled by default. If the property is enabled, a record feed
is automatically created whenever a record is viewed, and you become a
member of that feed.

A second property, `glide.live-feed.auto_join_document_group`, enables
automatic membership to a record feed whenever the associated document is
visited and the user clicks **Show Live Feed**.

**View the activity stream in record feeds**

When you view record feeds, live feed displays the activity stream for the
document.

For example, for an incident feed, the screen displays recent activity for the
incident. The activity stream is updated whenever anything is changed in the
associated record.
Live feed activity stream

INCO0000003 - Wireless access not available on floor 3

Note: The information in the activity stream is subject to the same ACL rules as those for viewing the underlying document.

Participate in a feed
When you join a feed, you become a feed member.

About this task
Feed members can:

• View messages posted to the feed. Non-members can also view the messages for a public feed.
• View a list of feed members.
• Invite another user to join the feed.
• Subscribe to feed email notifications.
• Leave the feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then click All Feeds.
• If you received an invitation, click **Accept**. You can **Decline** the invitation if you do not want to join the feed.

• If the feed is public, click **Join**.

• If the feed is private, click **Request**. The feed administrator receives an email notification and must accept your request before you can join the feed.

**Mark a feed as a favorite**

Top-level messages in feeds can be marked as favorites on a per user basis only.

**About this task**

You can also search for messages marked as favorites, and remove the favorite designation as needed.

**Procedure**

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then click **All Feeds**.
3. In the list of feeds, click the star icon (⭐️) adjacent to the feed name you want to mark as a favorite.

To unfavorite a message, click the star icon (⭐️) of a message that is already a favorite.

View a feed
You have several options for viewing a feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
   • To view a feed you belong to, select the feed name.
   • To view a public feed you do not belong to, select Show All and then click the feed name. You must be a member to view the feed for a private feed.

   ☀️ Note: If you navigate away from the live feed application and then back again, the system displays the feed you last visited if you are a member of it.

View a feed member
View a specific member of a group feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds.
   This displays a list of feeds you belong to and an option to view all feeds.
3. Click the feed name.
   The list of feed members appears, organized by feed administrators and members.

Invite a new member to a group feed
The feed administrator can invite another user or a group to join a feed.
About this task
When a team is added to a feed, all members of the team also indirectly become members of the feed. Only users, and not teams, can be the feed administrators. A team member who is following a feed can become administrator by directly inviting another user to the feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list. The invited user or team members receive an email notification.

Invite a new member to a record feed
The feed administrator can invite another user or a team to join a record feed.

About this task
When a team is added, each of the individual members of the team become members of the feed. That is, if Team ABC is added to a feed, the feed does not show that Team ABC is a member. Instead, the feed shows each of the individual members of Team ABC as members of the feed.

When users are invited, their membership state is initially Invited. When they accept the invitation, the system checks their access to the work_notes journal field. If they have write access, they become administrator members; otherwise, they become active members.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click Record Feeds and select the record feed name.
3. Click the Pending members tab.
4. In the Add user or team field, begin entering a user or team name and select a user or team from the suggestion list.
   If you invite a team, the individual members of the team are invited.
   The invited users receive an email notification.
Remove a member from a feed
The feed administrator can remove any member from the feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click the Members tab.
4. Locate the member you want to remove and click Remove.

Note: You can remove members regardless of their current state. That is, you can remove members who have already joined the feed or whose membership is pending.

Subscribe to a feed
Direct members of a feed can subscribe and unsubscribe to the feed in order to receive email notifications whenever any activity in the feed occurs, such as new messages being posted, replies, likes, polls, and @mentions.

About this task
Individual indirect members—that is, members of a team that is participating in a feed—cannot subscribe or unsubscribe from a feed directly. If the team administrator subscribes the team to a feed, the individual members receive an email notification for activities in the feed such as new messages being posted, replies, likes, polls and @mentions.

All notifications related to a top-level message, such as replies, mentions, and likes, are sent out with the same subject. The subject line defaults to Live Feed followed by the beginning of the subject line from the top-level message.
example, if the subject of the feed is **IT Support**, the email notification's subject will be **Live Feed IT Support**.

**Procedure**

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click the subscribe icon ((mail icon)).
   
   You can click the unsubscribe icon (unmail icon) to stop receiving email notifications.

   ≥ **Note:** If a team is subscribed to receive email notifications for a feed, but a member of the team did not subscribe to the team, that member does not receive the email notifications.

**Navigate between live feed and other modules**

If you are participating in a feed and navigate to another module, when you return to live feed it displays the feed you were previously viewing if it is public or if it is a private feed that you are a member of.

For example, assume you are viewing a public feed and then navigate to a particular incident record. Upon returning to live feed, the feed you were previously viewing opens. If you were last viewing a private feed that you are not a member of, returning to live feed opens the Company Feed.

**Leave a feed**

Members can choose to leave a group feed.

**Procedure**

1. Navigate to **Live Feed > Live Feed**.
2. Click either **Group Feeds** or **Record Feeds**, and then select the feed name.
3. Click **Leave**.

   ≥ **Note:** If you leave a feed associated with a record, such as an incident, you automatically rejoin that feed if you modify the associated record again.

**Delete a feed**

If you are a feed administrator, you can delete the feed.
Procedure

1. Navigate to Live Feed > Live Feed.
2. Click either Group Feeds or Record Feeds, and then select the feed name.
3. Click Delete.
4. Click Yes to confirm deletion.
   The feed is deleted from live feed. Messages posted to a private feed are deleted. Messages posted to a public feed remain on the Company Feed without a feed link.

Live Feed UI overview

The Live Feed user interface provides many methods you can use to share content with others in your organization.

Update your Live Feed profile

Your profile information includes a photo or image, and tabs for different types of information including messages, feeds, teams, followers, and those who are following you. You can update your profile information and picture at any time.

About this task

ℹ️ Note: The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and IE10 and above.

Procedure

1. Navigate to Live Feed > Live Feed.
2. Click your name or title displayed below your picture.

The profile record opens.
3. Click the pencil icon next to **About Me** and type a short description about yourself that you want to share with others who view your profile. This is text that you might not necessarily want to change on a regular basis.

4. You can change your profile photo using either of the following two methods:

   • Locate the photo file you want to use, and drag-and-drop it over the existing photo.

   • Hover over the existing picture (or tap the photo in the case of the smartphone or tablet interface) to display the **Upload a picture** link. Click the link, navigate to the location of the photo you want to use, and click **Open**.

   

   ![Upload a picture](image)

   

   **Note:** Your profile picture is used by the Connect and legacy chat features as well if they are activated.
Work with Live Feed messages

This portion of the UI gives the user access to various types of messages and tools for grouping and categorizing messages. Also included are methods for identifying which user feeds you are following and which users are following you.

Tools for working with live feed messages

<table>
<thead>
<tr>
<th>Menu section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>These are custom feeds that allow you to customize live feed to view the content that is most important to you.</td>
</tr>
<tr>
<td>Company Feed</td>
<td>This feed displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Group Feeds</td>
<td>These feeds are created by users. Record Feeds: These feeds are associated with a record, such as an incident or change.</td>
</tr>
<tr>
<td>Record feeds</td>
<td>These feeds help users collaborate on records by providing a place for anyone who can access the record to share messages and post attachments specific to that record.</td>
</tr>
<tr>
<td>People</td>
<td>This option displays people who are following the current user and people the current user is following.</td>
</tr>
<tr>
<td>Teams</td>
<td>This option is used to combine users into groups for the purpose of subscribing to specifically-focused conversations.</td>
</tr>
<tr>
<td>Hashtags</td>
<td>Hashtags are words marked with a hash (#) symbol in messages. Hashtags are used to categorize messages by keyword or topic for improved search results messages filtered from all conversations that include specific hashtags.</td>
</tr>
</tbody>
</table>

View another Live Feed user

When a requester user, one that has no ServiceNow role, is viewing a feed and points to another user’s picture, information for the user appears from the Business Card view of the User [sys_user] table.

About this task

You can customize ACLs to increase the amount of information you want displayed for users with different roles.
If you click a user's name or title, the user's profile appears. Click the tabs to view different types of information for the user.

**Profile tabs**

Follow other Live Feed users

As you use Live Feed, you can follow the message threads of other users.
Procedure

1. Navigate to a thread that the user you want to follow is engaged in.
2. Click that user’s name or point to the user’s picture.
   - A Follow link appears in the user’s profile.
3. Click Follow.
4. To stop following the user, navigate to People > Following.
5. Click **Unfollow**.

6. To view people who are following you, navigate to **People > Followers**.

**Select feeds**

A feed is a stream of related messages. You can use the feed selector to switch between feed types and to view specific group feeds and record feeds.

**Procedure**

1. Use the **Search** field to locate any type of feed. As you type in the **Search** field, the results are dynamically displayed. For example, if you type `INC`, records that are incidents are forced to the top of the results list.

2. You can also select the following types of feed information.
### Feeds types

<table>
<thead>
<tr>
<th>Feed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My Live Feeds</td>
<td>Displays the following posts:</td>
</tr>
<tr>
<td></td>
<td>• messages from users you follow</td>
</tr>
<tr>
<td></td>
<td>• messages with hashtags you follow</td>
</tr>
<tr>
<td>Company Feed</td>
<td>Displays all posts, except those posted to private or unlisted groups.</td>
</tr>
<tr>
<td>Add Group Feed</td>
<td>Allows you to add a group feed.</td>
</tr>
</tbody>
</table>

### Follow feeds

You can view users who are following you or other users you are following.

**About this task**

To view users who are following you or other users you are following, click **People** in the sidebar.

The system shows 10 most recent followers or users you are following.

**People**

- **Following**
  - **@Pat Hoshaw**
    - Follows you
    - Unfollow
  - **Annie Approver**
    - Unfollow

If either list contains more than 10 users, a Show More link appears.
Note: If you are following a particular user whose profile changes, that user moves to the front of the Following list. This alerts you to changes in the profile of a user you are following.

**Bookmark feeds and hashtags**
The live feed interface uses the standard bookmarking functionality for feeds and hashtags.

**About this task**
In UI15, you can drag-and-drop group feeds and hashtags from the Feed Summary section to the Edge for quick access.

### Bookmark a hashtag

![Diagram of bookmarking a hashtag]

**Add Live Feed to your homepage**
You can add Live Feed to your own homepage or to a global homepage.

**Procedure**
1. Navigate to a homepage.
2. Click the add content icon (+) in the top left corner of the homepage.
3. Select Live Feed in the left panel.
4. On the bottom of the window, click **Add here** in the appropriate layout position, then close the window.
**Note:** Administrators can add live feed to a global homepage to make it available for all homepage users by default. Users with any role can add live feed to their homepage; however, administrators can restrict this ability.

### Post content in Live Feed

In Live Feed, you can post new messages and replies to existing messages for all users in the feed. You can also send a reply message to a team or record.

#### Post a live feed message

You can post a message to open a new feed.

**Procedure**

1. Navigate to **Live Feed > Live Feed**.
2. Click the feed to which you want to post your message, for example My Live Feed, Company Feed, and so on.
3. Enter a message in the **Share your thoughts** field. Use hashtags, if you want.
4. As needed, click [poll], [attachment], or [screenshot] to add a poll, attachment, or screenshot image, respectively.

5. Click Post.

Reply to a live feed message
To participate in an existing thread of a feed, you can compose and submit a reply message. By default, the message is visible to all members of the feed.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Locate the message you want to reply to.
3. Type your reply in the message box and click Reply.
   - As needed, you can add hashtags, attachments, links, or knowledge base articles.
4. To limit who can view the reply to a single individual, select a user from the To choice list.
5. Click Reply.
6. By default, 7 replies are visible for each message. To view additional replies, click Show all replies. Any reply to a reply includes a Threads link.
7. Click **Threads** to view all of the replies within the selected reply in reverse chronological order within the **Message Thread** pop-up window, similar to an email thread.

**Message thread**

![Message thread screenshot]

**Attach files, links, images, and knowledge articles to messages**

In addition to entering text, you can attach files, such as images, documents, and spreadsheet files in any ServiceNow supported file type to live feed messages.

Administrators can manage attachment file settings, such as supported file types and maximum attachment file size, by editing system properties.

You can also include links to user-defined URLs and knowledge articles contained in your instance’s knowledge base.

**Note:** The functionality described here applies to HTML5-compliant browsers, such as Chrome, Firefox, Safari and Internet Explorer 10 and above. Significant differences while using different browsers are highlighted.
Attach a file to a post or reply

You can attach files to a post by dragging a file into a post or pasting an image from the clipboard.

About this task

Use the paperclip icon (.attachment) to drag files into a post. Additionally, you can paste images into a post or reply from the clipboard.

Procedure

1. Do one of the following:

   • While composing a post or reply (see Reply to a Message), locate one or more images or other supported types of files, and drag them into the message box.

   • Click the paperclip icon (attachment) in the message box, navigate to the location of the files you want to attach, select them, and click Open.

2. To add more files, drag-and-drop additional files into the text box below the displayed files or images, or click the plus sign.
3. If you want to delete an attachment before posting the message, click the trashcan icon adjacent to the attachment.

4. Enter a comment to share your thoughts about the image.

   🔄 **Note:** The **Post** button is enabled only after you add the comment.

5. Click **Post** or **Reply**.

6. If you added files that do not contain previews and then posted the message, they will be listed in the message box with a **Download** link.

7. Click the link to download the files.

**Copy an image from the clipboard**

In addition to adding files to a message, you can also copy images to the clipboard and paste them into a message or reply.
Procedure

1. Click into the **Comment** box and add a comment.

   **Copy paste**

   Here is how to drag-and-drop tags in order to bookmark them.

   ![Comment box](Image)

2. Click the **Add an image** button. The **Screenshots** dialog box opens.

3. Right-click the **Paste an image here** box and select **Paste** to paste the image from the clipboard.

   **Copy pasted**

   ![Screenshot](Image)

4. To add another image, repeat the previous steps.

5. When you finish pasting images into the message, click **Done**.

6. To change the link text, click **Pasted Image** and enter a new label.

7. When you finish, click **Post** or **Reply**.
8. To remove an image, click the trash can icon adjacent to the link.

9. To make changes to an existing image, click the edit icon ( 🗑️).

ℹ️ **Note:** The copy/paste functionality is supported in Chrome, Firefox, and Internet Explorer 11.

**Add a link to a post or reply**

Add or modify a link to a live feed post.

**Procedure**

1. Click into the **Comment** box.
   
   The **Add a link** button appears.

2. Click the **Add a link** button.
   
   The **URL** and **Link text** fields appear.

![Add a URL](image)

3. Enter the URL and the text you want to appear as the link.

4. To add another link, click the link icon under the **URL** field.

5. When you have finished entering your message, click **Post** or **Reply**.
To remove a link, click the trash can icon adjacent to the link. To make changes to an existing link, click the edit (✏️) icon.

**Add a knowledge article link to a post or reply**

Use the ID of a knowledge article to post it as a reply to a live feed conversation.

**Procedure**

1. While composing a post or reply, type the ID of the knowledge article you want to link to. You do not need to identify the knowledge article ID as a hyperlink; live feed recognizes it as such and automatically converts it into a link when the message is posted.

2. When you are finished entering your message, click **Post** or **Reply**.

**Add a poll to a message**

When you are posting a message, you have the option of creating a poll in order to record your viewers’ opinions. As users take the poll, their feedback statistics are displayed within the feed.
Procedure

1. Open the feed where you want to create a message with a poll.
2. Enter the message with an invitation to take the poll in the Share your thoughts box.
3. Click the poll (_poll) icon.

4. In the **Question** field, enter the question on which you are soliciting opinions.
5. In the **Option** fields, enter possible responses to the query.
6. To add more response options, click **Add more options**.
7. Click **Post**.

After the poll is posted, users who view the message can vote. After they vote, their pictures appear next to their response, with others who have voted for the same option.

ℹ️ **Note:** Only the poll creator can view results without casting a vote. Other members can see results only after casting a vote or if the poll is closed.
An email notification with the poll result is sent to all participants of the poll informing them that the poll is closed.

**Add mentions to a message**

An @mention is any posted update that contains @username anywhere in the body of the message.

**About this task**

The user’s name, with a link to that user’s feed, is inserted into the message. Additionally, the mentioned user receives an email notification about the mention. This is a great way of bringing attention to other members in a conversation. All @mentions are included in the logged-in user’s My Feed.

⚠️ **Note:** If an @mention is used by a member of a team, only members of that team appear in the auto-suggest list.

**Procedure**

1. While entering a message or reply in a conversation, type @username anywhere in the message. As you type, an auto-suggest list appears with names and pictures of users that match your entries. For example, if you type @t, the auto-
suggest list shows the pictures and names of all users with names that start with T.

2. Click the user you want to add.
That user's name is inserted into the @mention in the body of the message.

![Screenshot of suggest list](image)

Note: My Feed displays @mentions of you and the teams you are a member of. Profile feeds for another user display only @mentions of that user.

Like a message
Like a message to provide feedback to the author.

Procedure
1. Navigate to Live Feed > Live Feed.
2. Click Feeds.
3. Locate the feed that contains the message you want to like.
4. Under the message title, click Like.
   If the message has previously been liked, the number of likes for a message displays next to the Like link.
   For a top-level message, the profile pictures of the first 5 users who liked a message are displayed. Any additional users who liked the message can be viewed by hovering over the # more link. If the logged-in user has liked the message, that user's image will appear first, followed by the image of the user who last liked the message.
For a reply, you must hover your mouse pointer over the count link to view the users who liked the message.

Note: After a message has been liked, it cannot be unliked.

Delete a message

Users can delete any of their own posts or replies. A conversation administrator can also delete messages.

Procedure

1. Hover over the message you want to delete.
2. Click the trash can icon in the upper-right-hand corner of the message box.
3. Click Delete in the confirmation box.
   The message disappears from the feed.

MetricBase

The MetricBase application stores time-series data, which is data that is sampled at regular intervals. You can graph the stored data or use it with triggers to execute Flow Designer flows. MetricBase helps developers working with IoT-based applications that monitor or act on large amounts of machine-generated data.

How MetricBase works

You use MetricBase to deal with large amounts of data by using a smaller summary of that data that is stored in the MetricBase database. For example, an instance might store CPU usage. With MetricBase, you might summarize that data by storing the average CPU usage for every five-minute interval. You can graph the data or you can use it with Flow Designer to trigger flows.

MetricBase works with:

- An instance that stores machine-generated data
- A server that has the MetricBase application and database

On a very high level, when using MetricBase, you can:
1. Define the sampling rate for the data (float) on an instance. For example, you can sample the machine-generated data that is stored on an instance once every five minutes. This sampling rate is called the time-series definition.

2. Use a MetricBase API to send data from the instance to the MetricBase database at the rate that is prescribed by the time-series definition. If you send the data to MetricBase at a different rate, you get an error.

3. Use the Reporting application to graph the time-series data that is stored in MetricBase, or create triggers that execute Flow Designer flows. The time-series data remains in the MetricBase database for a prescribed amount of time, after which MetricBase deletes the data.

This figure shows that machine-generated data is sampled every 4 seconds. You send the average of the values in each sampling period to the MetricBase database, which stores the data until its expiration date.

Benefits
- MetricBase integrates seamlessly with ServiceNow IoT-based applications that monitor or act on large amounts of machine-generated data.
- MetricBase collects, retains, analyzes, graphs, and acts on time-series data.
- MetricBase works with Flow Designer to trigger flows and with Reporting to generate reports.

Use cases
- Create graphs about metrics, such as about CPU usage over time.
- Generate an email if the average CPU usage is more than 85% in the last 5 minutes.
• Train a machine language model to detect anomalies and execute a Flow Designer trigger when an anomaly is detected.

• If MetricBase detects a gap in data submitted for 10 minutes or more, generate an email.

• If the average of the collected data is less than 10 or greater than 500 in the last 5 minutes, generate an alert.

• If memory usage is likely to exceed 90% in the next 10 minutes, generate an alert.

**MetricBase demo**

Use the MetricBase Demo plugin to familiarize yourself with MetricBase. The demo contains sample metrics, triggers, and a scheduled job that collects and stores data. Use the demo to explore MetricBase before you set it up. The Data Explorer, which comes with the demo plugin, provides a place to experiment with MetricBase JavaScript APIs. The demo plugin is separate from the MetricBase plugin. Make sure to request both.

**Next**

Request the installation of the MetricBase and MetricBase Demo plugins.

**Requesting the MetricBase product**

The MetricBase plugin [com.snc.clotho] requires a separate subscription and must be activated by ServiceNow personnel. Be sure to also request the MetricBase Demo plugin [com.snc.clotho.demo], which includes sample tables, metrics, triggers, and data.

**Before you begin**

Role required: none

**About this task**

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

When ServiceNow personnel install the MetricBase Demo plugin, they also connect your instance to the server that contains the MetricBase database. A MetricBase database can connect with only one other instance. For example, a clone of the original instance can’t talk to the same database as the original instance.
What to do next

- Play with MetricBase to get familiar with it.
- Define and collect MetricBase data.

Getting familiar with MetricBase

After ServiceNow personnel install the MetricBase and MetricBase Demo plugins, you can use the demo to get familiar with MetricBase.

Prerequisites

- MetricBase and the MetricBase demo plugins must be installed by ServiceNow personnel.
- Role required: admin

MetricBase Demo

With the MetricBase Demo plugin, you can experiment with MetricBase without configuring it or knowing much about it. The plugin includes sample time-series data and triggers in your MetricBase database to help you visualize the data and see how triggers operate. The demo also includes scheduled time-series data updates, as if they had been received from an instance, so you can test the functionality of the included triggers.

In the demo, a fictional fleet of drones has been outfitted with sensors that broadcast their metrics, including their speed, altitude, and battery life over time.

1. Navigate to MetricBase Demo > Drones to see the name, model, length, width, altitude, and speed for all drones in the fleet.

2. Click MetricBase Demo > Metrics to see how the metrics are defined. In the Time Series Metrics list, the column values specify the table where the drone’s time-series metrics are stored, the names of all the metrics that are stored for each drone, and the retention policy for each metric. The retention policy
specifies how frequently measurements are taken, and how long MetricBase retains that data.

Now that you've seen the drone data and learned how to find it, let's see how the data was collected using a retention policy.

3. Click a retention policy. The Retention Policy form shows the definition for the policy. In the following example, this metric is measured once a minute for the first 8 days, then once every 10 minutes for the following 94 days, and then once an hour for the following 397 days. After that, the system discards the data.

For more information on retention policies, see Define and collect time-series data.

4. To see how the data is aggregated during the Retention Durations, click the left arrow (<) at the top of the Retention Policy Schedules window to return to the Time Series Metrics list.

5. Click a table name. The Time Series Metric definition shows the Retention policy aggregator. This aggregator summarizes the data as, for example, the average, maximum, or minimum value in the aggregation period. In the following example, the admin clicked the table for the speed metric. The
result is that MetricBase stores the speed averages during each sampling period in the MetricBase database.

Now that you understand how the data was collected using retention policies, let's see how to display the data in lists and graphs.

6. Notice the parameter fields that start with **Display**. In this example, they mean that the speed values that are displayed in the list view of drones are the last speeds recorded in every hour interval for each drone. These **Display** fields control what appears in the list view of the drones only. They have nothing to do with the retention policy.

7. Display the list view of a table by entering `<table-name>.list` in the **Field navigator** field. For example, `mb_demo_drone.list`. All drone data appears. In the example from the previous step, the speed column would contain the **Last** value of the sampling period.

8. Click **MetricBase Demo > Drones** and look at the speed (kph) column. From the previous step, you know that these values are the last speeds recorded for each drone up to an hour ago. The values are the same as you would get by using the `.list` command.

9. Click the speed value of the first drone. The following graph shows the speed of the drone that was measured hourly.
Note: You might need to select a different Time Span field value to get a clearer graph. For example, try 1 Day. The speed is a sine wave because it’s artificially generated. Hover over the sine wave to see the actual measurements.

10. Click the left arrow (<) to return to the list of drone metrics, right click on one drone type (Model column), and select Show Matching. Only the drones of the selected type appear.

11. Click the menu icon (Ξ) next to the Altitude column heading and select Time Series Chart. You see a graph that shows the altitude measurements of the Warbler-T7-type drones.

You might like to change the Time Span value for a clearer graph.
12. In the **Transform** field, select **Envelope**. You see a graph that shows the minimum and maximum (envelope) altitudes for the fleet of Warbler T7 drones over time.

![Graph showing drone altitude over time](image)

13. Click the left arrow (<) to return to the list of drone metrics.

14. Click the menu icon (Ξ) next to the Altitude column heading and select **Time Series Chart Designer** to see another way of visualizing the data.

![Chart Designer interface](image)

15. In the Create a Report page that displays in the Reporting application, vary with the graph parameters.

**Note:** In the following steps, to stay on the same page, click **Run**. To advance to the next page when designing the graph, click **Next**.
a. Change the Last value to one day and click Next.

b. In the Style pane, change the Chart color value and click Run.

c. Click Type, select the kind of graph to display, and click Run.

d. Click Configure, select a transform to run on the data from the Transform list, and click Run.

e. Edit the report title, which is above the graph, and click Run.
f. Click **Configure**. In **Time range**, select the time line to display on the graph.

**Note:** **Relative** uses the **Last** timespan relative to the present time. For example, if **Last** is 1 hour, the time line in the graph always spans the previous hour. You can add this report to your dashboard to show the metrics in the previous hour.

You've displayed drone data in lists and graphs. Now, let's define a trigger that executes when data that you monitor reaches a threshold value.

16. Click **MetricBase Demo > Trigger Definitions**. The MetricBase Trigger Definitions list, shows the name (**Name**) of the trigger, the metric (**Metric**) the trigger monitors, the table (**Table name**) the metric that it is in, the trigger description, and whether the trigger is active. Triggers kick off flows when metrics meet trigger thresholds. An example is when a drone flies too low. For more information about triggers, see **Trigger Workflows**.

17. Click **Low-Battery Drone**. The MetricBase Linear Predictor trigger form displays the definition of the Low-Battery Drone trigger.
In this example, the trigger monitors the Remaining Battery (%) metric (Metric) in the Drone table (Table name) every 10 minutes (Window). If the battery life is trending downward (Trend) and is 80% likely (Confidence Level) to reach 20% (Threshold) within 20 minutes (under Window for Level 1), the trigger executes. Although it fires, nothing happens until you associate this trigger with a flow. The flow defines the actions to take.

19. Click + New > New flow to associate a trigger that is defined in the system to a flow.

20. In the Name field, name the flow and click Submit.

21. Click Click to add a Trigger and select MetricBase in the list.
22. In **MetricBase Trigger**, select a trigger that already exists and click **Done**. Alternately, you could click the plus sign to the right of **MetricBase Trigger** to create a new trigger.

23. Click **Click to add an Action, Flow Logic, or Subflow**.

24. Click **Action** to specify the actions to take when the trigger fires. The Action modal appears.

25. Select a domain of actions from the left column and the specific action to take in the right column.

26. Click **Save** and **Activate**. The flow doesn't execute unless it is activated. For more information about Flow Designer, see **Flow Designer**.
The following table summarizes the modules in the MetricBase demo.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drones</td>
<td>Table that keeps metrics on drones, such as speed and altitude. Each record is a different drone. You can add records.</td>
</tr>
<tr>
<td>Fleets</td>
<td>Table that maintains metrics about groups of drones. Each record is a different fleet. You can add records.</td>
</tr>
<tr>
<td>Data Generators</td>
<td>Table that defines how data is created for the drone records. This field is provided for informational purposes. You cannot change or add records.</td>
</tr>
<tr>
<td>Metrics</td>
<td>List of metrics that are defined in the system. This list is the same table as MetricBase &gt; Time Series Metrics. You can add metric fields.</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Scheduled job that is created for the demonstration application. The job runs every five minutes to add data to the demo tables in the MetricBase database. You can change the schedule.</td>
</tr>
<tr>
<td>Trigger Definitions</td>
<td>List of triggers that are defined in the demo. This list is the same table as MetricBase &gt; MetricBase Triggers &gt; Trigger Definitions. You can create additional triggers.</td>
</tr>
<tr>
<td>Anomaly Logs</td>
<td>List of logs that result from triggers firing. The Low-Flying Drone trigger creates the anomaly logs.</td>
</tr>
<tr>
<td>Data Explorer</td>
<td>Widget that enables you to experiment with MetricBase JavaScript APIs using the demonstration application data. See Get Familiar with MetricBase APIs for more information.</td>
</tr>
</tbody>
</table>

**Next topics**
- Set up MetricBase.
- Explore the MetricBase JavaScripts APIs.

**Define and collect MetricBase data**

MetricBase stores time-series summaries of much larger data collections. In MetricBase, you specify the metric that you want to store and how often
to collect it. You can also determine how long to store it in the MetricBase database. Then, you send the data from an instance to the MetricBase server at the rate that you define using MetricBase REST or JavaScript APIs. In this way, you can monitor a much larger data collection with MetricBase summaries of it.

**Before you begin**
- **Install MetricBase**
- **Role required**: clotho_admin

**About this task**
MetricBase collects the metrics of how often you send data and what the aggregation of that data is, for example, maximum, minimum, average, or last. This data is called *time-series data*. For example, if you collect drone speeds on an instance, you can send the average drone speed for every two minutes to the MetricBase database. You can also collect altitude and battery life. MetricBase stores each metric as a column in its database.

![Sending information from an instance to a MetricBase server](image)

Retention policy schedules specify how long MetricBase stores the time-series data in the MetricBase database. You can create, edit, and delete retention policy schedules. To create, edit, or delete retention policy schedules, navigate to **MetricBase > Retention Policy Schedules**.

Retention policies include multiple retention schedules with coarser granularity the longer that the data is kept. For example, the Coarse retention policy stores sampled data every:
• Hour for one week (7 Days per 1-hour interval)
• Two hours for one month (31 days per 2-hour interval)
• Day for 13 months (397 Days per 1-day interval)

In this policy, the specified metric is measured every hour for the first 7 days. It is then measured every other hour for the next 31 days, and once a day for the next 397 days. MetricBase deletes data that is older than 435 days.

To see the list of all supported retention policies, navigate to MetricBase > Retention Policies.

**Procedure**

1. Navigate to MetricBase > Time Series Metrics and click **New** to create a time-series definition.
2. On the form, fill in the fields.

### Time series metric form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Intuitive name for the <strong>Metric field name</strong>. For example, altitude could be the label for the metric field name, mb-altitude.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table to add the metric to in the MetricBase database. For example, in the MetricBase Demo, the mb_drone table stores the drone data. Each column in the table is a different metric, for example, altitude, length, and speed.</td>
</tr>
<tr>
<td>Metric field name</td>
<td>Name of the time-series metric that records. For example, mb-altitude. You can think of it as the name of a column in the MetricBase database table.</td>
</tr>
<tr>
<td>Retention policy</td>
<td>Sampling frequency and how long MetricBase keeps the values in the database. You cannot customize the value. For a definition of the values, click the magnifying glass and then a policy. The coarser the sampling rate, the less data that stores. Use the coarsest sampling rate that works for your dataset. For example, do not collect data every minute if collecting it once an hour suffices. See MetricBase retention policies for a description of the policies you can select.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Retention policy aggregator</td>
<td>Operator that aggregates the data in a sampling period. For example, last, minimum, maximum, and average.</td>
</tr>
<tr>
<td>Display value aggregator</td>
<td>The aggregation method in use when using <code>&lt;table-name&gt;.list</code> where <code>&lt;table-name&gt;</code> is a table in the MetricBase database. This value is unrelated to the retention policy. For a definition of the options, see MetricBase transforms.</td>
</tr>
<tr>
<td>Display value aggregate duration</td>
<td>Duration that is used to calculate the aggregation only when using the list view. For example, <code>&lt;table-name&gt;.list</code> where <code>&lt;table-name&gt;</code> is a table in the MetricBase database. This value is unrelated to the retention policy.</td>
</tr>
<tr>
<td>Subject field</td>
<td>You can select a unique table column as your subject for the metric. The unique column must be designated on the table before you select it. For example, if your metric tracks temperatures in different houses, you can make the house address column the subject of your metric. The house address column on your table must be unique before you set the subject field.</td>
</tr>
<tr>
<td></td>
<td>✨ Note: The sys_id column is the default unique column.</td>
</tr>
<tr>
<td>Data Type</td>
<td>You can specify the data type of the subject field.</td>
</tr>
</tbody>
</table>

You’ve created a time-series specification for a metric that you want to track.

3. **Click Submit.**

4. Sample the data according to the time-series specification and send it from an instance to the MetricBase database server. There are many ways to send the data to the MetricBase database. The following example shows how to use REST and JavaScript APIs. For information about the MetricBase REST APIs, see the Clotho Time Series API. For information on the MetricBase JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart, TransformResult.
Note: Send the data at the rate that the time-series definition prescribes. If you send the data at a different rate or for a different duration, you receive an error. Make sure to aggregate the data according to the time-series metric definition. Also, the MetricBase database only stores values of data type float.

You can gain experience with the APIs by using the Data Explorer. For more information, see Get familiar with MetricBase APIs.

Example: Store time-series data using REST and JavaScript APIs

The following examples store time-series data in the MetricBase database using REST and JavaScript APIs. The following example uses REST.

```
curl -X POST -H "Content-Type: application/json" -H "Accepts: application/json"
   "https://<your_instance.servicenow.com>/api/now/v1/clotho/put?align_time"
-d
   
   
   "metric": "<metric-name>", "start": "<start-time-of-data>",
   "values": [0.0, 1.4, 1.1, 1.0, 0.9]] -u username:passwd
```

- **sys_id-of-data-source**—Sys ID of the object that generates the metric. For example, in the MetricBase Demo, this entry would be the sys_id of a drone.
- **metricbase-table**—Name of the table in the MB database that stores the time-series data.
- **metric-name**—Metric field name of the metric that is recorded in the database.
- **start-time-of-data**—Time that the data was sampled from the instance, for example, 2019-04-02T03:00:00Z.

Note: Line returns were introduced into the curl statement to make it fit on the page. To use the code, remove the line returns.

If you prefer to use a JavaScript API to store the time-series data in the MetricBase database, here’s a similar example:

```
var count = 60 * 48; //2 days of data
var values = [];
for (var i =0; i < count; i++) {
   values.push(Math.random());
}
var now_GR = new GlideRecord('<metricbase-table>');
```
gr.get('<sys_id-of-data-source>');

var start = new GlideDateTime();
start.addSeconds(-1 * 60 * count);

var dataBuilder = new sn_clotho.DataBuilder(gr, '<metric-name>').add(start, values);
new sn_clotho.Client().put(dataBuilder);

• **sys_id-of-data-source**—Sys ID of the object generating the metric. For example, in the MetricBase Demo, this would be the sys_id of a drone.

• **metricbase-table**—Name of the table in the MB database that stores the time-series data.

• **metric-name**—Metric field name of the metric that is recorded in the database.

**What to do next**

• If you use a predictive model to detect anomalies, create a predictive model. To see how, refer to [Detect anomalies using predictive models](#).

• View the metrics that are stored in the MetricBase database. To see how, refer to [View the metrics](#).

• Set up triggers that execute Flow Designer flows. To see how, refer to [Set up triggers](#).

**MetricBase retention policies**

The retention policies you can choose when retaining your data in MetricBase.

<table>
<thead>
<tr>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coarse</td>
<td>This policy stores data with 1 week at 1-hour interval, 1 month at 2-hour interval and 13 months at 1-day interval. This policy is suitable for metrics that change less often or metrics that do not require high resolution such as disk usage.</td>
</tr>
<tr>
<td>Dense</td>
<td>This policy stores data with 1-minute increments for 8 days then 10-minute increments for 94 days then</td>
</tr>
</tbody>
</table>
### MetricBase Retention Policies (continued)

<table>
<thead>
<tr>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1-hour increments for 13 months. It is suitable for metrics that require higher resolution for longer terms.</td>
</tr>
<tr>
<td>High</td>
<td>This policy stores data for 1 week at 1-minute interval, 1 month at 10-minute interval and 13 months at 1-hour interval. It is suitable for metrics that require higher resolution for longer terms.</td>
</tr>
<tr>
<td>Medium</td>
<td>This Medium Series policy stores data with 1 week at 10-minute interval, 1 month at 30-minute interval and 13 months at 2-hour interval. This policy is suitable for metrics that change less often such as job processing throughput.</td>
</tr>
<tr>
<td>Medium High</td>
<td>This policy stores data with 13 months at 1-hour interval.</td>
</tr>
<tr>
<td>Operational Intelligence</td>
<td>This policy stores data with 1-minute increments for 8 days then 10-minute increments for 94 days then 1-hour increments for 13 months.</td>
</tr>
<tr>
<td>Sparse</td>
<td>This policy stores data with 13 months at 1-day interval.</td>
</tr>
<tr>
<td>Ultra Dense</td>
<td>This policy stores data with 1 day at 10-second interval, 3 months at 1-minute interval and 1 year at 1-hour interval.</td>
</tr>
</tbody>
</table>

### Detect anomalies in MetricBase data using predictive models

Use statistical models to determine significant anomalies in real-time using MetricBase triggers. You will need to train a model using representative data that has already been stored in MetricBase.
Before you begin
Role required: admin

About this task
MetricBase creates a model by training a representative sample of your time series data to determine the model parameters. The training process determines the model parameters that best fit your data, to distinguish normal data from anomalous data. MetricBase supports the following model types:

- Probabilistic Exponentially Weighted Moving Average (PEWMA), a moving average algorithm that uses a probability factor to determine how it reacts to change in data
- Autoregressive Integrated Moving Average (ARIMA), a moving average algorithm that factors in previous errors and values
- Seasonal Trend decomposition using Loess (STL), a seasonal algorithm for decomposing time series data into seasonal and trend components
- Holt-Winters (HW), a seasonal algorithm that decomposes the trend and seasonal components to determine the level

† Note: MetricBase selects the most appropriate model type when you select Find Best Fit Model from the model class list.

After you have a model trained from your data, you can trigger flows when new data is significantly different than the trained data.

Procedure
1. Navigate to MetricBase > MetricBase Models and click New.
2. On the form, fill in the fields.

Model New Record form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model name</td>
<td>Name of the model. The name can be any combination of alphanumeric characters. This model name is not the same as the model class. In general, the name relates to the value in Group by.</td>
</tr>
<tr>
<td>Table name</td>
<td>Name of the table that contains the training data.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric that you use to train the model. The metric must belong to the table.</td>
</tr>
<tr>
<td>Created</td>
<td>Date that you trained the model.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Filters that you use to exclude some of the data in the dataset.</td>
</tr>
<tr>
<td></td>
<td>✉ Note: When choosing data to train your model, try to select data that demonstrates an expected behavior to reduce anomalies in the training set.</td>
</tr>
<tr>
<td>Group by</td>
<td>You can use <strong>Group by</strong> as a discriminator field for your model data. For example, if you want to create a data model over a group of production servers whose performance differs by role (such as database or application server roles) then you would choose role as the <strong>Group by</strong> field. The training process creates one model per role in the group of records selected by the filter. You do not have to manually create a model for each role.</td>
</tr>
<tr>
<td>Model Class</td>
<td>The algorithm to use when training data. Select a moving average algorithm (PEWMA, ARIMA), a seasonal algorithm (STL, HW), or choose <strong>Find Best Fit Model</strong>. The default is <strong>Find Best Fit Model</strong>, which tries each algorithm and selects the one which appears to have the best fit over the training set.</td>
</tr>
<tr>
<td>Training Dataset Start Date</td>
<td>MetricBase time series data for the metric starting with this date.</td>
</tr>
<tr>
<td>Training Dataset End Date</td>
<td>MetricBase time series data for the metric ending with this date.</td>
</tr>
<tr>
<td>Valid until</td>
<td>Date that serves as a reminder to consider retraining the model. If the model is performing well, there's no need to retrain it. The model can continue working past this date.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the trained model. Once the model is active it becomes available for use as a Flow Designer trigger.</td>
</tr>
</tbody>
</table>

3. Click **Submit and Train**. MetricBase trains the model. When complete, the model appears on the **MetricBase Model Instances** tab.

4. Click the model name. The modeling data appears as does the model string with the parameters optimized by the training.
5. Optional: Click the model name and then click Set Model to change the model parameters. You can edit the model parameters when you want to override the settings for training your model. The graph does not update, you are saving the revised model string.

What to do next
You can create a Flow Designer trigger for this model. For more information, see Create a model trigger.
**Access MetricBase data**

Access the time-series data that you sent to the MetricBase database in the way that is convenient to you.

**Before you begin**
Role required: admin

**About this task**
You can access and visualize time-series data in the MetricBase database by using:

- **Reporting application**
  You can generate reports and graphs from the time-series data that is stored in the MetricBase database. For more information, see [Create reports from MetricBase time-series data](#).

- **Table lists using the `.list` command**
  For more information, see [View MetricBase data using the list command](#).

- **REST or JavaScript APIs**
  For more information, see [View MetricBase data using REST and JavaScript](#).

**Access MetricBase data using the list command**

Use the list command on a table in the MetricBase database to view time-series data. The data reveals the behavior of the entity that supplies the data.

**Before you begin**
Role required: admin

**Procedure**

1. On the MetricBase instance, in the **application navigator**, type `<table-name>.list`, and press the Enter key.
   
   `<table-name>` is the name of the table in the MetricBase database that contains the metric you want to view.

2. Click the menu icon (☰) above the metric column, and select **Time Series Chart**.

3. Change the **Time Span** and **Transform** fields to evaluate the data.

4. **Optional:** Adjust the data:
a. Select one of the transforms: **Add**, **Multiply**, or **Divide**.

b. In the **Value** field, enter the number to add, multiply, or divide the metric data by and click **Submit**.

**Note:** The adjusted data is not saved in the MetricBase database.

**Retrieving MetricBase data using REST and JavaScript**

Use JavaScript or REST APIs to retrieve time-series data from the MetricBase database and to run transforms on the data. The transformations enable you to visualize time-series data in a variety of ways.

For more information about MetricBase time-series data transformations, see **MetricBase transforms**.

**Using REST**

For information about the MetricBase REST APIs that return time-series data from the MetricBase database, see:

- **Clotho Time Series API**, which inserts, retrieves, and transforms data in the MetricBase database.
- **MetricBase Data Explorer** that comes with the MetricBase Demo, and enables you to experiment with the APIs.

**Using JavaScript**

For information about the MetricBase JavaScript APIs that return time-series data from the MetricBase database, see:

- **Client** — Execute transforms on the MetricBase database and receive the results.
- **Data** — Return the object that contains the result of a transform.
- **DataBuilder** — Create a series of data points for a metric.
- **Transformer** — Manipulate time-series data to prepare the data for evaluation and analysis.
- **TransformPart** — Specify details of the transform to be done.
- **TransformResult** — Return the object that contains the result of the transformation.
Example: Analyze time series data with JavaScript APIs

This example returns the average CPU usage over the specified time for each XYZ computer.

```javascript
// Query the cmdb_ci_computer table for the records for
var now_GR = new GlideRecord('cmdb_ci_computer');
gr.addEncodedQuery('manufacturer=xyz');
gr.query();

// Create a DataSelector object and specify the metric (cpu_percentage),
// the transform (avg), and label (avg cpu)
var transform = new sn_clotho.Transformer(now_GR).addMetric('cpu_percentage').avg()
    .label('avg-cpu-percentage');

// Run the transform between startTime and endTime.
// startTime and endTime are GlideDateTime
var data = transform.execute(startTime, endTime);
var values = data['avg-cpu-percentage'].getValues();
```

Example: Filter data

Developers can use SQL WHERE clauses in transformation scripts to filter data in report visualizations. Transformations in clotho aggregations apply mathematical functions on metric records. Use SQL WHERE clauses in transformation scripts to filter data. In the following example, the WHERE clause filters out all results except those results where mb_demo_mt_speed equals 100.

```javascript
var eqCon = new sn_clotho.Condition().eq(100);
var builder = new sn_clotho.Transformer(drones);
var fit = builder.metric("mb_demo_mt_speed").where(eqCon);
```

MetricBase triggers

Time-series data that is stored in the MetricBase database can trigger Flow Designer flows. These triggers can log incidents, send emails, and create other alerts.

You use MetricBase to define a trigger on an instance. When you associate the trigger with a Flow Designer flow, the trigger definition transfers from your instance to the MetricBase server. When you make the trigger and flow active, the trigger monitors the time-series data that is stored in the MetricBase database. When data meets the triggering conditions, MetricBase adds the trigger alert to the Trigger queue. The instance regularly polls that queue. When the polling finds a trigger waiting in the queue, the Flow Designer flow executes on the instance.
For more information about time-series policies, see Define and collect MetricBase data.

### High-level overview of implementing triggers

1. Define one or more of the following triggers on an instance:
   - **Band trigger**—Triggers when a metric value falls within a range of values.
   - **Linear Predictor trigger**—Triggers when a series of values trend toward and are expected to reach a specified value.
   - **Gap trigger**—Triggers when values are not received for a period of time.
   - **Model trigger**—Triggers when a trained model detects anomalous behavior.

2. Create a **trigger condition** to add additional requirements for a trigger to execute a flow.
   
   For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

3. **Associate the trigger with the flow it executes** using Flow Designer.

4. **Test the trigger and workflow.**

5. **Activate the trigger.**
Deleting triggers
You can't delete a trigger in MetricBase if it is associated with a Flow Designer. To delete a trigger, you must first delete the flow in Flow Designer and then you can delete the trigger in MetricBase.

Legacy triggers
Legacy triggers are deprecated. You can't create new ones; you can only carry forward ones that already exist. To see them, navigate to Legacy triggers.

Create a MetricBase band trigger
Create a MetricBase band trigger that detects when a metric value falls within a range of values.

Before you begin
Role required: admin

About this task
Band triggers execute when metrics fall outside of or within a range of values.

Procedure
2. On the MetricBase Trigger Creation form, click Band Trigger - Detects and takes action when metric value meet certain threshold or is within a range.
   On the MetricBase Band Trigger form, you can see the table and tracked metric but not the band trigger parameters.
3. On the form, fill in the fields.
MetricBase Band Trigger form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the band trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
<tr>
<td>Metric</td>
<td>Table metric that you want to monitor that is specified by the Table name. The only metrics that appear when you click the search icon are the metrics in that table. If you select a metric before you specify a Table name, the metrics in all your time-series metrics appear. After you select a metric, only the tables that contain that metric appear when you click the search icon that is next to the Table name.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
<tr>
<td>Aggregator</td>
<td>Aggregation value that you select: None, Max, Min, or Average. None means that you use the last value in the collection interval.</td>
</tr>
</tbody>
</table>

4. Click Save.

5. In the MetricBase Band Trigger Levels area, double-click each cell to add values that specify trigger parameters.
### MetricBase Band Trigger Levels

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define the CPU usage for level 1 to be above 85% and the CPU usage for level 2 above 90%. Each level should trigger a different flow. <strong>Level</strong> is often used in <em>Conditional Scripts</em>.</td>
</tr>
<tr>
<td>Function</td>
<td>Function that makes the <strong>Value</strong> the maximum or minimum value of the lower end of the band and defines whether trigger values are inside or outside of the band. For example, if the <strong>Function</strong> is <strong>Less than</strong>, the trigger executes when the metric goes below band.</td>
</tr>
<tr>
<td>Value</td>
<td>Lower end of the band. See the following image.</td>
</tr>
<tr>
<td>Band Function</td>
<td>Function that makes the <strong>Band Value</strong> the maximum or minimum value of the upper end of the band and defines whether trigger values are inside or outside of the band. For example, if the <strong>Band Function</strong> is <strong>Greater than</strong>, the trigger executes when the metric goes above the band. See the following image.</td>
</tr>
<tr>
<td>Band Value</td>
<td>Upper end of the band. See the following image.</td>
</tr>
<tr>
<td>Tolerance</td>
<td>Tolerance range, plus or minus the <strong>Value</strong> and <strong>Band Value</strong>. Select a tolerance to prevent repeatedly executing a trigger for small fluctuations in the data. Once a trigger executes, the data must exceed the tolerance to execute</td>
</tr>
</tbody>
</table>
For example, if the **Function** is **Less than**, the **Value** is 100, the **Band Function** is **Greater than**, the **Band Value** is 200, and the **Tolerance** is 0, the trigger executes for all values that are less than 100 and greater than 200.

6. **Optional:** Add additional rows in the table to create multi-layered triggering behavior.
   Typically, each additional row indicates a more severe condition and the Flow Designer flow that is associated with the level warns with increasing severity.
   For example, level 1 might define the band from 100 through 200. Level 2 might define the level from 50 through 250.

7. Click **Update**.

8. **Optional:** Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see [Create a triggering condition](#).

**What to do next**
Associate this trigger with a Flow Designer flow. For more information, see [Assign a trigger to a flow](#).

**Create a MetricBase linear predictor trigger**
Create a MetricBase linear predictor trigger to detect when a metric is likely to cross a specified threshold within a specified period of time.

**Before you begin**
Role required: admin
About this task

The linear predictor trigger uses past data to generate a line that predicts future values. When MetricBase predicts that the linear value will reach a threshold, the trigger executes.

If the most recent data point reaches the threshold, the trigger executes regardless of the linear prediction.

Trigger parameters include how much past data to use in the calculation of the prediction, how far ahead to look, and the level of confidence that you accept.

Procedure

2. Click Linear Predictor Trigger - Predicts and takes action when a metric follows an upward or downward trend and is expected to reach a given threshold in the future.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>MetricBase Linear Predictor Trigger form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Table name</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>--------------</td>
</tr>
<tr>
<td>Metric</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Window</td>
</tr>
<tr>
<td>Confidence Level (%)</td>
</tr>
<tr>
<td>Trend</td>
</tr>
</tbody>
</table>
**Field** | **Description**
---|---
**Threshold** | Target value that the metric is expected to reach before the trigger executes.
**Description** | Description of the trigger.

4. **Click Save.**
   In the MetricBase Linear Predictor Trigger Levels form, you can create multiple trigger levels of increasing severity. For example, you can configure the battery level to be 80% for level one and at 90% for level two.

5. In the MetricBase Linear Predictor Trigger Levels area, double-click each cell to add values that specify trigger parameters.

| **MetricBase Linear Predictor Trigger Levels** |
|---|---|
| **Field** | **Description** |
| Level | Numbers that indicate increasing severity. For example, you might define level 1 to be CPU use is predicted to reach 85%. Level 2 might be CPU use is predicted to reach 90%. Each level can trigger a different Flow Designer flow. |
| Function | Function to use on the value. For example, **Less than or is**. |
| Window | How far into the future that you want the linear predictor to look to see if the metric is predicted to cross the threshold. Do not confuse this value with the **Window** value in the trigger definition form. That value specifies how much data to use (measured in time) to calculate the slope of the predictor line. |

6. **Click Update.**

7. **Optional:** Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow.
   For more information, see Create a triggering condition.

**What to do next**
Associate this trigger with a Flow Designer flow. For more information, see Assign a trigger to a flow.
**Create a MetricBase gap trigger**

Create a MetricBase gap trigger to alert you when MetricBase stops receiving data.

**Before you begin**
Role required: admin

**About this task**

Gap triggers execute when MetricBase stops receiving data for a specified period.

![Graph showing amount of data over time with gaps]

You can define multiple trigger levels to indicate different severities. For example, you can set a gap of 15 minutes as level 1, a gap of 30 minutes as level 2, and so on. Each level should trigger a different Flow Designer flow. The difference between gap durations on different levels must be at least 10 minutes. For example, if you set level 1 to a gap of 15 minutes, you must set level 2 to a gap of 25 minutes or more.

**Note:** If you make the gap durations between levels less than 10 minutes, MetricBase displays an error message and deletes the level that you added.

MetricBase calculates how often to poll data by taking the difference between gap durations on different levels and dividing them by 2. For example, if level 1 triggers after 20 minutes of missing data and level 2 triggers after 40 minutes of missing data, the polling frequency is \((40-20)/2 = 10\) minutes. The maximum polling frequency is every 5 minutes, and the minimum frequency is every 30 minutes. If a trigger has only one level, the polling frequency is 30 minutes.

MetricBase searches through the data that is stored in the MetricBase database, not through incoming data. For that reason, a gap trigger might execute after the gap when data is missing. For example, if MetricBase polls the database every 10 minutes and the gap is 30 minutes of missing data, the trigger might execute as late as 40 minutes after the data was last received.
Procedure

2. In the MetricBase Trigger Creation form, click Gap Trigger - Detects and takes action when no data is received for a metric.

3. On the form, fill in the fields.

**MetricBase gap trigger form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the trigger.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table in the MetricBase database that contains the metric that you want to monitor. The only tables that appear when you click the search icon are the tables that you specified in the time-series metrics. If you select a metric before you select a table, only tables that have that metric appear in the Table name modal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Metric</td>
<td>Value the trigger monitors in the MetricBase database.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the trigger.</td>
</tr>
</tbody>
</table>

4. Click Save.

5. In the MetricBase Gap Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be no data for 1 minute. Level 2 might be no data for 5 minutes. Each level should trigger a different flow.</td>
</tr>
<tr>
<td>Function</td>
<td>Function, <strong>Greater than or is</strong>, which means that this trigger executes when the gap in received data is greater than the value that you specify in the Window field.</td>
</tr>
<tr>
<td>Window</td>
<td>Length of time that no data has been received that executes the trigger. The format is</td>
</tr>
</tbody>
</table>
Field | Description
---|---
| | hours:minutes:seconds. For example, 00:20:00 means that this trigger executes after 20 minutes of missing data.

6. Click **Update**.

7. **Optional:** Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see [Create a triggering condition](#).

**What to do next**
Associate this trigger with a Flow Designer flow. For more information, see [Assign a trigger to a flow](#).

**Create a MetricBase model trigger**
Model triggers execute when the time-series data deviates from expected values.

**Before you begin**
Role required: admin

**About this task**
Probabilistic exponentially-weighted moving average (PEWMA) is the only model type supported. MetricBase uses this model to create a definition of expected, normal values.

**Procedure**
1. Click **MetricBase > Flow Designer > Trigger Definitions** and click **New**.
2. Click **Model Trigger - Detects and takes action when a metric value deviates from the trained model**.
   The MetricBase Model Trigger form specifies the table and metric used to train the model.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name the model trigger.</td>
</tr>
<tr>
<td>Model</td>
<td><strong>Trained model</strong> this trigger uses.</td>
</tr>
<tr>
<td>Metric</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Table name</td>
<td>Automatically filled in based on the model.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the trigger.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of the trigger.</td>
</tr>
<tr>
<td>Spike Direction</td>
<td>Trigger execution criteria. Specify whether you want to trigger only on anomalies that occur above predicted values, only on anomalies that occur below predicted values, or both.</td>
</tr>
<tr>
<td>Window</td>
<td>Amount of data to use when calculating the moving, weighted average; the longer the window, the more data. The recommendation is 30 times the sampling interval. For example, if the time-series data is sampled every minute, make this value 30 minutes. Values must be multiples of the sampling interval.</td>
</tr>
<tr>
<td>Active</td>
<td>Turns on the trigger.</td>
</tr>
</tbody>
</table>
**Note:** For the Window value, very short durations make the weighted average move with the data itself and fail to detect anomalies. Very long durations make the weighted average unresponsive to current trends in the data and may cause false triggers.

4. Click **Save**.

5. In the MetricBase Model Trigger Levels area, double-click each cell to add values that specify trigger parameters.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Numbers that indicate increasing severity. For example, you might define level 1 to be 3 standard deviations from the mean. Level 2 might be 5 standard deviations. Each level should trigger a different Flow Designer flow. Level is often used in Conditional Scripts.</td>
</tr>
<tr>
<td>Function</td>
<td><strong>Always Greater than or is</strong>, meaning that in order to trigger, the time-series metric must be greater than or equal to the number of standard deviations from the mean specified in <strong>Number of Standard Deviations</strong>.</td>
</tr>
<tr>
<td>Number of Standard Deviation</td>
<td>Float value specifying the number of standard deviations the time-series metric must be away from the mean to trigger an alert at this level.</td>
</tr>
</tbody>
</table>

6. **Optional:** Add additional rows in the table to create multi-layered triggering behavior. Each successive row should indicate a more severe condition.

7. Click **Update**. The MetricBase Trigger Definitions page displays the list of defined triggers.

8. Test your model and trigger on real data before deploying to production.

9. **Optional:** Add a triggering condition that determines whether or not a trigger executes a Flow Designer flow. For more information, see Create a triggering condition.

**What to do next**
Associate this trigger with a Flow Designer flow. For more information, see Assign a trigger to a flow.
**Execute triggers conditionally**

MetricBase triggers execute based on a single metric. Condition Scripts impose additional requirements that determine whether a trigger kicks off a flow.

**Before you begin**
Role required: admin

**About this task**
Condition Scripts execute when conditions for a trigger are met but before the trigger executes a Flow Designer flow. In that way, Condition Scripts can prevent triggers from executing flows even when trigger conditions are met. For example, data often fluctuates over time. Small fluctuations can cause unwanted, duplicate triggering events. A Condition Script can prevent that erroneous duplication.

Condition Scripts always return True (trigger) or False (do not trigger). To learn how to write these scripts, see Scripting in ServiceNow Fundamentals. To experiment with scripts, see Get familiar with MetricBase APIs.

You can create and save Condition Scripts in MetricBase but you associate them with triggers using Flow Designer.

**Procedure**

1. Click **MetricBase > MetricBase Triggers > Trigger Condition Script > New**.

2. On the Additional MetricBase Trigger Filtering Condition New Record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the Condition Script.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the Condition Script. The value, Global, means that the action applies to all applications.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of what the Condition Script does.</td>
</tr>
<tr>
<td>Script</td>
<td>Field to enter the JavaScript. Make it returns True to execute a flow. See the next step.</td>
</tr>
</tbody>
</table>

3. Write the Condition Script.
   The key part of these scripts is the conditional statements. If all evaluate true, the script returns True and the flow executes, otherwise it does not. The following example script triggers a flow when a drone is traveling too fast at a low altitude (defined by level 1). The example shows a typical approach to writing a Condition Script.
a. Get the trigger definition.

b. Get the record (current) that is causing the triggering event.

c. Get the time from the record that the trigger conditions were satisfied.

d. Get the trigger level, which defines the trigger parameters.

e. Use these parameters to return True if the level 1 trigger conditions are met and travel_state equals traveling or speeding.

```javascript
function filter(/*GlideRecord*/ triggerDefinition, /*GlideRecord*/ current, /*GlideDateTime*/ start, /*int*/ level) {
    // retrieve current travel state of drone
    var travel_state = String(current.travel_state);

    // the drone is traveling at a significant speed, and the altitude just went below
    // the threshold
    if (((travel_state === 'traveling') || (travel_state === 'speeding')) && (level === 1)) {
        return true; // process this trigger
    }

    return false; // don't process this trigger
}
```

⚠️ **Note:** Condition Scripts must execute quickly.

4. Click **Submit**.

**What to do next**

Use Flow Designer to **associate a flow with a trigger**. When configuring a flow, you can select a Condition Script you created.
Assign a trigger to a flow

Now that you created a trigger, use Flow Designer to specify the flow a trigger executes. The flows provide alerts for unexpected behavior.

Before you begin
Role required: admin

About this task
Triggers, by themselves, execute nothing. After defining a trigger in MetricBase, you use Flow Designer to associate the trigger with a flow.

Procedure
1. Navigate to **MetricBase > Flow Designer**.
   Flow Designer displays a list of triggers associated with Flow Designer flows.

2. Click **New > New Flow**.

   Note: If the list contains triggers, click **+New** and then **New Flow** in the list.
3. Enter values for the modal fields and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the flow to execute. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Protection</td>
<td>Option to make the flow read-only. Selecting read-only prevents users who do not own the application scope from making changes to the flow. You can only select a value when you create the flow in an application scope you own.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of why you are associating this flow with the trigger.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session. Use the user who initiates the session option when the update should come from the user who triggered the flow. For example, comments to incident records that should come from the current user, or approval emails that should originate from the approver. Settings on a flow do not apply to child subflows. When run as the user who initiates the session, flow actions are limited by the user's ACL restrictions. Flows run by the initiating user respect user-specific settings like date/time format.</td>
</tr>
</tbody>
</table>

**Note:** When choosing the option to run as the user who initiates the session, ensure that security restrictions do not prevent users who will trigger the flow from performing the flow actions.

A tab opens and the tab name is the value for Name.

4. Click Click to add a trigger to specify the trigger that kicks off this flow. A modal displays that enables you to find and select a trigger type.

5. Scroll and select MetricBase for the trigger type. The Flow Designer form displays.
6. Under **TRIGGER**, fill in the form to define the trigger to associate with this flow.

   a. Beside **MetricBase Trigger**, click the magnifying glass to select an existing trigger or click the plus sign (+) to define a new trigger.

   b. Optionally, add requirements for the flow to execute by clicking **Add Filter** and adding filter conditions, for example, **flight-status is-not landed**.

   c. Optionally, beside **Condition Script**, click the magnifying glass to select a condition script or click the plus (+) to **create a script**. Condition scripts add additional requirements for a trigger to execute a flow.

7. Under **ACTIONS**, click **Click to add an Action, Flow Logic, or Subflow** and select a category in the first column and a flow action in the second column.
8. Click **Done**.

9. Test the flow.

   a. Navigate to **Flow Designer > Designer**, and double-click the flow.

   b. Click **Test**.
      The Test flow dialog box displays. The contents of the Test flow dialog depend on the type of trigger: Data or Schedule. If the trigger is a Data trigger, the dialog asks for a record to use for the test.

   c. Select a record in the dialog box and click **Submit**.

      ✋ Note: When you test a flow, the system does not execute the trigger, and therefore does not create a new record. By selecting a record in the Test flow dialog box, the system acts as if that record was just created. For more information, see Test a flow.

10. Click **Activate** to activate the trigger.
    The flow will not execute unless you activate it.
Maintain MetricBase

View the status of MetricBase and debug its triggers.

View MetricBase status and statistics

You can view the status of the MetricBase database.

Before you begin

Role required: admin

Procedure

1. View the status of the MetricBase instance.

   a. Navigate to System Diagnostics > Stats > Stats

   b. Scroll down to find MetricBase Statistics

2. View the metrics monitored by MetricBase and statistics about them.

   a. Click MetricBase > MetricBase Status

   The MetricBase Status page displays all of the metrics tracked in MB.
b. Click the gear icon. The Personalize List Columns modal displays.

c. Select and move metrics from the Available column to the Selected column to display the metric and click OK.
The metrics display on the MetricBase Status page.

<table>
<thead>
<tr>
<th>Name</th>

</tbody>
</table>

View trigger logs
Trigger logs show different levels of trigger malfunctions.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to MetricBase > MetricBase Triggers > Trigger logs.
2. Click one of the trigger logs.
4. **Optional:** Change the default values in the Enter parameters for log file entries to browse form to select the log entries to view and click Submit.

Debug MetricBase
You can display the results of debugging scripts in MetricBase.

**Before you begin**
Role required: admin
Procedure

1. Navigate to System Diagnostics > Session Debug > Debug MetricBase.
   When the page you are on submits queries to MetricBase, you see the
   transforms and how long they took on the bottom of the page. Submitting a
   lot of MetricBase queries may slow down the page load time significantly.

2. To view a history of the debug script's execution, click available here.

3. Click Update.
   Session debug tracking for MetricBase activities starts and the MetricBase
   Status page displays.

Get familiar with MetricBase APIs

Experiment with MetricBase APIs using Data Explorer that is part of the
MetricBase Demo application. Data Explorer uses the data installed with the
MetricBase Demo application.

Before you begin
Role required: clotho_admin

About this task
Data Explorer is a playground where you can see and edit example scripts that
visualize data included with the MetricBase Demo application. The example
scripts use the MetricBase JavaScript APIs. For information on the MetricBase
JavaScript APIs, see Client, Data, DataBuilder, Transformer, TransformPart,
TransformResult.

Example scripts use either:

• Transforms, which use the Transformer method.
• Machine Language, trained models that predict expected behavior. All the
  scripts without "Transform" in their title use Machine Language.

Procedure

1. Navigate to MetricBase Demo > Data Explorer.
   The Data Explorer displays.
When you run a script, the data visualization appears under **Data Explorer Script Result Display**.

2. Select one of the sample scripts to run in the **Example Script** menu.

3. Click **Load Example**.

4. Click **Run**.
The script displays the data visualization under **Data Explorer Script Result Display**.

5. **Optional:** Change the values or statements in the script or write an entirely new script and click **Run**.

   ✨ Note: If you want to save the changes you made in the script, click **Save**.

6. Under **Server Output**, look at the server's response that might include error information.

**Example:**

**Example scripts**

<table>
<thead>
<tr>
<th>Example script</th>
<th>Definition and visualization</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple Transform</td>
<td>Uses the transformer API to display a single time-series metric, the average speed of the drones: transformer.metric('mb_demo_mt_speed').avg().</td>
</tr>
</tbody>
</table>
| Simple Transform with Grouping  | Uses the transformer API to display a group of time-series metrics, the average altitude of the fleet of the drones: 

```plaintext
transformer.groupBy("fleet").metric("mb_demo_mt_altitude")
  .avg().label('avg - %g: fleet:')
```
<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td><strong>ARIMA Model</strong></td>
<td>The most general class of models for predicting time-series data that has no trend, meaning all the data has the same value or the values fluctuate sinusoidally around the mean.</td>
</tr>
<tr>
<td><strong>Deviation Model</strong></td>
<td>Uses chisquare model to show the differences between the real data and the model's prediction.</td>
</tr>
</tbody>
</table>

```javascript
var metric = 'nb_demo_mt_rem_battery';
builder.metric(metric).deviation(model, 'chiSquare');
```

---

### Domain separation and MetricBase

Domain separation is supported in the MetricBase application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Basic**
• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.

• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.

• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

MID Server

The Management, Instrumentation, and Discovery (MID) Server is a Java application that runs as a Windows service or UNIX daemon on a server in your local network. The ServiceNow® MID Server enables communication and the movement of data between a ServiceNow instance and external applications, data sources, and services.

The MID Server initiates all communications with the ServiceNow® instance. This communication is recorded as records in the ECC Queue, which acts as the communication log between the instance and the MID Server. The MID Server picks up any work it has to do from the ECC Queue and returns the results of that work to the queue.

This video gives you an overview of the MID Server:

<table>
<thead>
<tr>
<th>MID Server overview</th>
</tr>
</thead>
</table>
Setting up the MID server

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

This documentation provides detailed instructions for setting up a functioning MID Server for use with ITOM applications. Click the icons to go to each task’s portal page. These procedures help you prepare your system, download and run the installer, and configure MID Servers to run in your environment. After you get a valid MID Server up and running, you can add security and encryption to protect your data.

At the bottom of each page is a link to the reference materials you need, such as MID Server system requirements, configuration parameters, and instructions for monitoring your MID Server. Use the additional links at the bottom to move through the content within a specific category or return to the MID Server setup to access a different portal.

If you are new to the MID Server or an experienced user who wants to set up a MID Server quickly, you can use the MID Server Guided Setup. This wizard walks you through the process of installing and configuring a MID Server with default settings in just a few steps.
Upgrading the MID Server

The MID Server checks with the instance periodically to see if an upgrade is necessary. If the MID Server detects that a new version is available for upgrade, it downloads the installer from install.service-now.com and runs the package automatically. You can also elect to upgrade the MID Server manually. See MID Server upgrades for details.

Resolving MID Server issues

You can search the HI Knowledge Base for troubleshooting articles or monitor the MID Server status and track active issues from within the instance. Many articles on resolved MID Server issues have been collected on Servicenow MID Server Landing page [KB0960404]. For more information about common resolution procedures, see Resolving MID Server issues.

ServiceNow applications that use the MID Server

- Discovery
- Orchestration
- Service Mapping
- Event Management
- Operational Intelligence
- Cloud Management
- IntegrationHub
- Cloud Insights

External applications that use the MID Server

- Import Sets
- Microsoft SMS/SCCM
- LANDesk Maintenance Suite
- Microsoft System Center Operations Manager (SCOM)
- Microsoft MIIS

MID Server version compatibility

The version of the MID Server must be compatible with the version of the instance. Otherwise, the MID Server cannot process commands or communicate with the instance.

The instance determines which version of the MID Server is allowed. The MID Server version must at a minimum belong to the same major release, such as
Madrid. If the MID Server version belongs to the same major release, it can, but does not have to, belong to the same minor version, such as Madrid Patch 1. In this case, communication with the instance might still be possible, but it is always suggested that you upgrade to the latest version.

⚠️ **CAUTION:** You can pin the MID Server to a specific version, but you should be aware that the version might become out of date.

### Configure MID Server network connectivity

Prepare the network for MID Servers to connect with the instance and access the download site. The network must be prepared before installing or configuring the MID Server. If computers or devices have additional security measures, that security may interfere with MID Servers on those systems.

**Before you begin**

Role required: admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Ensure that the MID Server can connect to elements inside and outside your network
3. Configure MID Server security
4. Configure your MID Server
5. Download and install the MID Server on a Linux or Windows host
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**Prerequisites:** Make sure that the host machine meets the requirements specified in the MID Server system requirements.

**About this task**
The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-
hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

The host machine must have these network privileges:

- Firewall access: Configure any firewalls between the MID Server and the target devices to allow a connection. If your network uses a DMZ, and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a MID Server to a machine within the DMZ to probe the devices there.

- Network access: Configure target devices to allow the MID Server probe to connect. If network security prevents you from configuring new machines that can connect to the targets, install the MID Server on an existing machine with connection privileges.

- Network account: Install the MID Server with the proper account, either local or domain administrator.

Additionally, for the MID Server to access your ServiceNow instance, satisfy these prerequisites:

- Network access to the ServiceNow instance: Configure the network that the MID Server uses to allow traffic over TCP port 443.

- A MID user: Create a ServiceNow user record for the MID Server to use. This user record must have the mid_server and import_admin roles.

⚠ Note: Verify that the baseline public page InstanceInfo is active for the MID Server to connect to the instance.

Procedure

1. Configure the network to allow MID Server network connectivity to the ServiceNow instance over TCP port 443.

2. Configure basic authentication for SOAP communications with the ServiceNow instance.

3. Navigate to System Web Services > Scripted Web Services > Scripted SOAP Services.

4. Confirm that the following web services are active:
5. Type `sys_public.list` in the navigation search field and press Enter. The Public Pages record list appears.

6. Verify that the `InstanceInfo` public page is active, to allow the MID Server to validate its version.

7. Ensure that the MID Server host computer can access the download site at `install.service-now.com`.

What to do next
After the network is prepared, proceed to Installing the MID Server.

Prepare network connections for MID Servers
Before you install the MID Server, perform the necessary prerequisites that it needs to connect to elements inside and outside your network. This includes network privileges and security considerations.

Security considerations
Sometimes computers or devices have additional security measures configured, and these measures may interfere with the MID Server's ability to run commands or queries on those systems.

For example, a Linux server might be configured to allow only certain IP address to connect to it via SSH. Similarly, a network router might be configured to allow only certain IP address to query SNMP on it. To allow access in such cases, use one of the following methods:

- Update the configuration of those computers or devices to allow the desired MID Server to run commands or query them. For example, a network router may be configured to only allow the network management systems to query SNMP on it. In that case, add the MID Server as though it were another network management system.
• Install a MID Server on a computer that already has access to the computers or network devices with such restrictions. For example, to use Discovery within a DMZ (where communication from outside the DMZ will be severely restricted), install a MID Server on a computer that is already in the DMZ.

**External connectivity requirements**

These requirements are specifically for the use of MID Servers with the ServiceNow® Discovery and Orchestration products.

The MID Server communicates securely on port 443 to the instance and requires no inbound connections. In some cases, it might be necessary to allow this communication through the firewall if the MID Server fails to register on the instance. To determine if the application or a network security restriction is to blame for connection failure, attempt to telnet to the instance on port 443 from the server that is hosting the MID Server application. If this connection fails, then the problem could be a web proxy (since 443 is an https connection) or a Firewall rule preventing external TCP connections from that host. Contact network security personnel for the proxy information to add to the config.xml file, or request that the firewall be configured to allow access using one of the following syntaxes:

- `<source IP> to <any>`
- `<source IP> to <ServiceNow> any established`
- `<source IP> to <instance_name.service-now.com> 443`

**Important:** The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

**Internal connectivity requirements**

These methods are used for discovering various devices on a network and are specifically for the use of MID Servers with the Discovery and Orchestration products.

- **SSH**: For UNIX-like machines, Discovery and Orchestration use SSH protocol, version 2 to access target machines. SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH communicates on port 22 within an encrypted datastream and requires a login to access the targets using two available methods of authentication: a user name and password combination and a user name and shared private key. Specify SSH authentication information and type
in the **Credentials** module. If multiple credentials are entered, the platform tries one after the other until a successful connection is established or all are ultimately denied. To provide for application relationships a limited number of SUDO commands must be available to be run. Additional details to these requirements can be found in UNIX/Linux commands requiring root privileges for Discovery and Orchestration.

- **WMI**: For Windows machines, Discovery uses the Windows Management Instrumentation (WMI) interface to query devices. Due to security restrictions for WMI, the MID Server application executing the WMI queries must run as a domain user with local (target) administrator privileges. When Discovery detects activity on port 135, it launches a WMI query. The response from the Windows device is sent over a Distributed Component Object Model (DCOM) port configured for WMI on Windows machines. This can be any port. Ensure that the MID Server application host machine has access to the targets on all ports due to the unique nature of the WMI requirements.

- **Windows PowerShell**: PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. Orchestration uses PowerShell to run Workflow activities on Windows machines. PowerShell must be installed on any MID Server that executes these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1. Orchestration activities for PowerShell require a credentials **Type** of Windows.

- **SNMP - Network**: For network devices, Discovery uses an SNMP scan to get device specific MIBs and OIDs. SNMP is a common protocol used on most routers, switches, printers, load balancers and various other network enabled devices. Use a **community string** (password) for authentication when scanning a device via SNMP. Many devices have a default community string of **public** which Discovery uses by default when querying a target. Define additional community strings in the **SNMP credentials** form which are tried in succession, along with **public**, until a successful query returns. In addition to the credentials, the platform also requires the ability to make SNMP requests on port 161 from the MID Server to the target. If Access Control Lists (ACLs) are in place to control the IP addresses that can make these queries, ensure that the IP address of the MID Server is in the ACL. Discovery supports SNMP versions 1, 2c, and 3.

- **WBEM**: Web-Based Enterprise Management (WBEM) defines a particular implementation of the Common Information Model (CIM), including protocols for discovering and accessing each CIM implementation. WBEM requires either of two ports, 5989 or 5988 and uses the HTTP transport protocol. WBEM supports SSL encryption and uses CIM user name/password credentials.
Discovery launches a WBEM port probe to detect activity on the target ports and to append gathered data to a classification probe that explores CIM Servers.

## Installing the MID Server

Download and install the MID Server on the host machine, test the connection, and then validate the MID Server. Use the manual procedures or the guided setup. Set up multiple MID Servers for load balancing and domain separation. These procedures prepare it for use with any application.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**Prerequisites:** Ensure the MID Server system requirements and MID Server connection prerequisites are met before you install the MID Server manually or use the guided setup utility.

**MID Server manual installation**

The manual process requires these setup tasks, performed in the order shown here:

1. Create the MID Server user account and grant the appropriate role to this user.
2. Download the installer file for the host machine.
3. Install the MID Server on a Linux or Windows host.
4. **Validate the MID Server** to ensure that it is trusted to access credentials used by the instance for automations.

5. **Test connectivity** between the MID Server and the instance for automatic upgrades.

6. Optionally, **deploy multiple MID Servers** in your network for load balancing or when domain separation is enabled.

**MID Server guided setup**

Alternatively, the MID Server Guided Setup streamlines the process and allows you to set up a basic MID Server quickly.

**Create the MID Server user and grant the role**

To communicate with the instance, MID Servers need a user ID and the appropriate role. Create the user ID for a MID Server and grant the ID the `mid_server` role. To prevent MID Server validation failure, the system runs business rules to monitor the settings selected for MID Server users.

**Before you begin**

Role required: admin

---

1. **Ensure that the MID Server can connect to elements inside and outside your network**

2. **Download and install the MID Server on a Linux or Windows host**

3. **Configure your MID Server**

4. **Configure MID Server security**

5. **Ensure that the MID Server can connect to elements inside and outside your network**

6. **Download and install the MID Server on a Linux or Windows host**

7. **Configure your MID Server**

8. **Configure MID Server security**
About this task
The MID Server connects to an instance by using the SOAP web service. To allow authentication with the instance, create a separate user account for each MID Server or share the same account across multiple MID Servers. Grant each MID Server user the mid_server role, which is required for the MID Server user on any instance on which basic authentication is enabled. The mid_server role allows the MID Server to access protected tables when strict SOAP security is in place. The system adds the necessary SOAP roles automatically with this role.

⚠️ Note: The strict SOAP security feature, enabled by default for any instance that uses basic authentication, protects all tables with Access Control Lists (ACL).

Procedure
1. From the instance, navigate to User Administration > Users.
2. Click New.
3. Complete the fields in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User name for the MID Server user. This name is specified in the mid.instance.username parameter of the configuration file that the MID Server installer creates. For details, see MID Server parameters.</td>
</tr>
<tr>
<td>First name</td>
<td>The user's first name.</td>
</tr>
<tr>
<td>Last name</td>
<td>The user's last name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the MID Server user. This password is specified in the mid.instance.password parameter of the configuration file that the MID Server installer creates.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
5. Under the Roles related list, click Edit.
6. Select the mid_server role for this user. Each MID Server account must have this role to access protected tables.
7. Click Save.
8. Confirm that the MID Server account was created successfully and the account has connectivity to the instance.

   a. On the host machine where you intend to install the MID Server, open a browser and navigate to the instance.

   b. Use your new MID Server user credentials to log in. If the login is successful, then any MID Servers you install on that host will be able to connect to the instance.

**MID Server role validation**

Real-time system validation of MID Server role assignments prevents incompatible settings.

To prevent MID Server validation failure and ensure that your MID Server is configured correctly, the system runs several business rules that monitor the roles and settings you select for your MID Server user. The instance displays a warning and blocks the change when you attempt to save an incompatible configuration.

**Elevated privileges not permitted**

The mid_server role cannot be configured for elevated privileges. The **Invalid MID Server settings** business rule runs on the Role [sys_user_role] table and prevents the *elevated_privileges* field from being set to true for the mid_server role.

**Warning for elevated privileges on the mid_server role**

![Warning for elevated privileges on the mid_server role](image)

**Relationship table protection**

The User Role [sys_user_has_role] table creates the relationship between the User [sys_user] and the Role [sys_user_role] tables.
• **Incompatible role**
  The mid_server and security_admin roles are incompatible and cannot be assigned to the same user. The system determines the user's current role and runs the **Security Admin incompatible with MID** business rule on the User Role [sys_user_has_role] table. This rule prevents an administrator from adding the security_admin role for a user who currently has the mid_server role.

<table>
<thead>
<tr>
<th>User</th>
<th>Tyree Courrege</th>
</tr>
</thead>
<tbody>
<tr>
<td>A user cannot be granted both the mid_server and security_admin roles</td>
<td></td>
</tr>
<tr>
<td>'security_admin' role assignment rejected</td>
<td></td>
</tr>
</tbody>
</table>

• **Incompatible user role and user record settings**
  The **Incompatible MID Server user role** business rule runs on the User Role [sys_user_has_role] table to protect its data from incompatible configurations. Validation for this related table ensures that an administrator cannot assign the mid_server role to a user who already holds the security_admin role.

**What to do next**

Download the MID Server files for your operating system.

**Download the MID Server files**

Download the MID Server installer package through the instance and make it available for installation on the host. Allow the local network to access the authorized IP addresses to ensure that you can download the installation package and receive automatic upgrades.

**Before you begin**

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
The IP address of the MID Server download site (install.service-now.com) can change without notice. To ensure that you can download the MID Server installation package and receive automatic MID Server upgrades, allow local network access to these IP addresses:

- 149.96.5.98
- 149.96.6.98

⚠️ Note: Download the MID Server first and then enable Discovery, Orchestration, or any integration that requires the use of the MID Server.

Procedure
1. On the ServiceNow instance, navigate to **Mid Server > Downloads**.
2. Select and download the MID Server for the appropriate operating system. For the best performance, install the 64-bit MID Server for your operating system.
Note: ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 6
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

MID Server downloads

3. Save the download file to a temporary file on the local drive.
4. Move the file into the designated MID Server folder you create for your operating system and run the installer from that location.

What to do next
You can manually verify the signature of an installation package with the jarsigner tool to ensure its authenticity. For more information about verifying the signature, see the MID Server upgrades section on manual verification.

Install the MID Server on the host computer.

- Linux
- Windows
Install a MID Server on Linux

Install MID Servers with the MID Server installer and verify it is active. The package includes an installer that automatically configures JRE to run in the environment. The MID Server can use an existing JRE rather than the provided JRE. Uninstall the MID Server to redeploy it.

Before you begin
Verify that the host computer satisfies the MID Server system requirements.
Role required: admin, mid_server

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
To install Linux on MID Server, the RedHat/CentOS systems require RPM while Debian (Ubuntu) systems require DEB. The default installation location is /opt/servicenow/mid. Installing DEB in user defined directories is not supported.

To improve security, this procedure installs the MID Server as a non-root user. A non-root user can manage a service only if they have the required permissions. For more details, see PolicyKit issues with Linux MID Servers using non-admin accounts [KB0815542].
Note: ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 6
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

Java 11 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 11 to run in your environment. No additional configuration is required. This version supports both 64-bit and 32-bit Windows MID Servers, and 64-bit Linux MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 11.0.8. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

Note: Linux MID Servers require glibc version 2.17. The library must be updated for JRE 11. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: yum install glibc.i686

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0.231 requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442]. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.
Procedure

1. On the instance, navigate to MID Server > Download and download either the MID Server installer RPM file for RedHat/CentOS or the DEB file for Debian (Ubuntu) systems.

   ![Download screen](image)

   **Note:** Use the copy link button to copy the download link and use the following `wget` command to directly download the installers in Linux machines.

   ```
   wget <copied link of the installer>
   ```

2. **Optional:** Manually verify the authenticity and integrity of the downloaded file.

   a. Download the signature ZIP files for RPM/DEB.

   b. Run the following commands for either RPM or DEB.

   (Optional) **RPM**

   - Extract the public key, `ServiceNow_Digicert_DGST.pem`, and signature file from the downloaded signature zip file.

   - Run the following command to verify the signature of the RPM file.

   ```
   openssl dgst -sha256 -verify <Extracted .pem file> -signature <Extracted bin file path> <RPM file path>
   ```

   **DEB**

   - Extract the public key, `ServiceNow_Digicert_Public.gpg`, from the downloaded signature zip files.

   - Import the public key and verify the signature of the DEB file with the following commands.

   ```
   gpg --import <public key>
   dpkg-sig --verify <DEB file path>
   ```

3. Use the following commands to install either the RPM or DEB installer:
RPM

• Install the RPM package for RedHat systems with the following command:

  ```bash
  sudo rpm -ivh --nodeps package_name.rpm.
  ```

• Install the RPM package for RedHat systems in a user defined location with the following command:

  ```bash
  sudo rpm -ivh --nodeps package_name.rpm --prefix=/path/to/user/directory.
  ```

DEB

• Install the DEB package for Debian systems with the following command:

  ```bash
  sudo dpkg -I package_name.deb.
  ```

4. To configure the MID Server service, run the following command from the agent/bin folder as root and provide the required inputs.

  ```bash
  ./installer.sh
  ```

5. The `installer.sh` script takes the following inputs.

   **Instance URL**
   Enter the full URL of your instance, for example: `https://mycompanyinstance.service-now.com`

   **MID-Server Username**
   Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.

   **MID-Server Password**
   Set the password for the current MID Server user.

   **MID-Server Name**
Set the name of the MID Server.

Proxy Server Information (optional)

**mid.proxy.use_proxy**
Enables the MID Server to use a web proxy to access the ServiceNow instance.

**mid.proxy.host**
Set this parameter to define the web proxy's host.

**mid.proxy.port**
Set this parameter to define the web proxy's port.

**mid.proxy.username**
If the web proxy requires a user name, set this parameter to define that username.

**mid.proxy.password**
If the web proxy requires a password, set this parameter to define that password.

To run a MID Server as a daemon service, the following properties are also required.

**app_name**
Set a unique name for the current MID Server.

**app_long_name**
Set a unique long name for the MID Server.

**run_as_user**
Set the username to run the service as a non-root user.

**Results**
Once all the inputs are entered, the MID Server automatically runs as a daemon service and starts the service.

**Linux MID Server silent installation**
Silently installing the MID Server uses predefined parameters and requires no user input after it is initiated. You can use silent installation on several machines at once to quickly set up a network and to ensure all MID Servers have the same installation settings.

To perform a silent installation with the Linux installer, run the following command:
The following fields can be passed through the command line:

**INSTANCE URL**

Enter the URL of your instance, for example: https://mycompanyinstance.service-now.com

**MUTUAL_AUTH**

Set this value to Y to use mutual authentication instead of basic authentication. Otherwise, set it to N.

*Note:* If MUTUAL_AUTH = Y then provide the path to the certificate with CERTIFICATE_PATH.

**CERTIFICATE_PATH**

If mutual authentication is enabled, provide the path to the certificate.

**MID_USERNAME**

Enter the user name of the MID Server user that you already created. The MID Server user must have the mid_server role.

**MID_PASSWORD**

Enter the password for the user.

**USE_PROXY**

Set this value to Y if your MID Server communicates through a proxy to connect to the instance.

*Note:* If USE_PROXY = N then skip the other proxy details.

**PROXY_HOST**

Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example: proxyserver.domain.com is correct, but https://proxyserver.domain.com is incorrect.

**PROXY_PORT**

Enter the port the proxy server uses to communicate. If this value is blank, the installer uses the proxy server’s default port number.

**PROXY_USERNAME**

Enter the username that has administrator rights to the proxy server.
**PROXY_PASSWORD**

Enter the password for the username.

**MID_NAME**

Enter the MID Server name.

**APP_NAME**

Provide the service name. It must be unique for the current MID Server.

**APP_LONG_NAME**

Provide the service long name.

**NON_ROOT_USER**

Provide the username to run the service as a non-root user.

The following is an example command for a MID Server which uses a proxy and mutual authentication:

```
./installer.sh -silent -INSTANCE_URL https://instance_name.service-now.com MUTUAL_AUTH
Y -CERTIFICATE_PATH <path-to-certificate> -USE_PROXY Y -PROXY_HOST <ip> -PROXY_PORT
(port) -PROXY_USERNAME <username> -PROXY_PASSWORD <password> -MID_NAME proxymid -APP_NAME
proxymid -APP_LONG_NAME servicenow_proxy_mid -NON_ROOT_USER nonrootuser
```

⚠️ **Note:** To reconfigure the MID Server, run the installer.sh command again. Reconfiguring the MID Server deletes the old configuration.

---

**Run Linux MID Servers as non-root users**

Run MID Servers as non-root user on a Linux machine to improve security. Multiple MID Server can be installed as services so they can start by themselves after system reboots.

**Before you begin**

Role required: root

This process is only applicable if you installed the MID Server manually using the ZIP file. If you installed the MID Server with the procedure in Install a MID Server on Linux, then the MID Server is already running as a non-root user.

Supported versions for this procedure are Linux Red Hat 6 or newer, Ubuntu 1404 or newer, and CentOS 6 or newer.
Procedure

1. Stop any MID Server running on the host with the command `bin/mid.sh stop`.
2. Remove any MID Servers on the host with the command `bin/mid.sh remove`.
3. Edit the file `mid.shconf_override`.

```
# To put any changes into effect, re-install the service using the commands
# bin/mid.sh stop then bin/mid.sh remove followed by bin/mid.sh install

# Uncomment the lines below and set some name for the current MID server.
# This allows multiple MID Servers to run as a service on the same host.
#APP_NAME=“this_mid_app_name”
#APP_LONG_NAME=“this_mid_long_app_name”

# Put a username here to run the service as a non-root user.
# The specified user will be the owner of the entire agent directory.
# If left empty, the owner is unchanged.
RUN_AS_USER=

# Put a group name here that will be the group owner of the entire agent directory.
# If left empty, the group is unchanged.
GROUP_NAME=

# Set a flag to control whether the script will prompt for confirmation before
# changing the owner or group of the agent directory
PROMPT_BEFORE_OWNERSHIP_CHANGE=true
```

4. Add the MID Server's name using the lines `APP_NAME=` and `APP_LONG_NAME=` to run it as a service.
   To prevent errors, the `APP_NAME` of each MID Server must be unique.

5. **Optional:** To run multiple MID Servers as services on the same host, add an `APP_NAME` and `APP_LONG_NAME` for each instance.
6. Add the name of the non-root user to operate the account using the line `RUN_AS_USER=`.

7. Optional: Add the name of the group to own the entire agent directory using the line `GROUP_NAME=`.

8. Set the line `PROMPT_BEFORE_OWNERSHIP_CHANGE=` to `true` to prompt the user for confirmation before any changes to file permissions are applied. The file permission change is applied to the entire agent folder and everything inside recursively. The changes include blocking other users’ access to the entire agent folder, changing the owner to `$RUN_AS_USER` if specified, and changing the group to `$GROUP_NAME` if specified.

9. Reinstall the MID Server with the command `bin/mid.sh install`.

*NNote:*
To prevent errors, make sure to stop and remove any existing MID Server services before starting new ones. During the first installation, a root user is required to call `bin/mid.sh install`. Reinstalling the MID Server applies the changes in `mid.shconf_override`. Then the non-root user specified in `mid.shconf_override` is able to start/stop/restart the service without elevated privileges.

**What to do next**
For more information about managing the allow list and file permission enforcement, see [File permission enforcement for Windows MID Servers](#). Running a Linux MID Server with a non-root account may result in issues with PolicyKit in some systems. See [PolicyKit issues with Linux MID Servers using non-root accounts](#) for more information.

**Configure a Linux MID Server to use an existing JRE**
You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

**Before you begin**
Ensure that your JRE version is supported. See [MID Server system requirements](#) for details.
Role required: admin

About this task
By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

Procedure
1. Navigate to this file in the MID Server installation directory:
   agent/conf/wrapper-override.conf
2. To specify the existing Java executable that you want to use, add this line to the file:
   wrapper.java.command={your_java_executable}
   For more information, see the Java service wrapper property documentation.
3. Save the file.

Uninstall a Linux MID Server
The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.

Before you begin
Role required: admin

Procedure
Run the uninstall.sh script in the agent folder to remove the service and uninstall the RPM/DEB.

```
[centos761810:/opt/servicenow/mid-agent]# ./uninstall.sh
Uninstalling MID Server RPM package : agent-19.itomqcopper.0.268-172.el7.x86_64
Preparing packages...
Running 'mid.sh remove' to uninstall MID server
Detected RHEL or Fedora:
Stopping servicenow_mid_server_silentMId...
Waiting for servicenow_mid_server_silentMId to exit...
Stopped servicenow_mid_server_silentMId.
Removing servicenow_mid_server_silentMId daemon from systemd...
Removed symlink /etc/systemd/system/multi-user.target.wants/silentMId.service.
agent-19.itomqcopper.0.268-172.el7.x86_64
[centos761810:/opt/servicenow/mid-agent]# 
```

Results
The MID Server service is uninstalled.
What to do next

Validate the MID Server to prepare it for use.

Install a MID Server on Windows

Install MID Servers with the MID Server guided Windows installation package. The package includes an installer that automatically configures OpenJDK to run in the environment. The MID Server can use an existing JRE rather than the provided OpenJDK. Uninstall the MID Server to redeploy it.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

- Verify that the host computer satisfies the MID Server system requirements.
- The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1.
- Ensure that the Microsoft Application Experience Lookup Service is enabled on the MID Server host. If this service is disabled, the MID Server auto-upgrade might fail, causing the MID Server to go down. For information on managing issues with the Application Experience service, see KB0597552.

Java 11 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 11 to run in your environment. No additional configuration is required. This version supports both 64-bit and 32-bit Windows MID Servers, and 64-bit Linux MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The
MID Server requires a minimum JRE version 1.8.0_161, and recommended version 11.0.8. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

抬注: ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 6
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442]. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.

Upgraded MID Servers might use different Java versions depending on their operating system versions.

- MID Servers upgraded from earlier versions use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.
- The JRE version is not upgraded when upgrading 32-bit Linux MID Servers or Linux with glibc versions lower than 2.17. The MID Server will continue to use earlier the earlier version of JRE, such as 1.8.0_231.
- MID Servers upgraded on any other operating system versions also automatically upgrade the JRE to the version provided with the installation package.

Install a MID Server on Windows with guided installation

Install MID Servers with the MID Server guided Windows installation package. The package includes an installer that automatically configures OpenJDK to run in the environment.
Before you begin
Role required: admin or mid_server

About this task
The MID Server guided native Windows installer will configure the MID Server with provided settings. The installer creates the MID Server Service and assigns it to the provided user. The installer sets the file permissions on the MID Server Install folder. The installer allows for the configuration of proxy settings. Optionally, the installer can start the MID Server automatically.

Procedure
1. On the instance, download the MID Server installation .msi file from MID Server > Download.
2. Log in to the Windows host machine where you want to install the MID Server.
3. Place the installer .msi on the desired MID Server host.
4. Open the installer with Administrator level privileges.
5. Use the installer to enter the following information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Type</td>
<td><strong>Basic</strong> Username and password based authentication.</td>
</tr>
<tr>
<td></td>
<td><strong>Mutual</strong> Client certificate based authentication. See MID Server unified key store for more information on mutual authentication.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Selecting mutual authentication disables the MID Server username and password fields. The disabled fields are not written to config.xml.</td>
</tr>
<tr>
<td>ServiceNow instance URL</td>
<td>Enter the full URL of your instance, for example:</td>
</tr>
<tr>
<td></td>
<td><a href="https://mycompanyinstance.service-now.com">https://mycompanyinstance.service-now.com</a></td>
</tr>
<tr>
<td>ServiceNow MID Server username</td>
<td>Enter the name of the MID Server user that you already created. The MID Server user must have the mid_server role.</td>
</tr>
<tr>
<td>ServiceNow MID Server password</td>
<td>Enter the password for the user in the ServiceNow MID Server username.</td>
</tr>
<tr>
<td>Use proxy</td>
<td>Select this check box if your MID Server communicates through a proxy to connect to the instance.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>Proxy host</td>
<td>Enter the proxy server host name or IP address. Do not include the protocol in the host name. For example, enter</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Proxy port</td>
<td>Enter the port through which the proxy server communicates. If you leave this field blank, it should use the proxy server's default port number.</td>
</tr>
<tr>
<td>Proxy username</td>
<td>Enter the user name that has administrator rights to the proxy server.</td>
</tr>
<tr>
<td>Proxy password</td>
<td>Enter the password for the user name.</td>
</tr>
</tbody>
</table>

6. Click **Test your connection** to validate the credentials and instance information. If you encounter any errors, verify the information that you input.

7. Click **Next**.

8. Configure the MID Server name and Service Account parameters (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server name</td>
<td>Enter a MID Server name.</td>
</tr>
<tr>
<td></td>
<td><strong>CAUTION:</strong> MID Server names cannot begin with <code>mid.server</code>.</td>
</tr>
<tr>
<td>Service Account Name</td>
<td>Username of the service account that will be used to run the MID Server service. For information on creating service accounts, see Create a Windows service account with &quot;Log on as Service&quot; [KB0867669]. The name can follow 3 formats.</td>
</tr>
<tr>
<td></td>
<td><strong>a.</strong> If the service account is local to the computer, you can give just the name.</td>
</tr>
<tr>
<td></td>
<td>• Example: <code>My_Local_Service_Account</code></td>
</tr>
<tr>
<td></td>
<td><strong>b.</strong> If the service account is local to the computer, you can provide &quot;.&quot; as the domain name for the account.</td>
</tr>
<tr>
<td></td>
<td>• Example: <code>.\My_Local_Service_Account</code></td>
</tr>
<tr>
<td></td>
<td><strong>c.</strong> Any account can follow the format <code>{domain}\{username}</code>.</td>
</tr>
<tr>
<td></td>
<td>• Example: <code>MY-COMPUTER-DOMAIN\My_Domain_Service_Account</code></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note:</td>
<td>The provided service account credentials must meet the following requirements in addition to being a valid account.</td>
</tr>
<tr>
<td></td>
<td>• The user cannot be a local system or an administrator level account (local admin, domain admin, etc.)</td>
</tr>
<tr>
<td></td>
<td>• The service account provided has the <code>log on as service</code> right, which is required for an account to be used as the <code>log on user</code> for a service.</td>
</tr>
<tr>
<td>Service Account Password</td>
<td>Password of the service account that will be used to run the MID Server service.</td>
</tr>
<tr>
<td>Set Service Name Manually</td>
<td>Select this check box if you want to manual set the service name and display name for your MID Server.</td>
</tr>
<tr>
<td></td>
<td>Note: Your proxy server must use Basic Authentication for the MID server to connect to the instance.</td>
</tr>
<tr>
<td>MID Service wrapper name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>snc_mid_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
<tr>
<td>MID Server wrapper display name</td>
<td>Modify this field if necessary. It is populated automatically by prefixing <code>ServiceNow MID Server_</code> to the MID Server name. In most cases, you do not need to modify this.</td>
</tr>
</tbody>
</table>

9. Click **Next** and select a destination folder for the installation.
Users can manually enter an existing, valid file path, or use the “Change” button to open up a browsing page where they can choose the install location.

10. Click **Next** to view the summary.

![Review MID Server Configuration](image)

Select **Start MID Server after installation** if you want to start the MID Server immediately after installation. If you wish to make additional configuration changes, before starting the MID server, leave this box unchecked. If mutual authentication was selected, the MID Server username and password fields are removed.

![Review MID Server Configuration](image)

**Note:** If the MID Server fails to start, the cause might be a duplicate name or multiple services that point to the same executable path. This can happen when you have MID servers previously not installed through the installer. See [MID Server fails to start](#) for details.

11. Click **Mid Servers List Page.**

The installer opens the MID Server list from your instance.

12. Select the MID Server name from the list.

**Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.
The system displays the MID Server record.

13. From Related Links, click Validate. The MID Server Validated changes to Yes.

What to do next
To upgrade the MID Server, see MID Server upgrades for procedures and requirements.

Uninstall a Windows MID Server with the guided installer
The MID Server guided native Windows installer also supports guided uninstallation of the MID Server.

Before you begin
Role required: admin
There are three ways to uninstall a MID Server after installing it with the guided native Windows installer.

Procedure
1. On the MID Server host, navigate to the Control Panel > Programs > Programs and Features > Uninstall a program.
   a. Uninstall the program with the MID Server's name.

2. Optional: Alternatively, navigate to Settings > Apps
   a. Uninstall the program with the MID Server's name.

3. Optional: The MID Server can also be uninstalled with the silent uninstall script. This is useful for uninstalling multiple MID Servers. For more information, see Windows MID Server silent installation and uninstallation

Configure Windows MID Server service credentials
MID Server service credentials are required to manage the MID Server service on the host machine, including its ability to successfully auto-upgrade.

About this task
If you installed the MID Server using the native installer, you will not need to complete this procedure. However, to change the service user after the installation for any reason, use this procedure.

Windows service credentials control the level of privilege on the device. The user should not be a local system or an administrator level account (local admin, domain admin, etc.) The service account provided should have the log on as
service right, which is a requirement for an account to be used as the log on user for a service.

Note:
Windows service credentials are not the same as the MID Server user credentials, which allow communication between the MID Server and the instance. You must configure both of these credentials separately. See Create the MID Server user and grant the role for instructions on MID Server user credentials.

Procedure
1. Open the Windows Services console.
2. Double-click the ServiceNow <MID Server name> service for each MID Server.
3. Select the Log On tab.
4. Choose a non-admin user and provide the password for that user.
5. In the General tab, set the Startup type. The field is set to Automatic by default.
6. Click OK.
7. Restart the ServiceNow <MID Server name> service, and make sure that ServiceNow\<MID Server name>\agent\logs\agent0.log does not have error messages. If the MID Server does not start, see the ServiceNow knowledge article Review the agent log for MID Server errors (article KB0535148).
8. On the instance to which this MID Server is connected, navigate to MID Server > Servers. If Discovery is installed, alternately navigate to Discovery > MID Servers.

All MID Servers connected to this instance are listed.
9. Make sure that the Status of the MID Server you just installed is Up.

Windows MID Server silent installation and uninstallation
Silently installing the MID Server uses predefined parameters and requires no user input after it is initiated. You can use silent installation on several machines at once to quickly set up a network and to ensure all MID Servers have the same installation settings.

MID Server silent installation

Note: All silent install/uninstall commands must be run with administrator level privileges.
To silently install the MID Server on a Windows system, download the script attached to the Knowledge Base article Windows MID Server silent installation and uninstallation. Place the file on the target MID Server host machine and run the following command from the command prompt. You can also run the script directly from powershell.

```
powershell -command ".\SilentInstall.ps1 -<parameter_name1> '<value for parameter1>' -<parameter_name2> '<value for parameter2>' etc..."
```

The script checks the following mandatory parameters:

- **MSI_FILE_NAME**: the name of the MSI file used for the installation.
- **INSTALL_LOCATION**: the location to install the MID Server.
- **MID_INSTANCE_URL**: the target ServiceNow instance the MID Server will connect to.
- **MID_USERNAME**: the instance account name.
- **MID_PASSWORD**: the instance account password.
- **MID_NAME**: the name of the MID Server.
- **SERVICE_ACCOUNT_NAME**: the name of the service account.
- **SERVICE_ACCOUNT_PASSWORD**: the password of the service account.

The following parameters are optional:

- **LOG_NAME**: enables logging and puts logs into the file named by this parameter.
- **START_MID**: sets the MID Server to start automatically after the installation finishes.
- **USE_PROXY**: enables the use of a proxy. If you choose this command, the following parameters become mandatory:
  - **PROXY_HOST**: the name of the proxy host.
  - **PROXY_PORT**: the port number of the proxy.
  - **PROXY_USERNAME**: the proxy username. If there is no username, input "".
  - **PROXY_PASSWORD**: the proxy password. If there is no password, input "".
- **MANUAL_SERVICE_NAME**: the service name. If you choose this command, the following parameters become mandatory:
  - **SERVICE_NAME**: the service name.
  - **SERVICE_DISPLAY_NAME**: the service display name.
- **MUTUAL_AUTH**: enables mutual authentication. If this switch is enabled, **MID_USERNAME** and **MID_PASSWORD** are not required. See MID Server unified key store for more information.
Note: The parameters START_MID, USE_PROXY, MUTUAL_AUTH, and MANUAL_SERVICE_NAME are switches. They use the format -<switch_param_name> and are not followed by a value.

After the script runs, verify the MID Server files, service, and entry in Programs and Features are installed. If you enabled logging, verify the log info in the file specified by the LOG_NAME parameter.

An example MID Server silent installation command:
```powershell
powershell -command ".\SilentInstall.ps1 -MSI_FILE_NAME 'MID-Installer.msi' -INSTALL_LOCATION 'C:\Users\Administrator' -INSTANCE_URL 'https://my-instance-name.service-now.com' -MID_USERNAME 'mid_server' -MID_PASSWORD 'mid_password' -MID_NAME 'Silent_Install_MID' -SERVICE_ACCOUNT_NAME 'DOMAIN\My_Service_Account' -SERVICE_ACCOUNT_PASSWORD 'Service_Account_Password' -LOG_NAME 'Silent_Install_Log.txt'"
```

An example command using the START_MID switch:
```powershell
powershell -command ".\SilentInstall.ps1 -MSI_FILE_NAME 'MID-Installer-Wix.msi' -INSTALL_LOCATION 'C:\Users\Administrator' -INSTANCE_URL 'https://my-instance-name.service-now.com' -MID_USERNAME 'DOMAIN\My_Service_Account' -MID_PASSWORD 'mid_password' -MID_NAME 'Silent_Install_MID' -SERVICE_ACCOUNT_NAME 'DOMAIN\My_Service_Account' -SERVICE_ACCOUNT_PASSWORD 'Service_Account_Password' -LOG_NAME 'Silent_Install_Log.txt' -START_MID"
```

MID Server silent uninstallation
To silently uninstall the MID Server on a Windows system, download the script attached to the Knowledge Base article Windows MID Server silent installation and uninstallation. Then run the script using the command prompt. It can also be run directly from powershell.
```powershell
powershell -command " SilentUninstall.ps1 -MID_NAME '<value for MID_NAME>' -LOG_NAME '<value for LOG_NAME>'"
```

The script requires the mandatory parameter:

• **MID_NAME**: the name of the MID Server you want to uninstall.

The following parameter is optional:

• **LOG_NAME**: enables logging of the uninstallation and puts logs into the file named by this parameter.
After the script runs, verify the MID Server files, service, and entry in Programs and Features are uninstalled. If you enabled logging, verify the log info in the file specified by the **LOG_NAME** parameter.

An example MID Server silent uninstall command:

```
powershell -command ".\SilentUninstall.ps1 -MID_NAME 'silent_install_cmd' -LOG_NAME 'uninstall.txt'
```

**Manually install a MID Server on Windows**

Install MID Servers with the ZIP file installation package and verify it is active.

**Before you begin**

Role required: admin or mid_server

**About this task**

Click this link to view the installation video: Installing the MID Server on Linux

**Procedure**

1. Log in to the Windows host machine where you want to install the MID Server.
2. Create a folder for the MID Server on the top level of the drive such as `ServiceNow\MID Server1`.
3. Download the MID archive file into the new folder.
4. Right-click the archive and select **Extract All**.
5. Navigate to the `service-now\<mid server name>\agent` folder that was created when the file was extracted.
6. To configure the MID Server manually, edit the `config.xml` file with a text editor such as WordPad:

   a. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` element and change the value to the URL of your instance.

   b. Enter the MID user credentials in the `mid.instance.username` and `mid.instance.password` parameters.

   By default, the MID Server, uses basic authentication for SOAP messages. The password value is also encrypted authentication.
c. Optional: Find the `<parameter name="name" value="YOUR_MIDSERVER_NAME_GOES_HERE" />` element and change the value for the MID Server name.

d. Optional: Enter connection information for the proxy server. Remove the appropriate comment tags from the proxy configuration information.

Example
For example, you can configure these parameters:

- `mid.proxy.use_proxy`
- `mid.proxy.host`
- `mid.proxy.port`
- `mid.proxy.username`
- `mid.proxy.password`

7. Run `start.bat` to start the MID Server.

8. On the instance, in the Related Links, select Validate. The MID Server Validated changes to Yes.

Run a Windows MID Server as a non-admin after manual installation

MID Servers can be configured to run using non-administrative accounts. Using non-admin accounts in conjunction with file permission enforcement can improve security by restricting access to MID Server files.

Before you begin
Role required: admin

Note: In a future release, non-admin accounts will be mandatory for the MID Server, and support for using an administrative account will be deprecated.

This procedure is only for users who install the MID Server using the ZIP file. The Windows MID Server installer already requires the MID Server run as a non-admin user. As part of the MID Server installer’s installation process, the access control lists for the MID Server folder are restricted to the following users and groups.

- System
- Administrator
- The configured service account
When installing using the ZIP file, install the MID Server on a Windows machine using an administrator account. Create a Windows user account without administrative privileges.

Running a MID Server with a non-admin account has limitations and changes the behavior of other applications. The following behavior changes can occur:

- The MID Server account needs appropriate credentials to run a Discovery schedule. If the credentials are insufficient, the MID Server falls back to the user account's privileges. A non-admin user account may not have the necessary privileges to access the Discovery target.
- Enhanced Application Dependency Mapping (ADME) and File Based Discovery (FBD) may not work by default. To correct this issue, non-admin users need to be given permission to read/write to the Admin Share folder.
- Non-admin accounts cannot initiate upgrade services in versions prior to the Orlando release.

**Procedure**

1. Run the MID Server service as LocalSystem or as a user with admin rights.
2. Add the non-admin account name to the MID Server parameter `mid.windows_host.file_permissions.allow_list` in the MID Server host's `config.xml` file.
   This step adds the non-admin account to the allow list.
   See [MID Server parameters](#) for more information about `mid.windows_host.file_permissions.allow_list` as well as instructions for adding a parameter to the `config.xml` file.
3. Restart the MID Server.
   The new file permission enforcement rules take effect when the MID Server starts.
4. Switch the MID Server to the non-admin service account.
5. Restart the MID Server.

**What to do next**
For more information about managing the allow list and file permission enforcement, see [File permission enforcement for Windows MID Servers](#).

**Uninstall a Windows MID Server after manual installation**
The MID Server runs as a stand-alone service. You can remove a stand-alone MID Server service to accommodate such tasks as redeploying the MID Server to another host machine or changing the unique name of a MID Server when deploying multiple MID Servers.
Before you begin
Role required: admin
This procedure is only for users who install the MID Server using the ZIP file.

Procedure
1. Stop the running MID Server service, using either of these procedures:
   - **Windows command line**: From the MID Server home (agent) directory, run `stop.bat`.
   - **Windows Services console**: From the Windows Services console, right-click the ServiceNow MID Server name and then select stop.
2. From a command prompt, go to the `\agent\bin` directory in the MID Server installation directory and double-click the `UninstallMID-NT.bat` file.

What to do next
Validate the MID Server to prepare it for use.

Configure a MID Server on Windows to use an existing JRE
You can choose to use an existing JRE for your MID Server rather than the OpenJDK provided with the MID Server installer.

Before you begin
Ensure that your JRE version is supported. See MID Server system requirements for details.

Role required: admin

About this task
By electing to use your own JRE, you are responsible for upgrading it as necessary. For a detailed procedure and cautions regarding changing the JRE, see KB0778272.

Procedure
1. Navigate to this file in the MID Server installation directory:
   `agent/conf/wrapper-override.conf`
2. To specify the existing Java executable that you want to use, add this line to the file:
   `wrapper.java.command={your_java_executable}`
   For more information, see the Java service wrapper property documentation.
3. Save the file.
Validate the MID Server

You must manually validate the MID Server after it is installed to enable it to execute automation tasks. You can invalidate a MID Server you suspect has been compromised to prevent it from accessing automation credentials in the instance or executing outbound ECC probes.

Before you begin
Role required: agent_admin, admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Make sure that the MID Server version is compatible with the instance.

About this task
Validation restricts access to automation credentials to trusted MID servers only. When you validate a MID Server, you specify the capabilities it can use, the applications that use it, and the IP ranges it is allowed to explore. You will be prompted to set the initial selection criteria when you validate MID Servers that do not already have capabilities, applications, or IP ranges already configured. You do not have to set the initial selection criteria to actually validate the MID Server. See MID Server selection for more information on capabilities, applications, and IP ranges.
Note: When you upgrade, MID Servers that are already configured in your instance are automatically validated. This prevents the interruption of automation tasks that MID Servers might be performing. See MID Server upgrades for more information.

Procedure

1. Navigate to MID Server > Servers.
2. Open the new MID Server you created from the list of MID Servers.
3. Under Related Links click Validate.
   The Set Initial Selection Criteria window appears if there are no records in the Supported Applications, IP Ranges, or Capabilities related lists.
4. On the Set Initial Selection Criteria window, use the switches to enable or disable selection criteria for this MID Server:
   • Allow ALL capabilities: Allow all capabilities for Orchestration and Event Management to use this MID Server.
     Note: Service Mapping and Event Management alert aggregation and RCA, which used capabilities in previous releases, rely on the application for MID Server selection.
   • Allow ALL applications: Allow all applications that use MID Servers to use this MID Server.
   • Allow ALL IP ranges: Make all IP ranges valid for this MID Server, meaning that it can target any IP address.

Setting initial selection criteria

Selected MID Server(s) are now being validated.
Approve setting the initial selection criteria for each MID Server.

Allow ALL applications
Allow ALL capabilities
Allow ALL IP ranges

Note that any previous criteria will be overwritten.

Cancel OK
If you click **Cancel**, the validation continues but none of the capabilities, applications, or IP ranges are added.

5. Click **OK**.
   
The **Validated** field on the dashboard is set to **Validating**, and then set to **Yes** after the validation completes.

6. To invalidate a MID Server, open the record for the MID Server you suspect has a security issue.

7. Under **Related Links**, click **Invalidate**.
   
   Invalidating a MID Server forces it to clear its memory and restart. The MID Server generates a new keypair on restart.

**What to do next**

Test network connectivity to ensure that the MID Server can upgrade automatically.

**Related information**

Rekey a MID Server

**Test MID Server connectivity**

Confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors. Successful communication is necessary for automatic upgrades.

**Before you begin**

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
The computer that hosts the MID Server must be able to access one of these URLs to upgrade automatically:

- HTTPS: https://install.service-now.com on the default HTTPS port (443)
- HTTP: http://install.service-now.com on the default HTTPS port (80)

Procedure
1. Use PING to test connectivity with the host on the network (ping<host IP>).
2. If no ping response is returned, use TRACEROUTE to see where traffic might be stopped (traceroute<host>).
3. Use TELNET to connect to any of the TCP ports (telnet<host> <port>).
4. Use an SNMP scanning tool to determine if a potential network device is responsive.
5. Resolve the most likely issues around network connectivity:
   - Routing: Confirm that the MID Server host has network access to the IP ranges you are attempting to discover.
   - Firewalls: Confirm access to the physical firewalls that protect a large environment such as the Data Center. Confirm access to any logical firewalls that protect an individual computer. MID Server communications
are initiated inside the firewall and therefore do not require any special firewall rules or VPNs.

- **Access Control Lists (ACL):** Confirm that ACLs contain the IP addresses based list on SNMP network devices that allows communication to a particular target.

- **Resolve all issues with your network teams to better understand your topology.** Deploy additional MID Servers if necessary to help keep your network secure. Configure access from your existing MID Server host to networking components.

6. Verify that the MID Server service is running on the host:
   - **Windows:** In the Windows Services console, locate the **ServiceNow [MID Server name]** and confirm that each MID Server has the **Started Status** value.
   - **Linux:** Ensure that the **agent0.log.0.lck** appears in the **/servicenow/ MID Server name]/agent** folder.

7. After each MID Server restart, open the **agent0.log.0** and address all error messages.

8. From the ServiceNow instance, navigate to **MID Server > Servers**.

9. Review and verify that all MID Servers that are connected to the instance are listed.

10. Verify that the **Status** is **Up** for the MID Servers.

**What to do next**

This concludes the installation of a single MID Server. If necessary, continue to deploy multiple MID Servers from a single host in your network. Otherwise, begin configuring your MID Server.

**Install multiple MID Servers on a single system**

Install multiple MID Servers on the same host computer. Multiple MID Servers can support each other with load balancing, as well as use domain separation. The number of MID Servers required is determined by factors like network policies, security restraints, and the reliability of the host computer.

**Before you begin**

Role required: admin, mid_server
1. Ensure that the MID Server can connect to elements inside and outside your network

2. Download and install the MID Server on a Linux or Windows host

3. Configure your MID Server

4. Configure MID Server security

5. Ensure that the MID Server can connect to elements inside and outside your network

6. Download and install the MID Server on a Linux or Windows host

7. Configure your MID Server

8. Configure MID Server security

About this task
You can install multiple MID Servers on a Linux or Windows host or on a virtual machine. Installing multiple MID Servers may involve other setup steps depending on your network configuration.

Important: Only one MID Server service can be a daemon on a Linux host. This is a limitation of the Tanuki wrapper service.

Procedure
1. Log in to the host system or virtual machine where you want to install multiple MID Servers.

2. Create a directory for each MID Server on the top level of the drive.
   Make sure you create a unique and descriptive name for each MID Server, such as MIDServer_SMS_Int or MIDServer_Disc1.

3. Extract the downloaded MID Server archive file into each MID Server directory. When the extract completes, there should be a directory path similar to the following for each MID Server: ServiceNow\<MID Server name>\agent.

4. For each MID Server, run the installer appropriate to the host's operating system.
### MID Server installers

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Installer path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows</td>
<td>/agent/start.bat</td>
</tr>
<tr>
<td>Linux</td>
<td>/agent/installer.sh</td>
</tr>
</tbody>
</table>

5. Use the installer to enter the following information.

- URL to your instance
- User credentials to run the MID Server
- Proxy server connection details
- MID server name
- MID server service wrapper name and display name (Windows systems only)

**Note:** The MID Server user must have the `mid_server` role.

6. From the installer, click **Start MID Server**.
The local host starts the MID Server.

7. Click **Mid Servers List Page**.
   The installer opens the MID Server list from your instance.

8. Select the MID Server name from the list.

   **Note:** It may take a few seconds for the MID Server time to establish a connection with your instance.

   The system displays the MID Server record.

9. From **Related Links**, click **Validate**.
   The MID Server **Validated** changes to **Yes**.

**What to do next**
All MID Server installation procedures are complete. Proceed to **configure your MID Server**.

**Multiple MID Server deployments**
Depending upon how you use the MID Server (for an external integration, Discovery, Service Mapping, or Orchestration) and the load placed on it, you might find it necessary to deploy multiple MID Servers in your network.

Factors determining the number of MID Servers your network will require to support external applications that integrate with ServiceNow include the following:
- The security constraints in your network.
- Your network policies.
- The amount of traffic between ServiceNow and the integrations.
- The reliability of the MID Server machines.

**Network policies and security**
Security policies in your network (firewalls between network segments, for example) might make direct communication impossible between your instance and an integration's data source (JDBC, LDAP, etc.). To retrieve data for the instance, you can install a MID Server that has access to both the data source and the instance.

These network policies can determine if you need to install multiple MID Servers in your environment:
• **Access control lists (ACL):** If your security policy controls access to network devices (e.g. switches and routers) with an ACL, it might be necessary to install one or more MID Servers on a machine in the network that is already on the ACL.

• **DMZ:** Your network policy might require you to install one or more MID Servers in your DMZ to probe the devices there. This is common in networks that tightly regulate the ports that are opened on the inside firewall.

• **Probe types:** If you are conducting probes of different operating systems, your network policy might require a separate MID Server for each type of probe (e.g., one MID server for Windows WMI probes and another for SSH probes on UNIX).

**Load balancing**
Deploy multiple MID Servers where capacity is an issue, as when Discovery has to gather information about thousands of configuration items quickly. In a high volume environment, it might be necessary to deploy multiple MID Servers as load balancers for certain transactions. For example, JDBC data transfers can tie up the resources of a MID Server, making it unable to respond to other requests. The following operations between an integration might require separate MID Servers in a busy network:

- File exports
- Running scripts
- JDBC data sources
- Reading files

**High availability model**
Avoid installing MID Servers for critical integrations on a machine that might experience any type of planned outage or an outage caused by overloaded processes. If necessary for reliability, consider deploying these types of MID Servers to dedicated machines for high reliability.

⚠️ **Note:** Do not integrate with an external application on a MID Server provisioned for ServiceNow Discovery or Orchestration.

**Wide area network (WAN)**
When determining where to deploy MID Servers in a WAN, consider the bandwidth available between your local area networks. In most cases, install a MID Server on each LAN to probe devices locally, rather than deploying MID Servers that must probe devices across slow WAN connections. An alternative to this type of deployment is to install MID Servers that probe other LANs via VPN connections that take advantage of fast Internet connections. If the bandwidth
of your WAN connections is comparable to that of your Internet connection, then there is no performance impact in running MID Server probes across WAN connections.

**Domain separation**

In deployments where domain separation is enabled and domains are configured to form a hierarchy, place the MID Servers at the lowest domain level.

**Deploying MID Servers with domain separation**

Use **MID Server guided setup**

MID Server guided setup provides a sequence of tasks that help you install a MID Server with the proper user account and validate the MID Server. If you are setting up a MID Server for the first time, this is a good way to get one up and running in your environment quickly.

**Before you begin**

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
You are guided through a series of configuration activities that create a fully qualified MID Server. A progress indicator on each screen allows you to monitor your progress on each task. Each configuration activity provides the following resources to help you:

- Contextual embedded help.
- Links to comprehensive documentation on the ServiceNow product documentation site.

Important: You must complete MID Server configuration before you can launch any other IT Operations Management guided setup.

Procedure
2. Take one of the following actions:
   - If none of the MID Server installation and configuration tasks are complete, click Get Started.
   - If you have completed any of the MID Server installation and configuration tasks, click Continue to return to the task list.
Select the MID Server icon in the progress bar on the left side of the category screen to display the MID Server category pane at any time.

3. Click **Continue**.
The IT Operations Management Guided Setup category screen appears. The controls for starting the MID Server tasks are at the top of the list. These task must be completed before you can set up the other applications that rely on the MID Server.

4. In the MID Server pane, click **Get Started**.
The MID Server task list appears with a description of each task.
5. Click **Configure** to create the MID Server user and follow the instructions in the help pane that appears on the right side of the screen.

**Attention:** If you configured MID Servers manually prior to starting Guided Setup, select from that information to complete each specific task.

6. When you have provided the requested information for the MID Server user, click **Submit**, and then click **Mark as Complete** at the bottom of the help pane.

The view returns to the task list. Notice that the circular progress indicator for the category shows 33% of the MID Server configuration complete.

The progress indicator on the left side of the screen shows the completion percentage for all the IT Operations Management tasks.
7. Click **Configure** for the next task, **Download & Install MID**.

Java 11 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 11 to run in your environment. No additional configuration is required. This version supports both 64-bit and 32-bit Windows MID Servers, and 64-bit Linux MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version 11.0.8. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

8. Validate your new MID Server.

**What to do next**
If necessary, **deploy multiple MID Servers from a single host** in your network. Otherwise, proceed to **configure your MID Server**.

**Configuring MID Servers**
After installing and validating your MID Servers, ensure that they have access to sufficient system resources, probe the proper targets, and communicate with the instance as expected. Configure MID Server selection criteria, create clusters for failover protection, and set up MID Servers in different domains to protect data.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Some of these configuration procedures rely on data found in the MID Server references home page. See that page for links to the parameters, properties, and privileged commands you need to fine tune the behavior of your MID Servers. You can apply controls to individual MID Servers or to all the MID Servers in your environment. Remember to restart the MID Server after any configuration change for those changes to take effect.

**MID Server selection**

MID Servers are selected for use based on three criteria: applications, IP address or range, and capabilities. You can designate specific applications for a given MID Server, such as Discovery or Orchestration. You can specify an IP address or a range that a MID Server is allowed to work within. Some applications require specific capabilities, and so are restricted to MID Servers with those capabilities.

**MID Server selection**
Configure the way your instance selects a MID Server, either by application, IP address ranges, network capability, or behavior.

**MID Server capabilities**
Create capabilities that define the specific functions of a MID Server within an IP address range.

**MID Server IP range auto-assignment**
Configure the system to automatically assign a qualified MID Server to a subnet by that subnet's IP address range.

**Map an IP address to a DNS name**

Map host server DNS names to IP addresses if your MID Server manages resources within defined IP ranges.

**Configure MID Server as WinRM trusted host**

Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

**File permission enforcement for Windows MID Servers**

To improve security, Windows MID Servers will enforce Windows file permission restrictions. This will prevent compromised accounts from accessing unauthorized files by restricting their permissions to the minimum necessary for their role.

**MID Server clusters**

MID Server clusters are groups of MID Servers which provide support to each other in the forms of load balancing and fail-over protection. Work sent to a MID Server that is part of a cluster is automatically balanced between all the MID Servers in that cluster. MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure.

**Create a MID Server cluster**

Create a MID Server cluster for load balancing and fail-over protection.

**Set thread use**

Set the number of threads your MID Server uses for the desired MID Server speed, based on hardware capabilities and competing applications running on the host.

**Domain separation**

Domain separation segregates MID Servers based on the records they can access. The credentials configured in a MID Server's config.xml file determine which records that MID Server can read, update, or create. You can specify MID Server policy records that only MID Servers from the same domain can use.

**MID Server domain separation**

Set up your MID Servers in different domains to restrict the records and credentials that a MID Server can access.

**Synchronize a JAR file to MID Servers**
Upload a JAR file to an instance and synchronize it to all MID Servers connected to that instance. Use JAR file synchronization to create policies that only a MID Server from the same domain can use.

**MID Servers used for credential-less Discovery**
MID Servers that are used for credential-less Discovery require special configuration to run Network Mapper (Nmap) commands on target computers.

**Install and uninstall Nmap on a MID Server**
You must install Nmap on each MID Server running on a Windows host. When given the proper capability, those MID Servers can discover some basic information about CIs in your network if normal authentication fails.

**MID Server extensions**

- **vCenter event collector**
  The vCenter event collector listens for vCenter-related events and updates the CMDB accordingly. The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

- **SNMP trap collector extension**
  The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network. Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

**MID Server selection**
You can configure MID Server selection by application, IP address ranges, network capability, or behavior. Specific MID Servers can be assigned to particular tasks, or the MID Server can be selected automatically. MID Servers can use domain separation to limit the scope of discoveries and event management.
1. Ensure that the MID Server can connect to elements inside and outside your network

2. Download and install the MID Server on a Linux or Windows host

3. Configure your MID Server

4. Configure MID Server security

5. Ensure that the MID Server can connect to elements inside and outside your network

6. Download and install the MID Server on a Linux or Windows host

7. Configure your MID Server

8. Configure MID Server security

**MID Server criteria**

MID Servers offer these types of criteria that help an application determine which MID Server to use:

- **Application**: The application that you specify on the MID Server. You can designate these applications for a specific MID Server:
  - Discovery
  - Orchestration
  - Service Mapping
  - Event Management
  - Operational Intelligence
  - Cloud Management
  An **ALL** application option is also available. By default, this option includes all applications. You can **configure which applications** are included in the **ALL** designation.

- **IP address or range**: The IP address or the IP ranges that the MID Server is allowed to work within. You can specify an IP address or IP range in the application, such as on a Discovery schedule or an Orchestration activity, and for the MID Server. If the IP configured in the application matches the IP address or falls within the allowable IP range configured on the MID Server, a match is possible, and that MID Server passes this criteria. To have the instance
automatically assign IP ranges (subnets) to available MID Servers, see Using MID Server IP range auto-assignment.

- **Capabilities**: The network capability an application needs to use, such as the PowerShell Orchestration activity or the Flow Designer PowerShell step. Some applications, like Cloud Management, require a specific capability.

  Note: Discovery and Service Mapping can also use behaviors, which determine the type of port probes used during the port scan phase of Discovery. Both Discovery and Service Mapping use a behavior to discover load balancers running on Linux. Other applications do not use behaviors. Behaviors are not used for auto-selection, default MID Servers, or specific MID Servers as described below. See Discovery behaviors for more information.

### How an application selects a MID Server

If you do not specify a specific MID Server for an application to use, the application tries to select one. Each application relies on different criteria to select an appropriate MID Server.

<table>
<thead>
<tr>
<th>Application</th>
<th>Supported Application on the MID Server</th>
<th>IP address range</th>
<th>Capability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>The Discovery or ALL application must be specified on the MID Server.</td>
<td>Discovery uses IP ranges that you configure on the Discovery Schedule form to see if they fall within the IP ranges that you configure on the MID Server, or the ALL IP ranges option must be selected on the MID Server.</td>
<td>N/A</td>
</tr>
<tr>
<td>Orchestration</td>
<td>The Orchestration or ALL application must be specified on the MID Server.</td>
<td>The target IP address that you configure in an Orchestration activity must fall within the IP ranges that you configure on the MID Server.</td>
<td>The capability that is required for an Orchestration activity must match the capabilities you configure on the</td>
</tr>
<tr>
<td>Application</td>
<td>Supported Application on the MID Server</td>
<td>IP address range</td>
<td>Capability</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------</td>
<td>------------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>The <strong>Service Mapping</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The endpoint IP address must fall within the IP range that you configure on the MID Server, or the <strong>ALL</strong> option must be selected on the MID Server.</td>
<td>One of the supported Service Mapping capabilities (for new installs) must be configured on the MID Server, or the MID Server capability must be set to <strong>ALL</strong>.</td>
</tr>
<tr>
<td>Event Management</td>
<td>The <strong>Event Management</strong> or <strong>ALL</strong> application must be specified on the MID Server.</td>
<td>The IP configured in the event connector instances, such as HPOM, must fall within the IP range configured on the MID Server.</td>
<td></td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
<td>The <strong>Cloud Management</strong> or <strong>ALL</strong> capability must be added.</td>
</tr>
</tbody>
</table>

**Using a specific MID Server**

Discovery and Event Management can use a MID Server that you specifically call out.

⚠️ **Note:** Selecting a specific MID Server is not the same as specifying the default MID Server for an application. A specific MID Server is always used. If it is **Down** or not validated, the application does not execute commands against the MID Server. A default MID Server is fallback that is used when the auto-selection of MID Servers does not find any eligible MID Server.
### Application

<table>
<thead>
<tr>
<th>Application</th>
<th>How you specify a specific MID Server</th>
<th>Criteria that the default MID Server must meet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Choose the MID Server on the Discovery schedule.</td>
<td>If you select a MID Server without the <strong>Discovery</strong> or <strong>ALL</strong> application, it automatically adds the <strong>Discovery</strong> application.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>Event Management</td>
<td>Choose one or more MID Servers on the connector instance event collection, such as HPOM.</td>
<td>N/A</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** If a MID Server manages resources within defined IP ranges for Orchestration, you must map the fully-qualified domain name (FQDN) of a server with its IP address to run certain activities, such as Exchange activities.

### Domain separation

If you are using domain separation, you can configure MID Servers to be in separate domains. The domain that the MID Server is in affects how the application selects the domain:

- **Discovery and Service Mapping:** On the Discovery schedule, the MID Servers and clusters that available for selection are limited to the same domain of the user who is configuring the schedule. This also applies to the auto-selection option: only MID Servers in the same domain as the user can be automatically selected.

### MID Server selection test

If Service Mapping is active, you can preview which MID Server that Service Mapping uses for a specific target device or computer. To do this, navigate to **Service Mapping > MID Servers** and click **MID Selection Test**. Enter the IP address and an optional application and capability, and then click **OK**. The name of the MID Server that Service Mapping will use appears in the window.
Configure a default MID Server for each application

You can configure a default MID Server that an application can use if all other possible MID Servers are unavailable. You can narrow down the list of applications that are included in the definition of ALL.

Before you begin
Role required: agent_admin or admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Applications are only available when their respective plugins are activated. The default MID Server is used when applications fail to find a suitable MID Server that matches configured criteria during auto-select. The default MID Server for the ALL application is used if the default MID Server for the specific application is not available. Some applications also offer a property to set the default MID Server.

Important: If you configure a MID Server for ALL IP ranges (type Include) and also create an IP range of type: Exclude for the same MID Server, the system ignores the excluded IP range for that MID Server.

The default MID Server does not need to meet any criteria (application, IP range, behavior, or capability) to be used. Specifying a default MID Server
is optional, and you can use a MID Server as the default for more than one application.

<table>
<thead>
<tr>
<th>Application</th>
<th>Additional notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery</td>
<td>Discovery attempts to use the default MID Server when the Discovery schedule specifies <strong>Auto-Select MID Server</strong> and Discovery cannot find any MID Servers with the correct application and IP range.</td>
</tr>
<tr>
<td>Orchestration</td>
<td>Orchestration attempts to use the default MID Server when it cannot find any MID Servers with the capabilities that you define in the Orchestration activity. You can also specify a default MID Server. The value in that property automatically synchronizes with the default MID Server you select in the Orchestration application.</td>
</tr>
<tr>
<td>Alert aggregation and RCA</td>
<td>Not applicable. The MID Server is selected if it has the RCA capability. Route to right MID by domain.</td>
</tr>
<tr>
<td>Service Mapping</td>
<td>If there are no MID Servers with matching application, capability, or IP range, Service Mapping uses the default MID Server.</td>
</tr>
<tr>
<td>Event Management</td>
<td>You can specify a default MID Server for Event Management using the mid.server.connector_default system property. Event Management does not use the default MID Server in the application record.</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to **MID Server > Applications**. The list of installed applications that can use MID Servers appears.
2. Click the name of an installed application.
3. Select a MID Server from the list in the **Default MID Server** field.
4. To select additional MID Servers for this application, click **Edit** in the **MID Servers** related list and select alternate MID Servers that this application is allowed to use.
5. Click **Update**.
**Select applications to include in the definition of ALL for a MID Server**

You can narrow down the list of applications that are included in the definition of ALL.

**Before you begin**
Role required: agent_admin or admin

**About this task**
You can specify the ALL application for a MID Server, which means that the MID Server is allowed to work with any of the applications that require MID Servers, such as Discovery, Event Management, Service Mapping, and so on. But you might not want all applications to be included in the definition of ALL. For example, you might want to exclude Service Mapping from the ALL definition if you already have a dedicated MID Server to work with Service Mapping.

**Procedure**

1. Navigate to **MID Server > Applications**.
   The list of installed applications that can use MID Servers appear.

2. If you do not see the **Included in application ALL** column, you can personalize the list and add it.

3. For each application, double-click the value in the **Included in application ALL** column.

4. Change the value to **true** (to include) or **false** (to exclude).

**Configure an IP address range for the MID Server**

You can manually configure an IP address range for the MID Server to explore.

**Before you begin**
Role required: agent_admin or admin
About this task
Applications, such as Discovery and Orchestration, can specify an IP range or the specific IP address of a target. When the application looks for a MID Server to use during auto-selection, it chooses a MID Server whose IP range includes the application’s range or specific IP address. Applications also use other criteria, such as the MID Server’s supported application or capability. See MID Server selection for more information.

Note: This is a manual configuration procedure. To learn how the system can assign IP address ranges to selected MID Servers automatically, see Using MID Server IP range auto-assignment.

These applications use IP ranges as follows:

• **Orchestration**: Use the IP address of the target machine (together with the capability) to select the correct MID Server for Orchestration activities. See the procedure in this topic to configure the IP address.

• **Service Mapping**: Select the MID Server whose IP address range matches the IP in the discovery request. See MID Server configuration for Service Mapping for more information.

• **Discovery**: Can select an IP address range using the same criteria as Service Mapping. Discovery can also use a quick IP range that you specify in the Discovery schedule.
Tip: You can also use the ALL IP range, which allows the MID Server to be used with any range of IP addresses that an application specifies. This only allows the MID Server to access IP ranges, it does not mean that the MID Server can actually reach all of the IP ranges. To function with an application, the MID server must have access to the IP ranges that the application needs.

Valid IP address ranges can be as follows:

- An IP address in dotted decimal or hexadecimal format. The hexadecimal format can be explicitly prefixed with 0x, this is not mandatory. Here are examples:
  - 10.11.144.155
  - 0x0A0B909B
  - 0A0B909B

- An IP address range in dotted decimal or hexadecimal format. Here are examples:
  - 10.11.144.150-10.11.144.160
  - 0x0A0B9096-0x0A0B90A0
  - 10.11.144.150-0x0A0B90A0

- An IP network address with the net mask specified after a slash (/) in regular notation (0-32 inclusive) or in IP address notation. Here are examples:
  - 10.11.144.0/24 10.11.144.0/255.255.255.0
  - 10.11.144.0/0xFFFFFFFF
  - 0x0A0B9000/24
  - 0x0A0B9000/0xFFFFFFFF

Procedure
1. Navigate to MID Server > IP Ranges.
2. Click New.
3. Complete the form, using the fields in the table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for this IP range. The default is <strong>Global</strong>.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of range:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Include</strong>: Include the specified IP range.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Exclude</strong>: Exclude the IP address range.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If a MID Server is configured for <strong>ALL</strong> applications, any IP</td>
</tr>
<tr>
<td></td>
<td>addresses configured for exclusion are ignored by the system. If your goal</td>
</tr>
<tr>
<td></td>
<td>is to configure default MID Servers for separate applications in your</td>
</tr>
<tr>
<td></td>
<td>system, see <strong>Configure a default MID Server for each application</strong>.</td>
</tr>
<tr>
<td>Range</td>
<td>Enter the range in a valid format.</td>
</tr>
</tbody>
</table>

**Related list**

| MID Servers | The MID Servers that can use this IP address range. |
4. Click **Save**.

**Important:** IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:

- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the **ALL** ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.

**What to do next**

Open the **ALL** IP range record and configure the MID Servers that you want to use with any set of IP addresses.

**Override the MID Server selection filter**

You can use the override feature to write your own filter condition that overrides the normal MID Server selection criteria for an application. An override has precedent over the default filter and can be defined for a specific selection condition.

**Before you begin**

Before attempting to create an override filter, be sure you understand the criteria the platform uses to select MID Servers. See **MID Server selection** for details.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task

Note: The override feature is intended for Cloud Management and Cloud Discovery only. The Override by capability filter is provided by default.

There are four MID Server selection filters included in the base ServiceNow system. These filters are applied to all MID Servers in order until the system finds a matching condition:

- Status Filter
- App Filter
- Capability Filter
- IP Filter

Important: The override feature allows multiple filter types but only one override filter for each filter type. The Override selector filter type overrides all other filters and takes complete control of the MID Server selection. If this type is active, it is the only filter applied.

Procedure

1. Navigate to **MID Server > Mid Selector Override**.
   The list of MID Server overrides appears.
2. Click **New** to create a new filter.
3. Complete these fields:
   - **Name**: Unique name for this override. Ensure that you can identify the override type by the name.
   - **Script**: Condition for this filter. Create the MID Server selection logic for your override in this field, using the directions provided in the function template. Look at the **Override by capability** filter as an example before starting to create your filter.
   - **Type**: Type of override being configured. Select one of the four default filters to override with your condition, or select **Override selector** to create a filter that overrides all the others.

4. Click **Submit**.

### Using MID Server IP range auto-assignment

Discovery Quick Start can automatically assign ranges of IP addresses, called subnets, to qualified MID Servers. This subnet auto-assignment requires SNMP credentials for read-only access to routers Discovery uses. The Automation Status Set form shows summary details of subnet Discoveries and the IP range assignments for associated MID Servers.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To be automatically assigned to a subnet, a MID Server must be:

• In a running (Up) state.
• Successfully validated.
• Able to access one or more subnets in your network.

The subnet assignments that the instance makes for your MID Servers are stored in the Automation Status Set [automation_status_set] table. For details about MID Server auto-assignment, see Discovery Quick Start.

**Important:** You must auto-assign at least one MID Server to create a schedule automatically.

**Required SNMP OIDs for MID Server IP range auto-assignment**

Customers who use network service providers must request specific SNMP access to use MID Server IP range auto-assignment.

IP range auto-assignment requires SNMP credentials for read-only access to all routers that Discovery uses to identify subnets. In addition, your service provider must grant the following SNMPWALK access:
View automation status sets and IP range assignments

The Automation Status Set form shows summary details of a subnet Discovery and the subsequent IP range assignments for MID Servers selected for automatic subnet assignment.

Before you begin
Role required: admin

Procedure
1. Navigate to MID Server > Automation Status Sets.
2. Select a status record for a subnet Discovery you want to view.
   The form contains read-only status information about the selected Discovery, the subnets found, and the range assignment process for the MID Servers you selected for auto assignment.

Important: IP ranges assigned manually prior to using auto-assignment in the Discovery Quick Start are affected as follows:
- Individual IP ranges are retained and appended to the ranges assigned automatically by the system for the designated MID Server.
- If the MID Server was configured with the ALL ranges selection, the auto-assignment feature overwrites that designation with the ranges it finds.
3. Select the **Subnets Discovered** related list to view the list of subnets available for assignment.

4. Select the **IP Range Assignments** related list to view the IP ranges that were assigned to a MID Server.
CAUTION: IP ranges identified by Discovery are stored in the IP collection [ip_address_collection] table, which is only used for MID Server IP range auto-assignment in the Jakarta release. This table is intended for future development and should not be used in any customizations, including column additions, business rules, or scripting actions.

File permission enforcement for Windows MID Servers

To improve security, Windows MID Servers enforce Windows file permission restrictions. The enforcement limits access to the MID Server files to a restricted allow list of users and groups.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

File permission enforcement for Windows MID Servers goes into effect on the MID Server on start up in Orlando. By default the agent folder is locked to four user accounts and groups: the local admin group, the system account,
creator owner, and the user account the Windows MID Server is using. The list of permitted user accounts is managed by an allow list, which is controlled by the MID Server parameter `mid.windows_host.file_permissions.allow_list`. This parameter takes a string of comma separated group names, user names, and security identifiers (SID). Group and user names must follow SAM account naming requirements. Domain accounts must be specified by using the SID.

**Roll back file permission changes**

Changes to the file permissions are recorded, and the last used settings are saved in the `/etc` folder as a backup. The file is `fileperm.aclsave`. Open a command prompt and run the command `icacls <agent_folder> /restore <agent_folder>/etc/fileperm.aclsave` where `<agent_folder>` is name of your agent folder.

**Run a MID Server as a non-admin**

To run a MID Server as a non-admin user, it must first be installed using an admin account. Then add the non-admin user to allow list and restart the MID Server. Once the new enforcement rules run, the MID Server can be switched to the non-admin service account. See [Run a Windows MID Server as a non-admin after manual installation](#) for more information on setting up non-admin Windows MID Servers, or [Run Linux MID Servers as non-root users](#) for Linux MID Servers.

**Map an IP address to a DNS name**

Associate the IP address to a DNS name to ensure the appropriate MID Server is selected. The IP Address range configuration determines which MID Server is selected. If the MID Server manages resources within defined IP ranges, all host servers must have their DNS names mapped to an IP address.

**Before you begin**

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The association of an IP address to a DNS name ensures that the appropriate MID Server is selected based on the IP Address range configuration. If this is not done, Orchestration reverts to the default MID Server.

If Discovery cannot discover the server and resolve the DNS name to an IP address, you must create the mapping manually.

**Important:** The platform does not map localhost to 127.0.0.1 automatically. You must create that mapping using this procedure.

**Procedure**

1. Enter `cmdb_ci_dns_name.list` in the navigation filter.
   A list of DNS names appears.
2. Check the list for your host server.
   If the server does not appear in the list, continue with this procedure.
3. Click **New**.
4. Enter the fully-qualified domain name (FQDN) of the host server in the **Name** field.
5. Right-click in the form header and select **Save** from the context menu.
6. In the **IP Address** related list, click **New**.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
7. In the IP Address field, enter the IP address of your host server.
8. In the Nic field, select eth0 or your preferred network interface controller.
9. Leave the Netmask field blank.
10. Click Submit.

Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Before you begin
Role required: admin or sm_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.
The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>Capability</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to **MID Server > Capabilities**.
2. Select an existing capability. You can also select **ALL** to include all capabilities.

**Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a. Click **New**.
   b. Configure the value for a custom capability.

   **Example**
   An example is a capability for **DOMAIN**, with a value of **service-now**.

   c. Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the **Available** list.
6. Click **Save**.

   The capability defined here also appears in the primary record for this MID Server.

**MID Server capabilities**

MID Server capabilities define the specific functions of a MID Server within an IP address range.
Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server.

MID Server capability values

Capabilities provided in the base system do not have a defined value string. The capability value can be blank, a single value, or a * (wildcard). A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match. The * (wildcard) will match a request capability specifying any non-blank value.

Starting with the Madrid release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
**MID Server selection**

The MID Server is selected using an algorithm based on the capabilities available. The selector produces a list of suitable MIDs using filters in the following order: server status > applications > IP range > capabilities. The algorithm searches the capabilities in the following sequence and, if a step finds at least one MID server, the remaining steps are skipped:

1. **Exact value match:** Find each MID Server containing capabilities with name/value pairs with an exact match to all requested capability name/value pairs. Blank is a valid value. * (wildcard) values are ignored.

2. **Wildcard value match:** The same as an exact value match, but also allows a non-blank request value to match MID server capability records containing value *.

3. **Special capability name ALL:** Find each MID Server containing the special capability name ALL, ignoring capability's value field.

**Note:** If the requested capability name does not exist in the ecc_agent_capability table, BadArgumentException is thrown rather than falling back to the ALL capability.

**Scripted MID Server capability value matching**

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

**Note:** If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure a MID Server cluster

Group multiple MID Servers to form clusters, then configure clusters for fail-over protection or load balancing. Load-balancing clusters automatically balance work between each MID Server to improve stability and performance. Fail-over clusters have a configured order used to determine which MID Server to use next if a failure occurs.

Before you begin

Ensure that each MID Server in the cluster has the appropriate capabilities for the job. A MID Server in a fail-over cluster must have the same capabilities (or expanded capabilities) as the MID Server it is expected to replace.

Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
You can select a MID Server cluster from the Discovery Schedule form.

Procedure
1. Navigate to MID Server > Clusters.
2. Click New.
3. Name the cluster and select the cluster type: Failover or Load Balance.
4. Right click in the header bar and select Save from the context menu.
5. Click Edit in the Includes MID Servers Related List.
6. Select appropriate MID Servers for this cluster from the slushbucket.

MID Server clusters
MID Server clusters enable multiple MID Servers with the appropriate capabilities to be grouped together for load balancing and fail-over protection.

External data sources
For performance and reliability reasons, these data sources should not be used with MID Server clusters. These external data sources should only be used with dedicated MID Servers.
• LDAP
• Export sets
• JDBC data sources

⚠️ **Note:** If a MID Server in a cluster fails, the fail-over MID Server starts over at the beginning of the ECC queue task even if much of the information from the JDBC data source was already returned. This can result in duplicate data. For more details, see the Using MID Server clusters for JDBC data sources can cause duplicate and out-of-date data [KB0727739] article in the HI Knowledge Base.

### How clusters work

MID Servers in clusters must be able to connect to the instance and to all the devices with which they are expected to communicate. If all MID Servers in a cluster are down, the discovery is canceled. Make sure all the MID Servers are added to any Access Control List (ACL) in use. MID Server clusters are managed by a business rule called MID Server Cluster Management, which checks to see if the MID Server assigned to a job in the ECC Queue belongs to a cluster.

#### Load balancing

If the cluster business rule determines that a MID Server is part of a load balancing cluster, the application using the MID Server automatically balances the work between the MID Servers in that cluster. It is good practice to put MID Servers with the same capabilities in a load balancing cluster.

#### Fail-over protection

MID Servers in a fail-over cluster each have a configured order that the platform uses to determine which MID Server to use next in case of failure. MID Servers in a fail-over cluster work independently and do not load balance with other MID Servers in that cluster (although they might also be members of load balancing clusters). When a MID Server fails, the MID Server Cluster Management business rule selects the highest available MID Server in the order to take over the work. The selected MID Server checks the ECC Queue and starts with jobs that are either Processing or Ready.

⚠️ **Note:** MID Server clustering does not support the ECC queue topics Command or SystemCommand. If these commands are received, the clustered MID Servers do not redirect the ECC queue to another MID Server. The ECC queue records stay on the ECC queue without being processed.
Configure a fail-over MID Server with at least the same capabilities as the MID Server it is intended to relieve.

**Note:** If a MID Server fails while the Shazzam probe is running and auto-selection is configured, failover is not available. The Shazzam discovery stops. Discovery does not automatically choose another MID Server.

**MID Server cluster event**

The following event is triggered when the platform cannot find a MID Server with the appropriate capabilities to replace a MID Server in a fail-over cluster. Use this event to create an email to notify appropriate users that the cluster has failed.

<table>
<thead>
<tr>
<th>Event</th>
<th>Table</th>
<th>Description</th>
<th>Business Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid_server.cluster.down</td>
<td>MID Server Cluster</td>
<td>A MID Server cluster has failed</td>
<td>MID Server Cluster Management</td>
</tr>
</tbody>
</table>

**Combining clusters**

A MID Server can be added to both types of clusters at the same time. This diagram shows a scenario in which a MID Server from a load balancing cluster (MID Server D) is also present in a fail-over cluster. If MID Server D fails, MID Server E in the failover cluster is available to the load balancing cluster to perform the tasks previously assigned to MID Server D.

![Diagram of combining clusters](image)

**Specifying a specific MID Server cluster**

You can specify a specific MID Server cluster for a Discovery schedule. The discovery process uses that cluster only. You cannot chain clusters or specify a single MID Server that belongs to multiple clusters.
Distributed MID Server clusters for Operational Intelligence

The distributed MID Server cluster type is used exclusively in Operational Intelligence, which analyzes Event Management events and generates anomaly alerts. These MID Servers communicate with one another to distribute and balance the workload. For details, see MID Server distributed clusters for Operational Intelligence.

Set MID Server thread use

The three parameters: threads.interactive.max, threads.expedited.max, and threads.max define the maximum numbers of worker threads that can run simultaneously in each pool. Change the number of threads used by the MID Server according to performance requirements. MID Servers which compete with other programs for CPU time can use fewer threads than the default. MID Servers which need more speed, and have a host computer powerful enough, can use more threads.

Before you begin
Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Changing the thread parameters can affect the MID Server performance. The interactive thread pool is designed for executing interactive messages including system commands and heartbeats. They are typically lightweight,
so usually there is no need to change the default value. The expedited thread pool is designed for executing messages that have higher priority than the standard ones but less than interactive ones. Unless you have applications that produce a lot of expedited messages, there is no need to change the default value for threads.expedited.max. The standard thread pool is the busiest pool. Most probes are using it and they can take a lot of system resources such as CPU, memory, and so on. You can set the MID Server to use as few as five threads without issue. To increase the speed of the MID Server if the host is powerful enough or lightly loaded with other programs, you can increase the threads setting. The threads setting depends on the limitation of the CPU speed, memory, and operating system of the host machine. You might have to experiment to find the optimal threads count that works best when the MID Server is busy so it does not exhaust the host machine’s hardware limitations. This means you may have to refine the thread count to best meet your situation. The following general observations may be useful:

- PowerShell is resource intensive and threads may not scale linearly.
- Most MID Server tasks require file handles to do their job.
  - Windows: On the Windows operating system, file handles are available in a fixed quantity. If you configure too many MID Server threads on a Windows host, the MID Server can consume all the file handles before approaching maximum CPU usage. This situation appears as an Out of file handles error in the MID Server log and indicates that the MID Server is trying to use too many threads.
  - UNIX and Linux: UNIX and Linux hosts have a much different scheme for allocating file handles. Generally, you can increase MID Server thread use on these operating systems until the CPU of the host is overloaded. See your OS documentation for monitoring CPU usage.
- Each thread on the MID Server requires some memory. Exactly how much memory varies considerably from task to task and depends on the equipment being discovered. To increase the number of threads, you might have to increase the amount of memory that Java uses. If you configure insufficient memory, an Out of memory error appears in the MID Server log.
- You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Follow the steps below to change the config.XML file. Alternatively, use the threads.max connection parameter. See MID Server Connection parameters for more details.
Procedure
1. Open the \agent\config.xml file using any text editor.
2. Locate the following lines:

   <!-- MID Server Threads -->
   <parameter name="threads.max" value="25"/>

3. Edit the value. Keep in mind the cautions described above.
4. Save the record.
5. Restart the MID Server service.

Install and uninstall Nmap on a MID Server
If you decide to use credential-less Discovery in your network, you must install Nmap on each Windows MID Server that you want to use for this purpose. Self-hosted customers whose network security does not permit downloads from install.service-now.com must use a specific manual process to install and configure Nmap.

Before you begin
Role required: mid_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security
• Assign MID Server IP ranges to all deployed MID Servers. The quickest and most reliable way to do this is with the Using MID Server IP range auto-assignment feature available in the Discovery Quick Start wizard. This method ensures that the set of MID Servers configured to access an IP address range is comprehensive.

• Identify the IP ranges you want to explore with credential-less Discovery. Ensure that these ranges can only be accessed by MID Servers with Nmap installed, running on supported Windows hosts.

• Use the All option for selecting IP ranges and observe these requirements:
  ◦ Restrict the use of this feature to Windows MID Servers only.
  ◦ Ensure that Nmap is installed on each of these MID Servers.
  ◦ Ensure that the MID Servers can access the entire customer network.

• When you create a Discovery schedule with Nmap enabled, observe these requirements for the MID Server selection options:
  ◦ Specific MID Cluster: Verify that Nmap is installed on all MID Servers in the cluster, where each MID Server in the cluster is configured to access the same set of IP ranges.
  ◦ Auto-Select Mid Server: When running horizontal Discovery, verify that Nmap is installed on at least one of the MID Servers that can access the Discovery schedule's configured MID Server IP ranges.
  ◦ Specific MID Server: Verify that Nmap is installed on each MID Server that can access the schedule’s configured MID Server IP Ranges.

⚠️ Note: To use credential-less Discovery for Service Mapping, install Nmap on all MID Servers that can access the Discovery schedule's configured MID Server IP ranges.

Role required: agent_admin

About this task
The Discovery - IP Based [com.snc.discovery.ip_based] plugin provides connection to the installer for Nmap and the programming elements that allow a Windows MID Server to run approved scripts on target CIs for credential-less Discovery. MID Servers on which Nmap is installed can execute an Nmap command configured to perform reverse DNS name resolution, discover MAC addresses, or gather OS information on target CIs without using credentials. The Discovery - IP Based plugin is activated automatically when the Discovery [com.snc.discovery] or Event Management and Service Mapping Core [com.snc.service-watch] plugins are activated.

Service Mapping and Nmap
Service Mapping does not check for the presence of the **Nmap** capability and selects the MID Server based on the IP address only. To ensure that Service Mapping does not select a MID Server without the **Nmap** capability, install Nmap on all MID Servers assigned to the IP address ranges for which you want credential-less Discovery to be available. If Service Mapping selects a MID Server for credential-less Discovery that does not have Nmap capabilities, this error message appears in the map at the site of the CI being discovered: `Nmap is not installed on MID Server. Verify all MIDs configured to handle selected IP Address have Nmap Capability. Nmap root directory path does not exist: <path>`

**Amazon Web Service AWS**

Running Nmap scans to or from any resource within the Amazon Web Service AWS environment is tightly regulated and requires the permission of AWS through the **AWS Vulnerability/Penetration Testing Request** form. AWS only permits testing of EC2 and RDS instances that you own. Tests against any other AWS services or AWS-owned resources are prohibited. In addition, any Nmap scan of a permitted instance must be performed within an approved time window. For these reasons, credential-less Discovery within an AWS environment is not appropriate, and if a violation of their policy occurs, could result in expulsion from the service.

**Supported operating systems**

Nmap is supported on all editions of these operating systems, including virtual machines and 64 bit systems:

- Windows 2008
- Windows 2012
- Windows 2016

**MID Server requirements**

Nmap can be installed on MID Servers that meet these requirements:

- Status is **Up**.
- MID Server is validated.
- MID Server does not already have the **Nmap** capability.
⚠️ **Warning:** The MID Server installation path must not contain the following characters:

- `()`
- `{}`
- `[]`

The Nmap installer replaces these characters with spaces. This prevents the installer from finding the correct path, and the installation fails. An example of a path that will fail is `C:\MIDServers\MID(1)\agent`.

**Procedure**

1. Navigate to **MID Server > Servers**.
2. Open the desired MID Server record.
3. Under **Related Links**, select **Enable Credential-less Discovery**.
   A confirmation dialog box appears.

4. Click **Yes** to continue with the installation.
   The instance runs the Nmap installer from `https://install.service-now.com`, a site within a ServiceNow datacenter that contains installers for the platform. This progress notice appears during installation:

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The **Logs** tab in the MID Server record shows the message: Running system command: installNmap.

5. Click **OK** if you want to hide the dialog box while the installer continues to run in the background. Installing Nmap also installs Npcap on the host, if it is not already installed. Npcap is Nmap's packet capture library for Windows that allows Nmap to perform port scans quickly and to identify the family of the operating system running on the target. Npcap is installed once on the host and can be used by any other application that requires it, such as Wireshark.

**Note:** If a more recent version of Npcap is already installed on the Windows MID Server host, Nmap is installed without Npcap. If an older version of Npcap is installed on the host, the Nmap installer upgrades it to the newer version.

The installation process has either of these outcomes:

- **Success**: These conditions indicate a successful installation:
  - The version of Nmap that is installed appears in the **Nmap version** field in the MID Server record.
  - The **Related Link** changes to **Disable Credential-less Discovery**.
  - The **Nmap** capability is assigned to the MID Server and appears in the **Capabilities** tab of the MID Server record.

- **Failure**: If the installation fails, an error message is logged to the MID Server Issue [ecc_agent_issue] table. If you run the installer again with success, the issue is marked as **Resolved**.

6. To uninstall Nmap for a selected MID Server, select **Disable Credential-less Discovery** under **Related Links** in the MID Server record. This dialog appears during the uninstallation process:
The **Logs** tab in the MID Server record shows the message: Running system command: uninstallNmap.

⚠️ **Attention:** Because Npcap can be used by other applications, uninstalling Nmap does not automatically uninstall Npcap. You must uninstall Npcap manually, after determining that no other dependencies exist.

**Related information**

**Credential-less Discovery**

**Install Nmap on a self-hosted system**

Use this procedure to install Nmap on MID Server host machines in a self-hosted environment that does not allow network access to the ServiceNow® install.service-now.com download site.

**Before you begin**

Role required: admin, maint

**About this task**

You must install Nmap manually on each MID Server host, and then configure the instance to execute credential-less Discovery.

ℹ️ **Note:** This procedure does not apply to self-hosted customers whose MID Server hosts can access install.service-now.com from within their network.

**Procedure**

1. Navigate to **MID Server > Properties** (MID Server Property [ecc_agent_property] table) and open the record for the mid.nmap.version property.
   This property contains the version of Nmap that you must install. Record the version number.

2. Download the correct installer executable from one of these URLs:
   - **https://nmap.org/dist/**: If the Nmap version in the property is 7.50, the executable you need is https://nmap.org/dist/nmap-7.50-setup.exe.
   - **https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-xxx-windows.exe**: If the Nmap version in the property is 7.50, the executable you need is https://install.service-now.com/glide/distribution/builds/package/thirdparty/nmap/nmap-setup-7.50-windows.exe

3. Create a folder called nmap in the MID Server agent folder of every MID Server you want to use for credential-less Discovery.
4. Copy the Nmap installer file that you downloaded to the `nmap` folder and rename it to `nmapInstaller.exe`.

5. Run the `agent\scripts\PowerShell\NmapInstallation.ps1` script and pass it the following parameters in the order in which they appear. This script runs the `nmapInstaller.exe` file.

   a. `$operation`: Task that `NmapInstallations.ps1` will process. To install Nmap, the task is `install`.

   b. `$nmap_root_path`: Complete path for the `nmap` folder that you create in step 4.

   c. `$nmap_self_installer`: Complete path for `nmapInstaller.exe` file that you copied in step 5.

   d. `$nmap_command`: Complete path for the Nmap install command. The `NmapInstallations.ps1` script installs Nmap in the `nmap` folder created in step 4. This parameter is `$nmap_root_path\nmap.exe`.
e. `$nmap_uninstall_command`: Complete path for the Nmap uninstall command. This command is `$nmap_root_path\Uninstall.exe`.

f. `$nmap_npcap_version`: The Npcap version installed with Nmap. This value must be the same as the value of the `mid.nmap.npcap.version` property in the MID Server Property [ecc_agent_property] table.

g. `$nmap_safe_scripts`: List of safe scripts that Nmap uses. You can retrieve this list from the `mid.nmap.safe.scripts` property in the MID Server Property [ecc_agent_property] table.

6. Set up the parameters in the `NmapInstallation.ps1` script in this order:

   ```powershell
   .\NmapInstallation.ps1 $operation $nmap_root_path $nmap_self_installer $nmap_command $nmap_uninstall_command $nmap npcap_version $nmap_safe_scripts
   ```

   For example, the script might look like this:

   ```powershell
   PS C:\MidServers\mid1\agent\scripts\PowerShell> .\NmapInstallation.ps1 "install"
   "C:\MidServers\mid1\agent\map" "C:\MidServers\mid1\agent\nmap\nmapInstaller.exe"
   "C:\MidServers\mid1\agent\nmap\unmap.exe" "0.91"
   "allseeingeye-info.nse,amqp-info.nse,db2-das-info.nse,drda-info.nse,freelancer-info.nse,
   ike-version.nse,mcafee-epo-agent.nse,mqtt-subscribe.nse,openlookup-info.nse,oracle-tns-ve
   rsion.nse,
   quake1-info.nse,quake3-info.nse,rfc868-time.nse,rpcinfo.nse,snmp-info.nse,ventrilo-info.n
   se,
   weblogic-t3-info.nse,xmpp-info.nse"
   ```

7. After installation is complete, add the **Nmap** capability to each MID Server you want to use for credential-less Discovery.

   **Attention:** Only a `maint` user can add the **Nmap** capability to a MID Server. Contact Customer Service and Support to request temporary `maint` access to your instance.

   a. On the instance, open the MID Server record.

   b. Select the **Capabilities** related list.

   c. Click **Edit**.
d. Select **Nmap** from the list of available capabilities and click **Save**.

![Image of Nmap capabilities in ServiceNow](image)

**Uninstall Nmap on a self-hosted system**

Use this procedure to uninstall Nmap in a self-hosted environment that does not allow network access to the ServiceNow `install.service-now.com` download site.

**Before you begin**

Role required: admin, maint

**About this task**

Nmap must be manually uninstalled from each MID Server host machine and then disabled on the ServiceNow instance.

**Procedure**

1. Run `Uninstall.exe` in the `nmap` folder on each MID Server host configured for credential-less Discovery.
2. After uninstallation is complete, delete the `nmap` folder from the `agent` folder.
3. Remove the **Nmap** capability from each MID Server record.

⚠️ **Attention:** Only a **maint** user can remove the **Nmap** capability from a MID Server. Contact Customer Service and Support to request temporary **maint** access to your instance.

a. On the instance, open the MID Server record.

b. Select the **Capabilities** related list.

c. Click **Edit**.

d. Remove **Nmap** from the active capabilities list and click **Save**.
Configure MID Server as WinRM trusted host

In environments using Windows Remote Management (WinRM), Discovery or Service Mapping can discover servers using the WinRM protocol. Add servers, which are part of WinRM, as trusted hosts on all MID Servers that Discovery or Service Mapping use for discovery.

Before you begin
Role required: mid_admin

Procedure

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
MID Server cannot access servers using the WinRM protocol unless these servers are configured as trusted hosts for this MID Server.

Perform this procedure on each MID Server used by Service Mapping or Discovery.

Procedure

1. On the MID Server, open the command-line shell.
2. To add all servers to the TrustedHosts lists, run the following command:

   ```shell
   winrm s winrm/config/client @{TrustedHosts="*"}
   ```
3. To add specific servers to the TrustedHosts list, run the command with the comma-separated hosts instead of the asterisk (*), for example:

```
winrm s winrm/config/client @{TrustedHosts="serverA,serverB,serverC"}
```

**MID Server domain separation**

Use the MID Server user role to configure MID Servers to access separate domains. The credentials in the `config.xml` file of a MID Server determine which domains it can access. Specific MID Server policy records can be restricted for use only by MID Server from the same domain.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The records that can be read, updated, or created by a MID Server are determined by the credentials configured for that MID Server in the `config.xml` file. These are the user credentials that a MID Server uses to access the instance and specify which domain's records that MID Server can access.

You can create versions of these specific MID Server policy records that only a MID Server from the same domain can use. This process separation is supported for records in tables that extend MID Server Synchronized Files [ecc_agent_sync_file]:
• MID Server MIB File [ecc_agent_mib]
• MID Server JAR File [ecc_agent_jar]
• MID Server Script File [ecc_agent_script_files]

⚠️ Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Set up domain separation for MID servers

Set up domain separation through the MID server user role and the MID Server configuration file.

Before you begin
Role required: admin, agent_admin

Procedure

1. Configure a MID Server user within a specified domain with the proper mid_server role.

2. Specify this user within the MID Server config.xml file. When you set the MID Server user credentials in the config.xml file, make sure they are in the proper domain.

What to do next

If you must change the MID Server domain:

1. Stop the MID Server and delete the ecc_agent record.

2. Update the MID Server config.xml with the new user in the new domain and restart the MID Server service.

If you need to create versions of specific MID Server files that only MID Servers in your domain can use:

1. Open or create a record in one of these MID Server modules:
   - SNMP MIBs
   - JAR Files
   - Script Files
2. Update an existing domain policy or submit a new record.

Note: Attachments on MIB or JAR file records might not appear as they did in a non-domain separated environment. The attachments do not appear because the Attachments [sys_attachment] table is data separated. When data is separated between domains, a record in a child domain cannot access records in a parent domain.

Configure a multi-domain MID Server

You can create a MID Server in the global domain that can explore targets in other domains.

Before you begin

Before configuring a multi-domain MID Server:

- Ensure that your instance is domain separated.

Role required: admin

Procedure

1. Type sys_properties.list in the navigation filter and press Enter.
2. Locate the glide.ecc.enable_multidomain_mid property.
3. Set the value of the property to true.

Note: Enabling this property has no effect on existing MID Servers. MID Servers in a domain prior to setting this property, remain in that domain.

4. Create a MID Server in the global domain.

A MID Server created in the global domain after this property is set to true can explore any domain for which it has the credentials. However, this MID Server is restricted to trying only the credentials for the target domains requested by ECC Queue inputs.

CAUTION: If you reset the glide.ecc.enable_multidomain_mid property to false after creating a multi-domain MID Server in the global domain, that MID Server writes all the data it receives to the global domain and not to the correct domains.
Synchronize a JAR file to MID Servers

You can upload a JAR file to an instance and synchronize it to all MID Servers, or write custom probes that use the synchronized JAR file.

Before you begin

Role required: admin, agent_admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server JAR File [ecc_agent_jar] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

⚠️ CAUTION: Synchronizing a JAR file with this procedure causes all MID Servers connected to the instance to restart automatically.

Procedure

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the following fields:
   - Name: A unique and descriptive name for identifying the file in the instance.
   - Version: A version number for the file, if one is available.
**Source:** Location of the JAR file for reference purposes. Source information is not used by the system.

**Description:** Short description of the JAR file and its purpose in the instance.

4. Click the paper clip icon in the banner.

![Attach a file](image)

5. In the Attachments dialog box, click **Browse** and select the file you want to attach.

The platform attaches the JAR file to the record and restarts the MID Servers to synchronize the file. It is not necessary to update the record to attach the file.

**vCenter event collector**

The vCenter event collector is a MID Server extension that listens for vCenter-related events and updates the CMDB accordingly.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The event collector allows the CMDB to be updated with changes to virtual machines (VMs), in addition to the updates detected by Discovery. A change to a VM is sent as an event from the vCenter server to the vCenter event collector. When an event is received, the CMDB is updated accordingly. Full vCenter Discovery does not need to rerun. For some events, such as powered on and powered off events, Discovery does not need to run again at all. For most events, Discovery runs only on the necessary vCenter resource.

For example, if a VM is turned off, the vCenter server sends the event `VmPoweredOffEvent`. The vCenter event collector receives and processes the event and the CMDB is updated to reflect that the state of the corresponding VM is set to off.

**Important:** With this extension, Discovery can only modify the state of a VM which exists in the CMDB. When an event with "CreatedEvent" occurs in its name, such as `VmCreatedEvent`, Discovery scans that VM and then creates the CI using the data it collects. When a new event occurs involving that CI, Discovery can update the existing record without launching another scan.

**Note:**

vCenter event collector supports domain separation by inheriting the domain of the specified Mid Server in the event collector context. However, it does not support multi-domain Mid Server configuration.
See Discovery for VMware vCenter for supported versions of vCenter.

**How vCenter events are processed**
The MID Server listens for the vCenter events configured in the vCenter Event Collector form. When one of these events is returned from vCenter, the instance parses the payload with a business rule that converts the vCenter event into a system event (sysevent). The instance then uses that sysevent to perform tasks, such as email notification.

⚠️ **Note:** If the MID server is paused when a vCenter event occurs, the MID server still processes the event. In this case, it is possible for the event collector to display a status of **Started**.

The resulting sysevents contain these values:

- **Name:** Name of the system event created from the vCenter event. This value is always `automation.vcenter`.
- **Parm1:** vCenter event that was returned. This event must be associated with an event collector record.
- **Parm2:** Event data provided by vCenter, in JSON format.

### Log entries for vCenter events
![Log entries for vCenter events](image)

### Supported vCenter events
The following events are the only vCenter events handled by the base system when Discovery is activated. If you have upgraded your instance from an earlier version, you might not have the default events added with later releases. To use the missing events, manually add them.

#### vCenter events

Configure and run the vCenter event collector extension

Configure the vCenter event collector extension in the MID Server module, and then add or remove supported events.

**Before you begin**

Before configuring event collectors, perform these tasks:

- Deploy and start a MID Server.
- Ensure that the MID Server has access to the vCenter.
- Run discovery on the vCenter.

Role required: agent_admin, admin

**About this task**

Multiple MID Servers can listen to the same vCenter instance, and you can add multiple Event Collectors for different vCenters to a single MID Server. Make sure you configure the events on the event collector record that specify the correct MID Server.

**Note:** You can add events to the vCenter event collector. However, not every event is supported by the base system event handlers. If you want to handle events other than those supported in the base Discovery system, you must create a script action to process the events. For instructions, see . As a reference, the instance processes the vCenter events in the base system with a script action called **Discovery: Process vCenter events**. Do not edit or delete this script action.
To configure the vCenter event processor extension:

Procedure

1. Navigate to MID Server > Extensions > vCenter Event Collectors.
2. Click New or open an existing extension.
3. Fill in the fields, as appropriate from the table.
4. Right-click in the header bar and click Save in the context menu.
   The vCenter Event related list appears, containing the default events that the system is configured to handle.
5. To select a different vCenter event, click Edit in the vCenter Event related list and browse for the event.
   The slushbucket does not display all the available events in the opening list. Use the filter to browse for events not displayed.
6. Under Related Links click Start to save the events in this collection and start the collector.
   The Related Links in this form work as follows:

<table>
<thead>
<tr>
<th>Related Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>Starts the collector if it is not running. The extension connects to the specified vCenter server by enumerating the VMware credentials in the credential set until a connection can be made. Next, the extension tells the vCenter server to supply the events specified in the Collector Context.</td>
</tr>
<tr>
<td>Stop</td>
<td>Stops the running collector on the configured MID Server. No action is taken if the extension is not running.</td>
</tr>
<tr>
<td>Restart</td>
<td>Stops, then starts the collector on the configured MID Server.</td>
</tr>
<tr>
<td>Test</td>
<td>Tests the parameters for validity. If the IP address, hostname, and the set of events is valid then the test returns a successful status. If any of the parameters are incorrect, an error is shown. Running a test does not affect any extensions that are currently running.</td>
</tr>
<tr>
<td>Update parameters</td>
<td>Sends updated parameters to the collector. Any changes you make to the collector while the MID Server is running do not take effect immediately when they are saved. If you click this control when the collector is not running, no update is made.</td>
</tr>
</tbody>
</table>
In the case of the vCenter extension, the collector first tests the parameters for validity. If the parameters are valid, the extension disconnects from the vCenter server and reconnects with the new parameters.

VMware discovery

**SNMP trap collector extension**

The SNMP trap collector is a MID Server extension that listens for SNMP traps from the devices on your network.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

Upon receiving a trap, the MID Server sends the trap to the instance for further processing by Event Management. If Event Management is not active, traps are not processed and are discarded by the instance.

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap. See the documentation for the network device to configure your hardware to do this. Generally, the SNMP trap collector extension should run on only one MID Server per VLAN. Multiple MID Server recipients on the same VLAN causes duplicate data in the CMDB. If network
devices are separated by VLANs, multiple MID Servers may have trap collectors installed.

To configure multiple SNMP trap collector extensions, configure each in a separate record, with a unique name, and a designated MID Server.

**Configure the SNMP Trap Collector Extension**

For the SNMP trap collector extension to receive traps from network devices, each device must designate the MID Server that runs the SNMP trap collector extension as a recipient of the trap.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **MID Server > Extensions. > MID SNMP Trap Listener**
2. Click **New** or open an existing extension.
3. Fill in the fields from the table, as appropriate.
4. Click **Submit** or **Update**.

<table>
<thead>
<tr>
<th>Field name</th>

<td>If you make changes to the extension configuration, use this option to update the parameters of the currently running extension. First, the parameters are tested for validity. If the parameters are valid, the extension disconnects and reconnects with the new parameters.</td>
</tr>
</tbody>
</table>

**MID Server Resource Reservation**

This feature allows resources to be reserved before a task is assigned to a thread. If the resources the task needs aren’t available, then that task waits in the MID Server work queue while other tasks are assigned to the thread.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

For Discovery, the MID Server tasks are the probes or patterns it executes. While probes are waiting to be executed on the MID Server, they provide resource requirements (CPU, memory, and so on) and if they cannot be met, the probe waits in the work queue until the resources are available.
Note: MID Server Resource Reservation delays probe execution until resources are available. This is based on extremely flexible criteria. The MID Server Resource Reservation feature is for advanced users and should not be configured until a problem is identified. This configuration depends entirely on the problem details.

Using the MID Server Resource Reservation allows for better use of threads since the threads are not assigned a task it cannot complete.

Features:

- Resource reservations apply to a single MID Server only
- Resources can depend on system or MID Server properties
- Resources can depend on probe parameters, allowing you to limit the number of active probes and patterns against a given IP
- Reports resource usage
- Extensible (the customer defines their own resources)
- Scriptable

Benefits:

- Keeps PowerShell probes from impacting execution of other probes
- Can be used to limit the impact Discovery has on a target system
- Can be used to limit the number of "large" probes being executed by a MID Server at the same time
- Can be used to throttle Discovery (to minimize impact on the instance)

Use MID Server Resource Reservation

A resource is just a name and a count. Define the name of the resource, which probes use it, and how many of the resources those probes should use.

Before you begin

Role required: admin

- Make sure the MID Server property `mid.probe.wait.resources` is set to true to enable MID Server Resource Reservation. Changing this property requires restarting the MID Server.
- Choose a resource name. Anything in `{ }` in the name is replaced by the probe parameter with that name. This name is typically used for per-host resources, for example, `ssh{source}` means a separate resource named “ssh” is available on every host being discovered. (“source” is the name of the probe parameter that contains the IP address being probed.)
• Decide how to specify the number of the resource used by probes or patterns.
  ◦ Every probe uses a constant number of the resource: Create a "simple value" resource.
  ◦ The number of resources used depends on a system property: Create an "expanding" resource.
  ◦ The number depends on multiple factors: Create a "scripted" resource.
  ◦ Expanding: Anything in {} is replaced by the system or MID Server property with that name. Logical operators are allowed, for example, 
    `{mid.windows.management_protocol}`.toLowerCase() == "winrm" ? 1:0
  ◦ Scripted: the script is evaluated. The return value is expanded.

Procedure

1. Create a new resource.
   a. Navigate to Discovery Definition > Limited Resources > Simple Value and click New.
   b. Enter a resource name.
   c. Enter the number of resources used. Click Save.

2. Define which probes use the resource. Navigate to the desired tab and select from the list.
   • Used by Topic tab: Includes all probes with that topic. Click Invert Topic to include all probes without that topic. For example: SSHCommand with Invert Topic, means all probes except for SSH. Heartbeat and queue messages are always excluded.
   • Used by probes tab: Includes a list of probes. Click Invert Probes List to include all probes without that probe. Horizontal Discovery probe means apply to all patterns.
   • Used by patterns tab: Includes a list of patterns. You can also click Invert Pattern list.

3. Define availability on the MID Server. Navigate to Discovery Definition > Limited Resources > MID Resources.
   • Resource: This is the reference to the resource.
   • Available: Number available. Anything inside brackets, is replaced by the system or MID Server property.
   • MID Server: MID Server to apply this to. (Empty) means all.

4. Set the resource order.
a. Click in the **Order** field of each resource.

b. Type in the number.

c. Click the check mark to Save.

**Note:** Less valuable resources should have a lower order – these resources are reserved and held until higher order resources can be obtained. For example, both the total PowerShell sessions (resource is “PowerShell”) and the number of simultaneous sessions to any host (resource is “PowerShell{host}”) are limited. Therefore, PowerShell{host} resource should have a lower order. Obtaining PowerShell first would impact all other PowerShell probes. Obtaining “PowerShell{host}” first only impacts other PowerShell probes to that host.

5. Review the Resource State that you have set up.

a. Run a Discovery.

b. Observe Resource State. Click **Get resource state** from the MID Server page or view in an ECC input payload.

Result of Get resource state:

- PowerShell{source} has additional entries for every {source} with a current allocation.
- “Reserved by” may show multiple resources if the probe requires more than one resource.

Result of ECC input payload:

- resource_wait attribute only exists if the probe had to wait for a resource.
- The time displayed is in milliseconds.
- The probe may have waited on multiple resources, with different wait time for each.

**How MID Server Resource Reservation works**

In addition to the work queue, the MID Server contains a waiting queue. When picking a task for execution, the waiting queue is always checked first. If no task in the waiting queue can execute, then the work queue is tried. Probes and patterns in the waiting queue reserve all necessary resources until they’re able to execute.

The first probe or pattern in the queue is offered available resources. It takes any of the lowest order resource that is available. After getting the required number of lowest order resources, the probe or pattern goes to the next lowest order.
resources, and so on. The order allows the user to configure which resources are more or less important. Lowest order resources are gathered first because holding these resources has less impact on execution of other probes and patterns.

**Tables**

**mid_limited_resource**
- Defines the resources used by a probe or pattern.
- Extended by `mid_limited_resource_value`, `mid_limited_resource_expanded`, and `mid_limited_resource_script` each containing a single additional field.
  - `mid_limited_resource_value` adds a single field named “value” to the base table.
  - `mid_limited_resource_expanding` adds a field named “expanding.”
  - `mid_limited_resource_script` adds a field named “script”.

**mid_resource**
- Sets the resources available on a MID Server.
- Values from this table are copied to `ecc_agent_property`.
- A business rule on this table creates the corresponding MID Server properties.
- It has a reference to a resource and the number available. If the number available is inside `{ }` then it’s the name of a system property, MID Server config, or MID Server property (all three places are checked). So `{mid.powershell_api.session_pool.max_size}` is the value of that MID Server config that sets the size of the PowerShell session pool.

### Containerized MID Server

Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale. MID Servers are deployed using orchestration tools like Docker Swarm, Kubernetes or OpenShift. Orchestration tools can automate their deployment and maintenance and add new containers on demand or replace failed containers automatically.
To use Containerized MID Servers, you can download Docker recipes for Windows and Linux from the MID Server download page. Use the recipes to build the Docker images for the current release. The recipes are zipped and signed.

**Containerized MID Server system requirements**

- CentOS 7 and Windows Server 2019 are supported.
- The recipes cannot be used to build images for previous MID Server versions.
• Discovery of NMAP and CyberArk are not supported.

• Other applications such as Orchestration and Integration Hub are not certified.

Once the Docker images are available, you can create new MID Server containers and configure them with configuration parameters passed through environment variables or secret files. Docker and Kubernetes secrets are supported. The MID Server application inside the container is run as a process by a non-admin user.

When a containerized MID Server record is first created on the instance, a random UUID is created and set to the `container_id` column. During the start-up sequence, this value is replaced by the actual container ID. The container ID can be used to differentiate between containerized and regular MID Servers. Non-containerized MID Servers’ container ID have a null or empty value.

In order to automatically clean up the down MID Servers on Instance, a scheduled job called Purge Orphaned Containerized MID Servers is scheduled to run daily. This job removes orphaned containerized MID Servers if they are down longer than the value set by the `max_retention_days` property. The job also creates a warning MID Server issue each day before the removal day, if there are equal to or less than the value of `warn_days` remaining. The default values for `max_retention_days` and `warn_days` are 30 and 7, respectively.

**Auto-upgrade**

Auto-upgrade works the same way for containerized MID Servers as it does for regular MID Servers.

**HealthCheck**

A HEALTHCHECK rule is implemented to check MID Server health status based on heartbeat every 5 minutes. If there was no heartbeat activity in last 30 minutes, it is considered a failure. After 3 consecutive failures, it becomes unhealthy in the `docker ps` command output.

To see more HealthCheck details, run the following `docker inspect` command:

```
docker inspect --format='{{json .State.Health}}' <container-id>
```

**Basic Container Operations**

Basic operations are supported on container side. For example, you can stop, start, or restart a running container using Docker commands.

```
docker stop <container_id>
```

This command shuts down the containerized MID Server.
docker start <container_id>
This command starts a containerized MID Server if it is stopped.

docker restart <container_id>
This command shuts down a MID Server and restarts it.

Build MID Server Docker Image for Windows

Deploy Containerized MID Servers on Windows by creating a Docker image with the provided recipes. Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale.

Before you begin
Role required: admin

Prerequisites

- Windows hosts must use Windows Server 2019, 64 bit architecture.
- The host must use Docker engine and command-line interface (CLI) 20.10.4 or later.

Note: Check docker availability by running the docker version command as administrator. See the docker version command documentation for more information.

Procedure

1. Download the Windows Docker recipe ZIP file from the MID Server download page and verify its signature.
   For more information about the MID Server download page and signature verification, see Download MID Server files.
2. Unzip the ZIP file to a folder.
3. Optional: You can change the current directory to the new folder.
4. To build an image, run the build command: docker build <path-to-docker-recipe> [--tag <docker-tag>]
   For more information on the build command, see the Docker build command documentation. The path to the docker recipe can be a relative path or simply a dot (.) if the recipe folder is the current directory. Setting an image tag is optional but recommended. The default tag is provided in the .env file in the recipe folder. Use the ‘type’ command to get the value (without DOCKER_TAG=) and replace the <docker-tag> placeholder in the command above.
The build command takes the following build arguments:

**MID_INSTALLATION_URL**

This parameter gives the link to download the MID installation file. By default, it is set to the download link for the Windows 64 bit Installation ZIP file provided on the MID Server download page.

**MID_INSTALLATION_FILE**

This parameter gives the name of a local MID installation file. The default value is empty. If this parameter is not empty, the recipe will use the local file instead of downloading from remote. Please note that this parameter is supposed to give the file name only, not the full path. Before the build, the local file needs to be copied to the asset subfolder of the recipe folder.

**MID_SIGNATURE_VERIFICATION**

This parameter specifies whether the signature of the MID installation file must be verified. The default value is TRUE. If it is TRUE, the build process always verifies the digital signature of the MID installation file whether it is downloaded from remote or a local file.

**Note:** To use a different build argument value than the default, you can add the `--build-arg` option to the build command. The resulting image may not work if the build parameters are changed for a non-default MID Server version. Windows MID versions before Rome release are not supported. Also note that the recipes only work with the MID Server installation ZIP files.

5. To see a list of available images, run the `docker image ls` command:

```
   docker image ls
```

For more information, see the `docker image ls` command documentation.

**Build MID Server Docker Image for Linux**

Deploy Containerized MID Servers on Linux by creating a Docker image with the provided recipes. Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale.

**Before you begin**

Role required: admin

**Prerequisites**
• Linux hosts must use CentOS distribution 64 bit architecture, and CentOS distro is recommended.

• The host must use Docker engine and command-line interface (CLI) 20.10.4 or later.

Note: Check docker availability by running the docker version command as administrator. See the docker version command documentation for more information.

Procedure
1. Download the Linux Docker recipe ZIP file from the MID Server download page and verify its signature. For more information about the MID Server download page and signature verification, see Download MID Server files.

2. Unzip the ZIP file to a folder.

3. Optional: You can change the current directory to the new folder.

4. To build an image, run the build command: > docker build <path-to-docker-recipe> [ --tag <docker-tag> ]

For more information on the command, see the Docker build command documentation. The path to the Docker file can be a relative path or the current directory if the file is in the Docker recipe directory.

The default image tag is provided out-of-the-box in the .env file with the DOCKER_TAG parameter. You can export this parameter before executing any docker command by running the command: > export $(grep DOCKER_TAG .env). You can replace <docker-tag> with the DOCKER_TAG value in all the following commands.

The build command takes the following build arguments:

**MID_INSTALLATION_URL**

This parameter gives the link to download the MID installation file. By default, it is set to the download link for the Linux 64 bit Installation ZIP file provided on the MID Server download page.

**MID_INSTALLATION_FILE**

This parameter gives the name of a local MID Server installation file. The default value is empty. If this parameter is not empty, the recipe uses the local file instead of downloading from the installation server. This parameter uses the file name only, not the full path. Before the build, the local file must be copied to the
mid_installation_file=<mid.installation.file.name>) --tag <docker-tag>

MID_SIGNATURE_VERIFICATION

This parameter specifies whether the signature of the MID Server installation file must be verified. The default value is TRUE. If it is TRUE, the build process always verifies the digital signature of the MID Server installation file whether it is downloaded from the remote server or a local file. Otherwise, the signature verification will be skipped.

For example: > docker build <path-to-dockerfile> --build-arg MID_SIGNATURE_VERIFICATION=false --tag <docker-tag>

USER_ID and GROUP_ID

These two parameters run the containerized MID Server as current host user. By default, when no user is specified, Docker creates a MID Server user with user id = 1001 and group id = 1001. You may assign a host user by passing its user id and group id into container by using the USER_ID and GROUP_ID build arguments. Docker creates a container user for the MID Server with the provided user id and group id. Any files generated by the container MID Server are owned by this host user.

For example: > docker build <path-to-dockerfile> --build-arg USER_ID=1234 --build-arg GROUP_ID=1234 --tag <docker-tag>

5. Optional: After the image is built successfully, you can list the image built with command: > docker image ls

Launch Containerized MID Server

Containerized MID Server uses a Docker image of the MID Server that allows you to quickly deploy MID Servers at scale. MID Servers are deployed using orchestration tools like Docker Swarm, Kubernetes or OpenShift.

Before you begin
Role required: admin

Prerequisites
• Windows hosts must use Windows Server 2019, 64 bit architecture.

• Linux hosts must use CentOS distribution 64 bit architecture, and CentOS distro is recommended.

• The host must use Docker engine and command-line interface (CLI) 20.10.4 or later.

**Note:** Check docker availability by running the `docker version` command as administrator. See the the `docker version` command documentation for more information.

**Procedure**

1. Once the image is available, launch the new MID Server using the `docker run` command and specify an env file or env variable options: `docker run --env-file <env_file_name_here> <docker_tag_or_image_id>

**Note:** Do not pass sensitive data using this command, as there may be security vulnerabilities. To pass sensitive data, use the procedures Pass sensitive data to a containerized MID Server with Docker Secrets and Pass sensitive data to a containerized MID Server with Kubernetes Secrets.

For more information, see the Docker documentation pages for the `docker image ls` command, the `docker run` command, and specifying an env file or env variable options. The env file is a simple text file using the name=value format. If a variable is specified in both env file and in the `--env` option, the variable defined in the command line takes precedence.

When the container is first started, the initialization script will take the environment variables and configure the MID Server application using the following environment variables:

**MID_INSTANCE_URL**
This variable sets the 'url' config parameter.

**MID_INSTANCE_USERNAME**
This variable sets the 'mid.instance.username' config parameter.

**MID_INSTANCE_PASSWORD**
This variable sets the 'mid.instance.password' config parameter.

**MID_SERVER_NAME**
This variable sets the 'name' config parameter.
**MID_PROXY_HOST**

This variable sets the 'mid.proxy.host' config parameter. This variable is not mandatory and is only necessary when a proxy is set up.

**MID_PROXY_PORT**

This variable sets the 'mid.proxy.port' config parameter.

**MID_PROXY_USERNAME**

This variable sets the 'mid.proxy.username' config parameter.

**MID_PROXY_PASSWORD**

This variable sets the 'mid.proxy.password' config parameter.

**MID_SECRETS_FILE**

This variable specifies the full secret filename that contains sensitive data like passwords or certificate.

**MID_MUTUAL_AUTH_PEM_FILE**

This variable specifies the full filename of the client certificate file used for auto validation setup.

2. **Optional:** To see a list of containers, run the docker container ls command:

```
docker container ls [-a]
```

Pass sensitive data to a containerized MID Server with Docker Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.

**Before you begin**

Role required: admin

**About this task**

You can pass sensitive data, such as passwords or certificates, into a containerized MID Server using Docker Secret. Setup and start Docker Swarm before using this procedure.

If certificate based authentication is enabled on the instance, the MID Server can be configured to auto-validate using a mutual authentication client certificate (PEM file). This can be done via setting the full path to the PEM certificate file inside container with the `MID_MUTUAL_AUTH_PEM_FILE` environment variable. For example, you can update variable to `MID_MUTUAL_AUTH_PEM_FILE= /run/secrets/certificate.pem` in the `mid.env` file.

You can pass the PEM certificate file into a container using Docker or Kubernetes secret. The following is an example command to pass the PEM...
certificate file into a container: `docker service create --name mid-service --secret mid-secrets.properties --secret <certificate-secret-name> --env-file mid.env <docker-tag or image-id>

When creating deployments, ensure that the replicas are kept to 1.

The mutual PEM certificate is installed on the MID Server during initialization. MID Server then connects to the instance and auto-validates. When the MID Server connects to the instance with mutual authentication successfully enabled, you might observe some of the following entries in the MID agent log:

• Installed custom certificate into the MID keystore
• Configured MID to use mutual authentication

Procedure

1. Place the sensitive data in `mid-secrets.properties`

2. Create a docker secret using the docker secret create command: `docker secret create mid-secrets.properties mid-secrets.properties`  
   The first `mid-secrets.properties` represents the secret file inside the container, while the second `mid-secrets.properties` parameter represents the file path to read the secret on the host machine's filesystem. You can list all created secrets by running the command `docker secret ls`.  
   For more information on the docker secret command, see the docker secret documentation.

3. Update the `MID_SECRETS_FILE` environment variable with the path to the secret file inside the container.  
   The default path for Docker Swarm secrets on Linux is `/run/secrets/mid-secrets.properties`. On Windows the default path is `C:\ProgramData\Docker\secrets\mid-secrets.properties`.

4. Deploy the MID Server Image Container to Swarm using the docker service create command: `docker service create --name mid-service --secret mid-secrets.properties --env-file mid.env <docker-tag or image-id>`  
   Make sure that the `--secret` flag is provided for the container service to associate with the specified secrets.

Pass sensitive data to a containerized MID Server with Kubernetes Secrets

You can configure containerized MID Servers with configuration parameters passed through environment variables or secret files.
Before you begin
Role required: admin

Prerequisites:
Setup and start Kubernetes cluster before using this procedure. For more information on Kubernetes Secrets, see the Kubernetes secrets documentation.

Note: Kubernetes doesn’t work directly with a local image. Upload the MID Server image to a public registry or setup a local registry. See the official Docker instruction on building a docker registry.

If certificate based authentication is enabled on the instance, the MID Server can be configured to auto-validate using a mutual authentication client certificate (PEM file). This can be done via setting the full path to the PEM certificate file inside container with the MID_MUTUAL_AUTH_PEM_FILE environment variable. For example, you can update variable to MID_MUTUAL_AUTH_PEM_FILE= /run/secrets/certificate.pem in the mid.env file.

You can pass the PEM certificate file into a container using Docker or Kubernetes secret. The following is an example command to pass the PEM certificate file into a container: docker service create --name mid-service --secret mid-secrets.properties --secret <certificate-secret-name> --env-file mid.env <docker-tag or image-id>

When creating deployments, ensure that the replicas are kept to 1.

The mutual PEM certificate is installed on the MID Server during initialization. MID Server then connects to the instance and auto-validates. When the MID Server connects to the instance with mutual authentication successfully enabled, you might observe some of the following entries in the MID agent log:

- Installed custom certificate into the MID keystore
- Configured MID to use mutual authentication

Procedure
1. Place the sensitive data in mid-secrets.properties accordingly.
2. Create a Kubernetes secret with the command: kubectl create secret generic mid-secret --from-file=mid-secrets.properties
3. Optional: You can list all created secrets by running the command: kubectl get secrets
4. Update the MID_SECRET_FILE environment variable with the path to the secret file inside container.
The path is defined in data field when creating a configuration file for a Secret.

5. Create a deployment with the following sample YML content:

```yaml
apiVersion: apps/v1
kind: Deployment
metadata:
  name: mid-deployment
spec:
  selector:
    matchLabels:
      app: mid
  replicas: 1
template:
  metadata:
    labels:
      app: mid
      name: mid
spec:
  containers:
  - name: mid-service
    imagePullPolicy: Retry
    image: <image tag>
    volumeMounts:
    - name: mymount
      mountPath: "/etc/secret"
      readOnly: true
    env:
    - name: MID_INSTANCE_URL
      value: ""
    - name: MID_INSTANCE_USERNAME
      value: ""
    - name: MID_INSTANCE_PASSWORD
      value: ""
    - name: MID_SECRETS_FILE
      value: "/etc/secret/mid-secrets.properties"
    - name: MID_SERVER_NAME
      value: ""
    - name: MID_PROXY_HOST
      value: ""
    - name: MID_PROXY_PORT
      value: ""
    - name: MID_PROXY_USERNAME
      value: ""
```

- name: MID_PROXY_PASSWORD
  value: ""
- name: MID_MUTUAL_AUTH_PEM_FILE
  value: ""

volumes:
- name: mymount
  secret:
  secretName: mid-secret

**Note:** There are many ways to create a deployment or pod. For more information, see the Kubernetes deployment instructions.

6. Deploy the containerized MID Server to the pod with the deployment.yml and run the command: `kubectl create -f deployment.yml`

**Securing and encrypting MID Server data**

After configuring your MID Server, you can add security by encrypting MID Server parameter values in the `config.xml` file. Encryption protects data that the MID Server returns to the ECC Queue. Other available security options include the authorization of SOAP requests, restricting access to the MID Server configuration file, and establishing secure socket layer (SSL) connections.

1. **Ensure that the MID Server can connect to elements inside and outside your network**

2. **Download and install the MID Server on a Linux or Windows host**

3. **Configure your MID Server**

4. **Configure MID Server security**

5. **Ensure that the MID Server can connect to elements inside and outside your network**

6. **Download and install the MID Server on a Linux or Windows host**

7. **Configure your MID Server**

8. **Configure MID Server security**
How MID Server password encryption works

The **username** and **password** are initially set in the `config.xml` file on the MID Server. When the MID Server retrieves the credentials, it replaces the clear-text password with an encrypted password automatically, using an AES128 encryption algorithm. In continued efforts to improve MID Server security, the encryption algorithm has been enhanced. The MID Server also maintains an encryption key that is generated each time it starts and remains in memory and not on the hard disk. When credentials need to be sent from the instance to the MID Server, the following process takes place:

1. The instance retrieves the encrypted **password** and the unencrypted **username** from the instance database table.

2. The instance decrypts the encrypted **password**, and then re-encrypts it using the MID Server encryption key.

3. The **username** and re-encrypted **password** are sent to the MID Server through the encrypted TLS session was already established between the MID server and the instance.

4. The MID Server receives the credentials and decrypts the **password** in memory before using the credentials for remote operations. At no point is the credential password stored on the disk in an unencrypted format.

| Note: | In the Orlando release, the MID Server requires a minimum JRE version 1.8.0_161, and recommended version 1.8.0_181. If you are using a lower version than 1.8.0_161, you may see encryption related issues. |

**Security options**

The MID Server provides built-in security options for other content in the configuration file, such as the default encryptor, Windows Data Protection API, and options for custom encryption.

**MID Server certificate check policies**

Control the MID Server with the certificate check policies table to secure external traffic.

**Encrypt or decrypt MID Server configuration file values**

You can encrypt and decrypt any value in the MID Server `config.xml` file.

**ECC queue data encryption with the automation API**

Use the automation API to encrypt sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.

**MID Server configuration file security**
Protect sensitive MID Server configuration data in the config.xml file using internal and external data encryption and external data storage.

**MID Server authentication credentials and SOAP requests**

Set basic authentication credentials to update the web service invocation data and enforce basic authentication on each incoming SOAP request to the MID Server.

**MID Server unified key store**

The MID Server unified key store allows all products on the MID Server to use a common certificates and key pairs.

**MID Server command audit log**

The command audit log records the commands run by the MID Server for the Discovery application.

**Rekey a MID Server**

Rekey a MID Server to force it to restart and generate a new private key. Typically, this process is only necessary if the MID Server keystore is compromised.

**Add SSL certificates for the MID Server**

Add certificates to the MID Server to communicate over SSL.

**MID Server SSH cryptographic algorithms**

The MID Server utilizes SSH clients to perform many discovery actions. The MID Server automatically determines the best cryptographic algorithm to use.

**MID Server authentication credentials and SOAP requests**

For added security, enforce basic authentication on each incoming SOAP request to the MID Server.

**Attach a script file to a file synchronized MID Server**

Attach a script file and synchronize it to a MID Server to prevent Windows enhanced security from blocking MID Server download files it determines are dangerous.

**MID Server certificate check policies**

MID Server uses three kinds of security checks to secure external traffic. The security checks use TLS/SSL certificate validation, hostname validation, and OCSP validation to improve security. Control these security checks with the MID Server certificate check policies table.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**TLS/SSL certificate validation**

TLS/SSL encryption security uses asymmetric encryption, also called public-key encryption. This encryption uses two cryptographic keys: the public key and the private key. The public key is used for encryption of data and is publicly visible. The private key is used for decryption of data and its security is essential to verifying authenticity. For more information about preparing your network, see MID Server TLS/SSL certificate check policy Quebec upgrade information [KB0867397].

In TLS/SSL certificate validation, the MID Server attempts to connect to a web server secured with a TLS or SSL certificate. The web server sends a copy of its TLS/SSL certificate to the MID Server. The MID Server checks the authenticity of the certificate and sends a message to the webserver. The webserver responds with a digitally signed acceptance for initiating an TLS/SSL encrypted session. After which the MID Server can begin encrypted communication with the web server.

**Hostname validation**

Hostname verification is a part of HTTPS that involves a server identity check to ensure that the client is talking to the correct server. This check prevents sending information to a server after being redirected by a man in the middle attack.
The check involves verifying that the `dnsName` of the certificate sent by the server matches the URL used to make the request. According to RFC 6125, hostname verification should be done against the certificate's `subjectAlternativeName`'s `dNSName` field. In some legacy implementations, the check is done against the certificate's `commonName` field. If the names don't match, the connection is terminated.

**Note:** Hostname validation derives the hostname from the validated certificate presented by the server. Therefore, TLS certificate validation is a pre-requisite for hostname validation.

**Online Certificate Status Protocol (OCSP)**

OCSP involves contacting the remote certificate authority server and verifying the certificate before the MID Server communicates further with the target server. Compromised certificates can be a security vulnerability, especially if those certificates have the ability to sign other certificates. If certificates have been broken or forged, then a certificate authority can inform a client which certificates are invalid and should not be used.

An OCSP responder (a server typically run by the certificate issuer) returns a signed response that the certificate is 'good', 'revoked', or 'unknown'. If it cannot process the request, it may return an error code.

The certificate's issuer may delegate another authority to be the OCSP responder. This creates a chain of certificates that must be verified. The responder's certificate must be issued by the issuer of the certificate in question. The responder's certificate must include a certain extension that marks it as an OCSP signing authority.

**Note:** OCSP checks are secondary HTTP calls made to an OCSP responder. The primary call may discontinue the connection based on the response from the OCSP responder.

**MID Server security policy**

MID Server security policies control all HTTPS traffic originating from the MID Server. This includes HTTPS connections from the MID Server to an internet endpoint, ServiceNow URLs, intranet endpoints, as well as cloud endpoints.
These connections can be further classified into 4 security policies:

**ServiceNow endpoint policy**

This policy is the system default exclusively for ServiceNow URLs. On the MID Server `config.xml`, there are bootstrap properties which are only used to make first connection to the instance and will get updated with the `system_default` policy.

**Internet policy**

These policies cover all HTTPS connections initiated from MID Server to any endpoint on the internet.

**Intranet policy**

These policies cover the reserved IP subnets, such as self-hosted networks.

**Overridden policy**

You can override specific endpoints or URLs with this policy definition. Overridden policies take the highest order of precedence during operation.

Both tables are editable to include or exclude IP ranges, as well as control what kind of certificate validation checks need to be done. Enable all certificate validation checks to maximize security. The Quebec version has all policies and checks turned on by default for fresh installations.

For upgrading customers, the intranet policy has the certificate validation checks disabled by default. To improve security, configure and enable the policy for endpoints within the internal network.

Note: Internal endpoints or URLs need to possess a valid CA signed certificate for a successful connection.

For endpoints that host a self-signed certificate, either import the certificate to the MID Server truststore or disable the policy checks which validate that host.
For more information about adding certificates, see Add SSL certificates for the MID Server.

After upgrading to Quebec, go to the certificate check policies table and make changes to policy configuration if necessary. Once the MID Server starts up and connects to the instance, any subsequent HTTPS connection originating from the MID server will start applying these certificate checks at runtime. Insecure connections are broken with appropriate error messages.

Encrypt or decrypt MID Server configuration file values

The value of any MID Server parameter in the `config.xml` file can be encrypted. The attributes for all encrypted values are managed from within the configuration file, including the security attribute of the login password.

**Before you begin**

Role required: admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

---

**Procedure**

1. Navigate to the `agent` directory that was created when the MID Server was installed and open the `config.xml` file using a text editor such as WordPad.

2. Locate or add the parameter you want to encrypt.
   
   For example, you might want to protect your proxy server passwords by configuring this parameter:
3. Add the encryption attribute `secure="true"`.

```xml
<parameter name="mid.proxy.password" secure="true" value="securepassw0rd"/>
```

4. Restart the MID Server.

5. Open the `config.xml` file. The encrypted password appears as follows:

```xml
<parameter name="mid.proxy.password" secure="true" value="encrypted:rhrfUNYRzZAI8/BkTtZmNA=="/>
```

6. To decrypt this or any other value in the `config.xml` file and display the value in clear text:
   a. Stop the MID Server.
   b. Set the `secure="true"` attribute to `false`.
   c. Replace the encrypted value with the clear text value.
   d. Restart the MID Server.

**ECC queue data encryption with the automation API**

The automation API encrypts sensitive probe data that is sent from an instance to the MID Server through the ECC Queue.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

You can use the automation API to encrypt data that you send from a custom application to the ECC queue and prevent that data from appearing in clear text. For example, you can encrypt a password used by a MID Server to authenticate on a REST endpoint.

**Methods**

The API provides these methods:

- `encrypt()`
- `isEncrypted()`

The following example shows how you might call these methods:

```javascript
var automation_api = new sn_automation.AutomationAPI();
var password = 'xyz';
var encrypted_password;
if (automation_api.isEncrypted(password))
    encrypted_password = password;
else
    encrypted_password = automation_api.encrypt(password);
```

The `encrypted_password` value can then be passed safely to the ECC Queue and on to the desired MID Server.
MID Server configuration file security

Sensitive MID Server configuration data can be protected using several different schemes, including internal and external data encryption and external data storage.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server provides the following built-in security options for content in the config.xml file:

- **Default security provider**: Secures the data in the config.xml file by encryption. When the MID Server is restarted, any unencrypted data is encrypted and written to the config.xml file. The default security provider offers these encryption options:
  - **Default encryptor**: Default process for encrypting data in the MID Server config.xml file. See Encrypt or decrypt MID Server configuration file values for details.
  - **Windows Data Protection API (DPAPI)**: The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can only be decrypted by the same user account. If the account changes, the data must be re-encrypted.
  - **Custom encryption**: Implement the IMidServerEncrypter interface to create your own custom encryption scheme to manage sensitive config.xml data.
**CyberArk**: Data security is provided by CyberArk’s Privileged Account Security system, which moves sensitive data from the `config.xml` file to a secure CyberArk vault. This solution does not encrypt the data.

**Custom external storage**: Implement the `ISecuredConfigProvider` interface to create your own custom external storage system to manage sensitive `config.xml` data.

### Secured content and encryption schemes

![Diagram showing encryption schemes]

**Encrypt MID Server configuration data with DPAPI**

Windows Data Protection API (DPAPI) encrypts sensitive data from the `config.xml` file, based on the MID Server user account.

**Before you begin**

Role required: admin

**About this task**

DPAPI encryption provides another level of security for data such as credentials, IP addresses, and URLs in the MID Server `config.xml` file. The operating system performs the data encryption, rather than the MID Server. DPAPI encryption is based on the logged in user's account. When this scheme is used, the data can...
only be decrypted by the same user account. If the account changes, the data must be re-encrypted.

**Procedure**

1. Open the `config.xml` file in a text editor. This file is located in the `/agent` folder in your MID Server installation path.
2. Enable this parameter and value:
   ```xml
   <parameter name="mid.secure_encrypter" value="com.service_now.mid.services.config.WindowsDPAPIEncrypter"/>
   ```
3. Save the configuration file.
4. Restart the MID Server. Any values in clear text in the `config.xml` file are encrypted by the operating system.
5. Follow this procedure if you need to change the MID Server user account that is used for encryption.
   a. Stop the MID Server service.
   b. Open the `config.xml` file in a text editor. This file is located in the `/agent` folder in your MID Server installation path.
   c. Re-enter all the encrypted values in clear text.
   d. Make the changes to the MID Server user account in the ServiceNow® instance.
   e. Restart the MID Server service. The data is re-encrypted by the operating system, based the new MID Server user account.

**Use CyberArk as a secure configuration provider**

You can use a CyberArk vault to secure any sensitive data from the MID Server `config.xml` file.

**Before you begin**
Role required: admin
About this task
CyberArk is commonly used to secure credentials in its external vault. However, a MID Server parameter in the config.xml file enables you to store other types of data in CyberArk.

Procedure
1. Open the config.xml file in a text editor. This file is located in the /agent folder in your MID Server installation path.
2. Enable this parameter and value:
   ```xml
   <parameter name="mid.secure_config.provider" value="com.service_now.mid.services.config.CyberArkSecuredConfigProvider"/>
   ```
3. Configure specific data to secure in the CyberArk vault, as shown in these examples.
   a. Secure the MID Server credentials by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      ```xml
      <parameter name="mid.instance.username" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      <parameter name="mid.instance.password" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      ```
   b. Secure the URL of the instance by setting this parameter to match the ID and Type for that data in your CyberArk configuration.
      ```xml
      <parameter name="url" secure="true" value="cyberark: id=<CyberArk ID>, type=<CyberArk type>"/>
      ```
4. Save the configuration file.
5. Restart the MID Server.

Change MID Server configuration file security schemes
The MID Server provides several schemes for securing sensitive data in the config.xml file and allows you to switch between these options to suit your security requirements.

Before you begin
Role required: admin

Procedure
1. Stop the MID Server service.
2. Open the config.xml file in a text editor.
This file is located in the /agent folder in your MID Server installation path.

3. Re-enter all the encrypted values in clear text.

4. Disable the previous security scheme and configure the MID Server to use the new provider.

5. Restart the MID Server service.
   The data is re-secured or encrypted, based on the security scheme you have selected.

**MID Server ISecuredConfigProvider interface**

Use the methods in this interface to create custom providers that manage secured parameter values in the MID Server config.xml file.

*Note:* These methods are contained in the snc-automation-api.jar file, located in the MID Server installation folder.

**initialize**

This method initializes the provider with additional configuration parameters and does not return a value.

**Example**

```java
void initialize(java.util.Properties properties,
   IMidServerEncrypter encrypter)
   throws java.lang.Exception
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
<tr>
<td>encrypter</td>
<td>Encrypter to use if the provider is encryption based.</td>
</tr>
</tbody>
</table>

**Exception**

`java.lang.Exception`
**isParameterValueSecured**
This method checks to see if the parameter value has been secured or not. This method returns a **boolean** type value.

**Example**

```java
boolean isParameterValueSecured(java.lang.String paramValue)
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>paramValue</td>
<td>The parameter value.</td>
</tr>
</tbody>
</table>

**Returns**

The parameter returns **true** if the parameter value is secured.

**secureParameterValue**
This method secures the parameter value if it has not been secured. This method returns a **string** type value.

**Example**

```java
java.lang.String secureParameterValue(java.lang.String unsecuredParameterValue)
    throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unsecuredParameterValue</td>
<td>The unsecured parameter value.</td>
</tr>
</tbody>
</table>

**Returns**

This method returns the unsecured parameter value.
**Exception**

java.lang.Exception

**unsecuredParameterValue**
This method returns the unsecured value of the parameter. This method returns a **string** type value.

**Example**

```java
java.lang.String unsecuredParameterValue(java.lang.String parameterName)
    throws java.lang.Exception
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameterName</td>
<td>The parameter name.</td>
</tr>
</tbody>
</table>

**Returns**

This parameter returns the unsecured value.

**Exception**

java.lang.Exception

**MID Server IMidServerEncrypter interface**

Use the methods in this interface to create a custom external encrypter for the MID Server `config.xml` file.

⚠ **Note:** These methods are contained in the `snc-automation-api.jar` file, located in the MID Server installation folder.

**initialize**
This method initializes the encrypter with additional configuration parameters and does not return a value.
Example

```java
void initialize(java.util.Properties properties)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>Initialization properties.</td>
</tr>
</tbody>
</table>

Exception

`java.lang.Exception`

**encrypt**

This method encrypts the unencrypted data and returns a `byte[]` type value.

Example

```java
byte[] encrypt(byte[] unencryptedData)
    throws java.lang.Exception
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unencryptedData</td>
<td>The data unencrypted.</td>
</tr>
</tbody>
</table>

Returns

Encrypted data

Exception

`java.lang.Exception`
decrypt
This method decrypts encrypted data and returns a `byte[]` type value.

Example

```java
byte[] decrypt(byte[] encryptedData)
    throws java.lang.Exception
```

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encryptedData</td>
<td>The data decrypted.</td>
</tr>
</tbody>
</table>

Returns
Decrypted data.

Exception
`java.lang.Exception`

**MID Server authentication credentials and SOAP requests**
Set basic authentication credentials to update the web service invocation data. For added security, you can enforce basic authentication on each incoming SOAP request to the MID Server.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**Basic authentication credentials and SOAP requests**

You can enforce basic authentication on each request. The MID Server is not able to communicate through a proxy server if the proxy server supports only NTLM authentication. You can use basic authentication with a proxy server or create an exception for the MID server host.

Supplying basic authentication information, regardless of whether it is required, has an added advantage. The web service invocation creates or updates data using the supplied credentials. For example, when you create an incident record, the journal fields have the user id of the basic authenticated user instead of the default Guest user. This behavior allows you to identify data added by a specific MID Server.

You can set basic authentication credentials for SOAP requests. Each SOAP request contains an Authorization header as specified in the Basic Authentication protocol.

⚠️ **Note:** The setting for enforcing strict security controls how the instance uses the credentials you provide for the MID Server. When the setting is enabled, you must provide a user ID with access to the tables the MID Server is trying to access. When the setting is disabled, any valid user ID allows the MID Server to access to all tables.
Note: To learn more about properties that affect SOAP request processing, see Basic auth: SOAP requests in Instance Security Hardening Settings.

**Require basic authorization for incoming SOAP requests**

Enforce basic authentication on each incoming SOAP request to the MID Server.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to System Properties > Web Services.
2. Select the check box for Require basic authorization for incoming SOAP requests.
3. Click Save.
4. To provide basic authentication credentials for a MID Server, navigate to C:\Program Files\ServiceNow\<MID Server name>\agent and edit the config.xml file, as follows:
   
   **a.** Find the element `<parameter name="mid.instance.username" value=""/>` and enter the instance administrator user name as the value.
   
   **Example**
   For example, you might enter `<parameter name="mid.instance.username" value="admin"/>`.

   **b.** Find the element `<parameter name="mid.instance.password" value=""/>` and enter the configured password for this instance as the value.
   
   **Example**
   For example, you might enter `<parameter name="mid.instance.password" value="abc123"/>`.

**MID Server unified key store**

The MID Server unified key store allows all products on the MID Server to use a common certificates and key pairs. This feature allows applications to use the same secure communication channel to the MID Server that the MID Server uses to connect to the instance.
1. Ensure that the MID Server can connect to elements inside and outside your network

2. Download and install the MID Server on a Linux or Windows host

3. Configure your MID Server

4. Configure MID Server security

5. Ensure that the MID Server can connect to elements inside and outside your network

6. Download and install the MID Server on a Linux or Windows host

7. Configure your MID Server

8. Configure MID Server security

When the MID Server starts, the common name (CN) of the certificate is inspected to identify if a custom certificate has been installed. If a custom certificate is detected, the creation of the certificate/keypair will be skipped and an attribute is set on the ecc_agent record to indicate the usage of a custom certificate.

When a custom certificate is used, the **Re-key** UI-action is disabled on the instance for the MID Server. A new UI action called **Remove custom certificate** is available to switch back to using a self-signed certificate. Using this action will cause the MID Server to remove the custom certificate and generate a new self-signed certificate, similar to the re-key option.

When a MID is upgraded, any custom certificates that were installed will be retained.

**PEM bundle support**

MID Server unified key store supports PEM bundle certificate and key pairs.

**Sample PEM bundle**

<table>
<thead>
<tr>
<th>Bag Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>friendlyName: epic1016883</td>
</tr>
<tr>
<td>localKeyId: 54 69 6D 65 20 31 35 39 35 34 32 30 38 30 35 31</td>
</tr>
</tbody>
</table>
Install custom certificates in the MID Server unified key store

Install custom certificates to unify the security channels for various applications.

**Before you begin**

**Role required:** admin

When installing the certificate on a MID hosted from a headless virtual machine, the available entropy must be higher than 2000. Check the entropy with the following command.

```
cat /proc/sys/kernel/random/entropy_avail
```
If the entropy is below the required amount, install the Haveged package. For more information about installing Haveged for CentOS and Ubuntu, see How to Setup Additional Entropy for Cloud Servers Using Haveged.

Procedure
1. If the MID Server is running, stop the MID Server.
2. Create a PEM bundle certificate and keypair by running one of the following commands in the MID Server install folder.
   - Create a key store and a self signed cert using the command:
     ```
     keytool -keystore <myCustomCert>.jks -genkeypair -alias <myCustomCert> -dname 'CN=<myCustomCert>,L=Santa Clara,ST=CA,C=US' -keysize 2048 -keyalg RSA
     ```
   - Convert the key store to PKCS format using the command:
     ```
     keytool -importkeystore -srckeystore <myCustomCert>.jks -destkeystore <myCustomCert>.p12 -srcstoretype jks -deststoretype pkcs12
     ```
   - Export the key store to a PEM bundle using the command:
     ```
     openssl pkcs12 -in <myCustomCert>.p12 -nodes -out <myCustomCert>.pem
     ```
   - Install the certificate and private key for Windows hosts using the command:
     ```
     bin/scripts/install-certificate.bat [file path to PEM bundle]
     ```
   - Install the certificate and private key for Linux hosts using the command:
     ```
     bin/scripts/install-certificate.sh [file path to PEM bundle]
     ```
3. Start the MID Server.
4. Validate the MID Server with the instance.
5. Optional: To revert the MID Server to use a self-generated certificate, select the MID Server in the instance and use the UI action Remove custom certificate.
   - Note: The MID Server can also be reverted using the Invalidate UI action. Invalidating a MID Server removes any custom certificates that are installed and creates a new self-signed certificate for the MID Server.

Enable MID Server mutual authentication
Configure the MID Server to use a client certificate for authenticating to the instance. This avoids the need to create a basic authentication credentials in the Key Store for the MID Server’s configuration.
Before you begin
Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
MID Server mutual authentication removes the MID Server user name and password and provides a client certificate for authentication. Whenever a server requests authentication, this certificate is sent instead. To use mutual authentication, certificate-based authentication must be enabled. See Set up Certificate-based authentication for the procedure.

If a new MID Server is created with mutual authentication, it does not add capabilities automatically. An administrator must add capabilities to its record on the instance. However, existing MID Servers using basic authentication with capabilities are preserved when switching to mutual authentication.

A MID Server using mutual authentication cannot be re-keyed or validated as a UI action on the instance.

In the Quebec release, a MID Server using the Health Log Analytic application cannot be configured with mutual authentication.
Procedure

1. Contact ServiceNow support to request mutual authentication on the MID Server.

2. Obtain a certificate and private key from a respected certificate authority.

   Note: MID Server mutual authentication only supports the PEM bundle format.

3. On the instance, navigate to `sys_user_certificate.list`.

4. Create a new record.

   Note: The record must have the MID Server's name and the User Role must be MID Server.

5. Attach the certificate to the record.

   Note: Ensure that the attached file contains only the certificate.

6. Optional: If the MID Server is running, stop the MID Server.

7. On the MID Server host machine, run the following command to install the certificate and private key.

   • For Windows hosts, use the command:

   ```
   bin/scripts/install-certificate.bat [file path to PEM bundle] --useMutualAuth
   ```

   • For Linux hosts, use the command:

   ```
   bin/scripts/install-certificate.sh [file path to PEM bundle] --useMutualAuth
   ```

8. Start the MID Server.

9. Optional: To remove mutual authentication,
a. Stop the MID Server.

b. Run the following command on the MID Server host machine to remove mutual authentication and create a basic authentication username and password.

- For Windows hosts, use the command:
  
  bin/scripts/remove-certificate.bat --removeMutualAuth [myUserName] [myPassword]

- For Linux hosts, use the command:

  bin/scripts/remove-certificate.sh --removeMutualAuth [myUserName] [myPassword]

  **Note:** If you do not provide a username and password with this command, a username and password must be added to the config.xml file manually.

c. Start the MID Server and validate it.

**MID Server command audit log**

The command audit log records the commands run by the MID Server for the Discovery application. Review the commands to check for anomalies or errors.

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security
The MID Server command audit log is a record of the commands the MID Server runs during discovery. For example, executing one pattern may run many separate commands. The MID Server command audit log supports Powershell commands for WMI and WinRM. For SSH commands, the audit log supports SSNC but not J2SSH. In Quebec, the command audit log only supports recording the commands run during discovery.

Enable the command audit log

The MID Server audit log is enabled with the MID Server property `mid.log.command_audit.enable`, which is set to false by default. Add the property in the MID Server Properties table [ecc_agent_property_list.do]. Once enabled, the MID Server command audit logs are accessed in the instance by navigating to MID Server > Command Audit Logs [ecc_agent_command_audit_log_list.do]. To see or change this table, the user must have the role agent_security_admin.

Data recorded in the command audit logs

The MID Server command audit log records the name of the command and the command hash. If, for example, during discovery a probe does not run a command but instead runs a script then the script name is recorded. The command hash is calculated based on the content of the script, regardless of the name. Therefore, changing the name does not affect the command hash.

When a probe, such as a WMIRunner, runs a command with multiple WMI fields then WMI creates one script to query those fields. The script is created temporarily on the MID Server host in the temp folder. After the script is run, it is removed from the temp folder. The script is given a name based on the fields and a random number. However, the hash key is always the same given the same contents.
The command audit log reports the execution status as either a success or failure. The record entry is a success if the command was run, or a failure if it was unable to run. The command audit log does not consider the result of the command being run. For example, a command which runs but fails gather data is still listed in the execution status as a success.

Discovery supports JEA profiles for WinRM. The MID Server command audit log records the JEA profile of the discovery command, if it is available. See Microsoft Just Enough Administration (JEA) for Discovery for more information on JEA profiles.

By default, the table is rotated every seven days. For more information, see Table Rotation.

**Rekey a MID Server**

Rekey a MID Server to generate a new private key. Private keys are used to decrypt automation credentials, so that MID Servers can transmit information securely. Key pairs are initially generated when a MID Server is validated, and MID Servers should be rekeyed periodically to meet security requirements.

**Before you begin**

Role required: admin

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security
About this task
When the MID Server comes back online, the system automatically validates the new key, and the MID Server resumes processing automation tasks. Automation credentials are secured by encrypting them in the instance with the MID Server’s trusted public key prior to transmission. When the MID Server is created, it generates a keypair, consisting of a public and private key. After the MID Server is validated, it can use the private key to decrypt automation credentials. You should occasionally rekey the MID Server to meet your organizations security requirements.

Procedure
1. Navigate to MID Server > Servers.
2. Open the MID Server whose keypairs you want to rotate.

Related information
  Validate the MID Server

Add SSL certificates for the MID Server
Configure the MID Server to connect to a source over SSL.

Before you begin
Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
You can add certificates to the MID Server to communicate over SSL/TLS in one of two ways:

• Add certificates directly to the bundled JRE TrustStore file, using the following procedure.
• Specify a different TrustStore file for the MID Server to use. For more information, see Specify an external TrustStore for the MID Server.

Review both methods to evaluate which best meets your needs. During MID upgrade the bundled TrustStore is overwritten. The MID Server attempts to migrate certificates from the existing TrustStore to the incoming one. To be migrated, certificates must meet the following criteria:

**Quebec (backported to Orlando Patch 10 and Paris Patch 4)**

• X.509 v3 certificates
• Basic Constraints Extension evaluates to false (or is not present)

**Rome (backported to Paris Patch 7 and Quebec Patch 2)**
• X.509 certificates
• Any certificate present in the source, but not the destination TrustStore

Certificates that do not meet the criteria are overwritten. Alternatively, you can specify an external TrustStore file which is unaffected by MID Server upgrades. For more information, see Specify an external TrustStore for the MID Server.

In Rome and later families, the migration strategy utilized during upgrade is configurable via the MID Server configuration parameter `mid.truststore.migration.strategy`. It can take the following values:

• `migrate_delta`: the default strategy (outlined above for Rome)
• `migrate_non_ca`: a strategy matching the one outlined above for the Quebec family
• `do_not_migrate`: disables the TrustStore migration during upgrade, though a backup of the original TrustStore is made in the event of overwrite

During this migration process, a backup of the original and upgrade TrustStores are made and stored in the agent’s work directory: `...\agent\work\truststore_migration\<time epoch seconds>\`. The original TrustStore is renamed to `cacerts_before` and the upgrade TrustStore is renamed to `cacerts_from_upgrade`.

**Procedure**

1. Open a command prompt and navigate to the folder containing the JRE `keytool`. This is the location of the JRE you installed. An example path might be: C:\Program Files\Java\jre1.8.0_161\bin
2. Import a certificate into the MID Server's cacerts keystore, using this command:

   keytool -import -alias <certificate alias> -file "<path to certificate>" -keystore "<path to the JRE>\lib\security\cacerts"

   For example, you might enter: keytool -import -alias MyCA -file "C:\myca.cer" -keystore "C:\Program Files\Java\jre1.8.0_161\lib\security\cacerts"
Note: The keytool prompts you for a certificate password. If the certificate is for a CA, the keytool also asks whether to trust the certificate authority. To add a certificate to an instance, see Upload a certificate to an instance.

3. Optional: Display a list of the current certificates by running the command:
   keytool.exe -list -keystore "C:\Mid Server\agent\jre\lib\security\cacerts"

Specify an external TrustStore for the MID Server

The MID Server JVM can utilize a TrustStore external to the MID installation directory so any certificates added to the TrustStore are not overwritten during an upgrade. It is important that this TrustStore file reside outside of the MID installation directory, and the Truststore location can be specified by adding additional parameters to the MID Server’s wrapper-override.conf file.

Before you begin
Role required: admin

Procedure

1. In the MID Server host, navigate to the wrapper-override.conf file.
2. Specify an external TrustStore by appending a custom parameter to the end of your MID’s wrapper-override.conf file.
   For example, on a Windows MID with an external TrustStore found at C:\external_truststore\cacerts, the end of the file would appear similar to:

```
# Add additional custom parameters below

wrapper.java.additional.3=-Djavax.net.ssl.trustStore=C:\external_truststore\cacerts
wrapper.java.additional.4=-Djavax.net.ssl.trustStorePassword=<truststore’s password>
```

Note: If you have specified other additional parameters in this file then the numerical identifier, in this case 3 and 4, may differ.

MID Server SSH cryptographic algorithms

The MID Server utilizes SSH clients to perform many discovery actions. During the SSH handshake, both the client and server first determine which algorithms both parties support, then client picks the highest priority algorithm. For the Host Key Algorithm, the client picks highest priority algorithm which both parties support that matches the key type.
1. Ensure that the MID Server can connect to elements inside and outside your network

2. Download and install the MID Server on a Linux or Windows host

3. Configure your MID Server

4. Configure MID Server security

5. Ensure that the MID Server can connect to elements inside and outside your network

6. Download and install the MID Server on a Linux or Windows host

7. Configure your MID Server

8. Configure MID Server security

Default supported SSH algorithms by priority

Key Exchange Algorithm

1. ecdh-sha2-nistp256
2. ecdh-sha2-nistp384
3. ecdh-sha2-nistp521
4. diffie-hellman-group-exchange-sha256
5. diffie-hellman-group14-sha256
6. diffie-hellman-group16-sha512
7. diffie-hellman-group14-sha1
8. diffie-hellman-group1-sha1
9. diffie-hellman-group-exchange-sha1

Host Key Algorithm (used for public key signature during authentication)

1. ecdsa-sha2-nistp256
2. ecdsa-sha2-nistp384
3. ecdsa-sha2-nistp521
4. rsa-sha2-256
5. rsa-sha2-512
6. ssh-rsa
7. ssh-dss

Customize the SSH algorithms priority list
The MID Server SSH algorithm priorities can be customized based on security needs. Each algorithm is controlled by one of the following MID Server properties.

Note: Glide Import on the instance uses the default algorithm list. The four MID Server properties do not affect Glide Import because it is not run on the MID server. SNCSSH is used for Glide Import on instance for SFTP and SCP.

- Key Exchange algorithms: mid.ssh.algorithms.kex
- Host Key algorithms: mid.ssh.algorithms.host_key

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• Cipher algorithms: `mid.ssh.algorithms.cipher`

• MAC algorithms: `mid.ssh.algorithms.mac`

The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. The following operators are based on the OpenSSH standard syntax and modify the algorithm priority list.

• The `+` operator appends the comma separated list of algorithms to the default algorithm list.

• The `-` operator removes the comma separated list of algorithms from the default algorithm list.

• The `^` operator places the comma separated list of algorithms at the front of the default algorithm list.

**Attach a script file to a file synchronized MID Server**

You can attach a script file to synchronize to a connected MID Server. Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous. However synchronizing the files avoids this security problem.

**Before you begin**

Role required: **admin**
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**About this task**

Enhanced security in Windows browsers, such as Internet Explorer, blocks downloaded files that it determines are potentially dangerous. This would block files downloaded for use by the MID Server. You would need to unblock each file manually through the browser.

To get around this issue, use file synchronization. File synchronization requires you to proactively take script files from your instance and save them on the MID Server. The files on the instance and the MID server stay synchronized, but there is no longer any need for the MID Server to download the whole file. File synchronization also protects any updates you make in those script files from being overwritten during the upgrade of an instance.

You can attach multiple files, but the last attached file gets synchronized to the MID Server. If you delete the attachment, the script file becomes inactive, and the synchronized file is deleted from the MID Server.

**Procedure**

1. Navigate to **MID Server > Script Files**.
2. Open the file to which you would like to attach the script file, or click **New** to create a new file.
3. Select **Use attachment**, and then click the paperclip icon to add the attachment.
When **Use attachment** is checked, an attached script file overrides the script contained in the **Script** field. If this check box is cleared, the script in the **Script** field is used instead of the attachment.

The script file attachment name must match the MID Server script file name, since the record can contain other attachments.

4. Click **Update** to initiate the synchronization process. Ensure that the file name matches the script name. If you receive the error message: *File type not permitted or mime type does not match the file content*, request that your administrator turn off mime type validation on attachments. The system property `glide.security.file.mime_type.validation` controls this setting.

**Enable script file synchronization for Windows enhanced security**

Windows Internet Explorer enhanced security blocks downloaded files that it determines are potentially dangerous.

Script files synchronized with the MID Server are stored on the instance in the MID Server Script File [ecc_agent_script_file] table, which you can access in the MID Server > Script Files module.

When the MID Server first connects to the instance, the instance creates a directory called \scripts in the MID Server root. The instance then creates a parent directory in the path \scripts\<parent name> using definitions from the ecc_agent_script_file table. Finally, the instance creates the script files themselves inside the parent directory using the records from the ecc_agent_script_file table.

The record for the parent directory looks like this:
The instance creates each script file in the parent directory on the MID Server using the record Name from the ecc_agent_script_file table as the file name and the Script field payload as the file contents. A script file record looks like this:

The synchronization of the script file continues to work as if the script was manually added to the form.

See Attach a script file to a file synchronized MID Server for instructions on how to attach a script file.

**Note:** The MID Server Script File [ecc_agent_script_file] table is domain separated. You can create versions of these policies that only a MID Server from the same domain can use. For instructions, see Set up domain separation for MID servers.

**MID Server FIPS Enforced Mode**

The MID Server supports the National Security Cloud (NSC) IL-5 environment, which requires all utilized cryptography to be FIPS validated. The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms which are FIPS validated are utilized.
1. Ensure that the MID Server can connect to elements inside and outside your network

2. Download and install the MID Server on a Linux or Windows host

3. Configure your MID Server

4. Configure MID Server security

5. Ensure that the MID Server can connect to elements inside and outside your network

6. Download and install the MID Server on a Linux or Windows host

7. Configure your MID Server

8. Configure MID Server security

The Federal Information Processing Standards are a group of standards compiled by the National Institute of Standards and Technology for use in computer systems. There are many FIPS publications, but for the sake of this discussion we are specifically referring to FIPS 140-2: Security Requirements for Cryptographic Modules. Cryptographic algorithms can proceed through a validation process specified by the NIST. For the purposes of our new secure cloud environment, the MID server will be utilizing algorithms that have been validated by such process.

Only MID Servers of the Rome release family or later with a JRE version of 11.0.9+11 or later can be set to run in FIPS Enforced Mode.

FIPS Enforced Mode

The following algorithms are not available for use in these SSH functions by the MID in FIPS Enforced Mode.

Key Exchange:

- diffie-hellman-group1-sha1

Mac:

- hmac-md5
- hmac-md5-96
The following restrictions are now in place for SNMP for use by the MID in FIPS Enforced Mode.

- SNMP v1 and v2 are completely disabled.
- For SNMP v3, the following protocol uses are not permitted by the MID in FIPS Enforced Mode:
  - auth protocol: none or MD5
  - privacy protocol: none or DES

Other functionality that utilizes the MID may be impacted when run in FIPS Enforced Mode. Please refer to that functionality's specific documentation for details.

Enable MID Server FIPS Enforced Mode

The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms which are FIPS validated are utilized.

Before you begin
Role required: admin

Procedure
1. Deploy a new MID Server or upgrade existing MID Servers to the Rome family release or later.
2. Shut down the MID Server.
3. Execute the following bundled script provided to convert the MID to run in FIPS Enforced Mode:
   - For Windows hosts: `> <MID install directory>/agent/bin/scripts/set-fips-enforced-mode.bat on`
   - For Linux hosts: `$ <MID install directory>/agent/bin/scripts/set-fips-enforced-mode.sh on`
   Success will be logged to the console including the location of modified files and any backups generated during the conversion process. If invoked programmatically, success will be indicated by a 0 return code.
4. Start the MID Server.

What to do next
The mode the MID is running in can be confirmed via two methods:
1. Check the agent logs after start-up and look for the following log line: \textbf{Running in FIPS Enforced mode}

2. Check the \texttt{ecc\_agent} table on the instance and look for the value of the \textbf{FIPS Enforced} boolean column.

\textbf{Manually convert the MID Server to FIPS Enforced Mode}

The MID server can be run in FIPS Enforced Mode, where only cryptographic algorithms which are FIPS validated are utilized.

\textbf{Before you begin}
Role required: admin

\textbf{About this task}
To manually convert the MID Server to FIPS Enforced Mode while using an external JRE, you must perform the following steps while the MID Server is shut down:

- Convert the JRE's TrustStore to BCFKS type.
- Set the JRE's default KeyStore type to be BCFKS.
- Set the FIPS Enforced Mode flag in the MID Server's configuration file.

\textbf{Procedure}
1. Convert the JRE's cacerts file type to BCFKS by using the \texttt{Java Keytool} with a command similar to:

\begin{verbatim}
$ keytool -importkeystore -srckeystore <source keystore path> -srcstoretype <source keystore type> -srcstorepass changeit -destkeystore <destination keystore path> -deststoretype BCFKS -deststorepass changeit -provider org.bouncycastle.jcajce.provider.BouncyCastleFipsProvider -providerpath <BouncyCastle FIPS jar path>
\end{verbatim}

\textbf{Note:} Rome and later MID installations contain a BouncyCastle jar suitable for this purpose. It can be found at: \texttt{.../agent/lib/bc-fips.jar}

2. The JRE's default KeyStore type can be set in the <JRE installation directory> \texttt{\conf\security\java.security} file.

3. In that file find the \texttt{keystore.type} line and set its value as follows:

\begin{verbatim}
keystore.type=bcfks
\end{verbatim}

4. In the MID Server's \texttt{.../agent/conf/wrapper-override.conf} file, uncomment the FIPS line and set its value to true.

The line should read:

\begin{verbatim}
wrapper.java.additional.106=-Dorg.bouncycastle.fips.approved_only=true
\end{verbatim}
MID Server upgrades

Upgrade MID Servers manually, or automatically through the instance. MID Server automatic upgrade is triggered when the instance upgrades and the MID Server no longer has the same version. The new MID Server package is downloaded from install.service-now.com, replaces the old one, and the MID Server starts with the new version.

⚠️ Warning: The MID Server cannot auto-upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.

MID Server Upgrade Requirements

Access to the MID Server download site

The MID Server host computer must have access to the ServiceNow download site at install.service-now.com to upgrade automatically. If you have a self-hosted ServiceNow environment that blocks access to the download site, you must import the MID Server installer package into your MID Server hosts manually. For instructions, see KB0760123 in the Self-Hosted knowledge base.

MID Server access to OCSP blocked

Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

MID Server operating system compatibility

Upgrading Windows or Linux MID Servers with 32-bit operating systems is not supported. For more information refer to [KB0863694].

The MID Server cannot upgrade on a Windows host if the Windows Application Experience service is disabled. For information on the error that is displayed and instructions for re-enabling this service, see KB0597552.

The MID Server upgrade is blocked by some antiviruses running on Windows hosts. For information on the errors and list of these antiviruses see KB0870329.

Any Linux MID Server upgrade whose service is installed under system in Madrid or lower needs to re-install the service after upgrade. If you didn’t manually reinstall the service in previous upgrades and your MID Server service is still installed on Madrid or lower versions, during upgrade the MID Server automatically re-installs the service. To re-install the service MID Server needs to
run as an admin user. If your MID Server upgrade needs to re-install the service, make sure that the MID Server user is admin, or you can manually re-install the service before upgrade. For manually re-install the service, see KB0821436.

When does the MID Server need to Upgrade?

Any MID Server with a version different from the instance version needs to upgrade. The following two system properties control the version of all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of **mm-dd-yyyy-hhmm**. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the **mid.buildstamp** property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  **Warning:** This property is not visible by default and should not be configured.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see Add a system property.

When the MID Servers check the version each hour, they look at the **mid.version.override** property first. If this property is empty, the MID Servers get their version information from the **mid.buildstamp** property. If an override version is configured, the MID Servers use this value and ignore the version information in the **mid.buildstamp** property. This override value remains when the instance is restarted and is passed to the MID Servers. The value in the **mid.version.override** property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the **mid.buildstamp** property.

In addition to **mid.version.override**, the MID Server version can also be controlled with the configuration parameter **mid.pinned.version** which pins the MID Server to a specific version. To pin a MID Servers, set the **mid.pinned.version** parameter with the name of that version in the **config.xml** file of each MID Server. Use the format **<version>-mm-dd-yyyy**. This setting overrides the property setting for the pinned MID Server version. For instructions, see Add a MID Server parameter. The value set in this parameter is not affected by an upgrade.
Warning: Using `mid.version.override` and `mid.pinned.version` is not recommended. The different versions on the MID Server and instance can cause outage issues on the MID Server.

Upgrade methods

Automatic

Automatic upgrade can be triggered by the instance or the MID Server itself. This functionality is available by default. Automatic upgrade occurs:

- When the instance is upgraded and the MID Server for that version is different than the version currently on the MID Server. The instance sends `autoUpgrade` system command to the connected MID servers.
- Every hour, the MID Server checks with the instance to see if there is a different version available for upgrade. You cannot modify this time period.

Manual

Manually start the upgrade by clicking a related link on the MID Server record. Use this method when you do not want to wait until the next hourly automatic update or if your upgrade failed and you want to force an upgrade. See Upgrade the MID Server manually for instructions.

The Upgrade Process

1. **Pre-upgrade Check:** Before starting the actual MID Server upgrade process, the MID Server runs a set of tests to make sure that the host machine meets the minimum requirements. Any errors encountered during this automatic test prevent the upgrade from occurring until the issues are resolved. The pre-upgrade test is enabled by default but can be disabled by adding and setting a system property. See MID Server pre-upgrade check for more information.

2. **Download the packages:** The MID Server downloads upgrade packages from install.service-now.com. These packages are in zip format and are downloaded to the agent folder in the `package/incoming` folder.

   Digital Signature Verification

   After downloading every package, MID Server verifies the digital signature of the package. It throws an exception if the verification fails. The error will be recorded in the agent log and the MID Server issue table.
If the packages are downloaded and replaced manually you can verify the signature manually. To manually verify the signature of an installation or upgrade package, use the jarsigner tool which is available for free with JDK. The following is the jarsigner command to initiate the verification: Jarsigner -verify -verbose -certs -strict <zip-file>

The output should be similar to the following example:

```
- Signed by "CN=ServiceNow Inc., O=ServiceNow Inc., L=Santa Clara, ST=California, C=US"
  Digest algorithm: SHA-256
  Signature algorithm: SHA256withRSA, 2048-bit key
  Timestamp digest algorithm: SHA-256
  Timestamp signature algorithm: SHA256withRSA, 2048-bit key

jar verified.
```

The signer certificate will expire on 2021-08-09.
The timestamp will expire on 2029-03-22.

3. Extracting Zip Files: After downloading all required packages, the MID Server extracts the zip files.

- **Before Rome:** The zip files are extracted in a folder under the operating system defined temporary folder. The folder name is a randomly generated number. The operating system temporary folder is specified by system property `java.io.tmpdir`. On a UNIX host, the value for this property is typically `/tmp` or `/var/tmp`.

- **From Rome onward:** The MID Server avoids using operating system defined temporary folders during MID Server upgrade. The zip files are extracted in a folder in the `work/upgrade_temp` folder under the agent folder. The folder name format is a randomly generated number. If you want to switch to the previous behavior and use an operating system defined temporary folder you can add `mid.upgrade.use_os_temp_folder` to MID Server's `config.xml` file and set it to true. To switch the behavior for all MID Servers, you can add it to the MID Server property [ecc_agent_property] with MID Server field blank.
4. **Replace old packages with the upgraded packages:** After downloading and extracting the upgrade packages, the MID Server replaces old files with the new files and starts with the new version. To replace the packages, the MID Server starts a process named *ServiceNow Platform Distribution Upgrade* and shuts down. ServiceNow Platform Distribution Upgrade waits for the MID Server to shut down properly, then replaces the required files as follows:

- **Before Rome:** The process deletes all files and folders in the bin, lib and jre folders and copies the new files into those folders.

- **From Rome onward:** The process replaces the files in the bin, lib and jre only if the new version of the file is different from the old version. *ServiceNow Platform Distribution Upgrade* does not clean the upgrade files and the unchanged files are kept.

If the reinstalling service was required as a part of MID Server upgrade, *ServiceNow Platform Distribution Upgrade* reinstalls the service before starting the MID Server. For more information refer to **KB0821436**.

**Note:**

If the MID Server upgrade fails in this step the MID Server stays “Down”. There are some anti-viruses block replacing files in this step. For more information refer to **KB0870329**.

5. **Start the MID Server:** After replacing all required files with the new version, ServiceNow Platform Distribution Upgrade starts the MID Server. When the MID Server comes up with the new version, it cleans up all temporary folder used to extract the upgrade files.

**Upgrade Log messages**

The MID Server log messages are available in the following log files:

- Pre-upgrade check log messages are available in agent.log file under agent/logs folder. The message **Performing pre-upgrade validation tests**, indicates that the pre-upgrade check has started. If all mandatory tests are passed **Pre-upgrade validation tests successful. Continuing with upgrade process** indicates the end of the pre-upgrade check.
• Downloading Missing files log messages are also available in agent.log. Every package download starts with **Downloading package to PACKAGENAME.ZIP from https://install.servicenow.com/ PACKAGEINFO** message. The download progress and the size of downloaded file is monitored in the log. After download every package, **Package was successfully downloaded from https://install.servicenow.com/ PACKAGEINFO** indicates the successful download.

• Extracting the zip files is the last step available in the **agent.log**. The message **Upgrading MID server** indicates the start of this step, and the message **Extracting package PACKAGE.ZIP to EXTRACT_TMP_FOLDER** is shown for every package extraction. When all required zip files are successfully extracted, the MID Server starts the ServiceNow Platform Distribution Upgrade process and the message **Stopping MID server. Bootstrapping upgrade** shows the end of this step before MID Server goes Down.

• ServiceNow Platform Distribution Upgrade logs include log messages for the process start up and for replacing files during the MID Server upgrade. The upgrade log messages are placed between the messages

    ***********UPGRADE MAIN LOGIN START*********** and ***********UPGRADE MAIN LOGIN END***********. ServiceNow Platform Distribution Upgrade log messages can be found in the following log files:

    ▪ In **glide-dist-upgrade.log** file under temp extract folder. This file is available in upgrade-wrapper/logs folder under temp extract folder. This log file includes process log messages and upgrade log messages.

    ▪ In **dist-upgrade.log** in **agent\logs** folder. This file only includes the upgrade portion of log messages. If there was some issue with the process startup you need to look at **glide-dist-upgrade.log**.

    ▪ In **wrapper.log** under **agent\logs** folder. After replacing files, ServiceNow Platform Distribution Upgrade append **glide-dist-upgrade.log** to wrapper.log file.

### MID Server states

#### Upgrading

The MID Server status is changed to Upgrading while the upgrade is running. The **Upgrading** state is similar to the **Paused** state. This is avoids potential miscommunication between the new version of the instance and the previous version of the MID Server during upgrade. While in the **Upgrading** state, you cannot resume or restart the MID Server. However, you can perform the same actions that you can when the MID Server is in the **Paused** state.
Note: If you are using an Istanbul instance but you are upgrading a pre-Istanbul MID Server to Istanbul, these upgrade states are not available. They are only available for MID Servers that are already on Istanbul.

Upgrade Failed

If the upgrade failed in pre-upgrade check step or download/extract packages step, failed upgrades are handled differently based on the version you are upgrading.

- Upgrade to another major release (such as Istanbul to the next full release): the status changes to Upgrade Failed.
- Upgrade from a minor version within a release (such as Jakarta patch 1 to patch 2): the MID Server continues using the version it is currently running. It does not perform the upgrade and the status eventually changes to Up, assuming the MID Server was already functioning properly.
- If the upgrade failed in last step, replacing old version of packages with the new version of packages, the MID Server stays Down.

MID Server Upgrade History

Use the MID Server Upgrade History module for troubleshooting problems with MID Server upgrades. The module contains a record of each instance upgrade. Those records provide step-by-step status details for each MID Server's upgrade process. If an error occurs, it is noted in the step and a message is dynamically generated with further details. The table cleanup job automatically deletes issues that haven't been detected for 30 days, regardless of their state. For further information, see MID Server Upgrade History.

JRE TrustStore certificate migration during JRE updates

For JRE updates after upgrading to Quebec, the MID Server migrates existing self-signed certificates in the JRE TrustStore to the new JRE version's TrustStore. When these certificates are migrated, their aliases are prepended with the string "snc_".

In order for a certificate to be migrated it must be:

- an X509 certificate
- certificate standard v3
- have the basic constraint extension set to false (i.e. it is not CA issued)
The MID Server identifies when a JRE upgrade is about to take place and begins the migration process. Before the migration, the MID Server creates a backup of the original TrustStore as a fall-back in the event of failure. If there is a failure, the backup TrustStore can be manually restored.

**MID Server pre-upgrade check**

Prior to an upgrade, the MID Server runs tests to identify issues that could cause the upgrade process to fail or result in a MID Server outage.

Each MID Server contains an AutoUpgrade monitor that compares the MID Server version with that of the instance to determine if the MID Server needs to upgrade. If the AutoUpgrade monitor discovers that the MID Server version is out of date, the monitor runs pre-upgrade validation tests for that MID Server. If an issue is detected, a message is logged to the MID Server Issue [ecc_agent_issue] table, and the upgrade is blocked. The AutoUpgrade monitor continues to run every hour, until all the tests pass. If there are no blocking issues, the MID Server downloads the appropriate upgrade package and begins the upgrade process. The MID Server pre-upgrade check also runs for the upgrades triggered by the instance when the instance was upgraded, as well as for manual upgrades.

**Pre-upgrade tests**

The pre-upgrade runs two sets of tests: Mandatory tests and Alert tests. Every mandatory test is required to pass to start MID Server upgrade. If a mandatory test was not passed, the test is recorded in the agent log and a MID Server active issue is created in the MID Server issue [ecc_agent_issue] table. These errors are published before the actual MID Server upgrade occurs and must be resolved before the upgrade can continue. MID Server stops the Upgrade process and changes the status based on MID Server states. If any alert test was not passed, a message is added in the agent log and MID Server issue table, but the pre-upgrade check continues and MID Upgrade doesn’t stop.

Pre-upgrade validation tests check the following mandatory tests:

- At least 1 GB of free disk space
- Access to the download site at install.service-now.com
- Verify the digital signature of a sample downloaded file
- Permission to execute, which involves the following:
  - Extract a Zip archiver to a temp folder
  - Copy file from temp folder to the agent folder
Read a text file and validate the content
Delete the pre-upgrade check contents

- MID Server host machine is not a 32 bit system
- On Linux MID Servers, the glibc version is at least 2.17

On Windows MID Servers, the pre-upgrade validation runs the following alert tests:

- Any MID Server Upgrade blocker services is running on the host machine
- Status of Application Experience on the host machine
- Ensure that the Log On As user for the Windows service is either LocalSystem or a user that is part of the local Administrator group. By default, domain administrators are added to the local Administrator group when joining a computer to a domain.

Errors that block the upgrade
These messages describe failing a mandatory test and are published to the MID Server Issue [ecc_agent_issue] table. Failure of any of these tests blocks the upgrade.

- Not enough free disk space. The system reports <n> bytes free
  This message is displayed when less than 1 GB of free disk space is detected on the MID Server host. This error is also written to the MID Server agent log.

- Unable to download updates from the install server
  This message indicates that either the MID Server host does not have permission to download the installation package from install.service-now.com, or network problems prevent connection. This error is also written to the MID Server agent log.

- Signature verification failed:<message>
  This message indicates that a Verification Exception has occurred when pre-upgrade check tries to verify the digital signature of the downloaded check file.

- Unable to verify digital signature:<message>
  This message indicates that the verification signature process was interrupted by an exception.

- Unable to extract contents of pre upgrade check zip
This message indicates that the service account on the MID Server host does not have permission to extract the pre-upgrade ZIP archive to the temporary folder.

**Unable to create folder <upgrade check file path>**

This message indicates that the MID Server service account does not have permission to create the upgradeCheck folder for the pre-upgrade checking files in the agent/package path.

**Unable to verify file permissions: <message>**

This message indicates an exception has occurred when checking file permissions, such as a file that does not exist or access failure.

**MID Server Windows Service is not running as LocalSystem or a local Administrator**

This message warns that the Windows service is not running with the desired permissions.

**Upgrade Failure: The host machine does not meet the minimum system requirements to upgrade the MID server.**

MID upgrade is not supported on 32-bit host. Please refer to KB0863694 for more information.

**Upgrade Failure: Host does not meet the minimum system requirements to upgrade the MID server. Please refer to MID Server product documentation on GlibC library for more information**

This error can only occur for Linux MID Servers. Refer to Java version support for more information.

**Non-blocking warnings**

These warnings are displayed in the MID Server Issue [ecc_agent_issue] table and do not prevent a Windows MID Server from upgrading:

**Unable to parse $logOnAsUser**

This message warns that the Log On As User value for the Windows service is not in either of these expected formats:

- user@domain.company.com
- domain\user

**Unable to look up Log On As user’s groups**

When the instance attempts to look up the logged on user’s group memberships, it executes the **net user <username>** command. The instance expects a certain output structure by the Windows service
from this command and issues this warning if the expected output
does not match the actual output.

These PowerShell warnings are written only to the MID Server agent
log. Because PowerShell is not required to use a MID Server, these
configuration issues do not prevent a Windows MID Server from
upgrading. However, these warnings might indicate issues in your
environment that require attention.

Skipping PowerShell upgrade checks since PowerShell is not usable

PowerShell 3.0 (at a minimum) is not installed or powershell.exe is not
available to the MID Server service user.

Skipping Powershell test: Target folder has not been initialized

Skipping Powershell test: Unable to detect the service name

Service CiscoAMP running on the MID Server host machine is identified as a
MID Server upgrade blocker

For more information, refer to KB0870329.

The Application Experience is disabled on the MID Server host, which can
cause the auto-upgrade process to fail and the MID Server to go down.
Enable the service on the host to ensure successful auto-upgrade

For more information, refer to KB0597552.

Continuing with upgrade, but the following issue was encountered during
upgradeCheck: <exception message>

This message indicates that there was an issue running the
PowerShell portion of the pre-upgrade tests.

Disabling the pre-upgrade check

A MID Server configuration parameter called mid.upgrade.run_precheck is
set to true by default, which allows the automatic pre-upgrade test to run.
To disable these tests for a single MID Server, add this parameter to that MID
Server’s config.xml file and set it to false. To disable these tests for all MID Servers,
add a new record to the MID Server Property [ecc_agent_property] table called
mid.upgrade.run_precheck. Set the value of this property to false and leave the
MID Server field blank.

Pinning a MID Server to a specific version

You can pin all the MID Servers in your environment to a specific version by
setting a system property, or you can configure specific versions for individual
MID Servers.
Note: Under most circumstances, do not pin the MID Server to a specific version. Pinning the MID server can make it out of sync with the instance, and lead to broken functionality. Instead, let the instance determine which MID Server version to use.

Version control properties
These system properties control the version for all MID Servers:

- **mid.buildstamp**: Identifies the MID Server version with an identifier based on the date of the build. This property uses the format of *mm-dd-yyyy-hhmm*. The MID Server checks for version information hourly. If no override version is configured, the MID Server looks at the *mid.buildstamp* property for the version to use. This property resets itself to the default version (the version that matches your instance version) when the instance is restarted or upgraded, so any user changes are lost at that time. The system appends the release name and patch information to the date and time format.

  **CAUTION**: This property is not visible by default and should not be configured.

- **mid.version.override**: Sets an override condition for the current version for all MID Servers in your environment. This action pins the MID Servers to a single version and disables the automatic upgrade feature. This property is not visible in the base system and must be added to the System Property [sys_properties] table when it is set. For details, see Add a system property.

  When the MID Servers check the version each hour, they look at the *mid.version.override* property first. If this property is empty, the MID Servers get their version information from the *mid.buildstamp* property. If an override version is configured, the MID Servers use this value and ignore the version information in the *mid.buildstamp* property. This override value remains when the instance is restarted and is passed to the MID Servers.

  **Attention**: The value in the *mid.version.override* property is cleared during an upgrade, which forces the MID Server to reset itself to the version in the *mid.buildstamp* property.

Version control configuration parameter
To pin specific MID Servers on a desired version, set the **mid.pinned.version** parameter with the name of that version in the *config.xml* file of each MID Server. Use the format `<version>-mm-dd-yyyy`. This setting overrides the property setting for the pinned MID Server version. For instructions, see Add a MID Server parameter.

Note: The value set in this parameter is not affected by an upgrade.
Upgrade the MID Server manually
You can manually upgrade MID Servers at any time if you do not want to wait for the automatic upgrade.

Before you begin
Role required: mid_server or admin
For the upgrade to run, MID servers must be in the Up state and must be validated. The MID Server automatically runs the pre-upgrade test before upgrading. Any errors encountered during this test must be resolved for the upgrade to proceed.

About this task
The MID Server is upgraded to the version specified by build stamp on the instance, or by the upgrade property that you specify.

Procedure
1. Navigate to Discovery > MID Servers or Orchestration > MID Server Configuration > MID Servers.
2. Open the record of the MID Server that you want to upgrade.
3. Click Upgrade MID under Related Links.
4. Confirm that you want to perform the upgrade.

Resolving MID Server issues
Troubleshoot problems with the MID Server to find solutions. Monitor the MID Server to receive alerts about issues as they occur. Troubleshooting procedures exist to resolve specific problems with the MID Server. The Knowledge Base on Hi contains several articles to help you troubleshoot MID Server issues.

Monitor the MID Server
Monitoring a MID Server involves verifying entries in log files, confirming network connectivity, and checking MID server status.

• If the MID Server is on a Windows host, navigate to the Windows Services console, locate the service name that matches the name that appears from the wrapper-override.conf file. If the MID Server process is the only Java process running on the host, monitor the memory used by java.exe and alert on less than the maximum configured memory defined in the ~\agent\conf \wrapper-override.conf folder.
• Ensure that the `agent0.log.0.lck` file appears in the `~\agent\logs` folder to confirm that the MID Server running and logging system activity in the `agent0.log.0` file.

• Review the following logs for warning, critical, and severe errors: `~\agent\logs\agent0.log.0\agent\logs\wrapper.txt` See Manage ECC Queue content for a MID Server to see how to open log entries from the instance.

• Test MID Server connectivity to confirm that the MID Server host is able to communicate with the instance. Resolve any issues with the network connectivity such as conflicts with firewalls, access control lists, and routing errors.

• From the MID Server instance, navigate to the MID Servers page, and review the status of the MID Server. For additional information, click a Name.

• Set up email, SMS, and push notifications to alert you when issues occur with MID servers. The MID Server Down notification is enabled by default. See Notifications for details.

Troubleshooting procedures

The following procedures provide information on resolving specific problems with the MID Server. Knowledge Base articles also cover a wide range of issues. If you are encountering problems which are not covered in these procedures, search the Knowledge Base for related articles. For instance, if you are experiencing symptoms such as the MID Server going down or not responding, or CIs being duplicated during discovery, see KB0597571 for information and recommended solutions.

MID Server active issues

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

Active MID Server post-cloning credential issues

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

MID Server resource threshold alerts

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.
**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server active issues**

The ServiceNow® instance has a dedicated table that publishes active issues with MID Servers and alerts administrators when a MID Server is in danger of exceeding its resources.

The MID Server Issue [ecc_agent_issue] table displays a number of common issues that a MID Server can experience, as they occur. Error checking processes attempt to pinpoint the most likely cause of the issue. Informative error messages name the affected MID Server and explain the possible cause of the issue. The ecc_agent_issue table retains its records for 30 days.

To access records in this table, navigate to **MID Server > Server Issues**.

**Supported MID Server active issues:**

- Bad user credentials after instance cloning.
- Unsupported Java Runtime Environment (JRE) on the MID Server host.
- Approaching resource thresholds for CPU usage and JVM memory.
- Errors detected during pre-upgrade testing.
- User authentication and authorization failures.
- Network connectivity interruptions and role configuration errors.
MID Server fails to start
When a newly installed MID Server fails to start or shuts down prematurely, improper configuration could be to blame.

Duplicate MID Server names
When the MID Server service starts, it verifies that it is the only active (not down) MID Server with that name. If the MID Server discovers another active MID Server with the same name, the starting MID Server waits 5 minutes and sends another query. The MID Server repeats this query three times and logs each attempt in the agent log. If the MID Server still detects a duplicate after this cycle, it creates a record in the MID Server Issue [ecc_agent_issue] table and shuts down.

Note: The record in the MID Server Issue [ecc_agent_issue] table cannot be resolved automatically by the instance. Close this record manually for accounting purposes. Either mark the issue Resolved or delete it.

Upgraded MID Servers running multiple services
Beginning with the New York release, a batch file in the MID Server installer package ensures that only one Windows MID Server service is configured for an executable path (MID Server installation folder). Previous versions have not checked for this configuration. Upgraded MID Servers that run multiple services with the same executable path are prevented from starting. If you experience this issue, follow this procedure to reconfigure the MID Server to use only one service:
1. Delete the unwanted Windows service by running `sc.exe delete <service name>` from the command line.

2. Open the `wrapper-override.conf` file in the MID Server installation folder.

3. Change the `wrapper.name` and `wrapper.displayname` parameters to the service name that you want to keep.

4. Restart the MID Server.

**Active MID Server post-cloning credential issues**

The system provides automatic processes to detect and notify you of possible MID Server credential issues after instance cloning.

During an instance clone, the MID Server `[ecc_agent]` table is not copied from the source instance, but the User `[sys_user]` table is copied. As a result, the source MID Server user credentials copied into the target instance might not match those used by the existing set of MID Servers used by the target. Bad credentials can cause those MID Servers to be down for the target instance. Processes on the instance notify you if a MID Server is down from suspected bad credentials following an instance clone.

**Table for post-cloning credential issues**

The MID Server Issue `[ecc_agent_issue]` table stores active MID Server issues after an instance clone. Records in this table show a MID Server's current state, evaluation times, and the **Issue source**. For cases in which a MID Server for a cloned instance is down because of possible bad credentials, the **Issue source** is `InstanceClone`. Data from the MID Server Issue `[ecc_agent_issue]` table are displayed in a related list on a MID Server record. Records in this table are removed if they have not been detected for 30 days. Ongoing issues reappear as they occur.

**Post-cloning cleanup script and scheduled jobs**

A cleanup script called `Bad MID Server credentials after clone` runs on the target instance after cloning and calls a script include called `BadMIDCredentialAfterClone`. This script include schedules the execution of the following jobs on the Schedule Item `[sys_trigger]` table:

- `BadMIDCredentialAfterClone-1`: Runs 15 minutes after clone execution.
- `BadMIDCredentialAfterClone-2`: Runs 75 minutes after clone execution.

These jobs log to the MID Server Issue `[ecc_agent_issue]` table any MID Servers that existed on the target instance prior to the clone that are in the **Down** state. These MID Servers are not ready for normal processing and might be down due...
to invalid credentials resulting from the cloning process. The state of MID Servers added to the target instance after the clone is not evaluated.

⚠️ Note: The MID Server log shows that the MID Server user associated with the target instance could not be authenticated or was missing the proper role.

**Business rule that checks for bad credentials**

The **Check for bad MID credential after clone** business rule monitors the MID Server [ecc_agent] table for MID Servers that are transitioning from **Down** to **Up**. If the business rule finds a MID Server making that transition, the rule attempts to find a matching MID Server in the MID Server Issue [ecc_agent_issue] table that has an issue source of **InstanceClone** and a state other than **Resolved**. If a match is found, the business rule updates the state of the MID Server in the [ecc_agent_issue] table to **Resolved**.

**Resolving MID Server issues**

The error message in the MID Server Issue [ecc_agent_issue] table names the affected MID Server user. This message appears each time the business rule runs and finds a MID Server that is down from suspected bad credentials:

MID Server not operational (status: Down), possibly due to recent clone. Verify credentials for logged in User 'local-midserver'.

Attempt to resolve the issue first by comparing the user's credentials with the credentials that the affected MID Server is expecting. If the credentials are incorrect, fix the problem and check the MID Server status again. If the credentials are correct, but the MID Server remains down, check the Knowledge Base for other possible causes.

**MID Server resource threshold alerts**

The instance displays warnings when a MID Server breaches its resource thresholds for CPU and JVM memory usage, enabling users to create email notifications or custom scripts when a breach occurs.

The MID Server Issue [ecc_agent_issue] table warns users when a MID Server exceeds configured thresholds of its allocated CPU and memory resources. These warnings are published before the MID Server experiences performance degradation or an out-of-memory error, enabling the administrator to increase resources and avoid downtime. Administrators can use a registered event to send email notification to selected recipients, advising them of any threshold breaches, or to create a custom script to do some other type of work. The instance continues to update the MID Server Issue [ecc_agent_issue] table to keep unresolved issues current.
By default, CPU and memory threshold alerts are disabled and no alerts are published to the MID Server Issue [ecc_agent_issue] table. To enable both types of alerting, add these properties to the System Property [sys_properties] table, and then set their values to true:

• mid.threshold.resource.breach.enable.cpu.alerts
• mid.threshold.resource.breach.enable.memory.alerts

For details on adding system properties to the platform, see Add a property using sys_properties.list.

**Evaluation process**
This processing occurs whether or not alerting is enabled:

1. Every 10 minutes, each MID Server transmits its CPU and memory consumption metrics to the instance. The instance inserts CPU metrics into the **Mean CPU used %** field of the ECC Agent Scalar Metrics [ecc_agent_scalar_metric] table and memory metrics into the **Max memory used %** field of the ECC Agent Memory Metrics [ecc_agent_memory_metric] table.

2. After a successful insert, the following business rules run on each table, invoking a script include that calls an appropriate function. Each function takes an average of the metric sets inserted into the tables, based on the configured sampling intervals.

   - **Update cpu mean on MID Server Status**: Calls the MIDResourceThresholdBreach.checkCpuUsage() script include.
   - **Update max memory on MID Server Status**: Calls the MIDResourceThresholdBreach.checkMemoryUsage script include.

Each function takes an average of the metric sets inserted into the tables, based on the configured thresholds and sampling intervals. The instance first looks at each MID Server for configuration parameters that set custom threshold values or sampling intervals for that MID Server. If no configuration parameters for these attributes are found, the instance looks in the System Properties [sys_properties] table for custom values to use. If no properties are found, the instance uses the default threshold and interval values from the code.

**Note**: Both the threshold percentages and the sampling intervals are configurable. See Configuring thresholds and sampling intervals for details.

**Alerting process**
When alerting for CPU or memory thresholds is enabled, this processing occurs:
1. If the aggregated average metric value equals or exceeds the configured percent threshold, the instance triggers the mid.threshold.resource.breach event. Administrators can use this event to create email notifications for threshold breach alerts or to create a custom script.

2. The instance inserts a record of the breach into the MID Server Issue [ecc_agent_issue] table with a State value of New and a Count of 1, and then publishes a message containing all the pertinent details of the breach. An example of this message is Mean CPU used % has exceeded threshold (96>=91) for a 40 minute interval span, occurring after start date 2017-01-11 14:25:19. This message appears in the Short description field of the MID Server Issue form and in the event. You can copy any part of the message into your email notifications.

**MID Server issue states**

When the administrator first examines an issue in the MID Server Issue [ecc_agent_issue] table, the administrator can change the State of the issue to Acknowledged to indicate that the issue is being addressed. Each time the instance detects a breach, it attempts to match the breach with an existing issue. If a MID Server already has an issue record for that breach in a State of New or Acknowledged, the instance updates the Last Detected field with the current date/time and increments the Count field in the existing record. This prevents the creation of duplicate records in the MID Server Issue [ecc_agent_issue] table and records the number of times after the initial incident that the breach reoccurred. The administrator can increase MID Server resources gradually and watch the effect on the Count field. When the counter stops incrementing, the administrator knows that the MID Server has adequate resources. When the MID Server resource have been adjusted appropriately, the administrator sets the State to Resolved. If a new threshold breach is logged that matches a MID Server issue with a State of Resolved, the instance creates a new issue record.

⚠ **Note:** Any record in the MID Server Issue [ecc_agent_issue] table that has not been updated in 30 days is deleted, regardless of its state.

**Recommendations for resolving resource issues**

Administrators have the opportunity to resolve any resource issues with a MID Server when they receive notification of the event. Follow these recommendations for reducing the strain on MID Server resources:
• JVM memory:
  ◦ Allocate more max memory to the MID Server. For more information, see Set the MID Server JVM memory size.
  ◦ Add additional MID Servers to share the workload. For more information, see MID Server clusters.
  ◦ Reduce the amount of concurrent processing for the MID Server. This includes segmenting IP Address ranges into smaller segments for a Discovery schedule or loading smaller segments of data within an import job.

• CPU: Reduce the activity on the host or migrate the MID Server to a new host with more available resources.

ℹ️ Note: MID Server can create a resource usage spike during Discovery, especially discovering against a large number of targets or executing multiple Power Shell sessions concurrently. The MID Server host’s resource utilization automatically returns to normal after the Discovery execution successfully stops. To decrease CPU utilization, host the MID Server on a dedicated machine. If you encounter resource usage issues, make sure only one MID Server is run on each dedicated host machine. If the MID Server is hosted on a public cloud, add more CPU resources and avoid the noisy neighbor issue. For more information, see High CPU Usage on Host with MID Server(s) [KB0597639].

Tables used for resource threshold evaluation

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server Issue [ecc_agent_issue]</td>
<td>Stores data on various types of MID Server issues, including breaches of configured CPU and memory thresholds. Fields used for resource threshold breaches are:</td>
</tr>
<tr>
<td></td>
<td>• count: Number of times a previously reported threshold breach occurs, if the event is not marked Resolved.</td>
</tr>
<tr>
<td></td>
<td>• last_detected: Current date and time a threshold breach is detected. This field is updated each time a previously detected breach is found, if it is not marked Resolved.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>• <strong>message</strong>: Descriptive message summarizing the conditions that triggered the threshold breach event. This message includes the actual percentage of CPU and memory calculated and the configured thresholds that were breached.</td>
<td></td>
</tr>
<tr>
<td>• <strong>mid_server</strong>: Name of the MID Server experiencing the resource threshold breach.</td>
<td></td>
</tr>
<tr>
<td>• <strong>source</strong>: The issue source for the breach. These are the possible sources:</td>
<td></td>
</tr>
<tr>
<td>◦ <strong>CpuMIDResourceThresholdBreach</strong>: CPU threshold issue sources.</td>
<td></td>
</tr>
<tr>
<td>◦ <strong>MemoryMIDResourceThresholdBreach</strong>: Memory threshold issue sources.</td>
<td></td>
</tr>
<tr>
<td>MID Server Status [ecc_agent_status]</td>
<td>Stores the percentages used for the CPU and memory resources, averaged over configurable intervals for each resource. The fields used are:</td>
</tr>
<tr>
<td></td>
<td>• Mean CPU used %</td>
</tr>
<tr>
<td></td>
<td>• Max Memory used %</td>
</tr>
<tr>
<td>ECC Agent Scalar Metric [ecc_agent_scalar_metric]</td>
<td>Stores the CPU usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>mean</strong>.</td>
</tr>
<tr>
<td>ECC Agent Memory Metric [ecc_agent_memory_metric]</td>
<td>Stores the memory usage data inserted by each MID Server every 10 minutes. The table field used by resource threshold alerting is <strong>max_used_pct</strong>.</td>
</tr>
</tbody>
</table>
Business rules that check for threshold breaches

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update cpu mean on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Scalar Metric [ecc_agent_scalar_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured CPU resource thresholds.</td>
</tr>
<tr>
<td>Update max memory on MID Server Status</td>
<td>Runs after the MID Server inserts a record into the ECC Agent Memory Metric [ecc_agent_memory_metric] table. This business rule triggers the MIDResourceThresholdBreach script include function that evaluates threshold settings to determine if the MID Server has breached its configured memory resource thresholds.</td>
</tr>
</tbody>
</table>

Configuring thresholds and sampling intervals
You can use the default threshold percentages and sampling intervals or configure custom values using either of these methods:

- Add system properties to the instance and change the default values for all MID Servers.
- Add configuration parameters to change the default resource values for individual MID Servers.

The system properties and the configuration parameters use the same names.

<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mid.threshold.mean_cpu.aggregate_interval_span</td>
<td>10 minute units in the interval for sampling CPU usage data. The default interval is 30 minutes (3 x 10 min.)</td>
</tr>
</tbody>
</table>

Default: 3
<table>
<thead>
<tr>
<th>Property/configuration parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| mid.threshold.mean_cpu.percent  | Usage percentage of the total CPU resources that initiates a threshold breach alert.  
**Default:** 95 |
| mid.threshold.mean_max_memory.aggregate_interval_span | Number of 10 minute units in the interval for sampling memory usage data. The default interval is 30 minutes (3 x 10 min.)  
**Default:** 3 |
| mid.threshold.mean_max_memory.percent | Usage percentage of the total memory resources that initiates a threshold breach alert.  
**Default:** 95 |

**MID Server resource reporting**

The **MID Server dashboard** contains two reports that give you views into the consumption of CPU and JVM memory resources. These reports show usage over the previous 30 days.

- **Avg Percentage of CPU Used**: Trending the daily average on CPU usage helps illustrate the amount of CPU processing that the MID Server host consumes. MID Servers deployed on the same host will report the same CPU usage.

- **Avg Percentage of Max Memory Used**: The maximum used percentage *(max_used_pct)* is a useful metric for determining if the MID Server has enough memory resources. This metric is a percentage of the max used memory over the total available memory. Trending this over time provides a visualization of how much memory is needed by the MID Server.

**MID Server user connectivity issues**

The instance writes issues involving MID Server user logins and network connectivity to the MID Server Issue [ecc_agent_issue] table and creates events you can use in custom scripts or to send email notifications.

Records in the MID Server Issue [ecc_agent_issue] table can provide insight into why your MID Server user cannot log in or why a MID Server cannot connect to the instance. The system displays records for connectivity problems in this table that include informative error messages suggesting possible causes. By default, a scheduled job called MIDUserConnectivity runs every four hours and launches...
the MIDUserConnectivity script include to evaluate MID Server connection activity. Records in the MID Server Issue [ecc_agent_issue] table reflect the status of MID Server login attempts and connectivity at the time the scheduled job runs.

From the perspective of the instance, the MID Server is **Down** when:

- User authentication fails
- User authorization fails.
- Network issues prevent MID Server from establishing a TCP/IP connection.

**Note:** To associate a user with a MID Server, navigate to the servicenow/ `<mid server name>/agent/config.xml` file and enter the user credentials in the `mid.instance.username` and `mid.instance.password` parameters. Make sure to restart the MID Server to activate your changes.

**How issues are logged**

User authentication failures and authorization issues are logged automatically to the MID Server agent log file. The message for both is the same: **User cannot be authenticated or is missing the proper roles.** If the issue is related to authorization, the `agent.log` file shows the list of missing roles.

When debugging is enabled, MID Server issues are logged to the system log (syslog) and are available for display in either a **summary or a detailed format**. You can also change the sampling interval from the default 4 hours to something shorter for tracking your remediation efforts. For instructions on enabling and configuring debugging for MID Server user issues, see Test remediation efforts for MID Server user connectivity issues.

**Data provided**

When the instance encounters user connectivity issues, it opens a record in the MID Server Issue [ecc_agent_issue] table.
The MID Server Issue table contains these fields:

### MID Server issue fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last detected</td>
<td>Date and time the issue was last detected.</td>
</tr>
<tr>
<td>Short description</td>
<td>Contents of the generated message that specifies a possible issue with the named user or the MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Empty in the Jakarta release.</td>
</tr>
<tr>
<td>Issue source</td>
<td>The process that identified the issue. For all issues with MID Server user connectivity, the source is MIDUserConnectivity.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the issue. Possible states are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: Starting state when the instance creates the issue.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Acknowledged</strong>: State set when the administrator first examines the issue.</td>
</tr>
</tbody>
</table>
**User authentication failure**

The credentials that the instance uses to authenticate a MID Server user are configured in the MID Server Configuration Parameters [ecc_agent_config] table. If the MID Server user attempts to log into the instance with invalid credentials, the instance rejects the connection, and writes the `login.failed` event to the Events [sysevents] table for the user. Administrators can use this event in a custom script or in email notifications for authentication failure.

⚠ **Note:** If user authentication fails, user authorization is not attempted.

**User accounts associated with a MID Server**

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authentication failure for user accounts that are associated with a MID Server:

- Login authentication failure for User `<user name>` associated with 1 down MID Server. Check password on MID server.

- Login authentication failure for User `<user name>` associated with `<n>` down MID Servers. Check password on MID servers.

The necessary conditions for these messages to appear are:
• The Status field in the MID Servers [ecc_agent] table that is associated with the MID Server indicates that the MID Server is **Down**.

• The user identified in the MID Server Configuration Parameters [ecc_agent_config] table is the user that one or more MID Servers is configured to use for authentication and authorization when connecting to the instance. The record in the [ecc_agent_config] table must have these values:
  ◦ Parameter name [param_name] field set to **mid.instance.username**.
  ◦ Value [value] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The record created in the [sysevent] table contains these field values:
  ◦ Event Name [name] field is set to **login.failed**.
  ◦ Parm1 [parm1] field is set to the user’s name.

⚠ **Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

**User accounts with the mid-server role not associated with a MID Server**

The following message appears when a user with the mid_server role who is not associated with a MID Server fails to authenticate: **Login authentication failure for User **<user name>** with mid_server role not associated with a MID Server.**

The necessary conditions for this message to appear are:

• The User Roles [sys_user_has_role] table contains a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.

• The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.

• The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period:
  ◦ The [sysevent] table contains a record with the Event Name [name] field set to **login.failed**.
  ◦ The Parm1 [parm1] field is set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.
Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

User authorization failure

The user authorization check occurs after the MID Server has successfully authenticated on the instance. In this step, the system ensures that the user account associated with a MID Server is granted the minimum roles required. A SOAP web service called MIDServerCheck performs the role checking on the instance. If the MID Server user has the proper roles, the connection is allowed and a login event is written to the Events [sysevents] table. If the user does not have the proper roles, the instance writes a login.authorization.failed event to the Events [sysevents] table. This event provides a comma separated list of the user's missing roles. Administrators can use this event in custom scripts or in email notifications for authorization failure.

Authorization can fail if a user is missing the mid_server role or any of the important SOAP roles, as in these cases:

- If the user has the soap_script role, the MIDServerCheck SOAP web service runs to check for the appropriate MID Server roles. If the user lacks the mid_server role or any of the other SOAP roles, authorization fails, and the login.authorization.failed event is created.

- If the user is missing the soap_script role, that user is not authorized to launch the MIDServerCheck SOAP web service, which checks for all required MID Server roles. Authorization fails, but the login.authorization.failed event is not created. When this occurs, the instance displays this message: Connectivity of MID Server user <user name> cannot be detected by the instance.

Users associated with one or more down MID Servers

Either of the following messages in the MID Server Issue [ecc_agent_issue] table indicate authorization failure for user accounts that are associated with a MID Server that is Down:

- Login authorization failure for User <user name> associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.

- Login authorization failure for User <user name> associated with <n> down MID Servers. Re-assign mid_server role to grant all required roles.

The MIDUserConnectivity script includes identifies active users associated with one or more down MID Servers whose last login attempt within the reporting period failed user authorization. This message is generated when user authorization failures are detected and reported by the MIDServerCheck scripted web service. However, user authorization failures are not reported for
users who are not assigned the soap_script role. Should this occur, problems with the user are reported by the network connectivity message.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user may or may not have the mid_server role.
- The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.authorization.failed.
  - Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users with the proper role not associated with a MID Server

The following message appears when a user with the mid_server role who is not associated with a MID Server fails authorization: **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

This message is generated when user authorization failures are detected in which the user account, with the mid_server role, is not identified as a configured MID Server user in the [ecc_agent_config] table. It is possible that the user account was associated with a MID Server at the time of the failure.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user failed during the scheduled time period. The [sysevent] table contains a record with these settings:
Event Name [name] field set to login.authorization.failed.

Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Network issues

A network issue can prevent the MID Server from connecting to the instance’s TCP/IP server to begin a session. In this case, the instance marks the MID Server as Down, because the instance failed to receive the MID Server heartbeat within the prescribed 5 minute interval.

Users associated with down MID Servers who have not attempted to log in

Either of the following messages in the MID Server Issue [ecc_agent_issue] table name users associated with MID Servers who have not attempted to log in during the reporting period:

• User <user name> is associated with 1 down MID Server. No login attempts within reporting period.
• User <user name> is associated with <n> down MID Servers. No login attempts within reporting period.

The MIDUserConnectivity script include reports active users associated with down MID Servers where network connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

• The user may or may not have the mid_server role.
• The user is identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user which one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
• There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

Note: The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

Users not associated with MID Servers who have not attempted to log in

The following message appears when a user with the mid_server role who is not associated with a MID Server has not attempted to login during the configured
reporting interval: **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

The MIDUserConnectivity script include reports active users with the mid_server role not associated with a MID Server, where connectivity cannot be detected by the instance.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role. The User Roles [sys_user_has_role] table has a record linking the sys_id associated with the user record stored in the [sys_user] table, with the sys_id associated with the mid_server role record stored in the [sys_user_role] table.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- There are no login attempts, either failed or successful, recorded in the Events [sysevent] table for the user during the scheduled reporting period.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).

**Configuration issues**

Any of the following messages, discussed above, can indicate a configuration issue:

- **Login authentication failure for User <user name> with mid_server role not associated with a MID Server.**

- **Login authorization failure for User <user name> with mid_server role not associated with a MID Server.**

- **User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.**

These are some common configuration errors:

- An administrator neglected to associate the user record with the MID Server record as shown in the MID Server Configuration Parameters [ecc_agent_config] table. This table is read-only and cannot be updated directly. To associate a user with a MID Server, configure the user name and password in the MID Server’s config.xml file and restart the MID Server.
During the process of reconfiguring a MID Server to use a different account for TCP/IP connection, the administrator has not yet removed the mid_server role from the account or deleted the account.

A multipurpose user account was created and granted a large number of roles, including the mid_server role, although this account was never intended to be used as a MID Server account.

**User who successfully authenticates and authorizes but might not need mid_server role**

The following message appears when a user with the mid_server role who is not associated with a MID Server successfully logs in: **User <user name> with mid_server role successfully connected but not associated with a MID Server.**

The mid_server role should be reserved for MID Server use only.

The MIDUserConnectivity script include reports active users with the mid_server role who are not identified as a configured MID Server user, and whose last login attempt was successful during the scheduled time period. This message suggests that the user’s credentials are being used by a system administrator or a process that is not running on a MID Server. The assumption here is that the mid_server role should only be used for applications deployed to a MID Server. The presence of this message reminds the system administrator to remove extraneous mid_server roles from user accounts that do not require them.

This message appears in the MID Server Issue [ecc_agent_issue] table when:

- The user has the mid_server role.
- The user is not identified in the MID Server Configuration Parameters [ecc_agent_config] table as the user whom one or more MID Servers are configured to use for authentication and authorization when connecting to the instance.
- The Events [sysevent] table contains posts showing that the last login attempt associated with the user succeeded during the scheduled time period. The [sysevent] table contains a record with these settings:
  - Event Name [name] field set to login.
  - Parm1 [parm1] field set to the user’s name, corresponding to the User ID [user_name] field in Users [sys_user] table.

**Note:** The MID Server [mid_server] field in the MID Server Issues [ecc_agent_issue] table is empty (=NULL).
Test remediation efforts for MID Server user connectivity issues

After attempting to resolve a user connectivity issue that appears in the MID Server Issue [ecc_agent_issue] table, you can test your remediation efforts without having to wait until the next scheduled reporting period by shortening the sampling interval.

Before you begin
Role required: admin

About this task
Reconfigure the sampling interval using this procedure and then examine the results in the MID Server Issue [ecc_agent_issue] table. You can set any time span for the sample, but you should define a window of not less than 5 minutes, since this is the default interval of the MID Server heartbeat that reports its status. The recommended method for configuring a shorter sampling interval is to copy and modify the code from the MIDUserConnectivity scheduled job, and then run it manually in the background script utility.

CAUTION: Avoid editing the script in the MIDUserConnectivity schedule record. If you make any change to this record, it will not be updated when you upgrade the instance.

Procedure
1. Navigate to System Definition > Scheduled Jobs.
2. Open the MIDUserConnectivity scheduled job.
3. Copy this line from the Run this script field:
   MIDUserConnectivity(0).checkConnectivity(4 * (60 * 60 * 1000));
   This code sets the 4 hour sampling interval in milliseconds and turns debugging off with the MIDUserConnectivity(0) value.
4. Navigate to System Definition > Scripts - Background.
5. Paste the code from the scheduled job into the Run script field.
6. Set the sampling interval to 5 minutes by changing the time calculation to (5 * 60 *1000).
   The modified command looks like this:
   MIDUserConnectivity(0).checkConnectivity (5 * 60 *1000);
7. Click Run script.
8. Open the record of the MID Server that had the issue and select the MID Server Issues related list.
   The issue is updated as follows:
• If the issue persists, the **Count** column is incremented, and the **Last detected** column shows the current date and time.

• If the issue no longer exists, the system changes the **State** to **Resolved**.

9. Optionally, you can enable debugging by selecting a level, and then run the script again to see the breakdown for each condition evaluated. Use these settings to select a debugging level:

• For a summary view, enter `MIDUserConnectivity(1)`.

• For a detailed view, enter `MIDUserConnectivity(2)`.

For details about the type of debugging information provided, see **Interpreting MID Server user debugging output**.

**Interpreting MID Server user debugging output**

Debugging output from the system log is available in either a summary or detailed view for MID Server user issues, but must be enabled manually.

To enable debugging and display all connectivity issues in either of the available formats, you must run a method manually on your instance. For instructions on enabling debugging, see **Test remediation efforts for MID Server user connectivity issues**. For information about each error condition and how records are created in the MID Server Issue `[ecc_agent_issue]` table, see **MID Server user connectivity issues**.

**Available formats**

You can configure the instance to generate a simple summary of the issue or a detailed output that identifies users and MID Servers. Summaries provide a quick look at the issue conditions, by count, while the detailed view allows you to examine roles, MID Server associations, and login activity by named users.

In this summary example of an authorization issue, the instance evaluates each condition and indicates how many users met that condition. You can see that a MID Server is down and that one of two users configured for a MID Server failed authorization. Because this is a summary, neither the MID Server nor the users are named.

**Sample summary debug output**

```bash
[0:00:00.014]: Script completed in scope global: script
** Script: Log Object: MIDUserConnectivity JobSchedulerDateTime 2017-02-21 17:31:08
** Script: Log Object: MIDUserConnectivity JobSchedulerDateTime (current users display format and timezone) 2017-02-21 17:31:08
** Script: MIDUserConnectivity found (1) user(s) with the mid_server role defined
** Script: MIDUserConnectivity found (1) user(s) with the mid_server role defined
** Script: MIDUserConnectivity found (2) configured MID Server UsersID
** Script: MIDUserConnectivity found (1) user(s) with the MID Server role MID_ServersUser defined
** Script: MIDUserConnectivity found (2) configured MID Server UsersID
** Script: MIDUserConnectivity found (1) user(s) whose most recent login attempt during the reporting period failed
** Script: MIDUserConnectivity found (1) user(s) whose most recent login attempt during the reporting period failed
** Script: MIDUserConnectivity found (1) user(s) whose most recent login attempt during the reporting period succeeded
** Script: MIDUserConnectivity found (2) configured MID Server Users where connectivity to the MID by the instance can not be detected
** Script: MIDUserConnectivity found (1) new message(s) skipped by the auto-resolve
** Script: MIDUserConnectivity: processing completed
```
Authentcation failure
When a MID Server user cannot authenticate on the instance, the system displays these error messages in the detailed output:

- Login authentication failure for User <user name> associated with 1 down MID Server. Check password on MID server.
- Login authentication failure for User <user name> associated with <n> down MID Servers. Check password on MID servers.
- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, midserv2, local-midserver, and ardis.maison, failed to authenticate. Two of these users were configured for MID Servers that were Down, and the other user was not configured for any MID Servers. Each of these users has an authentication failure and is named in the appropriate error message.

Detailed debugging log for authentication failure

MID Server ID map
The debugging output lists all MID Servers that are marked as Down and maps them to their user accounts by the MID Server sys_id. This map includes all user
accounts that have the mid_server role, whether or not they are associated with a MID Server. If there are no Down MID Servers, the map is not displayed in the debugging output.

The map is presented in three sections:

- User accounts not associated with any MID Servers.
- User accounts associated with Down MID Servers, identified by their sys_id.
- The sys_id of each Down MID Server, identified by name.

**MID Server ID map**

![Map of MID Server IDs]

**Authorization failure**

If a user is missing any of the required roles, the instance generates these authorization failure messages:

- Login authorization failure for User `<user name>` associated with 1 down MID Server. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User `<user name>` associated with `<n>` down MID Servers. Re-assign mid_server role to grant all required roles.
- Login authorization failure for User `<user name>` with mid_server role not associated with a MID Server.

In this example, three users with the mid_server role, `midserver2`, `local-midserver`, and `ardis.maison` have failed authorization. One user is not associated with any MID Server, but the other two users are. The system has logged an authorization failure, indicating that the user is missing at least one critical role. To see what roles are missing, look at the comma separated list in the Parm2 field in the `login.authorization.failed` event record. This record is the most recent login attempt in the Event [sysevent] table for the user account within the reporting period.
Detailed debugging log for authorization failure

**Network issues**

Network issues may exist for these users who are associated with MID Servers, but who have not attempted to log in during the reporting period:

- **User <user name>** is associated with 1 down MID Server. No login attempts within reporting period.

- **User <user name>** is associated with <n> down MID Servers. No login attempts within reporting period.

Network issues may also exist for these users who are NOT associated with MID Servers, and who have not attempted to log in during the reporting period: **User <user name>** with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, no login attempts have been detected for midserver2, local-midserver, and ardis.maison, all of whom have the mid_server role. Two of those users are associated with MID Servers that are marked Down. The other user is not associated with any MID Server. None of these users has attempted to log in to the system within the configured reporting interval. The system assumes that these users would make an attempt to log in unless network issues prevented them from doing so.

**Note:** By default, the sampling period is 4 hours. However, during debugging or remediation, the sampling period can be reset to a value that matches the MID Server heartbeat interval of 5 minutes, or greater.
Detailed debugging log for network connection issues

**Script: Log Object: MIDUserConnectivity: activeUserIDsWithMIDServerRole**

Array of 3 elements
- [0]: string = adisa.maison
- [1]: string = midserver2
- [2]: string = local-midserver

**Script: Log Object: MIDUserConnectivity: downMIDServerConfiguredUserIDs**

Array of 2 elements
- [0]: string = midserver2
- [1]: string = local-midserver

**Script: Log Object: MIDUserConnectivity: userMIDServerMap**

Object
- adisa.maison: Object
  - sys_domain: string = global
  - mid_server: Array of 0 elements
  - midserver2: Object
    - sys_domain: string = global
    - mid_server: Array of 2 elements
      - [0]: string = f0a68f154b0b2320f7b30d3b237069e9
      - [1]: string = db2ced3e721300f7b30d3b237069e9

Any of the following messages can indicate a user configuration issue:

- Login authentication failure for User <user name> with mid_server role not associated with a MID Server.
- Login authorization failure for User <user name> with mid_server role not associated with a MID Server.
- User <user name> with mid_server role successfully connected but not associated with a MID Server. The mid-server role should be reserved for MID Server use only.
- User <user name> with mid_server role is not associated with a MID Server. No login attempts within reporting period.

In this example, a user with the mid_server role has logged in successfully within the configured sampling interval. However, this user is not configured for a MID Server and might have the role in error.
Detailed debugging log for MID Server user account login

**Detailed debugging log for MID Server user account login**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server Upgrade History**

Use this module to troubleshoot errors that occur during the MID Server upgrade process. The MID Server Upgrade Histories table contains a record of each instance upgrade. The MID Server Upgrade Stages table shows the status of each MID Server and its upgrade progress, including any errors encountered.

**MID Server Upgrade Histories**

Users with admin or agent-admin roles can find detailed information for any MID Server upgrade in the Upgrade History module for MID Server. Whenever an instance is upgraded, all MID Servers in the Up state are upgraded automatically. The Upgrade History module uses the MID Server Upgrade Histories table [ecc_agent_upgrade_history]. This table shows the following information:

- The old instance version.
- The new version.
- The number of successfully upgraded MID Servers.
- The number of MID Servers with pending upgrades. MID Servers have pending upgrades if the upgrade has failed or is in progress.

**MID Server Upgrade Stages**

Select an instance record to see more details about the MID Servers upgraded with that instance. The Pending Upgrades and Complete Upgrade Details related lists use the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage]. MID Servers pinned to a specific version generate an entry with a blank MID Upgrade History on the MID Server Upgrade Stages table [ecc_agent_upgrade_history_stage].
### MID Upgrade History

<table>
<thead>
<tr>
<th>MID Upgrade History</th>
<th>Refers to a corresponding record in the [ecc_agent_upgrade_history] table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Shows the progress of the MID Server through each stage of the upgrade process.</td>
</tr>
<tr>
<td>State</td>
<td>Shows the status of each stage.</td>
</tr>
<tr>
<td>Message</td>
<td>Displays dynamically generated messages about the upgrade stages, such as the file path to download directories or extract folders. It also displays information about any errors encountered, even if those errors do not block the upgrade.</td>
</tr>
</tbody>
</table>

### MID Server reference information

MID Server reference information includes system requirements and other information you need to configure a MID Server for your specific needs.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

### System clones and the MID server

See KB0547597 for information on what to do with MID Servers when you are cloning your instance.
Reference topics

System requirements
Use the minimum system requirements to allocate resources for computers hosting MID Servers.

ECC Queue
Learn about the External Communication Channel (ECC) Queue, which is the connection point between the MID Server and the instance. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

MID Server Dashboard
Use the reports and gauges in the MID Server dashboard to monitor ongoing operations.

MID Server properties
Use MID Server properties to control the behavior of all MID Servers or a particular MID Server.

MID Server parameters
Use MID Server parameters to control the behavior of a particular MID Server.

MID Server protected records and reserved characters
Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.

MID Server privileged commands
To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.

MIDSystem methods
MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

MID Server heartbeat
Configure the interval that the instance uses when it checks the "heartbeat" of MID Server. By default, the instance checks the MID Server for a response every 5 minutes.

Set JVM memory size
Modify the JVM setting for your MID Server from the default size to suit the amount of work your MID Server does in your network.

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

**MID Server system requirements**

Use these minimum system requirements to allocate resources for computers hosting MID Servers.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**MID Server supported systems**

**Windows server**

To discover Windows-based servers, run Service Mapping patterns, or execute Orchestration commands on Windows devices, the MID Server must be installed on a Windows server. The MID Server supports these Windows operating systems, including virtual machines and 64-bit systems:

- Windows Server 2012
- Windows Server 2016
- Windows Server 2019

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**Note:** .NET Framework version 3.5, 4.0, 4.5, 4.6, or 4.7 is required for Service Mapping support and for Windows pattern-based discovery.

**Linux**

The MID Server is supported on these Linux versions for virtual machines and 64-bit systems:

- Linux Red Hat 6 and above
- Ubuntu 1404 (Ubuntu 14) and above
- CentOS 6 and above

**Note:** ServiceNow no longer supports new installations of 32-bit MID Servers or upgrades to version Rome. New MID Server installation are blocked through RPM and MSI installer on the following operating systems:

- CentOS 6
- Windows server 2008
- Windows server 2008 R2
- Windows 8
- Windows 10

Unsupported MID Servers auto-upgrading to Rome create an issue record in MID Server Issues (ecc_agent_issue). For more information, see Supported platform changes for MID Server [KB0863694].

**Security requirements**

To meet high security standards, the MID Server performs x.509 certificate validation on HTTPS traffic when connecting to ServiceNow®. If a network appliance or proxy exists between the MID Server and the instance, that appliance needs to present a digital certificate signed by a trusted CA. If you are using a self-signed certificate or a certificate signed by an internal CA, please import the certificate to the MID Server truststore. For more information on adding SSL certificates, see Add SSL certificates for the MID Server.

**OCSP connectivity requirements**

The Online Certificate Status Protocol (OCSP) is the protocol used to determine the revocation status of SSL/TLS certificates. When certificates are exchanged and validated, the MID Server needs to determine if the certificate has been revoked and shouldn't be trusted.
OCSP works by using a client, such as a MID Server, to receive a certificate from an HTTP website. The client sends a request to an OCSP responder: a server operated by the certificate authority (CA) that issued the certificate. The OCSP responder’s response to the client indicates whether the certificate is valid or has been revoked.

In order to connect, the MID Server requires access to:

- servicenow.com
- install.service-now.com
- ocsp.entrust.net (or other OCSP CA)

While SSL/TLS certificates are always issued with an expiration date, there are certain circumstances in which a certificate must be revoked before it expires (for example, if its associated private key may have been compromised). Therefore, the current validity of a website’s certificate must always be checked by clients regardless of its expiry date.

Clients fail a connection when they can’t check the revocation status of a certificate. Firewalls and proxy configurations may block calls to the OCSP Entrust server, which prevents the MID Server from working. You may need to change your firewall permissions so the OCSP traffic to go through properly. For more information and resolutions, see the HI Knowledge Base article [KB0813636].

**PowerShell requirements**

The MID Server requires the minimum PowerShell version 3.0 and supports versions up to PowerShell 5.1. To find your current PowerShell version using the instance, go to `ecc_agent_list.do`. Using the Update Personalize List gear icon, add Host PowerShell Version to the Selected column. Then sort the list of MID Servers by their PowerShell version to find outdated MID Servers. Alternatively, you can find the PowerShell version on the host machine by using the command `$Host.Version` in the host's PowerShell console. The PowerShell version is listed as PSVersion.

**Java version support**

Java 11 is bundled with the MID Server installer package and is installed on the host for all new MID Servers. The installer automatically configures Java 11 to run in your environment. No additional configuration is required. This version supports both 64-bit and 32-bit Windows MID Servers, and 64-bit Linux MID Servers. For the best performance, install the 64-bit MID Server for your operating system. The MID Server requires a minimum JRE version 1.8.0_161, and recommended version...
11.0.8. If you are using a lower version than 1.8.0_161, you may see encryption related issues.

Testing showed that the MID Server works as expected with Oracle Java 11 version 11.0.5 and Oracle JRE 8 version 1.8.0_231. However, Oracle JRE 8 version 1.8.0_231 requires the workaround described in the HI Knowledge Base article MID Server running Oracle JRE version 8 [KB0784442]. If you need to upgrade the JRE to a different version, then coordinate with the appropriate account representative for support.

Upgraded MID Servers might use different Java versions depending on their operating system versions.

• MID Servers upgraded from earlier versions use the OpenJDK provided with the MID Server installer. This version of the OpenJDK was tested and certified for use with these MID Servers.

• The JRE version is not upgraded when upgrading 32-bit Linux MID Servers or Linux with glibc versions lower than 2.17. The MID Server will continue to use earlier the earlier version of JRE, such as 1.8.0_231.

• MID Servers upgraded on any other operating system versions also automatically upgrade the JRE to the version provided with the installation package.

⚠️ Note: Linux MID Servers require glibc version 2.17. The library must be updated for JRE 11. On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is: `yum install glibc.i686`

**MID Server JRE downgrade support**

If the ServiceNow® instance is downgraded from Quebec, then the MID Server is also downgraded. However, the JRE may not be downgraded unless the instance is downgraded to one of the following patches.

• New York Patch 12
• Orlando Patch 9
• Paris Patch 3

If the MID Server is downgraded from Quebec to a different patch than specified, follow the instructions in Install Java 11 on MID Servers [KB0752451].

**Java Service Wrapper**

The MID Server installer includes the Tanuki Software Java Service Wrapper, version 3.5.40.
Setting the JVM Memory size

The MID Server installs with 1 GB of JVM memory. If the suggested memory size for your product is greater than 1 GB, see Set the MID Server JVM memory size for the procedure to override the default setting.

Deployment types

System requirements for your instance are determined by the needs of the individual products you use that require a MID Server. Some applications, such as Health Log Analytics, have additional system requirements listed in their documentation.

Standard deployments

The following products are considered "standard" because their MID Servers share the same minimum disk space and memory requirements:

- Discovery
- Event Management
- Integrations
- Orchestration
- Service Mapping

The minimum standard requirements pertain to both a single product and a combined product deployment. You can deploy a single MID Server for multiple standard products without significantly increasing the disk or memory requirements.

High resource deployments

Cloud Management Platform (CMP) and Operational Intelligence are processing intensive and require more resources for each MID Server than the standard products. Install MID Servers for these products on dedicated hosts that do not support MID Servers for other products.

Recommended MID Server minimum requirements

MID Server performance and system requirement are driven by multiple factors including but not limited to:

- The size of the customer infrastructure and specific function (Capability) MID Server is configured to perform.
- The number of MID Servers installed on the host.
- The number of threads per MID Server.
• The number and nature of other applications running on MID Server host.

• Architectural and design enhancements over ServiceNow releases. For example, using PowerShell for Windows Discovery in Orlando or changing default Java Garbage Collection policy in Quebec.

As a result, there is no one size requirement that fits for all MID Server deployments. The following documented sizing guidelines can be a starting point for deployments. However, customers need to monitor MID Server performance and resource utilization continuously, then tune and scale up their MID Servers as needed.

**MID Server minimum system requirements**

The minimum CPU configuration required for a MID Server is a quad core processor with a speed of 2+ GHz for a Windows Server 2012 R2 host with a single MID Server deployed and with standard configuration of 25 concurrent threads.

**MID Server CPU utilization**

Most of the MID Server applications, such as Discovery, are designed for maximizing their performance which results in maximizing the resource utilization for the MID Server. As a result, some customers might observe very high CPU utilization segments in the range of 90-100% while the MID Server is running Discovery schedules or similar applications.

The very high CPU utilization segments should not be a cause for concern because it aligns with architectural design of maximizing the throughput and does not have any negative impact on the Discovery performance. The MID Server host’s resource utilization automatically returns to normal after the Discovery execution successfully stops.

Customers who notice frequent and long very high CPU utilization segments should avoid:

• Running more than one MID Server on same host when these MID Servers are expected to process active workloads at the same time, such as overlapping Discovery schedules.

• Sharing the MID Server host with other applications.

• Configuring performance alerts, which are purely based on CPU utilization, on MID server host. If required, these alerts need to be used in conjunction with other performance monitors.

**Configuring additional performance monitoring on MID Server host**
While CPU utilization on MID server is a good indicator of load on the host, it gives only limited visibility. Additional monitoring with System Processor Queue Length on Windows Operating Systems and Load Averages on UNIX Operating Systems is crucial.

- **Processor Queue Length (Windows OS):** the number of threads that are ready but currently unable to run on the processor due to another active thread. A bottleneck on the processor may occur where the number of threads in the queue is more than twice the number of processor cores over a continuous period.

- **Load Averages (Unix OS):** the average system load on a Linux server for a defined period. It is the CPU demand on a server that includes sum of the running and the waiting threads. Typically, the top or the uptime command provides the load average of the server with output.

### MID Server CPU Performance Case Studies

**The impact of modifying number of MAX threads on MID Server CPU utilization**

Based on internal benchmarking, the following is sample data for MID Server CPU utilization while running Cloud Discovery for 10,000 servers.

In these tests, the maximum CPU utilization was observed to be 100% independent of number of threads and OS. The average CPU utilization was observed to be proportional to number of threads. Increasing number of threads did not necessarily result in immediate CPU pressure. Increasing the number of threads from the default 25 to 50 did not create additional CPU pressure, as shown by the max processor queue length. However, increasing the max threads value to 100 caused a significant increase in processor queue length, indicating CPU pressure.

**The impact of sharing MID Server with other applications or MID Servers on CPU utilization**
Running Discovery is a CPU intensive operation for MID Server. Deploying other applications or MID Servers on same host creates additional CPU pressure on the host. This pressure results in a performance impact for running applications, including the MID Server. The following examples are sample CPU utilization data points for MID Server with different load patterns:

**Dedicated host for a single MID Server:** the average CPU usage is 48%.

**Host shared between a MID Server and another application with moderate load:** the average CPU usage is 77%.

**Host shared between a MID Server and another application with heavy load:** the average CPU usage is 97%.
Scaling up MID Server and its impact on MID Server CPU resource utilization

When the MID Server is heavily constrained on CPU resources, scaling up the MID Server host, by adding more CPUs, helps ease resource pressure. However, this may not necessarily eliminate the very high CPU usage segments. MID Server applications like Discovery, which are designed for maximizing the performance, will continue to use additional available CPU resources. The following examples are sample CPU utilization data points for a 4 CPU MID Server host and an 8 CPU MID Server host running same Discovery schedules:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>4 CPU</th>
<th>8 CPU</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average CPU%</td>
<td>48%</td>
<td>28%</td>
</tr>
<tr>
<td>Max CPU %</td>
<td>98%</td>
<td>98%</td>
</tr>
</tbody>
</table>

MID Server CPU utilization when deployed on a 4 CPU host:
Monitoring performance
To ensure that the MID Server resource allocations are sufficient for your environment, monitor performance during peak periods of product execution from the MID Server dashboard.

MID Server ECC Queue
The External Communication Channel (ECC) Queue is a connection point between an instance and the MID Server. Jobs that the MID Server needs to perform are saved in this queue until the MID Server is ready to handle them.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security
Asynchronous Message Bus

The MID Server subscribes to messages published by the Asynchronous Message Bus (AMB), which notifies the MID Server that it has pending tasks in the ECC Queue. If a job exists in the ECC Queue for that MID Server, the MID Server sets the status to "I'm working on it." When finished working on a requested job, the MID Server reports back to the ECC queue with the results.

The MID Server opens a persistent connection to the instance through the AMBClient and listens on the /mid/server/<mid_sys_id> AMB channel. When an output record is inserted into the Queue [ecc_queue] table, an AMB message is sent to the MID Server's channel. The MID Server receives this message and immediately polls the ecc_queue table for work.

The MID Server polls the ECC queue on the regular interval defined in the mid.poll.time configuration parameter, regardless of AMB message activity. The default polling interval is set to 40 seconds, but can be reconfigured. This polling of the ECC queue at a regular interval is done in case the AMB connection is dropped.

MID Server ECC queue polling process
**Note:** The AMB client on the MID Server does not work in all environments and might need to be disabled to avoid performance issues. To disable AMB in your environment, set the `mid.disable_amb` parameter to `true`. When you disable AMB, the MID Server reverts to a default polling interval of 5 seconds, unless the `mid.poll.time` parameter is set to a different value.

**ECC Queue information**

You can access the ECC Queue by navigating any of these paths:

- Discovery > Output and Artifacts > ECC Queue
- Discovery > Discovery Schedules > `{schedule name}` > `{Discovery status record}`
- ECC > Queue
- `{Discovery Status record}` > ECC Queue

An ECC Queue provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>The name of the external system that this messages is either from or to. If the message is from or to a MID Server, the agent name is in the form <code>mid.server.xxx</code>, where <code>xxx</code> is the name of a particular MID Server.</td>
</tr>
<tr>
<td>Topic</td>
<td>The name of the probe the MID server ran. If you are using a pattern for discovery, the Horizontal Pattern probe appears.</td>
</tr>
<tr>
<td>Name</td>
<td>The actual command the probe ran. For example, if <strong>Topic</strong> is SSHCommand, then the <strong>Name</strong> field contains the actual shell command to run. If you are using a pattern for discovery, the following appears:</td>
</tr>
<tr>
<td></td>
<td><strong>Pattern Launcher:</strong> followed by the name of the pattern and the multipage number.</td>
</tr>
<tr>
<td>Source</td>
<td>The IP address that the discovery is to run against. A few probes run against multiple IP addresses; in those cases, this field contains a human-readable description.</td>
</tr>
<tr>
<td>Response to</td>
<td>This optional field contains a reference (sys_id) to the ECC Queue message that this message is in response to. Discovery makes extensive use of this field to track the hierarchy of messages that result from a given scheduled Discovery. Click the record icon for the value in this field to open the ECC Queue record for the activity that spawned the current probe or sensor record.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Queue</td>
<td>An indicator of whether this message was an input message or an output message.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the current ECC queue record. States update automatically.</td>
</tr>
<tr>
<td>Processed</td>
<td>The time when this message was processed.</td>
</tr>
<tr>
<td>Created</td>
<td>The time when this message was created.</td>
</tr>
<tr>
<td>Sequence</td>
<td>The unique sequence number for this message. This value is automatically generated when an ECC Queue record is inserted. Its use is deprecated.</td>
</tr>
<tr>
<td>Error string</td>
<td>An error message, if an error occurred during processing. This field is hidden on the standard form unless there was an error.</td>
</tr>
<tr>
<td>Payload</td>
<td>The body of the message in XML format. The returned XML has a root tag of <code>&lt;results&gt;</code> containing one or more <code>&lt;result&gt;</code> tags and a single <code>&lt;parameters&gt;</code> tag. The parameters are simply an echo of those sent to the MID server in the probe; they vary from probe to probe, but in general they tell the probe the details of what it is to do and how it should behave. The result tags are the most interesting ones: they contain the actual data generated by the probe.</td>
</tr>
</tbody>
</table>

**ECC queue controls**

The ECC Queue form contains these related links:

<table>
<thead>
<tr>
<th>Related link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run again</td>
<td>Runs the probe again. You can re-run probes when you encounter a failed discovery or other unexpected results.</td>
</tr>
<tr>
<td>Go to CMDB item</td>
<td>Open the CI record for the CI that was updated during the discovery.</td>
</tr>
<tr>
<td>Go to Sensor</td>
<td>Open the record for the associated sensor.</td>
</tr>
</tbody>
</table>

**Manage ECC Queue content for a MID Server**

The ECC Queue allows you to create ECC Queue messages, access MID Server log entries, and retrieve statistics from an individual MID Server record.
Before you begin
Role required: admin, mid_server

Procedure

1. Send remote commands through a MID Server to a hosting device directly from the ECC Queue without running Discovery.

   a. Navigate to the ECC Queue and click New.

   b. Create a message with these settings:
      • **Agent**: The name of the MID Server that executes the command.
      • **Topic**: Command
      • **Name**: The actual command that you want to process. For Windows, this is expressed in a DOS command line structure. For Linux, the structure could be a bash command line entry.
      • **Queue**: Output
      • **Payload**: With proper XML tags, you can specify the command here instead of in the **Name** field. The advantage to this is that the command is not restricted by the **Name** field length of 120 characters. Use the following XML format for the command:

        ```xml
        <parameters>
          <parameter name="name" value="ACTUAL_COMMAND_LINE"/>
        </parameters>
        ```

2. Access entries in the ECC Queue that show **agent0.log.0** logs and **wrapper.log** logs for an individual MID Server.

   a. Open a MID Server record.

   b. Under **Related Links**, click **Grab MID Logs**.

      ECC queue records appear in the list using the following filter:
      • [Topic] [is] [SystemCommand]
      • [Source] [is] [grabLog]
      • [Agent] [is] [your MID Server]

      Only **agent0.log.0** and **wrapper.log** entries appear. These logs are also accessible in the `~\agent\logs\` file path.

   c. To open a log entry, click the link under the **Created** column.
3. Access the queue.stats topic for useful information about individual MID Servers, such as memory and CPU usage data.

   a. Open a MID Server record.

   b. Under Related Links, click MID Statistics. ECC queue records appear in the list using the following filter:
      - [Topic] [is] [queue.stats]
      - [Agent] [is] [your MID Server]

**MID Server dashboard**

The MID Server dashboard is a central place for MID Server users to monitor ongoing operations. The dashboard consists of reports and gauges that display information from the MID Server Status table.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server Dashboard is available from the MID Server > Dashboard module.

**MID Server status gauge**

The MID Server Status gauge on the dashboard displays basic information about each MID Server. This information comes from the MID Server Status [ecc_agent_status] table.
If the version is not compatible, the MID Server status is not changed to **Down** in the MID Server dashboard. So it might still appear to be processing commands when it actually is not doing so. You must check the MID Server **Version** on the dashboard.

See [KB0535181](#) for additional MID Server troubleshooting information.

The icons in the **Version** column indicates the following:

- **Red**: Incompatible. The MID Server and instance do not belong to the same release. You must [upgrade the MID Server](#) and verify that it is not pinned to an older version with the `mid.version.override` property. The MID Server will not be upgraded until the parameter is cleared.

- **Yellow**: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.

- **Green**: Compatible. No upgrade necessary.

- **Gray**: Incompatible. The instance cannot detect the version.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the MID Server.</td>
</tr>
<tr>
<td>Host name</td>
<td>The name of the system that hosts the MID Server.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the MID Server.</td>
</tr>
<tr>
<td>Validated</td>
<td>Whether or not the MID Server was validated.</td>
</tr>
<tr>
<td>Max memory used %</td>
<td>The highest percent usage of memory on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See <a href="#">MID Server resource threshold alerts</a> for details.</td>
</tr>
<tr>
<td>Mean CPU used %</td>
<td>The average percent usage of CPU on the system that hosts the MID Server, in the configured sampling interval. The default interval is 30 minutes, but this value is user configurable. See <a href="#">MID Server resource threshold alerts</a> for details.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Pending jobs</td>
<td>Number of pending ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Processing jobs</td>
<td>Number of processing ECC queue jobs for that MID Server.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of the MID Server. An icon indicates the validity of the MID Server:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong>: Incompatible. The MID Server and instance do not belong to the same release. You must upgrade the MID Server and verify that it is not pinned to an older version with the mid.version.override property. The MID Server will not be upgraded until the parameter is cleared.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Yellow</strong>: Compatible, but an upgrade is recommended. This indicates that the MID Server version belongs to the same family as the instance, but not the same version.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong>: Compatible. No upgrade necessary.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Gray</strong>: Incompatible. The instance cannot detect the version.</td>
</tr>
<tr>
<td>User</td>
<td>The login name of the user. An icon indicates the validity of the user:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Red</strong>: Incompatible. The user does not have the mid_server role or the user does not match the value in the mid.instance.username parameter (in the config.xml configuration file). Reconfigure the MID Server user and verify that it works.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Green</strong>: Compatible. The user has the mid_server role and matches the user in the configuration file.</td>
</tr>
</tbody>
</table>

**Note:** The user can also have any of the SOAP roles that the mid_server role inherits.

**CPU and maximum memory usage**
This graph shows the average percentage of CPU usage on all the systems that host MID Servers in the last 30 days.
This graph shows the average percentage of maximum memory used by all the systems that host MID Servers in the last 30 days.
MID Server properties

Properties control the behavior of all MID Servers or a particular MID Server.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

The MID Server properties are in the MID Server Property [ecc_agent_property] table and can be accessed by navigating to MID Server > Properties. To set these properties, you must add them, if they are not already present.

**MID Server properties**

**alias_filtering_behavior**

Sets the behavior of Discovery aliases. Behaviors define how strictly the system enforces the use of credential aliases in Discovery schedules.

The choices for behaviors are:

- **strict**: Aliases defined for the credential must match the aliases configured for the probe.
- **loose**: The probe’s credential is used if it contains all the aliases specified in the schedule.

- Type: string
- Default value: loose

**com.glide.closure_max_rows_per_table**

Sets the maximum number of rows allowed in a table. This property is not visible by default and must be added.
concurrent.dist.download

Sets the number of concurrent MID Server auto-upgrades permitted by the instance. The default value of this property is 2, which allows the MID Server to use 2 of the 4 semaphores available on the instance for upgrading. If your instance has more than 4 INT semaphores, you can increase the value in this property to allow more concurrent upgrades.

• Type: integer
• Default value: 2

glide.stored_proc.data_type.validation

Stops validation of data types in stored procedure parameters. Use this property if you use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases and you want to avoid performing data type validation. Restart the MID Server service after you change the value of this property.

• Type: true | false
• Default value: false

max_ci_count_per_page

Defines the maximum CI count per page.

• Type: integer (bytes)
• Default value: 500

You can also configure this as a configuration parameter on a individual MID Server.

mid.aws.sts.assume_role.disable_credential_caching

Set this property to true to prevent the caching of temporary credentials for Cloud Discovery. For more information, see Access setup for AWS service accounts.

• Type: true | false
• Default: false

mid.aws.sts.assume_role.credential_ttl_minutes
Set the number of minutes you want to cache temporary credentials for Cloud Discovery. For more information, see Access setup for AWS service accounts.

- Type: integer
- Default: 60

mid.ca.certificate.api.request.retry.count
Indicates how many times the Certificate Import query will retry after the rate limit has occurred.

- Type: integer
- Default: 3

mid.ca.certificate.api.request.retry.interval
Used to delay Certificate import from CAs when the rate limit has occurred.

- Type: integer
- Default: 30000

mid.discovery.max_pattern_payload_size
Defines the maximum overall payload size for the payload of results that come from patterns.

- Type: integer (bytes)
- Default value: 300000

You can also configure this as a configuration parameter on an individual MID Server.

mid.discovery.max_payload_size
Specifies the maximum string length of Discovery results that the MID Server sends to the instance. If the Discovery probe results exceed the limit, the MID Server discards them and returns a warning message.

For probes, this applies only to those probes where the Used by Discovery field is true. For patterns, this applies to the Horizontal Pattern probe.

Set the value to any negative number to disable the payload limit and allow payloads of any size to be sent to the instance. For example, -1.
• Type: integer (bytes)
• Default value: 5000000

You can also configure this as a configuration parameter on an individual MID Server.

mid.discovery.multiprobe.skip_others_on_error

Prevents probes in a multi-probe from iterating through available credentials when another member probe has already failed or timed out. If this property is set to false, each probe in the multi-probe attempts to connect to the target with the same invalid credentials. This condition results in longer probe execution times on the MID Server.

This property is not visible by default and must be added to the sys_properties table to change the value.

• Type: true | false
• Default value: true

mid.eccq.max_payload_size

Specifies the maximum string length of a payload that the MID Server sends to the instance. The MID Server verifies the size of the payload before sending it to the instance. If the payload size exceeds the limit, the MID Server discards it and returns an error message in the payload.

• Type: integer (bytes)
• Default value: 20000000

You can also configure this as a configuration parameter on an individual MID Server.

mid.jdbc.datastream.max.record.size

Specifies the maximum record size in KB.

• Type: integer
• Default value: 64
• Maximum value: 128

mid.jdbc.datastream.fail.when.attachment.limit.exceeded

Specifies if the data up to 4GB (four attachments, each of size 1GB) can be retrieved from the RDBMS. By default, a flow or action fails
with an error, when there is data of more than 4GB to be retrieved. Set value to false to retrieve data of size 4GB without an error.

- Type: string
- Default: true

**mid.log.command_audit.enable**

Enables the MID Server command audit log.

- Type: string
- Default value: false

**mid.powershell.target_base_dir**

Specifies the location of the target base folder used for Discovery using WMI. If another network share is mounted on each Window’s target, the folder may be changed by updating this property.

- Type: string
- Default value: admin$\temp

**mid.probe.collect_debug_info**

An optional property to collect debug information. If this property is set to true, the probe collects credential debug information when it runs and puts that information in the payload of ECC input message. It doesn’t affect how Discovery works.

- Type: true | false
- Default value: false

**mid.probe.use_legacy_forward_dns**

Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.

- Type: true | false
- Default value: false

**mid.probe.use_legacy_reverse_dns**

Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this property to disable those features. The default DNS probe's features include being lightweight and faster due to
executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

**mid.process_flow.log_listener.max_size**

Sets the maximum size in bytes of memory available to save log messages for Flow Designer actions running on a MID Server. The MID Server stores up to the limit in memory and discards additional log messages, then sends the messages back to the instance along with the execution plan.

- Type: integer (bytes)
- Default value: 10485760

**mid.property.jdbc_operations**

Tells the JDBCOrchestrationProbe what JDBC operations it is allowed to execute. Edit this property value to allow JDBC Orchestration activities to perform more operations. All operations are comma separated. Select a MID Server in the **MID server** field to define specific operations for that MID Server, or leave the field empty to apply the list of operations to all MID Servers. This property requires the Orchestration plugin.

- Type: string
- Default value: select, update, insert, delete, show, create, describe, begin, if, end, not, exists

**mid.property.jms.command.allowed_factory_names**

Comma delimited list of Java Messaging Service (JMS) connection factories that the MID Server requires for a custom JMS activity or action. This property requires the Orchestration plugin.

- Type: string
- Default value: connectionFactory, queueConnectionFactory, topicConnectionFactory

**mid.property.ssh.use_snc**
Enables the use of the SNCSSH client for Discovery and Orchestration. Change this property to false to use J2SSH. This property applies to all MID Servers connected to the instance.

- Type: true | false
- Default value: true

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

**Note:** It is not recommended to change this property as it is being deprecated.

- Type: True | False
- Default value: true

**mid.sa.ssh.use_sncssh**

Toggles SSH between non-interactive and interactive modes. True corresponds to non-interactive mode and allows probes to open sessions with the device without waiting for a prompt. False corresponds to interactive mode, which requires interactive sessions with the device for network devices and servers.

- Type: True | False
- Default value: true

**mid.servicewatch.max_concurrent_connections**

Defines the maximum number of concurrent tasks sent to an individual host by a single MID Server.

- Type: integer
- Default value: 7

**mid.shazzam.regulator.interval_ms**

Sets the interval, in milliseconds, in which Shazzam can launch packets.

- Type: integer
- Default value: 1

**mid.shazzam.regulator.packets_per_interval**
Sets the number of packets that Shazzam can launch in the time interval specified by the `mid.shazzam.regulator.interval_ms` property.

- Type: integer
- Default value: 1

**mid.shazzam.threads**

Specifies the number of concurrent threads that Shazzam uses. Setting this or the `mid.shazzam.max_scanners_per_thread` parameter to 0 disables Shazzam multi-thread optimization.

- Type: Integer
- Default value: 5

**mid.shazzam.max_scanners_per_thread**

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the `mid.shazzam.threads` parameter to 0 disables Shazzam optimization.

- Type: Integer
- Default value: 100

**mid.sm.discolog.max_log_size**

Limits the length of the log statements in the Horizontal Discovery Log. If the results are truncated, the **Command results** reports, "Result is larger than [value] characters and was truncated by the logger."

- Type: integer (characters)
- Default value: 1000

**mid.sm.discolog.max_object_size**

Limits the length of the object in the Horizontal Discovery Log. Objects in the log statement are truncated to the number of characters set by this property’s value. This property only affects the object character size in the Horizontal Discovery Log. The following message appears if an object is limited by this property "The max object size reached the maximum limit of [value]. To adjust this use the mid property mid.sm.discolog.max_object_size."

- Type: integer (characters)
- Default value: 1000
**mid.snmp.use_getbulk**

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to globally configure all MID servers.

- Type: true | false
- Default value: true

GETBULK can also be set at the probe level or for an individual MID Server. Settings are listed in the order of precedence:

- SNMP probe parameter
- MID Server configuration parameter
- MID Server properties

**mid.ssh.algorithms.kex**

Modifies the Key Exchange SSH algorithm priority list. The property accepts a comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see [MID Server SSH cryptographic algorithms](#).

- Type: string

**mid.ssh.algorithms.host_key**

Modifies the Host Key SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see [MID Server SSH cryptographic algorithms](#).

- Type: string
Modifies the Cipher SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

- Type: string
- Default value: aes128-ctr,aes192-ctr,aes256-ctr,3des-ctr,aes128-cbc,aes192-cbc,aes256-cbc,3des-cbc

mid.ssh.algorithms.mac

Modifies the MAC SSH algorithm priority list. The properties accept comma separated lists with operators. The first name in the list is highest priority, last name in list is lowest priority. Adding a comma separated list without any operators replaces the default algorithm list. For more information, see MID Server SSH cryptographic algorithms.

- Type: string
- Default value: hmac-sha2-256,hmac-sha1,hmac-sha2-512,hmac-sha1-96,mac-md5-96,hmac-md5

shazzam.chunk_size

Maximum number of IP addresses Shazzam can scan in parallel. This property primarily controls outbound port consumption.

- Type: integer
- Default value: 100

mid.use_net_tools

Enables or disables the use of net-tools commands during discovery of devices running on the Linux operating system. Starting from Quebec, ITOM Visibility supports the iproute2 commands for discovery. By default, ITOM Visibility and discovery patterns first use net-tools commands, and only then, as a fallback, may use iproute2 commands. If all Linux-based devices and applications in your IT network use iproute2 commands, disable net-tools commands to make the discovery process more efficient.

- Type: true | false
- Default value: true
**mid.servicewatch.use_full_linux_netstat_path**

Controls if the `netstat` command is executed with its full installation path. This command lists open ports on Linux servers during the process detection phase of the top-down discovery.

- **Type:** true | false  
- **Default value:** true

**mid.servicewatch.num_paths_linux_netstat_to_check**

Define the maximum number of installation paths to use during discovery of Linux servers. This property is relevant when you run the top-down discovery on Linux servers with several netstat installation paths, and the `mid.servicewatch.use_full_linux_netstat_path` property is set to true.

The top-down discovery attempts to execute the `netstat` command using each of these installation paths. The result of the first successful execution is used to determine the list of open ports.

- **Type:** true | integer  
- **Default value:** 5

**mid.servicewatch.use_full_linux_ss_path**

Controls if the `ss` command is executed with its full installation path. This command lists open ports on Linux servers during the process detection phase of the top-down discovery.

- **Type:** true | false  
- **Default value:** false

**mid.servicewatch.num_paths_linux_ss_to_check**

Define the maximum number of installation paths to use during discovery of Linux servers. This property is relevant when you run the top-down discovery on Linux servers with several ss installation paths, and the `mid.servicewatch.use_full_linux_netstat_path` property is set to true.

The top-down discovery attempts to execute the `ss` command using each of these installation paths. The result of the first successful execution is used to determine the list of open ports.

- **Type:** true | integer  
- **Default value:** 5
Create a MID Server property

Use a MID Server property to control either the behavior of all MID Servers or a particular MID Server.

Before you begin
Role required: admin

About this task
You set MID Server properties to override MID Server parameters. Configure MID Server properties in the MID Server plugin. Do not configure MID Server properties in the glide.properties file that is located in the properties folder of the agent. The glide.properties file gets overwritten during the upgrade process.

Procedure
1. Navigate to MID Server > Properties.
2. Click New.
3. Fill in the fields, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the property name.</td>
</tr>
<tr>
<td>Value</td>
<td>You can enter the value you want the property to have.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Leave this field blank to set a MID Server property that affects all MID Servers. To set a MID Server property for a particular MID Server, select the MID Server.</td>
</tr>
</tbody>
</table>

Note: If you are amending JDBC operations through the mid.property.jdbc_operations properties, you can enter verbs like BEGIN, END, IF, or common PL/SQL block statements. This will assist in being able to run CREATE or ALTER statements. You might have to restart the MID server before running some of the statements.

4. After setting any MID Server properties, restart the MID Server to ensure the properties sync with the instance.

MID Server parameters
Parameters control the behavior of a particular MID Server and have lower precedence than MID Server properties.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

To add a parameter to a MID Server, see Add a MID Server parameter.

**Important:** Changes to parameters only take effect when the MID Server is started (or restarted).

**Note:** The value of any MID Server parameter in the config.xml file can be encrypted. See Encrypt or decrypt MID Server configuration file values for more information.

### Required parameters

**Note:** Using special characters in an XML configuration file requires you to encode them.

#### url

Specifies the URL to the associated instance. Normally the URL is similar to https://instance.service-now.com, where you replace instance with the instance name. If you host your own instance, use the URL set by your organization.

- Type: string
- Default value: none

#### mid_sys_id
Records the MID Server record’s unique identifier. This parameter should be empty when you initially configure a MID Server. Do not change the value.

- Type: string
- Default value: automatically set (GUID)

name

Use this parameter to supply a name that is meaningful for you. If you do not supply this parameter, the MID Server uses the default value. A set of business rules synchronizes the name in the configuration file with the name in the MID Server record. The business rules ensure that changing the name in one location also changes the name in the other location.

- Type: string
- Default value: YOUR_MIDSERVER_NAME_GOES_HERE

mid.instance.username or glide.glidesoap.username

If the ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the user name the MID Server should use to log in to the instance. This user should have the mid_server role on the ServiceNow instance in order to access necessary tables and fields. You can use this parameter to define user names with special characters.

- Type: string
- Default value: none

mid.instance.password or glide.glidesoap.password

If your ServiceNow instance has authentication enabled, as it is by default, set this parameter to define the password the MID Server should use to log in to the instance. You can use this parameter to define passwords with special characters.

- Type: string
- Default value: none

CIM parameters

mid.cim.batch.size

Specifies the maximum number of messages sent at once to a CIM server.
mid.cim.request.interval

Specifies the number of milliseconds to wait between requests to the same Common Information Model Object Manager (CIMOM).

- Type: integer
- Default value: 1

mid.cim.host.connection.limit

Specifies the maximum number of simultaneous connections to each CIMOM. A value of zero disables simultaneous connections.

- Type: integer
- Default value: 0

Connection parameters

glide.mid.fast.responses

Instructs the MID Server to try sending messages to the instance as soon as they are ready. Normally the MID Servers end messages to the ServiceNow instance serially (that is, one message at a time). Since many probes can be run in parallel, there can be multiple messages transmitted simultaneously to the instance. Setting this parameter to true may decrease the time between a probe's completion and its response arriving at the instance. However, the multiple simultaneous messages consume resources, decreasing the overall instance responsiveness. If there are communications problems, this parameter's value can also cause a logjam on the MID Server, as threads normally used for running probes may become consumed for sending messages. Generally, leave this parameter out of your configuration. Setting it to true is meaningful only under very special circumstances.

- Type: true | false
- Default value: false

glide.mid.max.sender.queue.size

Places an upper limit on how large the queue is allowed to get. The MID Server starts deleting queued messages if this limit is exceeded. When the MID Server generates messages to the ServiceNow
instance faster than it can send them, it queues them temporarily on the file system of the MID Server's host. This queue is normally quite small, and is completely emptied as soon as the MID Server processing slows for a short period. However, this queue can grow in size when there are communication problems between the MID Server and the instance, and especially if there is an integration running on the MID Server. The parameter is of the form \{number\}{multiplier}, where \{number\} is any positive decimal number including non-integers, and the optional multiplier is any spelling of bytes, kilobytes, megabytes, gigabytes, or terabytes (only the first character is tested, and the test is case-insensitive). The default multiplier is bytes. White space is liberally tolerated. The following strings all represent valid parameters: "1000000000", "0.5m", "5 GB", "7.67gigas", "145.69392 meg", and "1.1 terra".

- Type: string  
- Default value: 0.5 GB

**instance.date.format**

Specifies the format the instance uses for dates and times. The primary impact of setting this parameter is to allow the MID Server to correctly refresh its start and stop times on the MID Server record in ServiceNow. The format of this date/time string is identical to that used by the Java SimpleDateFormat class.

- Type: string (Date format)  
- Default value: yyyy-MM-dd HH:mm:ss

**mid.disable_amb**

Disables the Asynchronous Message Bus (AMB) Client. When AMB is enabled, the MID Server uses a default polling interval of 40 seconds. When the AMB client is disabled, the default polling interval switches to 5 seconds. If you set a polling interval with the **mid.poll.time** parameter, the MID Server uses that value whether or not the AMB client is enabled.

- Type: true | false  
- Default value: false

**mid.https.truststore.password**

Sets the trustStore password that is required for HTTPS connections with the Asynchronous Message Bus (AMB) Client.
mid.https.truststore.path

Path to the trustStore to be used by the MID Server for TLS transactions (Asynchronous Message Bus (AMB) Client). Add this parameter only if you want to change the default path.

- Type: string
- Default value: none

mid.instance.skip_basic_auth

Allows the MID Server to connect to an instance using cookies instead of basic authentication credentials. When set to true, it uses cookies first. However, if the connection fails, the MID Server will try to connect again using basic authentication credentials.

- Type: true | false
- Default value: true

mid.jmx.enabled

Enables a JMX server on the MID Server, which exposes some management information to JMX consoles. Implementing JMX requires additional configuration of the Java runtime environment. Setting this parameter to true is only recommended for those with detailed knowledge of the Java security architecture and a specific need for JMX.

- Type: true | false
- Default value: false

mid.poll.time

Sets the default MID Server polling interval (in seconds). The polling interval is the amount of time the MID Server waits before checking the ECC queue for work when the ECC queue is not busy. The MID Server polls the ECC queue using this interval if the AMB client connection is dropped.

- Type: string
- Default value: none
Note: The default polling interval resets to 5 seconds when the AMB client is disabled. If you configure the mid.poll.time parameter, the MID Server uses this polling interval whether or not the AMB client is connected.

- Type: integer (seconds)
- Default value: 40

mid.probe.wait.resources
Indicates whether probe execution is delayed until resources are available. Used to enable MID Server Resource Reservation.

Note: Requires MID Server restart.

- Type: true | false
- Default value: true

mid.property.long_runner
Identifies the name of a script include that manages long running commands.

Note: This property is applicable till the Rome version only. If your instance is of version sandiego or later, you must configure the system property, glide.eccprobe.longrunner.class.

- Type: string
- Default value: LongRunner

threads.interactive.max
Sets the maximum number of interactive worker threads that can run simultaneously in the interactive thread pool. See Set MID Server Thread Use.

- Type: integer
- Default value: 10

threads.expedited.max
Sets the maximum number of expedited worker threads that can run simultaneously in the expedited thread pool. See Set MID Server Thread Use.
threads.max

Sets the maximum number of standard worker threads that can run simultaneously in the standard thread pool. This parameter provides direct control over what CPU resources the MID Server consumes on the computer that hosts it. See Set MID Server Thread Use.

• Type: integer
• Default value: 20

Important: You can set threads.max as high as 200, however, this setting may need to be changed depending on the OS. For example, Windows-based MID Servers running Discovery uses Powershell which is resource intensive. In this case, you may exhaust the CPU power of the host machine with just 50 threads count.

Credentials parameters

mid.aws.instance_profile_name

Name of the AWS IAM role configured on the EC2 instance. When configured, the MID Server uses the temporary credentials granted to this role by the AWS instance profile to Discover cloud resources.

• Type: string
• Default value: None (User must provide a non-blank value)

mid.credentials.provider

Specifies the Java class name of the credentials provider.

• Type: string
• Default value: com.service_now.mid.creds.standard.StandardCredentialsProvider

mid.secure_credentials.key_pairs.provider

Class that the MID Server uses to generate secure key pairs.

• Type: string
• Default value: com.service_now.mid.keypairs.provider.standard.StandardKeyPairsProvider
Debug parameters

debbug.logging

[Deprecated] Specifies whether to enable logging of MID Server events and messages (both sent and received). Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

• Type: true | false
• Default value: false

This parameter has been replaced by the mid.log.level parameter.

debbug

[Deprecated] Specifies whether to enable debug logging on the MID Server. Normally this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to true causes intensive logging on the MID Server, potentially using considerable disk space.

• Type: true | false
• Default value: false

This parameter has been replaced by the mid.log.level parameter.

citmap.template.debug

Specifies whether to debug file probe templates.

• Type: true | false
• Default: false

citmap.debug

Specifies whether to enable debug logging for CIM, WBEM, SLP, or SMI-S.

• Type: true | false
• Default value: false

mid.ssh.debug

Enables SSH debug information in the log file. The parameter usage depends on whether the ServiceNow SSH client is enabled.
When the ServiceNow SSH client is enabled, the parameter functions as follows:

- Type: string
- Default value: false

The following string values are valid for the ServiceNow SSH client:

- true: Enables SSH debug information in the log file.
- false: Disables SSH debug information in the log file.
- <IP Addresses>: Specify which IP ranges to enable SSH debug information in the log file. You can enter IP addresses in the following formats:
  - An IP range defined by a slash and the number of bits in the subnetwork. For example, the string 10.10.10.0/24 scans 24 bits of IP addresses from 10.10.10.0 to 10.10.10.254.
  - An IP range defined by a dash. For example, the string 10.10.11.0-10.10.11.165 scans the IP addresses from 10.10.11.0 to 10.10.11.165.
  - A comma-separated list of specific IP addresses. For example the string 10.10.11.200,10.10.11.235 scans the IP addresses 10.10.11.200 and 10.10.11.235.
- deferred: Logs SSH debug information in memory unless an error or warning occurs. If an error or warning occurs, the platform publishes the debug information to the log file. This ensures that only the part of the log file pertaining to the error or warning is recorded. If no error or warning is detected, the platform deletes the unused log data from memory when the session closes. Each session stores up to 1000 log messages. If the session exceeds 1000 log messages, the deferred log discards the oldest log message to make room for the newest log message.

When the ServiceNow SSH client is disabled, the parameter enables or disables SSH debug information in the log file:

- Type: true | false
- Default value: false
Note: The MID Server parameter `mid.ssh.debug` only affects SNCSSH and J2SSH. To enable Maverick client debug logging, set the MID Server configuration parameter `mid.log.level` to `debug, com.maverick=debug`.

`mid.log.level`
Specifies the logging level for the MID Server. Possible values are:
- `debug`
- `info`
- `warn`
- `error`

Note: Values are case insensitive.

- Type: string
- Default value: `info`

`mid.http.idle_connection_monitor.debug`
Enables debug logging for the Idle Connection Monitor.

- Type: `true | false`
- Default value: `false`

DNS parameters
`mid.dns_scan.regulator.interval_ms`
Specifies the interval between DNS scans in milliseconds.

- Type: integer
- Default value: `10`

`mid.dns_scan.regulator.packets_per_interval`
Specifies the number of regulator packets per DNS scan.

- Type: integer
- Default value: `1`

`mid.dns_scan.default_name_servers`
Specifies the host names or IP addresses of the default name servers.
mid.dns_scan.default_name_servers
Specifies the host names or IP addresses of the default name servers.
  • Type: string
  • Default value: none

mid.dns_scan.additional_name_servers
Specifies the host names or IP addresses of any additional name servers.
  • Type: string
  • Default value: none

mid.dns_scan.load_balancing_enable
Specifies whether to enable load balancing of name servers.
  • Type: true | false
  • Default value: false

mid.probe.use_legacy_forward_dns
Enables the legacy DNSNameResolver probe and disables the default DNSNameResolver probe. See Probes used by Orchestration for more information.
  • Type: true | false
  • Default value: false

mid.probe.use_legacy_reverse_dns
Enables the legacy DNS probe and disables the default DNS probe. If you experience problems with the features of the default DNS probe, use this parameter to disable those features. The default DNS probe's features include being lightweight and faster due to executing in parallel, while the legacy probe is throttled by the MID Server because it executes in serial. The default probe utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache, while the legacy probe does not. Consequently, after
a DNS lookup by the default probe fails in Windows systems, the OS also tries looking up by NETBIOS name.

- Type: true | false
- Default value: false

**Event Management parameters**

**mid.probe.event.bulk_size**

Specifies the maximum size of an event payload, in MB.

- Type: integer
- Default value: 120

**mid.probe.event.wait_time**

Waiting period on an empty queue for sending events.

- Type: integer
- Default value: 1000

**mid.probe.event.send.enabled**

Enables or disables the sending of events.

- Type: true | false
- Default value: true

**mid.probe.event.queue.max_size**

Specifies the maximum size permitted for the event queue before incoming events are rejected.

- Type: integer
- Default value: 100,000

**mid.probe.event.max.retry_time**

The maximum number of seconds MID retries sending events.

- Type: integer
- Default: 1800

**mid.probe.event.queue.use_bulk**

Specifies whether events are sent to the server singly or in bulk. If this parameter evaluates to true then events are sent to the server in bulk.
mid.probe.event.suppress.whitespaces

Allows line breaks in description fields for multi-line events. Apply this parameter to each MID Server used with event connector instances. Choices are:

- all
  This setting removes all whitespaces.
- leave_as_is
  This setting keeps all whitespaces.
- keep_newline
  This setting keeps only new_line and removes all other whitespaces.

mid.em.metric.metric_to_ci_map_limit

Specifies the maximum number of active metrics allowed per CI map.

- Type: integer
- Default value: 200,000

mid.em.metric_binding_timeout_seconds

Specifies the number of seconds to wait before resending unhandled events

- Type: integer
- Default value: 300

mid.em.metric_binding_timeout_max_seconds

Specifies the maximum number of seconds to wait before resending unhandled events.

- Type: integer
- Default value: 10800
mid.em.metric_max_elapsed_time_before_refresh
Specifies the maximum number of seconds before the metric source type cache is refreshed in memory.

• Type: integer
• Default value: 60

mid.em.metric_max_sql_string_length_for_types
Specifies the maximum length of the string (composed of types) used for an SQL command

• Type: integer
• Default value: 30000

mid.em.statistics_report_periodon_sec
Specifies the period, in seconds, between statistics reports to the instance. Use 0 to disable reporting. This parameter requires a restart.

• Type: integer
• Default value: 60

mid.em.metric_connector_max_run_time_seconds
Specifies the maximum number of seconds to collect metrics in every cycle.

• Type: integer
• Default value: 300

mid.em.metric_connector_history_min
Specifies the number of minutes to go back in history to retrieve metrics.

• Type: integer
• Default value: 180

mid.em.metric_event_logging
Specifies the level of metric and event logging. Choices are:

• none
• all
• events
• metrics
• metrics:<filter>
• events:<filter>

• Type: string
• Default value: none

mid.em.metric_connector_late_arrivals_delay
Specifies the number of seconds to delay when collecting metrics.
• Type: integer
• Default value: 30

FTP connection parameters
mid.ftp.max_pool_size
Specifies the maximum size of the FTP Connection Pool, in megabytes.
• Type: integer
• Default value: 25

mid.ftp.max_per_target
Specifies the maximum number of the FTP connections per target.
• Type: integer
• Default value: 5

mid.ftp.max_conn_idle_time
Specifies the maximum amount of time, in milliseconds, that an FTP connection can sit idle in the pool.
• Type: integer
• Default value: 300000

mid.filesystem.max.ls
Specifies the maximum number of files that can be returned in the filesystem list directory command.
• Type: integer
• Default value: 10000
Logging parameters

**disable_monitors**

Specifies whether to disable the MID Server from actively checking for monitors on the instance.

- Type: true | false
- Default value: true

**mid.show.queries**

Instructs the MID Server whether to log details about every query it makes to the ServiceNow instance. Typically this parameter is only used by developers, but it is occasionally useful when troubleshooting a problem. Be aware that setting this parameter to **true** causes intensive logging on the MID Server, potentially using considerable disk space.

- Type: true | false
- Default value: false

**disable.remote.logging**

Prevents the MID Server from logging any information to the MID Server log on the instance. Relatively little information is logged on the instance in any case, but setting this parameter to **true** eliminates all logging to the instance.

- Type: true | false
- Default value: false

**disable.status**

Prevents the MID Server from sending a status report to the instance every 10 minutes.

- Type: true | false
- Default value: false

Pattern parameters

**mid.parsing.max_field_size**

Sets the maximum character length of strings stored as temporary variables while patterns are run. Strings longer than this parameter's value are truncated to equal the value. Use the parameter to increase the limit when parsing longer strings.
**Warning:** Exceeding the max field size limits of the SQL database implementation cause errors.

- Type: integer
- Default value: 1024

**mid.sa.discovery.pattern_string_attributes.deduplicate**

Reduces memory consumption for pattern execution context attributes by eliminating duplicate strings.

- Type: true | false
- Default: true

**Proxy server parameters**

**mid.instance.use_proxy or mid.proxy.use_proxy**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server’s host and port, and perhaps the user name and password as well.

- Type: true | false
- Default value: false

**mid.proxy.host**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy’s host.

- Type: string
- Default value: none

**mid.proxy.password**

If your MID Server must go through a web proxy to access the ServiceNow instance, and your proxy requires a password, set this parameter to define that password.

- Type: string
- Default value: none

**mid.proxy.port**

If your MID Server must go through a web proxy to access the ServiceNow instance, set this parameter to define the proxy’s port.
mid.proxy.username

If the MID Server must go through a web proxy to access the ServiceNow instance, and the proxy requires a user name, set this parameter to define that user name.

• Type: string
• Default value: none

Request timeout override parameters

mid.sa.cloud.request_timeout

Sets the timeout in milliseconds for cloud requests. This parameter overrides the glide.http.timeout system property, which specifies the maximum number of milliseconds to wait before an outbound REST transaction times out.

• Type: integer
• Default value: 30000

mid.http_classy.request_timeout

Sets the timeout in milliseconds for HTTP classification requests with the HTTP - Classify probe. This parameter overrides the glide.http.timeout system property, which specifies the maximum number of milliseconds to wait before an outbound transaction times out.

• Type: integer
• Default value: 30000

Security parameters

mid.windows_host.file_permissions.allow_list

Sets an inclusion list for Windows file permissions enforcement to improve security. The parameter takes a string of comma separated group names, user names, and SIDs. Group and user names must follow SAM account naming requirements. Domain accounts can be specified by using the SID.

• Type: string (comma separated group and user names)
• Default value: None
**mid.windows_host.file_permissions.enforce**

Enables the MID Server to use Windows file permissions enforcement to improve security. Setting this parameter to false will prevent the MID Server from updating the file permissions inclusion list, but will not revert the file permissions.

- Type: true | false
- Default value: true

**Shazzam parameters**

**mid.shazzam.regulator.interval_ms**

Sets the interval, in milliseconds, in which Shazzam can launch packets. This parameter works with the mid.shazzam.regulator.packets_per_interval parameter to set the number of packets allowed in this interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

**mid.shazzam.regulator.packets_per_interval**

Sets the number of packets that Shazzam can launch in the configured time interval. This parameter works with the mid.shazzam.regulator.interval_ms parameter, which sets that interval. By default, Shazzam launches one packet each millisecond.

- Type: integer
- Default value: 1

**mid.shazzam.chunk_size**

Specifies the maximum number of IP addresses that Shazzam scans in parallel. This parameter primarily controls outbound port consumption.

- Type: integer
- Default value: 100

**mid.shazzam.threads**

Specifies the number of concurrent threads that Shazzam uses. Setting this or the mid.shazzam.max_scanners_per_thread parameter to 0 disables Shazzam multi-thread optimization.
• Type: integer
• Default value: 5

mid.shazzam.max_scanners_per_thread

Specifies the number of concurrent scanners processed by each Shazzam thread. Setting this or the mid.shazzam.threads parameter to 0 disables Shazzam multi-thread optimization.

• Type: integer
• Default value: 500

SNMP configuration parameters

mid.snmp.enable_auto_public

Specifies whether to use the SNMP public community string automatically if no other SNMP credentials were successful.

• Type: true | false
• Default value: true

mid.snmp.request.timeout

Specifies the timeout value for the first OID request, in milliseconds. For subsequent requests (for example, table OIDs), the mid.snmp.session.timeout configuration parameter (see below) takes effect.

Note: You can override this parameter with the timeout SNMP probe parameter.

• Type: integer
• Default value: 1500

mid.snmp.session.timeout

Specifies the timeout value for subsequent OID request, in milliseconds. SNMP communication is stateless and does not have a session or connection in the normal sense. The system regards a positive response from the first OID request as a sign that it should expect prompt responses to subsequent requests. While the default is short, it may be useful to increase this parameter value to the same value as that used for mid.snmp.request.timeout.
Note: You can override this parameter with the `establish_session_timeout` SNMP probe parameter.

- Type: integer
- Default value: 500

**mid.snmp.use_getbulk**

Specifies whether to use GETBULK to receive a large amount of data in batches. This can be used to configure an individual MID Server.

- Type: true | false
- Default value: True

GETBULK can also be set at the probe level or globally for all MID servers. Settings are listed in the order of precedence:

- SNMP probe parameter
- MID Server configuration parameter
- MID Server properties

**mid.snmp.use_snmp4j**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to `false` based on advice from Customer Service and Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v1_v2c**

Use the Snmp4j library for SNMP communication. This is a strict requirement for SNMPv3. This parameter should only be set to `false` based on advice from Customer Service and Support.

- Type: true | false
- Default value: true

**mid.snmp.use_snmp_v3**

Attempt communication using the SNMPv3 protocol version. Requires configuration of SNMPv3 credentials.
SSH Discovery parameters
By default, the MID Server is configured to search for SSH commands in the following paths and the logged-on user's default paths:

- /usr/sbin
- /usr/bin
- /bin
- /sbin

**mid.connection_cache**
Specifies whether to cache connections. Set to **false** to disable connection caching. This parameter applies to SSH connections only.

- Type: true  |  false
- Default value: true

**mid.ssh.set_path**
Specifies whether to set the PATH environment variable for SSH commands.

- Type: true  |  false
- Default value: true

**mid.ssh.local**
Specifies whether to execute commands for the MID Server host machine (localhost) via SSH rather than from a console. This allows long-running commands to execute properly. This parameter applies to the legacy SSH client only.

- Type: true  |  false
- Default value: false

**mid.ssh_connections_per_host**
Controls the number of concurrent probes the MID Server can run against a given host. Lowering the number of concurrent connections can slow Discovery.
• Type: integer
• Default value:
  ◦ 7 for the ServiceNow client
  ◦ 3 for the legacy SSH client

**mid.ssh.sudo_preserve_environment**

Specifies whether to use sudo to preserve the environment for SSH.

• Type: true | false
• Default value: false

**mid.ssh.path_override**

Overides the default paths set before executing a command. Enter one or more override paths delimited by a colon (:). The default path is /usr/sbin: /usr/bin: /bin: /sbin.

The ServiceNow SSH client accepts the following prefixes in front of the path_overide value.

• **append**: Appends the override path to the end of the host’s path. This is the default behavior.
• **replace**: Replaces the host path with the path_overide value.
• **prepend**: Appends the override path to the front of the host path.

• Type: string (a colon-separated list of directories)
• Default value: None

**mid.ssh.use_snc**

Enables the ServiceNow SSH client (SNCSSH) on individual MID Servers. SNCSSH is a ServiceNow implementation of an SSH client and is active by default for all MID Servers on new instances, via a MID Server property. Enabling the ServiceNow SSH client disables the legacy J2SSH client.

**Important**: Mixing SSH client types for MID Servers connected to the same instance is not a good practice.

• Type: true | false
• Default value: false
**mid.ssh.max_retries**

Specifies the maximum amount of times to retry an SSH operation after a time-out. The system sleeps two seconds between each connection attempt. By default, the MID Server retries once only. Set the parameter to 0 to disable retries.

- Type: integer
- Default value: 1

**mid.ssh.alt_rm**

Sets a different SSH remove file command.

- Type: string
- Default value: none

**mid.ssh.initial_delay_ms**

Delays sending any SSH probe commands to a server after connecting to the target for the time specified, in milliseconds. This parameter applies to the legacy SSH client only.

- Type: integer (milliseconds)
- Default value: 0

**mid.ssh.suppress_history**

Suppresses the generation of the SSH history file. This parameter applies to the legacy SSH client only.

- Type: true | false
- Default value: false

**mid.ssh.socket_timeout**

Specifies the timeout value for the SSH socket to prevent issues created by a socket timeout. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled require more time to respond to an authentication request. The default value of 2 minutes ensures such requests do not timeout prematurely.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.channel_timeout**
Specifies the amount of time that the MID Server waits for activity on the SSH socket before closing the connection. If there has been no activity on the SSH socket for the specified timeout value, the MID Server closes the connection. Some devices, such as systems with embedded controllers like UPSs and PDUs, that have SSH enabled may require more time to respond to an authentication request.

- Type: integer (milliseconds)
- Default value: 120000 (2 minutes)

**mid.ssh.session_timeout**

Specifies the amount of time that a cached session remains in memory after last use. Excessively small values tend to decrease performance. This parameter applies to the ServiceNow SSH client only.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.command_timeout_ms**

The timeout duration, in milliseconds, for the execution of an SSH command.

- Type: integer (milliseconds)
- Default value: 300000 (5 minutes)

**mid.ssh.use_keyboard_interactive**

Uses the keyboard interactive authentication mode in SSH daemons on which it is activated.

- Type: true | false
- Default value: false

⚠️ CAUTION: An issue exists in Mac OS X Sierra and later with the authentication order of the **password** and **keyboard-interactive** modes that can cause Discovery to fail. For details about this issue and the configuration required for proper SSH authentication, see KB0623600.

**mid.ssh.dh_group_length_min**

Specifies the minimum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger
the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 1024

**mid.ssh.dh_group_length_max**

Specifies the maximum group length in bits used for generating a "shared secret" key in Diffie-Hillman key exchange. The larger the key the more secure the SSH connection is but at the cost of performance.

- Type: integer (bits)
- Default value: 2048

**mid.ssh.shells_supported**

Defines the bourne-compatible shells supported by the MID Server. This value is a comma-separated list of supported shells, such as `ksh`, `dsh`, `bash` and `sh`.

- Type: string
- Default value: `ksh,bash,sh`

**mid.ssh.discard_lrc_error**

Discard long running command error output, emulating legacy behavior.

- Type: string
- Default value: `j2ssh - true, sncssh - false`

**mid.ssh.pool_thread_ratio**

Ratio of the SSH session pool capacity to the configured MID Server thread number (threads.max), expressed as a percentage. The number of permitted pool capacity sessions is set in this parameter. Regardless of the value set in this parameter, the system never permits the pool capacity to fall below 25 sessions.

- Type: integer
- Default value: 150

**mid.ssh.disable_privilege_check**
This parameter has no effect if the target is using a privileged command other than sudo. For more information, see MID Server privileged commands.

The remainder of this section only applies to targets which run sudo. When this parameter is set to true, the MID Server assumes that the user configured in the credential has the privilege to run the given command using sudo. The MID Server assumes the target user can run any command string following sudo on the target. When this parameter is set to false, the MID Server runs "sudo -l" on the target to verify the command which follows sudo has permission to run on the target. Regardless of this parameter's value, the MID Server always validates that sudo by itself can be run on the target.

Some releases do not show this parameter in the MID Configuration Parameters pull down list. In this case, you may optionally add this parameter in MID Properties.

- Type: true | false
- Default value: false

### Upgrade parameters

#### mid.pinned.version

Name of the version to which this MID Server is pinned.

- Type: string
- Default value: MID buildstamp

⚠️ Note: To see the MID buildstamp for your instance, type stats.do in the navigation filter.

An example of the buildstamp format is london-06-27-2018_patch3-10-24-2018_11-11-2018_0542.

#### mid.upgrade.use_proxy

If your MID Server must go through a web proxy to access the upgrade URL, set this parameter to true to instruct the MID Server to use the proxy. You must also set the proxy server's host and port. If the instance proxy user name and password are set, they are used for the upgrade proxy as well.

⚠️ Note: This parameter is not intended to control proxy details configured with glide.mid.autoupgrade.proxy* parameters.
• Type: true | false
• Default value: true

**glide.mid.autoupgrade.proxy_host or glide.glidesoap.proxy_host**
If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's host here.

• Type: string (URL)
• Default value: none

**glide.mid.autoupgrade.proxy_port or glide.glidesoap.proxy_port**
If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's port here.

• Type: integer (0-65535)
• Default value: 80

**glide.mid.autoupgrade.proxy_user**
If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's user name here.

• Type: string (URL)
• Default value: none

**glide.mid.autoupgrade.proxy_password**
If your MID Server must go through a web proxy to access the upgrade URL, define the proxy's password here.

• Type: string
• Default value: none

**Windows Discovery parameters**

**mid.powershell_api.session_pool.max_size**
Specifies the maximum number of sessions allowed in the session pool.

*Note: Setting or changing this parameter requires restarting the MID Server.*

• Type: integer
• Default value: 25
**mid.powershell_api.session_pool.target.max_size**

Specifies the maximum number of sessions allowed in the pool per target host.

**Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 2

**mid.sa.prefer_powershell**

Enables MID Server to use PowerShell Remoting.

- Type: true | false
- Default value: false

**mid.powershell_api.winrm.use_ssl**

Requires the use of SSL certificates for HTTPS connections using WinRM.

- Type: true | false
- Default value: false

**mid.powershell_api.winrm.additional_pssesion_options**

Controls advanced options for a PSSession. For more information about advanced PSSession options, see https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.core/new-pssessionoption?view=powershell-6.

**mid.powershell_api.winrm.remote_https_port**

Configures the port for connecting to Windows servers using PowerShell over HTTPS.

- Type: integer
- Default value: 5986

**mid.powershell_api.winrm.remote_port**

Configures the port for connecting to Windows servers using PowerShell over HTTP.

- Type: integer
- Default value: 5985
**mid.powershell_api.winrm.skip_ssl_cert_check**

Skips the SSL certificate check when using WinRM for HTTPS connections.

- **Type:** true | false
- **Default value:** false

**mid.powershell_api.winrm.skip_ssl_cert_check_options**

Skips specific SSL certificate checks when using WinRM for HTTPS connections. Configure the MID Server to skip checks for certificates from a Certification Authority (CA), from the Common Name (CN) that identifies the host associated with the certificate, and for revoked certificates.

- **Type:** string
- **Default value:** -SkipCACheck -SkipCNCheck -SkipRevocationCheck

**mid.powershell.use_credentials**

Determines the credentials to use for Discovery with PowerShell. A setting of **true** directs the MID Server to run probes with the Windows credentials from the credentials table. To run probes with the credentials of the user for the MID Server service, set this parameter to **false**.

- **Type:** true | false
- **Default value:** true

**mid.powershell.path**

Enables an administrator to point to a specific PowerShell on a MID Server in cases where more than one PowerShell is installed. Supply the path to the folder containing the PowerShell executable, for example, C:\mypowershell or C:\mypowershell. ServiceNow automatically appends the string powershell.exe to the path. Configure this parameter when both a 32-bit and 64-bit PowerShells are active on the same MID Server, and it becomes necessary to launch the correct PowerShell for the context. 64-bit Windows employs file system redirection and the MID Server runs as a 32-bit application. If trying to specify a path in %WinDir%\System32, Windows automatically redirects to %WinDir%\SysWOW64. To avoid redirection, specify the path as %WinDir%\Sysnative. For example,
instead of C:\WINDOWS\system32\WindowsPowerShell\v1.0\,
specify C:\\WINDOWS\sysnative\WindowsPowerShell\v1.0\.

⚠️ **Note:** On a 64-bit version of Windows XP, a Microsoft hotfix may be required to enable this.

To discover applications running on a 64-bit Windows machine, the MID Server must be running on a 64-bit Windows host machine.

- Type: string (path)
- Default value: none

**mid.powershell.enforce_utf8**

Enable this parameter to force commands on a target Windows system to return UTF-8 encoded output. Disabling it allows the target system to use its default encoding. This parameter is only valid when PowerShell is enabled.

Setting this value to **false** may result in incorrect values in the CMDB when non-ASCII characters are returned by a probe.

- Type: true | false
- Default value: true

**mid.powershell.local_mid_service_credential_fallback**

Enables automatically falling back to MID Server service credentials if all other credentials fail.

- Type: true | false
- Default value: true

**mid.powershell_api.idle_session_timeout**

Specifies the timeout value of idle PowerShell sessions in seconds.

⚠️ **Note:** Setting or changing this parameter requires restarting the MID Server.

- Type: integer
- Default value: 60

**mid.powershell.command.parameter_passing**
Enable this parameter to allow passing PowerShell parameters from the command line.
• Type: true | false
• Default value: false

`mid.powershell.command.script.parameter_passing`
Enable this parameter to allow passing PowerShell scripts from the command line.
• Type: true | false
• Default value: true

`mid.windows.management_protocol`
Enables administrators to select the Windows management protocol used for device and process classification. Options include: WMI and WinRM.
• Type: string
• Default value: WMI

`mid.windows.probe_timeout`
Sets the timeout interval for all Windows probes on a specific MID Server. This value is overridden by the values configured for individual probes with the `wmi_timeout` probe parameter.
• Type: integer
• Default value: 300

`mid.powershell.jea.append_username`
Specifies whether user name of the current user will be appended to the JEA endpoint.
• Type: true | false
• Default value: False

`mid.powershell.jea.endpoint`
JEA configuration name (endpoint) on remote servers that the MID Server will connect to. Set to `JEADISCO_BASIC`.
• Type: string
• Default value: ""
Add a MID Server parameter

Use a MID Server parameter to control the behavior of a particular MID Server.

Before you begin

Role required: admin

Procedure

1. Navigate to MID Server > Servers.
2. From the list of MID Servers, select a MID Server to configure.
3. Select the Configuration Parameters related list.

   This shows all the parameters currently in the MID Server's configuration file. If there are any passwords, they are displayed in asterisks for security reasons. See MID Server parameters for a list of available parameters.

   ![Configuration Parameters](image)

4. To add parameters, click New, and then complete the form.

   After the form is submitted, the configuration file for that MID Server is modified to include the new parameter. Changes to existing parameters are reflected in the MID Server configuration file as well. Changes made to the MID Server configuration file do not take place immediately, but rather the next time the MID Server is restarted. The MID Server form has a related link for restarting the MID Server.

   **Note:** ServiceNow prevents you from saving changes, such as modifying or deleting parameters, that would cause the MID Server to lose communications with the instance. For example, you cannot change the url parameter. Any changes to these protected parameters must be made directly in the config.xml file for that MID Server.
5. (Optional) Set parameters in the config.xml file. MID Server configuration is controlled by an XML file called config.xml. This file is located in the /agent directory, in the MID Server installation directory. You can edit this file directly to make any configuration changes to protected parameters. Many configuration changes, such as those that do not disrupt communication between the MID Server and the ServiceNow instance, may also be made from the instance.

The structure of the config.xml file is simply an outer parameters tag and a series of inner parameter tags. Each parameter tag has name and value attributes.

- To change the value of a parameter, edit the value attribute.
- To add a parameter, add another parameter tag with its name and value.
- To delete a parameter, delete the entire parameter tag.

The order of the parameters within the file is not important. Notice the green comment sections in the sample. Use these elements to add useful comments to the configuration file.

Note: When configuring the MID Server for use with a proxy server, be sure to remove the comment tags around the proxy sections that you configure.
MID Server config.xml file

```xml
<parameters>
</!-- MID Server Configuration -->
  <parameter name="url" value="https://example.service-now.com"/>
  <parameter name="refresh_rate" value="65"/>
  <parameter name="name" value="Super Duper MID Server #1"/>
  <parameter name="mid_sys_id" value=""/>
</!-- MID Server Threads -->
  <parameter name="threads.max" value="25"/>
</!-- MID Server proxy configuration -->
  <parameter name="mid.proxy.host" value=""/>
  <parameter name="mid.proxy.port" value=""/>
  <parameter name="mid.proxy.username" value=""/>
  <parameter name="mid.proxy.password" value=""/>
</parameters>

MID Server to instance configuration options
  mid.instance.use_proxy
  - when talking to instance, should we use the proxy config?
  mid.instance.username
  mid.instance.password
  - supply username and password if instance has basic authentication enabled

MID Server upgrade options
  mid.upgrade.use_proxy
  - when talking to upgrade server, should we use the proxy config?
  mid.upgrade.branch
  - define a branch our MID server is pinned to

Note: The sample file here is from a Firefox browser. Conventional text editors, such as Notepad, WordPad, or TextEdit, do not display colors and variable fonts.

MID Server protected records and reserved characters

Some MID Server records cannot be altered. Certain special characters are pre-defined in XML and cannot be used in passwords.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**MID Server Records that cannot be altered**
These records cannot be modified or deleted.

<table>
<thead>
<tr>
<th>Table</th>
<th>Record</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public Page [sys_public]</td>
<td>InstanceInfo</td>
</tr>
<tr>
<td>Scripted Web Service [sys_web_service]</td>
<td>• InstanceInfo</td>
</tr>
<tr>
<td></td>
<td>• GetMIDInfo</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Using special characters in an XML file**
The XML specification defines five predefined entities that represent special characters, and requires that all XML processors honor them. If these characters are used in a password, you will experience unexpected results.

The following characters represent the five pre-defined entities:
If you use the pre-defined entity characters in an XML file, such as the MID Server configuration file, you need to encode them. To encode pre-defined entities into an XML document:

- replace " with &quot;
- replace & with &amp;
- replace ' with &apos;
- replace < with &lt;
- replace > with &gt;

For example, to specify the password as test& in the MID Server config.xml file:

```
<parameter encrypt="true" name="mid.instance.password" value="test&amp;"/>
```

**MID Server privileged commands**

To discover certain information on a host server, the MID Server must run SSH commands with higher privileges. The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system.
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

An example of information that requires elevated privileges is information about storage disks on a host server, retrieved with the `fdisk -l` command. If your system cannot use sudo commands, you must configure the hosts in your network to use one of the other privileged commands. You can configure different privileged commands for different hosts. However, Discovery supports only one privileged command per host.

**Important:** You can edit supported privileged commands, but do not delete them.

For a list of possible SSH commands requiring root privileges, see [SSH credentials](#).

**SSH privileged escalation command requirements**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| sudo    | • Host must support the `sudo -S -p <password>` command and return the correct list of allowed SSH commands.  
• Credentials provided for Discovery must be able to run the command `sudo -S -p <password> <commands>`. |
| pbrun   | • Host must support the `pbrun -v` command and return the correct version of PowerBroker.  
• Credentials provided for Discovery must be able to run `pbrun <commands>`.
### SSH privileged escalation command requirements (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| • Discovery does not support any other `pbrun` - options, such as a password prompt.  
• The instance must be able to reach the target host via SSH. | |
| `pfexec` | • Host must support the `pfexec id -a` command and return the correct ID.  
• Credentials provided for Discovery must be able to run `pfexec <commands>`.  
• Discovery does not support any other `pfexec` - options, such as a password prompt. | |
| `dzdo` | • Host must support the `command -v dzdo` command and return the path to dzdo in standard output.  
• Credentials provided for Discovery must be able to run `dzdo <commands>`.  
• Discovery does not support any other `dzdo` - options, but Discovery supports password authentication for `dzdo`. | |

### Long-running commands with sudo

Configure J2SSH and ServiceNow SSH to prevent long running commands using sudo from failing when the MID Server disconnects.

ServiceNow SSH allows probes to run sudo against individual commands or an entire, long-running script. This is also supported for the `pbrun` and `pfexec` privileged commands.

### Sudo for individual commands

You can run sudo against individual commands within a probe, but only if all the following sudoer configurations are performed on the target:

• The `!requiretty` option is required.

• Allow individual commands to be run by the user in the provided credential with `NOPASSWD` configured.

• The target specifies an individual sudo call in the command or referenced scripts. For example, set sudo as "`sudo fdisk -I" or "$\{sudo:fdisk -I\}" rather than "must_sudo" for the entire script."
Note: Running sudo against individual commands with ServiceNow SSH produces detailed and useful entries in the sudo logs on the target computer.

Running sudo on an entire script
If any of the required sudoer configuration requirements for individual commands is not in place, Discovery applies sudo to the initial and complete probes, and does not execute sudo remotely inside the command. This condition can be forced by setting `must_sudo` on the probe and eliminating any sudo commands within the probe.

This approach prevents long running commands from failing when the probe disconnects, but cannot specify individual commands in the sudoers configuration.

Logging
The logs from ServiceNow SSH sudo activity run against an entire script show cryptic entries, such as `/tmp/.run.aef13123fe124123`, which prevent administrators from controlling permissible commands and knowing the exact command that was run. Sudo run against individual commands produces more detailed log entries, such as `/sbin/fdisk -l`.

Add a new privileged command for use by the MID Server
Add a new privileged command to the Privileged Command [privileged_command] table that is available to your MID Servers.

Before you begin
Role required: admin

About this task
⚠️ Important: Do not delete any of the supported commands.

Procedure
1. Navigate to MID Server > Privileged Command and click New.
2. Complete these fields:
   • Command: The name of the privileged command.
   • Password Prompt: The password prompt displayed to the user for this privileged command, or a regular expression that matches this password.
prompt. If this field is empty, no password is required for this privileged command, and no prompt is displayed. SUDO commands do not require a password prompt.

3. Click Submit.

Configure the MID Server to use specific privileged commands
You can configure the MID Server to use specific commands in a defined order.

Before you begin
Role required: admin

Procedure
1. Navigate to the list of MID Servers using one of the following paths:
   - MID Server > Servers
   - Discovery > MID Servers
   - Orchestration > MID Servers
2. Select the MID Server you want to configure.
3. Click the menu icon in the header bar and select View > Advanced from the context menu.

Selecting the Advanced view
4. In the Privileged Command related list, click **Edit**.

5. Select the command you want this MID Server to use and click **Save**. The default order of privileged commands is 100, but you can change the order as necessary. The privileged command with the smallest order number is tried first.

---

**List of privileged commands to use for a MID Server**

Create a **pbrun** profile privileged command

You can create a special configuration for the **pbrun** privileged command that allows it to run as a profile.

**Before you begin**

Role required: discovery_admin, admin

**About this task**

Of all the privileged commands, only the **pbrun** command can be configured to run as a profile, and only one of these special **pbrun** configurations can function on a MID Server.

**Important:** Edit the existing **pbrun** record for this purpose. The system ignores any additional commands you create for **pbrun**.

**Procedure**

1. Navigate to **MID Server > Privileged Command**.

2. Select **pbrun** from the list.

3. In the Privileged Command record, edit the value in the **Command** field to use the format `pbrun -u <profile>`. For example, you can set `pbrun -u admin` as a command to run with an admin profile.

4. Click **Update**.
What to do next
Return to Configuring MID Servers.

MIDSystem methods

MIDSystem variables (referred to by the variable name ms.) provide a variety of methods to get information about the MID Server.

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

<table>
<thead>
<tr>
<th>Method summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log(String message)</td>
<td>Logs the given message with a standard prefix to indicate that the message was generated by JavaScript.</td>
</tr>
<tr>
<td>getConfigParameter(String parameter name)</td>
<td>Returns the value of the named configuration parameter.</td>
</tr>
<tr>
<td>include(String script include)</td>
<td>Include the MID Server script include with the given name into the current context.</td>
</tr>
<tr>
<td>getName()</td>
<td>Returns the name of the MID Server.</td>
</tr>
<tr>
<td>getSysID()</td>
<td>Returns the sys_id of the MID Server.</td>
</tr>
<tr>
<td>toJavaScript(Object)</td>
<td>Converts the given Java object into the equivalent JavaScript object.</td>
</tr>
</tbody>
</table>
This example writes a message to the log:

```javascript
ms.log('Attempting to log in with user: ' + this.getParameter('user'));
```

**Manually start, stop, and restart a MID Server**

If you did not start the MID Server at the end of the installation procedure, you can manually start the MID Server.

**Before you begin**

Requires a MID Server Service account user or a Windows Admin account. This procedure is only for users who install the MID Server using the ZIP file. The Windows MID Server installer completes the installation automatically.

**Procedure**

1. Open the agent directory in the directory you created for the MID Server installation files. For example, the path might be `C:\ServiceNow\MID Server1\agent`.
2. Start the MID Server by executing the `start.bat` file.
3. To stop the MID Server, execute the `stop.bat` file.
4. To restart a stopped MID Server, either:
   - If the MID Server is stopped, execute the `start.bat` file.
   - If the MID Server is running, execute the `restart.bat` file.

**MID Server heartbeat**

The instance checks the MID Server for a response every 5 minutes, using a synthetic transaction monitoring system.
Checking for a heartbeat

ServiceNow instances send a synthetic transaction via the Heartbeat probe to every MID Server every 5 minutes. The Heartbeat probe functions exactly as a normal probe does and is sent by writing an output record to the ECC queue. A MID Server retrieves the record when it queries the ECC queue for work. The MID Server processes the probe just as it would any other probe and responds back to the instance. If the instance does not detect a response from a MID Server, the instance marks that MID Server as **Down**. If the MID Server responds, the instance considers the MID Server to be functioning and communicating properly with the instance.

⚠️ **Note:** Make sure that your MID Server can communicate on port **443**. See Configure MID Server network connectivity and MID Server system requirements for more information.

System events

When a MID Server transitions from one state to another, one of these events is triggered:

- **mid_server.up**: The MID Server goes from a status of **Down**, **Paused**, or **Upgrading** to a status of **Up**.
- **mid_server.down**: The MID Server goes from a status of **Up** to a status of **Down**.
• **mid_server.paused**: The MID Server is paused.

• **mid_server.upgrading**: The MID Server is being automatically upgraded because the instance is being upgraded.

You can use these events to send notifications or trigger actions that you specify in scripts.

**Scheduled job**
To change the trigger interval for the Heartbeat probe, navigate to **System Scheduler > Scheduled Jobs > Scheduled Jobs**. Open the **MID Server Monitor** record and edit the interval.

**MID Server heartbeat trigger interval**

![MID Server heartbeat trigger interval](image)

**Set the MID Server JVM memory size**
The MID Server starts with a default JVM memory allocation, but you can modify this setting in the configuration file.

**Before you begin**
Role required: admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
In the base ServiceNow system, the MID Server JVM memory is set to 1024 MB, which is configured in the `\agent\conf\wrapper-override.conf` file in the MID Server installation directory. This setting might not be appropriate for the way your organization uses the MID Server. If you want the MID Server to work harder, allocate more resources to it. If the MID Server is located in a small branch office and runs in an environment where memory allocation is shared between a print server, mail server, or web proxy server, the allocation might have to be reduced.

ℹ️ Note: For a complete list of minimum MID Server requirements, see MID Server system requirements.

Procedure
1. Open the `\ServiceNow\<MID Server name>\agent\conf\wrapper-override.conf` file in a text editor.
   For more information about this file, see Installing Multiple MID Servers on a Single System.
2. Locate the following lines in the file:
   ```
   # OPTIONAL: Maximum Java Heap Size (in MB)
   wrapper.java.maxmemory=1024
   ```
3. Edit the memory allocation.
4. Remove the comment tag (#) from the memory allocation parameter.
5. Save the file.
6. Restart the MID Server service.

**Pause the MID Server**

Pause the MID Server to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

**Before you begin**
Role required: agent_admin

---

1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

**About this task**

You can only pause validated MID Servers. You might want to pause the MID Server when your network infrastructure is undergoing changes. This prevents applications like Discovery from throwing errors during a particular maintenance window.

A paused MID Server continues processing commands that it had already retrieved before it was paused. When you resume the MID Server, the MID Server starts retrieving new commands to process.

**Note:** Discovery continues to assign jobs to MID Servers that are **Paused**. MID Servers that are **Down** are not assigned jobs.
Procedure
1. Open the MID Server record.
2. Select a running MID Server that has been validated.
3. On the MID Server form, select **Pause MID** under **Related Links**. The state of the MID Server changes to **Paused**.

A paused MID Server

- **Name**: MidServer1
- **Version**: Version
- **Host name**: MidServer1hostname.com
- **Status**: Paused
- **Validated**: Yes

4. To resume MID Server processing, select **Resume MID** under **Related Links**.

**MID Server pause**
The MID server can be put into a **Paused** state to temporarily prevent it from polling the ECC Queue for work or sending Discovery results back to the instance.

Unlike stopping the MID Server from the Windows or Linux server command line on the MID Server machine, pausing the MID server is something that you can do from the instance. The MID Server pause feature is available starting with the Istanbul release.

**Note:** You can only pause **validated MID Servers**.

You can still perform these actions when the MID Server is paused:

- **Access the MID Server logs** and delete log entries.
- **View MID server statistics**. While the MID Server is in the **Paused** state it stops generating statistics. But you can still view the statistics generated before you paused the MID Server.
- **Retrieve the MID Server thread dump**.
- **Make and save configuration changes** and property changes to the server. The changes take effect after the MID Server is resumed.
- **Clear the ECC queue**.

The **MID server heartbeat** continues to function while the MID Server is in the **Paused** state. If the MID Server is upgraded while it is in the **Paused** state, the MID Server state automatically changes to **Up** after successful upgrade. It does not return to the **Paused** state.
During **MID Server selection**, paused MID Servers can still be selected but are prioritized below MID Servers that are not paused.

**Events that occur during MID Server pause**

The **vCenter** and **SNMP** event collectors, continue to run and process events when you pause the MID Server. These events are not part of the normal synchronous communication that the MID Server has with the instance that you see in the ECC queue. Events are still relayed to the instance and can even trigger actions on records in the instance, such as a CI update. For example, if vCenter detects that a virtual machine goes down or is deleted, a vCenter event makes a change to the status of the corresponding CI record for that virtual machine.

To prevent these events from being processed, stop the extensions from running. For more information, see:

- Configure and run the vCenter event collector extension
- Configure the SNMP Trap Collector Extension

**Notifications**

Use ServiceNow® Notifications to manage system email, create system notifications, and configure how your system responds to inbound email.

Email setup

All email notifications use the email properties that you define for your instance and the email accounts that you set up. Your email service can also affect the successful transmission of incoming and outgoing email.

Email accounts

Email administrators set up email accounts to allow the system to connect to external mail services such as POP3, SMTP, or IMAP servers. You can use the ServiceNow-provided email accounts or create your own accounts for your own email services.

Email properties

Use Email Properties to configure settings for inbound and outbound email. Email properties apply to all email accounts.

Email service size restrictions

Your email service, whether you are using a standard ServiceNow email configuration or an alternate email configuration, determines the successful transmission of incoming or outgoing emails based on a maximum email size. An email configuration consists of your instance, email server, and email client.

- Standard email configurations – For instances that use the standard email configuration, the ServiceNow mail servers cannot send or receive emails
larger than approximately 50 MB (before encoding), including the email header, body text, and attachments. Email messages are encoded by an email client, which increases total email message size. The maximum ServiceNow mail server size restriction is 75 MB (after encoding). The maximum email size limit is enforced regardless of any configured attachment size limits.

- **Alternate email configurations** – If your email service uses a company-owned or third-party server, the approximate size restriction of 50 MB (including the email header, body text, and attachments) may still apply. However, your service might support different maximum total file sizes for inbound and outbound emails. Check with the email administrator of your email service to verify email size limits.

For details on how encoding can affect email message size and email transmission, see KB0521772.

**Email service availability**

Email service is intentionally shut down on instance clones to prevent resending already delivered email. Upgrades no longer require an extended interruption of email service. Instances continue to process email during an upgrade. For a possible explanation for undelivered emails, see this blog post by a ServiceNow Technical Support Engineer in the Now Community.

For instructions on creating and sending custom emails when events on the instance occur, see the tasks in Email and SMS notifications.

**Instance-to-instance communication via email**

Use to communicate between two instances.

**Designate untrusted and trusted email domains**

Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate untrusted and trusted email domains.

**Next steps after enabling email**

After enabling email on your instance, consider performing several of these important tasks.

- Test the email configuration by routing all email to a single user (set the glide.email.test.user property).
- Review the baseline notification categories, email notifications, and templates to determine if they meet your business needs.
• Review the baseline inbound email actions to determine if they meet your business needs.

• Determine if you want to use email layouts to add consistent content elements.

• Determine if you want to use email filters to restrict the email the instance receives.

• Determine if you want to implement a retention policy to archive and destroy email at certain intervals.

• Determine what kind of watermarks outbound email uses to associate records with email messages.

• Determine if you want to create users when the instance receives an email from an unrecognized user.

• Set the precedence of outgoing mail. By default, the instance sends email with a precedence of bulk (set the glide.smtp.precedence_bulk property).

• Consider preventing untrusted users from triggering inbound actions to prevent unwanted email from affecting your instance.

• Implement a spam filter to restrict unwanted messages sent to your custom email addresses.

Basic email setup

All production instances can send and receive email using ServiceNow-provided resources. The instance has an email address of instance@service-now.com.
Basic email services and features

- Mail servers maintained by ServiceNow.
  - Encrypt mail with opportunistic TLS (Transport Layer Security) if supported by your mail servers.
    - If your internal mail servers send and receive messages via a TLS-encrypted channel, ServiceNow mail servers support that communication.
  - Provide a dedicated mailbox for your instance.
- Pre-configured email accounts to connect to ServiceNow mail servers.
An SMTP account sends email to your primary Mail Exchange (MX) server from your instance email address of instance@service-now.com.

A POP3 account receives email sent to your instance email address of instance@service-now.com.

- High availability features from ServiceNow datacenters.
- Spam detection for incoming email.

Administrators who want to use basic email services can do so by enabling the email properties for sending and receiving email.

**Enable basic email**

Enable basic email to use ServiceNow-provided email servers and accounts.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Properties > Email**.
2. Configure these email properties and click **Save**.

<table>
<thead>
<tr>
<th>Email property descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Property section</strong></td>

**Advanced email setup**

With an advanced email setup, you can use your own SMTP server, POP3 server, or both.

Setting up your own email environment can be useful if you want to use existing filtering, retention, or compliance aspects of your internal email architecture.

You can set up email in several ways:

- Use your own SMTP server to forward email to ServiceNow servers.
- Use your own SMTP server to send email.
• Use your own POP3 server to receive email.
• Use your own SMTP and POP3 servers to send and receive email.
• Use an OAuth 2.0-enabled SMTP server to send email from a third-party service.
• Use an OAuth 2.0-enabled IMAP server to receive email from a third-party service.

The following procedures assume that you enabled basic email properties.

Enable using your own SMTP server
Enable using your own SMTP server so that you can leverage the existing filtering, retention, or compliance aspects of your own SMTP server while also using the ServiceNow POP3 server.

Before you begin
• Role required: admin
• Email server required: SMTP
• Basic email properties: enabled

About this task
You can combine your own internal email architecture with the ServiceNow email architecture to handle email. The following diagram demonstrates how you would use your own SMTP server alongside the ServiceNow POP3 server.
Procedure

1. Navigate to **System Mailboxes > Administration > Email Accounts**. The system displays the list of available email accounts.

2. Locate the record for **ServiceNow SMTP** and change **Active** to **false**.
3. Click **New**.

4. Create an email account record for your SMTP server where the **Type** is **SMTP**.

5. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

**What to do next**
Configure the SMTP server in your internal email architecture to forward email from the custom email address to the instance email address. Implement a spam filter on the custom email address.

**Related information**

Configure an email account

Enable using your own POP3 server
You can use your own POP3 server to store and receive email for the instance.
Before you begin

- Role required: admin
- Email server required: POP3
- Basic email properties: enabled

Procedure

1. On your POP3 server, create a mailbox for your instance that has a custom email address. For example, create a mailbox for service-desk@company.com.

2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.

3. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.

   An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active allows the instance to receive email sent to the instance default email address.

4. Click New. The system displays a blank Email Account form.

5. Create an email account record for your POP3 server where the Type is POP3.

6. From Related Links, click Test Connection.
If the email account is valid, the system returns a success message.

Connection Test

Connection Successful

Close
Enable using your own SMTP and POP3 servers

You can use your own SMTP and POP3 servers to send email from the instance and to store and receive email for the instance.
Before you begin

- Role required: admin
- Email servers required:
  - SMTP
  - POP3
- Basic email properties: enabled

Procedure

1. On your POP3 server, create a mailbox for your instance. For example, create a mailbox for service-desk@company.com.

2. Navigate to System Mailboxes > Administration > Email Accounts. The system displays the list of available email accounts.

3. Locate the record for ServiceNow SMTP and change Active to false.

4. Optional: If you do not want to receive email sent to the instance@service-now.com mailbox, locate the record for ServiceNow POP3 and change Active to false.

An instance can receive email from multiple POP3 accounts at the same time. Leaving the ServiceNow POP3 account active means that the instance receives email sent to its default email address.
5. Click **New**.
The system displays a blank Email Account form.

6. Create an email account record for your SMTP server where the **Type** is **SMTP**.

7. From **Related Links**, click **Test Connection**.
   If the email account is valid, the system returns a success message.

8. Click **New**.
The system displays a blank Email Account form.

9. Create an email account record for your POP3 server where the **Type** is **POP3**.

10. From **Related Links**, click **Test Connection**.
If the email account is valid, the system returns a success message.
Example:

Using your own SMTP and POP3 servers

OAuth email authentication

OAuth enables your instance to receive and send email through a third-party email account.

Open Authentication (OAuth) is an open standard for authorization that provides administrators with an authorization method when connecting to incoming IMAP and outgoing SMTP servers. OAuth enables an instance to...
receive and send email from a third-party account, such as Gmail, without having to enter the credentials for that account.

The OAuth 2.0 implementation requires you to obtain an access and refresh token from your third-party email provider for each third-party email account. The tokens are automatically saved to the instance database. They provide authorization for all email communication between the instance and the authorized third-party account. A scheduled job regularly checks to see if email access tokens are valid. If the access token is not valid, but the refresh token is, the instance automatically regenerates a new access token.

OAuth 2.0 support is available starting with the Geneva release. The OAuth implementation supports IMAP and SMTP accounts only. POP3 is not supported. OAuth 1.0 is no longer supported.

⚠️ Note: Customer email accounts configured to use OAuth 1.0 authentication with Gmail cease to function as of April 20, 2015. See KB0546976 for more information.

Activating the Email - OAuth support for IMAP and SMTP plugin allows you to use OAuth with email. If you upgrade to Geneva or later instances and are already using OAuth 1.0, activate the plugin again.

See for an example of using an OAuth 2.0 profile to authenticate an outbound REST message with Google to retrieve contact information. Also see for more information on OAuth 2.0 support in the instance.

Activate the OAuth email authentication plugin

OAuth email authentication requires the Email - OAuth support for IMAP and SMTP plugin.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

---

**Enable OAuth 2.0 for email**

Setting up OAuth 2.0 for email requires you to obtain access and refresh tokens from your email provider.

**Before you begin**

- Role required: admin
- Plugin required: Email - OAUTH support for IMAP and SMTP

**Procedure**

1. Log in to your third-party email account, such as Gmail, and enable OAuth 2.0.

2. Obtain the following from your third-party email account:
   - client ID
   - client secret
   - authorization URL
   - token URL
   - redirect URL
   - token revocation URL

3. Navigate to **System OAuth > Application Registry**.

4. Click **New**.

5. Click **Connect to a third party OAuth Provider** to create an application registry record that email uses.

6. Use the information you obtained from your third-party email account to fill in the fields on the form. See for instructions. Create the OAuth application registry record and its associated OAuth Entity Profile and OAuth Entity Scope records.

7. Click **Submit**.

8. Navigate to **System Mailboxes > Administration > Email Accounts**.
The system displays the list of available email accounts.

9. Optional: If you do not want to receive email sent to the default instance email address, locate the record for ServiceNow POP3 and change Active to false.

The system can receive email from multiple POP3 and IMAP email accounts.

10. Locate the records for ServiceNow SMTP and change Active to false.

11. Click New.

The system displays a blank Email Account form.

12. Create an email account record for your OAuth 2.0 SMTP server where the Type is SMTP.

13. For Authentication, select OAuth 2.0.

14. For OAuth Profile, select the application registry record you created.

15. Click Authorize Email Account Access to obtain the access and refresh tokens.

Another browser window opens asking you to authorize the account access on the third-party email account.

16. Authorize the access.

After the authorization is successful and the tokens are saved to the instance, the Authorize Email Account Access button no longer appears on the Email Account form.

17. Click New.

The system displays a blank Email Account form.

18. Create an email account record for your OAuth 2.0 IMAP server where the Type is IMAP.

Use the same Authentication and OAuth profile settings as the OAuth SMTP email account.
System address filters

Prevent your system from communicating with untrusted domains and email addresses.

System address filters control who can communicate with your instance via email. You can improve email security by filtering domains and email addresses that you find suspicious.

For example, you might identify example.com as a suspicious domain. You can stop receiving emails from example.com by specifying the domain in a system address filter. You can also use another system address filter to prevent your system from sending emails to example.com.

There are two types of system address filters:

- **Outbound**
  - Controls which domains and email addresses can receive email from your instance.

- **Inbound**
  - Controls which domains and email addresses can send email to your instance.

When setting up system address filters, you can create one default outbound filter and one default inbound filter. A default outbound filter applies to all active SMTP email accounts automatically. A default inbound filter applies to all active IMAP or POP3 email accounts automatically.

To control senders and recipients for a specific email account, create a non-default filter and then apply it to the account.

**Before setup**

Before you set up system address filters, consider doing the following:

- Monitor your email to identify suspicious domains and email addresses.
  - Using Instance Security Center, you can monitor the blocked and allowed incoming email metrics for your instance. For more information, see Designate untrusted and trusted email domains.
- Designate someone to set up system address filters by assigning them the email_account_admin role.

**Setting up system address filters**

To set up system address filters for your instance, complete the following tasks:

1. **Set email address filters**
   - Specify which domains and email addresses are allowed or disallowed.
2. Create a system address filter

   Define how email address filters apply to inbound and outbound email.

Next steps

After you set up system address filters, configure email filters for an added layer of security. Email filters enable you to ignore an inbound email or move it to a particular mailbox. For more information on configuring email filters, see Email filters.

Set email address filters

Specify which domains and email addresses are allowed or disallowed.

Before you begin

Role required: email_account_admin

About this task

You can specify two types of email address filters:

- Allow List: A list of allowed domains and email addresses
- Deny List: A list of disallowed domains and email addresses

You can also specify exceptions to the allowed or disallowed domains and email addresses.

Procedure

1. Navigate to System Mailboxes > Administration > Email Address Filters, and then click New.

2. Enter the Name of the address filter.

3. Select the filter Type:
   - Allow List: Allow all specified domains. All other domains are disallowed.
   - Deny List: Disallow all specified domains. All domains that do not match the denied list domains are allowed.

4. In the Domains field:
   a. Click the lock icon to unlock it and access the domains controlled by this filter.
   b. Select an existing domain or enter a new domain:
• If the filter **Type** is Allow List, click the Search icon. Select the domains for which all email addresses are allowed. To add a new domain, click **New**, enter the **Domain**, and click **Submit**.

• If the filter **Type** is Deny List, click the Search icon. Select the domains for which all email addresses are disallowed. To add a new domain, click **New**, enter the **Domain**, and click **Submit**.

**Note:** You can specify a wildcard (*) in the domain name, for example *.com*. If you create an email configuration that has multiple email address filters, all the filters evaluate the given email addresses. The filters determine whether the addresses are valid and the message can be sent as outbound email.

By default, the maximum number of domains that you can associate with an email address filter is 100. You can reconfigure this limit by setting the `glide.email_address_filter.max_domains` property.

c. Click the lock icon to lock the **Domains** field.

5. Specify any email addresses that are **Exceptions** to the domains specified in Step 4.

   a. Click the lock icon to open the Email Address Filter Exceptions [sys_email_address_filt_except] table.

   b. Click the search icon to choose an existing email address. To add a new email address, click **New**, enter the email address exception, and click **Submit**.

   **Note:** You can specify a wildcard (*) in an email address exception.

By default, the maximum number of exceptions that you can associate with an email address filter is 1000. You can reconfigure this limit by setting the `glide.email_address_filter.max_exceptions` property.

c. Click the lock icon to lock the **Exceptions** field.

   The exception is added to the Email Address Filter Exceptions [sys_email_address_filt_except] table.

6. Click **Submit**.

   The email address filter is added to the Email Address Filters [sys_email_address_filter] table.
Example:

**Email address filter — allowed exception example**

**Email address filter — disallowed exception example**

### What to do next

Apply the email address filters to a system address filter. For more information, see Create a system address filter.

### Create a system address filter

Define how email address filters apply to inbound and outbound email.

### Before you begin

Complete the steps in Set email address filters.

Role required: email_account_admin

### About this task

You can use a combination of allowed list and denied list email address filters in a system address filter.

A system address filter blocks a domain or address that appears only on denied lists and never on allowed lists. To ensure that a system address filter effectively blocks a certain domain or address, check for the following:

- The domain or address is included in at least one denied list
- The domain or address is not included in any allowed list
**Procedure**

1. Navigate to **System Mailboxes > Administration > System Address Filters**, and then click **New**.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the system address filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the system address filter.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of system address filter. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td><strong>Outbound</strong></td>
</tr>
<tr>
<td></td>
<td>Control which domains and email addresses can receive email from your instance. Select this option if you plan to use the system address filter for an SMTP server.</td>
</tr>
<tr>

<td><strong>Inbound</strong></td>
</tr>
<tr>
<td></td>
<td>Control which domains and email addresses can send email to your instance. Select this option if you plan to use the system address filter for an IMAP or POP3 server.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the system address filter.</td>
</tr>
<tr>
<td>Default</td>
<td>Option to use this system address filter as the default inbound or outbound filter.</td>
</tr>
<tr>
<td></td>
<td>To control senders and recipients for a specific email account, leave this field cleared.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of the system address filter.</td>
</tr>
<tr>
<td>Email Address Filters</td>
<td>Email address filters to apply to the system address filter.</td>
</tr>
<tr>
<td></td>
<td>By default, the maximum number of email address filters that you can associate with a single system address filter is 100. You can reconfigure this limit by setting the <code>glide.email_system_address_filter.max_address_filters</code> property.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Results
A default outbound filter applies to all active SMTP email accounts automatically. A default inbound filter applies to all active IMAP or POP3 email accounts automatically.

For a non-default filter, the next step is to apply the filter to an email account manually. For more information on applying a filter to an email account, see Configure an email account.

Email accounts
Email accounts store the connection details and credentials the system uses to access external email servers and services.

By default, instances come with email accounts for ServiceNow-managed SMTP and POP3 servers to send and receive email. These accounts cannot be modified, but can be deactivated if you do not want to use them. To connect to other email servers and services you must create email accounts for them. You can create email accounts for servers and services that use these protocols:

- SMTP
- POP3
- IMAP

Note: The system only allows one SMTP email account to be active at a time and sends all email through this account. You can however receive email from multiple POP3 or IMAP accounts.

The system stores individual email accounts in the `sys_email_account` table. Create separate email accounts to send and receive email. Use email properties to define how the system processes email for all email accounts.

By default, the ServiceNow POP3 server provides each instance with its own mailbox at the address instance@service-now.com. Likewise, the ServiceNow SMTP server sends email from the address instance@service-now.com. To create another mailbox, provision your own POP3 or IMAP server and create an email account to the server on the instance. To change the sent from email address, update the address in the email account you use for sending email.

Emails received via a POP3 or IMAP server account are stored in the Email [sys_email] table and then deleted from the account.

Note: ServiceNow has exclusive access to an account you configure. After a mail is read from a POP or IMAP account that you have configured, ServiceNow deletes the email from the server.
A ServiceNow configured email account

Configure an email account

You can create email accounts in addition to the accounts provisioned for you.

Before you begin

- Role required: admin
- Email server: a compatible email server
  - SMTP
  - POP3
  - IMAP

⚠️ Warning: An SMTP server that uses a localhost or loopback (127.0.0.1) IP address is not accepted as a compatible email server. For more information, see KB0724199.
Procedure

1. Navigate to System Mailboxes > Administration > Email Accounts, and then click New.
2. On the form, fill in the fields.

<table>

<td>Type of secure connection. Choose a setting:</td>
</tr>
<tr>
<td></td>
<td><strong>None</strong></td>
</tr>
</tbody>
</table>
### Field Description

**Connect to an SSL/TLS encrypted port to secure the connection. Email is encrypted between the ServiceNow instance and your mail server.**

**Warning:** Selecting a less secure protocol like STARTTLS or None may expose your data. To better ensure the security of data in your email server, select SSL/TLS.

**Port**
- Connection TCP port.

**System Address Filter**
- System address filter to apply to the email account. If left blank, the system uses the default system address filter for inbound or outbound email.

For more information, see System address filters.

---

3. Click **Submit**.

4. Click the test connection link at the bottom to test the SMTP, POP3, or IMAP account.

   The system displays a pop-up window with the results of the connection test.
If the test succeeds, click **Close** to return to the email account record. If the test fails, click **View Logs** to display more information about the test results.

**Results**
The system uses the email account to send or receive email.

**What to do next**
Enable the system to send or receive email.

**Multiple email readers**
Organize POP3/IMAP email accounts into email account groups (subsets of email accounts) that can be processed by multiple email reader jobs. To improve the performance of inbound email account processing, you can incrementally add email account groups and if needed, email reader jobs to process email account groups concurrently.

**How email account group processing works**
By default, the email reader job processes POP3/IMAP email accounts serially, which can result in longer processing times when you have many email accounts. It can also be difficult to identify any problematic email accounts that might contribute to slower processing times.

To reduce email account processing time, you can create one or more email account groups that contain subsets of your email accounts. Organizing your email accounts into groups enables the default email reader job to process each email account group separately. After creating one or more email account groups, you can then add another email reader job to process account groups concurrently.

Use the `glide.email.inbound.account_group_processing` system property to activate email account group processing.

During email account group processing:
The system stores the email accounts in the Email Account Groups [sys_email_account_group] table.

The default email reader job runs every two minutes. The email reader chooses the account group to be processed based on the account group processing state and the date and time that the group was last processed.

- Claimed state: If an account group has a claimed state, the email reader is processing the account group. If you defined other email reader jobs, no other email reader job can claim the group for processing.
- Unclaimed state: If an account group is unclaimed, the account group is available for processing by the email reader.

The email reader job processes the email accounts contained in the selected account group.

The email reader job chooses the next available account group for processing and continues processing that account group.

You can monitor the processing of each email account group by using the Email Account Groups [sys_email_account_group] table. Each account group record includes the processing duration (how long it takes for the email reader to process all the accounts in the group).

After you review the processing times for your email account groups, determine whether to make further adjustments in email account group processing. For example, you can create another email account group or create another email reader job to process your email account groups in parallel. You define additional email reader jobs using the Schedule [sys_trigger] table.

**Set up email account group processing**

To set up email account group processing, you must have the email_account_admin or admin role.

1. **Create email account groups.**

   Define one or more email account groups that contain a subset of your POP3/IMAP email accounts. Your base system includes a default email account group. Any POP3/IMAP accounts not contained in an email account group are processed as part of the default email account group.

2. **Enable email account group processing**

   Navigate to sys_properties.list and locate the glide.email.inbound.account_group_processing system property. Set the Value to true. The email reader job starts processing the email account groups that you created.
3. **Monitor email account group processing.**

   Check the status of your email account groups to see if processing time has been reduced. Determine whether the additional groups sufficiently reduce account processing time or consider adding another email reader job to further reduce processing time.

4. **Create an email reader job.**

   As part of fine-tuning email account group processing, create an email reader job to process email account groups concurrently, in addition to the default email reader job.

---

### Create email account groups

Define an email account group that contains a subset of your POP3/IMAP email accounts. The email reader job automatically processes each email account group as scheduled.

#### Before you begin

**Role required:** admin or email_account_admin

#### Procedure

1. Navigate to System Mailboxes > Administration > Email Account Groups and click New.

2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the account group.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>A subset of POP3/IMAP email accounts. Select the email accounts that make up the group.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When you add an email account to a group, it cannot be reused in other account groups.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the email account group for processing. New account groups are active by default.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Default | Read only. Check box that indicates the account is the default email account.
Status | Read only. Processing state of the email account group: Unclaimed or Claimed.
Claimed by | Read only. ID of the email reader job currently in progress.
Last Processed | Read only. The last time that the email reader job processed this group.
Processing Duration | Read only. The length of time taken by an email reader job to process the account group.

3. **Click Create.**
   The system updates the Email Account Group [sys_email_account_group] table with the new account group. Use this table to monitor email account group processing.

**What to do next**
- Review email account group processing.
- Determine if you want to continue fine-tuning email account processing. You could add another email account group or another email reader job to process email account groups concurrently.

**Enable email account group processing**
Enable the email reader job to start processing your email account groups so that you can reduce the time it takes to process inbound email accounts.

**Before you begin**
Create email account groups.
Role required: admin

**Procedure**
Add a system property with the following settings:
• Name: glide.email.inbound.account_group_processing
• Type: true | false
• Value: true

What to do next
Check the status of your email account groups to see if processing time has been reduced. For more information, see Monitor email account groups.

To further reduce processing time, consider creating another email reader job to process inbound email accounts. For more information, see Create an email reader job.

Monitor email account groups
Use the Email Account Groups [sys_email_account] table to check the status of email account groups processed by email reader jobs.

Before you begin
1. Create email account groups.
2. Enable email account group processing.

Role required: email_account_admin or admin

Procedure
1. Navigate to System Mailboxes > Administration > Email Account Groups.
2. Review the processing details for each account group:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the email account group.</td>
</tr>
<tr>
<td>Active</td>
<td>The operational state of the email account group. The value true indicates</td>
</tr>
<tr>
<td></td>
<td>that the account is enabled for email account processing.</td>
</tr>
<tr>
<td>Claimed by</td>
<td>The ID of the email reader job if the job is running on the account group.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default</td>
<td>The default indicator. The value true indicates that the email account group is the default.</td>
</tr>
<tr>
<td>Email Accounts</td>
<td>The names of the email accounts contained in the email account group.</td>
</tr>
<tr>
<td>Last Processed</td>
<td>The day and time that the email reader job last processed this account group.</td>
</tr>
<tr>
<td>Processing Duration</td>
<td>The length of time (in hours, minutes, seconds) to process the account group.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing state of the email account group:</td>
</tr>
<tr>
<td></td>
<td>• Unclaimed: The account group is available for processing by the next email reader job.</td>
</tr>
<tr>
<td></td>
<td>• Claimed: An email reader job is processing the current account group.</td>
</tr>
</tbody>
</table>

**Example:**

**Email account group — unclaimed processing state**

![Image of email account group table with columns for Name, Active, Claimed By, Default, Email Accounts, Last Processed, Processing Duration, Status, showing an example account group with unclaimed processing state.](image)
What to do next
If fine-tuning email accounts, consider doing one of the following:

• Create another email account group.
• Create another email reader job to process email account groups concurrently.

Create an email reader job
If you created email account groups to fine-tune inbound email account processing, you can create an email reader job to process those account groups concurrently, in addition to the default email reader job.

Before you begin
1. Create email account groups.
2. Enable email account group processing

Role required: email_account_admin or admin

Procedure
1. In the Navigation filter, type sys_trigger.list.
2. In the sys_trigger table, select the Email Reader job record.
3. In the Email Reader job form:
   a. Enter a unique name for the email reader job to be added so that you can differentiate it from the default email reader job.
   b. If needed, change the time interval for this email reader job.
4. From the form context menu, click Insert.
   Another email reader job is created. This job runs concurrently with the default email reader job to process email account groups.

What to do next
Monitor email account group processing and determine if the additional reader job reduces processing time. If needed, you can continue fine-tuning email
account processing. For example, you might consider adding another email account group.

**Email properties**

The Email Properties page is where you can configure settings for inbound and outbound email.

Email properties are available from either of these modules:

- **System Mailboxes > Email Properties**
- **System Properties > Email Properties**

Troubleshooting steps to take when a ServiceNow instance does not receive email

Email accounts are configured in the **System Mailboxes > Administration > Email Accounts** module. For more information and instructions, see [Configure an email account](#).

Email diagnostics are available from the **System Mailboxes > Email Diagnostics** module.
Note: To learn more about the security properties that affect email processing, see and in Instance Security Hardening Settings.

Outbound mail configuration

The Outbound Mail Configuration section of the Email Properties page contains properties for sending email.
Outbound email configuration

Outbound Email Configuration

- Email sending enabled
  - Yes | No

- Send all email to this test email address (non-production testing)

- Append timezone to dates and times in sent email
  - Yes | No

- Create visible watermark in sent email. If false, create invisible watermark via hidden div tag.
  - Yes | No

- Resend email if server returns these SMTP error codes
  - 421,450,451,452

- Do not resend email if server returns these SMTP error codes
  - 500,501,502,503,504,550,551,552,553,554

- Resend email when server returns unknown SMTP error codes
  - Yes | No

- Roles that can view email in the Activity formatter when including "Sent/Received Emails"
  - itil

- Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all)
  - 3
<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.email.smtp.active | Email sending enabled                           | Specifies whether to enable or disable the outgoing mail server.  
  • Type: true | false  
  • Default value: true |
| glide.email.test.user  | Send all email to this test email address       | Specifies the comma-separated list of email addresses to which the instance sends all email messages. Typically used in non-production instances for testing purposes.  
  • Type: string  
  • Default value: none |
| glide.email.append.timezone | Append time zone to dates and times in sent mail | Specifies whether to append the system time zone to date and date/time values in outbound emails. For example, 2010-07-02 04:01:14 PST.  
  • Type: true | false  
  • Default value: true |
| glide.email.watermark.visible | Create visible watermark in sent mail. If false, create invisible watermark via hidden div tag. | Indicates whether the watermark in email notifications is visible (true) or wrapped in a hidden div tag (false).  
  • Type: true | false  
  • Default value: false |
| glide.smtp.defer_retry_ids | Resend email if server returns these SMTP error codes | Specifies the comma-separated list of SMTP error codes that force the instance to resend email.  
  • Type: string  
  • Default value: 421,450,451,452 |
<table>
<thead>
<tr>
<th>Property</th>

</table>
Inbound mail configuration

The **Inbound Mail Configuration** section of the Email Properties page contains properties to control inbound email.

**Inbound Email Configuration**

**Email receiving enabled**  
Yes | No

Identify email as a reply by these subject prefixes

re:, aw:, r:, Accepted:, Tentative:, Declined:

Identify email as a forward by these subject prefixes

fw:, fwd:

Discard everything below this text if found in a reply body (comma separated, case sensitive)

Original Message-----

Automatically create users for incoming emails from trusted domains

Yes | No

Default password for users created from email sent from trusted domains. (must reset upon login)

Password:

Trusted domains when creating new users from incoming email (ignore email from untrusted domains unless from an existing user; use * for all domains)

</thead>
</table>
| glide.pop3readerjob.create_caller | Automatically create users for incoming emails from trusted domains | Controls the behavior when an instance receives an email from an email address not associated with a user record. If this property is set to **true**, the instance creates a new user record for the email address and places that new user in the **Caller** field of any tickets created. If the property is set to **false**, the instance places **Guest** in the **Caller** field of any tickets created.  
  • **Type:** true | false  
  • **Default value:** false  
  • **Learn More:** Enabling Automatic User Creation |
| glide.user.default_password | Default password for users created from email sent from trusted domains. (must reset upon login) | Specifies the password for new users created from incoming email. Users must reset the password at first login.  
  • **Type:** string  
  • **Default value:** password  
  • **Learn More:** Enabling Automatic User Creation |
| glide.user.trusted_domain | Trusted domains when for which the instance automatically creates a user based on incoming email | Comma-separated list of trusted domains for which the instance automatically creates a user based on incoming email. |

⚠ **Note:** The case of the forward prefix in the email, for example `fw:` must exactly match the case of the prefixes defined in this property. If, for example, an email contains the `Fwd:` prefix and only `fwd:` is defined in the property, the email will not be recognized as a forward. Therefore, it is a best practice to define multiple versions of the prefix, including mixed-case versions, such as `FWD:`, `Fwd:`, and so on.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>creating users from incoming email.</td>
<td>Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email “guest user” but it does not create a guest user in the instance.</td>
</tr>
</tbody>
</table>

• Type: string
• Default value: asterisk (*)
• Learn More: Enabling Automatic User Creation

Note: To learn more about the security properties that affect email processing, see in Instance Security Hardening Settings.

Email image filtering properties

Use email image filtering properties to control how inbound email images attach to a target record.

When a user sends an email to the system, email images (such as logos or email signatures) attach to the target record by default. These images are also visible in the activity stream of the target record. The system then replicates these images, which can cause duplicate image attachments to the target record and also duplicate images in the activity stream.

To filter images from emails and reduce duplicate image attachments to target records, configure the following properties in the System Properties [sys_properties] table. Use these properties to:

• Specify the email image sizes eligible for filtering.
• Choose an action that controls image attachment behavior and image visibility in the activity stream.

Note: These properties do not delete attachments. You can verify attachment records in the Attachments [sys_attachment] table.

Email image filtering properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.minimum_bytes</td>
<td>Set the minimum image size in bytes for inbound email images</td>
</tr>
</tbody>
</table>
Email image filtering properties (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.inbound.image_sys_attachment.filter.action</td>
<td>Specifies the image filtering behavior.</td>
</tr>
</tbody>
</table>

Note: Regardless of the action you select, the image is visible when you choose to Preview HTML Email or Show Email Details in the activity formatter.

- **Type:** Choice list
  - AttachTarget - Associate the image to the target record. The image is visible in the activity formatter and in the attachment to the target record.
  - AttachEmail - Attach the image to the email record. The image is not visible in the activity formatter of the target record nor in the attachment to the target record.
  - AttachNone - Do not attach the image to a record. You can select this option to attach the image manually at a later time.

- **Default value:** AttachEmail

Advanced email properties

Use advanced email properties to fine-tune the way your instance sends or receives email.

Add these properties to the System Property [sys_properties] table before they can be used to overwrite the defaults. To learn more about properties that affect email processing, see in Instance Security Hardening Settings.
com.glide.email.max_read

Specifies the maximum number of emails a POP3 reader should process concurrently.

- Type: integer
- Default value: 20

com.snc.on_call_rotation.reminders.showtz

Specifies whether to show a user's time zone.

- Type: true | false
- Default value: false

glide.cms.use_email_override_url

Forces the system to use the glide.email.override.url property, rather than the glide.servlet.uri property, when a notification has a link to a CMS page in an instance.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.email_address_filter.max_domains

Sets the maximum number of domains that can be associated with a single email address filter.

- Type: integer
- Default value: 100

glide.email_address_filter.max_exceptions

Sets the maximum number of exceptions that can be associated with a single email address filter.

- Type: integer
- Default value: 1000

glide.email.allow_duplicate_message_ids

Allows storing of emails with duplicate message IDs and adds error message "Duplicate message-id encountered, prevented loop."

- Type: true | false
- Default value: false
**glide.email.append.timezone**

Appends the user time zone to all date and time values in outbound email messages (for example, 2018-07-02 04:01:14 PST). The time zone does not show if the system property **glide.sys.time_format** does not have a "z" value. For more information on configuring the time zone in email notifications, see **Time zone for email notifications**.

- Type: true | false
- Default: false

**glide.email.email_client.check_attachment_availability**

Enables a system scan of each file that a user attaches to an email draft in the email client. If a file is found to be infected with a virus, the user can't send the email with the attached file. The user must remove the attachment to send the email.

- Type: true | false
- Default value: true

**glide.email.email_with_no_target_visible_to_all**

Email that is missing a target record or whose target record is the email are made visible to any user regardless of their roles. By turning this property to false, the user is restricted unless they sent in the record or have an admin role.

- Type: true | false
- Value: false

**glide.email.inbound.calendar_behavior**

Specifies how the system stores calendar data, such as an invitation or an invitation response. Enter one of these options (not case sensitive):

- Attach: Store the calendar data as an attachment on the associated record, such as the incident or change that triggers an invitation.
- Ignore: Discard the calendar data.
- Inline: Store the calendar data as text in the email Body field.
- Type: string
- Default value: Attach
glide.email.inbound.check_attachment_availability

Prevents users from downloading and using virus-infected files that are attached to inbound emails.

The system detects infected files in an email by checking the ServiceNow virus header. If there are multiple email attachments, the system scans the files via Antivirus Scanning. All attachments that are found to be infected are made unavailable for use.

- Type: true | false
- Default value: true

---

glide.email.inbound.convert_html-inline_attachment_references

Specifies whether to convert inbound email HTML so email images appear in the email HTML body preview. The system displays broken cid (content ID) links in place of images received when this property is disabled. The format in which the system displays an email image depends on the property setting at the time the email is received, not the current property setting.

- Type: true | false
- Default value: true

---

glide.email.inbound.generate.missing.html.part

Enables the system to generate HTML text for inbound emails that contain only a plain text message.

- Type: true | false
- Default value: true

---

glide.email.inbound.generate.missing.text.part

Enables the system to generate plain text for inbound emails that contain only an HTML message.

- Type: true | false
- Default value: true

---

glide.email.inbound.max_attachment_count

Sets the maximum number of attachments allowed per inbound email.
• Type: integer
• Default value: 30
• Location: System Property [sys_properties] table

glide.email.inbound.max_body_chars
Sets the maximum body size in characters allowed per inbound email.
• Type: integer
• Default value: 524288

glide.email.inbound.max.total_attachment_size_bytes
Sets the maximum total attachment size in bytes allowed per inbound email.
• Type: integer
• Default value: 18874368
• Location: System Property [sys_properties] table

glide.email.mail_to
Specifies the email address for sending notifications that use the ${mailto:} variable.
• Type: string
• Default value: SMTP email address that is active by default

glide.email.name_split
Specifies the delimiter used between first and last names in an email address. For example, a delimiter of "." (period) in the email address john.smith@company.com tells the system to look for a user record for John Smith.
• Type: string
• Default value: period (.)

glide.email.notification.save_when_no_recipients
Controls whether a notification-generated sys_mail record is saved even if there are no recipients. Used along with other notification recipient logging properties, this property enables investigating problems with notifications.
• Type: true | false
• Default value: false

**glide.email.outbound.check_attachment_availability**

Prevents users from sending emails that contain virus-infected files. If an outbound email contains an attachment that was previously marked as infected via *Antivirus Scanning*, then the system doesn’t send the email. An event is created to indicate that the email attachment is not available for use.

• Type: true | false
• Default value: true

**glide.email.outbound.header.auto_submitted**

Stores the value used in the "Auto-submitted" outbound email header. Clear the property value to remove the "Auto-submitted" header from all outbound emails. Some spam filters flag auto-generated email as spam.

• Type: string
• Default value: auto-generated

**glide.email.outbound.max_attachment_count**

Sets the maximum number of attachments allowed per outbound email.

• Type: integer
• Default value: 30
• Location: System Property [sys_properties] table

**glide.email.outbound.max_body_chars**

Sets the maximum body size in characters allowed per outbound email.

• Type: integer
• Default value: 524288

**glide.email.outbound.max_total_attachment_size_bytes**

Sets the maximum total attachment size in bytes allowed per outbound email.
• Type: integer
• Default value: 18874368
• Location: System Property [sys_properties] table

glide.email.override.url
Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is https://servicenow.customerdomain.com/production.nav_to.do. This property is suitable for customers who use custom redirect URLs for their instances.
• Type: string
• Default value: instance URL

glide.email.remove_illegal_address_quotes
Removes invalid quotation marks from an inbound email address, thus allowing the inbound email address to be accepted as valid. For example, when you set the property to true, the address "john.doe@example.com" is changed to john.doe@example.com. However, only addresses that are formatted as John Doe <john.doe@example.com> are removed entirely.
• Type: true | false
• Default: false

glide.email.smtp.max_recipients
Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.
• Type: integer
• Default value: 100

glide.email.smtp.max_send
Specifies how many emails to send through each new SMTP connection. If there are more emails to send than the specified value, the instance establishes a new SMTP connection.
• Type: integer
• Default value: 100

**glide.email_system_address_filter.max_address_filters**

Sets the maximum number of email filters that can be associated with a single system address filter.

• Type: integer
• Default value: 100

**glide.email.text_plain.strip_xhtml**

Converts the XML of both outbound and inbound emails that are shown in comments to plain text. If false, the system preserves the XML.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging**

Enables or disables logging all reasons a recipient was excluded. If set to true, the subsequent properties dealing with the exclusion of logging are enabled. If false, the properties are disabled. This property cannot suppress log messages generated by the **glide.email.test.user** property.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.device_inactive**

Logs recipients who are excluded because their chosen notification device record is marked as inactive.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.device_schedule**

Logs recipients who are excluded based on the **Schedule** field on the Notification Device [cmnnotif_device] record for their chosen notification device.

• Type: true | false
• Default value: true
glide.notification.recipient.exclude_logging.event_creator
Logs recipients who are excluded because they initiated the notification event, such as updating an incident record. The Send to Event Creator check box is then cleared on the notification record.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.invalid_email
Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_calendar_integration_disabled
Logs recipients of calendar invitations who are excluded. Recipients are excluded because the Calendar Integration field is set to None on the user record.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_inactive
Logs recipients who are excluded because the Active check box is cleared on the user record.

- Type: true | false
- Default value: true

glide.notification.recipient.exclude_logging.user_notification_disabled
Logs recipients who are excluded because the Notification field is set to Disabled on the user record.

- Type: true | false
- Default value: true

glide.notification.recipient.include_logging
Enables or disables logging all reasons a recipient was included. If set to true, the subsequent properties dealing with the inclusion of logging are enabled. If false, the properties are disabled.
• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.delegate

Logs recipients who are included because they are delegates of another user.

• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.event_parm

Logs recipients who are included because they are in the parm1 or parm2 fields of the event record.

• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.recipient_fields

Logs recipients who are specified in the Users/Groups in Field field for the notification record. The recipient_fields are fields in the target record that contain a recipient to add. For example, to include an incident assignee as a recipient, set the Users/Groups in Field field to Assigned to.

• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.recipient_groups.group_email

Logs users who are included in a notification that is sent to a group. The property also logs users in the event parm1 or parm2 field.

• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.recipient_groups.manager

Logs recipients who manage a recipient group. The property also logs users in the event parm1 or parm2 field.

• Type: true | false
• Default value: true

glide.notification.recipient.include_logging.recipient_groups.membership

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Logs recipients who are part of a notification recipient group. The property also logs users in the event `parm1` or `parm2` field.

- Type: true | false
- Default value: true

`glide.notification.recipient.include_logging.recipient_users`
Logs recipients who are included via notification record's Users field (recipient_users).

- Type: true | false
- Default value: true

`glide.notification.recipient.include_logging.subscription`
Logs recipients because they are subscribed via the user notification preferences.

- Type: true | false
- Default value: true

`glide.pop3.parse_start`
Specifies the text that indicates the beginning of the email body section. The instance parses name:value pairs within this section to set or update field values when processing inbound email actions.

- Type: string
- Default value: none

`glide.pop3.parse_end`
Text indicating the end of the email body section where the instance should parse name:value pairs to update field values when processing inbound email actions.

- Type: string
- Default value: none

`glide.smtp.dateformat`
Specify the date format to use for outgoing email notifications.

- Type: string
- Default value: date format listed in email sender's user record
  `[sys_user.date_format]`
glide.smtp.precedence_bulk

Specifies whether outbound email includes the header “Precedence: bulk”. Some spam filters flag bulk email as spam. Set the value to **false** to remove this header from outbound email.

- Type: true | false
- Default value: true

glide.smtp.send_partial

Splits outgoing email between valid and invalid recipients. The email is sent only to the valid recipients. A new email containing the invalid recipients is created in the **send-ready** state and attempts to send again.

- Type: true | false
- Default value: false

glide.smtp.timeformat

Specify the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record [sys_user.time_format]

glide.ui.activity.email.use_display

Specifies whether to display email addresses or user IDs (display value from the User table) in email headers. If true, the instance searches for a user record with a matching email address. If it cannot find a matching user record, it displays the email address.

- Type: true | false
- Default value: false

glide.ui.email_client.email_address.disambiguator

Sets the columns from the User [sys_user] table that the autocomplete list displays. Separate each column name with a semicolon character (;).

- Type: string
- Default value: name

glide.ui.incident_activity.max_addresses
Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5

**NotifyAffectedCI.max_rel_level**

Sets a value that is used by the **Affected ci notifications** business rule. The business rule notifies subscribers when tasks affect configuration items (CIs). The business rule generates notifications for parent CIs up to the level defined by this property. You can adjust the property value according to the complexity and depth of your CI relationships.

- Type: integer
- Default value: 5

**Email size limits**

To prevent issues with large email messages, the system enforces configured limits on the maximum allowed email body size, total attachment file size, and number of attachments per email.

An email or attachment that exceeds the system capacity may not be processed as expected. To ensure that your emails and attachments are processed as expected, you can configure properties that limit the size of emails and attachments.

**Message body size limit properties**

Add properties to control the maximum email body size allowed for inbound and outbound email messages.

**Properties**

By default, the system processes up to 524,000 characters in the email **body** and **body_text** fields (524 KB each).

You can add and configure system properties `glide.email.inbound.max_body_chars` and `glide.email.outbound.max_body_chars` to increase or decrease the email body size limits. The system truncates the email body when it exceeds the configured limit. For example, if you configure the body size limit of `glide.email.inbound.max_body_chars` to 1,000 characters but
receive an inbound email that is 2,000 characters, then the system truncates the email body at 1,000 characters.

Also note that the system cannot process email body or body text larger than 16 MB.

### Message body size limit properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>glide.email.inbound.max_body_chars</strong></td>
<td>Sets the maximum body size in characters allowed per inbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
<tr>
<td><strong>glide.email.outbound.max_body_chars</strong></td>
<td>Sets the maximum body size in characters allowed per outbound email.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 524288</td>
</tr>
</tbody>
</table>

**Note:** A different property, `com.glide.attachment.max_size`, sets the maximum file size allowed for any attachment in the system and overrides any larger values of `glide.email.inbound.max_total_attachment_size_bytes` and `glide.email.outbound.max_total_attachment_size_bytes`.

### Inbound email body processing

For inbound emails, the system enforces the maximum body size as set by the `glide.email.inbound.max_body_chars` property. When the body size exceeds the configured value:

- The system does not run inbound email actions that would otherwise be triggered by the email.
- The system truncates the Body text on the Email form.
- The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

  ```
  Email set to receive-ignored because its size exceeds the value set in `glide.email.inbound.max_body_chars`. 1995 character(s) were truncated from the body field.
  ```

### Outbound email body processing

For outbound emails, the system enforces the maximum body size as set by the `glide.email.outbound.max_body_chars` property. When the body size exceeds the configured value:
• The system does not send the email.

• The system truncates the Body text on the Email form.

• The system logs a warning and sets the Error string field on the Email form. The log message for such an email might look like this:

```
Email set to send-ignored because its size exceeds the value set in
glide.email.outbound.max_body_chars. 1337 character(s) were truncated from
the body field.
```

**Attachment limit properties**

Several properties control email attachment limits.

To see the status of all email attachments, go to the Email Attachments [sys_email_attachment] table.

**Properties**

All the properties are located in the System Property [sys_properties] table. Setting any of the following properties to an excessively large value may cause performance issues.

**Attachment limit properties**

<table>
<thead>
<tr>

Attachment limit properties (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Learn more:</td>
<td>Outbound Email Attachment Processing</td>
</tr>
</tbody>
</table>

Note: A different property, `com.glide.attachment.max_size`, sets the maximum file size allowed for any attachment in the system and overrides any larger values of `glide.email.inbound.max_total_attachment_size_bytes` and `glide.email.outbound.max_total_attachment_size_bytes`.

Inbound email attachment processing

For inbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.inbound.max_attachment_count` and `glide.email.inbound.max_total_attachment_size_bytes` properties. When an attachment for an inbound email exceeds either value, the attachment is discarded. A record is created in the Email Attachments [sys_email_attachment] table containing the discarded file name and the reason it was discarded. The discarded file remains in the Email [sys_email] record. The order in which the system processes the attachments determines which attachments are discarded. This order may not be consistent from email to email.

When an inbound email attachment is discarded, the system also fires the `inbound.email_attachments.discarded` event. You can use the event to trigger a notification that alerts the email sender. For an example of a notification that can be triggered by the event, see the inactive "Demo Email Attachment(s) Discarded" notification.

Inbound email attachments are prevented from attaching to the target record if an identical attachment exists.

Outbound email attachment processing

For outbound emails, the system enforces the maximum number and size of attachments as set by the `glide.email.outbound.max_attachment_count` and `glide.email.outbound.max_total_attachment_size_bytes` properties. Email records are created from various sources and may exceed the configured attachment limits.

Emails that are ready to be sent from the Email [sys_email] table are subject to the outbound attachment limits. Emails that exceed either limit trigger a warning in the email system log and are sent with attachments up to the maximum number or total file size.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The log message for such an email might look like this: Maximum combined attachment size exceeded. (max:15728640 bytes). One or more attachment records ignored.

Emails for notifications, scheduled reports, and exported tables

Notifications can be set to include all the attachments from the record that triggers the notification. If the attachments exceed either of the outbound email attachment limits, the system excludes the excess attachments from the email and logs a warning message.

Reports can be scheduled for email distribution as attachments. Large reports may exceed the outbound attachment size limit. In this case, the system sends the scheduled report email without the report attached and logs a warning message. To avoid the issue, send links to large reports instead of sending the reports as attachments.

If a user attempts to export numerous records from a list that exceeds a configured warning threshold, a dialog box offers the option to email the exported records as an attachment. If the attachment exceeds the outbound attachment size limit, the system sends the email without the exported record list attached and logs a warning message.

System mailboxes

Email messages can be seen in the System Mailboxes menu, which gives you access to the system Inbox, Outbox, and Sent mail box.

Each provides a filtered view of emails to let you see only what you need to at any given time, including list fields applicable to each. The system mailboxes menu shows your current POP and SMTP status.

The System Mailbox is hosted by ServiceNow, who have sole access to the mailboxes. By default, once the instance pulls an email message, it is deleted from the mail server and stored in the application on the Email [sys_email] table.

For information about the fields that are shown in the System Mailbox, see System email log and mailboxes. You can configure the layout of a system mailbox to show any of the email log fields, not only the ones that are shown by default.

- Inbound emails: All inbound mail is placed into the Inbox until it is processed. After it is cleared, the email moves to the Received state. If the email message matches the criteria in an inbound email action, the email is changed to Processed. If not, it is changed to Ready. If the system is restarted for any reason (such as during a system upgrade), all inbound mail waits on the external mail server until the system can request delivery.
• **Outbound emails:** All outbound mail is placed into the Outbox until it is processed. Once cleared, it is moved to Sent (if sent) or Skipped (not sent, as in the case of no valid recipients). If the system is restarted for any reason (such as during a system upgrade), all outbound mail waits in the instance database until the system comes online, and the scheduler looks for mail to deliver.

**Email filters**
Specify which inbound emails to ignore or move to a particular mailbox.

When an email is ignored, the email is saved to your instance but is not processed. You can access an ignored email by viewing its Email [sys_email] record.

The Email Filters (com.glide.email_filter) plugin is active by default.

**Default email filters**
By default, the following filters are available from the **System Mailboxes > Filters** module:

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore VCAL</td>
<td>Ignores all email containing vCalendar requests. This filter prevents inbound email actions from creating unnecessary incident records when the instance receives a response to sent email. vCalendar requests in email responses are identified by the EmailUtils script include.</td>
</tr>
<tr>
<td>Ignore header</td>
<td>Ignores email that contains specific headers. This filter overrides the glide.pop3.ignore_headers property.</td>
</tr>
<tr>
<td>Ignore sender</td>
<td>Ignores email from specific senders. This filter overrides the glide.pop3.ignore_senders property.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> To ignore emails from untrusted domains and addresses, consider setting up a system address filter instead. For more information, see System address filters.</td>
</tr>
<tr>
<td>Ignore subject</td>
<td>Ignores email with specific terms or phrases in the subject line. This filter overrides the glide.pop3.ignore_subjects property. This filter might not apply to emails arriving from unknown users. Unknown users can be locked out.</td>
</tr>
</tbody>
</table>
Default email filters (continued)

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move spam to junk folder</td>
<td>Moves email identified as spam to the Junk folder. This filter checks for the value of the ServiceNow spam header. If the header is x-ServiceNow-Spam-Status:Yes, the filter moves the email to the Junk folder.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** To learn more about enabling spam scoring and filtering, see in Instance Security Hardening Settings.

**Email filter script include**

Email filters use a script include called `EmailUtils` that contains a simple utility function to determine if vCalendar is in the body of the response email. The results of this query are used in a condition script in the Ignore VCAL email filter.

**Spam scoring and virus scanning**

Every message sent through email servers is assessed for the likelihood of being spam. Based on this assessment, the instance adds headers to each message that can be used for filtering within the customer instance using the Email Filters plugin.

The system also adds the `X-ServiceNow-Virus:INFECTED` header to an email that contains one or more virus-infected attachments. The system ignores the email.

Spam scoring and virus scanning are available only for instances that use the ServiceNow email infrastructure. For more information on spam scoring and filtering, see KB0549426.

**Activate email filters**

Administrators can activate the Email Filters plugin (com.glide.email_filter).

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

> **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

### Create an email filter

You can create email filters to apply a custom action script or filter actions when email matches your filter's conditions.

#### Before you begin

**Role required:** admin

#### Procedure

1. Navigate to **System Mailboxes > Administration > Filters**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the email filter.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the email filter.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the email filter takes over other filters for the same table. To give the filter higher priority over other filters, enter a lower number.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the email filter.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of what the filter does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to define which emails to filter. Note that conditions are case sensitive.</td>
</tr>
<tr>
<td>Condition script</td>
<td>Script to define which emails to filter. Use this script to access other tables, variables, or methods. For example, the condition script for the Ignore VCAL filter looks for the results of the EmailUtils script include, which detects vCalendar attachments.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Action script</td>
<td>Script to define additional behavior to be performed when the filter condition evaluates to true. This might include an email action not included in the default filter actions. In the base system, the action script is used to produce the error string that is published to the email log (System Logs &gt; Email).</td>
</tr>
</tbody>
</table>

4. Right-click in the header bar and select **Save** from the context menu.

The **Filter Actions** related list appears.

5. Click **New** in the related list.

6. Select how the system should react when the conditions of this filter evaluate to true.

   The two choices in the base system are: **Mark as Ignored** and **Move to Junk**.

   You can use the **Action script** to perform additional email tasks.

   **Note:** Before creating additional email actions with a script, see **Inbound Email Actions**. Like business rules, inbound email actions use both conditions and scripts and can provide a number of useful actions on emails the instance receives.

**Email Service**

Email Service installs the Email API on the instance.

By default, Email Service only allows admin users to access the **Email API**. Administrators can **grant access to the Email API** by:

1. Adding an access control for creating records in the Email [sys_email] table linked to the email_api_send role.
2. Assigning the email_api_send role to the non-admin user.
3. Verifying the non-admin user has read access to the notification target table. For example, an email notification for an incident, requires read access to the Incident table.

   Non-admin users with the email_api_send role can access the Email API from the **REST API Explorer**.

**Activate Email Service**

Users with the admin role can activate the Email Service plugin (com.glide.email.service) to enable the Email API.
Before you begin
Role required: admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.
   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

List of plugins (Rome)

Grant access to the Email API
To grant non-admin users access to the Email API, administrators must create an access control and assign a special role.

Before you begin
Role required: admin

About this task
For additional details, see Email API.

Procedure
1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control for the Email [sys_email] table.

Access control values

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>record</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>sys_email</td>
</tr>
<tr>
<td>Requires role</td>
<td>email_api_send</td>
</tr>
</tbody>
</table>

5. Assign the email_api_send role to the non-admin user.

6. Verify the non-admin user either has read access to all records in the notification target table or has read access to a specific record in the table. For example, to work with incident notifications the non-admin user needs access to the Incident table. You can provide record access by:

- Granting the user an appropriate role, such as the itil role.
- Selecting a specific incident that was opened on behalf of the user.

**System notifications**

Set up notifications to alert users of record changes that may concern them. You can notify users via email, SMS text message, push notification, or messaging app.

**Email and SMS notifications**

Use email notifications to send selected users email or SMS notifications about specific activities in the system, such as updates to incidents or change requests.

Email notifications allow administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification
- Whether the notification can be delivered in an email digest and if so, the digest content

Additional email notification options are available. Users can subscribe to notifications, and administrators can make some notifications mandatory.

Administrators also have the option of converting existing email notifications to a rich HTML format. This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
• Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.

• To prevent broken links, items like images and incidents, that are linked with URLs relative to an instance are converted to absolute links. For example, if an incident is linked using a relative URL, the link is converted to an absolute link.

⚠️ Note: The rich HTML format is the default for all new email notifications.

⚠️ Note: Instances cannot send or receive encrypted email messages. The system strips out the body of the encrypted email because it cannot process the encrypted content in plain text or HTML.

An email notification can also send as an SMS notification if the recipient has subscribed to the notification on an SMS channel. The system uses the subject line of the email notification and converts it to an SMS message. If the administrator doesn’t want to use the email notification subject for the SMS notification, they can define an alternate SMS message in the email template form or email notification form. For more information, see Create an email notification.

For more information on creating an SMS channel, see Create notification channels.

If you want to change how the instance processes incoming email, see Inbound email actions. See System email log and mailboxes for examples of messages the system displays when notifications or inbound email actions are not processed.

Create notification categories

You can create notification categories to identify and group related notifications that are listed in the notification settings for your users.

Before you begin
Role required: admin

About this task
Before adding new categories, review the base system notification categories in the Notification Categories [sys_notification_category] table to determine if you need a new category.

Procedure
1. Navigate to System Notification > Email > Notification Categories.
2. Click New.
3. Enter the **Name** of the category to identify the family of notifications. Provide a category name that is meaningful to your users, so that they can easily find their notifications under the appropriate category in their notification settings.

4. Enter a **Short description** to identify the category.

5. Click **Submit**.

**Results**
The system adds the new category to the Notification Categories [sys_notification_category] table. After you create at least one, active notification that uses the new category, the category and notification are listed in the notification settings for users (**Notifications** tab in the System Settings window).

**Create an email notification**
Creating an email notification involves specifying when to send it, who receives it, what it contains, and if it can be delivered in an email digest.

**Before you begin**
Role required: admin
Consider the following items when you create or update a notification:

- Your notification recipients must be active users and have a valid email address defined.

  ServiceNow users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary channel (device) in the Notification Device [cmn_notif_device] table. If users do not have an active profile and a valid email address, they will not receive notifications.

- Your notification recipients must have the appropriate notification preferences enabled.

  If the notification is subscribable, each ServiceNow user or group member must have the notification and channels (devices) for the notification enabled in their notification preferences. Admins can impersonate users to review and configure their notification preferences.

- To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see **Create notification channels**.
• After you create or update the notification, use the **Preview Notification** option to examine it. For example, you can test links that you may have added and verify the notification recipients. For details, see **Preview email notifications**.

**About this task**

Use the following tabs in the Notification form to configure an email notification:

• **When to send** — Conditions required to send the notification.
• **Who will receive** — Recipients of the notification.
• **What it will contain** — Contents of the notification.
• **What Digest will contain** — Contents of the email digest if the notification can be delivered in a digest.

⚠️ **Note:** If you do not see all the fields on the form, switch to the **Advanced** view.

Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. In the video, skip to 3:29 for details on configuring email notifications.

**Configuring inbound email actions and email notifications**

**Procedure**

1. Navigate to **System Notification > Email > Notifications**.
2. Click **New**.
3. Fill in the fields at the top of the Notification form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the email notification. Descriptive names help identify the purpose of the email notification. For example, Incident Opened &amp; Unassigned.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the database table to link the notification to, for example Incident [incident].</td>
</tr>
<tr>
<td></td>
<td><strong>Attention:</strong> Do not select the Task [task] table. This table is for extending other tables. Notifications that run on the Task table directly are not supported.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Only tables and database views that are in the same application scope appear in the list.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of notification you are creating: EMAIL or Meeting Invitation.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to enable the email notification.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category to which this notification belongs. A category identifies and groups related notifications. This notification, if active and subscribable, is listed in the selected Category in the notification preferences for each user (Notifications tab in the System Settings window).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not leave the category as Uncategorized, as users may not be able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td></td>
<td>If you need a new category, see Create notification categories.</td>
</tr>
<tr>
<td>Allow Digest</td>
<td>Select the check box if an email digest is to be created for the notification. If selected, the What Digest will contain tab is displayed for creating the digest content.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description for this notification.</td>
</tr>
</tbody>
</table>

4. Fill in the fields on the When to send tab.
Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Send when | Select under what condition the notification is sent:  
- When a record is inserted or updated  
- When a particular event is fired  
- When triggered as an action step in Flow Designer |
| Weight | [Required] Set a numerical value for the notification priority relative to duplicate notifications.  
Notifications that have the same target table and recipients are considered duplicates if the weights are different. If weights are same, an additional evaluation is done to check if the subject and the body (excluding watermark) are same to qualify as duplicate notification. When there are duplicate notifications, the system only sends the notification with the highest weight. All other notifications are moved from the Outbox to the Skipped mailbox. The default value 0 causes the system to always send the notification (assuming the conditions are met). |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>For example, suppose that a service desk agent adds a comment to an incident and shortly thereafter closes it. By default, these actions trigger both the Incident commented and Incident Closed notifications. However, both notifications are from the Incident table and also notify the incident caller. The system only sends the notification with the highest weight, which in this case is the Incident Closed notification.</td>
</tr>
<tr>
<td>Field</td>
<td><strong>Note:</strong> The SMTP Sender scheduled job determines how often to send email. By default, this job runs every minute.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Use the condition builder to select the conditions under which this notification is sent. For example, select <em>Priority &gt; greater than &gt; 3 - Moderate</em> to send the notification only for High and Critical priority incidents.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Select the check box to enable email notification when a record is inserted. This field appears when you set the <em>Send when</em> field to <em>Record inserted or updated.</em></td>
</tr>
<tr>
<td>Updated</td>
<td>Select the check box to enable email notification when a record is updated. This field appears when you set the <em>Send when</em> field to <em>Record inserted or updated.</em></td>
</tr>
<tr>
<td>Event name</td>
<td>Select the event that triggers this notification. This field appears when you set the <em>Send when</em> field to <em>Event is fired.</em></td>
</tr>
<tr>
<td>Advanced</td>
<td>Create a script to perform certain actions, like sending a notification based on the current email record, changing field values, or changing system properties.</td>
</tr>
<tr>
<td>condition</td>
<td><strong>The advanced condition script must return true or set a global answer variable to true to send the notification.</strong></td>
</tr>
<tr>
<td></td>
<td>The advanced condition script uses the following global variables:</td>
</tr>
<tr>
<td></td>
<td>• <em>current</em>: Contains the current record from the table to which the notification is linked.</td>
</tr>
<tr>
<td></td>
<td>• <em>event</em>: Contains the event that triggered the notification.</td>
</tr>
</tbody>
</table>
5. Fill in the fields on the **Who will receive** tab.

The following example shows the default view of the tab. The advanced view contains additional fields (see table).

**Tip:** Consider limiting the recipient list of any notification to 1000 users. By default, if a notification has more than 100 intended recipients, the system creates multiple notification messages with up to 100 recipients each. If you want to change the recipient limit, set the system property `glide.email.smtp.max_recipients`.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Select the users you want to receive the email notification. You can search for users with the reference lookup icon or manually add their email addresses. This list of users is static.</td>
</tr>
<tr>
<td>Users/groups in fields</td>
<td>Select fields from the target record that reference the User [sys_user] or Group [sys_user_group] tables. The system sends the notification to users or groups in each field that you select. For example, if a notification uses the Incident [incident] table, you can select the <strong>Opened by</strong> field to send the notification to users or groups who opened the incident. This list of users or groups is variable and depends upon the values of the associated task record. You can also select a field that includes an email address string to send a notification to that address.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.</td>
</tr>
<tr>
<td></td>
<td>If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.</td>
</tr>
<tr>
<td>Groups</td>
<td>Select the groups you want to receive the email notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Group members receive individual notifications only if Include members is selected in the group record.</td>
</tr>
<tr>
<td>Exclude delegates</td>
<td>Select this option to prevent the instance from sending email notifications to delegates of the users and members of the groups you selected.</td>
</tr>
<tr>
<td>Send to event creator</td>
<td>Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification regardless of the setting in this field. For new notifications, this option is selected by default. If you want to know why you may not be receiving certain email notifications, see the blog post Troubleshooting email notifications - Send to the Event Creator by a ServiceNow Technical Support Engineer in the Now Community.</td>
</tr>
<tr>
<td>Event parm 1 contains recipient</td>
<td>Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired</strong>.</td>
</tr>
<tr>
<td>Event parm 2 contains recipient</td>
<td>Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the <strong>Send when</strong> field is set to <strong>Event is fired</strong>.</td>
</tr>
<tr>
<td>Subscribable</td>
<td>Select this check box to allow all users to subscribe to this notification. See <strong>Subscription-based notifications</strong> for more information.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the record contains sensitive or protected data, consider restricting the recipient list only to those users and groups who normally have access to it, and do not enable the <strong>Subscribable</strong> option. You can also configure your notification content so that private or sensitive data is not exposed. For example, you could insert a link back to the associated record, so that details are not revealed in the notification.</td>
</tr>
</tbody>
</table>

The system does not exclude recipients based on access controls. Recipients can receive email about records that they cannot normally access from the user interface. For example, requesters can receive email about incidents and catalog requests opened on their behalf even though they normally do not have access to these records. If a notification includes record details, verify that all recipients need these details.

**Note:** By default, the system does not send email notifications to itself. For example, an email notification from instanceABC@service-now.com does not send to instanceABC@service-now.com. The system prevents this behavior to avoid looping.

6. Fill in the fields on the **What it will contain** tab.
   The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Email template      | If you want to reuse existing content, select an email template to add content to the email notification. You can only select an email template that meets one of the following conditions:  
  • shares the same scope and table as the notification  
  • shares the same scope but has no specified table  
  • shares the same table and is in the global scope |
| Subject             | Enter the subject line for the email message. The subject can include variables from the **Select variables** column.  
  If empty, the system uses the **Subject** value from the **Email template**. If you enter a value in this field, it overrides the template value.  
  If your recipients subscribe to the email notification on an SMS channel, then the system sends the email notification subject as an SMS message. To send a different SMS message, fill in the **SMS alternate** field on the email template form or the email notification form. |
| Message HTML        | Enter the content of the email notification message. The message can include variables from the **Select variables** column.  
  Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.  
  The **Message HTML** field is visible only if you set the content type to **HTML and plain text** or **HTML only**.  
  If empty, the system uses the **Message HTML** value from the **Email template**. If you enter a value in this field, it overrides the template value.  
  To prevent adding extra `<p>` and `<div>` elements to your email notifications, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community. |
<p>| SMS alternate       | Enter the notification message to send to an SMS device. The SMS alternate message is limited to 140 characters.                                                                                       |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>

<td>• Plain text only</td>
</tr>
<tr>
<td></td>
<td>By default, <strong>HTML only</strong> is enabled.</td>
</tr>
<tr>
<td>Include attachments</td>
<td>Select this check box to send all attachments from the triggering record as email attachments.</td>
</tr>
<tr>
<td>Omit watermark</td>
<td>Use this check box to apply or remove the watermark attached to each email. If the email does not contain a watermark, the system reviews the conditions of the inbound actions to create or update task records. For more information, and an alternative way to hide watermarks, see Watermarks on notification emails.</td>
</tr>
<tr>
<td>Message Text</td>
<td>Enter the notification message to send in plain text. This field appears when you set the content type to <strong>HTML and plain text</strong> or <strong>Plain text only</strong>.</td>
</tr>
<tr>
<td></td>
<td>If empty, the system uses the <strong>Message Text</strong> value from the <strong>Email template</strong>. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>From</td>
<td>Enter the email address that you want the email notification to use in the From field. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
<tr>
<td></td>
<td>Changing this address may require an advanced email setup such as enabling email forwarding, for example when using Sender Policy Framework (SPF) records for spam detection.</td>
</tr>
<tr>
<td>Reply to</td>
<td>Enter the email address you want people to use when replying to the email notification. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a></td>
<td>The email must be in a valid format, otherwise a notification message appears near the field. You can add no more than one email address in this field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Push message only</td>
<td>Select this option to send this notification only as a push notification to a mobile device. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Push messages</td>
<td>Associate one or more push messages with this notification. The Push Notification feature must be active.</td>
</tr>
<tr>
<td>Note:</td>
<td>The push message and notification must be for the same table.</td>
</tr>
</tbody>
</table>

7. If you selected the **Allow Digest** check box, fill in the fields on the **What Digest will contain** tab to create the email digest content for the notification. The following example shows the default view of the tab. The advanced view contains additional fields (see table).
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the <strong>Select variables</strong> column. If empty, the system uses the <strong>Subject</strong> value from the <strong>Email template</strong>. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the <strong>Select variables</strong> column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post <em>Extra line spacing with paragraph tags in email client</em> by a ServiceNow employee in the Now Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

When you save or update the notification, the email Digest option is available for the notification in the notification settings of your users.

8. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update.

**What to do next**
Use the Preview Notification option to check your notification. For example, you can see:
- How the Subject and Message fields are displayed.
- Which users will or will not receive the notification, including the reasons why users will not receive it.
Convert legacy email notifications to rich HTML

By default, new email notifications are created in the rich HTML format. But you can also convert legacy notifications to rich HTML.

Before you begin
Role required: admin

Procedure
1. Navigate to System Notification > Email > Notifications.
2. On the Email Notifications list screen, click the name of the email notification you want to convert.
3. Click the What it will contain tab.
4. Click Switch to Rich HTML Editor.
   The system copies any raw HTML from the Message field and converts it to rich HTML in the Message HTML field. Additionally, any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the notification body easier to read.
Note: The string "div" at the bottom of the screen shows the location of your cursor within the Message HTML field. In this case, the cursor is in a line containing an HTML <div> tag.

What to do next
When you convert an email notification that was created in a version prior to Eureka to rich HTML, mail scripts are automatically moved to the Email Script [sys_script_email] table and an embedded script tag with the name of the script is automatically inserted into the body of the notification.

When creating new email notifications, write mail scripts using System Notification > Email > Notification Email Scripts. When the scripts are completed, add a ${mail_script:script_name} embedded script tag to the email notification body. This makes it easy to use the same scripts in multiple email notifications. All you need to copy and paste from one notification to the next is the embedded script tag.

If you manually enter a mail script, any text bounded by <mail_script> </mail_script> in the body of a new or converted email notification or template which is saved to the record, a message asks whether the mail script should be converted.
In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select **Yes**, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag. You can view the mail scripts in their original form by opening the email notification and clicking the **Show Notification Scripts** related link.

**Control visibility to email records generated by notifications**

Define conditions that restrict read access to target email records containing sensitive information.

**Before you begin**

Role required: admin

**About this task**

Use the Email Access Restriction [email_access_restriction] table to define conditions that control read access to an email record generated by a notification containing sensitive information. These conditions are processed by the base system ACL for the Email [sys_email] table. When you specify conditions to restrict access for a notification, the email records are visible only to users that match the conditions specified for the notification.

**Procedure**

1. Navigate to **System Notification > Email Access Restriction**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>Choose the notification that generates the email record that should be restricted.</td>
</tr>
<tr>
<td>Application</td>
<td>Displays the application scope.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Displays the target table for the notification that you selected.</td>
</tr>
<tr>
<td>Condition</td>
<td>Use the condition builder to determine who can access the email record. The conditions must evaluate to true to enable read access to the email record.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a short description of the read access restriction.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Advanced conditions for email notifications**

Use an advanced condition to send a notification based on the current email record, changing field values, or system properties.

To send a notification using an advanced condition, you can:

- Call a function that returns a value, or
- Set the global variable `answer` using a script

For example, in the following code, you call a function to prevent the system from sending an email notification if the sender of a self-service request is a member of the XYZ group:

```javascript
(function() {
    var groupMember = gs.getUser();
    return !groupMember.isMemberOf('XYZ');
})();
```

Alternatively, you can script the same advanced condition by using the `answer` variable:

```javascript
var groupMember = gs.getUser();
if(groupMember.isMemberOf('XYZ')){
    answer = false;
} else {
    answer = true;
}
```

Note that the script must set the `answer` variable to `true` to send the notification. If you script no conditionals, the value of `answer` is equal to the last value that you set for the variable.
You can add a script-based condition in the **Advanced condition** field by configuring the Email Notification form and adding the field. You can access the field in the **Advanced** view without configuring the form.

The advanced condition script uses the following business rule global variables:

- **current**: contains the current record from the table to which the notification is linked.
- **event**: contains the event that triggered the notification.

⚠️ **Note:** The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the **Condition** and **Advanced condition** must evaluate to true in order to send the notification.

**Related information**

- [Create an email notification](#)

**Edit HTML content in an email notification**

For added control over the content of an email notification, you can edit the underlying HTML.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Notification > Email > Notifications**.
2. Open an email notification record.
3. On the form, open the **What it will contain** tab.
4. In the **Message HTML** field, click the source code icon (⋯) to open the HTML source code editor.
5. Make the needed changes to the HTML.

6. On the window, click **Ok**.

7. On the form, click **Update**.

Document attachments on an email notification

You can attach documents and reports to email notifications by scripting or linking to the sys ID of the record.

You can include all attachments from the source record with the notification. For example, if an incident update generates a notification, you can include all attachments from the incident record with the notification. To include all attachments from the source record, select the check box for the **Include attachments** field. Note that email messages, including attachments, cannot exceed the maximum email size. This size includes MIME encoding. For details on MIME encoding, see Email service size restrictions.

Attaching documents with scripting

Using scripting, you can attach documents by linking to them, or you can attach various types of reports by specifying their IDs in the system.
Linking to an attachment

You can add an attachment to a notification by linking to the attachment record in the message of the notification. Upon clicking the link, email recipients log in to the instance to view the attachment record.

Linking to attachment records in this fashion requires using email notification scripting. For example:

```javascript
template.print ( 'Attachment: <a href="/sys_attachment.do?sys_id=' + now_GR.sys_id + '">' + now_GR.file_name + '</a>
 ' ) ;
```

Attaching reports using the Sys ID

You can also attach various types of reports, including gauges, dashboards, and charts, to a notification. The scripts to attach these reports take the following syntax:

```${report:X:Y}```

where:

- X is the type of report you want to attach (reportID, gaugeID, dashboardID, or chartID).
- Y is the sys ID of the report, gauge, dashboard, or chart to be attached.

For example:

- `${report:reportID:<abc123>}`
- `${report:gaugeID:<abc123>}`
- `${report:dashboardID:<abc123>}`
- `${report:chartID:<abc123>}`

Note: Multilevel pivot reports can’t attach to email notifications.

Line breaks in email notifications and rich HTML

Rich HTML provides additional control over line breaks in your email notifications and templates.

To provide control over line breaks, a Newlines to HTML check box is available in the Email Script form.
Selecting the **Newlines to HTML** check box indicates that the method for handling line breaks in earlier versions carries forward for email notifications and templates. When an email notification or template is converted to rich HTML, the **Newlines to HTML** check box is automatically selected.

For new mail scripts, add correct HTML line breaks to `template.print()` statements. If an email notification or template is not converted to rich HTML, newlines are automatically wrapped with `<div>` tags, the same as previous versions. The old mail scripts still work. However, the administrator does not enjoy the benefits of working in the rich HTML format, and does not have as much control over exact HTML formatting.

**HTML line breaks in new scripts**

When writing new scripts, insert explicit HTML line breaks and clear the **Newlines to HTML** check box so that no HTML tags are injected when email notifications are generated. For existing notifications and templates, replace `template.print("\n")` JavaScript function calls with `template.print("<br />")`. This replacement gives you better control over the HTML formatting of your email notifications.

**Preview email notifications**

You can preview what notifications look like before you actually enable the instance to send them.

**Before you begin**

Role required: admin
About this task
You can preview both types of notifications as specified by the **Send when** field on the Notification form:

- **Record inserted or updated**: A change to record in the instance triggers the notification.
- **Event is fired**: An event, such as expiration of a certificate or an inbound email action, triggers the notification.

Procedure

1. Navigate to **System Notification > Email > Notifications**.
2. Open the notification or create one.
   You must save the record before you can view the preview accurately.
3. Click **Preview Notification** on the form header.
4. On the Notification Preview window, verify that the notification works as expected.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview records for this breakdown source</td>
<td>The type of event that triggers the notification. This choice list appears if you preview an event-triggered notification. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Generated Event</strong>: Preview the notification with a generic event that the previewer creates. This does not actually generate an event record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Existing Event</strong>: Preview with an existing event record in the instance. If you select this option, select the event in the <strong>Event Record</strong> field.</td>
</tr>
<tr>
<td>Event Record</td>
<td>An existing event to preview an event-created notification. This option appears if you select <strong>Existing Event</strong> as the event type (for event-triggered notifications only).</td>
</tr>
<tr>
<td>Event Creator</td>
<td>The user triggering the notification for the purpose of the preview. The event creator defaults to the user who clicked <strong>Preview Notification</strong>. You can change the creator as needed. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Preview Record</td>
<td>The record triggering the notification for the purpose of the preview. The preview record defaults to one of the records in the table specified in the <strong>Table</strong> field on the Email Notification form. You can change the preview record as needed to see the changes in the notification content.</td>
</tr>
<tr>
<td>Users</td>
<td>The users who will receive the notification, as specified in the <strong>Who will receive</strong> section of the Email Notification form:</td>
</tr>
<tr>
<td></td>
<td>• All users that you specify on the form appear, but only the users that will actually receive the notification with the current preview settings appear in black text.</td>
</tr>
<tr>
<td></td>
<td>• Users that are specified but for whatever reason will not receive the notification appear in red, strikethrough text. Place the cursor over any of these names to see the reason the user will not receive the notification. For example, one reason could be that the user's notification settings are <strong>disabled</strong>.</td>
</tr>
<tr>
<td>Subject and Body</td>
<td>The content of the notification as defined by the template. The <strong>Subject</strong> and <strong>Body</strong> sections on the preview display the content in the corresponding template fields.</td>
</tr>
</tbody>
</table>
5. After you have reviewed the notification, exit the preview window.
6. Make the necessary changes to the notification or template, if necessary.

**Time zone for email notifications**
A system property controls the time zone that the instance uses for the date and time stamp of a message.

The date and time stamp of a notification uses the system time zone, not the time zone of any recipient. The email property `glide.email.append.timezone` controls whether to append the time zone. If true, the system time zone of the instance is appended to any Date/Time fields in outbound email messages (for example, 2018-07-02 04:01:14 PST).

**Specify alternative outbound email addresses for notifications**
By default, the system sends all outbound email notifications from the default email address of the instance, but you can specify an alternative address.

**Before you begin**
**Role required:** admin

**About this task**
For organizations that need to send email messages from specific email addresses, such as from multiple service desks, or they want to send notifications in different languages, the platform supports configuring multiple outbound addresses.

**Procedure**
1. Navigate to **System Notification > Email > Notifications**.
2. Select an existing notification record for the desired event, such as **Incident Closed**.
3. Create a copy of this notification for each outbound email address.
4. Open one of the notification copies, and click the **Advanced view** related link.
5. In the **What it will contain** section, add an email address to the From field that is different from the default instance address.
   For more information on how to construct the From address, refer to section 3.6.2 of RFC 2822.
6. Add a different email address than the From address to the **Reply to** field if you want replies to this notification to go to a different address.
The system checks the **From** field for an address. If this field is empty, then the system uses the default address for the instance. If the **Reply to** field is empty, then all replies are sent to the address from which the notification was sent. If the **Reply to** field contains an email address, then the system sends all replies to the notification to this address.

7. Create mutually-exclusive conditions for notifications of the same type, so only the desired notification is sent when the event is fired.

   For example, if the **Company** is a certain value, then the notification comes from a unique email address entered in the **From** field.

8. Click **Update**.

**Specify an outbound email address for a particular language**

You can specify a different email address for each language your instance supports.

**Before you begin**

Role required: admin

**Procedure**

1. Create or copy a notification record for the desired event.

2. In the **What will it contain** section, enter a new email address in the **From** field.

3. Create the **Subject** and **Message** content in the desired language.

4. In the **When to send** section, create a condition as follows:
   
   a. In the list of **Condition** fields, select **Show Related Fields** from the bottom of the choice list.
   
   b. From the choice list of **Related Fields**, select the field that identifies the recipient.

      For example, select **Caller > User** fields to send the notification to the user who called in an incident, or **Assigned to > User** fields to send the notification to the user to whom an incident is assigned.

   c. From the choice list of user fields, select **Language**.
   
   d. Select the **is** operator.
   
   e. Complete the condition by selecting the language of the desired user.

5. Click **Update**.

   All notifications for that event originate from the specified email address and go out in the language of the recipient.
**Notification variables**

Use notification variables to display dynamic information in the body of a notification such as a field value, a link to a record, or a link to system preferences.

**Syntax**

Specify a notification variable using this syntax:

```
${variable-name+variable-parameters}
```

The `variable-name` portion is always required. Not all notification variables support the `variable-parameters` portion. When available, most variable parameters are optional. See the list of available notification variables for variable names and available parameters.

**Available variables**

The system provides these notification variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>${field-name}</code></td>
<td>Display the value of the specified field.</td>
<td>None</td>
</tr>
<tr>
<td><code>${image-field-name}</code></td>
<td>Display an image associated with a record. This variable is typically used</td>
<td>None</td>
</tr>
<tr>
<td></td>
<td>with HTML to specify the source of an image element.</td>
<td></td>
</tr>
<tr>
<td>• <code>${URI}</code></td>
<td>Display a link to the current record.</td>
<td>Any valid <code>sysparm</code> URL parameter.</td>
</tr>
<tr>
<td>• <code>${URI_REF}</code></td>
<td>• <code>URI</code>: The link text is the word <code>LINK</code>.</td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>• <code>URI_REF</code>: The link text is the display value of the record.</td>
<td>• <code>sysparm_scriptlet</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> These variables don’t apply to records in Workspace. To link to</td>
<td>• <code>sysparm_view</code></td>
</tr>
<tr>

<td>a record in Workspace, create a mail script that prints a URL to a</td>
<td></td>
</tr>
<tr>
<td></td>
<td>notification. For more information, see <a href="#">Linking to a record in Workspace</a>.</td>
<td></td>
</tr>
</tbody>
</table>
## Available notification variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{reference-field.URI}</code></td>
<td>Display a link to the record listed in a reference field.</td>
<td>Any valid <code>sysparm</code> URL parameter. For example:</td>
</tr>
</tbody>
</table>
| `{reference-field.URI_REF}` | URI: The link text is the word `LINK`  
       | URI_REF: The link text is the display value of the record.                                       | • `sysparm_scriptlet`  
       |                                                                                                  | • `sysparm_view`                                                      |
| `{CMS_URI}`                | Display a link to the specified record within a CMS page.                                        | `<CMS-site>/`  
       |                                                                                                  | `<CMS-page>`: The required relative path to the CMS page.                        |
| `{notification:body}`      | Display the body contents of an email template or email notification. Use this notification      | None                                                                                 |
|                           | variable to specify where to display body content in an email layout.                           |                                                                                      |
| `{mail_script:script_name}` | Run the specified mail script.                                                                  | None                                                                                 |
| `{NOTIF_UNSUB}`           | Display a link unsubscribe from this notification.                                              | `link_text`: specify the text to display as a link within quotation marks.            |
| `{NOTIF_PREFS}`           | Display a link to set notification preferences.                                                   | `link_text`: specify the text to display as a link within quotation marks.            |
| `{comments:n}`            | Display the most recent comments that were made on the target record.                           | Any number greater than 0.                                                           |
|                           | The number of comments to display is `n`. For example, `{comments:3}` displays the last three   |                                                                                      |
|                           | comments that were made to the record.                                                           |                                                                                      |
|                           | To display all comments, use the variable `{comments}`.                                          |                                                                                      |
| `{comments_and_work_notes:n}` | Display the most recent comments and work notes that were made.                                 | Any number greater than 0.                                                           |

Unsubscribe | Manage Preferences
Links to records in email notifications

Adding the `$URI` parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The `$URI` parameter has an extension called the `$URI+` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

```plaintext
${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()
    &sysparm_scriptlet_condition=current.assigned_to.nil()
    &sysparm_view=incident_active}
```

This example executes the JavaScript:

```javascript
current.assigned_to=gs.getUserID()
```

when the condition of

```javascript
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to `incident_active`.

Linking to a record in Workspace

The `$URI` and `$URI_REF` variables don’t apply to records in Workspace. To link to a record in Workspace, create a mail script and reference it in your notification. For more information on using mail scripts, see JavaScript in emails.

The mail script that you create should print a URL to the notification. The URL must have the following format:

```plaintext
https://<instance_name>/now/workspace/<workspace_name>/record/<table_name>/<sys_id>
```

The following example script shows the logic that a mail script must include to create a link to a record in Workspace.
Enable links to records

Adding the special `${URI}` parameter to an outbound email body or template creates a link to a specific record.

When a user clicks the word LINK, the instance prompts the user to log in if not already logged in, and then redirects the user to the record specified in the URI.

The `${URI}` parameter has an extension called the `${URI+}` format to specify additional arguments in the email link, such as sysparm terms, in addition to the automatically created URI. For example (whitespace added for improved readability):

`${URI+&sysparm_scriptlet=current.assigned_to=gs.getUserID()&sysparm_scriptlet_condition=current.assigned_to.nil()&sysparm_view=incident_active}`

This example executes the JavaScript:

```
current.assigned_to=gs.getUserID()
```

when the condition of

```
current.assigned_to.nil()
```

is satisfied. Additionally, the script sets the view to incident_active.

Change the link text

To show the display value of the record as the link text instead of the word LINK, use the `${URI_REF}` parameter instead of the `${URI}` parameter.
**URI_REF email notification**

Short description: SAP Sales app is not accessible

Click here to view incident: INC0000055

Comments:

For example, if the URL displays an incident record, the link text is the incident number, which is the display value for incidents. If the URL displays a user record, then the link text is the user name.

**Link to related records**

A notification can link to a related record by specifying a reference field in front of the \$\{uri\} or \$\{uri_ref\} parameters.

Format the related record link as follows:

- \$\{<reference field that contains the related record you want to display>.uri\}
- \$\{<reference field that contains the related record you want to display>.uri_ref\}

For example:

<table>
<thead>
<tr>
<th>Related record to provide link to</th>
<th>Notification record table</th>
<th>Reference field</th>
<th>Samples</th>
</tr>
</thead>
</table>
| Related task record to be approved from an approval notification | Approval [sysapproval_approver] | Approval for [sysapproval] | • \$\{sysapproval.uri\}  
• \$\{sysapproval.uri_ref\} |
| Related problem record in an incident notification | Incident | Problem [problem_id] | • \$\{problem_id.uri\}  
• \$\{problem_id.uri_ref\} |

For example, the following notification template produces the email links in the picture below:
Content page links in email notifications

Links to CMS pages can be put in notifications to make it easy for the reader to access the pages.

The link takes the following format: \${CMS_URI+<site>/<page>}

For example, to link the email recipient to a page called Incident in the content site ESS, with the current incident as the target document, use the following format: \${CMS_URI+ess/incident_detail}

The resulting email URL has this format: https://<instance name>.service-now.com/ess/incident_detail.do?sysparm_document_key=incident,46e18c0fa9fe19810066a0083f76bd56

Email unsubscribe

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

ℹ️ Note: The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.

- An unsubscribe link that creates an email message to the instance.
- An unsubscribe link that opens the notification preferences for the user on the instance.

Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-</td>
<td>link_text: specify the text to display as a link within</td>
</tr>
</tbody>
</table>
Available unsubscribe macros (continued)

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>formatted unsubscribe email message to the instance.</td>
<td>quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td>link_text: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

- Email layouts
- Email templates
- Email notifications

Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

- The **To** field has the email address of the instance.
- The **Subject** starts with the string *Unsubscribe from*.
- The **Body** has a JSON string with a name-value pair of **Unsubscribe** and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.

**Note:** Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See RFC6068 for information about the mailto URI scheme.

The **Unsubscribe from Notification** inbound action processes the email and unsubscribes the sender from the listed notification.
Note: Unsubscribing by email message does not require users to authenticate with the instance first.

Unsubscribe by notification preferences
Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

Example: Unsubscribe links
This email layout adds several unsubscribe links to the bottom of each email notification.

`${NOTIF_UNSUB} from this notification by email or `${NOTIF_UNSUB+link_text="click here"}.
Manage your `${NOTIF_PREFS} or `${NOTIF_PREFS+link_text="click here"}.

When rendered in an email notification, the unsubscribe links only display the link text.
Sample email with unsubscribe links

If a user clicks the **unsubscribe** link, the email client creates a message such as this:
**Scripting for email notifications**

Email scripts allow for business rule-like scripting within an outbound email message.

With mail scripts, you can dynamically change the email output of your system based on different criteria. Mail scripts allow you to perform simple tasks, such as displaying incident data, and complex ones, such as making advanced database queries.

You can add a `${mail_script:script name}` embedded script tag to the body of the email notification or template, replacing `script name` with the name of the script you created. This makes it easy to use the same scripts in multiple email notifications or templates.

If you manually enter a mail script bounded by `<mail_script>` and `</mail_script>` in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. In many cases, an unconverted mail script fails to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag (`${mail_script:script_name}`).

**JavaScript in emails**

Create mail scripts in System Notifications > Email > Notification Email Script, and refer to them by using `${mail_script:script name}` in the script field.

To print text into the body of the message, use the `template.print("a string")` function.
JavaScript in templates

The `event.parm1` and `event.parm2` parameters that come from the originating event can also be used.

**Mail script API**

Certain variables are available when processing mail_script scripts.

**Mail script variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template</td>
<td>Handles printing from the mail script to the email message.</td>
</tr>
<tr>
<td></td>
<td><code>template.print(&quot;message&quot;);</code> //outputs message to the email body.</td>
</tr>
<tr>
<td></td>
<td><code>template.space(&quot;number of spaces&quot;);</code> //outputs spaces to the email body.</td>
</tr>
<tr>
<td>email_action</td>
<td>GlideRecord object for the email notification (sysevent_email_action).</td>
</tr>
<tr>
<td>event</td>
<td>GlideRecord object for the event that fired the notification (sysevent).</td>
</tr>
<tr>
<td>email</td>
<td>EmailOutbound object</td>
</tr>
<tr>
<td></td>
<td>Available methods:</td>
</tr>
<tr>
<td></td>
<td>• <code>addAddress(String type, String address, String displayname)</code>: type can be cc or bcc.</td>
</tr>
<tr>
<td></td>
<td>• <code>setFrom(String address)</code>: override the sender address.</td>
</tr>
<tr>
<td></td>
<td>• <code>setReplyTo(String address)</code>: override the reply to address.</td>
</tr>
<tr>
<td></td>
<td>• <code>setSubject(String subject)</code>: override the subject of the message.</td>
</tr>
<tr>
<td></td>
<td>• <code>setBody(String message)</code>: override the body of the message.</td>
</tr>
</tbody>
</table>
Mail script variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Object Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The email address that is passed by setFrom and setReplyTo needs to be in a valid form such as <a href="mailto:helpdesk@sn.com">helpdesk@sn.com</a> or Display Name <a href="mailto:helpdesk@sn.com">helpdesk@sn.com</a>. If the email address includes a 'Display Name', then that value overrides the instance's display name.</td>
</tr>
</tbody>
</table>

Example scripting for email notifications

Examples of scripting for email notifications.

Scripting examples for email notifications

A simple text string is the most basic example of the way a mail script works. This script prints out "Incident number - INC00001".

```java
template.print("Incident number - "+ current.number);
```

More advanced scripts, like this one, can be found by browsing through the base system email templates.

```java
template.print("Summary of Requested items:<br />
" + gr.quantity + " X " + gr.cat_item.getDisplayValue() + " at " + gr.cat_item.price.getDisplayValue() + " each <br/>");
```

To dynamically change field values within an email, use the following functions within `<mail_script>` syntax:

```java
... email.setFrom(current.caller_id.email);
email.setReplyTo("joe.employee@yourcompany.com");
email.setSubject("This is the new subject line");
email.setBody("This is the new body");
...```
Using the `instance_name` property ensures that the notification still works when migrated between instances.

```javascript
function dothis(){
    var now_GR = new GlideRecord('sys_attachment');
    gr.addQuery('table_sys_id', current.sys_id);
    gr.query();
    while(gr.next()){ template.print('Attachment: <a href="https://' + gs.getProperty('instance_name') + '.service-now.com/sys_attachment.do?sys_id=' + gr.sys_id + '">' +
        gr.file_name + '</a>');}
}
```

You can specify copied and blind copied recipients by using the email object within a mail script.

```javascript
//email.addAddress(type, address, displayname);
    email.addAddress("cc", "john.copy@example.com", "John Roberts");
    email.addAddress("bcc", "john.secret@example.com", "John Roberts");
```

The following is an example script to add users from `watch_list` as copied recipients.

```javascript
if(!current.watch_list.nil()){ //get watch list addresses and add to cc
    var watcherIds = current.watch_list.split(',');

    //get user records
    var user = new GlideRecord("sys_user");
    user.addQuery("sys_id", watcherIds);
    user.addQuery("notification", 2);
    //email
    user.addQuery("email","!=" , "");
    user.query();

    while(user.next()){ //add to cc list
        email.addAddress("cc", user.email, user.getDisplayValue());
    }
}
```

**Useful attachment scripts**

This is a searchable version of the Useful Attachment Scripts.
CAUTION: The customization described here was developed for use in specific instances, and is not supported by ServiceNow Technical Support. This method is provided as-is and should be tested thoroughly before implementation. Post all questions and comments regarding this customization to our community forum.

Copy attachments from record to record
Use the following script to copy an attachment from one record to another record:

```
GlideSysAttachment.copy('sourcetable','sys_id','destinationtable','sys_id');
```

Note: GlideSysAttachment.copy copies all attachments; it cannot select specific attachments.

Delete duplicate attachments
Use the following script in a business rule, scheduled job, or background script to delete duplicate attachments located in the Attachments [sys_attachment] table:

```
function fixDuplicateImages(){var now_GR =new GlideRecord('sys_attachment');
  gr.addQuery('table_name','LIKE','ZZ_YY%');
  gr.orderBy('table_sys_id');
  gr.orderByDesc('sys_created_on');
  gr.query();var lastID ="not_a_match";var lastFile ="not_a_match";while(gr.next()){var isDuplicate =(lastID == gr.table_sys_id)&&(lastFile == gr.file_name);
    lastID = gr.table_sys_id;
    lastFile = gr.file_name;
    gs.print(gr.table_sys_id+ ' '+ gr.table_name+ ' '+ gr.file_name+ ' '+
              gr.sys_created_on+ ' '+ isDuplicate);if(isDuplicate)
      gr.deleteRecord();}}
```

Display whether tasks have attachments in list view
Use the following script in a business rule to display whether tasks have attachments when viewed in the record list view. Note that the script needs a custom field on the Has Attachments [u_has_attachments] table.
checkAttachment();

function checkAttachment(){ // if inserting then the task has an
  attachment
  if(current.operation()=='insert')
    hasAttachment('true'); // if deleting attachment check for
  other attachments
  if(current.operation()=='delete')
  {var timeNow3 =new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time
    is: ' + timeNow3.getNumericValue(),'jwtest');
    var attachCount =new GlideAggregate('sys_attachment');
      attachCount.addQuery('table_sys_id',current.sys_id);
      attachCount.addAggregate('COUNT');
      attachCount.query();

      var numAttachments = '0'; // if no other attachments task does not have
      attachCount.next();
      numAttachments =
      attachCount.getAggregate("COUNT");

      hasAttachment = 'true';
      else{
        hasAttachment = 'false';
      var timeNow4 =new GlideDateTime();
    gs.log('has_attachment br: gliderecord query start date time is: ' +
    timeNow4.getNumericValue(),'jwtest');
  } }

function hasAttachment(answer){
  var task =new GlideRecord('task');
  task.addQuery('sys_id',current.table_sys_id);
  task.query();

  if(task.next()){
    task.u_has_attachment = answer;
    task.autoSysFields(false); // Don't set the lastUpdatedTime or the
    Simultaneous Update Alert will likely get triggered
    task.setWorkflow(false); // Don't allow other business rules to run,
    otherwise multiple notifications will likely be sent
    task.update();
  }
}

Note: Schedule the business rule to run after insert/delete.

Link to attachments in an email notification
Use the following script in an email notification or template to include links to
attachments:
printattachments();

function printattachments(){var now_GR =new GlideRecord('sys_attachment');
    gr.addQuery('tableSysId',current.sys_id);
    gr.query();while(gr.next()){    template.print('Attachment: <a href="http://'+gs.getProperty("instance_name")+'.'+service-now.com/sys_attachment.do?sys_id='+ gr.sys_id+'">'+ gr.file_name+'</a>');}

! Note: Replace "instance_name" with your instance name.

Attachment Logging
Whenever a user downloads an attachment, the action writes an attachment.read event record to the event log. If desired, you can process these events with a Script Action or an Email Notification. This can be useful if you want to do something when an attachment is read. For example, you can record when and by whom certain attachments are downloaded. For this functionality, the current variable must point to a sys_attachment record, and the event record must use the following parameters:

- parm1: File name
- parm2: Table name

Baseline email notifications
The baseline system provides several email notifications.

Some events listed in this table do not appear in a business rule and are fired by other conditions in the platform. Some events are hardcoded and are not user configurable.

Notification example: notify an assignment group of updates to Priority 1 Incidents

Notify users by email when there are updates to high priority incidents.

Before you begin
Role required: admin

About this task
Send emails to an assignment group whenever there are updates to an incident in which the Priority is 1 - Critical. Include information that is of interest to the recipients, such as the incident number, category, assignees, and any comments that were added to the incident.
Procedure

1. Navigate to System Notification > Email > Notifications, and then click New.
2. On the email notification form, enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Priority 1 Incident Updated</td>
</tr>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Incident Alert</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Priority][is][1 - Critical] AND [Updated][changes]</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assignment group</td>
</tr>
<tr>
<td>Subject</td>
<td>Priority ${priority} Incident updated</td>
</tr>
</tbody>
</table>

Note: In this notification, the variable ${priority} returns the value 1 - Critical.

3. In the Message HTML field, enter the following message and script:

```
Short Description: ${short_description}
Click here to view incident: ${URI}
Incident number: ${number}
Category: ${category}
Assigned to: ${assigned_to}
Assignment group: ${assignment_group}
<hr/>
Comments:
${comments}
```

4. From the form context menu, click Save.
5. Preview the email notification to ensure it includes all the needed information.
a. On the notifications form, click **Preview Notification**.

b. Note that the email includes the following information:
   • Short description
   • A link to the incident record
   • Incident number
   • Category
   • The name of the user to whom the incident is assigned
   • The group assigned to the incident
   • Comments from the incident record

6. Test that the email notification sends to an assignment group when its Priority 1 Incident is updated.
   a. Create a user who has an email address that you can monitor, and then create a group that includes the user that you created.
   b. Navigate to **Incident > Open**, and then open an incident in which the **Priority** is **1 - Critical**.
   c. In the **Assignment group** field, enter the group that you created.
   d. From the form context menu, click **Save**.
   e. Add comments to the form to update the incident, and then click **Update**.
   f. Check the email account of the user member in the assignment group.

**Notification example: notify task assignees**

Notify users who are assigned a Task [task] record.

**Before you begin**

Role required: admin

Set up your email as a test email address. Navigate to **System Properties > Email Properties**, and then enter your email address under **Send all email to this test email address**.

**Procedure**

1. Navigate to **System Notification > Email > Notifications**, and then click **New**.
2. On the form, enter the following values:
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Task Assigned</td>
</tr>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
<tr>
<td>Category</td>
<td>Uncategorized</td>
</tr>
<tr>
<td>Send when</td>
<td>Record inserted or updated</td>
</tr>
<tr>
<td>Inserted</td>
<td>Selected</td>
</tr>
<tr>
<td>Updated</td>
<td>Selected</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Assigned to][changes]</td>
</tr>
<tr>
<td>Users/Groups in fields</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Subject</td>
<td>Task Assigned</td>
</tr>
</tbody>
</table>

3. In the **Message HTML** field, add a message to send to whomever the task is assigned to.

4. From the form context menu, click **Save**.

5. To see a mock version of the system email that you created, click **Preview Notification** on the notification form.

6. Test the notification sends to a task assignee.
   a. Assign some task records.
   b. Check your email for assignment notifications.

**Email templates**

Email templates enable administrators to create reusable content for the subject line and message body of email notifications.

Templates deliver consistent information on specific system activities and improve the efficiency of creating multiple email notifications for similar actions. If necessary, you can make minor changes on the fly to an email that uses a template by overriding the subject line and message body content in the notification form. A common practice is to define the message body in a template and create new subject lines for different types of recipients. There is no limit to the number of templates that you can create.
Email templates are created in rich HTML format, and administrators have the option of converting existing email templates to rich HTML (starting with the Eureka release). This format provides several advantages, including:

- Raw HTML content is converted into a WYSIWYG format.
- The content can be edited in a feature-rich HTML editor.
- Mail scripts are condensed into a single, easy-to-read line that can be reused in multiple email notifications.
- To prevent broken links, images linked using URLs relative to a particular instance are converted to absolute links.

Create an email template

You can create an email template with rich HTML formatting, rather than plain text.

Before you begin
Role required: admin

Procedure
1. Navigate to System Notifications > Email > Templates.
2. Click New.
3. Fill in the form fields (see table).
Email Template form with the HTML editor

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the template. For example, change.update.risk.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Email layout</td>
<td>If the message body for the template is to be formatted using a predefined email layout, select the layout.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the name of the table involved. For example, Change Request [change_request].</td>
</tr>
<tr>
<td>Subject</td>
<td>Enter a subject line that explains the purpose of the email. Select the appropriate variables for the subject line from the fields available on the selected table. Place the cursor where you want the variable to appear, and click the field name in the Select variables column. For example:</td>
</tr>
<tr>
<td></td>
<td><code>${sys_class_name} ${number} with ${risk} risk has been assigned to you.</code></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Message HTML**         | Enter the content of the email template message. You can use the HTML editor toolbar to format the HTML, and you can include variables from the **Select variables** column. Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. **Notes:**  
  • When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **HTML** in the **Content Type** field in the Email Notification form.  
  • You cannot use HTML code to control the appearance of the contents in the `{comments}` variable.  
  • If you want to include a link to the record that triggered the notification, see **Enable links to records**. |
| **Message Text**         | Enter the notification message to send in plain text. **Note:** When a template is applied to a notification, the contents of this field are used when you select **HTML and plain text** or **Text** in the **Content Type** field in the Email Notification form.                                                                                                                      |
| **SMS alternate**        | Create a different message to be delivered to an SMS device. Enter a brief message, showing the most important information only. If this message field is blank, the contents of the **Message Text** field are used for the SMS message. **Note:** The message in this field is used when the message is sent to a device configured as SMS.                                           |

**Related information**

- Create an email layout

**Apply a template to an email notification**

After you create an email template, you can apply it to a notification.

**Before you begin**

Role required: admin
Procedure
1. Navigate to System Notification > Email > Notifications.
2. Open the email notification record that should use the template.
3. Navigate to the What it will contain section.
4. From the Email template field, select the appropriate template.
5. Click Update.

Convert an email template to rich HTML
If you have an email template created prior to the Eureka release, you can convert it to rich HTML.

Before you begin
Role required: admin

Procedure
1. Navigate to System Policy > Email > Templates.
2. Open the email template you want to convert.
3. Click Switch to Rich HTML Editor.

When content is converted, these changes are made to the content:
• **HTML Editor:** Any raw HTML in the *Message* field is rendered as WYSIWYG text in the *Message HTML* field. The content can be edited in a feature-rich HTML editor.

• **Simplified Mail Scripts:** Any mail scripts in the body are automatically saved to the Email Script [sys_script_email] table and are replaced in the notification body with an embedded script tag. This makes the template body easier to read and makes it easier to reuse scripts in multiple email templates.

4. Modify the message text, as needed, using the WYSIWYG editor or by editing the underlying HTML.

  🔄 **Note:** The letter "P" at the bottom of the screen shows the location of your cursor within the *Message* field. In this case, the cursor is in a line containing an `<HTML>` tag.

  🔄 **Note:** Email templates that are already formatted with rich HTML do not show the **Switch to Rich HTML Editor** button.

**Example:**

Whether you are working with templates converted from earlier versions or creating new templates in the rich HTML format, it is a good practice to write mail scripts in **System Notification > Email > Notification Email Scripts**. When the scripts are completed, a `${mail_script:script name}` embedded script tag should be added to the email template body. This makes it easy to use the same scripts in multiple email templates. All that needs to be copied and pasted from one template to the next is the embedded script tag.
If you manually enter a mail script in the body of a new or converted email notification or template, and then attempt to save the record, a message asks whether the mail script should be converted. Unconverted mail scripts often fail to run from inside the HTML editor. If you select Yes, the script is added to the Email Script [sys_script_email] table and is automatically replaced in the body with an embedded script tag.

You can view the mail scripts in their original form by opening the email template and clicking the Show Notification Scripts related link.

**Construct an email message with a template**

Email templates provide a list of the fields from database tables that are available for constructing an email message.

An email template can include a mailto automatic response link, which enables the email recipient to simply choose a link that sends a preformatted response back to the instance. An example is the email template used for notification that an approval is required. The following example shows the base email:

![Email notification with the template specified](image)

In this case, when a change request approval is requested, an update is made to the sysapproval_approval table. The "approval events" business rule is then executed, which creates the "approval.inserted" event. The "Approval
Request" email event is defined to process the approval.inserted event, and this email event is defined to use the following change.itil.approve.role email template. Notice that this template has two mailto: items specified. One for "mailto.approval" and one for "mailto.rejection." This email template builds an automatic response that lets the email receiver simply click a link in the email to either approve or reject the change request.

Here is what the change.itil.approve.role template looks like using the rich HTML editor:

The selection list on the right shows the available fields from the sysapproval_approver table.

Notice the change.itil.approve.role template also uses a predefined email layout (Unsubscribe and Preferences), which provides links for the recipient to unsubscribe from approval notifications and set notification preferences.

And here is the mailto.approval template:
**mailto approval template**

If you put text on the lines following the **Click here to approve ${sysapproval}** line, this text forms the actual body of the email.

The combination of templates used would generate an email similar to the following example:

**Template generated email message**

*Short Description:* Upgrade to a new version of Windows Office  
*Click here to view Approval Request:* [LINK]  
*Click here to view Change Request:* [LINK]  

*Priority:* 4 – Low  
*Category:* Software  
*Comments:*  
All matches for the sales department must be updated to the latest version of Windows Office  

*Click here to approve CHG30003*  
*Click here to reject CHG30003*

[Unsubscribe] | [Notification Preferences]

Notice that the email recipient can use the following links in the mail:

- A link to view all the details of the change request  
- A link to view the approval record  
- A link that generates an automatic email response to approve the change
• A link that generates an automatic email response to reject the change
• A link to unsubscribe from approval notifications and another link to set notification preferences

Related information

Email layouts

Add blank lines in an email template
You can easily add blank lines in an email template using HTML tags.

Judicious use of these HTML tags can make your email easier to read.

• You can use `<br/>` to insert a line break
• You can wrap paragraphs in `<p>` ... `</p>` tags to format your email nicely.

Calendar integration
With email notifications, you can use import export maps to leverage information about records and integrate with Outlook or another calendar.

For example, an email notification can create a calendar event based on the planned start and end dates of a change request. To enable integration with a calendar, the following iCalendar variables are available to be added to an email template message and reference the email template from the notification. The variables must be added to the **Message Text** field.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>${dtstart}</td>
<td>Start Date</td>
</tr>
<tr>
<td>${dtend}</td>
<td>End Date</td>
</tr>
<tr>
<td>${location}</td>
<td>Location</td>
</tr>
<tr>
<td>${alarm_time}</td>
<td>Alert or reminder time</td>
</tr>
</tbody>
</table>

By default, the instance computes the value of iCalendar variables using import and export maps for the Appointment [itil_appointment] and Change Request [change_request] tables. The instance also uses import and export maps for other tables, depending on which plugins you activate. For example, if you activate the Incident (com.snc.incident) plugin, the instance uses the import and export maps of the Incident [incident] table.
Each import export map can specify a different set of iCalendar fields. For example, the icalendar.change_request import export map only maps two iCalendar fields.

### iCalendar change request mappings

<table>
<thead>
<tr>
<th>Associated variable name</th>
<th>Field mapped</th>
<th>Field label</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_date</td>
<td>start_date</td>
<td>Planned start date</td>
</tr>
<tr>
<td>end_date</td>
<td>end_date</td>
<td>Planned end date</td>
</tr>
</tbody>
</table>

The instance uses the **External Name** value as the variable name in the email template. For example, the icalendar.change_request import export map defines the *dtstart* and *dtend* variables.

### Map date fields to iCalendar variables

You can specify what fields provide the date information in calendar invitation notifications by changing the field mappings of the *dtstart* and *dtend* variables in the import export map for the iCalendar invitation.
Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `sys_impex_map.list`.
2. Open a map to edit.

3. In the Field Maps related list, click either the `end_date` or `start_date` mapped field to change the mapping for `dtstart` or `dtend`, as needed.
4. Change the **Database** field to the field you want to use to set the start date or end date.
5. Click **Update**.

Create iCalendar invitations for custom tables

To generate iCalendar invitations that use field values from custom tables, create an import export map that computes the values of the iCalendar fields.

Before you begin
Role required: admin

Procedure

1. Create the custom table and fields using the **Date/Time** field type for the fields that map to the `${dtstart}` and `${dtend}` variables.
2. In the navigation filter, enter `sys_impex_map.list`.
3. Click **New**.
4. Set the following fields:
   - **Name**: Use the following naming convention: `icalendar.<table name>`. For example, `icalendar.u_my_custom_table`.
   - **Table**: Select the custom table you created.
   - **Type**: Select `icalendar`.
5. Right-click the form header and select **Save**.
6. In the Field Maps related list, click **New**.
7. In the Mapping Entry Wizard, select **Mapping to a Database Field**.
8. Create field mappings for `dtstart` and `dtend`. These variables are required.
   For example, map the **External Name** `dtstart` to the `u_meeting_start_time` field in `u_my_custom_table`.
9. Click **Submit**.
10. Create field mappings for any other iCalendar fields as necessary.
11. Click **Update**.

Here are sample field mappings between iCalendar variables and custom fields in a custom table, `u_my_custom_table`:

### Sample field mappings

<table>
<thead>
<tr>
<th>External name</th>
<th>Database field</th>
<th>Type</th>
<th>Map</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtstart</td>
<td><code>u_meeting_start_time</code> field</td>
<td>icalendar</td>
<td><code>u_my_custom_table</code></td>
</tr>
<tr>
<td>dtend</td>
<td><code>u_meeting_end_time</code> field</td>
<td>icalendar</td>
<td><code>u_my_custom_table</code></td>
</tr>
<tr>
<td>description</td>
<td><code>u_meeting_description</code> field</td>
<td>icalendar</td>
<td><code>u_my_custom_table</code></td>
</tr>
</tbody>
</table>

12. Create an email template that defines what to include in the iCalendar invitation.

   **a.** Set the **Table** field to the custom table you created.

   **b.** In the **Message** text field, use the following format to define the iCalendar invitation:

   ```
BEGIN:VCALENDAR
PRODID:-//Service-now.com//Outlook 11.0 MIMEDIR//EN
VERSION:2.0
METHOD:REQUEST
BEGIN:VEVENT
ATTENDEE;ROLE=REQ-PARTICIPANT;RSVP=TRUE:MAILTO:${to}
DTSTART:${dtstart}
DTEND:${dtend}
UID:${sys_id}
DTSTAMP:${dtstamp}
DESCRIPTION:${description}
SUMMARY:${u_meeting_summary}
END:VEVENT
```
**Note:** Mail script is not allowed or processed in meeting invitation email templates.

### iCalendar invitation template details

<table>
<thead>
<tr>
<th>iCalendar template line</th>
<th>Required?</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>END:VCALENDAR</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

13. Create an email notification to trigger the iCalendar invitation and ensure the following fields are set accordingly:

- **Table**: Select the custom table.
- **Type**: Select *Meeting Invitation*.
- **Content type**: Select *Plain text* only.
- **Email template**: Select the template you created.

**Email layouts**

Create reusable content for the message body of email templates.

**Email layout overview**
Administrators can use email layouts to:

- Ensure all email notifications have a consistent layout such as always displaying a header, body, and footer.
- Display static content on all email notifications such as a company logo or a background.
- Declare inline styles available for use in the message body of an email template such as setting a text font, size, and color.
- Provide users with links to common response actions such as unsubscribe from a notification or manage notification preferences.

⚠️ **Note:** To display dynamic content such as mail scripts, use email templates. For more information, see Create an email template.

Email layouts insert HTML elements into the message body of email templates. Any style elements you define in the email layout are available to the email template. Email layouts support style sheets in these formats.

- Internal style sheets defined within a `<style>` element.
- Inline styles within a `style` attribute.

By default, the system includes several sample layouts administrators can use to create their own layouts. Administrators can create email layouts using an inline HTML editor or manually entering HTML code. The system stores email layout records in the Email Layout [sys_email_layout] table.

⚠️ **Note:** If there is no content in the notification from either the notification record or the template, the layout won’t be applied.

Create an email layout

Create an email layout to specify the HTML content you want to appear in the body of one or more email templates.

**Before you begin**

- Role required: admin
- Record required: email template record

**Procedure**

1. Navigate to **System Policy > Email > Layouts**.
   The system displays the list of existing email layouts.

2. Click **New**.
The system displays a blank email layout form.

3. Fill in the form.

### Email layout fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Specify a unique name for the record.</td>
</tr>
<tr>
<td>Application</td>
<td>Lists the parent application to which this record belongs.</td>
</tr>
<tr>
<td>Description</td>
<td>Specify an optional description of the layout.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select whether to display the Advanced Layout field.</td>
</tr>
<tr>
<td>Layout</td>
<td>Use the inline editor to add HTML elements. The system displays HTML from</td>
</tr>
<tr>
<td></td>
<td>this field in the body of any email template that uses the layout. Include</td>
</tr>
<tr>
<td></td>
<td>notification variables to show content from the related record. For more</td>
</tr>
<tr>
<td></td>
<td>information notification variables see Notification variables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The editor automatically formats any HTML code you enter from the</td>
</tr>
<tr>
<td></td>
<td>Source code view.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Use this field to manually enter HTML code. The system displays HTML from</td>
</tr>
<tr>
<td>Layout</td>
<td>this field in the body of any email template that uses the layout.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To enter text in this field, select Click here to disable</td>
</tr>
<tr>
<td></td>
<td>syntax highlighting and script formatting.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
   The system creates the email layout record.

5. Navigate to **System Policy > Email > Templates**.
   The system displays the list of existing email templates.

6. Select the email template which you want to use an email layout.
   The system displays the email template record.

7. In **Email layout**, select the email layout you want to use to format the body of email messages.

8. Click **Update**.
   The email template uses the selected email layout to format the body of email messages.
Email retention

You can archive and eventually destroy email messages that you no longer need or if your Email table is excessively large.

Email retention is available starting with the Helsinki release.

Email archive and destruction plugins

The email archiving and destruction feature uses the Data Archiving and Email Retention plugins. The Data Archiving plugin must be active to archive and destroy email records. The Email Retention plugin provides a set of rules that specify when the system archives and destroys email records.

Note: The Email Retention plugin also prevents the system from deleting watermarks, which are required for inbound email actions to continue to function.

The Email Retention plugin and associated archive and destroy rules are active by default on new instances. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. ServiceNow recommends that you review and approve these rules before activating them.

If your instance already has a process to manage email records, you do not need to activate the Email Retention plugin. If you want to replace your current process with Email Retention, be sure to deactivate the current process before activating the archive and destroy rules.

Archiving and destroying email records

Archiving means moving records from the Email [sys_email] table to the Archive Email [ar_sys_email] table when they exceed the archive rule time limit. Destroying means deleting records in the Archive Email table when they exceed the destroy rule time limit.

Note: When a destroy rule deletes email records, associated watermarks are not deleted. They are preserved to ensure that your inbound email actions continue to function.

Default archive and destroy rules

Email Retention provides these email archive rules:

- **Emails - Ignored and over 90 days old**: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.

- **Emails - Over a year old**: archives email message records that were created more than 365 days prior to the current date.
Email Retention also provides this email destroy rule:

- **Email Archive - Over a year old**: destroys email records that have been archived for more than 365 days prior to the current date.

With these default settings, your email messages are kept on the instance for a total of two years: one year in the Email table, and one year in the Email archive table. At the end of this period, the system deletes the expired email records from the Email archive table.

⚠️ **Note**: By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

### Compatibility with other record management implementations

If you are already using another method to manage email records, such as table cleaners, you do not have to use the Email Retention feature. To prevent unexpected record deletion, ServiceNow recommends that you avoid using multiple email management processes on the same instance at the same time.

⚠️ **Note**: For assistance replacing your existing record management implementation with Email Retention, contact your professional services or sales representative.

### Effects of archiving and deleting email records

Inbound email actions copy the body of an email to the work notes of the related record. If the inbound email record is later deleted, the work notes still contain a text copy of the email.

When the system sends an email message about a record, the activity formatter displays a **Sent Email** section with a link to the email message. If the system archives the email message, the activity formatter removes **Sent Email** section. When the system deletes the email message, it is no longer visible in the activity formatter nor the work notes.

⚠️ **Note**: Set the archive time length long enough so your users can access sent emails though the activity formatter.

Archiving email records changes the methods available to the system to identify inbound email as a reply. After archiving an email record, the system can no longer use the **In-Reply-To** field to match an incoming email to an email record. However, the system can still match incoming email to an existing record from a record number or watermark.
Activate the Email Retention plugin

The Email Retention plugin provides archive and destruction rules for email messages. It is active by default for new instances, but must be activated for upgrades.

About this task

Required role: admin
The Email Retention plugin requires these plugins:

• Data Archiving
• System Mailboxes

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   ✟ Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Archive email manually

You can archive email messages manually on demand instead of waiting for the instance to archive them based on a scheduled job.

Before you begin

Role required: admin

About this task

Email Retention provides these email archive rules:

• Emails - Ignored and over 90 days old: archives email message records that were created more than 90 days prior to the current date and are of type received-ignored or sent-ignored.
• Emails - Over a year old: archives email message records that were created more than 365 days prior to the current date.
You can manually archive email messages that meet these archive rules or any additional archive rules that you create.

ℹ️ Note: An archive record must be active for the instance to be able to process records with it.

Procedure
1. Navigate to System Archiving > Archive Rules.
2. Open the email archiving rule that you want to modify.
3. Click Recalculate Estimate to see how many records in the Email [sys_email] table are going to be archived. The estimate appears in the Record estimate field.
4. Click Run Archive Now.

ℹ️ Note: You can also archive related records.

Watermarks on notification emails
By default, the system generates a watermark label at the bottom of each notification email to allow matching incoming email to existing records. Each watermark includes a random 20-character string that makes it unique.

Starting with the Jakarta release, the system automatically generates randomized watermarks for notification emails in base systems. The random 20-character string reduces the possibility of a watermark being guessed or coincidentally matching the watermark of an email from another instance.

ℹ️ Note: If you are upgrading from a release before Jakarta, random watermark support is optional and requires the Random Watermark Support plugin to be activated.

Watermark format
The email watermark always begins with "Ref:" to identify the label as a watermark. After this identifier, the default label is 31 characters in length and consists of:

- Customizable prefix — The default prefix is MSG.
- Auto-numbered identifier — The numeric string identifying the source record, such as incident, problem, or change request.
- An underscore character followed by a random 20-character string
When inbound emails are processed, the system matches random watermarks to the appropriate source records.

**Watermark configuration**

Watermarks are always generated, but you can configure them to:

- Create a custom watermark prefix for each instance to prevent accidentally triggering events in the wrong instance.
- Have custom prefix characters after MSG
- Be hidden globally
- Be omitted from individual email messages

If watermarks are omitted from email notifications, inbound email actions might not work properly. Without a watermark, the system processes inbound email messages as described in **Criteria for matching email to inbound actions**.

⚠️ **Note**: Email clients that use the plain text version of the email still show the watermark.

**Create a custom watermark prefix for email notifications**

By default, email notifications use the watermark prefix **MSG**, but you can create a custom watermark prefix.

**Before you begin**

Role required: admin
About this task
Any email notifications that are forwarded from one instance to another might be more easily distinguished with different prefixes for each instance. To avoid unintentionally triggering events in the wrong instance, create a unique watermark prefix for each instance.

⚠️ Note: Do not use colons (:) in custom watermark prefixes. Colons are a reserved character and may cause the watermark to be ignored.

Procedure
1. Navigate to System Definition > Number Maintenance.
2. Open the MSG record in the Email Watermark [sys_watermark] table.
3. Enter the unique Prefix for this instance.
4. Click Update.

Results
Your custom watermark applies to all new email notifications. Email notifications that existed before you created a custom watermark keep the same watermarks as before.

Omit an email notification watermark
You can omit watermarks on email notifications if you do not want the instance to match the notification to an existing record.

Before you begin
Role required: admin
Procedure
1. Navigate to System Notification > Email > Notifications.
2. Select the email notification to update.
3. Click the Advanced View related link.
4. In the What it will contain section, select the Omit watermark check box.

What to do next
When incoming email does not contain a watermark, the system searches the subject line and message body for a record number. The system attempts to match any record number that it finds to an existing record. If there is a matching record number, the system updates the record with the values in the incoming email. To ensure that response email messages don't update records, remove the record number variable $\{number\}$ from the Subject and Message HTML fields.

Hide email watermarks globally
Rather than omitting watermarks, it is possible to hide watermarks on a global basis using HTML markup.

Before you begin
Role required: admin

About this task
Watermarks can only be hidden in the HTML message. The text version of the message, because it does not have markup allowing show/hide semantics, will always have the watermark.

Procedure
1. Navigate to sys_properties.list in the Application Navigator.
2. Create a new property named glide.email.watermark.visible and set it to false.
   This ensures that all watermarks are hidden on all email messages. This cannot be done on a per-email basis.

Email digests
An email digest is a single email that summarizes the activity for a selected notification and its target record during a specified time interval. You can
enable an email digest to reduce the number of notifications received when frequent updates to the associated record occur within a short time period.

Example email digest

```
Your incident INC0010015 has comments added - Digest

Service Management <it@example.com>
Monday, August 28, 2017 at 2:31 PM
To: fred.luddy@example.com

A copy of this message is on the server.

Ref: MSG0000320_ChV7spJr41TzAA8TNvnm6
```

⚠ Note: Email digests apply to email notifications only and are not supported for SMS messages, push notifications, and activity streams.

How email digests work

In new and upgraded instances, the Email digest (com.glide.email_digest) plugin is activated by default. Your instance must use the UI16 interface, since the email digest feature involves setting user notification preferences in the System Settings window.

Admins determine which notifications can be delivered in an email digest and configure the digest content for those notifications. Admins can also control the intervals for digests. An interval is the length of time that notifications are collected for the digest, such as daily or hourly.

Users enable the digest and select the digest interval for a specific notification in their notification preferences. The system accumulates the notifications that
normally would be sent during the specified interval and summarizes them in the email digest.

When processing an email digest, the system:

• Stores the digest configuration for the notification in the Notifications [sysevent_email_action] table.

• Temporarily stores the notification content accumulated for a user in the Email Digest Parts [sys_email_digest_part] table and the Email Digest Part Users [sys_email_digest_part_user] table.

• Runs an email digest job every 15 minutes to check when a digest is ready to be sent to a user.

The system uses the digest interval to determine when the digest is ready to be sent. The digest interval begins when the first notification is triggered for the user and stops at the end of the interval time.

• Sends the email digest to the user soon after the selected digest interval ends.

For example, if a user selects an hourly digest interval and the first notification is triggered at 08:15, the interval starts at 08:15. When the digest interval ends, the system generates the email digest approximately one hour later, at about 09:15 or shortly after, depending on when the email digest job ran.

Set up email digests

What to do — admins

1. Review the base system digest intervals and if needed, create or modify intervals.

   The base system digest intervals are one day (24 hours), one hour, every four hours, and seven days (weekly).

2. Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

   When determining which notifications are appropriate for an email digest, consider the notification content and intervals that your users can select. For example, digests that can be generated weekly might be better suited for notifications that are non-urgent.

What to do — all users

For a notification that can be delivered in an email digest, enable the email digest in your notification preferences (Notifications tab in
the System Settings window). You also specify the interval time that the notifications are accumulated.

**Next step**

If you are an admin, begin the digest setup process by reviewing the base system email digest intervals and create or modify the intervals.

**Create or modify email digest intervals**

Admins can create or modify the email digest intervals (length of time) during which activity for a selected notification is accumulated in an email digest. Users select a digest interval when they enable an email digest in their notification preferences.

**Before you begin**

Role required: admin

**About this task**

Before adding an email digest interval, review the base system digest intervals in the Digest Intervals [sys_email_digest_interval] table. You can modify intervals, including the base system intervals, which are one day (24 hours), one hour, every four hours, and seven days (weekly).

**Procedure**

1. Navigate to **System Notification > Email > Digest Intervals**.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an interval</td>
<td>Click <strong>New</strong>.</td>
</tr>
<tr>
<td>To modify an interval</td>
<td>Select the interval to be changed.</td>
</tr>
</tbody>
</table>

2. Enter the new or changed interval information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Interval name that describes the interval length of time, for example: Every 2 hours.</td>
</tr>
<tr>
<td>Interval</td>
<td>Length of the interval, either number of <strong>Days</strong> or <strong>Hours</strong> (hours, minutes, and seconds). The minimum time</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>length allowed is one hour, and the maximum time length allowed is seven days (one week).</td>
</tr>
</tbody>
</table>

3. If you created an interval, click **Submit**. Or, if you changed an interval, click **Update**. The system updates the Digest Intervals [sys_email_digest_interval] table with the new or modified interval. The digest interval is listed as an option in the notification preferences (**Notifications** tab in the System Settings window) when a user enables a digest for the notification. For example:

![](image)

4. To delete an interval, select the interval to be deleted in the Digest Intervals [sys_email_digest_interval] table and click **Delete**.

⚠️ **Note:** If the interval is in use, the system does not remove the interval.

**What to do next**
Determine the email notifications that can be delivered in a digest and configure the email digest content for those notifications.

**Related information**
Email digest properties
Configure email digests

Use the Notification form to create or modify the content of an email digest for a notification. You can also disable the email digest for a notification so that it is not available in the notification preferences of your users.

Before you begin
Role required: admin

About this task
When you create or update a notification, use the What Digest will contain tab of the Notification form to configure the email digest for the notification. After you define the digest content, the digest option for the notification is available in the notification settings of your users.

Procedure
1. Navigate to System Notification > Email > Notifications.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are creating a notification</td>
<td>Click New to open the Notification form.</td>
</tr>
<tr>
<td>If you are modifying a notification</td>
<td>Select the notification to be changed.</td>
</tr>
</tbody>
</table>

2. In the Notification form, select the Allow Digest check box to display the What Digest will contain tab and define the digest content.
3. Complete the fields in the **What Digest will contain** tab. The example shows the default view of the tab. The advanced view contains additional fields (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digest Template</td>
<td>If you want to reuse existing content, such as headers or footers, select an email template to add content to the email digest.</td>
</tr>
<tr>
<td>Digest Subject</td>
<td>Enter the subject line for the email digest. The subject can include variables from the <strong>Select variables</strong> column. If empty, the system uses the Subject value from the Email template. If you enter a value in this field, it overrides the template value.</td>
</tr>
<tr>
<td>Digest HTML</td>
<td>Enter the recurring content for the email digest. The digest content can include variables from the <strong>Select variables</strong> column.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Variables</td>
<td>Variables map to column names available from the notification table, its parent tables, and reference tables. Use variables to include values from a record in the table such as an incident short description or comments and work notes. To prevent adding extra <code>&lt;p&gt;</code> and <code>&lt;div&gt;</code> elements to your email digest, see the blog post Extra line spacing with paragraph tags in email client by a ServiceNow employee in the Now Community.</td>
</tr>
<tr>
<td>Digest Separator (HTML)</td>
<td>Use the line to separate each item summarized in the digest.</td>
</tr>
<tr>
<td>Digest From</td>
<td>Enter the email address to be used in the From field of the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email address must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Reply To</td>
<td>Enter the email address that you want people to use when replying to the email digest. For example, <a href="mailto:helpdesk@yourcompany.com">helpdesk@yourcompany.com</a>. The email must be in a valid format, otherwise a notification message appears near the field. Changing this address requires an advanced email setup such as enabling email forwarding.</td>
</tr>
<tr>
<td>Digest Text</td>
<td>Enter the recurring content of the email digest to send in plain text. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
<tr>
<td>Digest Separator (text)</td>
<td>[Optional] Use the dash character as a line to separate each item summarized in the digest. This field appears when you set the content type to HTML and plain text or Plain text only.</td>
</tr>
</tbody>
</table>

4. When you finish creating the notification, click Submit. Or, if you are done modifying the notification, click Update. The email Digest option is displayed in the notification settings of your users.
**Note:** The email recipients identified in the **Who will receive** tab will receive the digest after they **enable the digest** in their notification preferences. If the user is not a designated recipient for the notification, a digest is not generated even though the user may have the digest enabled for a notification. In this case, the user receives the actual notifications when they are generated.

5. [Optional]. To disable the email digest for a notification, unselect the **Allow Digest** check box and click **Update** when you finish your changes to the notification. When you disable the digest content, the digest option is also no longer available for the notification and is not listed in the notification preferences for your users. If a user previously enabled the digest option for the notification, the system stops collecting those notifications for a digest and does not generate the digest.

**Note:** If you disabled the digest and want to make the digest available again, select the **Allow Digest** check box. The system retains the previously saved digest content and displays it in the **What Digest will contain** tab.

**Related information**

- Email digests
- Create or modify email digest intervals
- Enable an email digest

**Enable an email digest**

In your notification preferences, you can enable an email digest that summarizes the activity for a selected notification during a specified time interval. The digest is a single email that you receive instead of the individual notifications generated during the specified interval.

**Before you begin**

Role required: none

**About this task**

The email digest option is available for a notification (in your notification preferences) only when your admin has configured the email digest content for that notification.

Consider enabling an email digest to reduce the number of emails you would normally receive when the target record for a notification is frequently updated within a short time period.
Procedure

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.

2. Select the notification:
   a. In the Notifications By Category section, click the row or right arrow (>) of the category that you want to view.
   b. In the list of notifications for the category, click the row or right arrow (>) next to the notification that you want to edit.

3. To enable or disable an email digest for the notification, if an email digest is available:
   a. Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b. If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.

   ![System Settings Tree](image)

   The digest interval begins with the first occurrence of notification activity. For example, if you select the daily (1 Day) interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day.

   Soon after the interval ends, the system sends the email digest to you instead of sending the individual notifications generated during the digest interval.
If you disabled the digest, the system immediately stops accumulating the notifications for the digest and does not send the email digest. The system resumes sending the notifications as they are generated.

Domain separation and Notifications
Domain separation is supported in the Notifications application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard
- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview
Domain separation is specifically supported in Notifications but not in email accounts. Notifications are not data-separated but they are process-separated. Notifications are also triggered by specific actions.

How domain separation works in Notifications
There are two basic components of domain separation and Notifications.
- Notifications are process-separated (not data-separated).
- Notifications are triggered in two main ways:
1. When a record is Inserted or Updated
   a. Notifications with matching conditions AND in the same domain as the
      inserted/updated record are processed.

2. When an event defined in the notification is triggered
   a. Events typically have a target record. For example, [incident.inserted]
      event references the incident record being inserted.
   b. When an event is fired, notifications configured for that event in the same
      domain as the event’s target record are processed.

Domains and email accounts

Domain separation is not supported in email accounts for these reasons:

1. Sending mail: There is only one SMTP sender per account. This prohibits
   providing domains for each account, and they are not configurable.

2. For receiving Inbound mail: You can set up multiple email accounts but
   cannot meaningfully set the domain of an inbound email action. Inbound
   Actions are processed in the domain of the user who sent the email. For
   example: User_A in Domain A sends an email to a ServiceNow email account
   which executes the “Create an incident” inbound email action. The resulting
   new incident created by the inbound action is in Domain A.

To learn more see Inbound email actions.

⚠️ Note: If the number of email accounts exceeds 20, reception of email
slows down.

Use case

• If an instance is using the Domain separation plugin and a new email
  notification is defined for a domain that has the same event as the notification
  on the global domain, the user receives two emails for the same event.

  Solution: Set the [sys_overrides] field on the notification that belongs to
  the domain so it overrides the setting on global. For more information, see
  Delegated administration.

Troubleshooting notification emails

Logs and diagnostics are provided to help determine whether notification emails are being sent and received successfully, what any issues are, and who receives the email.

Diagnostics help monitor the overall health of the system and troubleshoot general problems, such as not receiving any incoming mail. Logs help identify problems with individual emails, and different logs are useful for diagnosing different types of problems.

Log checking scenarios

<table>
<thead>
<tr>
<th>Problem</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Need to check whether an individual notification email was successfully sent</td>
<td>Check the <strong>Sent</strong> System Mailbox for that email. Also check the <strong>Failed</strong> System Mailbox for failure notifications.</td>
</tr>
<tr>
<td>Individual email failed</td>
<td>• Check the message log of the individual email.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td>Email not received by end user</td>
<td>• Check the <strong>Junk</strong> System Mailbox for notifications about returned emails. These emails also appear in the Emails log with a <strong>Type</strong> of received-ignored.</td>
</tr>
<tr>
<td></td>
<td>• Check the <strong>Error string</strong> field of the email record.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Some email servers do not return error strings</td>
</tr>
<tr>
<td></td>
<td>• Check the message log of the individual email for the reasons different recipients were included or excluded.</td>
</tr>
</tbody>
</table>
Troubleshooting resources

</tr>
<tr>
<td>Email from Outlook produces an empty Incident record containing an attachment named winmail.dat.</td>
<td>Configure the local Outlook client or Exchange server to not send Rich Text formatted (RTF) data to the instance.</td>
</tr>
</tbody>
</table>

Email diagnostics

The Diagnostics and Connection page provides information on the current state of your email configuration. This page includes status on email properties, scheduled jobs, and email account connections that affect how your instance receives and sends email.

Email diagnostic information can help you identify problems with inbound or outbound email. The following video shows different steps to determine why your instance is not receiving inbound emails. One of the steps uses email diagnostics to check the email connection status and email reader scheduled job.

Troubleshooting steps to take when a ServiceNow instance does not receive email

Navigate to the Diagnostics and Connection page from either of these modules:

- **System Mailboxes > Email Diagnostics**
- **System Diagnostics > Email Diagnostics**
Email Diagnostics and Connection page

For quick status on a field, point to the green check mark or red X icon. The check mark icon indicates that the item is operational or healthy, while the X icon indicates that the item is not operational or within the expected range.

### System email log and mailboxes

The system email log records all emails that the instance creates or receives. System mailboxes are filtered views of this log.

Every notification email that the instance creates or receives is recorded in an Email [sys_email] record. You can navigate to a log of these records at **System Logs > Emails**.

The System Mailboxes are filtered views of the Emails [sys_email] table. The instance assigns an email record to a system mailbox depending on the values of the **Type** and **State** fields. For more information, see **System mailboxes**.

The following fields can be included in the layout of the system log and any of the system mailboxes:
### Email log

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mailbox</td>
<td>The system mailbox that lists this email record. The instance sets the value of this field according to the values of the <strong>Type</strong> and <strong>State</strong> fields.</td>
</tr>
<tr>
<td>State</td>
<td>The current state of the email (Error, Ignored, Processed, or Ready).</td>
</tr>
<tr>
<td>Receive type</td>
<td>The type of inbound email (None, Forward, New, or Reply).</td>
</tr>
<tr>
<td>Type</td>
<td>The status of the email. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• received: The server received this email.</td>
</tr>
<tr>
<td></td>
<td>• received - ignored: The server received this email, but it was ignored by the instance for inbound email action purposes. Typically, these emails are either spam or auto-replies. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - failed: The server has attempted to send the email and failed. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ignored: The server skipped sending this email. Typically, this is for an email which was generated but lacked a recipient email address or is a duplicate email. See the Error String field for details.</td>
</tr>
<tr>
<td></td>
<td>• send - ready: The email is ready to be sent, but has not been sent out by the mail server. Typically, an email remains in this state for only a short time.</td>
</tr>
<tr>
<td></td>
<td>• sent: The email was sent by the instance without any errors or issues.</td>
</tr>
<tr>
<td>Target</td>
<td>A Document ID reference to the record if the email is generated by an insert, update, or delete of a particular record.</td>
</tr>
<tr>
<td>User</td>
<td>The name of the user, from the user record, of the instance from which the email notification was sent.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is a string field.</td>
</tr>
<tr>
<td>Notification Type</td>
<td>The type of notification. Choices are:</td>
</tr>
</tbody>
</table>
### Email log (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>UID</td>
<td>The unique ID of the email stored on the server.</td>
</tr>
<tr>
<td>Created</td>
<td>The date and time of the email activity for the locale of the machine running the instance.</td>
</tr>
<tr>
<td>Deleted</td>
<td>For inbound email, indicates whether the email was deleted from the email server.</td>
</tr>
<tr>
<td>Weight</td>
<td>The weight of the email, which determines the sending priority relative to other notifications on the same table.</td>
</tr>
<tr>
<td>Importance</td>
<td>An indication that the email was sent with a changed level of importance, such as Urgent.</td>
</tr>
<tr>
<td>Originating Event and Notification</td>
<td>For emails generated by notifications, an embedded list that stores the event and notification that created the email.</td>
</tr>
<tr>
<td>Subject</td>
<td>The email subject. For notifications, you create the subject text in System Notification &gt; Email &gt; Notifications.</td>
</tr>
<tr>
<td>Error String</td>
<td>The error string captured from the email server to determine why the email was not sent. This is logged only if the email is send-failed.</td>
</tr>
<tr>
<td>Recipients</td>
<td>The email addresses of the recipients.</td>
</tr>
<tr>
<td>Body</td>
<td>The body of the email, displayed in raw HTML markup. Use the related link Preview HTML Body to see the body text as rendered HTML.</td>
</tr>
<tr>
<td>Content type</td>
<td>The email content type.</td>
</tr>
<tr>
<td>Headers</td>
<td>Any headers embedded in the email.</td>
</tr>
</tbody>
</table>

### Message logs for individual emails

The email log entries for an individual notification email are accessible as a related list in the email record. The **Error string** field in the email record can provide additional information.
Every email record contains an Email Log related list. This list shows the Email Log Entry [syslog_email] records. For troubleshooting purposes, the most useful fields are probably Level and Message.

To diagnose problems with outbound emails, also examine the Error string field in the email record. However, not every receiving email server sends back an error string.

**Note:** The Email Log Entry record is available for only 7 days after the email record is created.

**Inbound actions on received emails**

Check these logs as the first step to diagnose issues with inbound actions. The logs show which inbound action did or did not apply and for what reason.

**Note:** If an inbound action did not update any field on the target record, the log indicates that the inbound action was skipped.

### Inbound email log

<table>
<thead>
<tr>
<th>Created</th>
<th>Level</th>
<th>Message</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>2018-12-17 07:57:24</td>
<td>Information</td>
<td>Processed 'Create Incident'; created incident dBCC0010002</td>
</tr>
</tbody>
</table>

**Reasons for including or excluding recipients**

For outbound notifications, the email system log provides reasons that recipients were included or excluded.
Each log entry corresponds to a reason for inclusion or exclusion. For example, all users who were excluded because they are inactive appear in a single log entry.

A series of system properties can be used to fine-tune the information to be logged. Two properties, `glide.notification.recipient.include_logging` and `glide.notification.recipient.exclude_logging`, control all recipient inclusion and exclusion logging. Several other properties allow you to tailor the information reported in the logs to meet your needs. All of the properties are enabled by default.

### Outbound email log

<table>
<thead>
<tr>
<th>Date</th>

</tr>
</tbody>
</table>

### Push notifications

In addition to sending email and SMS notifications, an instance can send push notifications to mobile devices.

A push notification is a text message that appears on a user’s mobile device to alert them about something important or to ask them to perform an action. Your instance supports push notifications.
An example push notification

Use push notifications to send messages to users when certain conditions are triggered on your instance, such as the assignment of an incident to the user. A push notification can even ask for a reply, and the instance can process the reply by acting on the related records. For example, you can have the instance send an approval request for a Change to a user. You can let the user approve or deny the Change by clicking a response button on the push notification. The user's response can then update the status of the Change record.

You can set up push notifications in a similar manner to email and SMS notifications. Determine:

• who to send the notification to
• when it should be sent
• what it should contain

The ServiceNow mobile app is available as ServiceNow Classic and as ServiceNow Agent. By default, ServiceNow Classic supports push notifications, but you can also develop your own push application and configure your instance to send push notifications to it. For more information on setting up push notifications in ServiceNow Agent, go to Mobile push notifications.
Push notification setup
Push notification setup differs depending on the mobile or push application that you want your users to use. For an overview, see:

- Push notification setup with the ServiceNow Classic mobile app

  Note: Push notifications for on-premise instances are not supported.

- Push notification setup with a custom push application for ServiceNow Classic mobile apps. If you create your own application, you must understand how push notifications and the Apple Push Notification Service system work. For more information, see the APNs Overview in the Local and Remote Notification Programming Guide for Apple developers.

Important: Apple does not guarantee delivery of all push notifications. Review the Quality of Service (QoS) information in the Local and Remote Notification Programming Guide for Apple developers.

Push notification system
The push notification system involves several key elements that manage the delivery of push messages and push notification responses.

Customer instance
Your ServiceNow instance.

Push proxy
An instance that collects all push notifications that go to the ServiceNow Classic mobile application and forwards them to the ServiceNow applications for Apple iOS or Android. If you create a custom push application, you do not use the push proxy.

Push provider
The provider of push messages, which is the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service, for the ServiceNow Classic mobile app or custom mobile apps.

Push application on a mobile device
The application, such as the ServiceNow Classic mobile application. You can also build and customize your own push application.

Push notification process
The push notification process is as follows:
1. Activity on the instance triggers a push notification.

2. The instance looks for who to send the notification to and checks the user notification preferences to find their push device settings.

3. The instance sends the push notification to the push notification service, either the Apple Push Notification service (APNs) or Firebase Cloud Messaging (FCM) service. If you are using the ServiceNow Classic mobile app, the instance sends the notification through a push proxy instance, which then forwards the notification to the APNs or FCM service.

4. The push notification service sends the notification to the user’s push application. When the instance sends the notification to the push notification service, it includes message content along with the instance name and ID. This information ensures that a response to the notification is sent back to the correct instance. If the user can reply to the notification, such as sending an approval to a change request, the response is sent via REST message back to the instance.

5. The instance identifies a script to run to handle the response.

6. The script performs an action on the instance, such as marking a change request approved. If there is invalid JSON or if the script fails, an error response is sent back to the device.

**Push notification with the ServiceNow Classic mobile app**

**Push notification responses**

With custom push applications, you can have your users act on records in the instance by responding to a push notification.

The actions that they can take are defined in a script that you associate with the notification message. The response is sent to the instance in this format:

```
https://{instance_name}/api/now/v1/push/{application Name}/action/{action}
```

The application name is the push application the user is using. The application name must match the application name in the Push Application [sys_push_application] table. The action is the Sys ID of the action in the Push Notifications Actions [sys_push_notif_act_script] table.

**Activate push notifications**

Several plugins must be activated to use push notifications. If you have the Mobile UI (com.glide.ui.m) plugin active, push notification plugins are automatically activated.
Before you begin
Role required: admin

About this task
Ensure the following plugins are active on your instance:

- Push Notification: Provides the necessary components and REST APIs to send push notifications to mobile devices.
- Notification System Push Addon: Adds support for push notifications to the existing notification system.
- Push Feedback: Handles feedback from Apple on which devices are no longer valid so they do not keep receiving push notifications.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.
Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click **Submit**.

Installed with push notifications

Several types of components are installed with the push notifications plugins.

Tables installed with push notifications

These tables are installed with push notifications.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Push Applications [sys_push_application]</td>
<td>Push applications registered to the instance to receive push messages.</td>
</tr>
<tr>
<td>Table name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push Default Registrations [sys_push_notif_default_reg]</td>
<td>Contains all the notifications users are automatically subscribed to for a given push application. You can add notifications to this table on the Push Default Registrations related list on the Push Application form.</td>
</tr>
<tr>
<td>Push Feedbacks [sys_push_feedback]</td>
<td>Feedback from the APNs that tells the instance which push devices can no longer receive push messages. The feedback is handled either on the same instance where your notifications are triggered, or on a central instance that uses a REST call to tell your instance which push applications to deactivate.</td>
</tr>
<tr>
<td>Push Message Attribute Definitions [sys_push_notif_msg_attr_def]</td>
<td>The attribute definitions used for push message content specification.</td>
</tr>
<tr>
<td>Push Message Attribute Values [sys_push_notif_msg_attr_val]</td>
<td>The values associated with push messages.</td>
</tr>
<tr>
<td>Push Notifications [sys_push_notification]</td>
<td>The push notifications that the instance attempted to send to users.</td>
</tr>
<tr>
<td>Push Notification Actions [sys_push_notif_act_script]</td>
<td>The action scripts that the instance uses in response to an actionable push message.</td>
</tr>
<tr>
<td>Push Notification Installations [sys_push_notif_app_install]</td>
<td>The devices with push apps where users agreed to receive push notifications. This table lists the records by the token for the push app. The instance uses this information to know which push device and app to send notifications to. Records are created in this table when a user logs on an instance with the push app. The Mobile Devices [sys_mobile_devices] table, which is installed with the Mobile UI plugin, contains all the user devices that logged in to the instance with the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Notification Messages [sys_push_notif_msg]</td>
<td>Messages customized for push notifications. These messages can be associated with a notification.</td>
</tr>
<tr>
<td>Table name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Push Notification Message Contents [sys_pushnotifmsgcontent]</td>
<td>The entire content, including JSON, for push messages.</td>
</tr>
<tr>
<td>Push Platforms [sys_push_platform]</td>
<td>The platforms that are supported for push notifications, and the maximum payload size.</td>
</tr>
</tbody>
</table>

**Business rules installed with push notifications**

These business rules are installed with push notifications.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Device and Subscriptions</td>
<td>Push Installation [sys_push_notification_installation]</td>
<td>Automatically creates a notification device on a user’s notification preferences when the user registers a mobile application with the instance.</td>
</tr>
</tbody>
</table>

**Outbound REST messages installed with push notifications**

These outbound REST messages are installed with push notifications.

<table>
<thead>
<tr>
<th>REST message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNowMobileApp Push</td>
<td>The REST message that you can use with your custom iOS mobile app.</td>
</tr>
</tbody>
</table>

**Roles installed with push notifications**

These roles are installed with push notifications.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>push_admin</td>
<td>Can create and modify push notifications.</td>
</tr>
</tbody>
</table>

**Push components installed with push notifications**

These components are installed with push notifications.
### Push applications installed with push notifications

<table>
<thead>
<tr>
<th>Push application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNowPushApp</td>
<td>The push application record for the ServiceNow ServiceNow Classic mobile application.</td>
</tr>
</tbody>
</table>

**Note:** The ServiceNow Classic mobile app automatically subscribes users to several push notifications. You can see the list of these notifications in the Push Default Registrations related list on the ServiceNowPushApp application record.

### Message content installed with push notifications

<table>
<thead>
<tr>
<th>Message content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessageContent</td>
<td>The payload for ServiceNow connect messages.</td>
</tr>
<tr>
<td>Generic Approval (Background)</td>
<td>The payload that provides an approval and rejection option to the user receiving the push message.</td>
</tr>
<tr>
<td>Generic Approval (Foreground)</td>
<td>The payload that provides an approval and rejection option to the user receiving the push message.</td>
</tr>
<tr>
<td>Generic Record Payload</td>
<td>A generic payload that you can use to send push messages to users.</td>
</tr>
</tbody>
</table>

### Push notification actions installed with push notifications

<table>
<thead>
<tr>
<th>Push notification action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Approve</td>
<td>Allows an administrator to approve a request.</td>
</tr>
<tr>
<td>Approval - Reject</td>
<td>Allows an administrator to reject a request.</td>
</tr>
</tbody>
</table>

### Push notifications installed with push notifications

<table>
<thead>
<tr>
<th>Push notifications</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectMessagePushNotification</td>
<td>Live Feed Message [live_message]</td>
<td>Sends a push notification when a new live feed message</td>
</tr>
</tbody>
</table>
Push notification properties

Push notifications provides several properties to customize the setup.

Add these properties to the System Properties [sys_properties] table.

**glide.push.apns.version**

Controls which version of the Apple Push Notification service (APNs) to use in your instance. You can use APNs version 1 or 2. The system uses APNs version 2 by default. To use APNs version 1 instead, set the value to 1.

- Type: integer
- Default value: 2

**glide.push.debug**

Creates entries in the system log for push notification errors.

- Type: true | false
- Default value: false

**glide.push.enabled**

Enables or disables push notifications.

- Type: true | false
- Default value: true

**glide.push.feedback.debug**

Creates entries in the system log for feedback sent by the APNs for custom iOS push applications.

- Type: true | false
- Default value: false

**glide.push.notification.ttl_seconds**

Specifies the number of seconds after which a queued push notification expires. After a push notification is triggered, it is queued and finally processed by a scheduled job. If the time the notification sits in the queue exceeds this value, the notification is not sent. Check the Push Notifications log for more information.

- Type: integer
- Default value: 21600
Push notification setup with the ServiceNow Classic mobile app

The ServiceNow Classic mobile application automatically enables push notifications and configures mobile devices for push notifications when users initially log in to the instance with ServiceNow Classic.

Note: Push notifications with the ServiceNow Classic mobile application are not supported in on-premise instances.

Setting up push notifications involves both the system administrator and users.

• Admin creates or updates push notifications for the ServiceNow Classic mobile app. The admin does not need to set up the mobile devices for users nor update their user preferences for receiving push notifications.

• Users install the ServiceNow Classic mobile app on their iOS or Android mobile devices and set their preferences for receiving notifications on the ServiceNow Classic mobile app.

What to do — admins

Admins create push notifications, similar to setting up email notifications. A push notification has two main parts: the push message and the notification, which includes the push message.

Note: The push message and notification must be for the same table.

Create the push message
Before creating a push notification, create the push message with the actual message content (JSON payload) to be included in the push notification.

**Create the push notification that includes the push message**

Create the push notification that includes the push message and message content. A push notification specifically sends the push message. You can update a standard platform notification and use it as a push notification that includes the push message.

**Add the new push notification to the Push Default Registration table**

To ensure that a new push notification is included and enabled in the notification preferences of your users, register a new push notification in the Push Default Registration table. The notification is listed in the notification preferences of your users the next time that they log in to the ServiceNow Classic mobile app.

**What to do — ServiceNow Classic mobile app users**

**Download the ServiceNow Classic mobile app**

Install the ServiceNow Classic mobile app on an iOS or Android mobile device.

**Agree to accept push notifications**

After installing the ServiceNow Classic mobile app, users are asked to accept push notifications. When the instance receives the push notification acceptance message from a user, it creates a record in the Push Notification Installations [sys_push_notif_app_install] table. This record is what the instance uses to identify the device + mobile application combination necessary to identify a push notification recipient.

The device then performs the following actions:

- Obtains a token that identifies the device.
- Triggers the creation of the device in the user notification preferences.

**Log in to the company instance from the ServiceNow Classic mobile app**

Logging in automatically subscribes users to the push-specific notifications registered in the Push Default Registration table.

**Update preferences for receiving notifications on the ServiceNow Classic mobile app**
Users can **enable or disable notifications** through **Notification Settings** in the ServiceNow Classic mobile app. They can set additional notification preferences, such as conditions or filters that affect notification delivery, by using the System Settings window on a desktop or mobile browser. For details, see Setting notification preferences in UI16.

**Next steps**

If you are an admin, review the base system notifications and determine if new **push message content** and **push notifications** are needed.

**Create a push message**

Before you create a push notification, create the push message with the actual message content for the notification.

**Before you begin**

The **Push notification plugin** must be active. The plugin is active by default.

Role required: admin

**About this task**

The push message and notification must be for the same table.

**Procedure**

1. Navigate to **System Notification > Push > Push Messages** and click **New**.
2. Fill out the fields on the form (see table).
3. Click **Submit**.

**Push Notification Message form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message.</td>
</tr>
<tr>
<td>Push App</td>
<td>Select the ServiceNow Classic mobile application.</td>
</tr>
<tr>
<td>Push Message Content</td>
<td>Select the JSON content to be included in the push notification payload.</td>
</tr>
</tbody>
</table>

**Note:** For details on defining payloads that control push notification behavior, see KB0622333. For example, you can specify predefined button pairs (Yes/No, Approve/Reject, Accept/Decline) as part of the push message content.
### Field | Description
--- | ---
Message | Enter the message. You can add variables just as you would for other notifications. Any message you enter here overrides the message in the notification.

**Related list**

| Push Message Attribute Values | Optional. Select the attributes that apply to this notification. For details, see [Create an attribute value or action for a push message](#). |

**What to do next**

*Set up the push notification* that contains the message created or update an existing push notification to use the push message.

### Create a notification using a push message

Email administrators can create a notification that specifically sends a push notification.

**Before you begin**

Configure the push message before performing these steps.

Role required: admin

**About this task**

You can associate a push message with a standard notification. A push message specifies the text the system sends as part of the push notification to the mobile device.

**Procedure**

1. Navigate to *System Notification > Create Push Notification*.
2. Fill out the notification form as necessary (see [Create an email notification](#) for descriptions of the form fields.
3. Click the *What it will contain* tab.
4. Next to *Push Messages*, click the lock icon and select a push message.

   **Note:** The push message and notification must be for the same table.

5. If you want this notification to be sent only as a push notification and not as any other type of notification, select *Push Message Only*.
6. Click **Submit**.

   If the notification fails, the user is not notified. If the message fails to send because it exceeds the maximum payload, the instance logs the failure in the System Log.

**What to do next**

Add the push notification to the Push Defaults Registrations table so that the push notification is listed in the notification preferences for users. Users can then select which notifications they want to receive for the ServiceNow Classic mobile app.

**Add a push notification to the Push Default Registrations table**

After you create a new push notification, add it to the Push Default Registration table. Push notifications registered in this table are listed and automatically enabled in the notification settings of your ServiceNow Classic mobile app users.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Notification > Push > Push Application**.

2. Select the **ServiceNow Classic Mobile Application**.

3. In the Push Application form for the ServiceNow Classic mobile app, select the **Push Default Registrations** tab and click **New**.
4. In the Push Default Registration New record, select the notification to be registered.

5. Click **Submit**.

   The next time that users log in to their instance, the new push notification is included in their list of notifications.

---

**Push notification setup with a custom push application for ServiceNow Classic mobile apps**

If you are using your own custom mobile or push application, you must configure your app for use and set up the push contents.

Setting up a push notification infrastructure that uses a custom push app involves a push admin (also called push app developer or mobile app developer) and system administrator. When push admins create a customized push app, they also configure the app, its push message content (payload generators), and optional attributes, such as push action scripts. The admin creates and updates the push notifications for the custom push app. After users install the custom push app and initially log in to their instance from their mobile device, the system automatically creates a device (channel) for the custom app.
Note: These instructions are intended for users who develop their own customized push application. You do not need to configure the ServiceNow Classic mobile push application.

Note: This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications.

Before you begin
Complete the steps in Activate push notifications.
Assign the push_admin role to your organization’s mobile app developer.

What to do — push admin
Configure push notifications for your custom push app. This process differs for iOS and Android devices.

1. (iOS only) Upload a push certificate to your instance
   Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

2. Create a push application record for your custom app
   Register your customized mobile application with your instance to receive push notifications for the application. The instance uses this push application record to identify the device + push application combination necessary to determine a push notification recipient.
3. Create push message content

Create a JSON content payload for different types of push notifications. The content determines how a push notification appears on the push application, and whether the user can send a message in response to the push notification. The push admin can create attribute definitions that specify a default push action script or string, for use in the push message content.

4. (Optional) Create a push message attribute definition

Push message attribute definitions allow you to create reusable properties for push message content specification.

5. (Optional) Create an attribute value or action for a push message

You can create attribute values that override the default attribute definitions used in the push message content.

6. (Optional) Create a push action

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

What to do — admin

Create the push messages and push notifications

The administrator creates the push messages, sets up push notifications for the custom push app, and if desired, the content.

Next steps

Use the Push Installation API to opt users in to receive push notifications. For more information, see Push Installation API.

Upload a push certificate to your instance

Upload a push certificate to your instance so that you can use it later to connect your iOS device to the push notification system.

Before you begin

Using your Apple developer environment, create a push certificate and convert it to a PKCS (.p12) file. For details on generating the .p12 file with the required certificate and private key, see Enable push notifications and Communicate with APNs using a TLS certificate in the Apple documentation.
Note: Ensure that your certificate is a push certificate and not a developer certificate. Also, if you're developing an app for testing purposes, ensure that you create a Sandbox certificate. If you're developing an app that you plan to launch in the Apple App Store, ensure that you create a Production certificate.

Role required: push_admin or admin

Note: This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

About this task
After you create a PKCS (.p12) file that contains the iPhone developer certificate and the private key used to sign the certificate, you need to upload the file to your instance. The system uses the information in the PKCS file to communicate with the APNs.

Procedure
1. Navigate to System Definition > Certificates, and then click New.
2. On the form, fill in the following fields:
   • Name: Enter a certificate name.
   • Type: Select PKCS12 Key Store.
3. Attach the PKCS (.p12) file to the record.
4. Click Submit.

What to do next
Create a push application record for your custom app

Create a push application record for your custom app
Register your customized mobile application with your instance to receive push notifications for the application.

Before you begin
Complete the following:
1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance

Role required: admin or push_admin
Note: This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications.

About this task
Push notifications are application-specific: They are sent to one type of mobile application, regardless of how many users have this application installed. If you develop your own mobile application, you must configure it for use by creating a record for it in the Push Application [sys_push_application] table. By default, ServiceNow mobile applications are automatically set up and ready to use.

Procedure
1. Navigate to System Notification > Push > Push Application, and then click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name of the push application.</td>
</tr>
<tr>
<td>Name</td>
<td>Database name of the push application. Enter a name that doesn't include spaces.</td>
</tr>
<tr>
<td>Push</td>
<td>Type of push service to enable for the application. Because you're setting up a custom push app, select Direct.</td>
</tr>
<tr>
<td>Feedback</td>
<td>Type of push feedback to use for the application. Because custom push apps don't receive push feedback, select None.</td>
</tr>
<tr>
<td>Apple</td>
<td></td>
</tr>
<tr>
<td>Certificate</td>
<td>The X.509 certificate that you created on the Apple notifications portal. The certificate enables a device to talk to the APNs.</td>
</tr>
<tr>
<td>Sandbox Certificate</td>
<td>Sandbox certificate that you created on the Apple notifications portal. The certificate enable a device to talk to the APNs.</td>
</tr>
<tr>
<td>APNS Bundle Id</td>
<td>Bundle ID included in the certificate that you created on the Apple notifications portal. The system populates this field automatically after you specify a certificate.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>API key</td>
<td>FCM API key you obtained from Google for the Android push notification.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**What to do next**

Create push message content that contains the JSON content in the push notification payload.

In the Push Default Registrations related list, you can select the notifications that you want automatically subscribed to users who use this application. Users are subscribed to only active notifications.

**Create push message content**

Push message content specifies additional JSON content in the push notification payload that is sent to the push provider.

**Before you begin**

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**

You must know how to use JSON with push messages.

Role required: admin or push_admin

**Note:** This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at [Mobile push notifications](#).

**About this task**

Push message content defines the style of push notification that can be sent out for your custom app. You can add custom content, such as a picture, icons, or action buttons for the user to respond to the notification. Use the following variables in the script:

- `current`: properties of the current record.
- `message`: push message sent as the body of the entire push content.
- `attributes`: object of the push message attributes that you define.
Procedure

1. Navigate to **System Notification > Push > Push Message Content**.
2. In the Push Notification Message Contents table, click **New**.
3. Fill out the fields on the Push Notifications Message Content form (see table).
4. Click **Submit**.

### Notification Message form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the message content.</td>
</tr>
<tr>
<td>Push app</td>
<td>The push application the content can be used with.</td>
</tr>
<tr>
<td>Push Message Generation</td>
<td>Enter a script that determines the message content. See the example scripts.</td>
</tr>
<tr>
<td>Related list</td>
<td></td>
</tr>
<tr>
<td>Push Message Attribute Definitions</td>
<td>Select the attributes that apply to this notification. Attributes can be a value or an action. These attributes are used as default values for the content items you create in the content script. However, any attributes you create with the push message can override these attributes. See Create a push message attribute definition for information on creating attributes.</td>
</tr>
</tbody>
</table>
Example:
The following is an example of a content record that creates a two-button layout, one to approve something, such as a change request, and one to decline it.

```javascript
var json = {
  "table": current.getTableName(),
  "sys_id": current.sys_id,
  "template": {
    "type": "2 button",
    "button1": {
      "title": "Approve",
      "action": attributes.button_action,
      "parameters": {
        "response": "approve"
      }
    },
    "button2": {
      "title": "Decline",
      "action": attributes.button_action,
      "parameters": {
        "response": "decline"
      }
    }
  }
};
```

What to do next

Define a push message attribute to specify a default push action script or string that you can use in the push message content.

Create a push message attribute definition

Push message attribute definitions allow you to create reusable properties for push message content specification.

Before you begin

1. Activate push notifications
2. (iOS only) Upload a push certificate to your instance
3. Create a push application record for your custom app
4. Create push message content
Role required: admin or push_admin

Note: This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications.

About this task
Use an attribute definition to specify a default push action script or string that you can then use in the push message content.

You can override these attributes by creating any push message attribute values.

Procedure
2. Select a content record or script record.
3. In the Push Message Attribute Definitions related list, click New.
4. Fill out the fields on the form (see table).
5. Click Submit.

Push Message Attribute Definition form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute Name</td>
<td>Enter a descriptive name for the layout.</td>
</tr>
<tr>
<td>Attribute Type</td>
<td>Select the type of attribute:</td>
</tr>
<tr>
<td></td>
<td>• Action: An action to take on the instance, as defined by a script.</td>
</tr>
<tr>
<td></td>
<td>• String: An arbitrary string to send as part of the message content.</td>
</tr>
<tr>
<td></td>
<td>The string can specify items like a button label in the message.</td>
</tr>
<tr>
<td>Default Script</td>
<td>Select the mobile action script that tells the instance what to do when it</td>
</tr>
<tr>
<td></td>
<td>receives a response from the push notification. This option appears if you</td>
</tr>
<tr>
<td></td>
<td>select Action for the Type.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default Value</td>
<td>Specify an arbitrary string value to be placed in the attribute that is used by the message content. For example, the string could specify a button label. This option appears if you select <strong>String</strong> for the <strong>Type</strong>.</td>
</tr>
</tbody>
</table>

**What to do next**

If you want to override default attribute definitions, see Create an attribute value or action for a push message.

**Create an attribute value or action for a push message**

Attribute values are associated with push messages to provide a way for the message to include certain types of information in the push notification.

**Before you begin**

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**
4. **Create push message content**
5. **Create a push message attribute definition**

Role required: admin or push_admin

⚠️ **Note:** This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications

**About this task**

These push message attribute values override values that you set in an attribute definition on the Push Content form.

**Procedure**

1. Navigate to **System Notification > Push > Push Messages**.
2. Select a message.
3. In the Push Message Attribute Values related list, click **New**.
4. Fill out the fields on the form (see table).
5. Click **Submit**.
Push Message Attribute Values form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select a push message attribute definition.</td>
</tr>
<tr>
<td>Value/Action</td>
<td>Enter the value for the attribute or select the push action. This field</td>
</tr>
<tr>
<td></td>
<td>changes to Value or Action depending on the type of attribute you select</td>
</tr>
<tr>
<td></td>
<td>in the Attribute field.</td>
</tr>
</tbody>
</table>

**What to do next**

(Optional) **Create a push action** to perform an action on the instance.

**Create a push action**

A push action is a server-side script that runs when the instance receives a response to an actionable push message.

**Before you begin**

Complete the following:

1. **Activate push notifications**
2. (iOS only) **Upload a push certificate to your instance**
3. **Create a push application record for your custom app**
4. **Create push message content**
5. **Create a push message attribute definition**
6. **Create an attribute value or action for a push message**

Role required: admin or push_admin
Note: This process describes configuration used in the ServiceNow Classic mobile app. Push Notification configuration for the current ServiceNow mobile UI can be found at Mobile push notifications.

About this task
Create a push action to perform an action on the instance. For example, you might have an actionable push message that lets the user approve a change request. The action that handles the response should update the Approval field on the relevant Change Request record.

You can use global variables or, optionally, current variables and parameters passed through the JSON content.

Procedure
2. Fill in the form fields (see table).
3. Click Submit.

<table>
<thead>
<tr>
<th>Push Notification Action form fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Script</td>
</tr>
</tbody>
</table>

Requeue failed push notification messages
Push notification delivery might fail for various reasons. You can view which messages failed and requeue them to be sent out if necessary.

Before you begin
Role required: admin

About this task

Note: There is no way for the instance to guarantee or confirm push message delivery. For more information on how Apple handles push notifications, see the Local and Remote Notification Programming Guide for Apple developers.

Messages can also fail to send for several reasons, such as a large message queue or other issue with the instance. You can use a system property to control how long the instance queues a push notification after it is triggered.
Push notification message payload size is limited by provider:

- Apple iOS: 2,048 bytes
- Google: 4,096 bytes

Your instance does not send push messages that exceed this limitation. System logs save any failed messages. For details on Apple payload limitations, see the Local and Remote Notification Programming Guide for Apple developers.

Procedure

1. Navigate to System Logs > Push Notifications.
   By default, the messages that were created today appear. You can change the filter if necessary. The Type column can have these values:
   - failure: The message could not be sent.
   - pending: The message is queued for processing.
   - success: The message was successfully sent, although not necessarily received by the mobile device.

2. Put any failed messages back into the queue to be resent by selecting the check boxes next to the failed messages, and then selecting Re-queue failed push notifications from the choice list.

3. If some push notifications continue to fail, consider increasing the value in the glide.push.notification.ttl_seconds property. See Push notification properties for more information.

Push notification retention

You can archive and eventually destroy push notifications that you no longer need or if your Push Notification table is excessively large.

Push notification retention is available starting with the Jakarta release.

Push notification archive and destruction plugins

The push notification archiving and destruction feature uses the Data Archiving and Push Retention plugins. The Data Archiving plugin must be active to archive and destroy push notification records. The Push Retention plugin provides a set of rules that specify when the system archives and destroys push notification records.

In new instances, the Push Retention plugin and associated archive and destroy rules are active by default. On upgraded instances, you must manually activate both the plugin and the archive and destroy rules. Be sure to review and approve the archive and destroy rules before activating them.
If your instance already has a process for managing push notification records, you do not need to activate the Push Retention plugin. If you want to replace your current process with Push Retention, be sure to deactivate the current process before activating the archive and destroy rules.

**Archiving and destroying push notification records**

Archiving means moving records from the Push Notification [sys_push_notification] table to the Push Notification Archive [ar_sys_push_notification] table when they exceed the archive rule time limit. Destroying means deleting records in the Push Notification Archive table when they exceed the destroy rule time limit.

**Default archive and destroy rules**

Push retention provides the following push archive rules:

- **Push Notification - Over a year old**: archives push notification records that were created more than 365 days prior to the current date.
- **Push Notification Archive - Over a year old**: destroys push notification records that have been archived for more than 365 days prior to the current date.

With these default settings, your messages are kept on the instance for a total of two years: one year in the Push Notification table, and one year in the Push Notification Archive table. At the end of the period, the system deletes the expired notification records from the Push Notification Archive table.

**Note:** By default these rules are active on new instances and inactive on upgrades. The system runs archive and destroy rules when you activate them.

**Compatibility with other record management implementations**

If you are already using another method for managing push notification records, such as table cleaners, you do not have to use the Push Retention feature. To prevent unexpected record deletion, avoid using multiple push notification management processes on the same instance at the same time.

**Note:** For assistance replacing your existing record management implementation with push notification retention, contact your professional services or sales representative.

**Activate the Push Retention plugin**

The Push Retention plugin (com.glide.push_retention) provides the retention policy for push notifications, so that you can specify when the system archives and destroys push notification records.
Before you begin
Role required: admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   🔄 Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

List of plugins (Rome)

Archive push notifications manually
You can manually archive push notifications on demand instead of waiting for the instance to archive them based on a scheduled job.

Before you begin
Role required: admin

About this task
Push retention provides these push notification archive rules:

• Push Notification - Over a year old: archives push notification records that were created more than 365 days prior to the current date.

• Push Notification Archive - Over a year old: destroys push notification records that have been archived for more than 365 days prior to the current date.

You can manually archive push notification messages that meet the default archive and destroy rules or any additional archive rules that you create.
Procedure

1. Navigate to System Archiving > Archive Rules.
2. Open the push notification archiving rule, for example Push Notification - Over a year old
3. Click Recalculate Estimate to see how many records in the Push Notification [sys_push_notification] table are going to be archived. The estimate appears in the Record estimate field.
4. Click Run Archive Now.

Subscription-based notifications

Subscription-based notifications enable users to proactively subscribe to items that interest them and unsubscribe from messages that are not mandatory.

Users can also specify additional notification channels that each of their notifications can be configured to use.

Before users can manage the notifications that are sent to them, administrators must create email notifications to which users can subscribe. Administrators can also make subscription-based notifications mandatory so users cannot unsubscribe to them. Then users can subscribe or unsubscribe to the notifications, and add schedules and filters to the subscription to limit the notifications that can be received.

Notifications that administrators mark as subscribable are automatically available in user notification settings. Users are limited to one subscription per notification.

Administrators should create subscription-based notifications when they do not want to specify users for a notification and want to let users proactively subscribe to the notification.

⚠️ Note: Subscription-based notifications are not domain aware and cannot support domain-specific settings.

Subscriptions 2.0 plugin

The Subscription Based Notifications 2.0 plugin must be active to use subscribable notifications. This plugin is active by default on all new and upgraded instances.

The plugin installs the Notification Subscription [sys_notif_subscription] table, which holds user subscriptions to all notifications.
Subscriptions and notification preferences

Users can subscribe to notifications available to them through their notification preferences. In the UI16 interface, all users can set and modify their notification preferences through the Notifications tab of the System Settings window. In the UI15 interface and earlier, admins and users set their notification preferences through the Notification Preferences link in the User form.

Setting notification preferences in UI16

You can set your own notification preferences, including personal subscriptions and channels for receiving them. All users can set these preferences through the Notifications tab of the System Settings window.

With the Notifications tab, you can:

• Search for a specific notification in the list of your notifications.
• Use a global switch to enable or disable all your notifications.
• Enable or disable a particular channel for receiving notifications, as well as create, edit, or delete channels.
• Control the notifications that you receive and apply conditions to restrict notification delivery.
• Create personal notifications, which are subscriptions to notifications that are important to you.

Comparison between notification preferences in UI16 and earlier interfaces

In new and upgraded instances that use the UI16 interface, the System Settings window is the central location for managing your notification preferences. The Notification Preference User Interface (com.glide.notification.preference.ui) plugin is activated by default.
Notification preferences in UI16 and UI15

In UI15 and earlier interfaces:

- Users set notification preferences through the Notification Preferences link in the User form (Self service > My Notification Preferences).
- Admins created user devices and set notification preferences for users through the Notification Preferences link in the User form, accessed through the User Administration module (User Administration > Users).

**Note:** Admins can revert to the UI15 notification preferences interface by setting the `glide.notification.preference.UI.enabled` property to false.

Manage your notification preferences in UI16

To access your notification preferences, click the gear icon (⚙️) in the banner frame, and in the System Settings window, click the Notifications tab. You can also access the System Settings by navigating to Self Service > My Notification Preferences.
In the **Notifications** tab, use the following settings to manage your notifications:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Search**            | Search bar for finding notifications. To find a notification:  
  • Enter the name of the notification you are searching for. When you type the first three characters, the system automatically returns a list of notifications matching the characters entered.  
  • Enter two asterisks to return a list of all notifications in alphabetic order (the notifications are not organized by category). |
| **Allow notifications** | Global switch for enabling or disabling all notifications. |
| **Notification channels** | List of your channels for receiving notifications. Use this section to:  
  • Enable or disable a channel by using its toggle switch. If you disable a channel, notifications are not delivered through that channel.  
  • **Add channels** using the **Create Channel** option.  
  • **Modify channel information**. Click the channel row or the right arrow (>) next to the appropriate channel to edit or delete it. |
<table>
<thead>
<tr>

<td>List of notification categories that identify and group related notifications. Each category contains the notifications that you can subscribe to. To view the notifications in a given category, click the category row or the right arrow (&gt;) next to the appropriate category. You can:</td>
</tr>
<tr>
<td></td>
<td>• Edit settings for a notification:</td>
</tr>
<tr>
<td></td>
<td>◦ Enable or disable channels for the selected notification.</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Apply notification conditions</strong>, such as schedules and filters, that affect the delivery of the notification.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Create personal notifications</strong>, which are subscriptions to specific notifications that matter to you.</td>
</tr>
</tbody>
</table>

**Create notification channels**

You can add channels to receive your notifications. A notification channel is an email account or voice message system that you have access to.

**Before you begin**

Role required: none

**About this task**

Notification channels include email addresses, service providers for SMS messages, and mobile applications. You can create voice notification channels to support applications like Notify.

ℹ️ **Note:** If you are using the ServiceNow mobile application or a custom push application, you do not need to create a push channel for your mobile device. The system automatically creates a channel for the mobile app after you initially log in to your instance from your mobile device.

**Procedure**

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Channel**.
3. Complete the fields on the New Channel form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the channel, such as the device or email account.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of channel:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Email</strong>: for email messages.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: All users with an email address have a primary email channel, which is created automatically after a notification is sent to them.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SMS</strong>: for SMS messages.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Voice</strong>: for phone messages.</td>
</tr>
<tr>
<td>Email address</td>
<td>The email address of the channel.</td>
</tr>
<tr>
<td>Phone number</td>
<td>The phone number for SMS messages or for voice messages.</td>
</tr>
<tr>
<td>Service provider</td>
<td>The service provider for SMS messages.</td>
</tr>
</tbody>
</table>
4. Click **Save**.
The system creates and enables the channel, and adds it to the list of notification channels.

**What to do next**
To receive notifications on your new notification channel, you must enable the channel for individual notifications. After you enable the channel for a notification, you can set conditions to further control the notifications that you receive on the channel. For more information, see **Apply notification conditions**.

**Modify notification channels**
You can update channel information for your notifications.

**Before you begin**
Role required: none

**Procedure**
1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. In the Notification Channels section, click the channel row or the right arrow (>) next to the channel name.
3. In the Edit Channel form, update the fields (see **Create notification channels** for descriptions of the form fields).
4. Click **Save**.

**Results**
The system updates and saves the channel information that you modified.

**Delete a notification channel**
Delete a notification channel so that you no longer receive notifications through the channel.

**Before you begin**
Role required: admin
Procedure

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.

2. In the Notification Channels section, click the channel row or the right arrow (►) next to the channel name.

3. On the Edit Channel form, click Delete.

Results
The system deletes the channel from the list of notification channels and no longer delivers notifications to that channel.

Apply notification conditions
You can set various conditions and filters to control the notifications you receive. You can also enable or disable an email digest and the delivery of individual notifications by channel.

Before you begin
Role required: none

About this task
You can choose to enable certain features and set different conditions that control the notifications you receive. You can:
• Enable or disable an email digest if a digest is available for the notification. An email digest is a single email that summarizes the activity for the notification during a time interval that you specify. Admins configure the email digest content for a notification.
• Enable or disable a channel on which the notification is received.
• Set preconfigured schedules and filters that determine when you receive your notifications.
• Set more advanced filter conditions to limit the notifications delivered to you.

Procedure
1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the Notifications tab.
2. Select the notification:
   a. In the Notifications By Category section, click the row or right arrow (▶) of the category that you want to view.
   b. In the list of notifications for the category, click the row or right arrow (▶) next to the notification that you want to edit.
3. To enable or disable an email digest for the notification, if an email digest is available:
   a. Click the Email Digest switch.
      The email digest is enabled when the switch is green and disabled when the switch is grey.
   b. If you enabled the digest, select the Interval (length of time) during which the notifications are accumulated.
The interval begins with the first occurrence of notification activity during the specified interval. For example, if you selected the Daily interval and the first notification occurs at 07:00, the system begins accumulating notifications at 07:00 and stops at 07:00 the next day. Soon after the interval ends, the system sends the email digest instead of sending the individual notifications that were triggered during the digest interval. If you disabled the digest, the system immediately stops accumulating the notifications and does not send the email digest.

4. To enable or disable a channel on which the notification is received, click the switch for the channel. The notification is enabled when the switch is green and disabled when the switch is grey. If you previously disabled an entire channel, you cannot enable that channel for the notification.

5. To set more criteria for notification delivery, click the row or the right arrow (>) next to the channel for the notification.
a. Complete the Apply Conditions form (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule</td>
<td>Select a schedule that determines when the notification can and cannot be received.</td>
</tr>
<tr>
<td>Filter</td>
<td>Select a pre-configured filter with the criteria that determines when the notification can be sent. For example, you might select a filter whose conditions send notifications when an incident with a priority of <strong>1 - Critical</strong> is opened for a network issue.</td>
</tr>
<tr>
<td>Advanced filter</td>
<td>Select this check box to use the condition builder to create additional criteria. When you select the check box, the <strong>Table</strong> and <strong>Conditions</strong> fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you selected an incident-related notification, you might select the Incident <code>[incident]</code> table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Define as many conditions as needed to limit the notifications you receive. For example, you can choose to be notified only when an incident communication plan is created for a specific configuration item.</td>
</tr>
</tbody>
</table>
b. Click **Save**.
   To navigate back, click the left arrow (≪) at the top of the Notifications window.

**Create personal notifications**

You can create personal notifications, which are subscriptions to notifications of importance to you. You can apply conditions that control specific content included in your personal notification, and also enable or disable the channels for delivery.

**Before you begin**

Role required: none

**About this task**

A personal notification is a subscribable notification that you can customize. You can assign the notification a name that is meaningful to you and filter the information received in that notification.

⚠️ **Note:** Users are limited to one subscription per notification.

**Procedure**

1. Click the gear icon (⚙️) in the banner frame to open the System Settings window, and click the **Notifications** tab.
2. Click **Create Personal Notification**.
3. Complete the New Personal Notification form (see table).

<table>
<thead>

<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can subscribe only to notifications that are configured to allow subscriptions. Depending on the notification you select, the Table, Affected record, and Send when fields are displayed.</td>
</tr>
<tr>
<td>Table</td>
<td>The database table that the notification is linked to.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the notification is based on. This field appears when you select a notification that has an affected record (for example, a notification for a problem record that has multiple affected CIs). Click the lookup icon, select the table and specific document (record) in that table, and click OK.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might create a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue.</td>
</tr>
</tbody>
</table>

4. Click **Save**. The system creates the personal notification and adds it to the appropriate notification category. In the following example, notice the category in which the system placed the personal notification.
5. Enable or disable the channels for your personal notification.

6. Navigate back to the list of notifications for the category by clicking the left back arrow ( freopen) at the top of the form. Notice that your Personal Notifications are listed above the System Notifications in the given category.

7. Navigate back by clicking the left back arrow ( freopen) at the top of the form or by clicking the Notifications tab.

User notification preferences in UI15 and earlier

In UI15 and earlier interfaces, use the Notification Preferences link in the User form to manage the notifications that you can subscribe to.

The following instructions explain how to use Notification Preferences to manage notifications.

Set up a notification device in UI15 and earlier

You can add devices for a user to receive notifications. A device is a mobile device, email account, or voice message system that the user has access to.

Before you begin
Role required: admin

About this task
Notification devices include email addresses, service providers for SMS messages, and mobile applications.
Procedure

1. Navigate to **User Administration > Users**.

2. Select a user.

3. Click **Notification Preferences**.

4. Click **Create New Device**.

5. Fill in the fields on the form (see table).

6. Click **Submit**.

### New Device form

<table>
<thead>
<tr>

<td>Additional, optional attributes of an SMS device used inside an advanced script from the SMS service provider. These attributes are generally used to deliver SMS notifications to an internal SMS distribution technology. This advanced scripting procedure is not necessary for configuring external SMS providers.</td>
</tr>
<tr>
<td>Variables</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If you inactivate a device, it still appears in the user preferences, but the switches that allow users to select the notifications are grayed out for that device column.

### Edit a notification device in UI15 and earlier

All users can edit their notification preferences, including notification devices.

**Before you begin**

Role required: none

**Procedure**

1. Navigate to **Self-Service > My Profile**.
2. Click **Notification Preferences**.
3. Click the name of the existing device.

The device form opens allowing you to make certain modifications, depending on your user role. See **Set up a notification device in UI15 and earlier** for a description of all fields.
Add personal subscriptions in UI15 and earlier

After setting up your devices, you can subscribe to notifications that are configured as subscribable.

Before you begin
The Subscription Based Notifications 2.0 plugin must be active.

About this task
If you have subscribed to messages, your list of notification messages can build over time. You can create preferences for how and when these messages are delivered, or unsubscribe to messages that are not configured as mandatory.

Note: Conditions that you apply to personal subscriptions do not override the filters that the administrator creates for the subscribable notifications. Your conditions are evaluated after the conditions on the subscribable notification are met. If the notification filter set by the administrator fails, the filter conditions on your personal subscription are not evaluated.

Procedure
1. Navigate to Self-Service > My Profile to open your user profile.
2. Click the Notification Preferences related link. The Notification Preferences page opens. You can see your personal subscriptions and the general notifications that you are subscribed to.
3. Click Subscriptions.
4. Click Add Personal Subscriptions.
5. Fill in the fields as described in the table.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A descriptive name for the subscription.</td>
</tr>
<tr>
<td>Notification</td>
<td>The notification to subscribe to. You can only subscribe to notifications that are configured to allow subscriptions.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the incident is configured to run on. You cannot modify the table from this form. To select another table, configure the notification. See Create an email notification.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box indicating whether the subscription is active. Users can receive notifications for subscriptions only if the subscription is active. If it is not active, the on-off switch for the subscription is set to off and is read-only.</td>
</tr>
<tr>
<td>Send to</td>
<td>The devices that this subscription is sent to. Selecting the devices in this field is the same as turning on the switch for the subscription on the Subscriptions page.</td>
</tr>
<tr>
<td>Affected record</td>
<td>The specific record that the subscription is based on. Click the lookup icon, and then select the table and the specific record in that table.</td>
</tr>
<tr>
<td>Send when</td>
<td>Another condition that must be met to send the notification. For example, you might select a filter whose conditions send notifications when an incident with a priority of 1 - Critical is opened for a network issue. The system evaluates the conditions in this filter after the conditions set in the notification filter by the administrator.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. You can turn the subscription for active subscribable notifications on or off using the switch on the Subscriptions management section of the Notification Preferences page.

Personal subscriptions are saved in the Notification Subscriptions [sys_notif_subscription] table. The records in this table are made active or...
inactive when you slick the switch to subscribe or unsubscribe from the notification.

8. You can edit the subscription at any time by clicking **Edit** next to it.

**Select notifications in UI15 and earlier**

Administrators can configure notification preferences for each user and users can also select which notifications they want to receive for various devices.

**Procedure**

1. Navigate to **Self-Service > My Profile** to select your own notifications, or if you have admin access, navigate to **User Administration > Users** to select notifications for another user.

2. Click a user record to open it.

3. On the User form, click **Notification Preferences** under Related Links.

   The notification preferences page appears. The preferences pages show all the notifications available to the user and the devices that the user has configured, such as email or mobile phone. If a user does not have read access to the table on which the notification is based, the notification does not appear.

   Every user has the **Primary email** device, where subscriptions to email notifications can be enabled.
4. Click the switch next to the notification to subscribe the user to it.

Modify notifications for a user device in UI15 and earlier

After you set up the devices through which users receive notifications, you can assign the notifications to each device and add advanced conditions to limit what notifications are received.

Before you begin
Role required: admin

Procedure
1. On the Notification Preferences page for a user, find the notification from the list of notifications.
2. Click Edit next to the notification. The preferences for that notification appear.
3. Fill in the fields on the form (see table).
4. Click Submit.
Notification preferences for a user's device

</tr>
<tr>
<td>Table</td>
<td>Select the table for the notification. For example, if you select the <strong>CI affected</strong> notification message, you might select the Incident [incident] or Change Request [change_request] table.</td>
</tr>
</tbody>
</table>
Create a service provider
Administrators can configure service providers for devices that use SMS.

Before you begin
Role required: admin

About this task
Administrators also have the option of configuring how a device's service provider affects the construction of the device's email address.

Procedure
1. Navigate to the Notification Service Provider [cmn_notif_service_provider] table by typing `cmn_notif_service_provider.list` in the application navigator filter.
2. Fill out or change the fields on the form (see table).
3. Click **Update**.
4. Click **Save** on the Notification Preferences page.

### The Notification Service Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configured name of the service provider.</td>
</tr>
<tr>
<td>Type</td>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Enables or disables this notification device.</td>
</tr>
<tr>
<td>Advanced notification</td>
<td>Removes all the previous options and displays the <strong>Advanced script</strong> field.</td>
</tr>
<tr>
<td>Advanced script</td>
<td>Used for custom notifications that run a script rather than construct a traditional SMS/email. This is generally used when all outbound SMS messages must run through a central SMS hub, as opposed to being sent directly from the instance to the SMS provider. Advanced users can construct a script in this field that will send a notification to an old style numeric pager that cannot receive SMS communications. This field is rarely used and employs advanced scripts. Contact your representative to assist you with any advanced SMS scripting.</td>
</tr>
<tr>
<td>Construct address manually</td>
<td>Removes the prefix and suffix options and displays the <strong>Construction script</strong> field.</td>
</tr>
<tr>
<td>Construction script</td>
<td>Allows you to script the email address construction as you would in a business rule. For example, abc + current.phone_number + <a href="mailto:def@text.att.net">def@text.att.net</a> would construct an email address of <a href="mailto:abc2223334444def@text.att.net">abc2223334444def@text.att.net</a>. <strong>NOTE</strong>: Current is a reference to the device, not the service provider, hence the current.phone_number variable that uses the device's phone_number value.</td>
</tr>
<tr>
<td>SMS Provider Email Prefix</td>
<td>Places the provided text before the device's specified phone number; for example: <a href="mailto:PREFIX2223334444@text.att.net">PREFIX2223334444@text.att.net</a></td>
</tr>
<tr>
<td>SMS Provider Email Suffix</td>
<td>Places the provided text after '@' sign; for example: 2223334444@SUFFIX</td>
</tr>
<tr>
<td>Notification Device Variables</td>
<td>Additional, optional attributes of an SMS device used inside an SMS service provider's <strong>Advanced script</strong>. This is generally used to deliver SMS notifications to an internal SMS distribution technology. This is an advanced scripting procedure and is not necessary for configuring external SMS providers.</td>
</tr>
</tbody>
</table>

**Select a service provider**

You can configure how a device's service provider affects the construction of the device's email address.
Before you begin
Role required: admin

Procedure
1. Navigate to User Administration > Users and open any user's record.
2. Under Related Links, click Notification Preferences, and then click an SMS notification device.
3. If no SMS device is present, click New Device and configure one.
4. Select the appropriate service provider, and then click the reference icon for the Service provider field. The service providers are saved in the Notification Service Provider [cmn_notif_service_provider] table. Only active providers are visible.

SMS notification advanced scripting
You can use these objects and their attributes in your advanced notification scripts on the SMS Notification Service Provider form.

Make a notification mandatory

To prevent users from turning off or deleting a subscription to a notification, make the notification mandatory.

Before you begin
Role required: admin

About this task
When you make a notification mandatory, the notification is locked in user notification preferences, preventing the user from removing or unsubscribing to the notification, filtering it, or changing the schedule.

Users receive mandatory notifications even if they disable notifications.

⚠️ Note: Mandatory notifications apply to only the primary device of the user. You cannot make a notification mandatory for secondary devices.

Procedure

1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Mandatory field. This field does not display by default.
a. Click the context menu icon ( ) and select **Configure > Form Layout**.

b. Using the slushbucket, select the **Mandatory** field and the order in which you want the field to appear.

c. Click **Save**.

4. Select the **Mandatory** check box.

When a user checks their notification preferences, the control button for the mandatory notification is on and is read only.

---

**Force a notification to be sent**

To force a notification to be sent to the specified users, enable forced delivery.

**Before you begin**

Role required: admin

**About this task**

Forcing a notification means that the relevant users receive the notification, even if they have not subscribed to the notification or have turned off the subscription. In addition, the users receive the notification even if the **Notification** field is set to **Disable**.

**Note:** Forced delivery applies to only the primary device of the user. You cannot force a notification to be sent to secondary devices.
Procedure
1. Navigate to System Notification > Email > Notifications.
2. Open the appropriate notification.
3. Configure the form and add the Force delivery field.
4. Select the Force delivery check box.
5. Click Update.
   Unlike using the Mandatory option, forcing the delivery does not lock the user's preference or prevent the user from unsubscribing from the notification.

Create a notification filter
Notification filters enable a user to control the delivery of messages by creating special conditions on multiple tables in a single, reusable filter.

Before you begin
Role required: admin

About this task
For example, you can create a filter that controls message delivery when active incidents, problems, and change requests for network issues reach a critical state. For UI15 and earlier interfaces, notification filters are available for selection in the Filter field of a user's Notification Preferences form. For UI16, filters for notifications or channels are set through the Notifications tab of the System Settings window. For details, see Apply notification conditions.

Note: The system applies the user's filter conditions after the administrator's conditions have been evaluated. If the administrator's conditions fail, the system ignores notification filters.

Procedure
1. Navigate to System Notification > Email > Notification Filters and create a record.
2. In the Notification conditions related list of the new record, create and submit filter conditions on one or more tables.
3. Repeat the procedure to create additional conditions on other tables for this filter.

### Filter device notifications using a schedule

You can associate devices, such as Email, SMS, and Voice, to schedules that define when the devices can and cannot receive notifications.

**Before you begin**

Role required: admin

**About this task**

Notifications that are triggered outside of the scheduled days and times for the device are not queued up for delivery at a later time. For example, if
an administrator selects the **Weekdays** schedule for an email device, the
device receives email notifications triggered between Monday and Friday. If
notifications are triggered on Saturday, they are not delivered to the device.

**Procedure**

1. Define schedules as needed using **System Scheduler > Schedules > Schedules**.
2. Add or edit a device.
3. Configure the New Device for System Administrator form and add the **Schedule** field.
4. In the **Schedule** field, select the schedule for the device.
5. Click **Submit**.

**Edit the schedule or filter of an existing notification message**

You can update a schedule or filter that was previously created for an email notification.

**Before you begin**

Role required: admin

**About this task**

To edit the schedule or filter of an existing notification message:

**Procedure**

1. In the Notification Preferences screen, click the message to edit.
   You cannot edit any attributes of a mandatory message.
2. Make the appropriate changes in the form.
3. Click **Update**.

**Email unsubscribe**

Administrators can add unsubscribe links to notifications so that users can stop receiving particular email messages.

ℹ️ **Note:** The base system notifications include unsubscribe and notification preferences links.

The system offers two types of macros to create unsubscribe links.
• An unsubscribe link that creates an email message to the instance.
• An unsubscribe link that opens the notification preferences for the user on the instance.

### Available unsubscribe macros

<table>
<thead>
<tr>
<th>Unsubscribe type</th>
<th>Macro used</th>
<th>Description</th>
<th>Available parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unsubscribe by email (Unauthenticated)</td>
<td>${NOTIF_UNSUB}</td>
<td>The system generates an HTML mailto hyperlink. When users click the link, their browser or email client creates a pre-formatted unsubscribe email message to the instance.</td>
<td><strong>link_text</strong>: specify the text to display as a link within quotation marks.</td>
</tr>
<tr>
<td>Unsubscribe by notification preferences (Authenticated)</td>
<td>${NOTIF_PREFS}</td>
<td>The system generates an instance link directly to the notification preferences for this notification type.</td>
<td><strong>link_text</strong>: specify the text to display as a link within quotation marks.</td>
</tr>
</tbody>
</table>

Administrators can add unsubscribe macros to any notification record type such as:

• Email layouts
• Email templates
• Email notifications

### Unsubscribe by email

Unsubscribe by email requires the user email client or browser to create a pre-formatted email message containing these elements:

• The **To** field has the email address of the instance.
• The **Subject** starts with the string *Unsubscribe from*.
• The **Body** has a JSON string with a name-value pair of `Unsubscribe` and an array value that contains two more name-value pairs.
  - The **notification_id** parameter specifies the Sys ID of the notification the user wants to unsubscribe from.
  - The **unsub_token** parameter specifies an instance ID the system uses to verify that the email came from a ServiceNow instance.
Some email clients and web browsers, such as GMail on Chrome, require extra client configuration to support mailto hyperlinks. Administrators can provide an alternative unsubscribe method for users whose email client or browser does not support mailto links. See RFC6068 for information about the mailto URI scheme.

The Unsubscribe from Notification inbound action processes the email and unsubscribes the sender from the listed notification.

Unsubscribe by notification preferences

Unsubscribe by notification preferences requires the user's browser to navigate to the notification preferences page on the instance. After logging in, the system displays the notification preferences for this particular notification.

Users can set preferences for this notification such as disabling notifications for a particular device. Users must save their notification preferences for changes to take effect.

Example: Unsubscribe links

This email layout adds several unsubscribe links to the bottom of each email notification.

```
$\{NOTIF_UNSUB\} from this notification by email or $\{NOTIF_UNSUB+link_text="click here"\}.

Manage your $\{NOTIF_PREFS\} or $\{NOTIF_PREFS+link_text="click here"\}.
```

When rendered in an email notification, the unsubscribe links only display the link text.
If a user clicks the **Unsubscribe** link, the email client creates a message such as this:
Sample unsubscribe by email message

Notifications in messaging applications

Enable users to receive their ServiceNow platform notifications in Slack or Microsoft Teams messaging applications. Use the Now Actions app to configure the messaging apps for your instance.

Admin setup

To enable ServiceNow notifications within Slack or Microsoft Teams, you must be an administrator for both ServiceNow and the third-party application.

1. Request IntegrationHub

   The Slack and Microsoft Teams spokes require a Starter subscription to IntegrationHub. To activate IntegrationHub and view available subscription types, see Request an IntegrationHub plugin.

   Note: Messaging notifications do not consume IntegrationHub transactions.

2. Request the Messaging Notification plugin

   To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

3. Install the Now Actions messaging app for Slack or Microsoft Teams

   As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.
Note: The primary owner of a Slack workspace or organization owns and manages the application. To avoid losing admin access to the workspace or organization, transfer primary ownership before any administration changes occur. If you transfer primary ownership, update the JSON payload for the Slack installation in the Notification Integration page. For more information about editing the Slack installation, see Install the Now Actions messaging app.

If the Now Actions app is uninstalled, the workspace or team displays as inactive in the Notification Integration page. To view the Notification Integration page, navigate to System Notification > Messaging > Messaging Integration Configuration.

4. Configure message content

Create a message in the Message Contents [messaging_content] table that you can use in multiple notifications. Messages can be informative, or they can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

5. Create a messaging notification

Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Note: Message Channel Sync Job can sync more than 1000 channels using pagination.

User setup

To enable individual ServiceNow notifications in Slack or Microsoft Teams, and to take action on notifications, configure your system settings and link your user accounts.

Link your ServiceNow user account to your Slack or Microsoft Teams account

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within
Configure system settings

Each user can enable ServiceNow notifications in a third-party application by configuring the communication channel in their system settings. Opt in to receive approval requests and other actionable notifications in third-party channels.

Notification channels

In ServiceNow, a notification channel is a method or device for receiving notifications. For example, in the base system you can elect to receive notifications through email or SMS channels. If messaging applications are enabled on your instance, you can enable notifications to Slack and Teams using Notification Channels in your system settings.

Actions and events

The Message Actions [messaging_observer_handler] table processes communication channel events, such as adding or deleting a Slack channel, to keep the instance and the third-party application in sync. Only developers creating Slack or Teams applications should add actions to this table. Register new actions with the instance through the Message Event Registry [messaging_observable] table. To remove a base system action, clear the active flag instead of deleting the record.

Logging

The Inbound and Outbound message logs contain information on actions, events, and activities between ServiceNow and the third-party application. Use the logs to identify the content, state, and origin of communications to and from your instance.

Request the Messaging Notification plugin

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

There are two ways to request a plugin:
• Access the Now Support Service Catalog directly by clicking Service Catalog > Activate Plugin on Now Support.

• Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

5. Click **Submit**.

**Related information**

List of plugins (Rome)

**Install the Now Actions messaging app**

As an administrator for both ServiceNow and the third-party application, find and install the Now Actions app. Install the application in ServiceNow to associate the app with your instance.

**Before you begin**

To activate this feature, request the Messaging Notification plugin (com.glide.notification.messaging) through the HI Customer Service system. This plugin activates related plugins if they are not already active. For more information, see **Request the Messaging Notification plugin**.

Roles required:

- Admin or messaging_admin in ServiceNow
- Administrator for Slack or Teams
Install the Now Actions messaging app for Slack

Install the Now Actions messaging app from the Slack App Directory and associate the app with your instance.

Procedure

1. Install the Now Actions app from the Slack App Directory.
   b. Click Authorize when prompted.
   c. Enter a customized name, app description, and icon (optional).
   d. Configure your Now Actions web address. This is the base URL for your instance. For example, https://<instance_name>.service-now.com/.
   e. Copy the JSON configuration found in the Add your Slack credentials to your app section for use in later steps.
2. Associate your Slack app with your instance.
   a. Navigate to System Notification → Messaging Integration Configuration.
   b. Click the Install button next to Slack.
   c. In the JSON Configuration pop-up, paste in the JSON configuration you copied in earlier steps.
3. Check for installation verification. The Slack workspace should appear below the Slack heading on the Notification Integration page.

During installation, the instance synchronizes with all public Slack channels in the workspace. New public channels added after installation will automatically synchronize with the instance. You can browse to System Notification > Messaging Channels on your instance to verify that the new channel appears on the instance.

What to do next
To update the app after installation, use the Configure JSON Payload and Settings on Slack icons on the Notification Integration page. You can view the JSON payload, view app credentials, change app appearance, or delete the app.
Install the Now Actions messaging app for Microsoft Teams

Associate the Now Actions messaging app with your instance.

**Procedure**

1. Associate your Microsoft Teams app with your instance.
   
   a. Navigate to **System Notification → Messaging Integration Configuration**.
   
   b. Click the **Install** button next to Microsoft Teams.
   
   c. A pop-up message appears to confirm redirection to Microsoft Teams to verify your identity. Click **OK**.

   ![Entering a third-party site](image)

   d. When prompted, log in to Microsoft Teams with your Teams admin account.
   
   e. Click **Accept** to accept the permissions for the app.
f. If the selected workspace has already been assigned, you are asked whether you want to proceed to overwrite the previous assignment. Click Override to change the workspace, or click Cancel to leave the current assignment in place.

g. After authentication, installation will start in the background. Once installation completes, a message appears confirming the installation.
h. Click the **app package** link to access a knowledge base article KB0690098, containing the application package for Microsoft Teams. Follow the steps in the article to make this package available for your Microsoft Teams users.

2. Check for installation verification. The new team should appear below the Teams heading on the Notification Integration page.

During installation, the instance synchronizes with all public Teams channels. To add channels created after the install, open Microsoft Teams and @mention the app from the new channel. You can browse to **System Notification > Messaging Channels** on your instance to verify that the new channel appears on the instance.

**What to do next**

To receive a ServiceNow notification in Microsoft Teams, create a message and a notification. See **Configure message content** and **Create a messaging notification**.

**Configure message content**

Create a message in the `Message Contents [messaging_content]` table that you can use in multiple notifications. Messages can be informative, or they
can request action from an individual Slack or Teams user. For example, the Approval Request message includes Approve and Reject buttons to take the associated action in ServiceNow.

Before you begin
Role required: admin or messaging_admin

About this task
To enable users to take actions in Slack or Teams, use the Buttons message type and define scripted behavior. Only users that have linked their Slack or Teams account with their ServiceNow account can take action in ServiceNow from the third-party application.

Procedure
1. Navigate to System Notification > Messaging Content.
2. Open an existing notification record or click New to create a new record.
3. Fill in or modify the fields as appropriate.

### Messaging content fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the message.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a type of message.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Simple</strong>: Send an informative message to an entire Team or Slack channel.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Buttons</strong>: Send a message to an individual user in Slack or Teams and define the desired behavior in the Script field. Associate buttons in the message with actions in ServiceNow. Use the Approval Request as an example.</td>
</tr>
<tr>
<td>Target table</td>
<td>To use record content in your message, select the appropriate table.</td>
</tr>
<tr>
<td>Fields</td>
<td>Select which fields from the <strong>Target table</strong> appear in a simple message. Changing the order of the fields changes the display order in the notification.</td>
</tr>
<tr>
<td>Message heading</td>
<td>Enter text to appear at the top of the message.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the content of the message. Use notification variables to include dynamic information in your message. For example, use <code>Incident ${number}</code> to include the incident number in the message. For available variables, see Notification variables.</td>
</tr>
<tr>
<td>Buttons</td>
<td>Select or create buttons to use on the form. After selecting or creating a button, you must define button behavior in the Script field. Only visible when Buttons is selected in the Type field</td>
</tr>
<tr>
<td>Script</td>
<td>This field is only visible when Buttons is selected in the Type field. Enter a script to define what happens in your instance when a user selects a button in Slack or Microsoft Teams. Use the <code>actions.get</code> method to return the name of the button selected by the user.</td>
</tr>
</tbody>
</table>

```javascript
if (actions.get('button') == 'Approve') {
    target.state = 'approved';
    target.update();
}
```

In this example, the script conditionally executes when the "Approve" button is selected.

Use the method `sn_notification.Messaging.send` to send information to the messaging window.

```javascript
var content = new GlideRecord("messaging_content");
content.get("1bb10839572213007f004758ef94f9c4");
sn_notification.Messaging.send(application, userId, content, target);
```

In this example, the script stores a Message Content record in the `content` variable. It then posts a message from that Message Content record.

| Application | Select the application scope for this notification. |

4. Click Submit

Example:
This example shows the output of a message in Microsoft Teams. This message is of the buttons type, which shows buttons and performs scripted actions based on the user selection. In this case, the script uses the
sn_notification.Messaging.send method to display the change in state for the record.

What to do next
Use the message in a notification. For more information about creating notifications, see Create a messaging notification.

Create a messaging notification
Notifications define when a message is sent, who it is sent to, and what it contains. To send a notification to Slack or Teams, add a messaging content record to the notification and configure the notification messaging channel. Notifications that require action must be sent to individual users instead of groups.

Before you begin
Role required: admin

Procedure
2. Click New.
3. Fill in or modify the fields as appropriate.
Use Notifications to notify users about specific activities in ServiceNow, such as updates to incidents or change requests. Notifications allow administrators to specify:
- When to send the notification
- Who receives the notification
- What content is in the notification

## Messaging notification fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the notification. Use descriptive names to ensure that your users are able to easily distinguish between notifications.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to trigger the message. Must be a table or database view within the same application scope. <strong>Note:</strong> Notifications running on the task [task] table are not supported. Instead, use a table extended from task.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category for the notification. A category groups related notifications in the system settings. <strong>Note:</strong> Do not leave the category as Uncategorised, as users may not be able to find the notification in their list of notifications.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for this notification.</td>
</tr>
</tbody>
</table>

**Note:** Notification records are shared between messaging, email, and push notifications. Some fields on the form are not relevant to messaging notification records. Leave fields not described here at their default values.

4. Click **Advanced view** under **Related links** to switch the advanced view. Switching to the Advanced view saves the current record.
5. Open the **When to send** tab and complete the form.

Note: If the same trigger generates multiple notifications, the system only sends one notification. The system considers all other notifications, even if they have a different subject and body, as duplicates. The Ignore Duplicates business rule controls this functionality.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Send when | Select under what condition the notification is sent:  
• When a record is inserted or updated  
• When a particular event is fired  
• When triggered as an action step in Flow Designer |
| Weight | Set a numerical value for the notification priority relative to other notifications with the same target table and recipients. The system only sends the notification with the highest weight. The default value 0 causes the system to always send the notification (assuming the conditions are met). |
| Conditions | Use the condition builder to select the conditions under which this notification is sent. For example, select **Priority > greater than > 3 - Moderate** to send the notification only for High and Critical priority incidents. |
### Field | Description
--- | ---
**Inserted** | Select the check box to enable messaging notification when a record is inserted. This field appears when you set the **Send when** field to **Record inserted or updated**.

**Updated** | Select the check box to enable messaging notification when a record is updated. This field appears when you set the **Send when** field to **Record inserted or updated**.

**Event name** | Select the event that triggers this notification. This field appears when you set the **Send when** field to **Event is fired**.

**Advanced condition** | Create a script to define more filter conditions, like sending a notification based on the current messaging record, changing field values, or changing system properties.

The advanced condition script must return **true** or set a global answer variable to **true** to send the notification.

The advanced condition script uses the following global variables:

- **current**: Contains the current record from the table to which the notification is linked.
- **event**: Contains the event that triggered the notification.

**Note**: The **Advanced condition** field is evaluated in addition to other conditions you set on the notification. Both the condition and advanced condition must evaluate to true to send the notification.

---

6. Open the **Who will receive** tab and fill in or modify the following fields.

### Field | Description
--- | ---
**Messaging Channels** | Select the messaging channels to receive the messaging notification. Only complete this field if creating a simple notification to send to a channel. Simple notifications use a Messaging Content record of Type **Simple**.

**Users** | Select the users you want to receive the messaging notification. Only complete this field if creating a notification that requires user action. Notifications that require user action use a Messaging Content record of Type **Buttons**.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Users/groups in fields             | Select users or groups from reference fields. For example, if a notification uses the Incident [incident] table, you can select users or groups from incident fields like **Opened by** and **Assignment group**.  

**Note:** You can dot-walk to values in reference fields by clicking the plus sign in the field selector and then selecting the related field.  

If you address the notification to a user with an inactive record in the User [sys_user] table, the system does not send the notification to that user.  

| Groups                             | Select the groups you want to receive the messaging notification. You can search for groups with the reference lookup icon or by manually entering the group name. This list of groups is static.  

| Send to event creator              | Select this check box to send the notification to the person who performed the action that started the notification process if the person is also a recipient. If the event creator is not specified in one of the recipient fields, the event creator does not receive a notification, regardless of the setting in this field.  

For new notifications, this option is selected by default.  

| Event parm 1 contains recipient    | Select this check box if the event parameter 1 contains one or more notification recipients (in a comma separated-list). This field is visible only when the **Send when** field is set to **Event is fired**.  

| Event parm 2 contains recipient    | Select this check box if the event parameter 2 contains one or more notification recipients (in a comma-separated list). This field is visible only when the **Send when** field is set to **Event is fired**.  

7. Open the **What it will contain** tab and fill in or modify the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Messaging content                  | Select a messaging content record to be used in this notification.  

8. Click **Update**.
Link your ServiceNow user account to your Slack or MS Teams account for Now Actions

Link your ServiceNow account to your Slack or Teams account to take action on ServiceNow notifications from within Slack or Teams. If you do not link accounts, you can still receive notifications within group channels. However, you cannot to approve ServiceNow requests or take action on notifications from within Slack or Teams.

Before you begin
Role required: none

Procedure
1. Open the Slack or Teams application
2. Find the Now Actions bot. This bot is found in the left panel of Slack under Apps, and in the left panel of Teams in the Chat tab.
3. Start a conversation with the Now Actions bot. The bot then presents a link to authenticate.

Authentication message

4. Click the Connect to ServiceNow link.
   A new browser tab opens and prompts the user to Deny or Confirm the connect between your Slack or Teams account and your ServiceNow account. This link will expire five minutes after it is displayed.
5. Click Confirm to link the accounts.
6. After confirmation, you are directed to the instance user record. A confirmation message is displayed at the top of the screen.

Configure system settings
Configure the system settings of your instance to set the UI experience that you want.

Before you begin
Role required: admin

About this task
You can customize your general settings, theme, accessibility, lists, forms, notifications, and developer tools. You can also switch your instance UI to a previous version.

Procedure
1. Click the settings icon (⚙️) in your instance header.
2. In the System Settings modal, select a tab and change your system settings.
<table>

| **Switch to UI15** | Switch your instance to U15. Click the button again to return to your current version. |

**Unlink your ServiceNow user account from your Slack or MS Teams account for Now Actions**

Unlink your ServiceNow account from your Slack or MS Teams account to stop receiving actionable ServiceNow notifications in Slack or Teams.

**Before you begin**
Role required: none

**About this task**
If you unlink your account to a messaging app for Now Actions, you must also disable the corresponding messaging channel in your notification preferences.

**Procedure**

1. Navigate to **Self-Service > My Profile**.
2. Click the **View Linked Accounts** related link.
3. In the Linked Accounts page, check the selection box for the messaging integration to be unlinked.
4. Select **Actions on selected rows...**, then click **Unlink account**.
   Your ServiceNow account is unlinked from the Now Actions messaging integration (the link is inactive).

   **Note:** Even though you unlinked your account, you still receive notifications in any group channels to which you belong.
5. Disable the messaging channel in your Notification Preferences.
a. Select the gear icon in the banner frame to access the System Settings window.

b. Under Notification Channels, disable the appropriate messaging channel.

Note: If you want to link your ServiceNow account again, follow the steps in Link your ServiceNow user account to your Slack or MS Teams account for Now Actions.

Set up notifications for a custom Slack app
Send ServiceNow notifications to users via your own Slack bot.

Before you begin
• Request IntegrationHub
• Request the Messaging Notification plugin
• Create a custom application for Slack

Role required: admin or messaging_admin

Procedure
1. Create a JSON for your custom Slack application.

   Ensure that your JSON matches the following example format:

   ```json
   {
   "bot_user_id" : "U9TLFR6TA",
   "scope" : "bot,channels:read",
   "client_id" : "294380102274.335446283495",
   "client_secret" : "ed0da5felf844fdac15a9e1ac1b0b831",
   "verification_token" : "YXSNsRhioCeU8h9Fm2k4ACu0",
   "app_id" : "A9VD48BEK",
   "access_token" : "xoxp-294380102274-295238228534-335452648487-2fac31f923dadd7ff30f2bc8c852809d",
   "bot_access_token" : "xoxp-333695856928-6pNwnO3Y6vN5GI7KCAIPwv6V",
   "team_id" : "T8NB63082",
   "team_name" : "sn-notif-ext-test",
   "user_id" : "U8P706QFQ",
   "bot_username" : "empdmyers1snnotifext"
   }
   ```

   To get the Bot User ID, copy the member ID of the bot user in the Slack app.

   The Scope is always bot,channels:read.
To get the Client ID, Client Secret, and Verification Token, see the Basic Information page in your Slack workspace.

To get the App ID, copy the 9-character identifier from the app URL in your Slack workspace.

To get the Access Token and Bot Access Token, see the OAuth & Permissions page in your Slack workspace.

To get the Team ID, view the HTML source code for your Slack workspace page.

The Team Name is the same as your subdomain in your Slack workspace.

To get the User ID, copy the member ID for your own account in the Slack app.

The Bot Username is the name that you assigned to the bot user in Slack.

2. In your ServiceNow instance, navigate to System Notification > Messaging > Messaging Integration Configuration.

3. Next to the Slack listing, click Install.

4. On the JSON Configuration window, paste the JSON that you created in Step 1.

5. Click Submit.
6. On the confirmation window, click **Skip**.

### Configuration Submitted

You've completed the configuration process in ServiceNow. Now go to Slack to finish configuring the integration.

[Skip] [Go To Slack]

### Results

The system creates a notification channel for your custom Slack app automatically.

### What to do next

- Link ServiceNow user accounts to your custom Slack app so that users can take action on notifications that are delivered by your Slack bot.
- For each user account that you link, enable the notification channel using the system settings.
- Create notifications for your custom Slack app by following the steps in Create a messaging notification and Configure message content.

### Related information

- Slack API documentation

### Provider notification

Send notifications directly to recipients via the provider on supported channels. Notifications can be simple messages for review, or actionable messages with buttons that users can select to perform certain actions.

### Important terms

- **Provider**

  A provider is an implementation that delivers notifications to destinations of a specific channel.

- **Channel**
A channel represents a particular communication mechanism with a recipient.

**Destination Type**

A destination type represents a logical way of categorizing a destination for the underlying channel and is required to send via a channel, as well as set a preference. As an admin, you can modify the notification **Auto Opt-in** behavior for a destination type.

**Destination**

A destination is a specific contact information of a recipient for a channel. It includes a destination type and an identifier suitable for use in the channel. Destination Type sent by default is either set to true or false during the adapter installation. This determines if the destination type is opt-in or opt-out.

- If sent by default is set to true, notifications are delivered to the recipients if they have not explicitly opted-in/out to receive a notification on the destination type.
- If sent by default is set to false, notifications are not delivered to the recipients if they have not explicitly opted in to receive the notification on the destination type.

**Destination preference precedence**

Notifications are delivered to the destinations that honor the following preference precedence:

1. Notification preference of the recipient
2. Destination preference of the recipient
3. Destination Type send by default. You also have the option to modify **Auto Opt-in** behavior for a destination type.

**Common content for a notification**

Provide common notification content so that different notification channels can use the same generic content.

**Actionable notification**

Enable provider admins to define an actionable notification and send it to users. You can also enable response actions.

ℹ️ **Note:** A notification should either have Common Content or Provider Content in order to be delivered to the recipients.
Note: All the above-mentioned capabilities are applicable only for Virtual Agent and Workspace providers.

Create a provider notification

Execute the following steps to create a provider notification for Virtual Agent and Workspace providers.

Before you begin
Role required: admin

Procedure
1. Navigate to System Notification > Provider > Notifications and select New.
2. On the form, fill in the fields.

Notifications form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to receive notifications about.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the notification.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification. The notification is active by default.</td>
</tr>
<tr>
<td>Trigger</td>
<td>System action that triggers the notification. You can send the notification after a record is changed or after an event is triggered.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Option to send the notification after a record is inserted. This field appears when you select Record Change in the Triggered By field.</td>
</tr>
<tr>
<td>Updated</td>
<td>Option to send the notification after a record is updated. This field appears when you select Record Change in the Triggered By field.</td>
</tr>
<tr>
<td>Event</td>
<td>Event that triggers the notification. For example, to send a notification after an incident is closed or resolved, you would select the incident.inactive event. By default, this event is logged in the system each time a user resolves or closes an incident.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Note</td>
<td>You can select only an event that shares the same table as the notification. This field appears when you select <strong>Event</strong> in the <strong>Triggered By</strong> field.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filter to specify the table records that users receive notifications about. For example, to send notifications about top-priority incidents, you would select <strong>Incident</strong> [incident] in the <strong>Table</strong> field and set the conditions to <strong>[Priority] [is] [1 - Critical]</strong>.</td>
</tr>
<tr>
<td>Audience</td>
<td>Users who receive the notification. <strong>Note:</strong> Notifications in messaging channels are sent only to users with ServiceNow accounts (sys_user profiles). Consumers and customer contacts are considered as guests and cannot receive notifications in messaging channels.</td>
</tr>
<tr>
<td>Users in fields</td>
<td>Record fields that include users who receive the notification. For example, to send the notification to the record assignee, select <strong>Assigned to</strong>.</td>
</tr>
<tr>
<td>Is originating user included?</td>
<td>Option to include the user who changed the record or triggered the event.</td>
</tr>
</tbody>
</table>

3. Select **Submit**.

**Note:** Use the **Submit** button for Virtual Agent notifications. The **Submit and Add Common Content** button is for other use cases.

**Create and update a provider notification for all users**
Create a new notification in the notification provider framework to send to both sys and non-sys users.

**Before you begin**
Role required: admin and notifications provider admin

**Procedure**
1. Navigate to **System Notification > Provider > Notifications**. A list of notifications shows up.
2. Click **New** to create a new notification.

3. Fill in the fields in the Notification form.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the notification record</td>
</tr>
<tr>
<td>Table</td>
<td>Table name on which the notification is triggered</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification</td>
</tr>
<tr>
<td>Triggered By</td>
<td>Trigger used in the notification record</td>
</tr>
</tbody>
</table>

**Note:** The options in this field depend on the selected table. For example, if you select an incident table, the options are Events or Record Change.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inserted</td>
<td>Condition to trigger the notification</td>
</tr>
<tr>
<td>Updated</td>
<td>Condition to trigger the notification</td>
</tr>
<tr>
<td>Conditions</td>
<td>Additional conditions to trigger the notification</td>
</tr>
<tr>
<td>Users</td>
<td>Names of the available sys users</td>
</tr>
<tr>
<td>Recipients in fields</td>
<td>Field in the currently selected table that contains the users who receive an email notification</td>
</tr>
</tbody>
</table>

**Note:** The **Recipients in fields** field under Recipients allows you to choose both sys and non-sys users to send notifications to.

| Is originating user included? | Option to include the originating user to be included in the notification |

4. Click **Submit**.

**Note:** If you want to add common content immediately after submitting the notification record, click **Submit and Add Common Content**. See [create common content](#) for more information.
5. Open the recently created notification.

6. Update the form using any of the available related lists. See Create and add additional recipients for more information.

Create and add additional recipients

Update the notifications form by adding additional recipients from the Additional Recipients related list to send notifications to.

Before you begin
Role required: admin and notifications provider admin

Procedure

1. Click Additional Recipients related list on the notification form to add new recipients.

   Note: An error message about adding content to the notification shows up. See create common content and create default content to create content for a notification.

2. Click New in the Additional Recipients related list to add additional recipients. The Additional Recipients form shows up.

3. Fill up the fields in the Additional Notification Recipients form.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notification</td>
<td>Name of the notification</td>
</tr>
<tr>
<td></td>
<td>Note: The Notification name auto-populates and the Recipient Table field gets User[sys_user] as the default value.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the recipient record</td>
</tr>
<tr>
<td>Recipient Table</td>
<td>Table name of the recipient</td>
</tr>
<tr>
<td></td>
<td>Note: You can also select a non-sys users table.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification</td>
</tr>
<tr>
<td>Static Recipients</td>
<td>Names of static recipients of the notification</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Dynamic Conditions</td>
<td>Dynamic filter conditions for the users</td>
</tr>
</tbody>
</table>

**Note:** Click the refresh button next to the records matching condition link to update the exact number of records matching the latest filter condition. By default, it shows the total number of records in the current table.

**Note:** Only one active record can be added for a particular recipient table. If you want to add another record for the recipient table, you will have to deactivate the current record.

**Note:** For one recipient table, we can use either static recipients or dynamic conditions.

4. Click **Submit**.

**Create common content for a notification**

Provide common notification content so that different notification channels can use the same generic content.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Notification > Provider > Notifications**.
   
   A list of notifications shows up.

2. Click either **New** to create a new notification or select an existing notification.

3. Create the common content. There are two ways to create the common content.
   - If you have clicked **New**, do the following.
     - a. Fill the necessary fields on the Notification form to create a new notification record.
     - b. Click **Submit and Add Content**.
• If you have selected an existing notification, do the following.
  a. Scroll down to the Notification Contents related list.
  b. Click **New Shared Content**.
  c. Select **Common** to create common content type.
     The Notification Common Content form shows up.

4. Fill the Notification Common Content form to create a common content.

   ✋ **Note:** The **Short text** and **Long text** fields are the major fields to create a common content.

5. Click **Submit**.

### Create default content in a provider

Create and use the default content for a notification that doesn’t have a content provider or some of the fields in the content provider are not present.

**Before you begin**
Role required: admin

**Procedure**

1. Enter `sys_notification_content.list` in the left navigator.
   A list of **Notification Contents** shows up.

2. Click **New Provider Content**.

   ✋ **Note:** Both shared content and provider content can be default content. Provider content has been considered for this example.

3. Select the type of Notification Content you would like to create.

4. Fill the **Notification Content** form for the type you have selected in the previous step.

   ✋ **Note:** The **is default** field is visible only if the **Notifications** field is not present.

5. Click **Submit**.
   A new default content has been created.

6. Go to **Notification Providers** and select one of the providers.
   The **Notification Providers** form for the selected provider opens.

7. Click the search icon in the **Default content** field to select the default content.

   ✋ **Note:** The **Default content** is associated with a provider through the **Default content** field.
The Select the document modal opens up.

8. Select the default content in the Document field.
   You can select the recently created or any previous default content.

9. Save the changes.

Implementing notification action with a script

Use the Script field in the Notification Action form to update and implement a notification action.

Before you begin
Role required: admin

Procedure
1. Navigate to System Notification > Provider > Notifications.
   A list of notifications shows up.
2. Select an existing notification.
3. Scroll down to the Notification Actions related list.
4. Open the Notification Action form. There are two ways to reach the Notification Action form.
   • If there are no existing notification actions under Notification Actions related list, do the following.
     a. Click New Provider Action under Notification Actions related list.
     b. Select the type of notification action you would like to create from the Notification Action wizard.

   Note: Scriptable Action, Flow Action and Virtual Agent are the only types of notification actions available.
   • If there is an existing notification action, select one from the list under Notification Actions related list.
     The Notification Action form shows up.
5. On the form, update the fields as required.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the actionable notification.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the actionable notification record.</td>
</tr>
</tbody>
</table>
### Fields | Description
---|---
Notification | Name of the notification containing the actionable notification record.
Active | Option to activate the actionable prompt record.
Script | Script to implement the actionable notification.

6. Click **Update**.

**Select provider notification action capabilities**

Enable provider notification definitions to accept actions as scriptable action, flow actions, and virtual agent.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Notification > Provider > Notifications**.
   
   A list of notifications shows up.

2. Select an existing notification.

3. Scroll down to the related lists.

4. Select the Actions related list.

5. Click **New Provider Action**.
   
   The Notification Action wizard shows up.

6. Select one of the following types of notification actions you would like to create from the Notification Action wizard.

   • Scriptable Action
   • Flow Action
   • Virtual Agent

**Create a scriptable notification action**

Select **Scriptable Action** from the Notification Action wizard to create a scriptable notification action.

**Before you begin**

Role required: admin
Before performing this task, you must complete Select provider notification action capabilities.

**Procedure**

1. Select **Scriptable Action**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification action.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the notification action record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Name of the notification containing the notification action record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification action record.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to implement the notification action.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Create a flow notification action**

Select **Flow Action** from the Notification Action wizard to create a flow notification action.

**Before you begin**

Role required: admin

**Procedure**

1. Select **Flow Action**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification action.</td>
</tr>
<tr>
<td>Notification</td>
<td>Name of the notification containing the notification action record.</td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Async</td>
<td>Option to execute configured flow or action asynchronously.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification action record.</td>
</tr>
<tr>
<td>Choose Flow or Action</td>
<td>Option to select either Flow or Action. See Flow Designer for more information.</td>
</tr>
<tr>
<td>Note: You can select either</td>
<td></td>
</tr>
<tr>
<td>Flow or Action, but not both.</td>
<td></td>
</tr>
<tr>
<td>Inputs</td>
<td>Script used for the creation of flow notification action.</td>
</tr>
<tr>
<td>Note: The script returns Json of</td>
<td></td>
</tr>
<tr>
<td>key value pairs, which is passed</td>
<td></td>
</tr>
<tr>
<td>as input in executing configured</td>
<td></td>
</tr>
<tr>
<td>flow or action.</td>
<td></td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Add actions to the notification content**

Use the Link Actions to Content related list to add actions to the notification content, selection of the provider notification and ordering of actions of an actionable content.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Notification > Provider > Notifications**.
   A list of notifications shows up.
2. Click either **New** to create a new notification or select an existing notification.
3. Scroll down to the related lists and select the Link Actions to Content related list.
4. Click **New** to create an actionable content.
   The Actionable Content form shows up.
5. Fill in the following in the form.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the action set</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the notification</td>
</tr>
<tr>
<td>Notification</td>
<td>Name of the notification</td>
</tr>
<tr>
<td>Actions</td>
<td>Option to select the actions</td>
</tr>
</tbody>
</table>

**Note:** You can now set the order of actions of an actionable content.

<table>
<thead>
<tr>
<th>Provider</th>
<th>Option to select the required provider for the actionable content</th>
</tr>
</thead>
</table>

**Note:** A provider can reuse the actions defined by another provider.

**Note:** In order to avoid confusion with duplicate action names set by different providers, the Actions related list displays the Class of a particular action.

| Active      | Option to activate the action set                   |

6. Click **Submit**.
Email client
Send email directly from any record, such as an incident, change request, or problem record.

Using the email client
You can use the email client either from a form or the record view in a workspace.

• To open the email client from a form, open a record and click the more options menu (●). Click the email icon (✉).

   Note: In UI15, the email icon (✉️) appears in the form header.
• To open the email client in a workspace, open a record and click the menu icon (≡). Click Compose Email.

The email client looks like a standard email interface, which contains a toolbar for text formatting and adding attachments.

![Compose Email](image)

The email client uses the multipart/mixed content type and supports HTML markup in the message body.
**Note:** The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field on the Email [sys_email] table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field on the Email table.

For more information on using the email client in a workspace, see [Communicating via email in workspace](#).

**Activation information**

The email client is activated with the Email Client plugin (com.glide.email_client), which is active by default on the Now Platform.

The email client is enabled by default on the incident table. To enable the email client for another table, add the `email_client` dictionary attribute on the table’s collection record. For more information, see [Enable the email client for a table](#).

The email client is enabled by default on the change table.

Give users access to the email client by assigning them the email_composer role.

**More setup**

You can configure the email client by creating an Email Client Configuration [sys_email_client_configuration] record. For more information, see [Email client configurations](#).

You can also create email client templates or quick messages to use predefined content in email client messages. For more information, see the following:

- Create an email client template
- Composing emails with quick messages

Optionally, you can give users the option to send email client messages as SMS text messages. For more information, see [Enable SMS delivery with the email client](#).

**Enable the email client for a table**

Enable the email client for a table so that users can send emails directly from the table record.

**Before you begin**

Role required: admin
About this task
The email client is enabled by default on the Incident [incident] table. You can enable the email client for another table by adding the email_client dictionary attribute to the table.

ℹ️ Note: This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

Procedure
1. Open a record in the table that you want to enable the email client for. For example, to enable the email client for the Problem [problem] table, navigate to Problem > Open, and then open any problem record.
2. On the form, click the menu icon (☰) and then click Configure > Dictionary.
3. On the Dictionary Entries list, open the first record. The first record has the record type Collection and does not have any entry for Column name.
4. On the form, in the Related Links section, click Advanced view.
5. In the Attributes field, enter email_client=true. If there are other values in the field, separate the attribute with a comma.
6. Click Update.

Components installed with the email client
Several types of components are installed with activation of the Email Client (com.glide.email_client) and Email Client Template (com.glide.email_client_template) plugins, including tables and user roles.

ℹ️ Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

</tbody>
</table>
Email client configurations

Use email client configurations to manage the behavior of your email client. Each configuration consists of different email controls for setting allowable email recipients and email addresses.

In new and upgraded instances, the Email Client Configuration module is activated by default through the Email Client plugin (com.glide.email_client).

**Note:** If you upgraded to the Madrid release, a default email client configuration is created automatically during upgrade. This default email configuration is used if you do not define any other email client configurations. Also, if you previously defined certain email client properties to control email address auto-complete, disambiguation, and the display of the From and Reply-To email addresses, those settings are retained in the default email client configuration.

How email client configurations work

Email client configurations determine how your email client behaves, such as whether the From address or Reply-To address should be displayed. A configuration applies to a specific ServiceNow table, which enables you to define email client behavior for a specific context, purpose, or application. For example, if you have email client users who send email about Customer Service case records, you can create a configuration that applies email client controls specific to customer service. You can also select the email client recipient qualifiers for controlling the auto-complete recipient results from a selected table, such as the Customer Contact table.

An email client configuration consists of the following components:

**Email client recipient qualifiers**

Recipient qualifiers control the email recipients returned in the auto-complete results for the To, Cc, and Bcc fields of the email client. You can provide additional qualifiers displayed in the auto-complete results to differentiate recipients that have the same names and narrow the results.

**Note:** Use the To is Optional field in the Email Client Configuration form to make the To: field optional to send an email.

**Email client From addresses**

This control enables the display of the From and Reply-To addresses. Use the Email Client Template to create a set of allowable From addresses that can be used when a user sends an email with the
email client. You can provide a specific From address to be used in the email client, or you can choose to hide it entirely.

Email client attachment handling

By default, attachments that are sent from the email client are attached to the target record. Instead, you can select to attach files to the Email [sys_email] record, or you can set conditions that define which email client attachments are added to the target record. To see the status of all email attachments, go to the Email Attachments [sys_email_attachment] table.

You can also use an Email Client Template to define the content of an email client message and set other message characteristics, such as an email sender (From address) configuration.

Email client configuration process

Users with the admin role define and edit email client configurations. Users with the email_client_admin role can edit configuration information in selected tables.

1. Build the various email client controls that can be used to create an email client configuration.
   - Define email client recipient qualifiers
   - Define email client from addresses

2. Create the email client configuration.
   Define an email client configuration that determines how your email client behaves when users create an email message.

Define email client recipient qualifiers

Create a configuration that controls the auto-complete list of recipients displayed in the email client.

Before you begin
Role required: email_client_admin

About this task
You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names.
Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.
- **Display Configuration** – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.

- **Query Configuration** – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

**Procedure**

1. Navigate to **Email Client > Email Client Recipient Qualifier** and click **New**.
2. Fill in the fields at the top of the Recipient Qualifier form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client recipient configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table to be queried for recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of this recipient configuration.</td>
</tr>
</tbody>
</table>

3. Fill in the fields in the **Display Configuration** tab to control the auto-complete display in the email client.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Address</td>
<td>The field on the table that contains the recipient email address.</td>
</tr>
<tr>
<td>Display Name</td>
<td>The field on the table used for the recipient name displayed.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of results returned relative to other recipient qualifiers defined.</td>
</tr>
<tr>
<td>Additional Display Fields</td>
<td>A content list for choosing additional fields from the table to be displayed in the auto-complete list.</td>
</tr>
</tbody>
</table>
4. Fill in the fields in the Query Configuration tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefix Search</td>
<td>Option to find the desired recipient using prefix.</td>
</tr>
<tr>
<td>Note: Selecting the <strong>Prefix Search</strong> option displays the <strong>Last Name Field</strong> drop-down menu with options to filter the recipient's name.</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Select the method for filtering the recipients returned in the auto-complete list:</td>
</tr>
<tr>
<td></td>
<td>• Condition</td>
</tr>
<tr>
<td></td>
<td>• Script</td>
</tr>
<tr>
<td>Conditions</td>
<td>If you selected Condition for the <strong>Type</strong>, use the condition builder to specify the conditions that must be met to return the appropriate recipients.</td>
</tr>
<tr>
<td>Script</td>
<td>If you selected Script for the <strong>Type</strong>, enter a script that uses these variables to return the appropriate recipients:</td>
</tr>
<tr>
<td></td>
<td>• recipientQuery: GlideRecord for the table being queried.</td>
</tr>
<tr>
<td></td>
<td>• targetRecord: GlideRecord for the target record from which the email client was opened.</td>
</tr>
</tbody>
</table>
For example, this recipientQuery is a GlideRecord that represents the Customer Contact table. The targetRecord variable is a Customer Service case from which the email client was opened. This query limits the email client auto-complete results to contacts who belong to the same account as the Customer Service case.

```javascript
(function (recipientQuery, targetRecord)
{
    // Limit results to contacts belonging to the account for the case.
    var account = targetRecord.getValue('account');
    recipientQuery.addQuery('account', account);
})(recipientQuery, targetRecord);
```

5. Click Submit.
The recipient qualifier configuration is added to the Recipient Qualifier [sys_recipient_qualifier] table and is available for use in an email client configuration.

**Define email client from addresses**
Set an allowable email address that is displayed in the From address of a message sent from the email client.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to Email Client > Email Client From Address and click New.
2. In the Display name, enter the name to be displayed in the From field of the email client message.
3. Enter a valid Email address for the From address in the email client.
4. Click **Submit**.
   The From address is added to the Email Client From Address [sys_email_client_from_address] table.

**Create an email client configuration**
Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table.

**Before you begin**
Role required: email_client_admin

**About this task**
The configuration determines the recipient auto-complete results that are displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

You can create one email client configuration per ServiceNow table.

**Procedure**
1. Navigate to **Email Client > Email Client Configuration** and click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this email client configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that the configuration is active. The configuration is active by default.</td>
</tr>
<tr>
<td>Table</td>
<td>ServiceNow table that this client configuration applies to. Select a table from the list.</td>
</tr>
</tbody>
</table>

3. In the Recipient Configuration section, select **Recipient Qualifiers** to be used for this client configuration.
   a. Click the lock icon (🔒). By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.
   b. Click the search icon (🔍) and select a recipient configuration from the list of available recipient configurations.
   c. Click the lock icon (🔒) to lock it.

4. In the Display Configuration section:
a. Select the **Display From** option to display the From email address in the email client. To hide the From email address in the email client, clear the check box.

b. Select the **Display Reply-To** option to display the Reply To address in the email client. To hide the Reply To email address in the email client, clear the check box.

5. In the Attachment Handling section, select from one of three choices for the **Attachment Send Action** field:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach to Email Record</td>
<td>Keep email client attachments on the Email [sys_email] record when you send an email.</td>
</tr>
<tr>
<td>Attach to Target Record</td>
<td>Attach email client attachments to the target record when you send an email. This option is the default value.</td>
</tr>
<tr>
<td>Conditionally Attach to Target Record</td>
<td>Set conditions that define which email client attachments are moved to the target record when you send an email. Attachments that do not meet the conditions remain on the email record when you send an email.</td>
</tr>
</tbody>
</table>

6. In the Filter Configuration section, select **Email Address Filters** to be applied to the email client.

a. Unlock the lock icon (🔒).

b. Click the search icon (🔍) and select one or more Email Address Filters.

c. Click the lock icon (🔒) to lock **Email Address Filters**.

Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.

7. Click **Submit**.

The configuration is added to the Email Client Configuration [sys_email_client_configuration] table.

---

**Create an email client template**

You can create a different template for each table that uses the email client.
Before you begin
Role required: admin

About this task
The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- **Content**: The message body.
- **Recipients**: The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- **Sender Configuration**: The method used to generate the email sender (From email address) of the message.

Procedure
1. Navigate to **Email Client > Email Client Templates**.
2. Click **New**.
3. Fill in the fields at the top of the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Execution Order</td>
<td>A number that indicates the order in which template conditions are evaluated.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the **Content** tab.
### Field Description

#### Subject
Enter a description of the email.

**Note:** The **Subject** field on the email client allows a larger character count than the default setting for the **Subject** field on the Email [sys_email] table. If the subject text from the client is being truncated, increase the **Max length** value for the **Subject** field on the Email table.

#### Content Type
Select the format of the message body content: HTML or plain text.

#### Body HTML
If you selected HTML for the **Content type**, enter the content of the message body using the HTML editor toolbar to format the HTML.

To reference field values, select variables from the variables list or manually type variable references using the syntax `{table_name.variable_name}`. To reference the user who launches the email client, enter the variable `{current_user}`.

**Note:** Line breaks don't appear for multi-line fields such as `{description}` and `{comments}` in the email client template.

You can call a mail script by using `{mail_script:script name}` in the **Body HTML** field.

#### Body text
If you selected plain text for the **Content type**, enter any text or mail script that you want to appear in the message body.
You can insert a mail script in the **Body text** field by using the following syntax:

```
<mail_script> [code] </mail_script>
```

5. Fill in the fields in the **Recipients** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To</strong></td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>To</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
<tr>
<td><strong>Cc</strong></td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Cc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> field.</td>
</tr>
<tr>
<td><strong>Bcc</strong></td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Bcc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> or <strong>Cc</strong> fields.</td>
</tr>
</tbody>
</table>

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated.
Use this field only if you want a different From address than the one defined in your SMTP email account.

- None: The From address is not generated in the email client message.
- SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
- Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
- Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table. For example, the following script sets the From address based on the location of the incident caller:

```javascript
(function (fromAddressQuery, targetRecord) {
    // targetRecord is incident for this template
    var location = targetRecord.caller_id.country;

    if (location == 'us')
        fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
    else if (location == 'japan')
        fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
    else if (location == 'uk')
        fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');
}) (fromAddressQuery, targetRecord);
```

- Text: Enter the email From address to be used in the client.

**Note:** The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see Email client configurations.

**Note:** If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click Submit.

The template is added to the Email Client Templates [sys_email_client_template] table.

**Related information**

Script includes
Apply an email client template

After you create an email client template, you can apply it to an email.

Before you begin
Role required: admin

About this task
The following steps are implemented only after creating an email client template

Procedure
1. Click the ellipsis (...) icon at the top of the template to apply the template to an email
2. Select Email.
3. Fill in the fields to compose an email. See Create an email client template for field details.

Note: The body of the email is filled up with the details from the incident record. If you modify one or more fields in the incident record and are not saved, the unsaved changes still reflect in the email body.

Note: 2000 characters is the total limit for all the changes in the incident record. If some of your changes are not reflected and get truncated in the email body, this is because the total changes is more than 2000 character limit.

Create an email client response template

You can now create custom email client response templates that support conditions.

Before you begin
Role required: admin
Procedure

1. Navigate to Email Client > Email Client Templates. The following options for Response Template - Received and Response Template - Sent show up.

2. Click one of the available options to create a template for that selected option.

3. Fill in the fields at the top of the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Auto-filled template name based on the selected template option.</td>
</tr>
<tr>
<td></td>
<td>✅ Note: This is a read-only field.</td>
</tr>
<tr>
<td>Table</td>
<td>Auto-filled table name.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This is a read-only field because for response templates, the table name is</td>
</tr>
<tr>
<td><strong>Conditions</strong></td>
<td>The conditions that determine when this client response template is used. Use</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the conditions are not true, the email client gets the default template.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Select the target table name under conditions that the template applies.</td>
</tr>
</tbody>
</table>

**Application**
The type of scoped application.

**Execution Order**
A number that indicates the order in which template conditions are evaluated.

4. Fill in the fields in the **Content** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter a description of the email.</td>
</tr>
</tbody>
</table>

<td>Content Type</td>
<td>Select the format of the message body content: HTML or plain text.</td>
</tr>
<tr>
<td>Body HTML</td>
<td>If you selected HTML for the Content type, enter the content of the message body using the HTML editor toolbar to format the HTML. To reference field values, select variables from the variables list or manually type variable references using the syntax <code>${table_name.variable_name}</code>. To reference the user who launches the email client, enter the variable <code>${current_user}</code>. <strong>Note:</strong> Line breaks don’t appear for multi-line fields such as <code>${description}</code> and <code>${comments}</code> in the email client template. You can call a mail script by using <code>${mail_script:script name}</code> in the Body HTML field.</td>
</tr>
<tr>
<td>Body text</td>
<td>If you selected plain text for the Content type, enter any text or mail script that you want to appear in the message body. You can insert a mail script in the Body text field by using the following syntax: <code>&lt;mail_script&gt; [code] &lt;/mail_script&gt;</code></td>
</tr>
</tbody>
</table>

5. Fill in the fields in the Recipients tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>To</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Cc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> field.</td>
</tr>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Bcc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> or <strong>Cc</strong> fields.</td>
</tr>
</tbody>
</table>

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated.

Use this field only if you want a different From address than the one defined in your SMTP email account.

- None: The From address is not generated in the email client message.
- SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
- Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
- Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table.

For example, the following script sets the From address based on the location of the incident caller:

```javascript
(function (fromAddressQuery, targetRecord) {
    // targetRecord is incident for this template
    var location = targetRecord.caller_id.country;
    if (location == 'us') {
        // Set the From address to the caller's country
        fromAddressQuery.set('from_address', location);
    }
})(fromAddressQuery, targetRecord);
```
fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
else if (location == 'japan')
    fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
else if (location == 'uk')
    fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');
}}(fromAddressQuery, targetRecord);

• **Text:** Enter the email From address to be used in the client.

  🔄 **Note:** The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see Email client configurations.

  🔄 **Note:** If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click **Submit**.

**Composing emails with quick messages**

Insert predefined content into the message body of emails that you send from the email client.

**Using quick messages**

In the email client, you can select a quick message to fill the email body with the content that is specified in the quick message. After you define one or more quick messages, the Quick Message selector appears in the email client so that you can construct an email with multiple quick messages.

By default, the quick message content is inserted at the place of the cursor. It doesn't replace content that you created before selecting the quick message. To replace message content with a quick message, highlight the text to replace and then select a quick message.

flammatory Note: To instead have quick message content replace all existing content in an email draft, set the `glide.email_client.quick_message.insert` property to **false**.
Adding quick messages to an email

Creating quick message content
Define quick messages by creating records in the Email Client Canned Messages [sys_email_canned_message] table.

When you define a quick message, you can add any of the following types of content into the message body:

- Icons
- Logos
- Pictures
- Rich-text HTML
- Hyperlinks
- Variables
- Any other HTML constructs

⚠️ Note: If you add attachments to the quick message, the attachments are not sent as part of the email distribution.
Assign the email_client_quick_message_author role to business managers so that they can create quick messages for users in their group.

**Setting quick message conditions**
When you define a quick message, you can limit the availability of the quick message according to:

- The user who launches the email client
- The group of the user who launches the email client
- The table of the record from which you launch the email client
- The target record from which you launch the email client

For example, if you designate Beth Anglin as the user for a certain quick message, the quick message is available in the email client only for Beth Anglin.

If you associate a quick message to the Incident [incident] table, the quick message is available in the email client only after you launch from an incident record. If you specify a target record from the Incident table for the quick message, the quick message becomes available in the email client only for matching incident records.

**Define a quick message**
Create predefined content to add in the email client so that users can write emails consistently and efficiently.

**Before you begin**
Role required: email_client_quick_message_author or admin

**Procedure**
1. Navigate to Email Client > Quick Messages.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name that appears in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick message. When selected, the quick message is available for selection in the Quick Message selector.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>User</td>
<td>User who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to which the quick message applies. To make the quick message available for all tables, leave blank.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Target record that must match the conditions before the quick message appears for selection in the email client.</td>
</tr>
<tr>
<td>Body</td>
<td>Content to insert in the <strong>Message Text</strong> field in the email client. By default, the field supports HTML format. To reference field values, select variables from the variables list or manually type variable references using the syntax <code>${table_name.variable_name}</code>. To reference the user who launches the email client, enter the variable <code>${current_user}</code>.</td>
</tr>
</tbody>
</table>

\*\*\* Note: \*\*Line breaks don't appear for multi-line fields such as `${description}` and `${comments}` in the email client template.\*\*\*

4. Click **Submit**.

### Enable SMS delivery with the email client

Give users the option to send an email client message as an SMS text message.

**Procedure**

1. In the application navigator, enter `sys_properties.list`.
2. From the list, find and open the record for the `glide.email_client.show_sms_option` property.
3. On the form, change **Value** to **true**.
4. Click **Update**.

**Results**

In the email client, user can select to send the message as an SMS text message.
If the recipient doesn’t have a registered SMS device, the email client sends the message to the primary email device.

**Related information**

Add a system property

**Parse an email thread**

Parse the most recent email in an email thread by using Email Reply Separators.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to System Policy > Email > Email Reply Separators. A list of email reply separators shows up.
2. Click New to create a new email reply separator.
3. On the Email Reply Separator form, fill in the fields.
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the separator.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the separator.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the separator.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of separator.</td>
</tr>
<tr>
<td></td>
<td>• String: Searches for the specified string to parse out an email thread.</td>
</tr>
<tr>
<td></td>
<td>• Regex: Searches for the specified regular expression to parse out an email thread.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority of the separator.</td>
</tr>
<tr>
<td>Separator</td>
<td>Separator value based on the selection of the <strong>Type</strong>.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description about the separator.</td>
</tr>
<tr>
<td>Language</td>
<td>Language of the reply separator.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> All email clients don’t indicate a language, so all active reply separators are applied to locate a separator in the email message.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Automating system responses to inbound email**

Save time from responding to emails manually when you configure your instance to send replies, create incidents, or update records automatically in response to inbound emails.

You can define system responses to inbound emails in two ways:

- Create an inbound email flow in Flow Designer
- Script an inbound email action
Inbound email trigger in Flow Designer

With the inbound email trigger in Flow Designer, you can create flows that define the automated processes that your instance takes when it receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The following diagram shows the processing order for inbound emails. When an email is sent to your instance, the system first classifies the email as a reply, forward, or new email. Then the system runs the inbound email through an inbound email flow. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries to match the email to another inbound email flow. If at any point the email does not match with an inbound email flow, the system matches the email to an inbound email action instead.
The benefits to automating system responses to inbound emails in Flow Designer are:

- Provides an easy and accessible interface that uses natural language.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.

For more information on creating inbound email flows in Flow Designer, see Flow trigger types or follow the steps in Create a flow with an inbound email trigger. To view or manage your inbound email flows, navigate to Flow Designer > Inbound Email Flows.

Inbound email actions

Define an inbound email action to script how the system responds to an inbound email.

⚠️ Note: Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

Inbound email actions are similar to business rules: both use conditions and scripts that take action on a target table. An inbound email action checks the email for a watermark that associates it with a task and checks for other conditions. If the conditions are met, the system takes the inbound email action that you configure. The system can take two types of actions:

- Record action: setting a value for a field in the target table.
- Email reply: sending an email back to the source that triggered the action.

By default, if an email has no identifiable watermark, an inbound email action attempts to create an incident from the message. If the email has a watermark of an existing incident, an inbound email action updates the existing incident according to the action's script.

⚠️ Note: From Paris release and beyond, if an email body has multiple watermarks, consider the last valid watermark in the email body.
Watch this six-minute video to learn about the actions that the instance can take in response to messages from users and shows how to create or modify email notifications to users. Configuring inbound email actions and email notifications

**Inbound email receive types**
The system classifies all incoming email into one of three types: forward, reply, or new.

<table>
<thead>
<tr>
<th>Order</th>
<th>Type</th>
<th>Criteria</th>
</tr>
</thead>
</table>
| 1     | Forward | The system classifies an email as a forward only when it meets all these criteria:  
|       |       | • The subject line contains a recognized forward prefix such as **FW:**.  
|       |       | • The email body contains a recognized forward string such as **From:**. |
|       |       | The system classifies any email that meets these criteria as a forward, even if the message contains a watermark or record number that otherwise classifies it as a reply. |
| 2     | Reply | The system classifies an email as a reply when it fails to match it to the forward receive type and it meets any one of these criteria:  
|       |       | • The subject line or email body contains a recognized watermark such as **Ref:MSG0000008**. |
|       |       | • There is no watermark and the Reply-To header contains a recognized message ID of an email with a target record. |
|       |       | • There is no watermark and the subject line contains a recognized reply prefix such as **RE:** and a recognized record number such as **INC0005574** |
| 3     | New  | The system classifies an email as new when it fails to match it to the forward and reply receive types. |
Determining the type of incoming email

Attachments
If an inbound email contains one or more email attachments, the inbound email action adds the attachments to the first record the action produces.

Character encoding
- If the email encoding is ASCII-7 or UTF-8, inbound email actions preserve the character encoding in any associated task records they produce.
- If the email encoding is ISO-8859-1, the inbound email action attempts to convert the email to Windows 1252.
- Inbound email actions convert any other encodings (for example, Mac OS Roman) to plain text, which may or may not be readable.

See the System email log and mailboxes for examples of what you might see if a notification or inbound email action is not processed.

Note: The state of all incoming emails that have been run against inbound email actions, even if there is no matching action, is changed to Processed.

Domain separation
The system ignores the domain that the inbound email action record is in when it creates a record based on the inbound email action. Keep inbound actions in the global domain. For example, if your inbound email action creates an incident, the system creates the incident in the same domain as the user in the
**Caller** field. If that user is not in the User [sys_user] table, the incident is in the global domain.

**Related information**
- Notification variables
- Watermarks on notification emails

**Inbound email action processing**

The system determines which inbound actions to run by comparing the inbound email type and inbound action conditions to the incoming email message. Certain properties are available to set the reply and forwarding prefixes in the email subject lines that your instance recognizes when processing inbound emails.

**Note:** Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

The system follows this processing flow to determine whether to run an inbound action.

The system only runs an inbound action when:
• The incoming email type matches the inbound action **Type**.
• If present, the watermark or record number refers to a record in the **Target** table.
• The inbound action **Conditions** evaluates to true.

If any of these criteria are not met, the system skips the current inbound action and evaluates the next active inbound action. The system processes inbound actions from the lowest to highest **Order** value. If the inbound action has **Stop processing** enabled, the system updates the **State** of the email record to **Processed** after running the inbound action **Script**.

The following video shows how an inbound action condition prevents an incident from being created.

**Troubleshooting when inbound email isn't processed**

**Prefixes recognized in email subject lines**

**Email reply prefixes**

When no watermark is present or the In-Reply-To email header is present, the instance recognizes email containing a prefix from the glide.email.reply_subject_prefix property as reply email. You can use this property to set non-standard reply prefixes in your email system.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.reply_subject_prefix</td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify an email reply.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: re:,aw:,r:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>

**Note**: Prefixes are case insensitive.

**Email forward prefixes**
Emails with certain prefixes trigger the forward type of inbound email action. The instance recognizes any email whose subject line contains a prefix from the `glide.email.forward_subject_prefix` property as forwarded email. Emails with these prefixes trigger inbound email actions of the type forward. Use this property to set non-standard forward prefixes in your email system or you want email forwards to behave like replies. If the value of the system property is empty, then the system reverts to using the values `fw:` and `fwd:`.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.forward_subject_prefix</code></td>
<td>Specifies the list of prefixes (comma-separated) in the subject line that identify a forwarded email.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: fw:, fwd:</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Properties <code>sys_properties</code> table</td>
</tr>
</tbody>
</table>

**Note:** Prefixes are case insensitive.

### Email forwards as replies

Properties are available to force inbound actions to process forwarded mail as replied mail. These properties control the subject prefix that the inbound actions use.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value needed</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.email.reply_subject_prefix</code></td>
<td><code>re:, Re:, RE:, aw:, r:, fw:, fwd:, Fwd:, FWD:</code></td>
</tr>
<tr>
<td><code>glide.email.forward_subject_prefix</code></td>
<td>[any text that is not a forward prefix]</td>
</tr>
</tbody>
</table>

These properties cause the Update Incident inbound action to process all forwarded and replied-to mail.
**Note:** The `glide.email.forward_subject_prefix` property must contain some text so that the forwarded email can be processed as a Reply. It can be any text except a forward prefix (that is, fw:,fwd:,Fwd:,FWD:).

### Matching a sender email address to a user

The instance matches a sender's email address to an active user in the User [sys_user] table using inbound actions.

When processing an email, the instance sets the current user to the user whose email address matches `email.from`. Inbound actions can then reference that current user. For example, the base system inbound action Create Incident sets the `caller_id` of the incident to the value returned by `gs.getUserID()`.

If multiple users have the same email address, the instance first searches for an active user with the email address. The instance does not match inactive users.

**Note:** Each user record must have a unique email address so that the instance can reliably match the email to the correct user.

If a unique email address for each user is not possible, assign a shared email address to only one active user so that the instance always matches incoming email from that address to the active user.

### Matching watermarks in the Subject line or Body

The following examples illustrate how the instance matches randomized watermarks in an email subject line or body.

**Note:** For instances upgraded from a release before Jakarta, the system can recognize both randomized and non-randomized watermarks during a watermark transition period.

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ref:MSG0000008_aLJc130zDhCVuh3spXmt</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSG0000008_aLJc130zDhCVuh3spXmt. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email</td>
</tr>
</tbody>
</table>
Examples of matching watermarks in the Subject line or body (continued)

<table>
<thead>
<tr>
<th>Subject Line or Body Contents</th>
<th>Matching Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>messages as described in Criteria for matching email to inbound actions.</td>
<td></td>
</tr>
<tr>
<td>Ref: MSGWTR0000008_wfLLz42lxCgUvG2J1Ynh</td>
<td>The instance recognizes this string as a watermark and searches the Email Watermarks [sys_watermark] table for a record with the number MSGWTR0000008_wfLLz42lxCgUvG2J1Ynh. If this watermark exists, the instance matches the email to the associated record. If this watermark does not exist, the system processes inbound email messages as described in Criteria for matching email to inbound actions.</td>
</tr>
</tbody>
</table>

Matching record numbers in the Subject line or Body

The following examples illustrate how the instance matches record numbers in the subject line of an email to an existing record when no watermark is present.

Examples of matching record numbers in the Subject line

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: Example INC0005574</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574. If this incident exists, the email is associated with this incident. If this incident record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example &quot;INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example *INC0005574</td>
<td>The instance recognizes this subject line as a reply but does not recognize the &quot;INC prefix as belonging to the Incident table because of the quotation mark. The same error occurs for any character other than a space before the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>
Examples of matching record numbers in the Subject line (continued)

<table>
<thead>
<tr>
<th>Subject line contents</th>
<th>Matching results</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE: &quot;Example INC0005574&quot;</td>
<td>The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574&quot;, which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>RE: Example INC0005574*</td>
<td></td>
</tr>
<tr>
<td>RE: CHG0008593 and INC000576</td>
<td>The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>FW: Example INC0005574</td>
<td>The instance recognizes this subject line as a forward because of the FW: prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.</td>
</tr>
<tr>
<td>Example INC0005574</td>
<td>The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.</td>
</tr>
</tbody>
</table>

**Criteria for matching email to inbound actions**

The system matches incoming email to the conditions of the active inbound actions.

- The instance recognizes this subject line as a reply and recognizes the INC prefix as belonging to the Incident table. The instance searches the Incident table for an existing record INC0005574", which it cannot find because of the quotation mark. The same error occurs for any character other than a space at the end of the record number. The instance instead uses the inbound action for new emails to create an incident and associates the new incident with the email.

- The instance recognizes this subject line as a reply and recognizes one, but not both, of the number prefixes. There is no way to predict which prefix the instance matches first. Whichever prefix it matches, it searches the corresponding table for a matching record. If the record exists, the email is associated with the table. If the record does not exist, the instance uses the inbound action for new emails to create an incident and associates the new incident with the email.

- The instance recognizes this subject line as a forward because of the FW: prefix. It uses the inbound action for forwarded emails to create an incident and associates the new incident with the email.

- The instance recognizes this subject as a new email because it does not contain a matching reply or forward prefix. It uses the inbound action for new emails to create an incident and associates the new incident with the email.
The default inbound actions create or update task record under these conditions.

**Default matching criteria**

- **Start**
  - Subject line contains a forward prefix: Run Forward inbound email action
  - Subject line or body contains a watermark: Run Reply inbound action
  - “From:” appears in the email body: Run Forward inbound email action
- **Stop**
  - Reply-To header contains a record number: Skip Reply inbound email action
  - Subject line contains a reply prefix and record number: Run New inbound email action
  - The record table matches the inbound email action table: Run New inbound email action

If you customize or deactivate the default inbound actions, the system checks the conditions of the active inbound actions. If the system cannot find an inbound action with matching conditions, it sets the state to **Processed**.

**Custom matching criteria**

- **Start**
  - Default inbound email actions are active: Email is matched to default inbound email actions
  - Email matches conditions of an active inbound email action: Matching inbound email action runs
- **Stop**
  - Email state is set to **Processed**
**Inbound action type criteria**

<table>
<thead>
<tr>
<th>Inbound email action type</th>
<th>Required matching criteria</th>
<th>Name of default action (Incident table)</th>
<th>Result of default action</th>
</tr>
</thead>
</table>
| Forward                   | The email contains the following conditions:  
1. A subject starting with a recognized forward prefix (even if a watermark or an In-Reply-To header is present).  
2. From <user email> appears anywhere in the email body. | Create Incident (Forwarded) | Create new record |
| Reply                     | The email contains one of the following conditions and the table specified in the email matches the table of the inbound action:  
1. A valid watermark that matches an existing record.  
2. An In-Reply-To email header (when no watermark is present) that matches an existing record.  
3. A subject line starting with a recognized reply prefix (when neither a watermark nor an In-Reply-To header is present) and a valid record number that matches an existing record. | Update Incident (BP) | Update existing record |
| New                       | The email does not meet the conditions for either a reply or forward type inbound email action | Create Incident | Create new record |

If more than one inbound action is available for a particular type, the instance uses the Table field to match the email to a particular table. If there is also more than one action for the inbound action’s table, the instance uses the **Order** field to determine the order in which the actions run.

**Create an inbound email action**

You can create inbound email actions to define the actions that the system takes when an email is received.
Before you begin
Role required: admin

Procedure
1. Navigate to System Policy > Email > Inbound Actions.
2. Click New.
3. Fill in the fields as described in the table.

Note: You might need to configure the form to see all fields.

Inbound Email Actions form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to run</td>
<td></td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

### Description

Enter a detailed explanation of what this inbound email action does.

### Other fields

**Order**

Enter a number to define the order in which this email action should be processed. Actions with lower numbers are processed first. The Ordered Email Processing plugin does not install this field.

### Accessing email object variables

An inbound email action script contains the email object to access various pieces of an inbound email through variables. You can use the global variable sys_email with inbound email actions.

#### Accessing email objects with variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>email.to</strong></td>
<td>Contains a comma-separated list of email addresses in the To: and Cc: boxes.</td>
</tr>
<tr>
<td><strong>email.direct</strong></td>
<td>Contains a comma-separated list of email addresses in the To: box.</td>
</tr>
<tr>
<td><strong>email.copied</strong></td>
<td>Contains a comma-separated list of email addresses in the Cc: box.</td>
</tr>
<tr>
<td><strong>email.body_text</strong></td>
<td>Contains the body of the email as a plain text string.</td>
</tr>
<tr>
<td><strong>email.body_html</strong></td>
<td>Contains the body of the email as an HTML string.</td>
</tr>
</tbody>
</table>
## Accessing email objects with variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email.from</code></td>
<td>Contains an email address that depends on the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the address listed in the email Headers field matches an existing user's Email address, this variable contains the user’s email address.</td>

</tr>
</tbody>
</table>
Accessing email objects with variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>message is.</td>
<td>The value can be <strong>High</strong>, <strong>Low</strong>, or empty.</td>
</tr>
</tbody>
</table>

<i>Note:</i> The instance follows **RFC 2822** (Internet Message Format), which requires multiple email addresses in a group to be separated by commas, not semicolons. The instance can set the values of the `email.to`, `email.direct`, and `email.copied` variables only if emails addressed to groups follow the expected RFC format.

**Inbound email.recipient variables**
The recipients variables (`email.recipients`, `email.recipients-array`) allow processing of inbound email based on the email recipients. For example, you can create a script to process email based on the array values:

```javascript
var rarray = email.recipients_array ;
for ( var i = 0 ; i < rarray.length ; i ++ ) {
    var recipient = rarray [i ] ;
    // do something with it
}
```

**The sys_email variable**
This variable lets you access the received sys_email record that triggered the inbound email action. It can be used to reference fields on the email record, such as `uid`, `sys_id`, `content_type`, and so on.

**Email user matching**
When the instance receives an email message, the system searches for an existing user record with the same email address as the sender.

**Matching email to existing users**

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>Matching User ID</th>
<th>Email Address</th>
</tr>
</thead>
<tbody>

Note: This functionality requires that you activate the Email Automatic User Creation plugin.

Inbound Email Action scripts no longer support the `gs.createUser()` method. Use either the automatically-generated email variables or the `gs.GetUserID()` method instead.

User impersonations and inbound actions

When the instance receives an email, it can take a variety of actions by impersonating the sender.

If the sender of an incoming email matches an existing user, the instance impersonates the matching user to complete any inbound email actions. If the sender does not match an existing user, the instance impersonates the Guest user to complete any inbound email actions. If the impersonated user is locked out, the inbound email action fails.

Note: If inbound email comes from an untrusted domain, the instance impersonates the Guest user unless you explicitly prevent users from untrusted domains from triggering inbound actions. For more information on filtering domains, see Designate untrusted and trusted email domains.

Enable automatic user creation

An administrator can set an email property to automatically create users from incoming email. The administrator provides a list of trusted domains to prevent untrusted users from being automatically created.

Before you begin
Role required: admin

About this task
For example, you can prevent email from users outside your company domain from creating incidents. When an instance receives a message and there is no matching email address from the sender, the instance can create a user with the User ID `[sys_user.user_name]` set to the sender's full email address. Users in your instance must still have write and update access to the records that they create or update through inbound email actions.

Note: To learn more about the `glide.user.trusted_domain` property, which affects automatic email creation, see in the Instance Security Hardening Settings.
## Creating users from incoming email

<table>
<thead>
<tr>
<th>Value of email.from Variable</th>
<th>User ID Created</th>
<th>Email Address</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;New User&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User, New&quot; <a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td><a href="mailto:new.user@company.com">new.user@company.com</a></td>
<td>New User</td>
</tr>
<tr>
<td>&quot;User&quot; <a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td><a href="mailto:nuser@company.com">nuser@company.com</a></td>
<td>User</td>
</tr>
</tbody>
</table>

### Procedure

1. Navigate to **System Properties > Email Properties**.
2. Select the check box for **Automatically create users for incoming email from trusted domains** (`glide.pop3readerjob.create_caller`).

![Property name: glide.pop3readerjob.create_caller](image)

- Automatically create users for incoming emails from trusted domains
  - Yes | No

3. Enter the list of trusted domains in **Trusted domains for creating users from incoming emails** (`glide.user.trusted_domain`).

![Property name: glide.user.trusted_domain](image)

- Trusted domains when creating new users from incoming email (Ignore email from untrusted domains unless from an existing user; use * for all domains)
  - *

**Note:** The `glide.user.trusted_domain` property prevents user creation if the sender is not from a trusted domain. However, the system may still process inbound actions for emails that are received from the domain. To have the system ignore these emails, set up a system address filter. For more information on setting up system address filters, see System address filters. You can also prevent untrusted users from triggering inbound actions by locking out the guest user.
4. Click **Save**.

5. **Optional:** Complete the following steps to lock out the guest user.
   a. Navigate to **User Administration > Users** and select the user **guest**.
   b. Select the **Locked out** field to disable the guest account.

**What to do next**

When the property `glide.pop3readerjob.create_caller` is set to **false**, the instance runs inbound actions from users who do not match an existing user by impersonating the guest user.

If the property `glide.pop3readerjob.create_caller` is set to **true**, but a user has a valid email address associated with a non-primary device, the instance creates a new user record for that email address if there is no matching email address in the Users [sys_user] table. The instance does not validate non-primary email addresses against the Notification Devices [cmn_notif_device] table.

The method the instance uses to create users can be upgraded to use the full email address by activating the Email Automatic User Creation plugin.

The plugin sets the property `glide.email.create_userid_from_email` to **true** by default. After activating the plugin, enable automatic user creation from email.

⚠️ **Warning:** Review your existing user records to reconcile any that contain identical email addresses. If you activate the plugin prior to reconciling email addresses, your instance cannot distinguish between users with identical email addresses and randomly selects one of the users with the matching email address.

**Allowing locked out users to process inbound email actions**

A property is available to allow locked out users to trigger inbound actions. For example, enabling the property can allow locked out users to reset their password and send email to the instance asking for assistance.

**Property allowing locked out users to trigger inbound email actions**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>glide.pop3.process_locked_out</code></td>
<td>Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• System Properties [sys_properties] table</td>
</tr>
</tbody>
</table>
Warning: Enabling this property (`glide.pop3.process_locked_out`) also enables users from untrusted domains to trigger inbound actions. The user must still be active.

Redirecting email to the instance POP3 account

Configure other mailboxes to forward email to the instance's POP3 account.

By default, the **POP Reader** scheduled job checks for new email every two minutes. It connects to the mail server and account specified in email properties. The **POP Reader** downloads any email waiting on the mail server and creates `email.read` events. After the instance processes the events, the inbound email actions run.

The **POP Reader** shows the number of emails processed during the reader's last run. The message shows the number of emails the reader processed or 0 if no emails were available. The reader resets the status each time it runs.

While it is not possible to specify more than one POP3 account for the instance, you can forward other mailboxes to the designated POP3 account. This script can be added to the Create Incident inbound email action to differentiate the content based on the original recipient, and then set an `assignment_group` value.

```javascript
if(email.direct.indexOf('facilities@anycorp.com')>-1)
  current.assignment_group.setDisplayValue('Facilities Management');
```

Setting field values from the email body

Values in an inbound email can set field values in a task record.

Any name:value pair in an inbound email body gets parsed into a variable/value pair in the inbound email script. The name:value pair must be on its own line. Note that most email clients limit the number of characters allowed per line and may truncate excessively long name:value pairs.

**Tip:** To prevent unexpected parsing, ensure that all the names in the name:value pairs are unique.

To populate a reference field, use `setDisplayValue()` instead. See Redirecting Emails for an example of using `setDisplayValue()` in an inbound email action.

**Note:** The action always generates a lowercase variable name. Also, this functionality does not work on reference fields.
For example, if an email body contains this line:

```
Foo:bar
```

The inbound email script creates the variable `email.body.foo` with the value of `bar`. You can use these variables to create conditions such as:

```
if(email.body.foo!=undefined){
    current.[field]=email.body.foo;
}
```

In this example, the script sets the value of `[field]` to the value `bar`.

**Note:** Spaces are rendered as underscores when a name:value pair gets parsed into a variable/value pair. For example, if an email body contains a line with spaces like `my variable:data`, then the inbound email script creates the variable `email.body.my_variable`. The value of the variable is `data`.

### Integrate inbound events

This example illustrates how to create a notification from an inbound JSON request.

#### Before you begin

Role required: admin

#### About this task

When complete, you will be able to:

- Send a JSON request to the [imp_notification] web service import set with the JSON processor
- Create a new import set in the [imp_notification] table in the instance using data from the JSON request

The following example steps assume you have your own demonstration instance.

#### Procedure

1. Activate the JSON Web Service plugin.
2. Install the RESTClient Firefox plugin.
3. Open the RESTClient.
4. Create the following JSON request.
   - **Method**: POST
   - **URL**: `http://<instance name>.service-now.com/imp_notification.do?JSON`
• **Headers**: Authorization: Basic

• **Body**:

```json
{"sysparm_action":"insert","message":"this is an event","uuid":"abc"}
```

5. Click **Send**.

6. Navigate to **Response > Response Body (Raw)**.

7. Verify that the instance sends back a response with a `sys_id`.

8. Login to your development instance.

9. In Navigation filter, enter **imp_notification.list**.

10. Verify that the import set table has an event matching your JSON request.

**Reprocess received emails**

When an email has been processed incorrectly, fix the underlying problem, then reprocess the email. You can reprocess emails individually or in a batch.
Before you begin
Role required: admin

About this task
Various scenarios can result in improperly processed emails. After taking corrective action, reprocess the emails to get correct email records. Two of the most common scenarios are:

• The inbound action failed to trigger correctly. After you update or fix the inbound action, reprocess the affected emails to create the correct records.

• Emails have accidentally ended up on a development instance, usually due to the username or password of a production or test instance being reused on the development instance. In this case, you first export the emails from the development instance as XML and import them to the correct instance. On the correct instance, reprocess the imported emails to obtain correct email records.

You can reprocess emails with the types received or received-ignored. Such emails are processed to the system mailboxes Received and Junk, respectively.

Take the following steps only after fixing the underlying problem. This procedure only reprocesses the emails.

Procedure
1. Navigate to the relevant System Mailbox or navigate to System Logs > Email.
2. Decide whether to reprocess emails individually or in a batch.
• To reprocess an individual email, open that email and click **Reprocess**.

To reprocess several emails at once, select them from the mailbox or the email log and apply the **Reprocess received emails** action.

Remember that you can reprocess only received or received-ignored emails.

**Inbound email action examples**

Various examples of inbound email actions are available to help you build your own inbound email actions. These examples show how to set up inbound email actions to handle email replies, create (log) a problem record, request a change, and update an incident.

**Inbound email action example: handling email replies**

This example shows you how to set up inbound email actions to handle replies that users send back to the instance.
Before you begin
Role required: admin

About this task
The inbound email action parses the email and responds using a script. By default, an email received by the instance creates a new incident, and the body of the email is added to the Additional Comments text box. More refined Inbound Email Actions can create incident tickets with more data, thus saving the incident management team valuable time.

Normally, when a user responds to an email sent by the instance, the inbound email action matches the watermark to an existing incident, and updates the incident rather than creating a new record. However, if the watermark is missing, this inbound email action attempts to match a reply to the original incident.

This inbound email action is replicated in Flow Designer as the sample flow Inbound Email Flow Example: handling email replies. To view the sample flow, navigate to Flow Designer > Designer.

Procedure
1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Inbound action field values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Target table</td>
</tr>
</tbody>
</table>

3. In Script, enter this code.

```javascript
gs.include('validators');

//Note: current.caller_id and current.opened_by are already set to the first UserID that matches the From: email address

if (current.getTableName() == "incident") {
    current.comments = "reply from: " + email.origemail + "\n\n" + email.body_text;

    if (email.body.assign != undefined)
        current.assigned_to = email.body.assign;

    if (email.body.priority != undefined && isNumeric(email.body.priority))
        current.priority = email.body.priority;
}```
Inbound email action example: logging a problem

This example shows you how to set up inbound email actions to create a problem record.

Before you begin
Role required: admin

About this task
Inbound email actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

This inbound email action is replicated in Flow Designer as the sample flow Inbound Email Flow Example: logging a problem. To view the sample flow, navigate to Flow Designer > Designer.

Procedure
1. Navigate to System Policy > Inbound Actions and click New.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Log Problem</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Problem [problem]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Problem: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.description = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject.toString().substring(9);</td>
</tr>
</tbody>
</table>
Inbound email action example: requesting a change

This example shows you how to set up inbound email actions to create a change request record.

Before you begin
Role required: admin

About this task
Inbound Email Actions allow users to log or update incidents on an instance via email. The inbound email action parses the email and responds using a script.

Procedure

1. Navigate to **System Policy > Inbound Actions** and click **New**.
2. Populate the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Entry</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Request Change</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Active</td>
<td>True</td>
</tr>
<tr>
<td>Target Table</td>
<td>Change Request [change_request]</td>
</tr>
<tr>
<td>Condition</td>
<td>email.subject.indexOf(&quot;Change Request: &quot;) == 0</td>
</tr>
<tr>
<td>Script</td>
<td>current.comments = email.body_text;</td>
</tr>
<tr>
<td></td>
<td>current.short_description = email.subject;</td>
</tr>
</tbody>
</table>
Values automatically set from incoming email

The default inbound action for the Incident table automatically sets the following field values when it receives an incoming email.

<table>
<thead>
<tr>
<th>Field value set</th>
<th>Value used from incoming email</th>
</tr>
</thead>
<tbody>
<tr>
<td>current.caller_id</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
<tr>
<td>current.opened_by</td>
<td>User ID of the first user whose email address matches the email.from variable.</td>
</tr>
</tbody>
</table>

If multiple users have the same email address, the instance first searches for an active user with the email address. Use unique email addresses for each user record whenever possible. If not, having only one active user with the shared email address guarantees that the instance always matches incoming email from this address to the active user.
Specifying the inbound email processing order

You can configure a processing order for inbound email actions and use the order to manage multiple filters in inbound email actions.

The Ordered Email Processing (com.glide.email_ordered_processing) plugin is enabled by default for new instances. Users with the admin role can activate the plugin for upgraded instances. The plugin adds the Order column to the Rules [sysrule] table, which the instance uses to determine when to process emails. Admins can also add a command to an action script that halts processing after the script runs.

Configure the processing order

Configure the processing order for inbound email actions to force them to run in a prescribed order.

Before you begin
Role required: admin

Procedure
1. Navigate to System Policy > Email > Inbound Actions.
2. Open an existing inbound action or create one.
3. Complete the form and assign an order number to the Order field to establish when this inbound rule should run in relation to other rules. If you upgraded and activated the plugin, the Order field might be named Execution Order.

Note: Ensure each inbound action has a unique Order value to ensure the system stops processing as expected. If multiple inbound actions have the same Order value, the system might evaluate all of the inbound actions, even if one of them contains the event.state="stop_processing"; script or has the Stop processing option selected.
4. To stop rule processing when an inbound email action runs successfully: add the following line to the bottom of the script:
• Select the **Stop processing** check box.

• Add the following line to the bottom of the **Actions** script:

```
event.state="stop_processing";
```

### Manage multiple filters in an inbound email action

Use process ordering and the `stop_processing` command to manage multiple filters in inbound email actions.

**Before you begin**

Role required: admin
About this task
In this example, you can create new problem records when prb: appears in the subject line and new change requests when chg: appears in the subject line. All other emails are used to create an incident. The actions are set up as follows:

Procedure
1. Create an action with a condition of Subject > starts with > chg: and the event.state="stop_processing"; command appended to the script.
2. Assign this action an Order value of 100.
3. Create an action with a condition of Subject > starts with > prb: and the event.state="stop_processing"; command appended to the script.
4. Assign this action an Order value of 200.
5. Create an action for incident with no conditions and an Order value of 300.

   It is not necessary to add the stop_processing command to the script for the incident action unless you want processing to stop at this rule to avoid continuing to another action.

Results
If either a change request or a problem is created, the stop_processing command stops processing, and no incident record is created. If neither a change request nor a problem is created, the inbound email action for incident creates a record.

Notify
Notify provides support for SMS and voice channels on the ServiceNow platform for communicating internally with team members and externally with customers and contractors. The plug-in also provides APIs and workflow activities to achieve the above. Some customers directly make use of the APIs in their products others via products like Major Incident Management, On-Call and CTI Softphone.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td>• Notify Number and Number groups</td>
<td></td>
</tr>
</tbody>
</table>
### Use
- Using Notify with tasks
- Using Notify with Incident Communications Management
- Using Notify with On-Call Scheduling
- Notify conference calls
- Use SMS with Notify

### Develop
- Developer training
- Developer documentation
- Components installed with Notify

### Integrate
- Notify-Twilio Direct driver

### Troubleshoot and get help
- Ask or answer questions in the developer community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

### Migrate
- Migrating from Legacy Notify
- Migrate to Notify-Twilio Direct driver

### Activate Notify
You can activate the Notify (com.snc.notify) plugin if you are an administrator. This plugin includes demo data and activates related plugins if they are not already active.

### Before you begin
Role required: admin

### About this task
Notify activates these related plugins if they are not already active.
## Plugins for Notify

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E164 Compliant Phone Number [com.glide.phone_number]</td>
<td>Provides E-164 compliant phone number support.</td>
</tr>
<tr>
<td>SMS Preferences [com.snc.sms_pref]</td>
<td>Provides ability to set SMS preferences for receiving messages from different providers.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** If you are upgrading from an earlier version of Notify, the Notify-Twilio driver remains active.

### Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

⚠️ **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Related information

### Differences between Notify and Legacy Notify

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

<table>
<thead>
<tr>
<th>Legacy Notify (com.snc.notifynow)</th>
<th>Notify (com.snc.notify)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is deprecated. Supported only telephony services.</td>
<td>Supports pure conferencing solutions such as Zoom in addition to the Telephony providers like Twilio.</td>
</tr>
<tr>
<td>Legacy Notify (com.snc.notifynow)</td>
<td>Notify (com.snc.notify)</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Manage a single number from a Twilio account per instance.</td>
<td>Provides support for multiple numbers per Twilio account, especially cross-geographical scenarios.</td>
</tr>
<tr>
<td>Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.</td>
<td>Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.</td>
</tr>
<tr>
<td>Hard-coded join conference SMS and IVR prompts for joining a conference call.</td>
<td>Includes a configurable workflow for handling SMS and Voice IVR prompts.</td>
</tr>
<tr>
<td>Support for SMS-based answers.</td>
<td>Notify On Task support for sending SMS and initiating conference calls from any task.</td>
</tr>
</tbody>
</table>

### Migrating from Legacy Notify

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: **Legacy Notify** and **Legacy Notify Admin**. New modules that replace the Legacy Notify modules are added to these sections.

⚠️ **Note:** The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the **Legacy Notify** group.

### Notify-Twilio Direct driver

The Notify-Twilio integration with the Notify-Twilio Direct driver provides APIs and workflow activities for applications to handle various notification features.
The Notify-Twilio Direct driver provides the following notification features:

- Start and manage a conference
- Send and receive SMS messages
- Send and receive calls

Notify automatically creates a TwiML application in the Twilio account and configures the application to use the instance as an endpoint.

Phone numbers associated with the Twilio account are imported to Notify. To manage phone numbers per instance, set up one Twilio account for each instance and configure all relevant phone numbers for the instance under that account.

⚠️ Note: Only one Twilio account (or subaccount) can be configured on a given Notify driver at a time. Both the old and new driver can be used simultaneously because they can be configured with different accounts.

**Activation Information**

For new customers, only the Notify-Twilio Direct driver is available by default. For customers upgrading to the latest version, both the Notify-Twilio Direct and Notify-Twilio drivers are available.

The Notify plugin must be active to access Notify.

**Related information**

- [Configure Notify with Twilio](#)

**Differences between Notify-Twilio and Notify-Twilio Direct**

Describes the differences between the Notify-Twilio and Notify-Twilio Direct drivers, including architecture, workflows, Twilio support, and task-initiated conference calls.

### Migrate to Notify-Twilio Direct driver

Migrating to Notify-Twilio Direct driver provides next-generation integration with Twilio and Notify.

**Before you begin**
- Role required: notify_admin
- You must be connected to Twilio using the Notify Twilio driver.

**Procedure**

1. Click **Migrate Now**.
2. Click **Ok** on the confirmation dialog.
   - A disconnection of the Twilio driver is initiated and the Account SID and Auth Token are copied to Twilio Direct’s configuration page. Twilio Direct is then autoconnected to that account, and you are redirected to the driver’s configuration page.

### Configure Notify with Twilio

Configure Notify to use the Twilio telephony service.

**Before you begin**
- You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio.
Important: Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique account SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

Note: Account and sub-account are Twilio categorizations, and both act the same for a ServiceNow instance.

Role required: notify_admin

Procedure

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
   
   If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.

   If the account is already associated with an instance, the system displays an error message. To connect to this account,
   - Disconnect the account from the instance.
   - Delete the TwiML apps in the Twilio account.

   Note: If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the Active field set to false. Use only active phone numbers for inbound or outbound communication.

What to do next

Phone numbers and short codes are provided by Twilio once the account is successfully connected and are stored on the Notify Phone Numbers [notify_number] table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.
**Twilio-Direct callback testing**

Make an outgoing call or send an SMS using Twilio and trigger callbacks to ServiceNow to test whether Twilio can reach the instance. You can also view when the last callback test was run, its status, and the test logs.

**Before you begin**

Role required: admin, notify_admin

**Procedure**

1. Navigate to **Notify > Administration > Twilio Direct Configuration**.
2. Click **Test Callbacks**.
3. Select the SMS option and click **Initiate SMS**.
4. Select the call option and click **Initiate Test Call**.

   **Note:** The callbacks can be tested only after a connection is established with Twilio.

**Advanced configuration for SMS**

Use the Twilio co-pilot features to improve SMS delivery with phone number like using multiple numbers to send high-volume messages and content intelligence to automatically format every message without writing custom code. Reach large lists of users with one API request.

**Before you begin**

Role required: notify_admin

**About this task**

The Twilio co-pilot features are enabled in your instance once configured.

An example of a copilot feature is that you can configure which identity (phone number, shortcode, or alpha sender ID) to use to send a message. You can also spread the messaging traffic over several phone numbers or prioritize an alpha sender ID when sending messages to countries where alpha senders are commonly used. To know more about these features, visit https://www.twilio.com/copilot.

**Important:** All the Twilio numbers must be part of the same messaging service for which you have enabled the **Advance SMS Features** feature.

The Twilio Notify bulk SMS feature is used to send SMS in bulk to customers. Use the passthrough sendBulkSMS API to reach large number of users across using a single API request. For more information on these features visit https://www.twilio.com/notify.
Procedure

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
5. On the Advance SMS Features tab, check the Intelligent SMS Handling box.
   
   Note: To setup Alpha Sender ID, users need to go to Twilio console.
6. On the Advance SMS Features tab, check the Twilio Notify Bulk SMS box.
   
   Note: This feature uses Twilio Notify feature and might have an associated cost. Contact Twilio Support for more details.

Related information

Use SMS with Notify

Advanced configuration for voice

Configure Answering Machine Detection (AMD) to determine if a human has picked up the call or not.

Before you begin
Role required: notify_admin

Procedure

1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, enter your Account SID.
3. Enter your Auth Token.
4. Click Connect.
5. On the Advance Voice Features tab, check the Detect answering machine box.
6. On the Advance Voice Features tab, enter the number of seconds in the Machine detection timeout field to set a timeout value.

Disconnect from a Twilio account

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.
Before you begin
Role required: notify_admin

Procedure
1. Navigate to Notify > Administration > Twilio Direct Configuration.
2. On the Twilio Account Properties page, click Disconnect.
3. In the Disconnecting Twilio account pop-up window, click OK.
   The account is disconnected from the instance. The system clears the Account SID and Auth Token fields and deactivates the list of associated phone numbers.

Public URLs
On-premise customers should ensure that the URLs are accessible from the Internet for the Notify-Twilio driver to work correctly.

The Notify-Twilio drivers (both new and old) require that specific URLs on the instance be accessible from the Internet by the Twilio server without authentication. If the instance is within a private network, you need to either port forward or set up a reverse proxy.

For the Notify-Twilio driver, the URLs are:

- /NotifyTwilioCallProcessor.do
- /NotifyTwilioCallStatusProcessor.do
- /NotifyTwilioSMSProcessor.do
- /NotifyTwilioDialStatusProcessor.do
- /NotifyTwilioEventProcessor.do
- /NotifyTwilioDialProcessor.do
- /NotifyTwilioRecordingProcessor.do

For the Notify-Twilio Direct driver, the URLs are:

- /api/sn_twilio_direct/twilio_callbacks/process/twiml/{callback_name}
- /api/sn_twilio_direct/twilio_callbacks/process/xml/{callback_name}

⚠️ Note: The glide.notify.endpoint property needs to be set to an Internet visible name because the instance name inside a private network can be different from the Internet domain.
Components installed with Twilio Direct driver

Several types of components are installed with the Twilio Direct driver for integration with Notify.

Business rules installed with Twilio Direct driver

Twilio installs the following business rules:

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>

Notify Zoom connector
The Notify Zoom Connector expands the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Compatibility
New York and later

Key Features
• Start and end Zoom meeting directly from any task record such as incident, or a change or even from the Major incident Workbench.
• Manage a Zoom meeting by adding or removing participants.
• Track and report meeting details such as meeting duration and attendees for further analysis.

System Requirements
• Install and activate the Notify plugin (com.snc.notify) before you install the application.
• Ensure that the system has Zoom spoke, version 1.0.2, for ServiceNow IntegrationHub plugin (sn_zoom_spoke) installed and the necessary IntegrationHub license to use Zoom for meeting management.

Plugins
• ServiceNow IntegrationHub Installer (com.glide.hub.integrations): Suite of plugins necessary to design integration flows in the Flow Designer application.
• The Zoom spoke, version 1.0.2 (com.sn.zoom.spoke) for ServiceNow IntegrationHub provides actions that allow user to create and manage the conference meetings.

Set up Notify Zoom connector in Zoom
Use the Notify Zoom connector to expand the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Before you begin
Role required: admin, Zoom admin
1. Ensure that you have Zoom spoke installed on your instance.
2. Make sure you have the required credentials and connections to Zoom on your instance.
3. Configure the Notify Zoom connector with the same Zoom account with which you created the OAuth app for Zoom spoke.

**Procedure**

1. On your Zoom OAuth app, navigate to **Feature > Add Feature > Event Subscription**.
2. Use the toggle button to enable the event subscription feature.
3. In the form that appears, fill in the URL. The URL is used to post information about events in Zoom to your instance. The format of the URL is: `https://yourinstancename.com/api/sn_notify_zoom/notify_zoom/ZoomEvent`
4. Use the **Add Events** button to list all the events which Zoom is informing Notify about.
5. In the categories that appear, select **Meeting** and select all the meeting-related events from the list and click **Done**.
6. Under **Recording**, select **All Recordings have completed** and **Recording Transcript files have completed** from the list and click **Done**.
7. Click **Save** on the Add feature screen.
8. A **Verification Token** appears on the Add Feature screen. Record the token by clicking **Copy**

**What to do next**
Configure Notify with the verification token from Zoom.

**Related information**
Configure Notify Zoom connector in Notify

**Configure Notify Zoom connector in Notify**
Configure Notify to receive the event information from Zoom. An event is usually any action that is related to a meeting.

**Before you begin**
Role required: admin
Procedure

1. Navigate to Notify > Zoom > Configuration.
2. Paste the verification token that you recorded on Zoom Event Subscription screen in the Webhook validation token field.
3. Save the record.

What to do next
Configure and use Zoom as a conference provider from any of the task records.

Note: The person creating a conference is the host of the conference and must have their email set in their ServiceNow profile and use the same email for the Zoom account.

Related information
- Configure a provider in Notify
- Start a conference call

Disable Zoom meeting password
Disable Zoom meeting password so that you can join a Zoom meeting without any meeting password.

Before you begin
Role required: notify_admin or admin

Procedure

1. Navigate to Notify > Zoom > Configuration.
2. Select Do not set password.
3. Click Update.

Notify voice and SMS capabilities
Notify provides support for SMS and voice channels for communicating internally with team members and externally with customers and contractors.

Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.

How Notify processes incoming calls
Notify processes incoming calls using workflow activities.
Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity [notify_wf_activity] table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.
3. The workflow reaches a Notify activity and invokes the activity onExecute() function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a State value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record State changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity response_args field.
9. The notify_wf_activity State changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the Last action field in the Notify call record that triggered the workflow.
11. The workflow invokes the onUpdate() function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.
13. The workflow transitions to the next activity.

Notify conference calls

Notify administrators, major incident managers, or communications managers can manage conference calls.

Conference call records are stored on the Notify Conference Calls [notify_conference_call] table. Conference call participant records are stored on the Notify Conference Call Participants [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the Duration of a call, are set automatically using business rules.
**Note:** If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of *Invalid*.

Notify administrators, major incident managers, or communications managers can manage conference call participants.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS
- Notify: (Re)join Conference Call with muting

**Note:** Notify: (Re)join Conference Call with muting is available only with demo data.

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

**Start a conference call**

Start a conference call from a task or an incident communication plan by inviting one or more users to join a call. The conference will not start until at least two participants join.

**About this task**

Call participants can include:

- Users who have been assigned specific responsibilities
- Ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

**Procedure**

1. Navigate to Incident Communications Management > Open.
2. Open the relevant incident communication plan.
3. Click the Initiate Conference Call related link.
4. From the dialog box that appears, choose the Conference Bridge that you want to dial from.
5. Select the participants for the conference.
The dialog box displays the Recommended and Selected participants for the conference. All users from the User Contacts list in the incident communication plan are in the Recommended section by default. The user who initiates the conference call is added to the selected list of participants.

If a shift exists for the group contacts, the primary and secondary on-call resources are shown in the Recommended list.

Calls are placed to the number in the Mobile phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be
retrieved based on the user's location and, if possible, converted into a valid E.164 number.

6. To select ad-hoc participants,

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon, and select the relevant user.</td>
<td>Click <strong>Add to selected</strong>.</td>
</tr>
<tr>
<td>Enter the participant's phone number</td>
<td>Click <strong>Add to selected</strong>.</td>
</tr>
</tbody>
</table>

7. After the participant list is finalized, click **Start Call**. The conference call starts and a **Conference call initiated** message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.

8. Click the **Conference call initiated** message to see details of that conference call. When the final participant leaves the conference, the conference call closes.

   ✉  Note:  VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

Add participants to a conference call

Add a participant to a conference call using Notify.

Before you begin
Role required: notify_admin, major_incident_manager, or communication_manager

About this task
You can add the following participants:

- Users who have been assigned specific responsibilities
- Required ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts
Procedure
1. Navigate to **Notify > Conference Calls**.
2. Open the conference call that you want to add a participant to.
3. Click the **Add Participant** related link.
4. In the dialog box that appears, select the participants you want to add to the conference.
   You can add a single participant, a group of participants, or a phone number.

**Add Participants dialog box**

5. You can send an optional message for the participant who you want to add in the **Include a brief message for participants** field.

6. Click **Add Participant**.
   The selected user, group, or phone number is added to the selected conference call.
Related information

Mute or kick a conference call participant

Mute or unmute all participants
As a communications manager or a conference call host, mute/unmute all the conference participants from the workbench.

Before you begin
Role required: notify_admin, major_incident_manager, or communications_manager
Before starting this procedure, ensure there is an active conference call with one or more participants.

Procedure
1. Navigate to Major Incident Management in the application filters.
2. Select the incident that you are trying to resolve.
3. On the incident, click View Workbench
4. In the Conferences tab, select a conference

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mute All</td>
<td>Click this button to mute all the participants in the conference</td>
</tr>
<tr>
<td>Unmute All</td>
<td>Click this button to unmute all the participants in the conference</td>
</tr>
</tbody>
</table>
Mute All

Unmute All
Mute or kick a conference call participant
As a communications manager, you can mute or kick conference call participants.

Before you begin
Role required: notify_admin, major_incident_manager, or communication_manager
Before starting this procedure, ensure there is an active conference call with one or more participants.

Note: Any participant with the host flag set to active, can mute or kick a participant from a conference call.

Procedure
1. Navigate to Notify > Conference Calls.
2. Select a conference call.
3. In the Notify Conference Call Participants related list, select a participant.
4. Click Mute or Kick.

   Note: You can unmute a muted participant. A kicked participant may rejoin the conference call by calling in again.

Send a message to conference call participants
Send a brief message as a text or voice message to the participants of a conference call to set a context to the call.

Before you begin
Role required: major incident manager

About this task
You must configure a telephony provider like Twilio so that you can use one of the Notify numbers to send SMS to the conference call participants.

Procedure
1. Navigate to Major Incident Management > View Workbench.
2. In the Conference tab, select the type of the call and click Start Call.
3. In the Include a brief message for participants field, type the message that you want to send to the conference call participants and click Start Call.
**Initiate a conference call**

**Conference Bridge**
+14046204596

**Add Participants**
- Email

**Selected**
- System Administrator (Open eig
- Lucy Barnes (Incident Manage

**Include a brief message for participants**

*Users displayed in red do not have a mobile phone number*

*160 characters remaining of 160 characters*

**Note:** Upon clicking **Start Call** the message text entered will be stored as description on the conference call record. If the OOB workflow is not modified, then the workflow takes care of sending this message text as SMS to the user. This is applicable if you have configured a telephony provider.

**Viewing conference call information**

Conference calls are listed as system activities in the **Activity** section of the Incident Communication Plan form and also are listed in the **Conference Calls** related list.
List of Notify calls

If you are a Notify administrator, you can view a list of calls and the status of a call made to or from Notify. The call records help in reporting and analytics.

To view a list of calls, navigate to Notify > Calls.

Call records are generated automatically when a user calls a Notify number or when a user makes an outbound call through Notify. You cannot create call records manually.

**Note:** Although you can delete a call record, doing so may result in cascade deletion of related records.

For Notify calls where the source is specified, such as a task number, the source is added to the Notify Calls [notify_call] table in the Source column. For Notify conference calls where the source is specified, the source is added to the records for each of the calls in the conference.

<table>
<thead>
<tr>
<th>Call status</th>

<td>The call could not be completed as dialed, most likely because the phone number was non-existent.</td>
</tr>
<tr>
<td>invalid</td>
<td>The call could not be connected since input is invalid.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

### Use SMS with Notify

Send and receive SMS messages using Notify.

Notify stores inbound and outbound SMS messages in the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost because each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API `sendSMS` method. This method takes one recipient as an input parameter. You can also use the `send SMS` workflow activity.

To send SMS messages to one or more recipients, use the Notify API `sendBulkSMS` method. This method takes a list as an input parameter and uses one API call to send multiple messages. Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.

> **Note:** When using `SNC.Notify.sendBulkSMS` API, instead of simply iterating over the numbers, all the given numbers are sent for SMS to Twilio in one API call. This happens only when Twilio Direct driver is active and Twilio Notify bulk SMS is enabled for the number in Advanced SMS features.

The Notify-Twilio integration provides programmable SMS outbound message status tracking with Status Callbacks. These callbacks can be helpful to see if a message has been delivered, failed, or ran into some other delivery issues.
SMS Statuses

Every Twilio SMS message request has a status value which describes the current state of the message. Use this information for troubleshooting SMS related incidents/ issues. Here are few descriptions of possible statuses of SMS sent from Notify through Twilio REST API.

Outbound message status progression

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queued</td>
<td>The message has been queued by the provider to be sent to the carrier network.</td>
</tr>
<tr>
<td>accepted</td>
<td>The message is being processed by the provider before sending it to the carrier network.</td>
</tr>
<tr>
<td>sending</td>
<td>The message is being forwarded to the carrier network.</td>
</tr>
<tr>
<td>sent</td>
<td>The message has been successfully forwarded to the carrier network.</td>
</tr>
<tr>
<td>receiving</td>
<td>The provider has received an incoming message from the carrier network and is processing it.</td>
</tr>
<tr>
<td>received</td>
<td>ServiceNow has received the incoming message from the provider.</td>
</tr>
<tr>
<td>delivered</td>
<td>The message has been delivered to the target device.</td>
</tr>
<tr>
<td>undelivered</td>
<td>The message could not be delivered to the target device.</td>
</tr>
<tr>
<td>failed</td>
<td>The message failed to be forwarded to the carrier network.</td>
</tr>
<tr>
<td>unknown</td>
<td>The driver does not support the status</td>
</tr>
</tbody>
</table>

Note: A provider may not be able to report this status if the upstream carrier does not report this.
Send an SMS with Zoom meeting invite

Send an SMS with Zoom meeting invite to ensure that the meeting participants or any newly added participant is updated with the meeting details when the meeting host starts the conference or adds a participant to the conference.

Before you begin
Role required: notify_admin or admin

ℹ️ Note: You need a telephony provider like Twilio or Nexmo.

Procedure
1. Navigate to Notify > Zoom > Configuration.
2. In the Run Workflow on conference change field, enter Notify Zoom: Send SMS on Conference Change.
   The Notify Zoom: Send SMS on Conference Change workflow is available with the demo data of the Notify Zoom Connector plugin (sn_notify_zoom).
3. Click Update.

Outbound communication requirements
Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy recipient number requirements.

Recipient number requirements
These requirements apply to any number that receives a Notify phone call or message.

- The number must be E.164 compliant.
- The number must be different than the phone number used to initiate the call or message.

These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the glide.notify.debug property to true to create detailed error logs.

Using Notify with tasks
Notify allows you to initiate conference calls and send SMS alerts from task records.
This functionality is available for all tables that extend the Task table, such as incident, problem, or change request. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property `glide.notify.task.phone_number`.

**Start a conference call from a task**

Use Notify to start conference calls from a task record.

**Before you begin**
- Role required: itil
- Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflow.

Use the `glide.enable.notify_on_task` property to enable Notify integration for Task table and its extensions. Entering phone number in `glide.notify.task.phone_number` property is equivalent to setting `glide.enable.notify_on_task` to true.

**Procedure**

1. Navigate to any task record, such as an incident or change request.
2. Click the **Start conference call** related link.
3. Select one or more **Recipients** to participate in the conference call.
4. Click **Start**.
   - Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the **Conference calls** related list. You may need to configure the form to add the related list.

**Manage conference calls on task**

Add and manage multiple participants on the conference including self-joining in to the conference call and end the conference call when the discussion is over.

**Before you begin**
- Role required: itil, itil_admin, or admin
- A conference call is already initiated.
About this task
The **Manage Conference Calls** UI action is available for any table that extends the Task [task] table. If at least one conference call is active on a task record, the link appears on the related links section of the form. Out of the tables that extend the task table, the **Manage Conference Calls** UI action is intentionally hidden for Incident Communication Plan [incident_alert] table and Communication Task [comm_task] table. For these two tables, the functionality is already available as **Join conference call** and **End conference call** UI actions.

Procedure
1. Navigate to any task record such as Incident, Problem, or Change Request.
2. Open the record on which the conference all is active.
3. In the related links, click **Manage Conference Calls**.
4. In the Manage Conferences window, you can perform the following activities:

<table>
<thead>
<tr>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If the logged in user is not already a part of the conference call, the user can join the conference.</td>
</tr>
<tr>
<td>Add Participants</td>
<td>Add participants to the conference who can contribute to the discussion.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

5. **Optional:** In the Manage Conferences window, click the conference call number to know the details of the conference.

Send an SMS alert from a task
Use Notify to send information related to a call through SMS alerts from a task record.

**Before you begin**
Role required: itil

**About this task**
Ensure that there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows.
Use `glide.enable.notify_on_task` property to enable Notify integration for Task table and its extensions. Entering phone number in `glide.notify.task.phone_number` property is equivalent to setting `glide.enable.notify_on_task` to true.

Procedure

1. Navigate to any task record such as an incident or a change request.
2. Click the Send SMS related link.
3. In the From choice list, select the phone number from which you want to send the SMS message.
4. Select and add the participants to whom you want to send the SMS message. All users from the User Contacts list in the incident communication plan are in the Recommended section by default.

   The dialog box displays the Recommended and Selected participants you selected to send an SMS message.

5. To select ad-hoc participants, choose one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the reference lookup icon and select the relevant user</td>
<td>Click Add to selected.</td>
</tr>
<tr>
<td>Enter the participant's phone number</td>
<td>Click Add to selected.</td>
</tr>
</tbody>
</table>

6. After the participant list is finalized, type the message you want to send to the participants in the Message field and click Send SMS.

Results

Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the SMS Messages related list. You might need to configure the form to add this related list.

Using Notify with Incident Communications Management

Use Notify with incident communication plan to send SMS messages or start conference calls.

Certain configuration steps are required to use Notify with an incident communication plan.
• Both Notify and Incident Communications Management must be active.
• Notify must be configured and able to initiate and receive phone calls and SMS messages.
• The property `com.snc.iam.notify_number` must be set to an active Notify number with outgoing voice and SMS capability.
• This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

**Note:** The Conference Call Group number group is configured with conference call workflows by default.

**Related information**
- Incident Communications Management
- Numbers and number groups
- Notify conference calls

**Initiate a conference call from incident communication plan**

Use Notify to initiate a conference call from an incident communication plan by inviting one or more users.

**About this task**
Role required: admin

**Procedure**
1. Navigate to **Incident Communications Management > All**.
2. Open the relevant incident communication plan.
3. Click the **Conference** tab.
4. For the relevant incident communications task, under **Actions**, click **Start Conference Call**.
5. Select the conference bridge and the participants for the conference call. Available options in the conference bridge depend on the conference providers configured. For more information, refer **Configure a provider in Notify**.

**Join and end a conference call from incident communications management**

After a conference call is initiated, join the call to participate in the discussion or end the call when the conference is no longer required.
Before you begin
Role required: ia_admin or admin

Procedure
1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. For the relevant incident communications task, under Actions, perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join Conference Call</td>
<td>If you are not already logged into the conference call, you can join the conference.</td>
</tr>
<tr>
<td>End Conference Call</td>
<td>End the conference when the discussion is over.</td>
</tr>
</tbody>
</table>

Note: The work notes get updated with the details of the conference call such as duration and participants.

Send communication updates for an incident communications plan
Update users on the latest communication on an incident through selected communication channels.

Before you begin
• Role required: admin
• Activate the Notify plugin (com.snc.notify) if you want to send communication through SMS.
• Set at least one communication channel for a communication task as SMS or email.

Procedure
1. Navigate to Incident Communications Management > All.
2. Open an incident communication plan record.
3. From the Incident Communication Tasks related list, open the incident communication task for which you want to send updates.

4. In the related links, click **Start Updates**.

5. Fill the required information and click **Send**.
   For sending an SMS communication, in the From choice list, select a number from which you want to send the communication.

6. Click **Send**.

**Using Notify with On-Call Scheduling**

When using both Notify and On-Call Scheduling, you can send On-call escalation notifications as SMS messages, in addition to emails.

Configure the following items to use Notify with On-Call Scheduling:

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.

- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.

**Set up Notify with On-Call Scheduling**

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

**Before you begin**

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: admin

**About this task**

Set up Notify with On-Call Scheduling for the first time or migrate from On-Call Scheduling with NotifyNow.
Procedure

1. Navigate to Notify > Numbers.

2. Select the phone number you want to use to send and receive on-call scheduling messages.

3. In the Notify group field, select the On-Call Group.
   The On-Call Group is configured with the on-call workflows: On-Call: Check Assignment Response and On-Call: Assign by Acknowledgement Voice by default.

4. Navigate to Workflow > Workflow Editor.

5. Select the On-Call: Assign by Acknowledgement workflow.
   If migrating from NotifyNow, and you have previously customized this workflow, you must import the new version of the workflow manually. See KB0551603 for more information.

6. Click the workflow menu icon in the title bar and select Copy to copy the On-Call: Assign by Acknowledgement per rota workflow. Save the copied workflow under a different name than what it is named by default.

   Note: You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.

7. Select a Send SMS activity.

8. In the To (script) field, modify the getRecipientsAndNumberToSendFrom() to use the correct from number's sys ID.

9. Close the Workflow Editor

10. Navigate to On-Call Scheduling > Trigger Rules.

11. Select a trigger rule that launches an assignment workflow

12. In the Trigger action field, select Workflow.

13. In the Trigger workflow field, select the On-call: Assign by Acknowledgement workflow.

14. Click Update.

15. Repeat the previous 3 steps for each assignment trigger rule.
   Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

Related reference

Workflow editor title bar
Controlling the on-call communication channel with Notify

Configure On-Call Scheduling with Notify to always use a user's preferred communication channel.

If Force communication channel is specified in the Escalation settings for rosters, the preferred user device is used: SMS, voice, or email.

For example, if the preferred device is SMS and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

Related information

Subscription-based notifications

Workflow: On-Call: Assign by Acknowledgement

The On-Call: Assign by Acknowledgement workflow is provided with Notify.

The workflow uses data from the escalation settings, including overlapping shifts and custom escalation settings, of shifts and rosters. Depending on these escalation settings, the workflow iterates through the defined escalation chain and sends notifications by SMS, email, or voice to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-Call Scheduling and Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

Call a user from the WebRTC UI

Make outbound calls and receive a voice call in the browser through the WebRTC interface from On-Call Schedules landing page, Roster and Escalation Details modal and on-call calendar.

Before you begin
Role required: itil
Procedure
1. Navigate to On Call scheduling > On Call calendars.
2. In the calendar that opens, click the name of the user you want to call.
3. Choose Call to call the user.

Key differences between on-call scheduling with NotifyNow and with Notify
There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions
The On call: Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-Call Scheduling with Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Notify administration
As a Notify administrator, you can create number and number groups, create and modify workflows, update the tables and so on.
Numbers and number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.

If the number group workflows have incorrect conditions, a warning appears.

Create a number group

Group Notify phone numbers and share workflows across grouped numbers.

Before you begin

Role required: notify_admin

About this task

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the Notify Phone Numbers related list on the Notify Phone Number Group form.
Procedure

1. Navigate to Notify > Number Groups.

2. Click New.

3. Enter a Name, and select Notify: (Re)join Conference Call for the Incoming call workflow field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the number group.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Incoming call workflow</td>
<td>Workflow to run when there is an incoming phone call for this group.</td>
</tr>
<tr>
<td>Incoming SMS workflow</td>
<td>Workflow to run when there is an incoming SMS message for this group.</td>
</tr>
<tr>
<td>Outgoing call workflow</td>
<td>Workflow to run when there is an outgoing phone call for this group.</td>
</tr>
<tr>
<td>Outgoing SMS workflow</td>
<td>Workflow to run when there is an outgoing SMS message for this group.</td>
</tr>
</tbody>
</table>

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click **Submit**.

**What to do next**

**Associate a number to a number group**

After creating a number group, associate numbers with that group to use the selected workflows.

⚠️ **Note:** Each phone number can only be associated with one number group.

**Associate a number to a number group**

Associate a Notify number to a number group to use inbound and outbound workflows.

**Before you begin**

Role required: notify_admin
Procedure

1. Navigate to Notify > Numbers.

2. Click the listed phone number and assign it to a Number Group, as appropriate.

   Note: Each phone number can only be associated with one number group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number for the entry.</td>
</tr>
<tr>
<td>Phone number</td>
<td>E.164 phone number, if applicable.</td>
</tr>
<tr>
<td>Notify group</td>
<td>(Optional) Group to which this number is assigned.</td>
</tr>
<tr>
<td>Number owner</td>
<td>Service provider of the number.</td>
</tr>
<tr>
<td>Short Code</td>
<td>Short code number, if applicable.</td>
</tr>
</tbody>
</table>
3. Click **Update**.

### Configure a provider in Notify

Configure a conference provider or a phone number to be used as choices for initiating a conference call. For sending SMS, configure preferences for phone numbers.

**Before you begin**

Role required: notify_admin

**About this task**

**Procedure**

1. Navigate to **Notify > Provider Selector**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Provider selector fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Order</td>
</tr>
<tr>
<td>Source table</td>
</tr>
<tr>
<td>Condition</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Default</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual selection</td>
<td>Disables the automatic selection of this provider, for example, if in a communication plan you want to use this provider only as a forced communication channel.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

5. In the Provider Selector Choices section, click **New**.

6. Search for the conference provider or the Notify group that contains the phone numbers for initiating a conference.
   For sending SMS, search for the Notify group that contains the phone numbers.

7. Click **Submit**.

**Configure SMS opt-out preferences**

Allow recipients to opt out of receiving text messages.

**Before you begin**

Role required: admin, notify_admin

**About this task**

According to regulations in the CTIA Short Code Monitoring Handbook, recipients must be allowed to opt out of receiving text messages. The opt-out functionality is applicable only to Notify. When the user sends an SMS message with an opt-out keyword to any Notify number, the user is opted out of receiving messages from only the Notify number to which the message has been sent, not from all Notify numbers on that instance.

**Important:** The Advanced opt-out feature is automatically enabled for short code and long code numbers associated with a Messaging Service. For more information, refer Getting Started with Advanced Opt-Out for Messaging Services. As this feature is a duplicate of the Twilio’s new Advanced Opt-out feature, you should not activate the feature for numbers that are part of Messaging Service. For long code numbers that are not part of a Messaging service, Twilio handles the opt-out for default stop keywords listed at Twilio support for opt-out keywords.

**Note:** This feature is disabled by default and holds significance for short-code and long codes that are not part of Messaging Service. To enable this feature, the Notify admin needs to create a configuration for short and long codes using the given procedure.
Procedure

1. Navigate to Notify > Administration > SMS Preference Configuration.
2. Click **New** in the SMS Preference Configuration window.
3. Fill in the form fields.

### SMS configuration preference fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STOP, STOPALL, END, CANCEL, QUIT, and UNSUBSCRIBE.</td>
<td></td>
</tr>
<tr>
<td>Opt-out confirmation message</td>
<td>Customized confirmation message to send to customers when they opt out of receiving SMS messages.</td>
</tr>
<tr>
<td>Opt-in keywords</td>
<td>Customized confirmation responses that enable customers to receive the messages coming from a phone number. You can configure standard keywords such as START, UNSTOP, and YES.</td>
</tr>
<tr>
<td>Opt-in confirmation message</td>
<td>A customized confirmation message to send to customers when they opt in to receiving SMS messages.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Notify workflow activities**

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the **Table** field value is **Notify Call [notify_call]**.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the **current.is_human** variable, such as with an **If** workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

**Related information**

Using variables in Notify workflow activities
**Join conference call workflow activity**

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select this check box to record the conference call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

**Scratchpad entries**

The activity uses the workflow scratchpad to read persistent values.

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the</td>
</tr>
</tbody>
</table>
Values read from scratchpad (continued)

<table>
