<td>activity will log an error. When initiating an outgoing call workflow using the Notify API <code>call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)</code> method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable different attributes available with Join Conference Call activity

System administrators can enable any or all of the below attributes and use them in the Join Conference Call workflow activity.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hangupOnStar</td>
<td>When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.</td>
</tr>
<tr>
<td>muted</td>
<td>When muted is enabled (set to true), the participant will join the conference in a muted state.</td>
</tr>
<tr>
<td>beepOnEnter</td>
<td>When beepOnEnter is enabled (set to true), a notification beep is played when a user joins the conference.</td>
</tr>
<tr>
<td>beepOnExit</td>
<td>When beepOnExit is enabled (set to true), a notification beep is played when a user leaves the conference.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>enableImmediateInput</td>
<td>When enableImmediateInput is enabled (set to true), it allows input of a single digit immediately after the conference ends for this user and sets that in workflow.scratchpad.confDigits. This option will be ignored if hangupOnStar is false.</td>
</tr>
</tbody>
</table>

To enable any of the above attributes, perform the following steps:

1. Navigate to **Workflow > Administration > Workflow Versions**.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the **Show Workflow** related link.
4. To modify the workflow, click the WorkFlow Actions icon and click **Checkout**.
5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true in the **config** variable in the script. The default setting is false.
8. Click **Update**.
9. Click the WorkFlow Actions icon and click **Publish** to save the changes.

Similarly, you can enable the other attributes.

**Call workflow activity**

The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
</tbody>
</table>
## Input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number <code>sys_id</code>, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

## Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

## Send SMS workflow activity

The **send SMS** workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.

## Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
</tbody>
</table>
### Input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
</tbody>
</table>
| Message      | Enter the message to send. You can add field values from the current record by using the Select variables box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used.  
Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning. |
| To (script)  | Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message.  
The script should return a JavaScript object with the format `{notify_number: '\...sys_id...\', users: [...], groups: [...], numbers: [...]}. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers.  
This field appears only if **Advanced** is selected. |

### Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

### Forward call workflow activity

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.
If the person receiving a forwarded call hangs up, the forward call activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The forward call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**

The Input activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the Finish key to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
</tbody>
</table>
Input Variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an answer variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  "1": {
    "play": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "play": "https://some_url.com/options/two.mp3",
    "myCustomData": "some other data here"
  },
  "3": {
    "speak": "type 3 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code using the speak attribute or URL of the music to be played using the play attribute. You can also add optional attributes to store related information, such as myCustomData in the example above.

ℹ️ Note: The script object continues to support say attribute for backward compatibility.

**Conditions**

The conditions determine the transition that comes after this activity.

The input activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu.
menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire <strong>answer</strong> variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is <em>choices</em>, you can access values from the menu using</td>
</tr>
</tbody>
</table>

```javascript
var previousActivity = "choices";
var choicesMenu = workflow.scratchpad.menu[previousActivity];
var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input.
var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.
```
Hangup workflow activity

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

Play workflow activity

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <strong>play</strong> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The **Record** workflow activity records audio from a user on a Notify call.

**Note:** The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the **Record** activity variable on the **Join Conference Call** workflow activity.

**Input Variables**

Input variables determine the initial behavior of the activity.
### Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

### Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The **record** activity adds the **recording** variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

#### Values written to scratchpad

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller’s phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

### Reject workflow

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.
Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity
The say workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

Forward to notify client workflow activity
The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.

Input variables
Input variables determine the initial behavior of the activity.
### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to connect to, instead of using the <strong>User</strong> variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

### Queue workflow activity

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

### Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

When the telephony provider broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.
Creating Notify activities

Default Notify workflow generally performs a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the `onCompleted` function.

```javascript
onCompleted: function() {
  activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- **Within `onExecute` event handler function**, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the notify_wf_activity table.

- **Within the `onUpdate` event handler function**, deserialize the NotifyAction object from the notify_wf_activity table and use this object to perform any other operations.

- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

Related information

Notify languages

Notify supports multiple languages when using text-to-speech. For example, when using the `input` or `say` workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Languages [notify_language] table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.
Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the **Reject** activity ends the call before the caller connects so the **onNoAnswer** function is never invoked from this activity.

⚠️ **Note:** When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

<table>
<thead>
<tr>
<th>Event handlers</th>
<th>Description</th>
<th>Activities</th>
</tr>
</thead>
<tbody>
<tr>
<td>onExecute</td>
<td>Runs when the activity first runs.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onUpdate</td>
<td>Runs when the call record associated with the workflow is updated.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onCompleted</td>
<td>Runs when a call ends.</td>
<td>All call-related activities</td>
</tr>
<tr>
<td>onRinging</td>
<td>Runs when a call starts ringing.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onInProgress</td>
<td>Runs when both parties are connected on a call.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onNoAnswer</td>
<td>Runs when a call is not answered.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onBusy</td>
<td>Runs when a called number is busy.</td>
<td>Forward call, call, join conference call, forward to notify client</td>
</tr>
<tr>
<td>onFailed</td>
<td>Runs when an error occurs.</td>
<td>All call-related activities</td>
</tr>
</tbody>
</table>

Components installed with Notify

Several types of components are installed with the Notify application.
Roles installed with Notify

Notify adds the following roles.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify administrator [notify_admin]</td>
<td>Administrator with privileges for Notify 2 functionality.</td>
<td>• workflow_admin&lt;br&gt;• workflow_creator&lt;br&gt;• workflow_publisher</td>
</tr>
<tr>
<td>Notify viewer [notify_view]</td>
<td>Can view notify content. This role has read-only access to the Notify Conference Calls table [notify_conference_call] and the Notify Conference Call Participants table [notify_participant].&lt;br&gt;The itil role inherits the notify_view role when the Incident Communications Management and the Notify plugins are activated.</td>
<td></td>
</tr>
</tbody>
</table>

Tables installed with Notify

Notify adds the following tables.

<table>
<thead>
<tr>
<th>Tables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
</tr>
<tr>
<td>Notify Conference Calls [notify_conference_call]</td>
</tr>
<tr>
<td>Notify Calls [notify_call]</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>Notify Call Queue [notify_queue]</td>
</tr>
<tr>
<td>Notify Call Status [notify_call_status]</td>
</tr>
<tr>
<td>Notify Client Connected Sessions [notify_client_session]</td>
</tr>
<tr>
<td>Notify Conference Call Participants [notify_participant]</td>
</tr>
<tr>
<td>Notify Conference Call Participant Sessions [notify_participant_session]</td>
</tr>
<tr>
<td>Notify Messages [notify_message]</td>
</tr>
<tr>
<td>Notify Phone Numbers [notify_number]</td>
</tr>
<tr>
<td>Notify Phone Number Groups [notify_group]</td>
</tr>
<tr>

![Notify call sequence diagram](image)

### Properties installed with Notify

Notify adds the following properties.

### Properties for Notify

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_twilio_driver.max_conference_participants</td>
<td>Twilio maximum limit for number of participants in the conference call.</td>
</tr>
<tr>
<td>com.snc.iam.notify_number</td>
<td>The Notify number to use for conference calls.</td>
</tr>
</tbody>
</table>

**Note:** This number must have a group configured with conference call workflows.
### Properties for Notify (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.notify.task.phone_number</td>
<td>Notify phone number used for sending SMS-s and starting conference calls from any record that belongs to the task table (or a table that extends the task table). The number must be entered in E.164-compliant format.</td>
</tr>
<tr>
<td>glide.notify.sms.max_concatenation</td>
<td>Notify supports the concept of SMS concatenation. When the SMS body exceeds the maximum length of a single SMS (160 characters for plaintext SMS messages or 70 characters for Unicode SMS messages), Notify can concatenate up to 10 SMS messages which will be joined on the receiver’s mobile phone. This property configured the maximum number of SMS messages that will be concatenated into one large SMS message. If the body length is exceeded the body will be truncated and a message will be logged. Note: The charges are per sms, which means that 1600 character SMS will be 10 times as expensive as a 160 character SMS. Also note that not all providers support SMS concatenation.</td>
</tr>
<tr>
<td>glide.enable.notify_on_task</td>
<td>Use this property to enable Notify integration for Task table and its extensions. Entering phone number in</td>
</tr>
</tbody>
</table>

## Properties for Notify (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'glide.notify.task.phone_number'</code> property</td>
<td>Equivalent to setting this to true.</td>
</tr>
<tr>
<td><code>glide.notify.endpoint</code></td>
<td>If the instance is accessible on public internet using some other name, which can happen if the instance is within a private network and is accessible via a reverse proxy from outside. In that case the public name needs to be provided here. e.g. https://some_public_domain.com</td>
</tr>
<tr>
<td><code>glide.notify.sms.save_confirmation_in_db</code></td>
<td>Check <strong>Yes</strong> if you want track the confirmation of opt-in/out requests SMS. The confirmations are saved in notify_message table.</td>
</tr>
<tr>
<td><code>com.snc.iam.enable_notify</code></td>
<td>Use this property to enable Notify integration for Incident Communications Management. Entering phone number in <code>com.snc.iam.notify_number</code> property is equivalent to setting this to true.</td>
</tr>
<tr>
<td><code>com.snc.iam.notify_number</code></td>
<td>The Notify number to use for conference calls. Note that this number needs to have a group configured with conference call workflows.</td>
</tr>
<tr>
<td><code>com.snc.on_call_rotation.notify_webrtc_number</code></td>
<td>Specify a valid Notify number with voice capability. This will enable On-Call integration with Notify which allows On-Call users to directly call people on rosters from the browser.</td>
</tr>
</tbody>
</table>
## Properties for Notify (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_major_inc_mgmt.notify_webrtc_number</td>
<td>Specify a valid Notify Number with voice capability. This will enable a specific Major Incident Management integration with Notify which allows Workbench users to directly call people from the browser.</td>
</tr>
</tbody>
</table>

## Business rules installed with Notify

Notify adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Call Workflows for Shortcodes</td>
<td>[notify_group]</td>
<td>Checks and displays an error if the call is being triggered by a short code.</td>
</tr>
<tr>
<td>Update Participant Duration</td>
<td>[notify_participant]</td>
<td>Updates participant duration when it becomes inactive.</td>
</tr>
<tr>
<td>Check if Notify call exists and active</td>
<td>[notify_participant_session]</td>
<td>Checks if Notify call has valid reference record and updates it if the call is inactive currently.</td>
</tr>
<tr>
<td>Update Last Active On</td>
<td>[notify_participant]</td>
<td>Sets the last active before insertion/update of Notify participant.</td>
</tr>
<tr>
<td>Show info msg about selection in choice</td>
<td>[notify_group_selector_choice]</td>
<td>Displays a message if either Notify group or conference provider is not selected.</td>
</tr>
<tr>
<td>Validate values in the choice</td>
<td>[notify_group_selector_choice]</td>
<td>Checks if either of Notify group or conference provider is filled.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Set scratchpad values</td>
<td>[notify_group_selector_choice]</td>
<td>Checks if conference provider is available by iterating through service provider list.</td>
</tr>
<tr>
<td>Show message for empty choices</td>
<td>[notify_group_selector]</td>
<td>Displays an info message if there are no choices for the provider selector.</td>
</tr>
<tr>
<td>Clear fields when Manual Selection is set</td>
<td>[notify_group_selector]</td>
<td>Clears out some fields when manual selection is set in Notify group selector table.</td>
</tr>
<tr>
<td>Update Participant Duration</td>
<td>[notify_participant_session]</td>
<td>Calculates the duration of participant on conference call.</td>
</tr>
<tr>
<td>Update session muted state</td>
<td>[notify_participant]</td>
<td>Sets the value of mute and expelled to true once the conference call participant becomes inactive.</td>
</tr>
<tr>
<td>Update conference call</td>
<td>[notify_participant]</td>
<td>Sets the state of conference call based on the participant leaving or joining the call.</td>
</tr>
<tr>
<td>Validate Order field value</td>
<td>[notify_group_selector]</td>
<td>Validates order field value to be unique amongst all provider selectors.</td>
</tr>
<tr>
<td>Restrict Workflows For only Voice Nums</td>
<td>[notify_number]</td>
<td>Restricts association of voice only capable number with number group having inbound/outbound SMS workflows.</td>
</tr>
<tr>
<td>Restrict Workflows For only SMS Numbers</td>
<td>[notify_number]</td>
<td>Restricts association of SMS only capable number with number group having inbound/outbound voice workflows.</td>
</tr>
<tr>
<td>Validations on default record</td>
<td>[notify_group_selector]</td>
<td>Validates that source table and order field are mandatory in case of default set to false and</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Clearing fields when Default is true</td>
<td>[notify_group_selector]</td>
<td>Clears out some fields when default is set to true.</td>
</tr>
<tr>
<td>No Default selector set</td>
<td>[notify_group_selector]</td>
<td>Ensures one active provider selector is set as default.</td>
</tr>
<tr>
<td>Check active default selector is unique</td>
<td>[notify_group_selector]</td>

**Notify connector for Microsoft Teams**

Notify connector for Microsoft Teams enables you to manage and initiate a Microsoft Teams meeting directly from any record such as an incident, or a task.

**Key Features**

- Start and end Microsoft Teams meetings directly from any record such as an incident or a task or from the major incident workbench.
- Manage a Microsoft Teams meeting by adding or removing participants.

**System Requirements**

Install and activate the Notify plugin (com.snc.notify) before you install the application.

Install the ServiceNow IntegrationHub Installer (com.glide.hub.integrations) plugin to design the integration flows in the Flow Designer application. For more information, see Request IntegrationHub.

**Set up and configure Notify connector for Microsoft Teams**

Use Notify connector to expand the Notify communication channel by managing and initiating a Microsoft Teams meeting directly from any task record such as an incident or a change.
Setup and configure Notify connector for Microsoft Teams for multi-tenant

Configure the Notify connector for Microsoft Teams using the multi-tenant app. You can use the Microsoft Azure apps instead of creating a separate Microsoft Azure app for the integration.

Set up Notify connector for Microsoft Teams

Install and activate the Notify plugin (com.snc.notify) to be able to initiate a Microsoft Teams meeting directly from an incident record.

Before you begin
Role required: admin

Procedure
1. Navigate to System Definition > Plugins.
2. In the search field, enter Notify.
3. Click Install.

Connect the ServiceNow instance to your Microsoft Teams tenant

Connect your ServiceNow instance to your Microsoft Teams tenant to enable the users to create their requests from within Microsoft Teams.

Before you begin
Role required: External admin (external_app_install_admin)

Procedure
1. Navigate to ServiceNow for Microsoft Teams > Install Azure apps.
2. Click Connect to install Microsoft Teams in your instance.
   This connects your tenant to the ServiceNow instance.
3. Select the **Consent on behalf of your organization** option to provide the consent for all your users, and click **Accept** button to provide the admin consent.

![Microsoft Permissions requested](image)

**Permissions requested**

**Tab SSO**

**ServiceNow**

This app would like to:

- View users' basic profile
- Maintain access to data you have given it access to
- **Consent on behalf of your organization**

If you accept, this app will get access to the specified resources for all users in your organization. No one else will be prompted to review these permissions.

Accepting these permissions means that you allow this app to use your data as specified in their terms of service and privacy statement. **The publisher has not provided links to their terms for you to review.** You can change these permissions at [https://myapps.microsoft.com](https://myapps.microsoft.com). [Show details]

Does this app look suspicious? [Report it here]

![Cancel Accept buttons](image)

Tab SSO is one of the apps to verify the users and connect the Microsoft tenant to the ServiceNow instance. Provide the desired Microsoft tenant details to connect to the ServiceNow instance.

Select the **Consent on behalf of your organization** option to provide the consent for all your users.

**Note:** All the users must also accept the permissions, not accepting the permissions result in not being able to use the ServiceNow integrations with Microsoft Teams.
Authorize multi-tenant Azure apps to grant required permissions

Authorize the multi-tenant apps to enable ServiceNow to make API calls to Microsoft to enable each of the ServiceNow for Teams application workflows.

Before you begin
Role required: External admin (external_app_install_admin) (This role is available out of the box for users and is a part of channel proxy plugin)

About this task
To connect your ServiceNow instance to your M365 tenant and to Authorize apps, the user must have both the external_app_install_admin role as well as the application administrator role in M365. Application administrator is a Microsoft driven role, for more information on roles, refer Azure AD built-in roles.

Procedure
1. Navigate to ServiceNow for Microsoft Teams > Install Azure apps.

2. Click Authorize for Notify Connector.

3. Provide the admin consent by clicking on Accept button.

This authorizes to create a new app for Meeting extensibility app, and to create a new tab for a major incident meeting from the major incident workbench in Microsoft Teams.
Permissions requested
Review for your organization

Notify Connector
ServiceNow ©

This app would like to:
✓ Sign in and read user profile
✓ Read all users' full profiles
✓ Read and create online meetings
✓ Join group calls and meetings as a guest
✓ Join group calls and meetings as an app
✓ Initiate outgoing group calls from the app
✓ Initiate outgoing 1 to 1 calls from the app
✓ Manage Teams apps for all chats
✓ Allow the Teams app to manage all tabs for all chats

If you accept, this app will get access to the specified resources for all users in your organization. No one else will be prompted to review these permissions.

Accepting these permissions means that you allow this app to use your data as specified in their terms of service and privacy statement. The publisher has not provided links to their terms for you to review. You can change these permissions at https://myapps.microsoft.com. Show details

Does this app look suspicious? Report it here

Cancel  Accept
Upon successful authorization, the app is shown as **Installed**.

Download manifest file and configure Notify connector for Microsoft Teams app in Microsoft Teams

Download the Notify connector for Microsoft Teams manifest file from your instance and configure the manifest file in Microsoft Teams to use Notify connector for Microsoft Teams app.

**Before you begin**

Role required: external_app_install_admin

**Procedure**

1. Navigate to **ServiceNow for Microsoft Teams > Application Manifest > Meetings Bot**.

After you install the ServiceNow for Teams multi-tenant app, the client ID and the app ID entries will not be displayed in the manifest screen.

2. On the form, fill in the fields.
Manifest for Notify connector for Microsoft Teams

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short name</td>
<td>Short name of the meetings bot.</td>
</tr>
<tr>
<td>State</td>
<td>State of the manifest file.</td>
</tr>
<tr>
<td>Full name</td>
<td>Complete name of the meetings bot.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the meetings bot.</td>
</tr>
<tr>
<td>Use default images</td>
<td>Option to use default images for the meetings bot.</td>
</tr>
</tbody>
</table>

**Note:** If you want to customize the company branding, clear the *Use default images* option and then upload the icons. For more information on the size of icons, refer [App icons and manifest schema icons](#).

You can upload an image for **Color image** and **Outline image** options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Short description for the manifest file.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description for the manifest file.</td>
</tr>
</tbody>
</table>

3. Click **Move to Ready**.

4. Click **Download Manifest**.

   The manifest file downloads in the zip format.

5. Launch Microsoft Teams application.

6. Navigate to **Apps > Upload a customised app**.

7. Navigate to the location where the manifest file is downloaded and select the zip file.

8. Click **Open**.

   The **ServiceNow Meetings Bot** card will appear in Microsoft Teams.

**Make Microsoft Teams the default communication channel**

Make Microsoft Teams the default communication channel to initiate a conference call to resolve a ticket.

**Before you begin**

Role required: admin
Procedure

1. Navigate to Notify > Provider Selector.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the provider you are adding, for example, Microsoft Teams.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which this provider appears when multiple providers are configured.</td>
</tr>
<tr>
<td>Source table</td>
<td>The table to which Microsoft Teams must be added.</td>
</tr>
<tr>
<td>Condition</td>
<td>Field to add the filter conditions.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for indicating whether Microsoft Teams as a provider is active.</td>
</tr>
<tr>
<td>Default</td>
<td>Option for making Microsoft Teams the default provider if other notify providers like Zoom or Twilio are configured.</td>
</tr>
<tr>
<td>Manual Selection</td>
<td>Option for disabling the automatic selection of this provider.</td>
</tr>
</tbody>
</table>

4. Click Submit.
The list of service providers displays.
5. Click the newly created service provider.
6. In the Provider Selector Choices section, click New.
   a. Notify number group: Select the required notify group.
   b. Conference provider: Select Microsoft Teams.
   c. Click Submit.

Setup and configure Notify connector for Microsoft Teams for single-tenant
Configure the Notify connector for Microsoft Teams using the single-tenant app.
You may need to use Single Tenant setup in certain cases due to your company or regulatory requirements.
Add App Studio in Microsoft Teams

Add App Studio to Microsoft Teams so that you can use it to create apps to make calls using Notify connector with Microsoft Teams.

Before you begin
Role required: admin

Procedure
1. Launch Microsoft Teams.
2. Click Apps menu.
3. In the apps search field, enter App Studio.
4. Click the App Studio card.
5. Click the Open button.

The App Studio menu is added to the left navigation bar in Microsoft Teams.

Note: If the App Studio icon doesn’t appear in the left navigation bar in Microsoft Teams, click the More added apps icon (…) and click App Studio.

What to do next
Create an app in Microsoft Teams to enable making calls

Create an app to make outbound calls from Microsoft Teams.
Before you begin
Role required: admin

Procedure
1. Launch Microsoft Teams.
2. Click the **App Studio** menu.
3. Click the **Manifest editor** tab.
4. Click the **Create a new app** button.
5. On the **App details form**, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short name</td>
<td>Name of your application. For example, ServiceNow for Microsoft Teams.</td>
</tr>
<tr>
<td>App ID</td>
<td>Unique identification number for the app. You generate the app id by clicking the <strong>Generate</strong> button.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Name of the package for your application. For example, ServiceNow for Microsoft Teams.</td>
</tr>
<tr>
<td>Version</td>
<td>Version for the app. For example, 1.0.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of the app.</td>
</tr>
<tr>
<td>Full description</td>
<td>Detailed description of the app.</td>
</tr>
<tr>
<td>Developer/Company Name</td>
<td>Name of your company.</td>
</tr>
<tr>
<td>Website</td>
<td>Link to your company website.</td>
</tr>
<tr>
<td>Privacy Statement</td>
<td>Link to the privacy statement for your app.</td>
</tr>
<tr>
<td>Terms of use</td>
<td>Link to the terms and conditions for your app.</td>
</tr>
</tbody>
</table>

6. Set up the branding for your app by adding an icon and choosing colors.

   a. Click the **Update** button.

   b. Select an image file for your icon.
c. Click the **Open** button.
   The selected image will be the icon for your app.

7. Set up the bot.

   A bot allow the users to interact with your web service through text, interactive cards, and task modules to obtain the desired information.

   a. Navigate to **Capabilities > Bots**.
   b. Click the **Set up** button.
   c. Name: Provide a name for your bot.
   d. Calling bot: Select the **My bot supports video call**, and **My bot supports audio call** options.
   e. Scope: Select the **Personal**, **Team**, and **Group Chat** options.
   f. Click the **Create bot** button.

8. Click **Generate Password**.
   Note this password for later use.

### Manage permissions for the Notify connector app

Assign permissions to users to be able to authenticate successfully and participate in conference calls in Microsoft Teams.

#### Before you begin

**Role required:** Microsoft Azure admin

#### About this task

The Meeting extensibility app depends on Notify connector for Microsoft Teams app. You can configure the existing Notify connector app in Azure portal for Meeting Extensibility to have a seamless conference call experience in Microsoft Teams.

To use the Meeting Extensibility app, you need to assign the following permissions for the app in the Microsoft Azure portal:

- TeamsTab.ReadWriteForChat.All
- TeamsAppInstallation.ReadWriteForChat.All

For more information to manage permissions to use Meeting Extensibility for Microsoft Teams, refer [Configure the app for Meeting Extensibility in Microsoft Azure portal](#).
Procedure

1. Log in to the Microsoft Azure portal.

3. Open the existing app you are using for Notify.

4. Navigate to Manage > API Permissions > Add a permission > Microsoft Graph.

5. Click Application Permissions.

6. Grant the OnlineMeetings.ReadWrite.All permission to enable the initiation of calls by users who are not signed in.

   a. In the search field for Select permissions, enter OnlineMeetings.

   b. Click OnlineMeetings option.

   c. Select the OnlineMeetings.ReadWrite.All option.

7. Grant the permissions for the user to initiate a call, and to join a conference call.

   a. In the search field for Select permissions, enter Calls.

   b. Click the Calls option.
c. Select **Calls.InitiateGroupCall.All**, **Calls.JoinGroupCall.All**, and **Calls.JoinGroupCallAsGuest.All** options.

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calls Initiate Group Call All</td>
<td>Allows the app to initiate outgoing calls from the app.</td>
</tr>
<tr>
<td>Calls Join Group Call All</td>
<td>Allows the app to join scheduled meetings in your organization, without a signed-in user.</td>
</tr>
<tr>
<td>Calls Join Group Call As Guest All</td>
<td>Allows the app to join group calls and meetings as a guest.</td>
</tr>
</tbody>
</table>

8. Grant the **User.Read.All** permission to read the profile properties, reports, and managers of other users in your organization in User permissions.

a. In the search field for **Select permissions**, enter **User**.

b. Click the **User** accordion.
c. Select the **User.Read.All** check box.

| User (1) |
|-----------------|-----------------|
| ✔️ User.Export.All  | Export user's data | Yes |
| ✔️ User.InviteAll  | Invite guest users to the organization | Yes |
| ✔️ User.ManageIdentities.All | Manage all users' identities | Yes |
| ✔️ User.Read.All  | Read all users' full profiles | Yes |
| ✔️ User.ReadWrite.All | Read and write all users' full profiles | Yes |

9. Click **Update permissions**.

10. Grant admins access to the Azure applications that require admin approval.
   a. In the **API permissions** screen, click the **Grant admin consent for {tenant}** link.
   b. Click **Yes** in the pop-up dialog box.

Create a Microsoft Teams application registry entry in your ServiceNow instance

Register your Microsoft Teams application with your ServiceNow instance for OAuth authorization.

Before you begin
Role required: admin

Procedure
1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. Click **Connect to a third-party OAuth Provider**.
4. On the form, fill the fields.

### Third-party OAuth Provider form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example, Microsoft Teams.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the app creation in Microsoft Teams.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>The password you generated when creating the app in Microsoft Teams.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td><strong>Client Credentials.</strong></td>
</tr>
<tr>
<td>Token URL</td>
<td>Token endpoint URL that includes the Directory ID of your app with the structure <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token, where &lt;Directory ID&gt; is the tenant ID created during the app creation in Microsoft Teams.</td>
</tr>
</tbody>
</table>

5. Right-click in the form header and click **Save**.

6. Create an OAuth entity scope to provide the read and write permissions for users.
   a. Click the **OAuth Entity Scopes** tab.
   b. Double-click **Insert a new row**, and enter **Default**.
   c. Enter `.default` as the OAuth scope.
   d. Right-click in the form header and click **Save**.

7. Click **Update**.

**Results**
The Microsoft Teams app is now registered with an OAuth profile authorization.

**Create a Connection & Credentials alias for Microsoft Teams**
Create an alias that labels a credential or connection record.

**Before you begin**
Role required: admin

**About this task**
Create an alias to associates the connection information with the credential data required to complete the application integration. For more information, refer **Introduction to credentials, connections, and aliases**.

**Procedure**
1. Navigate to **Connections & Credentials > Credentials Aliases**.
2. Click **MSTeamsCommunicationsSpoke**.
3. In the **Credentials** tab, click **New**.
4. Click OAuth 2.0 Credentials.
5. Set the values for the credentials.
   a. In the Name field, provide a name for the credential, for example, "ServiceNow Microsoft Teams credentials."
   b. In the OAuth entity Profile field, enter the OAuth Entity profile information. The profile ID is set when you generate the application registry entry.
6. Click Submit.

Set up Notify connector for Microsoft Teams
Install and activate the Notify plugin (com.snc.notify) to be able to initiate a Microsoft Teams meeting directly from an incident record.

Before you begin
Role required: admin

Procedure
1. Navigate to System Definition > Plugins.
2. In the search field, enter Notify.
3. Click Install.

Make Microsoft Teams the default communication channel
Make Microsoft Teams the default communication channel to initiate a conference call to resolve a ticket.

Before you begin
Role required: admin

Procedure
1. Navigate to Notify > Provider Selector.
2. Click New.
3. On the form, fill in the fields.
Provider selector form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the provider you are adding, for example, Microsoft Teams.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which this provider appears when multiple providers are configured.</td>
</tr>
<tr>
<td>Source table</td>
<td>The table to which Microsoft Teams must be added.</td>
</tr>
<tr>
<td>Condition</td>
<td>Field to add the filter conditions.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for indicating whether Microsoft Teams as a provider is active.</td>
</tr>
<tr>
<td>Default</td>
<td>Option for making Microsoft Teams the default provider if other notify providers like Zoom or Twilio are configured.</td>
</tr>
<tr>
<td>Manual Selection</td>
<td>Option for disabling the automatic selection of this provider.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
   The list of service providers displays.

5. Click the newly created service provider.

6. In the **Provider Selector Choices** section, click **New**.
   a. Notify number group: Select the required notify group.
   b. Conference provider: Select Microsoft Teams.
   c. Click **Submit**.

**Using Notify connector for Microsoft Teams with task records**

Notify connector for Microsoft Teams enables you to initiate conference calls from task records such as incidents, problems, or change requests.

**Start and manage a conference call from a task record**

Make a conference call from a task record such as an incident, problem record, or change request in Microsoft Teams.

**Before you begin**

Role required: itil, itil_admin, or admin
Procedure

1. Navigate to any task record, such as an incident, problem, or change request.

2. Click the **Start conference call** related link.

3. In the dialog box, select the participants for the conference.
   
   All users from the User Contacts list in the task record are in the recommended section by default. The user who initiates the conference call is added to the selected list of participants.

4. After you finalize the participant list, click **Start**.

   A notification is sent to all the users in Microsoft Teams that a call has been initiated. Each user can accept the call to join the conference call.

   The host can view the users who have answered the call in Microsoft Teams.

5. Do one of the following activities.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add participants</td>
<td>Click the <strong>Manage Conference Calls</strong> related link, and select <strong>Add Participants</strong>.</td>
</tr>
<tr>
<td>End the conference call</td>
<td>Click the <strong>Manage Conference Calls</strong> related link, and selecting <strong>End Conference Call</strong></td>
</tr>
</tbody>
</table>

**Using Notify connector for Microsoft Teams with Incident Communication Management**

Use Notify with an incident communication plan to start conference calls.

The property `com.snc.iam.enable_notify` must be enabled in Notify Properties to make calls from major incident record.

1. Navigate to **Notify > Administration > Notify Properties**.

2. Check the option **Enable Notify integration for Incident Communications Management**. Entering phone number in 'com.snc.iam.notify_number' property is equivalent to setting this to true (com.snc.iam.enable_notify).

   Right-click on the "Enable Notify integration for Incident Communications Management. Entering phone number in 'com.snc.iam.notify_number' property is equivalent to setting this to true" text and click **Edit Property** to view the property details.
3. Click **Save**.

Start a conference call from an incident communication plan

Initiate a conference call in Microsoft Teams from an incident communication plan so you can discuss the resolution of an incident.

**Before you begin**

Role required: incident_communication_manager

**Procedure**

1. Navigate to **Incident Communications Management > Open**.
2. Open the relevant incident communication plan.
3. Click the **Initiate Conference Call** related link.
4. In the dialog box, select the participants for the conference.
5. After you finalize the participant list, click **Start Call**.

**Results**

A notification is sent to all the selected users in Microsoft Teams that a call is initiated. Each user can accept the call to join the conference call.

As the host, you can view the users who have answered the call.

Add participants to a conference call from the incident communication plan

Add a participant to a conference call on a task record from the incident communication plan.
Before you begin
Role required: ia_admin, or admin

Procedure
1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. Click (+) Participants under Active Participants.
5. In the dialog box, select the participants you want to add to the conference call.
6. Click Add Participants.

Results
A notification is sent to all the selected users in Microsoft Teams that a call is initiated. Each user can accept the call to join the conference call.
As the host, you can view the users who have answered the call.

Mute a participant in a conference call
Mute a participant in a conference call to avoid unnecessary background disruption.

Before you begin
This procedure assumes that there is an active conference call with one or more participants.
Role required: ia_admin, or admin

Procedure
1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. Click Mute next to the participant name you want to mute.

End a conference call made through an incident record
As a host or a user with the incident communication manager role, you can end the conference call.

Before you begin
Role required: ia_admin or admin
Procedure
1. Navigate to Incident Communications Management > All.
2. Open the relevant incident communication plan.
3. Click the Conference tab.
4. Click End Conference Call.

Results
When you end a call, only the host (bot) exits the call. The other participants still stay in the call until they manually disconnect. After the host (bot) exits the call, call details are no longer logged.

Using Notify connector for Microsoft Teams with a major incident
Initiate a conference call from the major incident workbench by inviting one or more users to join a call. The conference doesn't start until at least two participants join.

Notify administrators, major incident managers, or communications managers can manage conference calls.

Conference call records are stored in the Notify Conference Calls [notify_conference_call] table. Conference call participant records are stored in the Notify Conference Call Participants [notify_participant] table.

Initiate a conference call
As a participant in a major incident ticket, you can create a conference call from the record.

Procedure
1. Navigate to Incident > Major incidents > Open.
2. Open the relevant major incident.
3. Click the Conference tab.
4. Select the participants for the conference.
5. After you finalize the participant list, click Start Call.

Results
A notification is sent to all the users in Microsoft Teams that a call is initiated. Each user can accept the call to join the conference call.

As the host, you can view the users who have answered the call.
Join a conference call
After a conference call is initiated, as a logged-in user with the major incident manager role, you can join the conference call.

Before you begin
Role required: notify_admin, major_incident_manager, or communication_manager

Procedure
1. Navigate to Incident > Major incidents > Open.
2. Open the relevant major incident.
3. Click the Conference tab.
4. Click the Join Call related link to join the ongoing conference call.

Add participants to a conference call
Add a participant to a conference call to participate in the discussion to resolve the major incident.

Before you begin
Role required: notify_admin, major_incident_manager, or communication_manager

Procedure
1. Navigate to Incident > Major incidents > Open.
2. Open the relevant major incident.
3. Click the Conference tab.
4. Click (+) Participants under Active Participants.
5. In the dialog box that appears, select the participants for the conference.

6. Click **Add Participants**.

**Results**
A notification is sent to all the users in Microsoft Teams that a call is initiated. Each user can accept the call to join the conference call.

As the host, you can view the users who have answered the call.

**Mute participants from a major incident conference call**
Mute a participant from the conference call to avoid unnecessary background disruption.

**Before you begin**
Before starting this procedure, ensure that there is an active conference call with one or more participants.

Role required: notify_admin, major_incident_manager, or communications_manager
Procedure
1. Navigate to Incident > Major incidents > Open.
2. Open the relevant major incident.
3. Click the Conference tab.
4. Click Mute next to the participant name you want to mute.

End a conference call from a major incident
As a host or participant with the major incident manager role, you can end the conference call.

Before you begin
Role required: notify_admin, major_incident_manager

Procedure
1. Navigate to Incident > Major incidents > Open.
2. Open the relevant major incident.
3. Click the Conference tab.
4. Click End Call.

Results
When you end a call from ServiceNow, only the host (bot) exits the call. The other participants still stay in the call until they manually disconnect. The call details are no longer logged after the host (bot) exits the call.

Manage calls in Microsoft Teams
Manage conference calls in Microsoft Teams by muting or unmuting participants, or ending the call.

Mute participants from Microsoft Teams
As a manager or a conference call host, you can mute conference participants to avoid distraction.

Before you begin
Ensure that there is an active conference call with one or more participants.

Role required: notify_admin, major_incident_manager, communications_manager, itil_admin
Procedure

1. Open the active conference call in Microsoft Teams.

2. Click the participants icon ( ) in the toolbar.

3. Mute an individual participant or mute all participants.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
</table>
| Mute an individual participant | a. Select the participant name.  
                              | b. Click Mute. |
| Mute all participants        | Click the Mute all button that appears on the top of the participant list. |

End a call from Microsoft Teams

As the host or a user with the manager role, you can end a conference call after the discussion ends.

Before you begin
Role required: notify_admin, major_incident_manager, communications_manager, or itil_admin

Procedure

1. Open the active conference call in Microsoft Teams.

2. Click more options icon ( ) in the toolbar.

3. Click End meeting.

4. Click Confirm in the dialog box.

Results
All users are terminated from the conference call.

Orchestration

ServiceNow® Orchestration extends the workflow engine to manage processes and to automate things outside of a ServiceNow instance.

Orchestration is available as a separate subscription from the rest of the ServiceNow platform. See Activate Orchestration for details.
Introduction to Orchestration

Orchestration automates simple or complex multi-system tasks on remote services, servers, applications, and hardware.

An Orchestration process can cross all management disciplines and interact with hosted services and all types of infrastructure elements. These capabilities provide a powerful system for managing IT and Business processes quickly and reliably.

Orchestrated solutions aide collaboration among teams by providing reusable data and versioning for both the workflows and the activities within them. Subject matter experts can create activities that are reusable to numerous workflow developers. When an activity requires a change, developers can see the downstream implication of the change immediately by knowing which workflows use the activity. Well-designed orchestrations never fail and apply human tasks to address errors as they arise.

Orchestration tools

Orchestration can make calls outside of a ServiceNow instance, directly to web services or through a MID Server to systems within corporate firewall. Orchestration also enables the creation reusable activities that wrapper Java
Script functions for manipulating things inside the platform. Orchestration extends the Workflow editor by providing these features:

- **Activity packs** containing ready-to-use activities.
- **Activity Designer**, which enables developers to create custom activities without an over dependence to create scripts to orchestrate to third-party systems.
- Ability to create activity packs using **Scoped Applications**.
- A **Databus** for following the flow of data across orchestration activities.

Orchestration Core provides entitlements to use specific applications:

**FIPS Approved mode**

Supports Federal Information Processing Standards (FIPS) 140-2 standards for outbound integrations. In FIPS approved mode, activities that use HTTPS calls use TLS v1.2 or TLS v1.3 and SSH activity pack uses only ServiceNow SSH.

**Client Software Distribution**

An application that automates software delivery from the Service Catalog. Provides OOB support for SCCM. Partner solutions support Macs using JAMF. Other third-party solutions provide support through the extension framework.

**Password Reset**

An application for users to reset their password in Active Directory. It can expand to communicate with other third-party systems.

**Orchestration ROI**

Enables users to evaluate estimated costs and actual costs for tasks, automate these tasks, and track the ROI of these tasks.

**Systems that Orchestration can automate**

Orchestration can automate tasks such as employee onboarding, user access rights, server management, managed file transfers, and Security Operations Orchestration activities. For example, you might use the Active Directory and Exchange activities provided in the base Orchestration system to set up network accounts and mailboxes for new employees.

If Orchestration does not provide the activities you need for an integration, create the necessary activities using the templates in the Orchestration Activity Designer. The external systems that Orchestration can automate for:
• Any system exposing web services (SOAP, REST)
• Any system accessible from the command line (such as a UNIX system accessible through SSH, a Windows system enabled for PowerShell remoting or WMI)
• Numerous proprietary services: Windows Active Directory, Microsoft Exchange mail servers, InfoBlox, and F5 Networks.

⚠️ Note: For a full list of Activity Pack service offerings, see Orchestration Core Activity Packs.

• Any filesystem accessible by SFTP
• Any database with a compliant JDBC driver
• Additional Activity Packs are also available with other ServiceNow products, such as Security Operations

Orchestration capabilities

Orchestration workflow

When an Orchestration activity starts within a workflow, Orchestration launches a probe and writes a probe record to the ECC Queue. The workflow pauses as the MID Server picks up the request and executes the probe. When the probe
reports back, the workflow resumes as the results are analyzed. The workflow can exit or continue at this point.

**Orchestration workflow**

Orchestration video tutorial

Watch the introductory video for Orchestration.

**Domain separation and Orchestration**

Domain separation is supported in Orchestration. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Standard***

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

**Related information**

- Domain separation for service providers

**Activate Orchestration**

The Orchestration (com.snc.runbook_automation) plugin is available as a separate subscription from the rest of the ServiceNow platform.

**Before you begin**

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.
If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

**Procedure**

1. Navigate to **System Applications > All Available Applications > All.**
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th><strong>Activate Plugin request form</strong></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time. <strong>Note:</strong> Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the <strong>Reason/Comments</strong> field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**List of Orchestration plugins**

This table lists all plugins available for Orchestration and their dependencies.

These Orchestration plugins are available for purchase or can be requested as part of your Orchestration subscription. Contact your account representative for details.

The Orchestration - Runtime plugin displays the Orchestration activities shipped with these applications in the Workflow Editor and allows customers to modify the activities without requiring an Orchestration license.                                                                                                         | • Workflow Runtime Engine                        |
|                                                                      |                                                                                                                                                                                                                                                                                                                                                                       | • Core Automation                                |
| Orchestration - SFTP [com.snc.orchestration.sftp]                    | Installs the SFTP File Transfer activity pack. These activities manage files and directories on an SFTP server and move files from one SFTP server to another.                                                                                                                                                                                                                      | Orchestration                                    |
| Orchestration - SSH [com.snc.orchestration.ssh]                     | Installs the SSH activity pack. These activities read, write, and copy files, and reset user passwords on Linux computers.                                                                                                                                                                                                                                           | Orchestration                                    |
| Orchestration - System Center Configuration Manager [com.snc.orchestration.sccm_mgnt] | Installs the System Center Configuration Manager (SCCM) activity pack. These activities manage software deployments and collections on an SCCM server.                                                                                                                                                                                                                                           | Orchestration                                    |
**Orchestration Runtime plugin**

The Orchestration – Runtime plugin enables other applications on the ServiceNow® platform to automate tasks, without requiring an Orchestration subscription.

The Orchestration – Runtime plugin can be activated as part of another plugin or application. It is used by strategic technology partners and ServiceNow applications to distribute activity packs to customers who may not own Orchestration. For example, the Security Incident Response Management (SIRM) application provides orchestration content, which includes activities that are available from the Packs tab in the Workflow Editor. Customers who purchase SIRM can consume and modify the activities that SIRM ships without having to purchase an Orchestration license.

**Included with the plugin**

The Orchestration – Runtime plugin provides access to the Packs and Data tabs in the Workflow Editor. This plugin gives users access to custom activities for their applications and enables them to reuse data from the Databus. This plugin does not provide access to custom Orchestration activity packs or to the activity designer. The Custom tab in the Workflow Editor is not available without an Orchestration subscription.

**Orchestration plugin relationships**

The Orchestration – Runtime plugin activates these application plugins:

- Orchestration - ROI
- Orchestration - Client Software Distribution
- Orchestration - Runtime
- Service Release Automation
- Security Incident Response

**Dependencies**

The Orchestration – Runtime plugin activates these application plugins:
• Security Incident Response Orchestration
• Service Release Automation

Access to activities
Custom activities shipped with ServiceNow® applications are available in the Packs tab of the Workflow Editor for use in workflows. To edit these activities, navigate to Orchestration > Activity Designer Activities and select the activity you want to modify. For information about the provider templates used to create these activities, see Orchestration custom activity templates.

List of Orchestration activities
Use Orchestration activities in a Workflow to integrate with third-party systems.

Several Orchestration activities have been rewritten as scoped activities using the activity designer and grouped into activity packs. Other non-scoped activities are deprecated and may or may not appear in the Workflow Editor. However, all deprecated activities still function in existing workflows that use them.

Global activities
These activities run in the global scope only. Any activities you create in the global scope are organized in the Global category in the Packs and Custom tabs in the Workflow Editor.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Server Alive</td>
<td>Runs a command (including shell scripts) on a Linux or UNIX computer via SSH to validate whether the target system is alive.</td>
</tr>
</tbody>
</table>

Active Directory (AD) activities
All AD Orchestration activities were rewritten in the Geneva release as scoped activities and are available in the Active Directory activity pack. All previous version AD activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates a user account in Windows Active Directory when a user account is created in a ServiceNow instance.</td>

</table>

**Probe activities**

These probe activities were rewritten as scoped activities and are available in the Probe activity pack. All previous versions of these activities that were built on activity definitions are deprecated and are unavailable for use in new workflows.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resolve DNS Name</td>
<td>Resolves an IP address or a fully qualified domain name (FQDN) into one or more IP addresses.</td>
</tr>
<tr>
<td>SNMP Query</td>
<td>Queries an SNMP device.</td>
</tr>
</tbody>
</table>

**SCCM activities**

All these activities are scoped and part of the SCCM activity pack. They do not have legacy versions.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add to Device Collection</td>
<td>Adds a device to a Microsoft System Center Configuration Manager (SCCM) device collection.</td>
</tr>
<tr>

</table>

**Available activity packs**

Activity packs are available with your subscription to Orchestration.

**Before you begin**

Role required: admin

**About this task**

The following activity packs are available and active with your Orchestration subscription:
• Orchestration - Active Directory (com.snc.orchestration.ad)
• Orchestration - Azure Active Directory (com.snc.orchestration.azure.ad)
• Orchestration - Exchange (com.snc.orchestration.exchange)
• Orchestration - SFTP (com.snc.orchestration.sftp)
• Orchestration - Infoblox DDI Activity Pack (com.snc.orchestration.infoblox)
• F5 Network Management activity pack (com.snc.orchestration.f5)
• Orchestration - SSH (com.snc.orchestration.ssh)
• Orchestration - PowerShell (com.snc.orchestration.powershell)
• Orchestration - System Center Configuration Manager (com.snc.orchestration.sccm_mgnt)

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Deprecated Orchestration activities**

These Orchestration activities have been deprecated.

**Run Probe**

The Run Probe activity launches a MID Server probe on behalf of a document. All Orchestration activities that launch a probe on a target machine are based on the Run Probe activity. Your ServiceNow instance must have access to a MID Server configured to use SSH to run this activity.
\textbf{Attention:} This activity is deprecated and is unavailable for new workflows. To replace the functionality of this probe, use the \textit{Probe activity template} to create a custom activity. Workflows from a previous release that use the Run Probe activity can continue to do so.

### Run Probe Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>Select a MID Server probe from the list. This is the name of the probe as it appears in the \textit{discovery_probes} table.</td>
</tr>
<tr>
<td>Source for probe</td>
<td>Enter the IP address of the host system against which the probe runs (the probe's target).</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called \textit{output}. Any error from the probe is contained in a variable called \textit{error}.</td>
</tr>
</tbody>
</table>

### SOAP Request

The SOAP Request activity executes a SOAP request on a target server.

\textbf{Attention:} This activity is deprecated and is replaced by the \textit{SOAP Message workflow activity} activity. Workflows from a previous release that use the SOAP Request activity can continue to do so. However, this activity is not available for new workflows.

### SOAP Request input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP URL</td>
<td>The SOAP endpoint.</td>
</tr>
<tr>
<td>Username</td>
<td>User name for basic authentication credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for basic authentication credentials.</td>
</tr>
<tr>
<td>Envelope Script</td>
<td>Script for setting up parameters for the web service.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received.</td>
</tr>
</tbody>
</table>
Reactivate a deprecated activity

Orchestration activities that were converted to activity packs are deprecated for upgraded and new instances but can be reactivated for use in new workflows.

Before you begin
Role required: workflow_admin, admin

⚠️ **Note:** Reactivation of deprecated activities for use in new workflows is discouraged. Legacy activities cannot use the unique features of the scoped applications, such as reuse of data from the databus and input variable testing.

Procedure

1. Navigate to **Workflow > Administration > Activity Definitions.**
2. In the list of activities, clear the condition **Category != deprecated** from the filter.

```
   All > Category != deprecated
```

3. Open the definition record for the activity you want to reactivate.
4. Select the **What to Display** tab.
5. In the **Category** field, replace the value **deprecated** with another category. This can be an arbitrary string.
6. Click **Update**. The system creates a new category using the value provided and reactivates the activity, which becomes available in the **Core** tab of the Workflow Editor.

SOAP Message workflow activity

The **SOAP Message** activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

Your instance must have access to a MID Server configured to use SOAP.
### Input variables

#### SOAP Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message [sys_soap_message] table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, ... If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
SOAP Message activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>ignores this parameter if the <code>use_midserver</code> parameter is disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can only select a specific MID Server in the legacy SOAP message activity and REST messages. These legacy activities do not use the MID Server selection criteria available starting with the Istanbul release.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the <code>activity.output</code> object.</td>
</tr>
</tbody>
</table>

Probes used by Orchestration

Certain probes, controlled by MID Servers, perform Orchestration tasks on remote computers, such as restarting a server or creating virtual machines from templates.

How Orchestration probes work

When a Workflow executes an Orchestration activity, that activity launches a probe, which writes an `output` record to the ECC Queue. The MID Server selected for the activity checks the ECC Queue for assignments, and then executes the appropriate probe to do the work on the target machine. The information about the activity (machine restarted, files copied, etc.) that is returned from the target machine by the probe is written to the ECC Queue as an `input` record. This information is then sent from the ECC Queue to a sensor that is built into the Workflow activity. The Workflow is updated, and the next activity is executed.

**Note:** The probe parameters are set by the activities that launch the probe.
How Orchestration uses probes

The base system includes the following Orchestration probes (Orchestration > Definition > Probes).

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>Command</td>
<td></td>
<td>A probe that runs a local command on the MID server.</td>
</tr>
<tr>
<td>DNS Name Resolver</td>
<td>DNSNameResolver</td>
<td></td>
<td>A probe that resolves a fully qualified domain name (FQDN) into an IP address. The probe executes MID Server queries in parallel. It utilizes DNS lookup by the MID Server host OS to make use of the OS maintained DNS cache. It also leverages the hosts file on the OS.</td>
</tr>
<tr>
<td>SCPCommand</td>
<td>SCPCCommand</td>
<td></td>
<td>A probe that copies files securely from one machine to another. The copy function is performed using the MID Server as a tunnel.</td>
</tr>
<tr>
<td>Shazzam</td>
<td>Shazzam</td>
<td></td>
<td>A probe that identifies active devices.</td>
</tr>
<tr>
<td>Probe Name</td>
<td>ECC Queue Topic</td>
<td>ECC Queue Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SNMPProbe</td>
<td>SNMP</td>
<td>SNMP Query</td>
<td>This is a generic SNMP probe.</td>
</tr>
<tr>
<td>SOAPProbe</td>
<td>SOAPProbe</td>
<td></td>
<td>A probe that sends a SOAP request to target machine.</td>
</tr>
<tr>
<td>SSHCommand</td>
<td>SSHCommand</td>
<td></td>
<td>A probe that executes shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>SSHCommandLong</td>
<td>SSHCommandLong</td>
<td></td>
<td>A probe that executes long running shell scripts from a command line after logging in to a target machine via SSH.</td>
</tr>
<tr>
<td>VMWare</td>
<td>VMWareProbe</td>
<td></td>
<td>A generic VMware probe that executes the MID Server script include in the ECC queue name that is set by a VMware Orchestration activity. This probe can run any MID Server script include.</td>
</tr>
</tbody>
</table>
| Windows - PowerShell | PowerShell     | Windows - PowerShell    | A probe that runs a Windows PowerShell script on the MID Server. The PowerShell script is provided as the value of a parameter with name ending in .ps1. Two variables are available to the script:  
  • $computer: The computer pointed to as the source for this probe. |
Probe List (continued)

<table>
<thead>
<tr>
<th>Probe Name</th>
<th>ECC Queue Topic</th>
<th>ECC Queue Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$cred</td>
<td></td>
<td></td>
<td>• $cred: A PowerShell credential, using a user name and password from the Credentials table, that logs into $computer successfully.</td>
</tr>
</tbody>
</table>

**PowerShell activities**

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

PowerShell must be installed on any MID Server that uses these activities. MID Servers using PowerShell must be installed on a supported Windows operating system. ServiceNow supports PowerShell 3.0 to 5.1.

The ServiceNow Orchestration plugin adds these basic PowerShell activities to workflows. For instructions on using activities from the PowerShell activity pack, see [PowerShell activity pack](#).

**Legacy Run PowerShell activity**

The Run PowerShell activity executes Windows PowerShell commands on a MID Server.

⚠️ **Attention:** This activity is deprecated and is unavailable for new workflows. To replace the functionality of this activity, use the [Powershell activity template](#) to create a custom, scoped activity. Workflows from a previous release that use the Run PowerShell activity can continue to do so.

**Result Values**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the success or failure of the PowerShell commands used determines the result value of the Run PowerShell activity.

Possible result values are:

- Success
- Failure
Scratchpad Entries

Information written to stdout by the executing script is captured and returned to the activity in the activity.output variable. This information can be parsed, processed, or saved (to a scratchpad variable, for example) for future processing in the activity’s sensor script.

An example would be to run the `get-date` command to get the MID Server’s current time. This sensor script saves the full output received, but we can process it to return and save only the time.

Note: This is an over-simplified example. In most cases, the script operates against some remote Windows computer. However, the principal is the same – whatever is written to stdout is returned in activity.output and available to process.

Input Variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>IP address of the target Windows machine. This value is mapped to the $computer variable for use in commands (see the example in the Command field). A PowerShell credential variable called $cred that is based on information in the ServiceNow Credentials table will authenticate on the computer pointed to by Hostname.</td>
</tr>
</tbody>
</table>
| Command     | Enter the PowerShell command to run. For example, to execute a simple WMI query against a remote machine pointed to by the hostname variable, the command is: `get-wmiobject <class> -computer $computer -credential $cred` If no credentials authenticate on the computer, the command runs in the context of the MID Server user.
Input Variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You cannot run both a command and a script file. Specifying a</td>
</tr>
<tr>
<td></td>
<td>command hides the Script file variable.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the</td>
</tr>
<tr>
<td></td>
<td>probe is contained in a variable called output. Any error from the</td>
</tr>
<tr>
<td></td>
<td>probe is contained in a variable called error.</td>
</tr>
<tr>
<td>Script file</td>
<td>The MID Server script file to run. You cannot run both a script file</td>
</tr>
<tr>
<td></td>
<td>and a command. Selecting a script file hides the Command variable.</td>
</tr>
<tr>
<td>PowerShell script</td>
<td>Additional parameters, in JSON format, used by the specified</td>
</tr>
<tr>
<td>variables</td>
<td>script file.</td>
</tr>
</tbody>
</table>

States
The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the</td>
</tr>
<tr>
<td></td>
<td>activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was cancelled.</td>
</tr>
</tbody>
</table>

Add workflow variables for the command line using the normal workflow variable syntax. In the example above, if the <class> was in a workflow input variable called myclass, the command would look like:

```
get-wmiobject $ {workflow. inputs. myclass } -computer $computer -credential $cred
```

Similarly, if the variable is a scratchpad variable named myclass, the command would look like:

```
get -wmiobject $ {workflow. scratchpad. myclass } -computer $computer -credential $cred
```
**HResult codes**

When a PowerShell script encounters an error, the Windows machine may return an HResult code as part of the error message.

PowerShell activities can read and interpret this code. Not all PowerShell errors include an HResult code. In the event of a failed PowerShell script, you can use the HResult code to move the workflow through a specific condition.

For example, when resetting an Active Directory password to a password that does not meet policy requirements, such as minimum length or complexity, the PowerShell script returns the HResult code -2146022651. To use this code, create an activity condition with the **Condition** value of `activity.hresult = -2146022651`. If the PowerShell script returns this code when the activity runs, the workflow transitions through this new condition.

**SSH activities**

SSH activities allow workflows to perform operations on Linux and Unix computers.

Your ServiceNow instance must have access to a MID Server configured to use SSH to run these Orchestration activities.

**Run Command activity**

The Run Command activity runs a command (including shell scripts) on a Linux or UNIX computer.

⚠️ **Attention:** The Run Command activity is deprecated in this release. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading to Helsinki. However, to use this functionality in a new workflow, you must create a custom activity using the SSH activity template in the ServiceNow® activity designer.

**Input variables**

**Run command input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long running</td>
<td>Select this check box to disable the SSH connection timeout if you think the command will take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
</tbody>
</table>
Run command input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of destination server for SSH activity.</td>
</tr>
<tr>
<td>Directory</td>
<td>Name of the working directory.</td>
</tr>
<tr>
<td>Command</td>
<td>The command to run from this activity.</td>
</tr>
<tr>
<td>Sudo</td>
<td>Select this check box to use <code>sudo</code> to run the command on the host machine.</td>
</tr>
<tr>
<td>Sensor script</td>
<td>The script to run using the results of the probe. The output from the probe is contained in a variable called <code>output</code>. Any error from the probe is contained in a variable called <code>error</code>.</td>
</tr>
</tbody>
</table>

Run SCP activity

The Run SCP activity uses Secure Copy Protocol (SCP) to copy a file from one computer to another, including the directory in which the file resides.

⚠️ Note: This activity is deprecated in the Geneva release and is not available for use in new workflows. If you have a workflow created in a previous version that uses this activity, your workflow will continue to work normally after upgrading. The custom Secure Copy activity replaces the Run SCP activity in the Geneva release.

Input variables

Run SCP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Host</td>
<td>Hostname or IP address of the source computer.</td>
</tr>
<tr>
<td>From File</td>
<td>Absolute path to the file to copy. This value can be a directory.</td>
</tr>
<tr>
<td>To Host</td>
<td>Hostname or IP address of the target computer.</td>
</tr>
<tr>
<td>To File</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory. The specified directory must already exist on the target computer.</td>
</tr>
<tr>
<td>Copy Directory</td>
<td>Check box to copy a directory defined in the <strong>From File</strong> variable and all files contained in that directory.</td>
</tr>
</tbody>
</table>
**Orchestration applications**

Orchestration provides several applications with your subscription.

**Orchestration ROI**

The Orchestration ROI application allows you to estimate and compute cost savings for tasks in your system that could be automated with Orchestration.

After you automate the tasks, you can track cost savings by associating Orchestration workflows with corresponding task areas. Configuration in the application allows you to select the hourly rate for performing the task manually, the rules the system uses to select tasks for evaluation, and the time period of the evaluation. Orchestration ROI estimates your savings by multiplying the cost of performing repetitive tasks manually by the estimated number of times the system performs those tasks automatically during a specific date/time range. The system also calculates the actual savings of your automations. Orchestration ROI is included with the base Orchestration subscription.

Orchestration ROI reports offer a number of views of the comparative data and allow you to access the associated records directly from the reports. The standard reports included with the Orchestration - ROI plugin provide summaries, estimated costs, and calculated costs for automated processes. The ROI premium dashboard uses Performance Analytics to provide detailed reports on calculated savings over time. Performance Analytics requires a different plugin and subscription.

**Note:** When Orchestration ROI is activated as a dependent plugin of Orchestration, demo data is not installed. If you want to use demo data as a template for your own ROI evaluation, submit a request to ServiceNow® technical support for an Orchestration ROI plugin upgrade with demo data selected.

To set up Orchestration ROI, complete the configuration tasks in the order shown here.

**Create Orchestration ROI labor rate cards**

Before calculating your Orchestration ROI, you must create labor rate cards for the manual work that would be required to complete the tasks correlated to the ROI calculations.

**Before you begin**

Role required: orchestration_manager
About this task
The hourly rates defined in the rate cards are used to determine the savings from your orchestrated tasks.

Procedure
1. Navigate to Orchestration > ROI > Labor Rate Cards.
2. Complete the fields in the form using the descriptions in .
3. Click Submit.
4. Create additional rate cards as needed.

Create an Orchestration ROI automation entry record
The ROI automation entry record couples the cost of performing a task with the specific workflow that automates the task, for the purpose of calculating the resulting savings.

Before you begin
Role required: orchestration_manager
Before starting this procedure, verify that the appropriate labor rate cards were created.

About this task
Use this record to apply a manual hourly rate to a task that is performed automatically by your instance. To determine the savings realized from orchestrating a task, the system can evaluate whether those savings were estimated or calculated.

• Estimated savings: Uses the labor rate, the time estimates for completion of the task, and the number of automations that have been run to determine savings.

• Calculated savings: Uses the labor rate, the time calculated for completion of the task, based on the configured evaluation period, and the number of automations that have been run to determine savings.

Procedure
1. Navigate to Orchestration > ROI > Automation Entry Form.
2. Fill in the fields on the form, as appropriate.
## Automation Entry Form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Category of the selected workflow automation. The following categories are provided in the base Orchestration - ROI system:</td>
</tr>
<tr>
<td></td>
<td>• Access &amp; Identity Management</td>
</tr>
<tr>
<td></td>
<td>• Datacenter Automation</td>
</tr>
<tr>
<td></td>
<td>• IT Service Management</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To create a category, open the dictionary record for the Automation Entry Form [automation_entry_form] table and add an option to the choice list.</td>
</tr>
<tr>
<td>Item</td>
<td>Unique name for the specific task within the category. This value represents the work to which the labor rate card applies, such as <strong>Password Reset</strong>.</td>
</tr>
<tr>
<td>Resource</td>
<td>Labor rate card to apply to this automation entry. You must have IT Cost Management active on the instance for this field to appear.</td>

<tr>
<td>Calculated average volume per month</td>
<td>Actual average number of times this task is performed manually per month.</td>
</tr>
</tbody>
</table>

3. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record and calculates the savings based on the hourly rate and the number of workflow contexts for this automation entry.

**Create an Orchestration ROI correlated task rule**

The correlated task rule applies configurable conditions to fields in a selected table that tell the instance which manual tasks correspond to an automation entry record.

**Before you begin**

Role required: orchestration_manager

Before starting this procedure, make sure you have created labor rate cards and the appropriate automation entry records for the automated tasks you want to evaluate.

**About this task**

Create conditions that the system can use to correlate manual tasks to the automation entry. For example, a rule on the Incident [incident] table uses these conditions to correlate the employee on-boarding task to values configured in the Employee OnBoarding automation entry record:

- **[Subcategory] [is] [Employee OnBoarding]**
- **[Sort description] [contains] [new employee]**

When a new employee opens an incident to request services or assets which are typically handled manually, Orchestration applies the usual labor rate for the manual work to the potential automated solution, and then computes the actual savings.
Procedure

1. Navigate to **Orchestration > ROI Task Correlation > Correlated Tasks Rules**.
2. Click **New**.
3. Fill in the fields on the form, as appropriate.

**Automation entry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automation entry</td>
<td>Automation entry record that correlates to the manual task defined by these conditions. The entry record names the workflow used to automate the task and defines the labor rate used to calculate the cost of the task.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to filter, using these conditions. The rule selects records from this table that match the conditions. Information from these records is used to calculate the actual time to perform a manual task and the actual volume for that manual task.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder to use to filter records for this table. Use these conditions to identify all manual tasks correlated to this automation entry.</td>
</tr>
<tr>
<td>Read-only fields</td>
<td></td>
</tr>
<tr>
<td>Processed on</td>
<td>Date and time that the system performs the matching records lookup. The system automatically searches for new manual tasks matching these conditions.</td>
</tr>
</tbody>
</table>

4. Select one of these submission options:
   - **Submit**: Saves the record to the table without running any calculations.
   - **Submit and process now**: Saves the record, looks up all matching tasks, and saves matching record information to the Correlated Tasks [manual_mapping_records] table.

5. To view a rule, select the link in the **Table** column of the **Correlated Tasks Rules** related list for the automation entry you want to see.

6. To view the list of tasks that match all correlated rules in the system, navigate to **Orchestration > ROI Task Correlation > Correlated Tasks**.

7. To view the list of tasks that match this rule in the system, click **Correlated Tasks** under **Related Links** in this form.
Configure the time range for Orchestration ROI calculations

Select a date range to calculate the average number of tasks and the duration per month for the correlated tasks.

Before you begin
Role required: orchestration_manager

About this task
By default, the system creates a range ending at the current date and time and extending back over the previous month. You can change this range at any time and recalculate the ROI instantly.

Procedure
1. Navigate to Orchestration > ROI Task Correlation > Time Range for Calculated Averages.
2. Enter a new start or end date and time or click the icon to select a date using the calendar.
3. Click Calculate to recalculate the ROI based on the new time range and to save your settings.

Installed with Orchestration ROI
Several types of components are installed with the Orchestration - ROI plugin (com.snc.runbook_automation.roi).

Tables installed with Orchestration ROI
Tables are added with activation of Orchestration ROI.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expense and Savings</td>
<td>Contains the data for the reports in Orchestration &gt; ROI Reports &gt; Predicted Savings.</td>
</tr>
<tr>
<td>[run_rate_predicted_savings]</td>
<td></td>
</tr>
<tr>
<td>Savings Report</td>
<td>Contains the number of automations that have been run before the date specified in the Processed On column, based on:</td>
</tr>
<tr>
<td>[savings_report]</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Detailed Savings Report [detailed_savings_report]</td>
<td>Contains a detailed list for the Savings Report [savings_report] table. This list contains each automation’s run date and savings for that automation.</td>
</tr>
<tr>
<td>Automation Entries [automation_entry_form]</td>
<td>Contains automation entries that couple labor resources to specific manual tasks. You can specify the estimated duration to perform a task manually and the estimated number of times that a task is performed per month. If this automation entry already has workflow automations implemented, you can specify the associated workflows. The system calculates the savings, based on the labor rate card and the number of workflow automations that have been performed.</td>
</tr>
<tr>
<td>Roadmap Planning [roadmap_planning]</td>
<td>Contains roadmap planning for each automation entry to be implemented. You can provide estimated hours to implement a workflow automation, the automation percentage anticipated by the end of the year, and the starting month to implement the workflow.</td>
</tr>
<tr>
<td>Correlated Tasks [manual_mapping_records]</td>
<td>Contains all matching manual tasks for each automation entry. Each tasks’s information is stored in this table for the system to use to calculate the actual duration and volume for each manual task.</td>
</tr>
<tr>
<td>Correlated Tasks Rules [manual_mapping_conditions]</td>
<td>Contains the correlated task rules the system uses to look up manual tasks corresponding to each automation entry.</td>
</tr>

<tr>
<td>Insert into Savings Reports</td>
<td>Automation Entry Form [automation_entry_form]</td>
<td>When a new automation entry is provided, this business rule inserts a new record into the Savings Report [savings_report] table with the automations_run field set to 0.</td>
</tr>
</tbody>
</table>

---

**Orchestration ROI reports**

Orchestration ROI provides a collection of standard and premium reports to help you calculate savings from automating services in your organization.

The ROI standard reports are included with Orchestration ROI. The premium reports provide enhanced views generated with Performance Analytics and require the Orchestration - ROI Premium plugin.
Orchestration ROI standard reports
The dashboard of standard ROI reports provides summaries, estimated costs, and calculated costs for automated processes. To access the ROI standard dashboard, navigate to **Orchestration > ROI Reports > Dashboard**.

**Summary tab**
The Summary tab contains four reports on automation categories.

### ROI summary report sample

**Automation Savings by Category Over Time (Uses Estimated Duration)**

- **April 2015, Datacenter Automation = $11,227.50**
  (80.03%)

---

### Standard ROI summaries by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual Tasks by Category Over Time</td>
<td>Trend of manual tasks by category over time. For example, if you use automations to perform a portion of the necessary tasks, the report shows the number of tasks still executed manually, decreasing over time.</td>
</tr>
</tbody>
</table>
### Standard ROI summaries by category (continued)

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="#">Automations by Category Over Time</a></td>
<td>Trend of automated tasks by category over time. For example, this chart can show the increase in the number of automated tasks as a workflow automation rolls out slowly over time.</td>
</tr>
<tr>
<td><a href="#">Automation Savings by Category Over Time</a></td>
<td>Amount of savings from automated tasks over time, based on the estimated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
<tr>
<td><a href="#">Automation Savings by Category Over Time</a></td>
<td>Amount of savings from automated tasks over time, based on the calculated duration of the task, the number of automations performed, and the cost from the labor rate card.</td>
</tr>
</tbody>
</table>

**Estimated Costs tab**

The Estimated Costs tab contains eight reports on estimated time and expense for automations.
### Standard ROI time and expense estimates

<table>
<thead>
<tr>

Schedule Orchestration ROI calculations for standard reports

The scheduled job that calculates Orchestration ROI standard reports is active by default and controlled by system properties.

**Before you begin**

Role required: orchestration_manager, admin

**About this task**

The system provides a default scheduled job called Processing ROI Schedule that allows you to configure when Orchestration calculates the ROI for standard reports. This schedule allows scripting for advanced conditions. To modify the schedule or write a script to run, open Processing ROI Schedule from System Scheduler > Scheduled Jobs > Scheduled Jobs and click **Configure Job Definition**. To execute the schedule directly from the job definition, click **Execute Now**

To control the running of the schedule job with the Orchestration properties.
Procedure

1. Navigate to **Orchestration ROI > Properties**.
2. Configure the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>roi.processing.active</td>
<td>Activate scheduled job for ROI processing. This property activates the Processing ROI Schedule scheduled job.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: true</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default</strong>: true</td>
</tr>
<tr>
<td>roi.processing.interval</td>
<td>Scheduled ROI processing interval (hours). This property sets the repeat interval for the scheduled job that processes savings reports and correlated tasks.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default</strong>: 24</td>
</tr>
</tbody>
</table>

3. Click **Save** to save your changes.

**Orchestration ROI premium reports**

The premium dashboard provides detailed reports on calculated savings over time.

The ROI premium reports require the Orchestration - ROI Premium plugin and are built using **Performance Analytics**. The Orchestration - ROI Premium plugin is dependent on the **Performance Analytics - Premium** plugin which requires a separate subscription.

**Important:** You must activate the Performance Analytics scheduled collection job before Orchestration ROI premium can display data.

To access the ROI premium dashboard, navigate to **Orchestration > ROI Reports > Premium Dashboard**.
**ROI By Category tab**

The ROI By Category tab contains three reports showing the calculated savings over time by category.

### Calculated savings monthly by category

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ROI - Monthly By Category</strong></td>
<td>Shows the calculated savings each month by category. The chart displays the total calculated savings against the calculated savings for each category.</td>
</tr>
<tr>
<td>Type</td>
<td>Column chart</td>
</tr>
<tr>
<td>Table</td>
<td>Detailed Savings Report [detailed_savings_report]</td>
</tr>
</tbody>
</table>

### Premium reports for calculated savings over time by category

<table>

Request Orchestration ROI premium reports

To view the Orchestration ROI premium reports, you must request activation of the Orchestration - ROI Premium (com.snc.runbook_automation.roi_premium) plugin. The Orchestration - ROI Premium plugin is included with an Orchestration subscription, but must be activated by request.

Before you begin
The Orchestration - ROI Premium plugin requires the Performance Analytics - Premium plugin, which must be purchased separately.

Role required: admin
Procedure

1. Navigate to **System Applications > All Available Applications > All.**

2. On the All Applications page, click **Request Plugin** to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>
Schedule Orchestration ROI calculations for premium reports

Orchestration ROI premium reports use a Performance Analytics job that must be activated before premium reports can be generated.

**Before you begin**
Role required: orchestration_manager, admin

**About this task**
The scheduled job required to calculate premium ROI reports is called [PA ROI] Historic Data Collection and is installed with the Orchestration - ROI Premium [com.snc.runbook_automation.roi_premium] plugin. This job is not active by default.

**Procedure**
1. Navigate to **Performance Analytics > Data Collector > Jobs**.
2. Search for the [PA ROI] Historic Data Collection job.
3. Select the **Active** check box.
4. The scheduling options appear for the value selected in the **Run** field.
   
   For instructions on creating a schedule, see [ Link].
5. To execute the schedule directly from the job definition, click **Execute Now**.
6. Click **Update**.

### Client Software Distribution

The Client Software Distribution (CSD) application allows administrators to distribute software from the service catalog using third-party management systems.

CSD allows an administrator to create all the records necessary to deploy software from service catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the custom SCCM activity pack. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using Orchestration activities and workflows.

CSD also integrates with Software Asset Management to manage license counts for deployed software.

#### CSD process flow using SCCM

![CSD process flow using SCCM](image)

#### Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to Orchestration.

**Before you begin**
Role required: admin

**About this task**
The Orchestration - Client Software Distribution plugin activates the Orchestration - System Center Configuration Manager plugin that contains
the custom SCCM activities used to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note: The Orchestration - Client Software Distribution plugin runs in its own application scope.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the <strong>Reason/Comments</strong> field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Installed with client software distribution**

Several types of components are installed with client software distribution (CSD).

**Tables installed with client software distribution**

These tables are installed with the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Client software distribution tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item]</td>
<td>Contains all catalog items created for client software distribution. This table extends the Catalog Item [sc_cat_item] table.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Software Distribution Software Request</td>
<td>Contains all requested software, and their statuses.</td>
</tr>
<tr>
<td>Request [sn_client_sf_dist_req_software]</td>
<td></td>

### Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

**Before you begin**

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the
requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

Procedure
1. Navigate to Software Asset > Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset > Reconciliation > Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process
Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates
All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Orchestration - Asset Lease Management plugin that is activated automatically with CSD. The system prepopulates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.

Note: For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the SCCM configuration specifies an uninstall collection.

Software offered only to the logged in user
If the software catalog item is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.
In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.

Software ordered on behalf of another user

If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Defining software lease window

Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin
Role required: Any system user

About this task
If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

Procedure
1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

**Client software distribution from SCCM**

You can use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The SCCM activity pack contains Orchestration activities that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke
software deployed by SCCM without user interaction, and manage lease periods.

**Configuring SCCM**

Follow the SCCM configuration procedures in the order shown.

**Configure the Application Administrator role on the SCCM server**

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

**Before you begin**

SCCM role required: Application Administrator

**About this task**

These instructions are for Microsoft 2012 R2 Server.

**Procedure**

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
7. Log into SCCM as the user with the Application Administrator role.

8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell.**
9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

**Update the SCCM cmdlet libraries**

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

**Before you begin**

SCCM role required: Either current user or system administrator, depending on settings.

**About this task**

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155
```

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

**Procedure**

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

   **Important**: The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the *isEnabled* configuration variable has changed to **False**.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Before you begin**

Role required: admin

**Procedure**

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

**Create Windows credentials for SCCM deployments**

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Before you begin**
Role required: sn_client_sf_dist.csd_admin or admin

**About this task**
Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

**Procedure**
1. Navigate to **Orchestration > Credentials**.
2. Click **New**.
3. In the list of credential types, select **Windows Credentials**.
4. Provide a user name and password with administrative rights on the SCCM server.

**Important:** Ensure the following:

- This user must have the Application Administrator role on the SCCM server.
- Use the credentials to log into the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

5. Fill in the other fields on the form, as appropriate.
   For details, see **Windows credentials**.
6. Click **Submit**.
Retrieve SCCM data for client software distribution

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

Before you begin

Role required: sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- Configure a user with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
- Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

About this task

To populate the Client Software Distribution application with SCCM data:

Procedure

1. Navigate to Client Software Distribution > SCCM > SCCM Server Instance.
2. Click New.
3. In the SCCM Server Instance form, identify the server by name and provide the fully qualified domain name.
4. Click Submit.

   The new SCCM server appears in the list.
5. Open the new SCCM record and click Discover now under Related links.
The system runs the Discover SCCM workflow that retrieves the application, collection, and deployment data from the SCCM server.

### Retrieving SCCM data with Discovery

<table>
<thead>
<tr>
<th>SCCM Server Instance</th>
<th>SCCM Server</th>
<th>Name</th>
<th>SCCM Server</th>
<th>Fully qualified domain name</th>

• collection  
• type |
Note: For details about the custom activities used in this workflow to extract data from an SCCM server, see Orchestration SCCM activity pack.

Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin
Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.

About this task
You can link an SCCM application to an existing software model or create a new model.

Procedure

1. Navigate to Client Software Distribution > SCCM > SCCM Applications. A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.

4. To create a model, click Create Software Model under Related Links.
   
   a. Complete the software model fields.
      See for details.

   b. Click Submit.
      The view returns to the SCCM Applications form.
Define an SCCM configuration

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you begin

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin

About this task

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

SCCM table references
Procedure

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.

### SCCM configuration form

- **Name**: Dropbox
- **SCCM application**: Dropbox
- **SCCM collection**: Dropbox
- **SCCM uninstall collection**: Dropbox
- **Discovery model**: Dropbox, Dropbox, Dropbox, 3.0

### SCCM configuration fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the <strong>install</strong> deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
<tr>
<td>SCCM uninstall collection</td>
<td>Name of the collection associated with the <strong>uninstall</strong> deployment for the selected application on the SCCM server. You must specify an uninstall collection to:</td>
</tr>
<tr>

<tr>
<td></td>
<td>• Define a lease end date for deployed software.</td>
</tr>
<tr>
<td></td>
<td>• Allow lease extensions.</td>
</tr>
<tr>
<td></td>
<td>• Revoke software from a user's machine.</td>
</tr>
<tr>
<td>Discovery model</td>
<td>Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.</td>
</tr>
</tbody>
</table>

Create a catalog item for an SCCM application

Using the applications discovered on the SCCM server, create a catalog item for an application you want to offer for distribution from the service catalog.

Before you begin
Role required: sn_client_sf_dist.csd_admin or admin
Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

Procedure

1. Navigate to Client Software Distribution > SCCM > SCCM Applications. A list of applications discovered on the SCCM server appears.

2. Open a record for an SCCM application.

4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item [sn_client_sf_dist_cat_item] table by the Orchestration - Client Software Distribution plugin:

**SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the <strong>Skip approval</strong> check box to determine if the software item requires approval by the requester's manager.</td>
</tr>
<tr>
<td>Check license compliance</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
</tbody>
</table>
| Order on behalf of                         | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  - **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  - **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Lease start</strong></td>
<td>Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.</td>
</tr>
<tr>
<td>SCCM configuration</td>
<td>Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.</td>
</tr>
</tbody>
</table>

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list. By default, the Service Catalog Request workflow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this workflow skips approval altogether and ends. The system then runs the Order Client Software workflow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

6. Click **Update**. The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.

**SCCM deployment**

Ordering an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software workflow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software workflow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the workflow performs a software license check. If there is no license available, the workflow creates a catalog task to procure more licenses and assigns the task to the Client Software Distribution Administrators group.
3. The Order Client Software workflow triggers the Deploy SCCM Application workflow as a subflow. This workflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection SCCM activity.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application workflow checks if the user or device exists in the uninstall collection. The workflow uses the **Is Device in Collection** or **Is User in Collection** SCCM activity. If the user or device exists in the uninstall collection, the workflow removes the device or user. The workflow uses the **Remove from Device Collection** or **Remove from User Collection** SCCM activity before adding it to the **SCCM install collection**.

**Client software distribution validation process**

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the **sn_client_sf_dist.softwareInstallExpDays** property.

- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

SCCM software revocation

An administrator can revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

Revoke software deployed through the service catalog

Software deployed by SCCM can be revoked, but only when the software’s status is **Installed** and the application associated with the software configuration has an uninstall collection configured.

**Before you begin**

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.
- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A workflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**Procedure**

1. Navigate to **Client Software Distribution > Reports > Requested Software**.
2. Open the record for the SCCM software package you want to revoke. The package must have a **Status** of **Installed** to be revocable.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
**Revoke unentitled software**

An administrator can revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

**Before you begin**

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses **Software Asset Management** to identify unentitled software installations. Discovery detects the software on the user’s machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

**Procedure**

1. Navigate to **Client Software Distribution > Reports > Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. Under **Related Links**, click **Revoke software**.

   This action runs the Revoke Client Software workflow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal
policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

### Revoking a software installation

![Software installation image]

**SCCM software revocation workflow**

The Revoke SCCM Application workflow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation workflow to run, the software package must have a status of *Installed* and must be pre-configured for an appropriate uninstall collection. See [Revoke software deployed through the service catalog](#) for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application workflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The workflow employs two custom activities, **Remove from User Collection** and **Remove from Device Collection**, to remove either the user or the device from its original collection. The workflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the **Add to User Collection** or **Add to Device Collection** activity.

**Note:** This workflow is triggered by the Revoke Client Software workflow as a subflow.
Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to Client Software Distribution > Requested Software > Dashboard.

### Usage Overview dashboard

Navigate to **Client Software Distribution > Usage Overview** to view the current transaction count for your instance.

### Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.
CAUTION: The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the workflows and extension points for a customized software distribution process.

Before you begin

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

Procedure

1. Navigate to Client Software Distribution > Extensions > Providers.
2. Click New.
3. Complete the form using the fields in the table.

Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server table</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Discovery flow</td>
<td>Flow that discovers the provider server and returns the data from that server back to the instance. This is the flow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Software configuration table</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment workflow.</td>
</tr>
<tr>
<td>Deployment flow</td>
<td>Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revocation flow</td>
<td>Flow that revokes an installation from a provider server. This is the flow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
<tr>
<td>Use Flow</td>
<td>Option to use IntegrationHub flows for client software distribution. When this option isn’t selected,</td>
</tr>
</tbody>
</table>
Orchestration workflows are used for client software distribution.

**Note:**

---

### Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for workflows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment workflow.
- **SetRevocationData**: Generates the input variables for the revocation workflow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

---

### Client software distribution extension points

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation workflows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

#### SetDeploymentData

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.
**CheckRevocable**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration `sn_client_sf_dist_software_config` table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to true or false, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration `sn_client_sf_dist_software_config` table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

**Related information**

- Using extension points to extend application functionality
- Using scripted extension points in server-side scripts
- Using UI extension points in server-side UI macros
- Using client extension points in client-side UI scripting

**Orchestration examples**

These examples demonstrate how Orchestration can be used to automate common tasks.

**Active Directory automation example**

A set of six Orchestration Active Directory activities enables organizations to automate their on-boarding/off-boarding processes with auditable, self-documenting workflows that save time and eliminate mistakes.
The activities in the Active Directory activity pack are designed to manage user accounts and reset user passwords. The following activities cover the most common use cases administrators encounter when managing Active Directory user accounts:

- Create AD User Account
- Update AD User Account
- Remove AD User Account
- Disable AD User Account
- Query AD
- Reset AD User Password.

These activities share a common design, have complementary functionality, and share a common set of parameters. They can be used singly or together to create consistent workflows for provisioning and de-provisioning user accounts.

Update Active Directory with Orchestration

An organization plans to make their ServiceNow instance the single system of record for user account data and wants to update Active Directory with the latest changes.

About this task

The solution is to create an Orchestration workflow that pushes changes from the ServiceNow user record down to the Active Directory to create a new user record or update an existing record. This is accomplished by creating an Orchestration workflow that can create and update records in Active Directory based on the data in the ServiceNow User [sys_user] table.

Note: This example workflow assumes that ServiceNow is configured for LDAP and an LDAP server is configured to accept the new user accounts. The Active Directory user management activities are not dependent on LDAP, but the presence of LDAP makes this example workflow much easier. You must provide the domain controller’s IP address to the workflow, either by hardcoding it, adding another workflow input, or using a script to look it up from the CMDB.

Procedure

1. Navigate to Workflow > Workflow Editor.
2. In the Workflow tab, click the + icon to create a new workflow using these variables:
3. Click **Submit**.
   A basic workflow with a Begin and End point appears on the canvas.

4. Click the menu icon in the upper left corner of the canvas and select **Edit Inputs** from the context menu.

5. In the Workflow Inputs form, click **New** in the **Variables** record list, and create a new variable, using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Reference</td>
</tr>
<tr>
<td>Label</td>
<td>User</td>
</tr>
<tr>
<td>Column name</td>
<td>u_user</td>
</tr>
<tr>
<td>Reference Specification &gt; Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>
6. Click **Submit**.

7. In the **Custom** tab, expand **Custom Activities > Active Directory**.

8. Drag and drop the Update AD Object activity onto the transition line between the Begin and End points of the new workflow.

   This action automatically links the activity with the end point and opens the Workflow Activity property form.

9. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Update user data</strong>.</td>
</tr>
<tr>
<td>Domain controller</td>
<td>The ServiceNow LDAP integration adds a reference to the LDAP server to which the user's account is linked. To identify the LDAP server, enter the following statement:</td>
</tr>
<tr>
<td></td>
<td>${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Type</td>
<td>Type of AD object. In this case, the type is <strong>User</strong>, which is the default.</td>
</tr>
<tr>
<td>Object name</td>
<td>This example assumes that the ServiceNow user name matches the Active Directory sAMAccountName. Enter the following:</td>
</tr>
<tr>
<td></td>
<td>${workflow.inputs.u_user.user_name}</td>
</tr>
<tr>
<td>Object data</td>
<td>Updates the user's account in Active Directory, if the user exists. In this example, the user's title is updated:</td>
</tr>
<tr>
<td></td>
<td>{&quot;title&quot;: &quot;QA&quot;}</td>
</tr>
</tbody>
</table>

10. Click **Submit**.

    The workflow looks like this:

    ![Workflow diagram](image-url)
11. Attach both activity outcomes (Success and Failure) to the end point. At this point, the workflow takes a ServiceNow user record as input and updates the First Name, Last Name, and Title of the corresponding Active Directory account. If the account does not exist in Active Directory, the workflow fails.

**Note:** In a normal workflow, some type of alternate action is desirable upon failure. For example, you might send an email notification if the workflow failed to update the record.

12. To prevent the workflow from failing, add a Create AD Object activity to the transition lines between Begin and the Update AD Object activity.

13. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Create user data.</strong></td>
</tr>
</tbody>
</table>
| Domain controller | Same as for the update activity.  
|                 | `${workflow.inputs.u_user.ldap_server.server_url}`                   |
| Ou             | The organizational unit to which this object belongs. For the purpose of this example, you can enter **OU=HQ,OU=Managed Objects** |
| Object name    | Same as for the update activity.  
|                 | `${workflow.inputs.u_user.user_name}`                                 |
| Object data    | Creates an account with only the user name in it. For the purpose of this example, you can enter  
|                 | "${workflow.inputs.u_user.first_name}", "SN" :  
|                 | "${workflow.inputs.u_user.last_name}"                                 |

14. Click **Submit**.

15. Connect the Failure outcome of the Create AD Object activity to End. For this example, we are ignoring errors. The workflow now looks like this:
Creating an AD user

This procedure builds a simple workflow that creates a bare-bones Active Directory account consisting of a user name only. The workflow then updates that account with additional information provided by the ServiceNow User [sys_user] table. However, we do not want to execute the Create AD Object activity if the user account already exists. The workflow needs to query Active Directory for matching user records and then branch the workflow based on the results of the query. If an account already exists, then the workflow should update the account. If the account does not exist, then the workflow should create the account in Active Directory.

16. Drag and drop the Query AD activity onto the transition between Begin and Create AD Object.

17. Complete the Workflow Activity property form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as Search for existing account.</td>
</tr>
<tr>
<td>Domain</td>
<td>controller ${workflow.inputs.u_user.ldap_server.server_url}</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If the parameter field is blank, then all properties are returned. In this workflow, we leave the field blank.</td>
</tr>
</tbody>
</table>
| Search filter | An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. To find user accounts matching the input record, we use:  
  (samaccountname=${workflow.inputs.u_user.user_name}) |

18. Click Submit.

19. Connect the Failure outcome for the query activity to the End point. Remember that we are ignoring errors in this workflow.
20. Connect the Success outcome of the query activity to the Update AD Object activity.
   The workflow now looks like this:

   **Querying AD for user accounts**

   The Query AD activity returns its results as a JSON string in the workflow data bus. This JSON string is always an array of objects. Each object corresponds to an Active Directory entry that matched the query. Our workflow should branch, whether that array is empty or not.

21. Drag a standard If activity from the Conditions folder in the Core tab and drop it onto the transition between Query AD and Update AD Object.

22. Complete the Workflow Activity properties form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a logical name such as <strong>Account exists</strong>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to open the Script field.</td>
</tr>
</tbody>
</table>
| Script  | For the If activity to work correctly, we must return a **yes** or **no** in the answer variable (var) which corresponds to the Yes and No outcomes of the query activity. Line 1 converts the Query AD results from a JSON string into a Javascript array called `queryResults`. Line 2 checks the length of that array. If the array is more than 0, a match to the account was found, and we set our answer to yes. Otherwise, the answer is no.  
   
   ```javascript
   var queryResults=new JSON().decode(data.get(5).output);
   answer = ( queryResults.length>0 ? 'yes' : 'no' );
   ```

   **Note:** The expression `data.get(5)` in this script identifies the Query AD output in the Databus by order number, since it was the fifth activity added to the workflow.
23. Click **Submit**.

24. In the canvas, create a transition from the Yes outcome of the If activity to the Update AD Object activity.

25. Create a transition from the No outcome of the If activity to the Create AD Object activity.

This is the final step. This workflow will query Active Directory to determine if an account already exists. If an account exists, the workflow updates that account. If an account does not exist, the workflow creates the account and then updates the Active Directory with the configured user data set.

Creating the conditional paths

Orchestration activity packs

The base Orchestration system includes packs of custom activities you can use to automate typical IT and business processes in your network.

Activity packs allow you to automate several common business processes, such as managing Active Directory accounts and Exchange server mailboxes. Activity packs can also automate IT functions such as starting and stopping Windows servers, joining domains, assigning IP addresses, and configuring load balancers.
Use an activity pack

The **Packs** tab of the Workflow Editor contains any activity packs downloaded from the ServiceNow Store and any activity packs that you create.

**Before you begin**
**Roles required**: admin, activity_admin, activity_creator

**About this task**
You can organize custom activities into packs and upload them to the ServiceNow Store. Your custom packs do not appear in the tree until at least one activity in the pack is published. Activities added to an existing pack are not displayed until they are published. Activity packs from any application scope can appear in the **Packs** tab, regardless of the current scope setting for the instance.

**Procedure**
1. In the Workflow Editor palette, select the **Packs** tab.
2. Click the download icon.

   The hierarchy in the tab organizes packs by vendor, scope, category, and activity.

![Download packs](image)
Active Directory activity pack

The Active Directory (AD) activity pack enables an administrator to create, delete, and manage objects in Windows Active Directory, such as users, groups, and computers, using a ServiceNow Orchestration workflow.

Activities in this pack can reset a password automatically from a user request or manage any user account in Active Directory, whether or not it was created by an Orchestration workflow.

Domain controllers are identified by the IP address of the host machine. To use the hostname of the domain controller, add the Resolve DNS Name activity to resolve the hostname into an IP, and then pass the IP into the Active Directory activity.

Your instance must have access to a MID Server configured to use PowerShell to run these activities.

Note: All Active Directory activities pass through error messages returned from Active Directory. To view these error messages, point to the failed activity in the workflow canvas or select the Workflow Log tab in a Workflow Context record.

Custom Active Directory activities

Orchestration provides custom Active Directory activities that were created with the Orchestration Create a PowerShell activity, starting with the Geneva release. These activities perform the same functions as AD activities by the same name from previous releases and replace those activities for all new workflows. Existing workflows from earlier versions that were created with legacy AD activities continue to function normally after an upgrade to Istanbul. However, all new workflows must use these custom AD activities. The Powershell activity template gives workflow administrators the ability to store input and output variables from the Query AD activity in the Databus.

Note: To use the Active Directory custom activities, you must request activation of the Orchestration - Active Directory plugin.

Active Directory credentials with LDAP

If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.
Connection port used by AD Orchestration activities
All Active Directory activities use port 389 for LDAP access. If you are using AD activities with Oracle Virtual Directory (OVD) as a proxy, set up pass-through on port 389 only.

Add User to Group AD activity
The Add User to Group activity adds a user to a group in Windows Active Directory.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Input variables

<table>
<thead>
<tr>
<th>Add User to Group input variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
</tr>
<tr>
<td>DomainController</td>
</tr>
<tr>
<td>UserName</td>
</tr>
<tr>
<td>GroupName</td>
</tr>
</tbody>
</table>

Output variables

<table>
<thead>
<tr>
<th>Add User to Group output variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
</tr>
<tr>
<td>result</td>
</tr>
<tr>
<td>errorMessage</td>
</tr>
</tbody>
</table>
Conditions

Add User to Group conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>User was successfully added to group.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to add the user to the group. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Change AD User Password activity

The Change AD User Password activity changes the password for an Active Directory user account.

This activity requires the user's current password to run, unlike the Reset AD User Password activity. If the new password violates any Active Directory password requirements, such as length or character combinations, the activity fails and returns the appropriate error message. This error message appears in the ECC queue and in hint text when a user points to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Change AD User Password input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>

<tr>
<td></td>
<td>• Incorrect old password</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <code>executionResult.errorMessages</code> from the Activity designer parsing sources.</td>
</tr>
<tr>
<td>hresult</td>
<td>Powershell command result.</td>
</tr>
</tbody>
</table>

Conditions
The activity provides the following conditions:

Change AD User Password conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Password successfully reset.</td>
</tr>
<tr>
<td>Policy Failure</td>
<td>Password does not comply with the organization's Active Directory requirements.</td>
</tr>
<tr>
<td>Incorrect old password</td>
<td>Password being changed was not entered correctly.</td>
</tr>
<tr>
<td>Failure</td>
<td>An error occurred while attempting to change the password. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Active Directory credentials with LDAP
If you are using an LDAP Server with MID Servers, note that Orchestration and Active Directory activities do not use the user name and password configured on LDAP Servers. You must create a Windows type orchestration credential record. The username and password in the credentials record is used for LDAP queries that Orchestration and workflow activities perform.
Create AD Object activity

The Create AD Object activity creates an object in Windows Active Directory.

This activity fails if it finds an existing object with matching input variables.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

⚠️ Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Input variables

Create AD Object input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Type</td>
<td>The object type to create: user, group, or computer.</td>
</tr>
<tr>
<td>OU</td>
<td>The organizational unit to which this object belongs.</td>
</tr>
<tr>
<td>ObjectName</td>
<td>The sAMAccountName of the Active Directory object.</td>
</tr>
<tr>
<td>ObjectData</td>
<td>A JSON object containing Active Directory property names and their corresponding values. For example:</td>
</tr>
</tbody>
</table>

```json
{
  "givenName" : "John",
  "SN" : "Doe",
  "title" : "Sr. Account Specialist",
  "allowLogin" : true
}
```

This example sets the first name (givenName), last name (SN), and title on the Active Directory user account and allows that user to log in (allowLogin). This field allows...

</tr>
<tr>
<td></td>
<td>details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Disable AD User Account activity

The Disable AD User Account activity disables a Windows Active Directory user account, making it inactive.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

<tr>
<td>Failure</td>
<td>An error occurred while attempting to disable the account. Additional details may be available in the workflow log.</td>
</tr>
</tbody>
</table>

Enable AD User Account activity

The Enable AD User Account activity enables a Windows Active Directory user account, making it active.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**Note:** This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.
**Input variables**

</tbody>
</table>

**Is AD Account Locked activity**

The Is AD Account Locked activity determines whether an Active Directory user account is locked.

An account may be locked automatically if a user enters an incorrect password more times than allowed by the Active Directory security policy. You can unlock an account using the Unlock AD User Account activity.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.
Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Query AD activity

The Query AD activity retrieves entries from the Windows Active Directory based on an LDAP search filter and stores the results as a JSON string that can be used in the data bus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory > .

Note: This activity replaces an AD activity by the same name available in releases prior to Geneva. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul and will continue to save query results to the scratchpad. However, all new workflows must use the custom version of this activity. This activity was built with the Create a PowerShell activity, which stores input and output variables in the databus instead of the scratchpad.

Input variables

Query AD input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DomainController</td>
<td>IP address of the domain controller machine.</td>
</tr>
<tr>
<td>Properties</td>
<td>A comma-separated list of Active Directory properties to return. For example, givenName, SN, title. If this field is blank, then all properties are returned.</td>
</tr>
<tr>
<td>SearchFilter</td>
<td>An LDAP filter string that defines the search parameters. Use any valid LDAP filtering criteria. For example, to find user accounts matching the ServiceNow input record, use: (samaccountname=${workflow.inputs.u_user.user_name})</td>

<td>An error occurred while attempting to remove the user from the group.</td>
</tr>
</tbody>
</table>

Reset AD User Password activity

The Reset AD User Password activity resets the password of a user account in Windows Active Directory.

If the new password violates any Active Directory password requirements, such as length or character combinations, the reset activity fails and returns the appropriate error message. This error appears in the ECC Queue and when you point to the activity in the Workflow Editor.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

ℹ️ Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

</table>

Update AD Object activity

The Update AD Object activity updates an object in Windows Active Directory.

This activity only replaces existing values with new values. It cannot add new values to AD records such as adding a new group member to an AD group. For complex AD operations, use the Run PowerShell activity instead. The activity fails if it cannot find an existing account with matching object name and data.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

Note: This activity replaces an AD activity by the same name available in prior releases. If you have a workflow that uses the deprecated activity, your workflow will continue to work normally after upgrading to Instanbul. However, all new workflows must use the custom version of this activity, which was built with the PowerShell activity designer.

Azure AD activity pack

The Azure AD activity pack enables an administrator to automate employee onboarding and offboarding functions on Azure AD and manage Office 365 licensing.

Use the Azure AD activities to add and remove users to Azure Active Directory, manage security group membership, and assign or remove Office 365 licenses for individual users.

The Azure AD activities were created with the Orchestration REST Web Service activity template.

Add User to Group Azure AD activity

The Add User to Group activity adds a user to an existing security group in Azure Active Directory.
To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Azure AD**. This activity was built with the **REST** web service activity template.

⚠️ **Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

**Add User to Group input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_id</td>
<td>Object ID (GUID) of the member to be added.</td>
</tr>
<tr>
<td>group_id</td>
<td>Object ID (GUID) of the target group.</td>
</tr>
</tbody>
</table>

### Output variables

**Add User to Group output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>Returns the error string from the REST message. If there are no errors, this variable returns a null value.</td>
</tr>
<tr>
<td>body</td>
<td>Contains a string value representing the output from the REST message.</td>
</tr>
<tr>
<td>status_code</td>
<td>Contains the status code returned from the Web service.</td>
</tr>
</tbody>
</table>

### Conditions

**Add User to Group conditions**

<table>
<thead>
<tr>

Delete User Azure AD activity

The Delete User activity deletes the named user’s account from the Azure Active Directory tenant.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

Important: The REST message used for this activity must be configured to use OAuth2 authentication.

Input variables

Delete User input variables

</table>
Reset User Password Azure AD activity

The Reset User Password activity changes the named user’s Azure Active Directory password.

The Azure password policy imposes constraints on the complexity, length, and re-use of a password.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Azure AD. This activity was built with the REST web service activity template.

**Important:** The REST message used for this activity must be configured to use OAuth2 authentication.

### Input variables

<td>Activity failed to reset the named user’s password, or the activity failed to connect to Azure AD.</td>
</tr>
</tbody>
</table>

Exchange activity pack

The Exchange activity pack allows workflows to manage Microsoft Exchange mail systems.

The use of Orchestration Exchange activities requires the following:

- Microsoft Exchange 2010 or 2013.
- A MID Server configured to run Powershell 2.0
- A target Exchange server in the same Active Directory domain as the instance.
- Powershell Remoting enabled on the target Exchange server.

⚠️ Note: These activities cannot be used to interact with Microsoft Exchange Online.

Orchestration provides custom Exchange activities that were created with the Orchestration activity designer template. These activities perform the same functions as Exchange activities by the same name from previous releases and replace those activities for all new workflows. The custom Exchange activities were built with a Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.
**Note:** Existing workflows from earlier versions that were created with legacy Exchange activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom Exchange activities.

To use the Microsoft Exchange custom activities, you must request activation of the Orchestration - Exchange plugin. The custom Exchange activities are available in the Workflow Editor on the **Custom** tab. Expand the **Custom Activities** tree and select the **Exchange** category for the activity you want to use.

![Accessing custom Exchange activities](image-url)

- **Global**
- **Exchange**
  - **AddressList**
    - Delete AddressList - Version 1
    - Set AddressList - Version 1
    - Move AddressList - Version 1
    - Create AddressList - Version 1
    - Update AddressList - Version 1
    - Get AddressList - Version 1
  - **Mailbox**
    - Get Mailbox - Version 1
    - Disable Mailbox - Version 1
    - Enable Mailbox - Version 1
    - Create Mailbox - Version 1
    - Delete Mailbox - Version 1
    - Set Mailbox - Version 1
Configure MID Server for Exchange

Configure a MID Server with defined IP ranges to use Exchange.

About this task
If the MID Server manages resources within defined IP ranges, instead of all computers on your network, you must perform additional configuration steps to run Exchange activities. You do not need to perform these steps if your MID Server uses the default configuration.

Procedure
1. In the navigation filter, enter cmdb_ci_dns_name.list.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of your Exchange server in the Name field.
4. Right-click the form header and select Save.
5. In the IP Address related list, click New.
6. In the IP Address field, enter the IP address of your Exchange server.
7. In the Nic field, select eth0 or your preferred network interface controller.
8. Leave the Netmask field blank.
9. Click Submit.

Pass multivalued properties with an Exchange activity

To set a multivalued property using an Exchange activity, you must use a specific parameter format.

About this task
The Optional parameters shared input variable allows you to set multivalued properties.

Procedure
• To set a multivalued property, replacing any existing values, use this format: "PropertyName":"(value1, value2, value3)"
• To add values, use this format: "PropertyName":"+(value1, value2, value3);"
• To remove values, use this format: "PropertyName":"-(value1, value2, value3);"
• To both add and remove values, use this format: "PropertyName":"-(value1, value2, value3):+(value1, value2, value3);"
Create Address List activity

The Create Address List activity creates a new address list that acts as an alias for emailing all users in the group.

This alias cannot be used to manage user permissions. This activity implements the Microsoft Exchange New-AddressList command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Create Address List input variables

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Delete Address List activity

The Delete Address List activity removes an existing address list from an Exchange server.

This activity implements the Microsoft Exchange **Remove-AddressList** command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

**Get Address List activity**

The Get AddressList activity retrieves all attributes from the specified Exchange address list.

This activity implements the Microsoft Exchange Get-AddressList command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Move Address List activity

The Move Address List activity moves a Microsoft Exchange address list to another location in the address hierarchy.

This activity implements the Microsoft Exchange Move-AddressList command. The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List activity after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.
To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Address List**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Set Address List activity

The Set Address List activity modifies a Microsoft Exchange address list.

Use the Optional parameters variable to pass specific values to the Microsoft Exchange server. This activity implements the Microsoft Exchange Set-AddressList command.

The Exchange server caches the changes from this activity but does not immediately apply them. Use the Update Address List after this activity to apply the changes or wait for the Exchange server to automatically apply cached changes.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Address List.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. Create Mailbox activity

The Create Mailbox activity creates a new Active Directory user, if that user does not already exist, and a Microsoft Exchange mailbox for that user.

This activity implements the Microsoft Exchange **New-Mailbox** command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the **PowerShell activity designer**, which gives workflow administrators the ability to store input and output variables in the **databus**.

Input variables

Create Mailbox input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>The hostname of the Exchange server with which the activity interacts. Do not enter an IP address in this variable.</td>
</tr>
<tr>
<td>domain</td>
<td>The name of the Exchange server's assigned domain.</td>
</tr>
<tr>
<td>first_name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>middle_initial</td>
<td>Middle initial of the user.</td>
</tr>
</tbody>
</table>
Create Mailbox input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last_name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>alias</td>
<td>The display name for the mailbox address, the part of the email address to the left of the @ symbol. If no alias is specified, the activity uses First name.Last name as the alias. The alias is also used as the user's principal name (UPN) if none is specified in the optional parameters.</td>
</tr>
<tr>
<td>password</td>
<td>Password to use for the new mailbox. The password is encrypted when it is sent to the target host.</td>
</tr>
<tr>
<td>parameters</td>
<td>Optional parameters to pass to the Exchange server written in JavaScript Object Notation (JSON). Exchange activities cannot pass parameters that reference an object, such as a PSCredential object. Plain text is automatically converted to SecureString objects for parameters that require that data type. Attempting to save an activity that specifies duplicate parameters, including parameters from activity variables, or incorrectly formatted JSON causes a warning message to appear.</td>
</tr>
</tbody>
</table>

![Note:](image) When passing a switch parameter, such as ForceUpgrade, you must use the format "parameter":"true".

Output variables

Create Mailbox output variables

<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in creating a new mailbox for the specified user. If no Active Directory account existed for that user, this activity succeeded in creating a new account.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to create a new mailbox or an Active Directory account for the specified user.</td>
</tr>
</tbody>
</table>

Delete Mailbox activity

The Delete Mailbox activity deletes the Microsoft Exchange mailbox of an Active Directory user.

Optional parameters determine how the Exchange server handles the mailbox after deleting the user. This activity implements the Microsoft Exchange Remove-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tr>
</tbody>
</table>

Disable Mailbox activity

The Disable Mailbox activity disables the mailbox associated with a specified Active Directory account.

This activity implements the Microsoft Exchange **Disable-Mailbox** command.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Exchange > Mailbox**.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</tbody>
</table>

Enable Mailbox activity

The Enable Mailbox activity creates a new mailbox for an existing Active Directory user.

This activity implements the Microsoft Exchange `Enable-Mailbox` command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

**Note:** This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

</table>

Get Mailbox activity

The Get Mailbox activity gets the mailbox for the specified user or all mailboxes on a Microsoft Exchange server.

This activity implements the Microsoft Exchange Get-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.
Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

Set Mailbox activity

The Set Mailbox activity modifies the settings of an existing Microsoft Exchange mailbox.

Use the optional parameters variable to pass specific values to the Exchange server. This activity implements the Microsoft Exchange Set-Mailbox command.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Exchange > Mailbox.

Note: This activity replaces an Exchange activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

**F5 Network Management activity pack**

Orchestration provides custom activities for configuring elements of an F5 load balancer, including pools, pool members, and the virtual servers contained in the pool.

All F5 custom activities are in the F5 Network Management Application scope and are activated by the Orchestration - F5 network management plugin, which must be activated by request.

ServiceNow provides custom F5 activities, built from the REST web service activity template, that you can use to perform the following tasks:

- Add, delete, or verify pools.
- Add, delete, or identify pool members.
- Add or delete virtual servers.
- Add a profile to a virtual server.
- Configure the virtual server for vlans, irules, pool, and persistence.

**Add F5 Pool Member activity**

The Add F5 Pool Member activity adds a member to an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Active Directory**.

**REST settings**

- **REST message**: F5 POOL Membership Management
- **REST function**: post

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>MemberName</td>
<td>Pool member IP address and port, such as 192.168.2.19:80.</td>
</tr>
</tbody>
</table>
Output variables

Add F5 Pool Member output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Success or failure.</td>
</tr>
<tr>
<td>status_code</td>
<td>The HTTP status code.</td>
</tr>
<tr>
<td>error</td>
<td>The REST error.</td>
</tr>
<tr>
<td>output</td>
<td>The REST output.</td>
</tr>
</tbody>
</table>

Conditions

Add F5 Pool Member conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully added an F5 load balancer pool member.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to add an F5 load balancer pool member.</td>
</tr>
</tbody>
</table>

Get F5 Pool Member activity

The Get F5 Pool Member activity returns the pool members and verifies the pool's status.

Use this activity to verify that a pool member was created properly.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

</table>

Delete F5 Pool activity

The Delete F5 Pool activity deletes an F5 load balancer pool.

This activity was built using the REST web service activity template. To access the activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Active Directory.

REST settings

- **REST message**: F5 POOL Management
- **REST function**: delete

Input variables

Delete F5 Pool input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5IPAddress</td>
<td>IP address of the F5 console.</td>
</tr>
<tr>
<td>PoolName</td>
<td>Name of this pool, such as testPool.</td>
</tr>
</tbody>

</tr>
</tbody>
</table>

Infoblox DDI activity pack

This activity pack supports Infoblox DDI management through ServiceNow Orchestration.

The Infoblox DDI activity pack manages the IP addresses used in a network by integrating DNS and DHCP. Custom Orchestration activities use Infoblox Web API (WAPI) REST web services to access the Infoblox GRID server.

**Important:** Managing IP addresses through the Infoblox server requires a fully functional MID Server.

Starting with the Jakarta release, the Infoblox activity pack updates to version 2. This update supports Infoblox network views, which can restrict the visibility of network data. The view parameter can be passed as a query parameter or payload content, to do operations in a specific view. Version 2 also supports specifying the version of WAPI to use in integration endpoints. Supported for Infoblox:

- WAPI version 2.0 for REST messages
- NIOS appliance version 7.0
Note: To use the Infoblox DDI activities and workflow, you must request activation of the Orchestration - Infoblox DDI Activity Pack plugin.

Create a REST credential for Infoblox activities

All Infoblox activities require a REST credential to manage IP addresses from the Infoblox DDI server.

Before you begin

Before starting this procedure, make sure you have the following:

- A properly configured and running Infoblox DDI Grid Server.
- REST credentials defined on the Infoblox DDI server.

Role required: admin

About this task

You must create a REST credential record on the ServiceNow instance that each Infoblox activity can use to access management features on the Infoblox server.

Procedure

1. Navigate to Orchestration > Credentials and click New.
2. In the list of credential types, select Basic Auth Credentials.
3. Create the credential record with a logical name, such as InfobloxCred.
4. Right-click in the header bar of your new credential record and select Copy sys_id from the context menu. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
5. Paste the sys_id into the restCredentials input field of each activity you use.

Infoblox workflows

The Infobox DDI activity pack includes two default workflows, one that reserves and registers IP addresses and another that releases IP addresses.

To access these workflows, navigate to Workflow > Workflow Editor and select the Workflows tab. Click on a workflow to open it, and then click the information icon in the workflow header to display the properties dialog box.

Infoblox Reserve/Register IP in IPAM

Use this workflow to register IPv4 addresses or request the next available IP address on IPAM. Optionally, you can use it to register IP addresses on DNS. The custom Infoblox activities used in this workflow are:
• IPAM Register IP Address
• IPAM Reserve IP Address
• Register DNS A-Record
• Get Network Details

Infoblox Reserve/Register IP input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
<tr>
<td>Network</td>
<td>Network containing the target IP address.</td>
</tr>
<tr>
<td>Zone</td>
<td>The DNS zone for the IP address being registered.</td>
</tr>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>DNS Host Name</td>
<td>Name of the DNS server machine on which the IP address is being registered.</td>
</tr>
<tr>
<td>IPv4 Address</td>
<td>IP address being reserved or registered.</td>
</tr>
</tbody>
</table>

Infoblox Release IPAM Reservations
Use this workflow to release (delete) all the IPAM reservations associated with an IPv4 address. The custom Infoblox activities used in this workflow are:

• IPAM List IP Reservations
• List DNS Record
• DNS Delete
• IPAM Delete

Infoblox Release IPAM Reservations input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Credentials</td>
<td>The sys_id of the REST credentials from the ServiceNow instance.</td>
</tr>
<tr>
<td>IP to Delete</td>
<td>IP address to release.</td>
</tr>
<tr>
<td>Infoblox Server</td>
<td>IP address of the Infoblox DDI server.</td>
</tr>
</tbody>
</table>
Infoblox roles and permissions

Define the roles and permissions that the Infoblox activities need to access the various resources on the Infoblox server.

Admin groups

There are three types of admin groups on an Infoblox server:

• Superuser
• Default
• Limited Access

To perform specific operations on the Infoblox server, the Limited Access user must have a minimum set of privileges for the desired resources, using either the user interface or an API. These privileges are based on read and read/write access. For more information, refer to the “About Admin Groups” section in the Infoblox NIOS Administrator Guide.

Permission hierarchy

1. User: A user can be part of multiple groups.
2. Group: A group can have many roles.
3. Role: Each role consists of specific resource permissions.

Required permissions

The ServiceNow Infoblox activity pack requires appropriate read and read/write privileges for these resources:

• Network
• DHCP
• DNS
• IPAM

This example shows a default DHCP admin role, its resources, and the related permissions for each.
Infoblox DHCP activities

The Infoblox DHCP activities manage the IP addresses reserved for DHCP in your network.

Use these activities to reserve, list, or delete IP addresses that are used for DHCP assignment in your network.

DHCP Reserve IP v4 Address Range activity

The DHCP Reserve IP v4 Address Range activity reserves an IP address range for DHCP use.

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

Input variables

**DHCP Reserve IP v4 Address Range input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InfobloxServer</td>
<td>Name of the Infoblox DDI Grid Server.</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully reserved the specified IPv4 address range.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to reserve the specified IPv4 address range.</td>
</tr>
</tbody>
</table>

DHCP Delete IP Reservation activity

The DHCP Delete IP Reservation activity deletes IP reservations in DHCP using either an IPv4 or IPv6 address range.

An automation can obtain an Infoblox DHCP object to delete from either of these activities:
• DHCP List IP Reservations
• DHCP Reserve IPv4 Address Range

The DHCP activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DHCP.

### Input variables

#### DHCP Delete IP Reservation input variables

Infoblox DNS activities

The Infoblox DNS activities manage DNS records in your network using an Infoblox DDI Grid Server.

Use these activities to register, list, or delete DNS records managed on an Infoblox server.

List DNS C-records activity

The List DNS C-records activity retrieves all canonical (CNAME) records from a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

Register DNS A-record activity

The Register DNS A-record activity creates a DNS A record on a specified Infoblox server.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.

DNS Delete activity

The DNS Delete activity deletes DNS records of any type from in Infoblox server, such as C and A records.

The DNS activities use the REST web service activity template to manage DNS records using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > DNS.
**Note:** It is faster to create a new record than recover one that has been deleted.

Infoblox IPAM activities

The Infoblox IPAM activities manage IP addresses in your network using an Infoblox DDI Grid Server.

Use these activities to register, reserve, list, or delete IP addresses.

IPAM Register IP Address activity

The IPAM Register IP Address activity registers an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format `fixedaddress/<encryptedkey>:<reserved ip address>/<view>`. 

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > Infoblox DDI > IPAM**.

IPAM Reserve IP Address activity

The IPAM Reserve IP Address activity reserves an IP address in a network using Infoblox IPAM.

The output of this activity produces an InfoBlox IP address record that can be used for other IPAM functions in the format fixedaddress/<encrypted key>:<reserved ip address>/<view>.

The IPAM activities use the REST web service activity template to manage IP addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > IPAM.

**Infoblox network activities**

The Infoblox network activities manage networks using an Infoblox DDI Grid Server.

Use these activities to create, list, or delete networks on an Infoblox server.
Create Network activity

The Create Network activity creates new networks on a specified Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

Get Network Details activity

The Get Network Details activity retrieves the information about a specific network on an Infoblox server.

The network activities use the REST web service activity template to manage network addresses using an Infoblox DDI Grid Server. These activities are configured to use a MID Server with REST capabilities.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Infoblox DDI > Network.

Input variables

PowerShell activity pack

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications.

Orchestration provides custom PowerShell activities that were created with the PowerShell activity designer template. These activities perform the same functions as PowerShell activities by the same name from previous releases and replace those activities for all new workflows. These custom activities give workflow administrators the ability to store input and output variables in the databus.

Note: Existing workflows from earlier versions that were created with legacy PowerShell activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom PowerShell activities.

Starting with the Rome release, there are the following updates to the PowerShell activity pack:
• A new PowerShell probe (V2), which takes advantage of IntegrationHub functionality

• The ability to insert debug statements in the PowerShell scripts and produce the resulting messages at runtime

To use the PowerShell custom activities, you must request activation of the Orchestration - PowerShell plugin. These activities are available in the Workflow Editor on the Custom tab. Expand the Custom Activities tree and select the PowerShell category for the activity you want to use.

ServiceNow supports PowerShell 3.0 to 5.1.

PowerShell activity designer
PowerShell activities are configured to return data to a workflow from a host using Microsoft PowerShell.

You must purchase Orchestration to use this template. For specific information about using the tools in the activity designer, refer to these resources:

• Orchestration activity designer

• Create input variables

• Create a parsing rule

ServiceNow supports PowerShell 3.0 to 5.1.

PowerShell protocols and troubleshooting
PowerShell uses the Windows Management Instrumentation (WMI) and Windows Remote Management (WinRM) protocols to enable Orchestration activities to run commands on remote Windows hosts.

Windows Management Instrumentation (WMI)
WMI provides a uniform interface for any local or remote applications or scripts that obtain management data from a computer system, a network, or an enterprise. WMI contains these components:

• Managed objects and WMI providers: A WMI provider is a COM object that monitors one or more managed objects for WMI. A managed object is a logical or physical enterprise component, such as a hard disk drive, network adapter, database system, operating system, process, or service.

• WMI infrastructure: The WMI infrastructure is a Microsoft Windows operating system component known as the WMI service (winmgmt). The WMI infrastructure is composed of the WMI Core and the WMI repository. The
WMI repository is organized by WMI namespaces. The WMI service creates namespaces, such as root\default, root\cimv2, and root\subscription, at system startup and preinstalls a default set of class definitions, including the Win32 Classes, the WMI System Classes, and others. The remaining namespaces found on your system are created by providers for other parts of the operating system or products.

• **WMI consumers**: A WMI consumer is a management application or script that interacts with the WMI infrastructure. A management application can query, enumerate data, run provider methods, or subscribe to events by calling either the COM API or the Scripting API for WMI.

**WMI installation and configuration**

For the MID Server to successfully make a remote connection to the target host, TCP port 135 must be open. The Windows firewall automatically creates an inbound rule for WMI connectivity called Windows Management Instrumentation (DCOM-In).

**Windows Remote Management (WinRM)**

WinRM is the Microsoft implementation of WS-Management Protocol, a standard Simple Object Access Protocol (SOAP) protocol that allows hardware and operating systems from different vendors to interoperate.

WinRM contains these components:

• **WinRM Scripting API**: This scripting API enables Orchestration to obtain data from remote computers, using scripts that perform WS-Management protocol operations.

• **WMI Service**: The WMI service continues to run side-by-side with WinRM and provides requested data or control through the WMI plug-in. You can continue to obtain data from standard WMI classes, such as as Win32_Process.

**WinRM configuration**

WinRM is automatically installed on Windows 2008 R2 and above operating systems, but must be configured before use.

1. In a command prompt, enter `winrm quickconfig`. This command is not case sensitive.

2. When the console displays **Make these changes [y/n]?:**, enter `y`.

The `winrm quickconfig` command performs the following operations:
• Starts the WinRM service, and sets the service startup type to **auto start**.
• Configures a listener for the ports that send and receive WS-Management protocol, using either HTTP or HTTPS on any IP address.
• Creates a firewall exception for the current user profile.

**MID Server PowerShell files**

PowerShell functions are stored in script files (*.ps1) that use a PowerShell Script module (*.psm1) file name extension.

The PowerShell functions are used by the PowerShell MID Server script files included in these activity packs:

- Active Directory
- Exchange
- SCCM
- PowerShell

**PSScript.ps1**

This script performs a few tasks, such as credential testing, password encryption, and the execution of scripts configured in the Orchestration Activity Designer or in MID Script Files. However, this document focuses on how PSScript.ps1 uses the **credential.psm1** module for testing access to remote hosts.

The PowerShell variables are generally used directly in the **PowerShell execution command** or as arguments in the MID Server script file you specify. There are special variables that are passed to PSScript.ps1, such as **credType**.
Using credType in execution parameters

PowerShell credTypes

The PowerShell credential types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WMI</td>
<td>testCredentialWMI</td>
</tr>
<tr>
<td>Exchange</td>
<td>testCredentialExchange</td>
</tr>
<tr>
<td>AD</td>
<td>testCredentialAD</td>
</tr>
<tr>
<td>SCCM</td>
<td>testCredentialSCCM</td>
</tr>
</tbody>
</table>

If no credential type is passed to the PSScrip.ps1 script, the MID Server defaults to the WMI test function to test access to the target host. If there is a credential type used, the MID Server runs the corresponding test function for that credential type.

Exit codes

These exit codes are returned from the PSScript.ps1 script and logged in the MID Server log file.
## PSScript.ps1 exit codes

<table>
<thead>
<tr>
<th>Type</th>
<th>Test function</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>PowerShell command/script ran successfully.</td>
</tr>
<tr>
<td>1</td>
<td>Test finished successfully, but the command/script failed to execute.</td>
</tr>
<tr>
<td>2</td>
<td>Incorrect syntax passed to script.</td>
</tr>
<tr>
<td>3</td>
<td>All credentials including MID Server service account failed to execute the command/script.</td>
</tr>
<tr>
<td>4</td>
<td>Passed test and executed the activity, but an error was returned. Example user cannot be found.</td>
</tr>
</tbody>
</table>

## DiagnosticsUtil.psm1

The MID Server uses this module file to perform PowerShell logging that assists debugging any Orchestration activity using PowerShell scripting. You can also add debugging statements directly to custom scripts.

### PowerShell diagnostic utilities

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNCLog-DebugInfo</td>
<td>Log a debug message for a PowerShell script or PowerShell Orchestration activity. Examples:</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo -message &quot;My debug message...&quot;</td>
</tr>
<tr>
<td></td>
<td>• SNCLog-DebugInfo &quot;My debug message&quot;</td>
</tr>
<tr>
<td>SNCLog-ParameterInfo</td>
<td>Log a function parameter value. For &quot;function getHostName( param( [String] $target )&quot;, the first value to the PowerShell hashtable is a string to indicate which function executes, and the values for each of the function parameters. Examples:</td>
</tr>
</tbody>
</table>
### PowerShell diagnostic utilities (continued)

<table>
<thead>
<tr>
<th>Utility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Function with single parameter:</td>
</tr>
<tr>
<td></td>
<td>SNCLog-ParameterInfo @(&quot;Running getHostName&quot;, $target)</td>
</tr>
<tr>
<td></td>
<td>️ Note: The debug message shows, 'Running getHostName $target: [actual value of $target]'</td>
</tr>
<tr>
<td></td>
<td>• Function with multiple parameters:</td>
</tr>
<tr>
<td></td>
<td>SNCLog-ParameterInfo @(&quot;Running functionName&quot;, $param1, $param2, $param3)</td>
</tr>
<tr>
<td>SNCObfuscate-Value</td>
<td>Use this utility to encrypt values for security purposes. The function displays &quot;$variableName&quot;:***, where *** is the obfuscated value. Example:</td>
</tr>
<tr>
<td></td>
<td>• SNCObfuscate-Value $password</td>
</tr>
<tr>
<td></td>
<td>️ Note: The debug message reads: &quot;$password : ***&quot;</td>
</tr>
</tbody>
</table>

### Credentials.psm1

The MID Server uses this module file to test access to a target host. The MID Server loops through all Windows credentials stored in its credentials table using the following access type functions, unless the PowerShell activity has a credential type (credType) defined. All ServiceNow® authored PowerShell activities are hard-coded to use a specific credential type. As a result, the MID Server only tests credential access against the designated function.

### PowerShell test functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentialWMI</td>
<td>Tests the given user and password on the target host using the Get-WMI object.</td>
</tr>
</tbody>
</table>
### PowerShell test functions (continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testCredentilAD</td>
<td>Tests the given user and password on the target host using the built-in DirectoryEntry object.</td>
</tr>
<tr>
<td>testCredentialExchange</td>
<td>Tests the given user and password to create a session on an Exchange host. This test uses the built-in PowerShell remoting feature on a remote host. WinRM is configured on Exchange servers by default.</td>
</tr>
<tr>
<td>testCredentialSCCM</td>
<td>Tests the given user and password to create a session on an SCCM server. This test uses the built-in PowerShell remoting feature on a remote host. This test requires WinRM to be configured.</td>
</tr>
<tr>
<td>testNoCredentialAccessWMI</td>
<td>Tests the given user and password on the target host, using the Get-WMI object. This test is used when no credType is used.</td>
</tr>
</tbody>
</table>

**Note:** If the test passes using one of these functions, that credential is used to run the PowerShell script/command. If the tests fail to access the target host using these functions, the MID Server runs the PowerShell script/command under the account of the MID Server service.

This diagram illustrates the dependency of the credential selection behavior on the host being targeted by the PowerShell activity. If the target host is the IP address or host name of the MID Server, the MID Server bypasses all credentials in the Credentials table and uses the account of the MID Server service. If the target host is not the MID Server, then all Windows credentials are used first. If all credentials in the Credentials table are unsuccessful in running the PowerShell activity, then the MID Server uses the MID Server service account.
**PowerShell credential selection criteria**

![Flowchart of PowerShell credential selection criteria]

**ActiveDirectory.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the Active Directory activity pack.

**Exchange.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the Exchange activity pack.

**SCCM.psm1**

This module file stores the functions used by the PowerShell scripts shipped with the SCCM activity pack.

**Set up credential tags for a PowerShell activity**

Credential tagging gives an administrator more control over the credentials used in a PowerShell activity.

**Before you begin**

Role required: admin, activity_creator or workflow_admin
About this task
Tagging is useful when the activity requires specific credentials to perform a task. By populating the **Credential tag** field you are telling the activity to use a credential that has a specific tag set for it. Additionally, credential tagging allows you to use a different underlying credential in development, testing, and production systems without having to change the activity for a given target system. For example, you can use the **SCCMCred** tag and have it point to both a development and test instance.

Procedure
1. Navigate to **Orchestration > Credentials**.
2. Select the credential you want to tag.
3. Enter a unique name in the **Tag** field that is descriptive of the credentials purpose.

4. Click **Update**.
5. Open the Workflow Editor and select the PowerShell activity you want to tag.
6. In the activity's Execution Command, add the name of the tag you created to the **Credential tag** field.

**PowerShell troubleshooting**

Authentication and access denied errors can prevent PowerShell activities from running a command on a target host.

Use these procedures for troubleshooting authentication failures with Orchestration PowerShell activities and when the Remote Procedure Call (RPC) server is unavailable or when access is denied. The authentication failure error displays when all credentials, including those of the local MID Server service account, do not have the correct permissions to run the Powershell script/command. The same error displays when the target host is unreachable.
Authentication failure in an Active Directory activity

This example uses the Create AD Object activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin
Role required: Permissions to access and create accounts on Active Directory

About this task
Validate that the account you are using has the proper permissions to run the activity.

Procedure
1. Log on to the target machine using the account under which you want to run the activity.
   Active Directory tools must be installed on this machine.
2. Launch the Active Directory Users and Computers application.
3. Navigate to the OU under which you want to create the Active Directory object.
4. Attempt to create the object.
   If this procedure is successful under the specified user, the following might be the cause of the authentication failure:
• User name is invalid.
• Password entered incorrectly.
• Domain controller is unreachable.

⚠️ Note: The majority of the return codes listed in the MID Server log for this error are 1s and 3s. This is because the Active Directory activities use the ADSI provider and not WMI or WinRM. An error code of 1 means the account was able to connect with the test account, but running the script failed.

An error code of 3 means that the MID Server attempted to run the PowerShell activity under the MID Server service account but failed.

Authentication failure in an Exchange activity

This example uses the Create Mailbox activity to illustrate troubleshooting authentication failure in PowerShell.

Before you begin

Role required: Permissions to access and create mailboxes on the Exchange server

Procedure

1. Validate that the account you are using has the proper permissions to run the PowerShell activity.
2. Log on to a machine that has the Exchange Management Shell (EMS) installed.
3. Create a user using the New-mailbox Exchange commandlet.
Creating a new user in Exchange

If this procedure is successful under the specified credential, the following is the likely cause of the failure:

- User name is invalid.
- Password entered incorrectly.
- Exchange server is unreachable.

4. If the Exchange server is unreachable, examine the MID Server logs. Because the Exchange activities use WinRM to access the Exchange server, the logs can provide more troubleshooting information.

![Code Snippet]

Note: Ensure that the error is NOT WinRM cannot process the request.

Remote Procedure Call (RPC) server unavailable or access denied

Typically, this error is logged when running a PowerShell script/command that uses WinRM or WMI.

Possible causes of error

The target host might have one of these issues:

- WinRM isn’t configured.
- Firewall is blocking access to the host over TCP port 135 (WMI) or HTTP/HTTPS and TCP port 5985 (WinRM).
- Kerberos issue, caused by hopping to multiple hosts using WMI.

Example WinRM error

The Create Mailbox activity from the Exchange activity pack has generated an error in the ECC queue involving authentication using the MID Server service credential. This occurred because the MID Server credential is the last to be used if the targeted host is not the MID Server.
Authentication failure error message

The MID Server log shows that the MID Server tried to run the activity under specific credentials, but wasn’t successful and received an exit code of **1**.

**MID Server error code**

```
Attempting to use credential with username 'service-now\joel.zamalloa'

```

**Join Domain activity**

The Join Domain activity joins a Windows computer to a domain.

If the computer is already a member of a domain, this activity completes without modifying the computer. Joining a domain requires a username and password. This user must have domain administration privileges or privileges to join a computer to the domain.

**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.
Input variables

Join Domain input variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server that is joining the domain.</td>
</tr>
<tr>
<td>Domain</td>
<td>Name of the domain to join.</td>
</tr>
<tr>
<td>Domain_user</td>
<td>The name of a user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
<tr>
<td>Domain_user_password</td>
<td>The password for the user who has domain administration privileges or privileges to join a computer to the domain.</td>
</tr>
</tbody>
</table>

Output variables

Join Domain output variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources. If this variable is not null, the operation has failed.</td>
</tr>
</tbody>
</table>

Conditions

<td>The activity failed to join the computer to the domain.</td>
</tr>
</tbody>
</table>

Install Windows App activity

The Install Windows App activity installs an application from an MSI package on a Windows target machine.
**Note:** This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the PowerShell activity designer, which gives workflow administrators the ability to store input and output variables in the databus.

### Input variables

**Install Windows App input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS MID Server capability to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>installpath</td>
<td>Path to the installer. The installer can be on any machine that is visible to both the MID Server and the target machine (local drive, UNC path, mapped drive, etc.).</td>
</tr>
<tr>
<td>installer</td>
<td>Name of the installer file, such as winzip150.msi. The installer must be an MSI package.</td>
</tr>
<tr>
<td>arguments</td>
<td>The parameter that contains the command line arguments to the MSI package. These are name=value pairs, separated by a space. For example, the argument might appear as: INSTALLDIR=c:\myinstallfolder ADDDESKTOPICON=0. These arguments are dependent on what the actual MSI being installed defines. If there are no arguments, leave the field empty.</td>
</tr>
</tbody>
</table>

### Output variables

**Install Windows App output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
<td>Either <strong>success</strong> or <strong>failure</strong>.</td>
</tr>
<tr>
<td>errorMessage</td>
<td>The <strong>executionResult.errorMessages</strong> from the Activity designer parsing sources.</td>
</tr>
</tbody>
</table>

### Conditions

The activity state tells the workflow engine what to do with the activity.
Install Windows App conditions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The Windows application was successfully installed on the target machine.</td>
</tr>
<tr>
<td>Failure</td>
<td>The Windows application failed to install on the target machine</td>
</tr>
</tbody>
</table>

Enable WMI Windows Installer provider

To install software on Windows machines using the Install Windows App activity, enable WMI Windows Installer provider on all target machines.

Before you begin

- It is recommended that the MID Server, the target machine, and the installer source machine be on the same Active Directory domain. However, if these computers are on separate domains, those domains must have a trust relationship established between them.

- If the installer path is a UNC file sharing machine, the Active Directory account of the target computer must be trusted for delegation. For instructions on this configuration, see the posting on the community for installing and uninstalling Windows applications.

About this task

**Note:** See WMI Providers for a list of Windows operating systems that provide this tool by default.

Procedure

1. Open the Control Panel.
2. Go to Add or Remove Programs.
3. Select Add/Remove Windows Components.
   This action opens a secondary window displaying additional selections.
5. Select WMI Windows Installer Provider check box.
6. Click OK to return to the Windows Components Wizard window.
7. Click Next.
   You might be asked for the Windows installation CD to complete this process.
**Change Service State activity**

The Change Service State activity starts or stops a Windows service on a remote system.

This activity replaces a Powershell activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input Variables**

**Change Service State input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>Hostname or IP address of the target Windows machine on which the service is installed. Use the Resolve DNS activity to resolve hostnames into IP addresses.</td>
</tr>
<tr>
<td>service</td>
<td>Name of the Windows service to start or stop. The service parameter is the service name, not the display name of the service affected.</td>
</tr>
<tr>
<td>state</td>
<td>There are two actions to select for a service state change: <strong>StartService</strong> or <strong>StopService</strong>.</td>
</tr>
</tbody>
</table>

**Output variables**

<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The target service was successfully started or stopped.</td>
</tr>
<tr>
<td>Failure</td>
<td>The update to the target service was unsuccessful, or the service was not found on the target system.</td>
</tr>
</tbody>
</table>

Restart Windows Server activity

The Restart Windows Server activity stops and then restarts a Windows server using Powershell.

⚠️ Note: This activity replaces a Powershell activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the Powershell activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

Restart Windows Server input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>Hostname or IP address of the Windows server to restart.</td>
</tr>
</tbody>

</table>

Probe activity pack

Orchestration provides an activity pack customized using the ServiceNow activity designer that runs probes on target hosts to return specific information.

These custom activities were built with the Create a probe activity, which gives workflow administrators the ability to store input and output variables in the databus.

To use the custom probe activities, you must request activation of the Orchestration - Probe plugin.

Resolve DNS Name activity

The Resolve DNS Name activity takes an IP address or a fully qualified domain name (FQDN), which it resolves into one or more IP addresses.

The domain name is sent through the MID Server to the domain name system (DNS) to resolve the name. If a single IP address is returned, it is stored in two variables: `resolved_ip` and `resolved_ips`. If multiple IP addresses are returned, the first IP address is stored in the `resolved_ip` variable, and all the addresses are stored in the `resolved_ips` variable. If an IP address is provided instead of an FQDN, this address is output directly to both variables. Your ServiceNow instance must have access to a MID Server configured to use Resolve DNS to run this activity.
This activity replaces an activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the Probe activity template, which gives workflow administrators the ability to store input and output variables in the databus.

Input variables

**Resolve DNS Name input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FQDN</td>
<td>The fully qualified domain name to resolve or an IP address.</td>

</tbody>
</table>

SCCM activity pack

The Microsoft System Center Configuration Management (SCCM) activity pack provides Orchestration activities you can use to manage software deployments and collections on an SCCM server.

You can use SCCM Orchestration activities to deploy and revoke software from an SCCM server or manage user and device collections. The system manages software on an SCCM server using Orchestration activities and workflows.

Client software distribution requires:

- SCCM 2012 R2 and later.
- Powershell 3.x.
- Powershell Remoting enabled.
- The Windows PowerShell x86 execution policy must be set to unrestricted mode.
- Latest version of the SCCM cmdlet library installed on the SCCM server.
- Use the credentials to log onto the SCCM Server and connect via Windows PowerShell from the System Center Configuration Manager console at least once to set the path variable for that credential.

Request SCCM activities

The Orchestration - System Center Configuration Manager plugin installs the SCCM activity pack that deploys software from an SCCM host and manages user and device collections.

Before you begin

Role required: admin
About this task

The SCCM plugin is activated automatically when the Orchestration - Client Software Distribution [com.snc.orchestration.sccm_mgnt] plugin is activated, but can be activated separately.

Note: The activities in the SCCM plugin run in the System Center Configuration Manager scope.

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.
Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>this plugin to be enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments                            | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

5. Click **Submit**.

Configure the MID Server for SCCM activities

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Before you begin**
Role required: admin

**Procedure**
1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

### Add to Device Collection activity

The Add to Device Collection activity adds the specified device into a Microsoft System Center Configuration Manager (SCCM) device collection.

The Add to Device Collection activity uses the **Powershell activity template** to add a specified device to an SCCM device collection. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called **AddToDeviceCollection.ps1** to edit the collection.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Add to Device Collection activity does not use pre-processing or post processing scripts.

### Input variables

#### Add to Device Collection input variables

<table>
<thead>
<tr>
<th>Variable</th>

<td>Failure</td>
<td>Activity failed to add the device to the SCCM device collection.</td>
</tr>
</tbody>
</table>

Add to User Collection activity

The Add to User Collection activity adds a user to a Microsoft System Center Configuration Manager (SCCM) user collection.

The Add to User Collection activity uses the Powershell activity template to access the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called AddToUserCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Add to User Collection activity does not use pre-processing or post processing scripts.

Input variables

Add to User Collection input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>

</tr>
</tbody>
</table>

Get Applications activity

The Get Applications activity returns a list of all the applications available on a Microsoft System Center Configuration Manager (SCCM) server.

The Get Applications activity uses the Powershell activity template to access the applications on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetApplications.ps1. This script filters the results of the GET, so that only specific attributes are returned for the applications on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable application data. The list of available applications is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get Applications activity does not use a pre-processing script.
Input variables

Get Applications input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sccmServer</td>
<td>The fully qualified domain name (FQDN) of the SCCM server.</td>
</tr>
</tbody>
</table>

Output variables

The output variables for the Get Applications activity contain an array of objects called `applications` and an error message. Each object in the array contains the attributes in this table.

Get Applications output variables

<table>
<thead>
<tr>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>applications</td>
<td>The <code>applications</code> array contains these attributes:</td>
</tr>
<tr>
<td></td>
<td>• <code>id</code>: Primary key of the SCCM application.</td>
</tr>
<tr>
<td></td>
<td>• <code>ciUniqueId</code>: Unique ID of the SCCM application.</td>
</tr>
<tr>
<td></td>
<td>• <code>name</code>: Name of the application.</td>
</tr>
<tr>
<td></td>
<td>• <code>manufacturer</code>: Manufacturer of the application.</td>
</tr>
<tr>
<td></td>
<td>• <code>version</code>: Version of the application.</td>
</tr>
<tr>
<td></td>
<td>• <code>isDeployable</code>: True/false value indicating if this application is deployable.</td>
</tr>
<tr>
<td></td>
<td>• <code>isDeployed</code>: True/false value indicating if this application is already deployed.</td>
</tr>
<tr>
<td></td>
<td>• <code>numberOfUsersWithApp</code>: Count of users with this application installed.</td>
</tr>
<tr>
<td></td>
<td>• <code>numberOfDevicesWithApp</code>: Count of devices on which this application is installed.</td>
</tr>
<tr>
<td></td>
<td>• <code>application</code>: Object containing the data set listed above for this application. Use the script to parse additional data from this set that you might need.</td>
</tr>
<tr>
<td>error</td>
<td>Variable that contains the activity output error message.</td>
</tr>
</tbody>
</table>
Conditions

Get Applications conditions

<table>
<thead>
<tr>
<th>Variables</th>

<tr>
<td>Success</td>
<td>Activity successfully retrieved the list of applications available on the SCCM host.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to retrieve the list of applications available on the SCCM host.</td>
</tr>
</tbody>
</table>

Get Deployments activity

The Get Deployments activity returns the list of deployments performed by Orchestration using a Microsoft System Center Configuration Manager (SCCM) server.

The Get Deployments activity uses the Powershell activity template to access the deployments on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetDeployments.ps1 that returns the deployments on the host. This script filters the results of the GET, so that only specific attributes are returned for the deployments on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable deployment data. The list of available deployments is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get Deployments activity does not use pre-processing scripts.

Get Device Collections activity

The Get Device Collections activity returns the list of available device collections on a Microsoft System Center Configuration Manager (SCCM) host.

The Get Device Collections activity uses the **Powershell activity template** to access the collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called **GetDeviceCollections.ps1** that returns the device collections on the server. This script filters the results of the GET, so that only specific attributes are returned for the device collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable device collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the **Custom** tab, and then navigate to **Custom Activities > System Center Configuration Manager (SCCM)**.

**Note:** The Get Device Collections activity does not use pre-processing scripts.

Get User Collections activity

The Get User Collections activity returns the list of available user collections on a Microsoft System Center Configuration Manager (SCCM) server.

The Get User Collections activity uses the Powershell activity template to access the user collections on the SCCM server. The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called GetUserCollections.ps1 that returns the user collections on the host. This script filters the results of the GET, so that only specific attributes are returned for the user collections on the SCCM server. Filtering the results in this manner controls the size of the payload, while providing the most desirable user collection data. The list of available collections is returned as an array in a JSON object.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

Note: The Get User Collections activity does not use pre-processing scripts.

Is Device in Collection activity

This activity verifies if a device exists in an SCCM device collection.
The Is Device in Collection activity uses the PowerShell activity template to verify if a specific device exists in an SCCM device collection. The activity is configured to use a MID Server with PowerShell capabilities and to run a MID Server script called `IsDeviceInCollection.ps1` to perform the test.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

### Input variables

### Is User in Collection activity

This activity verifies if a user exists in an SCCM user collection.

The Is User in Collection activity uses the PowerShell activity template to verify if a specific user exists in an SCCM user collection. The activity is configured to use...
a MID Server with PowerShell capabilities and to run a MID Server script called IsUserInCollection.ps1 to perform the test.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

### Remove from Device Collection activity

The Remove from Device Collection activity removes a device from a Microsoft System Center Configuration Manager (SCCM) device collection.

The Remove from Device Collection activity uses the Powershell activity template to remove a device from a device collection on a Microsoft SCCM.
The activity is configured to use a MID Server with Powershell capabilities and to run a MID Server script called RemoveFromUserCollection.ps1 to edit the collection.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > System Center Configuration Manager (SCCM).

**Input variables**

<table>

### SFTP File Transfer activity pack

Use the SFTP File Transfer activities to manage files and directories on an SFTP server and to move files from one SFTP server to another.
The SFTP activity pack includes scoped activities for common file transfer tasks and a ready-to-use workflow that includes these activities. Use the SFTP workflow to control which files are going to be moved, what conditions the files need to meet, the order in which the files are moved, and which overwrite options are executed.

**Note:** To use the SFTP File Transfer activities and workflow, you must request activation of the Orchestration - SFTP plugin.

### SFTP File Transfer workflow

The SFTP File Transfer activity pack includes a scoped workflow that uses multiple activities to manage files on SFTP servers.

The maximum activity count for the SFTP File Transfer workflow is set to 10,000. This allows the workflow to move up to 1000 files from one server to another.

### Accessing the workflow

- Navigate to **Workflow > Workflow Editor** and select the **Workflows** tab.
- Click on the SFTP File Transfer workflow to open it.
- Click the information icon in the workflow header to display the properties dialog box.

### Input variables

#### SFTP File Transfer workflow input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source host</td>
<td>Name or IP address of the server containing the files you want to move.</td>
<td></td>
</tr>
<tr>
<td>Source port</td>
<td>Port number to use to communicate with the source server.</td>
<td>22</td>
</tr>
<tr>
<td>Source directory</td>
<td>Full path to the directory where the source files are located.</td>
<td></td>
</tr>
<tr>
<td>Source files</td>
<td>Names of specific source files to move. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
</tbody>
</table>
### SFTP File Transfer workflow input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excluded files</td>
<td>Names of specific source files to exclude from the move. The system moves all other files found in the source directory or subfolders. Separate the file names in this list with semi-colons. This field supports the use of wild cards. For information about how the values in this field are affected by options in other fields, see the section below the table.</td>
<td></td>
</tr>
<tr>
<td>Target host</td>
<td>Name or IP address of the server to which the files are being moved.</td>
<td></td>
</tr>
<tr>
<td>Target port</td>
<td>Port number to use to communicate with the target host.</td>
<td>22</td>
</tr>
<tr>
<td>Datetime format</td>
<td>Timestamp format to apply when the $[DateTime]$ variable is used in the Target directory or Target files field. The system uses the current time from the instance to create timestamp values.</td>
<td>yyyy-MM-dd</td>
</tr>
<tr>
<td>Target directory</td>
<td>Path to the directory in the target host where the files are being moved. You can specify a target directory whose name includes the timestamp by adding the $[DateTime]$ variable to the directory name. For example, you might enter this path to a target directory: /user/jacinto.gawron/documents/projects_$[DateTime]$. This produces the projects_20150505 directory. When the timestamp variable is used, the system uses the format specified in the Datetime format field.</td>
<td></td>
</tr>
<tr>
<td>Target file</td>
<td>Format to use for target file names when a timestamp is added. You can configure the system to add the timestamp as a prefix to the file name or insert the timestamp into the name, using these variables:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• $[DateTime]$: Current timestamp, using the format defined in the Datetime format field.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• $[SourceFile]$: Complete file name.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• $[SourceFile:Base]$: Base file name without the extension.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• $[SourceFile:Ext]$: File extension only.</td>
<td></td>

<td></td>
</tr>
<tr>
<td>Credential tag for target</td>
<td>Specific credential tag this activity must use to run SSH commands on the target host.</td>
<td></td>
</tr>
</tbody>
</table>

### File selection logic

When selecting the files to move from the source host, the system uses this logic:

- If the Source files and Excluded files fields are empty, the system moves all the files in the source directory.

- When the Include subfolders check box is selected, the following dependencies exist:
  - If no files are specified in the Source files and Exclude files fields, the system moves all files in the source directory and all files in all subfolders of the source directory.
  - If the Source files field contains file names, the system moves those files from their location on either the source directory or any of its subfolders.
  - If the Exclude files field contains file names, the system moves all the files from the source directory and its subfolders except those excluded files.

- When the Include subfolders check box is cleared, the system looks only in the source directory for files to move or exclude.
Copy File activity

The Copy File activity copies a file from an SFTP server (source host) to another SFTP server (target host).

Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the files you want to transfer.</td>

<td>includeSubfolders</td>
<td>True/false variable that determines if the given directory and all of its subfolders should be removed. The default value for this variable is false. If the value for this field is false, then the activity can only remove an empty directory. This field appears when the isDirectory checkbox is selected.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

Output variables

Remove File or Directory output variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessage</td>
<td>The executionResult.errorMessages from the Activity designer parsing sources. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>Either success or failure.</td>
</tr>
<tr>
<td>deletionResults</td>
<td>The deletionResults array contains these attributes:</td>
</tr>
<tr>
<td></td>
<td>• fullPath: Full path to the file or directory targeted.</td>
</tr>
<tr>
<td></td>
<td>• status: Either succeeded or failed.</td>
</tr>
<tr>
<td></td>
<td>• reason: Text message describing the cause of a failure.</td>
</tr>
</tbody>
</table>
**Conditions**

**Remove File or Directory conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in removing the file or directory specified.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to remove the file or directory specified.</td>
</tr>
</tbody>
</table>

**Rename File or Directory activity**

The Rename File or Directory activity renames a file or directory to a new name on an SFTP server.

**Input variables**

**Rename File or Directory input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory you want to rename.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is <strong>22</strong>.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory to rename.</td>
</tr>
<tr>
<td>targetFilePath</td>
<td>Full path to the renamed file or directory.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific <code>credential alias</code> this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

**Output variables**

**Rename File or Directory output variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errorMessages</td>
<td>The <code>executionResult.errorMessages</code> from the <code>Activity designer parsing sources</code>. If this variable is not null, the operation has failed.</td>
</tr>
<tr>
<td>result</td>
<td>A message saying that the operation has been successful. For example, you might see: <code>Rename /tmp/sftp_test/subdir1 to /tmp/sftp_test/subdir2 complete</code>.</td>
</tr>
</tbody>
</table>
Conditions

Rename File or Directory conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity succeeded in renaming the file or directory.</td>
</tr>
<tr>
<td>Failure</td>
<td>The activity failed to rename the file or directory.</td>
</tr>
</tbody>
</table>

Set File Attributes activity

The Set File Attributes activity sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List activity to return a list of files and their attributes first. Then, when you moved a file from a source host to a target host, use the Set File Attributes activity to set the source file attributes on the target file. This is demonstrated in the SFTP File Transfer workflow.

Input variables

Set File Attributes input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceHost</td>
<td>Name or IP address of the server containing the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>Port number to use to communicate with the target server. The default port number is 22.</td>
</tr>
<tr>
<td>sourceFilePath</td>
<td>Full path to the file or directory whose attributes you want to change.</td>
</tr>
<tr>
<td>userID</td>
<td>User ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>groupID</td>
<td>Group ID attribute to apply to the file or directory. The UID and GUID variables must be set together as a pair.</td>
</tr>
<tr>
<td>permissions</td>
<td>File or directory permissions to set for the user and group specified. This value must be expressed as an integer, such as 16877, which defines these permissions: rwxr-xr-x.</td>
</tr>
</tbody>
</table>
Set File Attributes input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accessTimestamp</td>
<td>Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair.</td>
</tr>
<tr>
<td>modificationTimestamp</td>
<td>Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair.</td>
</tr>
<tr>
<td>sizeInBytes</td>
<td>Size of the file or directory, expressed in bytes.</td>
</tr>
<tr>
<td>sourceCredentialTag</td>
<td>Specific credential alias this activity must use to run SSH commands on the host.</td>
</tr>
</tbody>
</table>

Note: The permissions number is an internal value returned by the Get File List activity.

Output variables

Set File Attributes output variables

<tr>
<td>Failure</td>
<td>The activity failed to change the attributes of the specified file or directory.</td>
</tr>
</tbody>
</table>
**SSH activity pack**

Orchestration provides an activity pack of SSH activities that were customized using the ServiceNow activity designer.

These activities perform the same functions as SSH activities by the same name from previous releases and replace those activities for all new workflows. The custom SSH activities were built with the Create an SSH activity, which gives workflow administrators the ability to store input and output variables in the databus.

⚠️ **Note:** Existing workflows from earlier versions that were created with legacy SSH activities continue to function normally after an upgrade to Geneva. However, all new workflows must use these custom SSH activities.

To use the SSH custom activities, you must request activation of the Orchestration - SSH plugin.

**Secure Copy activity**

The Secure Copy activity copies a file from one host to another, without storing the copied file on the MID Server.

This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

**Secure Copy input variables**

<table>
<thead>
<tr>
<th>Input variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_host</td>
<td>Host name or IP address of the source machine.</td>
</tr>
<tr>
<td>from_scp_file</td>
<td>Name of the file to copy, including the absolute path.</td>
</tr>
<tr>
<td>to_host</td>
<td>Host name or IP address of the target machine.</td>
</tr>
<tr>
<td>to_scp_file</td>
<td>Path to the target file. This path can be absolute or relative to the logged in user's home directory.</td>
</tr>
<tr>
<td>debug_mid</td>
<td>Check box that enables debug logging when selected.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>Success</td>
<td>Activity successfully copied the file from one host to another.</td>
</tr>
<tr>
<td>Failure</td>
<td>Activity failed to copy the file from one host to another.</td>
</tr>
</tbody>
</table>

Files Compare activity

The Files Compare activity compares two files on a Linux or UNIX computer. This activity replaces an SSH activity by the same name available in releases prior to Geneva. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Geneva. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity designer template, which gives workflow administrators the ability to store input and output variables in the databus.

To access this activity in the Workflow Editor, select the Custom tab, and then navigate to Custom Activities > Global > Orchestration - SSH.

File Write activity

The File Write activity writes a file on a Linux or UNIX computer.
The source file can be an absolute or relative path from the Directory. If an absolute path is used, then no value is required in the Directory field.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the SSH activity template, which gives workflow administrators the ability to store input and output variables in the databus.

**Input variables**

**File Write input variables**

<table>

</table>

Reset Linux User Password activity

The Reset Linux User Password activity resets the password for a given user on a Linux computer.

This activity requires that the user executing the command be able to run the **chpasswd** command and, if expiring the password immediately, to run **chage** with **sudo** privileges.

This activity replaces an SSH activity by the same name available in releases prior to Istanbul. If you have a workflow created in a previous version that uses the deprecated activity, your workflow will continue to work normally after
upgrading to Istanbul. However, all new workflows must use the custom version of this activity. This activity was built with the [SSH activity template](#), which gives workflow administrators the ability to store input and output variables in the [databus](#).

### Input variables

**Reset Linux User Password input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

Global activities

Global activities are Orchestration activities created in the global scope.

Any activities you create in the global scope are listed in the Global category in the Packs and Custom tabs of the Workflow Editor.

Global activities

[Workflow Editor interface showing Global activities with Pack and Custom categories]

</tbody>
</table>

Orchestration activity designer

The Orchestration activity designer enables a user with either the workflow_admin or activity_creator and workflow_creator roles to construct reusable activities that suit an organization's business needs.

Activities created by the activity designer offer the following advantages over core activities offered in previous releases:

- Reuse custom activities in multiple workflows.
- Upload and download custom activities from the ServiceNow Store.
- Parse data from standard input formats.
- Test input variables against a target host or endpoint and inspect the payload.
- Automatically map values from a test payload to an activity's output variables.
- Share data between activities.
- View previous versions of an activity.

Access to the activity designer requires activation of ServiceNow Orchestration. For instructions about managing transitions and conditions for all activities, see Workflow activities.

Orchestration provides numerous pre-defined activities, which are reusable components that can be used in numerous workflows without having to understand the complexities of the underlying system. These activities are grouped into activity packs, which address specific business needs, such as: Active Directory, Azure AD, Exchange, Infoblox DDI, and PowerShell. There are other ServiceNow applications which provide and maintain their own separate activity packs, such as Security Incident Response, Cloud Management, or Release Automation.

Customers can also build their own activities and activity packs. You can construct custom activities with a specified template through the Orchestration Activity Designer. Custom-built activities built with the Activity Designer are referred to as activity elements. Activity elements provide optimal operations, enable code reuse, and minimize the need to write code. They also enable you
to follow the flow of data within a given workflow across orchestration activities. Incorporating activity elements limits the dependency on the scratchpad which reduces problems in complex workflows. Limit the use of core activities, like ‘Run Script’, unless you need direct access the scratchpad, for example, for a counter. Activity elements do not have direct access to the scratchpad. You can, however, pass scratchpad variables as inputs into your activities.

Orchestration activities created by the activity designer:

- Can be uploaded and shared in the ServiceNow App Store
- Use the databus, which allows the activity to have well-defined inputs and outputs
- Share data across activities within a workflow
- Use versioning
- Provide a consistent approach for activity development regardless protocol

† Note: Prior to the Fuji release, activities were built with Activity Definitions. In Fuji, a new architecture was introduced using the Activity Designer. Orchestration Core activities, built originally as Activity Definitions, have been converted to use the new template format (Activity Elements) and the databus offered with the activity designer. Workflows in upgraded instances that use legacy activities continue to work normally.

For instructions on using activities to construct a workflow, see Add an activity to a workflow.

Introduction to credentials, connections, and aliases for Orchestration

All application integrations in Orchestration require connection information, credentials, and connection and credential aliases to their respective applications to access resources.

Before you can execute an application integration in Orchestration, you must create and configure the corresponding connection information and credentials. The Connections pertains to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated Credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, for connections...
and credentials, to decouple this data from application metadata. These aliases allow customers to design their application metadata to couple to an alias, which during runtime resolves to connection and credential data.

There are two types of aliases, a **connection and credential alias** and a **credential alias**. There are business rules that enforce certain constraints on these aliases. Names should contain alphabets, numbers, and underscores but cannot have special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection in per domain.

⚠ **Note:** If you enable multiple active connections, when the connection records resolve, your application picks one connection based on an established order. The order of the connections depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The **credential alias** resolves only credential data. Along with alias data model, you can use a scriptable API which can get connection and credential data during runtime.

### Using Connection and Credential Alias with Orchestration

Define an alias to label a credential or connection record.

The Credential and Connection Alias defines an alias that labels a credential or connection record. It is extended from the sys_metadata table. It requires the admin role. The credential_admin and connection_admin have read access to sys_alias. A connection alias contains:

- **Name**
  - Name of the alias.

- **ID**
  - This field is based on the format "scope name.alias name" Unique index on ID to ensure unique record based on scope name + name. If the scope is global, the ID is the alias name.

- **Type**
  - You can select either 'Credential' or 'Connection and Credential'. The default is Connection and Credential.

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This field is applicable when the alias type is set to Connection and Credential. There are three connection types: HTTP, JDBC, JMS. The default is HTTP.

If you create a workday alias in global scope, the ID is set to workday
If you create a workday alias in hr app scope, the ID is set to x_hr_app.workday

- Name can only contain alphabets, numbers and underscore.
- During the upgrade, the tag in credential record will be migrated to connection alias. If the tag in previous release’s credential record contains special characters other than alphabets, numbers and underscore, the tag data will be preserved during the upgrade. The user still can use these connection alias, but the user cannot update these alias, unless he removes these special characters when do the update.

Using credentials with Orchestration
Orchestration requires credentials to access resources.

Credential table
The credential table (discovery_credential) defines credentials that can be used for integration. In the previous release, the Credential table contains a string-type tag field, which labels a credential and the tag is used in orchestration activities. In the madrid release, we rename tag to credential alias, and change the type from string to GlideList, which is a reference to connection alias table.

Credential types
The following credential types are provided:

<table>
<thead>
<tr>
<th>Credential type</th>
<th>Description</th>
<th>Supports Test Credential option</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicative credentials</td>
<td>The credentials to explore the applications on a device or computer. Often need applicative credentials.</td>
<td>No</td>
</tr>
<tr>

</tbody>
</table>

**How MID Servers use credentials**

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should configure these service credentials so that they have domain or local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery > Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the **Workflow activities**. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for **PowerShell**) and VMware.

**Encryption and decryption**

The platform stores credentials in an encrypted field on the Credentials [discovery_credentials] table. Once they are entered, they cannot be viewed.

When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server's public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server's private key.
Note: The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the Credentials form, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials [discovery_credential] table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.

- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Credential alias

Credential alias allows flow and workflow creators to:

- Assign individual credentials to any activity in an Orchestration workflow
- Assign individual credentials to any action in Flow Designer
• Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

• Assign different credentials to each occurrence of the same action in designer flow.

Credential alias also works with credential affinities.

**External credential stores**

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. Only CyberArk is supported.

**Connections with Orchestration**

Use the connections table to setup a JMS, JDBC, or HTTP(s) connection to a target host.

**Connection Table**

The Connection table (sys_connection) is the base table for all connection tables. You can setup connections for the following protocols:

• JDBC
• JMS
• HTTP(s)

The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

<table>
<thead>
<tr>
<th>Base connection properties</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td><strong>Credential</strong></td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td><strong>Connection alias</strong></td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
</tbody>
</table>
Base connection properties (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty

**Upgrading connection information**
The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables. In madrid, we re-parent them to extend from Connection (sys_connection) table. They move from Orchestration run time plugins to Credentials & Connections plugins. They are originally extended from sys_metadata. The sys_metadata related data will be removed. JDBC field name changes:

- JDBC server is renamed to host
- Database port is renamed to port

**Create custom activities using custom activity designer templates**

You can create and update different types of custom activities in the Workflow Editor using a custom template.

**Before you begin**
Roles required: workflow_admin or activity_creator

**About this task**
The Activity Designer contains common steps which are applicable to all the activities that you create. This procedure guides you through the common steps and the order they should be set up. You specify an activity template before you create a custom activity.

**Procedure**
1. Navigate to Orchestration > Workflow Editor. The Welcome tab of the Workflow Editor opens.
2. On the Custom tab in the palette, click + to create a new activity select the appropriate template from the list.
The Activity Designer form appears, with a stage indicator at the top. All new activities start at the **General** stage. The current stage shows with a blue underscore.

### Activity designer stage indicator

3. **Add the general properties.**
   This information is standard for each custom activity, include a name, description, and other related information.

4. **Create the template Create input variables for the template.**
   Create the variables to pass into the activity in the Inputs form of the activity designer.

5. **Optional:** **Add a pre-processing script.**
   For input validation or transforming input data, you might need a pre-processing script.

   **Note:** This step is not included in the Run Script activity.

6. **Click Continue to open the Execution Command form, then fill out the Execution Command step based on the corresponding execution templates:**
• Create a SOAP web service activity
• Create a JDBC activity
• Create a JavaScript Probe activity
• Create a PowerShell activity
• Create a REST web service activity
• Create a Probe activity
• Create an SFTP activity
• Create a Run Script activity
• Create an SSH activity
• Create a JMS activity

7. **Optional:** Test your inputs.

8. **Optional:** In the Outputs form, define local and/or output variables. Local variables can be used for temporary storage when cascading parsing rules. For example, you might extract an XML payload from within a JSON payload. A local variable can access the XML document and use that as a source for another parsing rule. The graphic shows a Local1 variable source to parse data for Output2.

   ![Define local variable](image)

9. Use one of the options to assign values to Outputs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
   | Parsing rule    | You can create a parsing rule and map them to the output fields by dragging and dropping the variables into the parsing rules structure. The REST, SOAP, and JDBC templates provide auto-mapping to create the parsing rules automatically. If available from the test inputs form, au-
Post-processing scripts allow you to code your own output data validation, output parsing code, and related tasks. Post-processing executes after the execution command results have been returned and before the parsing rules and conditions are run. Click Go to Post-Processing (Advanced) to create a post-processing script.

Note: If you create a script, this step reflects as a stage in the indicator.

10. Click Continue to open the Conditions form to create exit condition rules for your activity and then click Save.

General properties for activity designer templates
The following General Property fields are common to all activity designer templates.

General Property fields common to all activity designer templates

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the activity. Select a unique name that makes the activity easily identifiable in the palette. If you do not name the activity, it is identified in the Data tab of the Workflow Editor with an index number when it is added to a workflow. This index reflects the order in which the custom activity was added to the workflow. Only custom activities and their output variables appear in the Data tab.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of what the activity does.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that identifies an activity of this type in the workflow palette.</td>
</tr>
<tr>
<td>Execution template</td>
<td>Predefined template selected for this activity.</td>
</tr>
</tbody>
</table>
General Property fields common to all activity designer templates (continued)

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Current scope set on the instance. To view the scope, click the gear icon on the right side of the title bar in any record or list and look at the value in the Application field. The activity runs in this scope within a workflow. You cannot view or change the scope for the instance in the Workflow Editor.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Accessibility setting for this activity, by scope. The following options are available:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: This activity is available to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Use of this activity is restricted to the scope named in the Application field.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for this activity in the Custom and Packs tabs. All categories are listed under their scope in the collapsible hierarchy.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the activity.</td>
</tr>
</tbody>
</table>

**Create input variables**

Create the variables to pass into the activity in the **Inputs** form of the activity designer.

**Before you begin**

You must name your activity in the **General** form before you can advance to the **Inputs** stage.

Roles required: workflow_admin or activity_creator

>i Note: Variable strings in the **Inputs** form have a 255 character limit.

**Procedure**

1. Click the + icon to create a new input variable.

   The designer creates a default variable called **Input1**.
2. Type your new variable name in the field.
3. To change the name of a variable or any of its attributes, double-click the value and then select or enter a new value in the field that appears.
4. Configure your variable using these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Data type for this variable. Double-click on the field to display the choice list. In addition to the usual data types, you can create input arrays and encrypt individual variables that contain sensitive data. Encrypted variables are passed to the ECC Queue and then decrypted by the MID Server when they run on the target host. Sensitive data returned from running these variables on the host can then be passed to another activity through encrypted output variables.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Marks an input variable as mandatory. Variables marked as mandatory are required fields in the properties form for the activity in the workflow. The input testing feature allows you to filter on mandatory variables.</td>
</tr>
<tr>
<td>Default</td>
<td>Default value for this input variable. Default values are prepopulated for</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>variables in the properties form for the activity in the workflow. You can override this value when you test the variables.</td>
</tr>
</tbody>
</table>

5. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon (↕).

6. To delete a variable, click the delete icon (🗑) in the row.

7. Click Continue to advance to the Execution Command stage or click Go to Pre-Processing (Advanced) to create a script that runs before the activity executes.

---

**Map an input variable**

After you create the input variables, map them to the fields in the Execution Command form.

**Before you begin**

Role required: activity_admin, activity_creator

**About this task**

These fields contain values required by the target host or endpoint to authenticate and query for data. Included in this example are fields for a command to run on the target and the MID Server to use, if one is required.

**Procedure**

To map a variable, drag it into the appropriate field.

The designer automatically expresses the variable in the syntax the system requires.
Configure the PowerShell execution command

Use the input variables you created to configure the command that Orchestration executes on the Windows target machine.

Before you begin
Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

Note: You can test the PowerShell connection between the MID Server and the target computer without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

### PowerShell command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create variables to map to available fields.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
<tr>
<td>Script type</td>
<td>Type of script to run on the PowerShell host. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom Powershell command</td>
</tr>
<tr>
<td></td>
<td>• MID Server script file</td>
</tr>
<tr>
<td>MID Server script file</td>
<td>MID Server script file to run. This field is available when the <strong>Script type</strong> selected is <strong>MID Server script file</strong>.</td>
</tr>
<tr>
<td>Command</td>
<td>Command that this activity runs on the target host. This field is available when the <strong>Script type</strong> selected is <strong>Custom Powershell command</strong>. You can drag and drop input variables from the variable builder into this field to create your command.</td>
</tr>
<tr>
<td>Powershell variables</td>
<td>Name-value pairs to pass to the host with Powershell. You can create these variables manually, or drag input variables into the <strong>Value</strong> field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the <strong>Encrypted</strong> data type, your value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use MID service account</td>
<td>Forces this activity to authenticate on the target host using the credentials of the MID Server service account only, without trying any other credentials. When this check box is selected, the <strong>Credential tag</strong> field is not available.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Specific credential alias this activity must use to run Powershell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential alias is defined, the MID Server tries the credentials for that alias only and does not try the MID Server service account. This field is not available when the <strong>Use MID service account</strong> check box is selected.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use for querying Powershell, by capabilities. By default, the system selects a Powershell MID Server.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

**Test activity template inputs**

You can test the input parameters of a custom activity during its development without having to run the activity in a workflow context.

**Before you begin**

Create input variables and map them to fields in the **Execution Command** form or provide actual values for these fields.

Role required: web_service_admin, activity_admin, activity_creator

**About this task**

An input test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. You need to use a workflow to test a pre-processing or post-processing script. You do not need to check out the activity to test it, and you can test input variables from any stage in the activity designer, if your activity is properly configured. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

**Note:** If you intend to use auto-mapping, you must test your input variables.
Procedure

1. Click **Test Inputs**.
   
   The list of input source variables appears. If you added default values for these variables, those values appear in the **Substitute Value** column. Mandatory variables are marked with a red star. In this example, a SOAP endpoint returns a value for a stock quote variable.

![Fill in your test values](image)

2. Filter the variable list with these controls:
   
   - **All Inputs**: Displays all input variables. This is the default view.
   - **Mandatory Inputs**: Displays only mandatory input variables.
   - **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   
   - **Reset default values**: Replaces any test values set in this form with the default values, if they are present.
   - **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an **auto-mapping option**.

6. Alternately, you can click **Save for parsing rules** to copy the entire payload to the parsing rules. This allows you to manually select values for the output variables directly from the payload. This action completely overwrites any previous payload that existed in the parsing rules.

7. Click the **X** in the upper right corner of the window to close it.

**Data encryption for activity variables**

You can protect sensitive data passed from Orchestration activities by encrypting input and output variables.

The system never stores encrypted variables as clear text. If the MID Server is used to fulfill the activity, the corresponding ECC Queue's input payload is encrypted if an **encrypted output variable** is defined in the template. Output variables passed to a downstream activity as input variables maintain their encryption throughout processing.

Inputs that require data encryption come from one of these sources:
• Workflows: These inputs are provided through the Workflow Editor and must be in the password2 format for two-way encryption.

• Service catalog requests: These input values are provided to an activity as encrypted variables from a service catalog item.

• GlideRecord: These are variables attached to any ServiceNow table. The source column in the table must be a password2 type variable.

• Activity outputs: These are variables passed as outputs from one activity to a downstream activity as inputs, through the data bus.

• Empty string: The system allows you to define encrypted input variables but never pass a value into the variable.

**Activity designer template pre-processing fields**

Use the **Pre Processing** form of the activity designer to define a script to run before the activity executes.

**Pre-processing fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input process script</td>
<td>Script to run before the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution parameters and input variables you passed into the activity on the <strong>Inputs</strong> form. All activity variables added in the <strong>Inputs</strong> form are read-only and are expressed in the pre-processing script with this syntax: <code>activityInput.variable</code>. Before the activity executes and makes a call to the service or host, you can override the effective execution value of this variable by assigning values to the <code>executionParam.variable_name</code> execution parameter. Refer to the specific execution parameters for your template.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the pre-processing using the **ActivityLogger** API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records.
for any workflow that uses the activity. The Source for these messages in the workflow log is ACTIVITY.

**Important:** To display the debug messages in the workflow log, set the glide.workflow.log.debug property to true.

The supported messages are:

- `ActivityLogger.debug("Pre Processing Log Message");`
- `ActivityLogger.info ("Pre Processing Log Message");`
- `ActivityLogger.warn ("Pre Processing Log Message");`
- `ActivityLogger.error("Pre Processing Log Message");`

**Template post-processing fields**

From the Post Processing form in the activity designer you can define a script to run after the activity executes.

**Post-processing fields**

To use the results returned by the activity, append the executionResult. prefix to these parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output process script</td>
<td>Script to run after the activity executes.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the output process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays execution results and the variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the post-processing script with this syntax: activityInput.variable.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>For parameter descriptions, refer to the table in the post-processing parameters topic for this activity.</td>
</tr>
</tbody>
</table>

**Logging**

Activity designers can add logging to the post-processing script using the `ActivityLogger` API, which works for scoped or global applications. Logged data from the script appears in the **Workflow Log** related list in the context records for any workflow that uses the activity. The **Source** for these messages in the workflow log is **ACTIVITY**.

**Important:** To display the debug messages in the workflow log, set the `glide.workflow.log.debug` property to `true`.

The supported messages are:

- `ActivityLogger.debug("Post Processing Log Message");`
- `ActivityLogger.info ("Post Processing Log Message");`
- `ActivityLogger.warn ("Post Processing Log Message");`
- `ActivityLogger.error("Post Processing Log Message");`

**Auto-map activity output variables**

You can map parameter values in a test payload to variables in the **Outputs** tab automatically.

**Before you begin**

Role required: admin

**Procedure**

1. From the Execution Command in the template, select the **Inputs** tab.
2. Click **Test Inputs** to test the input parameters.
If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.

3. Provide test values, if requested, and click **OK** to display the payload. The entire payload appears in the **Raw Output** tab of the Response form.

4. Select an auto-mapping option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Auto-Map to Local     | Translates the entire payload into a JSON object and places it in the data bus. This allows for post-processing manipulation in JavaScript. This selection causes the entire data field on the right to disappear and the inputs structure to be auto-populated with these default variables:  
  • output  
  • totalRows  
  • errorMessage  
  • eccSysId |
| Auto-Map to Output    | Automatically populates the output variables in the activity with the same default variables used as inputs for the local variable. |

⚠️ **Note:** No parsing rules are available with auto-mapping selections.

**Create an output variable**

The **Outputs** form in the designer contains a variable builder for creating data structures of objects and arrays.

**Before you begin**

Roles required: activity_admin, activity_creator
About this task
Elements in this structure are mapped with Create a parsing rule to specific data contained in payloads returned from an endpoint or host. These variables and their values are then made available locally or for reuse in other activities.

Procedure
1. Click the + icon in the Outputs column to create a local or output variable.

   Local variables are only available within an activity and are not visible in the data structures displayed in the Custom tab. Output variables are available for reuse in other activities, either individually or as an entire data structure. When you create a new variable of either type, the designer provides a default name of Local1 or Output1.

2. Type your new variable name in the field and select a data type.

   Variable names must be unique within an array or an object. You can assign a data type of Encrypted to output variables that contain sensitive data. Data protected by encryption is passed to other activities or processes encrypted and is never displayed in plain text.

3. To change the name of a variable or any of its attributes, double-click the value, type a new value in the editing field, and then press Enter.

   The icon to the left of the name reflects the data type of the variable.

4. To reorder the variable list, select a row and then drag the row to its new location.

   When you select a row to move it, the pointer icon changes to an up/down arrow icon (↑↓).

5. Drag and drop the row into another location.

6. To reuse a variable from another activity, drag it from the Custom tab in the palette and drop it onto the Local or Output heading at the top of the variable list. To copy an entire data structure, drag the parent object or array into the variable list header.

   The designer duplicates the copied data structure in the outputs variable builder.
7. To delete a variable, click the delete icon (🗑️) in the row.

Activity designer template outputs

Output variables contain messages returned from a destination that are available to other activities in a workflow or internally to the activity.

Activity designer output fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable name</td>
<td>Name of a variable, either Local or Output, that this activity passes.</td>
</tr>
<tr>
<td>Local</td>
<td>Variable that contains a value used within an activity. For example, use a local variable to identify metadata that is processed within an activity before the final value is exported to an output variable.</td>
</tr>
<tr>
<td>Output</td>
<td>Variable that contains a value that is passed to other activities in the workflow.</td>
</tr>
</tbody>
</table>

Map an output field

Mapping is configured with parsing rules that allow you to build expressions in the appropriate data format for the selected payload.

Before you begin

Role required: activity_admin, activity_creator

About this task

When you are finished creating the output data structure, map each variable to the specific data you want to extract from the target host.
Procedure

To map a variable, drag it from the Outputs variable builder and drop it into an empty Variable name field in the Parsing rules section.

See create a parsing rule for instructions on configuring parsing for output variables.

Create a parsing rule

Populate output variables defined in a custom activity with payload data returned from an inputs test on an external host or endpoint.

Before you begin

Roles required: activity_admin, activity_creator

About this task

Procedure

1. Navigate to Workflow > Workflow Editor.
2. From the Custom tab in the palette, open a custom activity.
3. In the Activity Designer form, advance to the Output stage.
4. Drag an output variable from the data structure builder into the Variable name field in the Parsing rules builder.
The parsing rules form appears for the selected variable. By default, the parsing type is set to **Direct**, which populates the variable with all the data from the selected payload, without parsing the contents. Each template has a specific default parsing source.

5. Complete the form using the fields in the table.
   In this example, the parsing type selected is **XML**, which allows you to select specific parameters from the payload to parse.
## Parsing rules fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parsing source</td>
<td>Source of the data returned from the target host or endpoint. Each template opens to a specific, default payload. Available choices depend on the execution template selected for the activity. You can also use local variables as a parsing source if a parsing rule has previously been defined for them. For a list of the available payloads for each template, see Activity designer parsing sources.</td>
</tr>
<tr>
<td>Expression</td>
<td>Expression used to extract specific data from the selected parsing source. This expression is created from clickable data in the sample payload and appears in the format selected in the Parsing type field. When testing, the expression can return multiple results. Discern which choice gives reliable or predictable results before choosing your expression.</td>
</tr>
<tr>
<td>Note</td>
<td>The system cannot generate clickable RegEx expressions from sample data. You must write all regular expressions manually.</td>
</tr>
<tr>
<td>Variable name</td>
<td>Revised variable name as it is used in the final output expression. The system adds the activityOutput or activityLocal prefix to the variable you specify.</td>
</tr>
<tr>
<td>Parsing type</td>
<td>The language to use for querying the target host's payload. The selections are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Direct</strong>: Maps to the entire content of the payload selected in the Parsing source field, without any parsing. This is the default parsing type.</td>
</tr>
<tr>
<td></td>
<td>• <strong>XML</strong>: XPath query used for selecting nodes from an XML payload.</td>
</tr>
<tr>
<td></td>
<td>• <strong>JSON</strong>: JSONPath query for selecting parts of a JSON payload.</td>
</tr>
<tr>
<td></td>
<td>• <strong>RegEx</strong>: Parsing method that uses a regular expression to extract data from a payload. The RegEx parsing type does not support multi-line parsing and is not case sensitive.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this parsing rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sample payload data</td>
<td>Sample data from the source containing the data requested. This field is not available for <strong>Direct</strong> parsing types. After you click <strong>Parse sample data</strong>, the data in this field cannot be edited, but becomes clickable for the purpose of creating expressions. Click <strong>Edit sample data</strong> to make the field editable again.</td>
</tr>
<tr>
<td>Parsing results</td>
<td>Displays the data returned from the source by the selected expression. This field is not available for <strong>Direct</strong> parsing types.</td>
</tr>
</tbody>
</table>

6. To retest the inputs, click **Get sample payload from test**. This action reopens the test form, allowing you to substitute different test values and create a different payload.

7. Click **Save** to have the parsing rules overwrite the previous payload with the one you just created.

8. To create an expression for the parsing rule, click the specific parameter you want to see in the sample payload. The value for that parameter appears in the **Parsing result** field, and the system creates the appropriate expression in the **Expression** field.

9. Click **Submit** to save the parsing rule for that variable.

**Activity designer parsing sources**

This table lists the parsing sources available with each execution template.

### Activity designer parsing rule example

In this example, the parsing rule is configured to populate the `activityOutput.ipv4` variable with the value for the IP address from a domain server, using PowerShell.

#### Before you begin
Role required: activity_creator, activity_admin

#### About this task
To generate the sample data, the administrator must actually run the command on the host and then paste the data returned into the **Sample payload data** field when creating the parsing rule. The administrator can then create an expression that returns IP addresses from that sample in two formats: `ipv4` and `ipv6`. In this example, the system produces two expressions to use for the parsing rule.

#### Procedure

1. Navigate to Workflow > Workflow Editor and open the activity that runs on the host.
2. Click the **Inputs** tab, and note the **Command**.
3. In a PowerShell console, run the **Command** on the host to extract the XML sample that contains the values you need.

4. Copy the data that is returned to the clipboard.

5. In the activity designer, click the **Outputs** tab and paste the returned data into the **Sample payload data** field.

   In this example, the data includes IP addresses in two different formats and the domain name.

6. Select the parsing type for the source. In this example, select **XML**.

7. Click **Parse sample data**.

   The system displays the XML in the proper format, and it becomes **clickable**.

   In this view, the system can translate clicked data from the sample into an expression.
8. To create the expression, click the elements in the data sample you want to map to the variable.

Based on the sample data you clicked, the system creates two expressions.

9. Select an expression from the list.

The desired result is the IP address that has a **type** attribute of **ipv4**. The system populates the **Expression** field with this choice.
10. Click **Test expression**.

The system parses the payload using the selected expression and returns the requested data in the **Parsing result** field.

11. Click **Submit**.

The view returns to the **Outputs** tab of the activity designer. The new parsing rule is listed, and a blank row is available for another rule.

**Activity conditions**

Create the exit conditions for your activity in the **Condition** column and set the order for each.

The system evaluates the condition with the lowest order number first and stops when it finds the first true condition. The system delays evaluation of conditions with an **Else** value set to **true** until all conditions with an **Else** value set to **false** are evaluated. If the system does not find a true condition, it looks for a default
condition in which the value for **Else** is true and takes this exit. You must have at least one default exit condition, or the activity hangs when the workflow runs.

The following are possible conditions you might create for an activity:

### Sample activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Tests for a success condition. <strong>Else</strong> is set to false and the Order is set to 100. If this condition is true, the activity takes the Success exit. If this condition is false, the system evaluates the next condition in order.</td>
</tr>
<tr>
<td>Retry</td>
<td>Tests for a condition that runs the activity again. <strong>Else</strong> is set to false. If this condition is true, the activity runs again. If this condition is false, the system takes the default Failure exit.</td>
</tr>
<tr>
<td>Failure</td>
<td>Default condition that allows the workflow to continue if the other conditions in the activity are false. <strong>Else</strong> is set to true.</td>
</tr>
</tbody>
</table>

### Orchestration custom activity templates

Orchestration provides customizable activity templates to create and manage custom activities in the Workflow Editor.

You create and update different types of Orchestration activities with the Activity Designer using activity templates for SSH, PowerShell, REST, SOAP, JMS, SFTP, JDBC, JavaScript Probes, and Probes.

Hundreds of workflows can share these activities simultaneously. Before you change an activity, you should check the workflows that they are part of by clicking the form menu icon (≡) and selecting **Used In**. Any central change to a versioned activity automatically updates across workflows unless you have pinned that activity.

All the Orchestration Core activities are built using the Activity Designer in scoped applications. Custom activities can be developed in the global scope...
or their own application scope even if that scope is different from the scope of the workflow. Use Activity scoping when build your own activity packs.

Create a JDBC activity
Create a custom JDBC activity to automate SQL commands and stored procedure calls to relational databases from workflow.

Before you begin
Role required: activity_admin, activity_creator

About this task
The JDBC activity template allows you to execute ANSI SQL statements or stored procedures on a target database. Support for stored procedures with IN, OUT, and INOUT parameters are available in Rome. To learn how to set up these parameters, see JDBC stored procedure parameters.

Note: If you are transferring bulk data into a ServiceNow instance from an external data source, use Import sets. The JDBC activities allow you to transfer data between external data sources and ServiceNow within a workflow. It is not intended to replace the bulk import features of data sources.

Procedure
1. Create or verify your JDBC credential.
   Your JDBC credentials must have permission for the target database and proper configuration for the corresponding JDBC connection. Credentials must be set up before you can create a JDBC activity.

2. Create or verify your JDBC connection.
   Your JDBC connection must be configured with valid JDBC credentials set up before you can create a JDBC activity.

3. Create a custom activity.
   This action creates a custom activity using a template.

4. After setting up general properties and creating input variables, configure the JDBC Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC Connection</td>
<td>Configure or reference the appropriate JDBC Connection for the database. The connection selected provides the activity with the following information:</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>• Target database information (server and database names)</td>
</tr>
<tr>
<td></td>
<td>• Connection URL</td>
</tr>
<tr>
<td></td>
<td>• Target database port (if different from standard port number)</td>
</tr>
<tr>
<td></td>
<td>• Database instance name</td>
</tr>
<tr>
<td>Credential</td>
<td>JDBC credential to use for your JDBC connection.</td>
</tr>
<tr>
<td>SQL statement</td>
<td>Input the ANSI SQL to execute on the JDBC target database.</td>
</tr>
</tbody>
</table>

**Note:** This field is hidden when the Stored Procedure check box is selected.

You can map the input variables you created to configure the SQL statements. By default, you can run the following SQL statements.

- select
- insert
- update
- delete
- show
- create
- describe

For added security measure, a MID Server property controls the operations that this JDBCOrchestration-Probe executes, which restricts the SQL commands used. This property protects against potentially destructive commands, such as drop database. The mid.property.jdbc_operations contains the MID Server property controls.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>You cannot run multiple statements of different types. For example, you cannot run a select statement and an update statement together, but you can run two insert statements. However, you cannot run multiple select statements in this activity.</td>
</tr>
<tr>
<td>Maximum rows</td>
<td>Maximum number of records to retrieve from database. The default is 1000.</td>
</tr>
<tr>
<td>Maximum payload size (KB)</td>
<td>You can set a limit on the maximum payload size of data retrieved from the database. The default is 64 kilobytes.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>How long the activity waits to make the connection. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Elapsed time to wait after running the query until the data is returned. This field is populated automatically from the data source, but can be changed for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilites</td>
<td>MID Server to use for querying JDBC, by capabilities. By default, the system selects a MID Server that has JDBC capability.</td>
</tr>
<tr>
<td>Use stored procedure</td>
<td>If checked, you can run a stored procedure on MySQL, Oracle, or SQL Server databases by entering the procedure name and parameters. See JDBC stored procedure parameters.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.
What to do next

- Test JDBC activity inputs
- Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Related information

Create custom activities using custom activity designer templates

Create a JDBC connection for an Orchestration activity

The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities use to connect to various target databases.

Before you begin

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Tip: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Create a JDBC connection for an Orchestration activity

The JDBC Connection [jdbc_connection] table provides the information custom JDBC Orchestration activities use to connect to various target databases.

Before you begin

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Tip: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sql-server-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: activity_admin, activity_creator

About this task

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

Procedure

1. Navigate to Orchestration > Credentials & Connections > JDBC Connections and click New.
2. Complete the form using the fields in the table.
   - The database selection in the Format field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Field</td>
<td>Database Format</td>
<td>Description</td>

<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. <strong>Note:</strong> If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.</td>
</tr>
<tr>
<td>JDBC driver</td>
<td>None, DB2 Universal, Sybase</td>
<td>The JDBC driver to use for this connection when it is not a default database. <strong>Note:</strong> If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.</td>
</tr>
</tbody>
</table>

**JDBC connection to Oracle example**

![JDBC connection to Oracle example](image)

3. Click **Submit**.

**Related reference**

JDBC credentials
Auto-map JDBC activity output variables

The ServiceNow activity designer allows you to map parameter values in a JDBC test payload to variables in the **Outputs** tab automatically.

**Before you begin**

Role required: admin

**Procedure**

1. In the JDBC provider template form, select the **Inputs** tab.
2. Click **Test Activity** to test the input parameters.
   - If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
3. Provide test values, if requested, and click **OK** to display the payload.
   - The entire payload appears in the **Raw Output** tab of the Response form.
4. Select one of these auto-mapping options.
   - **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.
   - **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**JDBC stored procedure parameters**

You can use Orchestration to run a stored procedure on MySQL, Oracle DB, and MS-SQL databases.

There is support of multiple data types, with the following limitations:

- Only one result-set is returned.
- The order of input and output data types in the stored procedure parameters must match the activity definition.
- Binary, Blob, Varbinary, and LongBinary should be base64 encoded.
- Date, Time, and Timestamp have a specific format:
Date format: yyyy-mm-dd

yyyy-mm-dd is the supported format.

Time format: hh:mm:ss[.sss]

hh:mm:ss[.sss] is the supported format. Precision is in milliseconds only, microseconds or nanoseconds cannot be handled.

⚠ **Note:** 10:30:59 and 10:30:59.999000 are correct but 10:30:59. is incorrect.

Timestamp format: yyyy-mm-dd hh:mm:ss[.ffffff]

yyyy-mm-dd hh:mm:ss[.ffffff] is the supported format. Precision is to microseconds.

- ResultSet is the first result set coming back from database server.
- MS-SQL does not support INOUT parameters. If you use INOUT parameters, the Activity Template transparently maps them to OUT parameters.

⚠ **Note:** If you do not want to do a validation of data types in stored procedure parameters, like the legacy behavior, you set the glide.stored_proc.data_type.validation as false. See MID Server properties for more information.

### Stored procedure parameters

</table>

⚠️ Note: Not all database providers support the entire realm of JDBC data types. Reference your database reference manual to understand the supported datatypes for your installation.

Test JDBC activity template inputs

You can test the input parameters of a custom JDBC activity during its development without having to run the activity in a workflow context.

Before you begin
Create input variables and map them to fields in the Execution Command form or provide actual values for these fields. Role required: web_service_admin, activity_admin, activity_creator

About this task
This test executes only the input parameters against an endpoint and not the pre-processing or post-processing scripts. It is not necessary to check out the activity to test it.

⚠️ Note: If you provide enough information for Orchestration to contact the endpoint or host and return data, you can test the input variables. You can test from any stage in the activity designer. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

Procedure

1. From the JDBC Execution Command, click Test Inputs.
   The list of input source variables appears. If you added default values for these variables, those values appear in the Substitute Value column. Mandatory variables are marked with a red star.

   ⚠️ Note: The test fails if the MID Server cannot be found or if it cannot connect to the target.
2. Filter the variable list with these controls:
   • **All Inputs**: Displays all input variables. This control is the default view.
   • **Mandatory Inputs**: Displays only mandatory variables.
   • **Inputs Without Defaults**: Shows input variables that do not have assigned default values.

3. Reset values as needed.
   • **Reset default values**: If values are present, this control replaces any test values set in this form with the default values.
   • **Clear values**: Clears all values in the input variable list, even if default values exist.

4. When your test values are configured correctly, click **OK**.
   The system runs the values for all the inputs configured against the specified target and returns the resulting payload. The buttons in the Response form display different views of the payload. The entire payload appears in the **Raw Output** window.
5. To map appropriate parameter values in the payload to variables in the **Outputs** stage automatically, select an auto-mapping option.

6. 

7. Click the X in the upper right corner of the window to close it.

**Create a SOAP web service activity**

Use this template to create a custom SOAP activity.

**Before you begin**

Role required: web_service_admin, activity_admin, activity_creator

**About this task**

For instructions on using the activity template process flow, see [create custom activities](#).
Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the SOAP web service Execution Command:

<table>
<thead>
<tr>
<th><strong>Option</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestration executes on the SOAP web service.</td>
</tr>
<tr>
<td><strong>Web service message</strong></td>
<td>Specify the SOAP web service message to use for this activity. If you need information on SOAP web services messages, see .</td>
</tr>
<tr>
<td><strong>Web service message function</strong></td>
<td>Specify the SOAP message function available in conjunction with the SOAP web service.</td>
</tr>
<tr>
<td><strong>Endpoint</strong></td>
<td>If you enter an endpoint in this field, it overrides the endpoint URL configured in the SOAP message web service. Click the lock icon to open the input field and add the endpoint.</td>
</tr>
<tr>
<td><strong>SOAP message parameters</strong></td>
<td>Name-value pairs to pass to the SOAP endpoint. You can create these parameters manually, or drag input variables into the parameter fields and then assign a value. Parameters defined in the SOAP message that use $() can be assigned data from this activity template. Use the Additional attribute column to configure the system to not escape the text. By default, text sent to the SOAP message is escaped. The Name column is auto-populated if the users have provided variables using variable substitution in the SOAP message.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server must be used to invoke the SOAP web service. If the SOAP web service message function defines a MID Server, that MID Server is used instead of the one selected here.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the SOAP endpoint. By default, the system selects a MID Server with SOAP capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the SOAP web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in SOAP message: Uses credential definitions from the SOAP message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials. Overrides the credentials in the SOAP message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with certificate authentication credentials.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Overrides the credentials in the SOAP message definition with both</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>

</tbody>
</table>
| basic authentication or certificate authentication credentials.  
- **Override with WS-Security Username profile**: Overrides the credentials in the SOAP message definition with credentials defined a WS Security Profile. |
| Required REST endpoint basic authentication credentials. This field is available when **Override with Basic Authentication credentials** is selected in the **Authentication** field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file by adding the name of a different safe as a prefix to the credential ID, separated by a colon. For example, `newsafe:orch-test-f5`. See **Configure the MID Server for CyberArk** for details. |
| Protocol profile to use for authentication. This field is available when the authentication type is either **Override with Certificate Authentication credentials** or **Override with Both Basic and Certificate Authentication credentials**. |

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See **automap output variables**.
What to do next

- Use **auto-mapping** to generate outputs and parsing rules (recommended for JDBC)
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

Auto-map SOAP activity output variables

The ServiceNow activity designer allows you to map parameter values in a SOAP test payload to variables in the **Outputs** stage automatically.

Before you begin

Role required: web_service_admin, activity_admin, activity_creator

About this task

ℹ️ **Note:** You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the **Execution Command** stage is the point at which your inputs are ready for testing.

Procedure

1. In the activity designer, proceed to the **Execution Command** stage.
2. Define an appropriate MID Server, if requested.
   - The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click **Test Activity** to test the input parameters.
   - If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click **OK** to display the payload.
   - The entire payload appears in the **Raw Output** tab of the Response form.
5. Select one of these auto-mapping options.
• **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.

• **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

**Provide credentials to access a SOAP message WSDL**

If the SOAP WSDL you are requesting in a test payload requires authentication, you must provide basic auth credentials in either the SOAP message or the SOAP activity.

**Before you begin**
Role required: web_service_admin, activity_admin, activity_creator

The ServiceNow instance only supports basic auth credentials for accessing a WSDL. If the SOAP function or the SOAP message does not provide these credentials, you must configure them in the SOAP activity template. Orchestration uses these priorities for deciding which basic authentication credentials to use:

• SOAP message: Credentials for a SOAP message are used if no other credentials are defined.

• SOAP function: Credentials for a SOAP function override the credentials configured for the SOAP message.

• SOAP activity template: Credentials for a SOAP activity template override both the SOAP function and SOAP message credentials.

**Procedure**

1. Navigate to **System Web Services > Outbound > SOAP Message**.
2. Select the SOAP message you want the activity to use.
3. In the SOAP Message record, select the **Download WSDL** check box.
4. In the **Authentication type** field, select **Basic**.
   
   The **Basic auth profile** field appears.
5. Select the basic auth profile to use with this SOAP message.
6. Alternately, you can configure basic authentication credentials in Configure the SOAP execution command.

   a. In the **Authentication** field, select **Override with Basic Authentication credentials**.
      The **Credentials** field appears.

   b. Select the basic auth credentials to use to access the WSDL.
This setting overrides any credentials configured in the SOAP message.

Configure the SOAP execution command

Use the input variables you created to configure the command that Orchestration executes on the SOAP endpoint.

Before you begin

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the SOAP connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.
Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.

SOAP execution command

2. Complete the fields shown in the table.

SOAP template execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <strong>Create input variables</strong> to map to available fields.</td>

<td></td>
<td></td>
<td>- use_existing_credentials</td>
</tr>
<tr>
<td>Credentials</td>
<td>credentials</td>
<td>Reference</td>
<td>Credentials to use for this SOAP message when the auth_type is basic_auth_pick_credentials.</td>
</tr>
</tbody>
</table>

### Create a JavaScript array in a SOAP template

These are instructions for creating JavaScript arrays using SOAP execution parameters.

**Before you begin**

Role required: web_service_admin, activity_admin, activity_creator

**About this task**

To add more name-value pairs to the parameter's array, append the values to the existing array.

**Procedure**

1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

   ```javascript
   var newParameter = {
     "name": "parameterName", "value": "parameterValue", "additional_attribute": "none"}
   executionParam.parameters.push(newParameter);
   
   By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the SOAP message parameters input field to Do not escape text.

   In this case, the system does not escape the value specified for the value attribute. An example of this is:
var newParameter =
{"name":"parameterName","value":"parameterValue","additional_attribute":"do_not_escape_text"};
executionParam.parameters.push(newParameter);

>Note: If the value for the **additional_attribute** field is **None**, then the system escapes the value specified by the **value** attribute. In the first example, **parameterValue** is escaped.

**SOAP template post-processing parameters**
Use these parameters to create a post-processing script.

**Activity designer post-processing parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Contains the key value paired hashmap associated with the header values passed into the web service. You can access each value with <code>executionResult.header[keyName]</code>.</td>
</tr>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the SOAP message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the SOAP web service, unless there are no errors, in which case it returns <code>null</code>.</td>
</tr>
</tbody>
</table>

**Create a JavaScript Probe activity**
Create a JavaScript Probe activity to instruct a MID server to execute server-side javascript.

**Before you begin**
Role required: activity_creator or workflow_admin

**About this task**
The JavascriptProbe activity has the same functionality as making ‘Packages’ calls into standard Java libraries. It allows you to have more control over the Java libraries on the MID Server. You can load your own JAR files on the MID Server and have the JavascriptProbe make Package calls into those java files.
Procedure

1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the JavaScript probe activity Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that OrchestratiOn executes on the MID server.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>
</tr>
<tr>
<td></td>
<td>• Custom JavaScript</td>
</tr>
<tr>
<td></td>
<td>• MID Server script include</td>
</tr>
<tr>
<td>Script</td>
<td>Custom JavaScript to run with this probe.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available when the Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag input variables into the Parameters fields and assign a value.</td>
</tr>
</tbody>
</table>

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.
What to do next
Finish creating your JavaScript probe activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

JavaScript probe template execution parameters
You use execution parameters to create the input process script in the Preprocessing form of the activity designer.

For descriptions of the JavaScript Probe command fields, see the table in Configure the JavaScript Probe execution command.

ℹ️ Note: You must use the `executionParam.` prefix with all variables in this table.

### JavaScript template execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Script Type      | script_type      | Enumerated        | Type of script to run. The possible types are:  
• custom_javascript_type  
• mid_script_include_type |
| Script           | script           | String            | Script that runs custom JavaScript when the `script_type` is `custom_javascript_type`.                                                   |
| Mid script include | mid_script_include | Reference | The sys_id reference associated with the MID Server script include to call, when the `script_type` is `mid_script_include_type`. |
| Source           | source           | String            | Target host on which to run the script.                                                                                              |
| MidCapabilities  | midCapabilities  | String (comma separated) | List of required MID Server capabilities.                                                                                           |
| Parameters       | parameters       | Array of JavaScript object | Array of JavaScript objects, expressed with the `executionParam.` prefix.                                                               |

<td>Contains the error messages returned from the JavaScript probe. If no error messages are returned, this value is null.</td>
</tr>
</tbody>
</table>

Configure the JavaScript Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the JavaScript Probe target host.

Before you begin

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

⚠️ Note: You can test the JavaScript Probe connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

### JavaScript Probe execution command fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td>Script type</td>
<td>Select the type of script to include. Available options are:</td>

<td>Script type selected is Custom JavaScript.</td>
</tr>
<tr>
<td>MID Server script include</td>
<td>Script for the MID Server to run with this probe. This field is available</td>
</tr>
<tr>
<td></td>
<td>when the Script type selected is MID Server script include.</td>
</tr>
<tr>
<td>Select MID Server by host</td>
<td>MID Server on which the probe runs.</td>
</tr>
</tbody>
</table>
3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

**Create a PowerShell activity**

Create a custom PowerShell activity return data to a workflow from a host using Microsoft PowerShell.

**Before you begin**
Role required: activity_creator or workflow_admin

**About this task**
ServiceNow supports PowerShell 3.0 to 5.1.

**Procedure**

1. Create a **custom activity**.
   This action creates a custom activity using a template.

2. After setting up **general properties** and **creating input variables**, configure the PowerShell Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes on the MID Server.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this PowerShell activity.</td>
</tr>
</tbody>
</table>
| Script type        | Type of PowerShell script to run on the PowerShell host. Available options are:  
  - Custom PowerShell command  
  - MID Server script file  |
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server script file</td>
<td>The MID Server script file contains the PowerShell scripts. This field is available when the <strong>Script type</strong> selected is MID Server script file.</td>
</tr>
<tr>
<td>Command</td>
<td>PowerShell command the activity executes. This field is available when the <strong>Script type</strong> selected is <strong>Custom PowerShell command</strong>. You can create your commands by dragging and dropping input variables from the variable builder into this field.</td>
</tr>
<tr>
<td>PowerShell variables</td>
<td>Name-value pairs to pass to the host with PowerShell. You can create these variables manually, or drag input variables into the <strong>Value</strong> field. Encrypted input variables retain their encryption, regardless of the data type settings in this field. If you type in a value and select the <strong>Encrypted</strong> data type, your value appears in plain text. It is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td>Use MID Service Account</td>
<td>If checked, this activity authenticates on the target host using the credentials of the MID Server service account only, without trying any other credentials.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>Credential tag this activity must use to run PowerShell commands on the host. If this field is left blank, the MID Server tries all the available credentials until it finds a valid one, ending with the MID Server service account. If a credential tag is defined, the MID Server tries the credentials with that tag specified only and does not try the MID Server service account.</td>
</tr>
</tbody>
</table>

**Note:** The **Credential tag** field is not available.
Required MID Server capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note: This field is not available when the Use MID service account check box is selected.</td>
<td></td>
</tr>
</tbody>
</table>

MID Server to use for querying PowerShell, by capabilities. By default, the system selects a PowerShell MID Server.

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

What to do next

Finish creating your PowerShell activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

PowerShell template execution parameters

You use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the Powershell command fields, see the table in Configure the PowerShell execution command.

Note: You must use the executionParam prefix with all variables in this table.

Powershell execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>source</td>

</tbody>
</table>

Create a REST web service activity

Use this procedure to create a custom REST web service Orchestration activity.

Before you begin
Role required: web_service_admin, activity_admin, activity_creator

About this task
To create and use a REST web service workflow activity:

• Create a REST message if an appropriate one is not already configured.
• Assign the web_service_admin role to any user who must create or edit a custom REST activity.
• Determine an application, or scope, for this activity.
• Determine the REST endpoint to use for the activity. Use this value to override the endpoint configured in the REST message.
• Optionally, create basic authentication credentials. Use this value to override the credentials configured in the SOAP message.

Procedure
1. Create a custom activity.
   This action creates a custom activity using a template.

2. After setting up general properties and creating input variables, configure the REST web service Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REST message function</td>
<td>REST message function to use for this activity.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>Endpoint URL for the REST web service this activity uses. Enter an endpoint in this field to override the endpoint configured in the REST message. Click the lock to open the input field.</td>
</tr>
<tr>
<td>Variable substitutions</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value. Parameters defined in the REST message that use ${} can be assigned data from this activity template. Use the <strong>Additional attribute</strong> column to configure the system to not escape the text. By default the text sent to the REST message is escaped. If the users have provided variables using variable substitution in the REST message, then the <strong>Name</strong> column is automatically populated.</td>
</tr>
<tr>
<td>Additional Headers</td>
<td>Additional HTTP header parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Additional Query Parameters</td>
<td>Additional query parameters for the REST message selected. You can also use these values to override parameters inherited from the REST message.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check box that determines if a MID Server should be used to invoke the REST web service.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the REST endpoint. By default, the system selects a MID Server with REST capabilities. This field is available when the Use MID Server check box is selected.</td>
</tr>
<tr>
<td>Timeout</td>
<td>Allowed duration of the REST web service request before it times out, in seconds. The default is 10.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Determines what type of authentication is required for the endpoint. The options are:</td>
</tr>
<tr>
<td></td>
<td>• Use existing credentials in REST message: Uses credential definitions from the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Basic Authentication credentials: Uses basic authentication credentials to override the credentials in the REST message definition. Basic authentication credentials must be provisioned before they are available for selection.</td>
</tr>
<tr>
<td></td>
<td>• Override with Certificate Authentication credentials: Uses a certificate, such as a private key, to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td></td>
<td>• Override with Both Basic and Certificate Authentication credentials: Uses both basic authentication and certificate authentication to override the credentials in the REST message definition.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• Override with OAuth Authentication</td>
<td>credentials: Uses OAuth 2.0 credentials to override the credentials in the REST message definition. The REST message selected for this activity must have its Authentication type set to OAuth 2.0 and its OAuth profile configured appropriately.</td>
</tr>
<tr>
<td>Credentials</td>
<td>Required REST endpoint basic authentication credentials. This field is available when Override with Basic Authentication credentials is selected in the Authentication field. Only basic authentication credentials appear in the selection list, which includes credentials stored on the instance and credential IDs from an external storage system. If you are using credentials stored in a CyberArk safe, you can override the default safe defined in the MID Server configuration file. See Configure the MID Server for CyberArk for details. Add the name of a different safe as a prefix to the credential ID, separated by a colon. For example, newsafe:orch-test-f5.</td>
</tr>
<tr>
<td>Protocol Profile</td>
<td>Certificate authentication to use. This field is available when the selections in the Authentication are either Override with Certificate Authentication credentials or Override with Both Basic and Certificate Authentication credentials.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See for more information.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.
What to do next
Finish creating your Rest web service activity by creating output variables, creating a parsing rule, or creating template conditions. Refer to the create custom activities topic to know your template options.

Auto-map REST activity output variables
The ServiceNow activity designer allows you to map parameter values in a REST test payload to variables in the Outputs stage automatically.

Before you begin
Role required: web_service_admin, activity_admin, activity_creator

About this task
Note: You can test input variables from any stage in the activity designer if you have provided enough information for Orchestration to contact the endpoint and return data. Typically, the Execution Command stage is the point at which your inputs are ready for testing.

Procedure
1. In the activity designer, proceed to the Execution Command stage.
2. Define an appropriate MID Server, if requested. The test fails if the MID Server cannot be found or if it cannot connect to the target.
3. Click Test Activity to test the input parameters. If you added actual values for the parameters and fields, the system runs those values against the specified target and returns the resulting payload. If you mapped input variables to fields and parameters, the system displays a dialog box for assigning test values to those variables.
4. Provide test values, if requested, and click OK to display the payload. The entire payload appears in the Raw Output tab of the Response form.
5. Select one of these auto-mapping options.
- **Auto-Map to Local**: Directly maps values to a local variable for use within the activity.

- **Auto-Map to Output**: Directly maps values to the output variable to pass to other activities in the workflow. Auto-mapping to an output variable creates an array of objects, each of which contains the column names from the query result.

### REST template execution parameters

You use execution parameters to create the input process script in the **Pre Processing** form of the activity designer.

For descriptions of the REST web service command fields, see [Configure the REST execution command](#).

**Note**: You must use the `executionParam.` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web service message</td>
<td>web_service_message</td>
<td>Reference</td>
<td>The sys_id of the corresponding web service message.</td>
</tr>
<tr>
<td>Web service message function</td>
<td>web_service_message_function</td>
<td>Reference</td>
<td>The sys_id of the REST message function.</td>
</tr>
<tr>
<td>Web service endpoint</td>
<td>web_service_endpoint</td>
<td>String</td>
<td>URL of the REST endpoint.</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JavaScript objects</td>
<td>Array of JavaScript objects, expressed with the <code>executionParam.</code> prefix. For instructions on creating arrays using this parameter see <a href="#">Create a JavaScript array in a REST template</a>.</td>
</tr>
<tr>
<td>Use mid server</td>
<td>use_mid_server</td>
<td>Boolean</td>
<td>Selects whether or not to use the MID Server. A value of <code>true</code> uses the MID Server, and a value of <code>false</code> does not use the MID Server.</td>
</tr>
</tbody>
</table>
### REST template execution parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td>List of references to required MID Server capabilities.</td>
</tr>
<tr>
<td>Time out</td>
<td>time-out</td>
<td>String</td>
<td>Allowable time out duration, expressed in seconds.</td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. Use this example to customize the MID Server selection if there are additional capabilities that are assigned by value:</td>
</tr>
<tr>
<td>Auth Type</td>
<td>auth-type</td>
<td>Boolean</td>
<td>Type of credentials to use. Choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• basic_auth_pick_credentials</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• use_existing_credentials</td>
</tr>
<tr>
<td>Credentials</td>
<td>credentials</td>
<td>Reference</td>
<td>Contains the credentials to use for this REST message when the auth_type selected is basic_auth_pick_credential</td>
</tr>
</tbody>
</table>
About this task
To add more name-value pairs to the parameter’s array, append the values to the existing array.

Procedure
1. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "none"
};

executionParam.parameters.push(newParameter);
```

By adding the new parameter JavaScript object to the array, you ensure that any elements already available in the array are not impacted.

2. Make sure to set the value in the Additional attribute column in the REST message parameters input field to Do not escape text.

In this case, the system does not escape the value specified for the value attribute. An example of this is:

```javascript
var newParameter = {
  "name": "parameterName",
  "value": "parameterValue",
  "additional_attribute": "do_not_escape_text"
};

executionParam.parameters.push(newParameter);
```

⚠️ Note: If the value for the additional_attribute field is None, then the system escapes the value specified by the value attribute. In the first example, parameterValue is escaped.

REST template post-processing parameters
Use these parameters to create a post-processing script.

Activity designer post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status code</td>
<td>status_code</td>
<td>Integer</td>
<td>Contains the status code returned from the REST web service.</td>
</tr>
<tr>
<td>Header</td>
<td>header</td>
<td>Hashmap of JavaScript object</td>
<td>Hashmap of key value pairs associated with the header values passed into the web service. You can access each value with executionResult.header[keyName].</td>
</tr>
</tbody>
</table>
Activity designer post-processing parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td>body</td>
<td>String</td>
<td>Contains a string value representing the output from the REST message</td>
</tr>
<tr>
<td>Error</td>
<td>error</td>
<td>String</td>
<td>Returns the error string from the REST web service, unless there are no errors, in which case it returns null.</td>
</tr>
</tbody>
</table>

Configure the REST execution command

Use the input variables you created to configure the command that Orchestration executes on the REST endpoint.

Before you begin

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: web_service_admin, activity_admin, activity_creator

Note: You can test the REST connection between the MID Server and the endpoint without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.
2. Complete the fields shown in the table.

**REST execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. <strong>Create input variables</strong> to map to available fields.</td>
</tr>
<tr>
<td>REST message</td>
<td>Name of an existing REST message to use in this activity. Users must have the web_service_admin role to configure this field.</td>
</tr>
<tr>

This field is available when the selections in the <strong>Authentication</strong> field is either <strong>Override with Certificate Authentication credentials</strong> or <strong>Override with Both Basic and Certificate Authentication credentials</strong>.</td>
</tr>
<tr>
<td>OAuth profile</td>
<td>Profile for the OAuth provider for this REST message. See for more information.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

Create an SFTP activity

Create an activity that executes basic SFTP commands on a remote server.

**Before you begin**
Roles required: activity_creator or workflow_admin

**About this task**
You can create a custom activity that manages files and directories on a target host or copies a file from one SFTP server to another. The file content is streamed through a MID Server, which avoids having to store the data on the hard drive of the MID Server host machine.
**Note:** This activity requires the credentials of a user who can execute SFTP commands on the source host. The **Copy File** activity, provided in the activity pack, requires separate credentials to access the target host.

**Procedure**

1. Create a **custom activity**.
   This action creates a custom activity using a template.

2. After setting up **general properties** and **creating input variables**, configure the SFTP Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td>Type of activity to create. The choices are:</td>
</tr>
<tr>
<td></td>
<td>• Copy file</td>
</tr>
<tr>
<td></td>
<td>• Create directory</td>
</tr>
<tr>
<td></td>
<td>• Get file list</td>
</tr>
<tr>
<td></td>
<td>• Remove file or directory</td>
</tr>
<tr>
<td></td>
<td>• Rename file or directory</td>
</tr>
<tr>
<td></td>

<td>Size of a file, expressed in bytes. Field available on following command:</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the source and target servers.</td>
</tr>
</tbody>
</table>
The system uses this logic to determine which files to move from the source host:

• If the Source files field is empty, the system selects all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.

• If the Excluded files field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.

• The exclude rule has a higher preference than the include rule. If a file name matches one of the file name patterns in the Excluded files field, it does not get into the selection regardless of the include rule.

• When the Include subfolders check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

Note: You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

What to do next

• Use auto-mapping to generate outputs and parsing rules (recommended for JDBC)

• If you do not use auto-mapping, you can manually create output variables and create parsing rules

SFTP template execution parameters

You use execution parameters to create the input process script in the Preprocessing form.

For descriptions of the command fields, see Configure the SFTP execution command.

Note: You must use the executionParam. prefix with all variables in this table.

<table>

SFTP post-processing parameters and payload parsing
Use these parameters to create a post-processing script, payload parsing, and tagging.

SFTP post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned by the query.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the Reference ID associated with the ECC Queue input message.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages returned from the query. If no error</td>
</tr>
</tbody>
</table>
SFTP post-processing parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>messages are returned, this value is null.</td>
</tr>
<tr>
<td>Tags</td>
<td>tags</td>
<td>Hashmap of tag values returned from the SSH command</td>
<td>Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in <code>%%tagname%% ... %%</code>. Set up the command using the following format:</td>
</tr>
</tbody>
</table>

```
%%tagname1%%
output1 line 1
output1 line 2
...
%%

%%tagname2%%
output2 line 1
output2 line 2
...
%%
```

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the `tagname`. 

```
{"__text__": 
"tagtagname1":"output1 line1
output1 line2
",
"tagtagname2":"output2 line1
output2 line2
"}
```

Configure the SFTP execution command

Use the input variables you created to configure the command that Orchestration executes on the SFTP target.

**Before you begin**

Create the input variables you need in the **Inputs** form before you can advance to the **Execution Command** stage.
Role required: activity_creator, admin

Note: You can test the JDBC connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.

   ![SFTP execution command](image)

   2. Complete the fields shown in the table.

   ![SFTP command fields](image)
<table>
<thead>
<tr>

The permissions number is an internal value returned by the Get File List activity. Typically, you first use the Get File List activity to return a list of files and their attributes. Then you can move a file from a source host to a target host and set the source file attributes on</td>
<td>Set file attributes</td>
</tr>
</tbody>
</table>
Field | Description | Command
---|---|---
the target file. This is demonstrated in the SFTP File Transfer workflow. | | 
Access timestamp | Override the timestamp when the file or directory was last accessed. The access and modification timestamps must be set together as a pair. | Set file attributes
Modification timestamp | Override the timestamp when the file or directory was last modified. The access and modification timestamps must be set together as a pair. | Set file attributes
Size in bytes | Size of a file, expressed in bytes. | Set file attributes
Required MID Server capabilities | MID Server with the appropriate capabilities for connecting to the source and target servers. By default, the system selects an SSH MID Server. | All

The system uses this logic to determine which files to move from the source host:

- If the **Source files** field is empty, the system select all the files in the source directory. Otherwise, it only selects those files whose names match one of the file name patterns given in the field.

- If the **Excluded files** field is empty, the system excludes nothing. Otherwise, it excludes those files whose names match one of the file name patterns given in the field.

- The exclude rule has a higher preference than the include rule. A file whose name matches one of the file name patterns in the **Excluded files** field does not get into the selection, even though it would be selected by the include rule.

- When the **Include subfolders** check box is cleared, the system looks only in the source directory for files to include or exclude. Otherwise, it looks in the source directory and any of its subfolders for files to include or exclude.

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

**Create a probe activity**

Create an activity that runs a probe on the target host that is configured to return specific information..
Before you begin
Role required: activity_creator or workflow_admin

About this task
For instructions on using the activity template process flow, see create custom activities.

Procedure
1. Create a **custom activity**.
   This action creates a custom activity using a template.
2. After setting up **general properties** and **creating input variables**, configure the Probe Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map the input variables</strong></td>
<td>Use the variables you created to configure the command that Orchestracion executes.</td>
</tr>
<tr>
<td><strong>Probe</strong></td>
<td>Probe to run with this activity, from the list of probes in the system</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td><strong>Parameters</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the Outputs tab automatically. See automap output variables.

What to do next
- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules
Probe template execution parameters

You use execution parameters to create the input process script in the Pre Processing form.

For descriptions of the command fields, see Configure the Probe execution command.

**Note:** You must use the executionParam. prefix with all variables in this table.

### Probe activity execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Probe</td>
<td>probe</td>
<td>Reference</td>
<td>The sys_id of the MID Server probe.</td>
</tr>
<tr>
<td>Source</td>
<td>source</td>
<td>String</td>
<td>Intended target host</td>
</tr>
<tr>
<td>Parameters</td>
<td>parameters</td>
<td>Array of JS object</td>
<td>Array of JavaScript objects, expressed with the executionParam. prefix. To add more name-value pairs to the parameters array, append them to the existing array. Create a JavaScript object with the following syntax, and add it to the executionParam.parameter array. This assigns additional parameters to the message:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>var newParameter =</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>{&quot;name&quot;:&quot;parameterName&quot;,&quot;value&quot;:&quot;parameterValue&quot;};</td>
</tr>
<tr>
<td></td>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

```javascript
var valueCapability = 
{"NEW_MID_CAPABILITY":"NEW_MID_CAPABILITY_VALUE"};
executionParam.valueCapabilities.push(valueCapability);
```

Probes template post-processing parameters

Use these parameters to create a post-processing script.

Probe post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Payload</td>
<td>payload</td>
<td>String</td>
<td>Contains raw payload returned from the probe.</td>
</tr>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains output data returned from the probe.</td>
</tr>
<tr>
<td>EccSysId</td>
<td>eccSysId</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message.</td>
</tr>
</tbody>
</table>

Configure the Probe execution command

Use the input variables you created to configure the command that Orchestration executes on the target.

Before you begin

Create the input variables you need in the Inputs form before you can advance to the Execution Command stage.

Role required: activity_creator, admin

**Note:** You can test the activity connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.
Procedure

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.

   **Probe execution command**

   ![Probe execution command interface]

   - **Input**: Input variable builder. Create input variables to map to available fields.
   - **Probe**: Probe to run with this activity, from the list of probes in the system.
   - **Target host**: Host name or IP address of the target server for this activity.
   - **Required MID Server capabilities**: MID Server to use, by capabilities.
   - **Parameters**: Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.

2. Complete the fields shown in the table.

   **Probe execution command fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>Input variable builder. Create input variables to map to available fields.</td>
</tr>
<tr>
<td>Probe</td>
<td>Probe to run with this activity, from the list of probes in the system.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
<tr>
<td>Parameters</td>
<td>Name-value pairs to pass to the host with this probe. You can create these parameters manually, or drag and drop input variables into the parameter fields and assign a value.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.
Create an SSH activity
Create an activity that extracts data from a target host that uses the SSH network protocol.

Before you begin
Role required: activity_creator or workflow_admin

About this task
For instructions on using the activity template process flow, see create custom activities.

Procedure
1. Create a custom activity.
   This action creates a custom activity using a template.
2. After setting up general properties and creating input variables, configure the SSH Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map the input variables</td>
<td>Use the variables you created to configure the command that Orchestration executes.</td>
</tr>
<tr>
<td>Target host</td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td>Command</td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that the SSH command line supports. For more information, see Advanced SSH script options below the table.</td>
</tr>
<tr>
<td>Directory</td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>The Orchestration credential tag to use when running the command.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Long running</td>
<td>If checked, disables the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.</td>
</tr>
<tr>
<td>Must Sudo</td>
<td>If checked, enables the use of <code>sudo</code> to run commands.</td>
</tr>
</tbody>
</table>

**Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

**Example: Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (*main_script.bash*) can reference another script (*my_include.bash*) as well as a separate file (*.my_profile*) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
```
# user is responsible for their own cleanup
rm ~/specialFunctions.py

What to do next

- Use auto-mapping to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually create output variables and create parsing rules

SSH template execution parameters

Use execution parameters to create the input process script in the Pre Processing form of the activity designer.

For descriptions of the command fields, see Configure the SSH execution command.

ℹ️ Note: You must use the `executionParam.` prefix with all variables in this table.

<table>
<thead>
<tr>
<th>SSH execution parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Source</td>
</tr>
<tr>
<td>Command</td>
</tr>
<tr>
<td>Directory</td>
</tr>
<tr>
<td>Credential tag</td>
</tr>
<tr>
<td>MidCapabilities</td>
</tr>
<tr>
<td>ValueCapabilities</td>
</tr>
</tbody>
</table>
### SSH execution parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
</table>
| customize the MID Server selection: |              |        | var valueCapability = {
|                    |              |        |   'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
|                    |              |        | executionParam.valueCapabilitie s.push(valueCapability);               |
| Long running       | long_running | Boolean| Indicates whether or not the command is long running. A value of true indicates that the command is long running. |
| Must sudo          | must_sudo    | Boolean| Indicates whether or not this activity must use sudo to run root commands. A value of true indicates that `sudo` must be used. |

### SSH post-processing parameters and payload parsing

Use these parameters to create a post-processing script, payload parsing, and tagging.

#### SSH post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>output</td>
<td>String</td>
<td>Contains the output returned from the SSH command.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains the error messages retrieved from the SSH command. This value is <code>null</code> if there are no error messages.</td>
</tr>
</tbody>
</table>
SSH post-processing parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tags</td>
<td>tags</td>
<td>Hashmap of tag values</td>
<td>Contains the tags used to extract output using the SSH commands. The tag output is delimited by double percentage signs, as in <code>%%tagname%% ... %%</code>. Set up the command using the following format:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>returned from the SSH command</td>
<td></td>
</tr>
</tbody>
</table>

The tags returned are JavaScript hashmap objects in which each key is prefixed with `tag` appended with the tagname.

```json
{"__text__": 
  "tagtagname1":"output1 line1
  output1 line 2
  
  
%}
%tagname2%
  output2 line1
  output2 line 2
  

%}
```

**Configure the SSH execution command**

Use the input variables you created to configure the command that Orchestration executes on the host target.

**Before you begin**
Create the input variables you need in the **Inputs** form before you advance to the **Execution Command** stage.

Role required: activity_creator, admin
**Note:** You can test the SSH connection between the MID Server and the target without having to run the activity in a workflow context. For details, see test template outputs.

**Procedure**

1. Drag variables from the list of inputs and drop them into command fields. The system formats the variable in the proper syntax for the command.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input</strong></td>
<td>Input variable builder. <a href="#">Create input variables</a> to map to available fields.</td>
</tr>
<tr>
<td><strong>Target host</strong></td>
<td>Host name or IP address of the target server for this activity.</td>
</tr>
<tr>
<td><strong>Command</strong></td>
<td>Command this activity runs on the target host. You can invoke a MID Server script from this field using any script type that is supported by the SSH command line. For more information, see <a href="#">Advanced SSH script options</a> below the table.</td>
</tr>
<tr>
<td><strong>Directory</strong></td>
<td>Directory on the target host where the command is run.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>The credential alias to use when running the command.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Select MID Server by capabilities | MID Server with the appropriate capabilities for connecting to the host. By default, the system selects a MID Server with SSH capabilities.
Long running | Check box to disable the SSH connection timeout for commands that might take longer to run than the default 60 seconds. Orchestration periodically checks the running process to determine its status until it is finished.
Must Sudo | Check box to allow the use of *sudo* to run commands.

3. Click **Save**.

4. Click **Continue** to advance to the **Outputs** stage.

**Create a run script activity**

Create an activity that runs any script.

**Before you begin**

Role required: activity_creator or workflow_admin

**Procedure**

1. Create a **custom activity**.
   This action creates a custom activity using a template.

2. After setting up **general properties** and creating input variables, configure the Run Script Execution Command:
   Create a script for this activity to execute.

   **Note:** You can map parameter values in a test payload to variables in the **Outputs** tab automatically. See automap output variables.

**What to do next**

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually **create output variables** and **create parsing rules**

**Run Script template processing script**

Use the Run Script custom template Script form to enter a script to call and use with other activities.
Run Script processing script

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing script</td>
<td>Script that the activity runs.</td>
</tr>
<tr>
<td>Variables</td>
<td>Input variables that are available to use as building blocks in the input process script. Click the arrow above the field to open the variables list. Click an item in the tree to add it to your script in the appropriate syntax. The list displays input variables you passed into the activity on the Inputs form. All activity variables added in the Inputs form are read-only and are expressed in the processing script with this syntax: <code>activityInput.variable</code></td>
</tr>
</tbody>
</table>

Create a JMS activity

Create a custom JMS activity to retrieve or send messages to external systems using the Java Messaging Service.

Before you begin
Role required: activity_creator or workflow_admin

About this task
The JMS activity supports third party JMS providers whose JMS client application is written with a typical Java EE pattern and can support these operations:

- Using JNDI to find a ConnectionFactory object.
- Using JNDI to find one or more destination objects.
- Using the ConnectionFactory to create a JMS connection object.
- Using the JMS connection to create one or more JMS session objects.
- Using a JMS session and the destinations to create the MessageProducer and MessageConsumer objects.
- Starting the JMS connection to enable delivery or consumption of messages.

Note: The JMS activity designer has been tested with the JMS providers ActiveMQ and Tibco EMS. When connecting to a JMS provider, refer to your third party user documentation.
Procedure

1. Create or verify your JMS credential.
   Your JMS credentials must have permission for the target database and proper configuration for the corresponding JMS connection. Credentials must be set up before you can create a JMS activity.

2. Create or verify your JMS connection.
   Your JMS connection must be configured with valid JMS credentials set up before you can create a JMS activity.

3. Create a custom activity.
   This action creates a custom activity using a template.

4. After setting up general properties and creating input variables, configure the JMS Execution Command:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure your credential</td>
<td>Fill in the fields necessary for your database connection.</td>
</tr>
<tr>
<td>Connection Factory</td>
<td>Name of the JMS Connection Factory. You should create or verify your JMS connection. This configuration links the name of the Initial Context Factory with the URL of the JMS provider.</td>
</tr>
<tr>
<td>Destination Type</td>
<td>Type of destination used for this message:</td>
</tr>
<tr>
<td></td>
<td>• Queue: Message is queued for point-to-point communications.</td>
</tr>
<tr>
<td></td>
<td>• Topic: Message is used for publish and subscribe communication.</td>
</tr>
<tr>
<td></td>
<td>Note: The GET operation is only supported for the Queue destination type.</td>
</tr>
<tr>
<td>Destination Name</td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td>Message Type</td>
<td>The JMS message type value. Only the Text Message type is supported. The queue or topic destination must</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Option</strong></td>
<td>be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td><strong>Operation</strong></td>
<td>The programmatic operation to perform on the destination. The choices are <strong>PUT</strong> or <strong>GET</strong>.</td>
</tr>
<tr>
<td><strong>Timeout (Secs)</strong></td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is <strong>30</strong>.</td>
</tr>
<tr>
<td><strong>Custom message headers</strong></td>
<td>The custom header values in a name/value pair format, that is available on the JMS destination.</td>
</tr>
<tr>
<td><strong>Message payload</strong></td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td><strong>Credential tag</strong></td>
<td>A tag for an individual credential for a JMS activity in an Orchestration workflow.</td>
</tr>
<tr>
<td><strong>Required MID Server capabilities</strong></td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>

### What to do next

- Use **auto-mapping** to generate outputs and parsing rules
- If you do not use auto-mapping, you can manually **create output variables** and **create parsing rules**

### Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

### Before you begin

**Role required:** admin
About this task
The MID Server must have the correct JMS connection factories for your organization. Configure those values in the mid.property.jms.command.allowed_factory_names property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

Procedure
1. Navigate to MID Server > JAR Files.
2. Click New and add:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

3. Click the paper clip icon in the banner and attach the JMS driver jar file. The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the activemq-all-5.10.1.jar file.

5. Click New, add the following, and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Provider URL</td>
<td>Location of the running JMS provider installation.</td>
</tr>
</tbody>
</table>

Note: For example, to connect to ActiveMQ V5.1: tcp://ipAddressOrHostName:61616.

6. Navigate to Orchestration > Credentials.

7. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider. For more information, see JMS credentials.

8. Click Submit. You are ready to create a custom JMS activity.

JMS template execution parameters
You use execution parameters to create the input process script in the Preprocessing form.

You must use the executionParam. prefix with all variables in this table.

<table>
<thead>
<tr>
<th>JDBC execution parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Jms ds</td>
</tr>
<tr>
<td>Destination type</td>
</tr>
<tr>
<td>Destination name</td>
</tr>
<tr>
<td>Message type</td>
</tr>
<tr>
<td>Operation</td>
</tr>
</tbody>
</table>
### JDBC execution parameters (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>Integer</td>
<td>Length of time to wait for the query to return results.</td>
</tr>
<tr>
<td>Custom headers</td>
<td>custom_headers</td>
<td>Array of JavaScript objects</td>
<td></td>
</tr>
<tr>
<td>Message payload</td>
<td>message_payload</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td></td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see MID Server capabilities. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

```javascript
var valueCapability = {
  'NEW_MID_CAPABILITY': 'NEW_MID_CAPACITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
```

### JMS template post-processing parameters

Use these parameters to create a post-processing script.
### JMS post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>status</td>
<td>String</td>
<td>Status of the operation (Put or Get) on the JMS destination.</td>
</tr>
<tr>
<td>StandardHeaders</td>
<td>standardHeaders</td>
<td>String</td>
<td>All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>CustomHeaders</td>
<td>customHeaders</td>
<td>String</td>
<td>All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>MessagePayload</td>
<td>messagePayload</td>
<td>String</td>
<td>Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessages</td>
<td>String</td>
<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

### Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same...
scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

Note: Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Before you begin
Roles required: admin, activity_admin, activity_creator

Procedure

1. When you finish configuring the activity, click Publish.
   
   This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click Checkout.
   
   When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.
   
   The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

   Note: Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.
Before you begin
Role required: admin, activity_admin, activity_creator

About this task
An administrator can return a locked activity to a published state.

Procedure
1. Open the Workflow Editor.
2. From the Custom tab, open the activity that is locked.
3. Click the menu icon in the title bar and select Versions from the context menu.
   A list of all the versions of that activity appears. The locked version displays the user who checked it out.

4. Select the checked out version.
   The system opens the record in the activity designer.
5. Click the menu icon again and select Force Checkout from the context menu.
   The activity fields become editable.
6. Click Publish.
   The activity becomes available to users with the appropriate roles.

Copy a custom activity
You can copy activities for reuse from the Custom tab in the global scope.

Before you begin
Role required: admin, activity_admin, activity_creator

About this task
⚠️ Note: You cannot copy an activity in a private scope.
Procedure

1. To reuse an activity in the global scope, expand the parent category to display the activities.

2. Right-click the activity you want to copy and select one of these options:

   • **Copy into global scope as new activity**: Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the **Custom** tab.

   ![](image)
   
   **Naming an activity copy**
   
   Add F5 Virtual Server - v1 - Copy into global scope as new activity
   
   Activity name
   
   ![Activity name field]
   
   [Cancel] [OK]

   • **Copy into global scope as new version**: Copies the activity using the same name, increments the version number, and moves it to the global scope in the **Custom** tab. The system automatically adds the parent category to the **Custom** tab if it does not already exist. This action will overwrite another activity with the same name and version number.

   ![](image)
   
   **Creating a new activity version**
   
   Confirm copy
   
   Are you sure you want to copy 'Reset AD User Password - v1' activity into global as a new version?
   This action will overwrite an existing activity with the same name.
   
   [Cancel] [OK]

   **Note:** If the activity is in any other scope but global, the system displays this message: **Cannot copy privately scoped activity.**

Orchestration databus

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the **Orchestration activity designer**. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the **Data** tab and are available for use as inputs in subsequent activities.
Note: Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don’t accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.

Reuse data in the activity designer

The Data tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Before you begin
Roles required: workflow_creator

About this task
Activities are categorized by application in this tab and are available for use as data sources for other activities. The Data tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

Procedure
1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

You can use any of the outputs in the structure, regardless of the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the Data tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.
2. Point to an activity to display information about it in a pop-up window.

Any output data reused by the activity is listed in the **Databus Output** field of the pop-up window.

**MID Servers for Orchestration**

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the **Orchestration** application or the **ALL** application assigned to it. See **Configure a default MID Server for each application** for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:

- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See **Select the default MID Server for Orchestration**.
Related reference

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server.

MID Server capability values

Capabilities provided in the base system do not have a defined value string. The capability value can be blank, a single value, or a * (wildcard). A MID Server configured to use a capability that has no value can locate any device using that capability's protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match. The * (wildcard) will match a request capability specifying any non-blank value.

Starting with the Madrid release, the [capability name]:[value] combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.
MID Server selection

The MID Server is selected using an algorithm based on the capabilities available. The selector produces a list of suitable MIDs using filters in the following order: `server status` > `applications` > `IP range` > `capabilities`. The algorithm searches the capabilities in the following sequence and, if a step finds at least one MID server, the remaining steps are skipped:

1. **Exact value match**: Find each MID Server containing capabilities with name/value pairs with an exact match to all requested capability name/value pairs. Blank is a valid value. * (wildcard) values are ignored.

2. **Wildcard value match**: The same as an exact value match, but also allows a non-blank request value to match MID server capability records containing value *.

3. **Special capability name ALL**: Find each MID Server containing the special capability name ALL, ignoring capability’s value field.

**Note**: If the requested capability name does not exist in the `ecc_agent_capability` table, `BadArgumentException` is thrown rather than falling back to the ALL capability.

Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.
The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.sanjose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.

Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Before you begin
Role required: admin or sm_admin
1. Ensure that the MID Server can connect to elements inside and outside your network
2. Download and install the MID Server on a Linux or Windows host
3. Configure your MID Server
4. Configure MID Server security
5. Ensure that the MID Server can connect to elements inside and outside your network
6. Download and install the MID Server on a Linux or Windows host
7. Configure your MID Server
8. Configure MID Server security

About this task
Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

⚠️ Note: At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>All</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>
Procedure

1. Navigate to **MID Server > Capabilities**.

2. Select an existing capability. You can also select **ALL** to include all capabilities.

   ✪ **Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a. Click **New**.
   b. Configure the value for a custom capability.
      
      **Example**
      An example is a capability for **DOMAIN**, with a value of **service-now**.
   c. Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.

5. Select one or more MID Servers for this capability from the **Available** list.

6. Click **Save**.

   The capability defined here also appears in the primary record for this MID Server.

---

**Select the default MID Server for Orchestration**

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The **Default MID Server** field on the Orchestration application record. See **Configure a default MID Server for each application** for instructions.

- The **Default MID Server to use for Orchestration Activities** property. Navigate to **Orchestration > MID Server Properties** to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.
**PowerShell probe version 2 system property**

View detailed PowerShell credential information and view extended logging information.

Starting with the madrid release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

`mid.server.rba_powershell_v2`

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

ℹ️ **Note:** This property only applies to Orchestration activities. Discovery probes are not affected.

You can access the property by selecting the MID Server Properties link in the navigation pane:

<table>
<thead>
<tr>
<th>Orchestration MID Server Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
</tr>
<tr>
<td>Default MID Server to use for Orchestration Activities</td>
</tr>
<tr>
<td>Debug SSH Probes</td>
</tr>
<tr>
<td>Use PowerShell Probe V2</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

---

**PowerShell log property**

Enable debug messages to display from PowerShell.

This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

`mid.property.powershell.log_info`
The new MID Server PowerShell log property:

• Displays logging information.

  ℹ️ **Note:** Once logging is enabled, OOB PowerShell scripts log information.

• Adds logging information to your developed PowerShell scripts and PowerShell activities.

  ℹ️ **Note:** Logging information is only available when property is enabled.

• Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.

  ℹ️ **Note:** All the debug messages that come back to the instance are also saved to the MID Server log file. The log file might have additional debug messages generated from Java code, which might help the debug process.
Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

**Before you begin**

Role required: orchestration_manager

**Procedure**

1. To view the dashboard, navigate to **Orchestration > Operations & Troubleshooting > Orchestration Usage Dashboard**.

The Orchestration Usage dashboard displays. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:

<table>
<thead>
<tr>
<th>Orchestration Usage Metrics</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Transaction Summary Last 12 months** | A running transaction count of all Orchestration transactions over the last 12 months. Includes:  
- The count of orchestration transactions associated with the HR Application  
- The count of Orchestration transactions associated with the Security Operations Application |
<p>| <strong>Transaction Summary YTD</strong> | Cumulative count of all transactions since the time the Orchestration plugin was activated or the customer upgraded to Geneva. |
| <strong>365 day Running Average of Server</strong> | The running average over the last 365 days for cmdb_ci_computer - cmdb_ci_server. This includes all physical and virtual client nodes and excludes server nodes from the count. |
| <strong>365 day Running Average of Client</strong> | The running average over the last 365 days for cmdb_ci_server. This includes all physical and virtual server nodes. |</p>
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Orchestration Transactions by Month for Last 12 Months</td>
<td></td>
</tr>
<tr>
<td>Average Client Nodes Orchestrated Last 365 Days</td>
<td></td>
</tr>
<tr>
<td>Average Server Nodes Orchestrated Last 365 Days</td>
<td></td>
</tr>
<tr>
<td>Number of Orchestration Activities Developed Last 365 Days</td>
<td>The aggregate number of activity definitions you have developed and OOB activity definitions you have modified. This number includes activity elements (Activities build with the Activity Designer) you have developed and OOB activity definitions you have modified.</td>
</tr>
<tr>
<td>Note:</td>
<td>This number excludes activity elements that are shipped with ServiceNow Applications that use the Orchestration Runtime e.g. ServiceNow Security Operations and Human Resources Apps.</td>
</tr>
<tr>
<td>Cumulative Client Nodes Orchestrated by Month</td>
<td></td>
</tr>
<tr>
<td>Cumulative Server Nodes Orchestrated by Month</td>
<td></td>
</tr>
<tr>
<td>Usage by Provider Last 12 Months</td>
<td>Breaks down emphasis by provider, such as PowerShell, JDBC, SSH, etc.</td>
</tr>
<tr>
<td>Top 10 Orchestration Activities</td>
<td></td>
</tr>
</tbody>
</table>

2. **Optional:** You can add more widgets to the dashboard by clicking the **Add Content** icon ( ). In the upper right corner of the dashboard.

**Note:** You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.
Password Reset

The ServiceNow® Password Reset enforces strong and secure passwords by enabling end users to reset or change their passwords either by self-service process or by taking the help of a service desk agent.

Features of Password Reset application

Manage enrollment

Automatically enrolls end users or allows manual enrollment.

Verification types

Validates user authenticity with the help various verifications.

Integrated plugins

Resets passwords on directly from Windows application and Microsoft Azure active directory (AD).

Enrollment types

Enables end users to enroll in different password reset programs as per their convenience.

Password Reset Quebec Release Notes

See changes and new features in this release

Get started

Select a tile to get started.

Exploring Password Reset

Get an overview of Password Reset so you can understand how to set it up and use it for your organization.
Self-service and Service Desk-assisted processes
In addition to configuring the connections, user groups, and verifications, you can specify one of the following operational methods for the organization:

Self-service process
End users reset passwords using a browser on any supported interface, including mobile devices. They can provide the identifying information and answer questions or submit a securely delivered code number. Here is the example for self-service process for password reset. The example of the default self-service password reset flow is as follows:

1. If a user does not remember the password, the user can click **Forgot Password?** on the login screen.

2. The Password Reset application starts. The user provides identification by entering a **Username** and clicks **Next**.

3. In the Verify tab, the user provides personal data associated with the username. In this example, the user enters the email address associated with the user profile. The admin can configure a different verification method. For example, a personal question that only the user can answer.
4. The **Reset** page tells the user to check email for instructions.

5. The user opens the email and clicks the **here** link to reset the password. The link is valid for a period of time that admin specifies by using the `password_reset.request.expiry` property.

6. The **Reset Password** page guides the user to reset the password.

**Service desk-assisted process**

An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset admin service desk role. The Reset request form that the agent works presents a **user** field and a **Process** field. On the form, the agent can view all processes in the end user’s domain.

**Next steps**

Do this next if you are a:
• Administrator—Configure password reset for your users
• End user—Start resetting your password

<td>UI for verifying questions.</td>
</tr>
<tr>
<td>$pwd_verify_simple_ui</td>
<td>Input section for a simple verification method. This field is a single input field.</td>
</tr>
</tbody>
</table>

### UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, `[UI Script Name]+".jsdbx"` is the name of the script:

```xml
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_email_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_google_auth_ui</td>
<td>JavaScript code for the $pwd_enroll_google_auth_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwd_util</td>
<td>Utilities for password reset UI pages and UI macros.</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>
</tr>
</tbody>
</table>

**Password Reset workflows**

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

**Workflows that connect to a credential stores**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>

Domain separation and the Password Reset application

Domain separation is supported in the Password Reset application. A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.
For more information on support levels, see Application support for domain separation.

**How domain separation works in Password Reset**

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.

- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.

- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.

- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.

- All Password Reset tables have a domain column.

- Password Reset process tables include a `sys-overrides` column on business rules, UI actions, and so on.

- The Password Reset application is built using Orchestration. Orchestration supports "Data only" domain separation — the data security model of separating visibility of data from one domain to another.

**Password Change process**

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted
process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.

- Domain separation for service providers

**Setting up Password Reset process**

The Password Reset application is active by default and includes example verifications. The base system enables connections only to the local ServiceNow instance credential store types.

**Requirements**

Role required: admin

**Note:** The Password Reset application is not available during an upgrade.

**Active and available plugins**

- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See [Request the Password Reset - Orchestration Add-on plugin](#).

- To enable connections to Microsoft Azure AD spoke for Password Reset, Integrate Microsoft Azure AD spoke with Password Reset and Configure the connection to Microsoft Azure AD credential store.

**Next steps**

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide.
Setup guide for Microsoft Azure AD for Password Reset

Set up Microsoft Azure AD for Password Reset by activating the plugin and configuring the Microsoft Azure AD instance. The Microsoft Azure AD plugin is activated with the help of this plugin. Microsoft Azure AD for Password Reset is also available in the ServiceNow store.

Related information

Request the Microsoft Azure AD for Password Reset plugin

Microsoft Azure AD users can reset passwords with the Microsoft Azure AD for Password Reset plugin.

Before you begin

Role required: admin

About this task

You can request the plugin from Now Support (HI) or from your instance.

From Now Support:

• In Now Support, navigate to Service Catalog Activate Plugin.
  Or:

Procedure

1. In your instance, navigate to System Applications > All Available Applications > All.

2. On the All Applications page, select Request Plugin to open the request form on Now Support.
3. On Now Support, select to be redirected to the HI Service Portal Service Catalog.

4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current date.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for ServiceNow personnel who will</td>
</tr>
</tbody>
</table>

**Note:** By default, plugins are activated in two batches each business day: once in the morning and once in the evening, Pacific (U.S.) time. If you need your plugin activated at a specific time, enter a request for this in the Reason/Comments field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>activate the plugin. For example, if you need the plugin activated on a specific day or time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**. The Microsoft Azure AD for Password Reset plugin is activated.

**What to do next**

Plan, create, and customize the Password Reset process for your organization.

**Setup guide for Microsoft Active Directory for Password Reset**

Enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types by activating the Password Reset - Orchestration add-on plugin. Microsoft AD for Password Reset is also available in the ServiceNow store.

**Related information**

- Request the Password Reset - Orchestration Add-on plugin
- Password Reset Windows Application

**Request the Password Reset - Orchestration Add-on plugin**

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and 'Remote (SOAP) ServiceNow instance' credential store types. No other components are installed.

**Before you begin**

Role required: admin

**About this task**

There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by clicking **Service Catalog > Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.
Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.

### Activate Plugin request form

<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Password Reset Windows Application

The Password Reset Windows Application enables a user, who forgets the password or is locked out of a Windows computer, to reset the password directly from the Windows login screen.

How the Password Reset Windows Application works

Download the Password Windows Reset application from the ServiceNow Store and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? as depicted in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.
Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.

- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset process.

- The Password strength indicator is not supported. See Configure the connection to a credential store for the Password Reset processes.

- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications for details.

- Custom UI macros configured on the Process > Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.

- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure the connection to a credential store for the Password Reset processes.

Password Reset Windows Application installation requirements

Activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application. You must activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

## Password Reset Admin Guide

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: Introducing Password Reset (video)
Password Reset processes
Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process:** Users reset passwords over the internet using a browser on any supported interface, including mobile devices.
- **Service desk-assisted process:** A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.

End-user experience of the self-service process
The following example is typical:

1. On the login page, the user clicks the **Forgot Password?** link to start the process.

   ![Login page example](image)

   - **User name**
     - able.tuter
   - **Password**
   - **Remember me**
   - **Forgot Password?**
   - **Login**

2. The Identify page opens and the user enters their identifying information (typically user name or email address). The example includes the default Google reCAPTCHA security feature:
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (Earlier, the user selected the question and provided a secure private answer while enrolling in the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.
4. The system checks the credential store to verify identity and then displays the new password on the Reset page.

Elements of a password reset process

You configure the following elements of the process for your organization:

• A connection to the credential store for your organization where user credentials (like username/password) are securely stored.

• One or more user groups on the ServiceNow instance that can use the password reset process.

• The type of identification that users must enter to identify themselves (typically user name or email address).

• One or more verifications — methods to verify the identity of the user. Examples:
  ◦ QA Verification: Answer a question that only the user knows (based on the Security Question verification type).
  ◦ Email verification: Enter a code number that was emailed to the user.
° **SMS verification**: Enter a code number that was texted to a mobile device.

° **Google Authenticator verification**: Enter a code number that appears on the Google Authenticator app on a mobile device.

**How to implement a password reset process**

1. Plan your implementation: Consider all applicable organizational guidelines, security policies, and areas of the organization.

2. Set up the elements of the password reset and password change processes according to the plan:
   
   • Connection to the credential store.
   
   • User groups that use the password reset process.
   
   • Identification type to use.
   
   • Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

**Password Reset Windows Application**

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the **Forgot Password?** link and is then guided through the process of resetting the password. To learn more, see [Password Reset Windows Application](#).

**Password Change application**

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the **Change Password** module or link from the user profile record. Password change is supported on mobile devices.

2. On the **Change Password** page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.
4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

**What to do next**

*Plan your Password Reset processes*

**Plan your Password Reset processes**

To ensure security and efficiency, take the time to plan your Password Reset implementation.

**Before you begin**

Role required: password_reset_admin or admin

**Procedure**

1. Decide on the password reset process:
   
   - **Self-service process:** Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the Public access property. See .
   
   - **Service desk-assisted process:** Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: *Resetting User Passwords (Video)* and *How to Set Up a Service Desk-Assisted Password Reset Process (Video)*.

2. Decide how groups and roles differ in access and security needs.

   Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

   Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

   Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Decide how to manage credentials.

   Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to
verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Decide how to implement enrollment in the Password Reset program. For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Decide which Password Reset options to offer to users.
   - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   - What options are available to users working off-site?

Related information

Configure your Password Reset process

Configure your Password Reset process

To implement the process, you configure credentials, verification methods and settings, and enrollment settings. You also specify which users the process applies to.

Before you begin
Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes.

2. Create the credential store record for usernames and passwords that are managed.

Note: For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the Password Reset plugin that is installed.

   - The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
   - The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
   - The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.
3. Define the verifications that the process will use.

4. Configure Password Reset to auto-enroll users or to enable users to enroll for the program. See Configure your Password Reset process to auto-enroll users and Enable users to enroll for Password Reset.

**About this task**
A Password Reset process consists of the following elements:

- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password. (Verifications are implemented by script includes.)

**Procedure**

1. Navigate to **Password Reset** > **Processes**.
2. Click **New** and then specify a meaningful **Name** and **Description** for the process.
3. Select the **Credential store** that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the **Password Reset** check box, the **Password change** check box or both check boxes.
5. Specify the **Apply to all users** setting.

<table>
<thead>
<tr>
<th>Setting of the Apply to all users check box</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the <strong>Groups</strong> related list.</td>
</tr>
</tbody>
</table>

6. For **Password Reset**, configure settings on the **Password Reset Details** tab.
## Settings on the Details tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Public access</strong></td>
<td>The check box is available only when <strong>Password reset</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>• Select the check box to enable a self-service process with public user access to the Password Reset or Password Change form through a URL.</td>
</tr>
<tr>
<td></td>
<td>• Clear the check box to define a Service desk-assisted process in which only service desk agents can reset a password at the request of a user.</td>
</tr>
<tr>
<td><strong>Public URL</strong></td>
<td>The field is available only when <strong>Public access</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>URL of the page where users go to reset or change the password. The value from the URL suffix field is appended to the URL when you tab out of the URL suffix field. For the Default self-service Password Reset process, this value must be /$pwd_reset.do?sysparm_url=ss_default.</td>
</tr>
<tr>
<td><strong>URL suffix</strong></td>
<td>The field is available only when <strong>Public access</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>Suffix used to create a unique URL for the Password Reset or Password Change form.</td>
</tr>
<tr>
<td><strong>Display CAPTCHA</strong></td>
<td>The check box is available only when <strong>Public access</strong> is selected.</td>
</tr>
<tr>
<td></td>
<td>Select the check box to display a CAPTCHA on the user identification page.</td>
</tr>
<tr>
<td></td>
<td>The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See <strong>Configure Google reCAPTCHA for the password reset process</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.</td>
</tr>
<tr>
<td></td>
<td>Because on-premises instances do not have access to the Internet, the instances cannot use the Google reCAPTCHA service. Set the password_reset.captcha.google.enabled system property to <strong>false</strong> for on-premises instances.</td>
</tr>
</tbody>
</table>
To use the base system CAPTCHA, change the `password_reset.captcha.google.enabled` system property to `false`.

**Identification type**
Method that the user employs to claim identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process.

The base system includes the Email and Username Identification identification types. You can create a custom identification type (some knowledge of JavaScript is recommended).

See [Personal data identification types and confirmation type verifications](#).

**Redirect URL**
URL to go to after a successfully resetting a password — typically, the URL of the original login page.

Enter a complete path, including the protocol (for example, `https://myDomain.myURL.com`). If the path is under the same domain as the **Public URL**, then start the path with the `/` character.

![Note:](notes.png) If the **Auto-generate password** check box is selected, then the instance displays the new password. The user must click **Done** to go to the URL.

**Minimum verifications**
Number of verifications that a user must successfully submit to reset the password.

If the number exceeds the number of mandatory verifications, then the user must submit enough additional optional verifications to meet the number specified for **Minimum verifications**.

![Note:](notes.png) Each user must submit all mandatory verifications regardless of the number specified.

By default, during the password reset process, the system presents optional verifications to the user based on the **Order** values for the verifications. If you selected **Allow user to choose from optional verifications**, then the Verification page presents all optional verifications to the user. The user then selects the appropriate number of verifications. In this...
example, the **Minimum verifications** value is 1. Because no mandatory verifications are configured, the user can choose an optional verification.

Also, see **Allow user to choose from optional verifications**.

| Allow user to choose from optional verifications | Select the check box to enable a user, on the Verifications page during the process of resetting the password, to select which optional verifications to use. The choice of optional verifications appears only if the **Minimum verifications** setting is greater than the number of mandatory verifications.

The number that you specify for **Minimum verifications** determines how many optional verifications that the user is allowed to select.

In the example, the **Minimum verifications** setting is 2 and there are no mandatory verifications. The user has selected two optional verifications, so cannot select a third verification. |

| Email Password Reset URL | Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. By default, the self-service Password Reset processes enable this option.

When you select this option, the **Auto-generate password** check box is not available.

**Note:** See [for an outline of the process that is enabled by default.](#) |
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable account unlock</td>
<td>This check box is available only when <strong>Password reset</strong> is selected. Select the check box to allow user accounts on credential stores to be unlocked without resetting the password.</td>

</tr>
</tbody>
</table>

8. For **Password Reset**, fill in any fields of interest on the **Enrollment Reminder** tab.

10. From the **Password Reset Process Verifications** related list, select one or more verifications. See **Password Reset verifications**.

11. Optional: From the **Password Reset Process Groups** related list, select the user groups that will use the process that you are defining. The **Password Reset Process Groups** related list appears only if the **Apply to all users** check box is not selected.

12. Save the record and then select the **Active** check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.

13. Click **Update**.

14. Navigate to **Password Reset > Properties** to set the properties that configure the Password Reset experience for end users.
Related information

Plan your Password Reset processes
Configure the required strength for passwords

Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User table [sys_user] or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

Credential store types installed with the base system

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to Password Reset > Credential Stores to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Password Reset - Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

Connection workflows for credential store types

A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.
**Creating a custom credential store type**

You can use a credential store type as a model to create a custom type. See [Create a credential store type for Password Reset](#).

**Related information**

- Request the Password Reset - Orchestration Add-on plugin
- Create a credential store type for Password Reset

**Configure the connection to a credential store for the Password Reset processes**

You create a Password Reset credential store record to configure access to your credential store server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that
users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

**About this task**
For an AD credential store, skip this procedure and instead follow the instructions in Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.

**Procedure**

1. Navigate to **Password Reset > Credential Stores**.
2. Select one of the following sample credential stores:
   - **Local ServiceNow Instance** credential store.
   - **Remote (SOAP) ServiceNow** credential store (installed with the Orchestration Add-on).
3. Enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of credential store that you are connecting to. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular kind of credential store. Credential stores inherit the functionality of the credential store type.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** For an AD credential store, skip this procedure and see Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.

<table>
<thead>
<tr>
<th>Auto-generate password</th>
<th>Script include that generates a temporary password for use during the reset process.</th>

<tr>
<td>Default settings:</td>
<td></td>
</tr>
<tr>
<td>• Selected for local ServiceNow credential stores</td>
<td></td>
</tr>
<tr>
<td>• Not selected for other credential stores</td>
<td></td>
</tr>
</tbody>
</table>
Note:
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

Note: The Password Reset Windows Application does not support Password Strength.

4. Click **Submit**.

5. If you use the Local ServiceNow Instance credential store and you selected the **Enforce history policy** check box, then follow these steps:
   a. Open the Password Reset process that is associated with the credential store: **Password Reset > Processes**.
   b. On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

6. Test the connection to the credential store.

Related information

**Credentials Store for Password Reset for Active Directory**

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to **Password Reset > Credential Stores** to view the list of example credential stores that are based on the base-system types.

Related information

- Integrate Password Reset with your Active Directory service
- Configure the connection to an AD credential store

**Integrate Password Reset with your Active Directory service**

When the Password Reset - Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.
Before you begin
Role required: admin
Active Directory must have a user role with the following privileges:

Descendent User objects:
• Reset password
• Read/Write pwdlastset
• Read/Write UserAccountcontrol
• Write Account Restrictions
• Read/Write lockouttime
• Read MemberOf

Descendent Group objects:
• Read Members
• Read MemberOf

Procedure
1. Install a MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. If using the Workflow and Orchestration add-ons, in the ServiceNow instance, navigate to Orchestration > Credentials.
4. Click New, complete the form with the following values for the AD credential, and then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Windows.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter your Active Directory domain user. For example, <code>domain\admin</code>.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter your Active Directory domain user password.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Applies to | Select the MID Server that you use to access the Active Directory server.

#### Note:
If you are using IntegrationHub, follow these steps:

- Navigate to **Connections and Credentials > Connections and Credentials Aliases > AD > Connections > New** and then set up your connection.

Or

- From the AD Credential store, click **AD Connection Alias** to create a new connection.

#### What to do next
Create a connection to the credential store as described in **Configure the connection to an AD credential store**.

### Configure the connection to an AD credential store

You create a Password Reset credential store record to configure access to your Active Directory server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

#### About this task
The Orchestration add-on installs the AD Credential Store type. The Password Reset Windows Application supports only **AD Credential Store**.

#### Procedure

1. Navigate to **Password Reset > Credential Stores** and select **Sample AD Credential Store** to use as a template.

2. Enter a unique and meaningful **Name** and **Description** and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>Select AD Credential Store. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-generate password</td>
<td>Specify a script include that generates a temporary password for use during the reset process.</td>
</tr>
</tbody>
</table>
Note: If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.

| Enforce history policy | Appears only if you select a credential store Type of AD Credential Store or Local ServiceNow Instance. For information on configuring the setting for credential store types other than AD, see Configure the connection to a credential store for the Password Reset processes.

Select the Enforce history policy check box to enforce both of the following password reset policies:

- **History policy (password reuse):** Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous 10 passwords when resetting a password.

- **Maximum number of reset attempts:** You can configure the maximum number of attempts to reset a password. A user who fails to reset the password (by failing password policies or the history policy) the specified number of times is blocked.

Follow this procedure to enforce the history policy that is configured for the AD credential store and to enforce the password policy:

a. Select the Enforce history policy check box.

b. In the Password Reset Credential Store Parameters related list, set the value of the max_reset_attempts parameter to the number of allowed attempts to change or reset the password. Attempts fail when password policies which are set up on the remote AD server. The max_reset_attempts setting applies only to Password Reset processes that use AD credential stores. The default value of 0 (zero) enables an unlimited number of reset attempts.

| Hostname | Specify the URL or IP address of the credential store.

| User account lookup | Specify the script include that maps the user ServiceNow platform ID to the user credential store ID.

The default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name.

| Password rule hint | Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.
**Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).

<table>
<thead>
<tr>
<th>Password rule</th>
<th>Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks <strong>Password Reset</strong>. You can use the script to enforce password strength/complexity requirements.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the <strong>Strength rule</strong> script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical <strong>Password Strength</strong> bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The Password Reset Windows Application does not support Password Strength.</td>
</tr>
<tr>
<td>Strength rule</td>
<td>This text box appears only if you select <strong>Enable Password Strength</strong>.</td>
</tr>
<tr>
<td></td>
<td>Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.</td>
</tr>
<tr>
<td></td>
<td><strong>Default settings:</strong></td>
</tr>
<tr>
<td></td>
<td>• Selected for local ServiceNow credential stores</td>
</tr>
<tr>
<td></td>
<td>• Not selected for other credential stores</td>
</tr>
</tbody>
</table>

**Note:**

To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

**Note:** The Password Reset Windows Application does not support Password Strength.

3. **Click Submit.**

4. On the domain controller, set **Password Aging** (MINAndPassword_AGE) to zero.

5. To enforce the history policy that is configured for the AD credential store, follow these steps:
a. Open the Password Reset process that is associated with the credential store: **Password Reset > Processes**.

b. On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

c. On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last 11 passwords are not repeated, set the history policy to 22.

   **Note:** To enforce the history policy that is configured for the AD credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you cleared the **Auto-generate password** check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.

6. To enforce the maximum number of attempts to reset the password: In the Password Reset Credential Store Parameters related list, set the value of the **max_reset_attempts** parameter to the number of allowed failed attempts. The default value of 0 (zero) enables an unlimited number of reset attempts.

   **Note:** The **max_reset_attempts** setting applies only to Password Reset processes that use AD credential stores.

7. Click **Submit**.

8. Test the connection to the credential store.

**Related information**

Integrate Password Reset with your Microsoft Azure AD

Configure the connection to Microsoft Azure Active Directory (AD) credential store
Integrate Password Reset with your Microsoft Azure AD

When the Microsoft Azure AD Spoke for Password Reset is activated, the Password Reset application can manage passwords of a Microsoft Azure AD Application. The application manages passwords by referencing an Azure AD user with appropriate roles and password change privileges.

Before you begin
Role required: admin

Procedure

1. Set up Microsoft Azure AD spokeSetup for Password Reset.
2. Configure Servicenow Credential Store.
   The Microsoft Azure AD Spoke for Password Reset is integrated.

What to do next
Create a connection to the credential store as described in Configure the connection to an AD credential store.

Configure the connection to Microsoft Azure Active Directory (AD) credential store

Create a Password Reset credential store record to configure access to your Microsoft Azure AD server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see and other settings.

About this task
The Microsoft Azure AD Spoke for Password Reset installs the Microsoft Azure AD Credential Store type. The Microsoft Azure AD application supports only the Microsoft Azure AD Credential Store.

Procedure

1. Navigate to Password Reset > Credential Stores and select Sample Microsoft Azure AD credential store which you can use out of the box or as a template.
2. Enter a unique Name and Description and then complete the form.

| Type | Select Sample Microsoft Azure AD credential store. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type. |

<td>Check this option to select either a default password policy or one you created yourself previously.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Password Reset Credential store record to access your Microsoft Azure AD server is configured.

ℹ️ **Note:** The **Enable Password Policy** option is new in the Quebec release. Checking the option displays your password policy choices right from your instance. To learn more, see [Enable password policies on your instance](#).
What to do next
Test the connection to a credential store

Test the connection to a credential store
You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

Before you begin
Role required: admin

Procedure
1. Navigate to Password Reset > Credential Stores and then open the credential store record.
2. In the header bar, click Save and Test Connection. A progress page displays the result of the test.

Set up SOAP credentials for Password Reset
When the Orchestration Add-on plugin is activated, the ServiceNow platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Before you begin
Role required: admin or web_service_admin

Procedure
1. Navigate to System Web Services > Outbound > SOAP Message.
2. Click Password Reset Request.
3. From the Soap Message Functions related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a. In Basic auth user ID, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b. In Basic auth user password, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c. Select Use basic auth.
   d. Click Update.
   You do not need to enter a value in the SOAP endpoint field. The field shows the name of the ServiceNow instance used for Password Reset.
Delete a connection to a credential store for Password Reset

Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Before you begin
Role required: password_reset_admin or password_reset_credential_manager

Procedure
1. Navigate to Password Reset > Credential Stores and then select the check box for the credential store.
2. In the Actions choice list, select Delete.

Password Reset verifications
Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.

Verifications included with Password Reset
The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

Note: The Password Reset Windows Application does not support custom verifications.

| QA verification | Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. Questions are presented in the language that the user requested during login. When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity. |
## Password Reset verifications (continued)

For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers.

This verification is based on the **Security Questions** verification type.

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Email verification</strong></td>
<td>This verification relies on auto-generated code numbers. You typically implement Email verification as a self-service Password Reset model. When a user requests password reset, the system sends a verification code to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using emailed codes. The Password Reset Windows Application supports Email verification. This verification is based on the <strong>Email Code</strong> verification type.</td>
</tr>
<tr>
<td><strong>SMS verification</strong></td>
<td>Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page. You can use the ServiceNow Notify feature to send the codes. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes. This verification is based on the <strong>SMS Code</strong> verification type.</td>
</tr>
</tbody>
</table>
**Password Reset verifications (continued)**

<table>
<thead>
<tr>
<th>Verification Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Google Authenticator verification</td>
<td>Password Reset model that relies on auto-generated code numbers. You typically implement Google Authenticator verification as a self-service Password Reset model. When a user requests password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using Google Authenticator. The Password Reset Windows Application supports Google Authenticator verification. This verification is based on the <strong>Google Authenticator</strong> verification type.</td>
</tr>
<tr>
<td>Personal Data — Confirm Email Address</td>

</tr>
<tr>
<td>Personal Data — Enter User Name</td>
<td>Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the <strong>Personal Data</strong> verification type.</td>
</tr>
</tbody>
</table>

**Verifications included with the demo data**

The following demo data is based on the Mock verification type:
- Sample Mock verification #1
- #2

**Related information**

- Create a custom Password Reset verification type
- Create a custom Password Reset verification
- Create a Password Reset verification from an existing verification
Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

User experience

For an example of how a user might enroll for Personal data verification, see Users: Enroll in the Password Reset program using questions and answers.

Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

Personal data confirmation verifications

- **Personal data verification**: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.

- **Personal data confirmation verifications** allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the **label** parameter (the text that the end user should see) to *Email* (that is, label=Email).

2. Set the **column** parameter (the column in the table that holds the verification data) to *email* (that is, column=email).

**Note:** You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.
To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

**Personal data and personal data confirmation type verifications**

<table>
<thead>
<tr>
<th>Parameter Name</th>

**Related information**

Create a custom identification type for Password Reset

**SMS Code Verification type for Password Reset**

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity with the help of any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user then enters the code on the Password Reset Verification page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table.
- Update property settings for the Password Reset application.

⚠️ **Note:** The system allows only one instance of each SMS code parameter.

**SMS Code Verification type parameters**

<table>
<thead>
<tr>
<th>Parameter name</th>

<td>Number of minutes before the user can request another SMS code for verification.</td>
<td>integer (any positive integer)</td>
<td>2</td>
</tr>
<tr>
<td>max_per_day</td>
<td>Maximum number of codes sent for verification in one day.</td>
<td>integer (any positive integer)</td>
<td>10</td>
</tr>
</tbody>
</table>

### User experience

For information on how users enroll for SMS verification, see [Users: Enroll in the Password Reset program using SMS codes](#).

### Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using the ServiceNow NotifyNow application (via the Twilio SMS Messaging system). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

**Before you begin**

Role required: admin

**About this task**

NotifyNow requires a separate contract with Twilio.
Procedure
1. Enroll for a Twilio account and telephone number at https://www.twilio.com/
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

Results
No other configuration is required. Users who request password change or password reset receive SMS codes through NotifyNow.

Related information

Specify the number of required security questions
When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll. You can also specify the number to display when a user is verifying identity while resetting the password.

Before you begin
Role required: password_reset_admin or admin

Procedure
1. Navigate to Password Reset > Verifications and then open a verification that uses the Security Questions Verification Type.
2. Configure the parameters in the Password Reset Verification Parameters related list.

Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of questions that a user must provide answers to while enrolling for the Password Reset process. The value that you specify here overrides the setting of the Number of security questions required during enrollment property. See Configure Password Reset properties. <strong>Data Type</strong>: Positive integer that does not exceed the number of questions in the security questions list (Password Reset &gt; Security Questions).</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| num_reset      | Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order. 

The value that you specify here overrides the setting of the **Number of security questions required during the password reset request** property. See Configure Password Reset properties. 

**Data Type**: Positive integer that does not exceed the value of the num_enroll parameter 

**Default Value**: 3 |

3. Click **Update**.

**Related information**

Add a custom question to the Security Questions verification

**Configure your Password Reset process to auto-enroll users**

To simplify management, many organizations auto-enroll users in the Password Reset program. Every base-system verification type enables you to specify automatic enrollment for your process.

**Before you begin**

Role required: password_reset_admin or admin

**About this task**

To enable automatic enrollment, you configure settings for the verification type that your Password Reset process is based on.

**Procedure**

1. Navigate to **Password Reset > Extensions > Verification Types**.

2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in **Password Reset verifications**.

3. On the **Verification Types** page, specify the following settings:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification.</td>
</tr>
<tr>
<td>Note:</td>
<td>For automatic enrollment to work, the <strong>Enrollment check</strong> script must return true. This may require additional setup by the admin to ensure that the preconditions are met. For example, for the <strong>SMS Code</strong> verification type, records must be populated in particular tables.</td>
</tr>
<tr>
<td></td>
<td>If no script is specified when <strong>Automatic Enrollment</strong> is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users.</td>
</tr>
<tr>
<td>Note:</td>
<td>If <strong>Automatic enrollment</strong> is not selected, then you must provide an enrollment UI macro and enrollment processor script as described in Create a custom Password Reset verification type.</td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.

**Enable users to enroll for Password Reset**

To enable users to enroll for the Password Reset program, you specify a UI macro that takes the user through the enrollment process and a script that processes the enrollment data that the user entered. The base system includes a functioning macro and script.

**Before you begin**

Role required: password_reset_admin or admin

**About this task**

To enable users to enroll, you configure settings for the verification type that your Password Reset process is based on.
Procedure

1. Navigate to **Password Reset > Extensions > Verification Types**.

2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in **Password Reset verifications**.

3. On the **Verification Types** page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic enrollment</td>
<td>Clear the check box to disable automatic enrollment.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that takes the user through the enrollment process.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes enrollment data.</td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.

**Example: Enabling user enrollment**

This example verification type uses the `pwd_enroll_sms_ui` enrollment UI macro and the `PwdEnrollSMSProcessor` enrollment processor script.
A verification type must also define a verification UI macro and a corresponding verification processor script. The example uses the `pwd_verify_sms_ui` verification UI macro and the `PwdVerifySMSProcessor` verification processor script.

**Verification UI macro**

```
<xml version="1.0" encoding="utf-8" ?
<!DOCTYPE jelly PUBLIC "-//Jelly Team//DTD Jelly 1.0//EN" "http://jelly.sourceforge.net/dtd/v1.0.dtd">
  <jelly xmlns="jelly:core" xmlns="glide" xmlns:js="null" xmlns:gl="null">
    <script language="javascript">
      addLoadEvent(getVerificationInfo);

      function getVerificationInfo() {
        var ga = new GlideAjax('/saasPublic мероприятиеSMS');
        ga.addParam('sysparm_name', 'getSMSVerificationInfo');
        ga.addParam('sysparm_user_id', '${sysparm_sys_user_id}');

        // add CSRF token for AJAX handling.
        ga.addParam('sysparm_pwd_verify_token', findCSRFElement().value);
        ga.getXML(onGetVerificationInfoResponse, null);
      }

      function handleGetVerificationInfoResponse(response, args) {
        // Process the verification form request, and return whether the user was successfully verified
        // Process the verification form request, and return whether the user was successfully verified
      }
    </script>
  </jelly>
```

**Verification processor script**

```javascript
var PwdVerifySMSProcessor = Class.create();

PwdVerifySMSProcessor.prototype = {
  initialize: function() {
    // Initialization stuff here...
  },

  process: function() {
    // Process the verification form request, and return whether the user was successfully verified
    // Process the verification form request, and return whether the user was successfully verified
  }
};
```
Configure Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Before you begin
Role required: password_reset_admin

About this task
While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is 3 attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between 5 and 7.

Procedure
1. Navigate to Password Reset > Properties.
2. Update settings as needed and then click Save.

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:

- You can add the glide.pwd_reset.onetime.token.validity property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.

**Note:** The setting for the password_reset.request.expiry property (time period during which a user must perform the Password Reset process) takes precedence over the setting for glide.pwd_reset.onetime.token.validity.

Properties accessible from the System Properties [sys_properties] table:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the **Forgot password?** button. See the glide.security.password_reset.uri property in High Security Settings. Default: /$pwd_reset.do?sysparm_url=ss_default

- If glide.security.forgot_password.display.link is set to **true**, displays the **Forgot Password?** link on the login page.

### Send email to remind users to enroll for Password Reset

You can automatically send messages that remind users to enrolled in the Password Reset process. You specify the text of the message and can configure the messages to repeat at intervals.

**Before you begin**

Role required: password_reset_admin
About this task
The default email content is:
• Subject: Reminder: Enroll in the Password Reset program
• Body: Click here to enroll in the Password Reset program.

To customize the email, see Customize the Password Reset enrollment reminder email.

Procedure
1. Navigate to Password Reset > Processes and select your process.
2. Click the Enrollment Reminder tab, configure the following settings, and then click Update. (The tab appears only when the Password reset check box is selected.)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send reminder</td>
<td>Select the check box to send reminder emails to users (either all users or users in the specified groups, as you configured). Clear the check box to send no reminders.</td>
</tr>
<tr>
<td>Sender alias</td>
<td>Enter a non-functional email alias that should appear in both the To and From fields of the message. For example, <a href="mailto:do-not-reply@myCompany.com">do-not-reply@myCompany.com</a>. Users will not be able to respond to the alias. The alias is required by the email system to use the bcc field for all of the users who receive the message. The intent is that the users should not see the other addressees. Default: <a href="mailto:do-not-reply@ServiceNow.com">do-not-reply@ServiceNow.com</a></td>
</tr>
<tr>
<td>Send, Day, and Time</td>
<td>Specify a schedule of one message each month or one message each week.</td>
</tr>
<tr>
<td></td>
<td>• If you set Send to Monthly, then enter the day of the month and optionally the time of day when the message should be sent.</td>
</tr>
<tr>
<td></td>
<td>• If you set Send to Weekly, then enter the day of the week and optionally the time of day when the message should be sent. Default: Weekly message at 00:00 on Monday</td>
</tr>
<tr>
<td>Starting</td>
<td>Date and time to send the first message. Click the calendar button to specify the setting. Default: [Now]</td>
</tr>
</tbody>
</table>
Customize the Password Reset enrollment reminder email

The email message that reminds users to enroll for the Password Reset process is based on an email template. To customize the message, you can modify the default template or create a custom template.

Before you begin
Role required: password_reset_admin

About this task
The default email content is:

- Subject: Reminder: Enroll in the Password Reset program
- Body: Click here to enroll in the Password Reset program.

Procedure
1. To modify the email subject text:
   a. Navigate to System Policy > Email > Templates.
   b. Open the Password reset enrollment reminder template.
   c. Update the Subject field as needed.
   d. In the Message HTML text box, you can add code as needed, but do not modify the default text.

2. To modify the email body content:
   a. Navigate to System Notifications > Email > Notification Email Scripts.
   b. Open the pwd.enrollment_reminder script.
   c. Modify only the indicated portion of the script.
3. To create a custom email template:
   a. Make a copy of the **Password reset enrollment reminder** template and edit as described above.
   b. Navigate to **Password Reset > Properties** and enter the template name in the **Email template for enrollment reminder emails** field.

**Configure the required strength for passwords**

The password that a user defines must meet certain requirements — for example, it must contain at least 12 characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

**Before you begin**

Role required: password_reset_admin
About this task
The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating a password. The default requirements are:

- At least eight characters
- At least one uppercase and one lowercase letter
- At least one numeral

Note: In addition to configuring password strength requirements, you can configure several other settings for the credential store, as described in Configure the connection to a credential store for the Password Reset processes.

Procedure
1. Navigate to Password Reset > Credential Stores.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.</td>
</tr>
<tr>
<td></td>
<td>Note: The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>• Display the text box for the Strength rule script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>• Display the graphical Password Strength bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td></td>
<td>Note: The Password Reset Windows Application does not support Password Strength.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Strength rule      | This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings:  
• Selected for local ServiceNow credential stores  
• Not selected for other credential stores  
**Note:** To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field. |
|                    | **Note:** The Password Reset Windows Application does not support Password Strength.                                                                                                                         |

3. **Click Submit.**  
You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. **Navigate to** **Password Reset > Credential Stores** and then open the credential store.

5. **In the header bar, click Save and Test Connection.**  
A progress page displays the result of the test.

Specify lockout for failed login attempts

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

**Before you begin**  
Role required: admin
Procedure

Navigate to **System Policy > Script Actions** to view or activate the scripts.

**Note:** Starting with the Kingston release, following a zBoot, the script actions **SNC User Lockout Check with Auto Unlock** and **SNC User Clear** are activated.

To learn more about properties that affect failed login attempts, see in the Instance Security Hardening Settings.

<table>
<thead>
<tr>
<th>Script action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SNC User Lockout Check with Auto Unlock</strong></td>
<td>• Uses the value of the <code>glide.user.max_unlock_attempts</code> property to set the limit for failed login attempts.</td>
</tr>
<tr>
<td></td>
<td>• Unlocks the user account after the time period that is specified for the <code>glide.user.unlock_timeout_in_mins</code> property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.</td>
</tr>
<tr>
<td><strong>SNC User Lockout Check</strong></td>
<td>Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).</td>
</tr>
<tr>
<td><strong>SNC User Clear</strong></td>
<td>Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.</td>
</tr>
</tbody>
</table>

**What to do next**

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for **login.failed** in the **Name** field. You can view the attempted login name, date, and IP address logged for the attempt.

**Configure Google reCAPTCHA for the password reset process**

To use the Google reCAPTCHA service, instances that are running on a domain other than `service-now.com` require an API key pair from Google.
Before you begin
Role required: admin

About this task

• The procedure described in this topic is optional for instances that are running on the service-now.com domain.

• Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the procedure described in this topic. Instead, set the password_reset.captcha.google.enabled system property to false. This setting enables the CAPTCHA service that is provided with the base system.

• The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

Procedure

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha.

2. Set the following system properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>password_reset.captcha.google.enabled</td>
<td>Set to true. Type: string Default: true</td>
</tr>
<tr>
<td>google.captcha.site_key</td>
<td>Set to the site key that Google provided. Type: string Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td>google.captcha.secret</td>
<td>Set to the secret that Google provided. Type: password2</td>
</tr>
</tbody>
</table>
Settings on the Advanced tab of the Password Reset Processes form

UI macros and script includes can extend the basic functionality of a Password Reset process.

The Advanced tab appears when you are configuring a Password Reset process (Password Reset > Processes).

### Advanced tab

</tbody>
</table>

![Password Reset Customization](image)

### Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

### Legacy

Password Reset scripting is available to users with the `password_reset_admin` role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in [Password Reset extension script categories](#).
   
   Extension scripts are example script includes that enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

2. Follow the configuration steps described in [Configure your Password Reset process](#).

3. Select the new types that you created. You can customize the following components:
• Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset.

• Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type.

• Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset.

Advanced password reset configuration
You can customize the Password Reset and Password Change applications to meet your organization’s needs. See Password Reset and Password Change applications for more information. Also see Configure Password Reset properties for a list of properties that control several aspects of password reset.

Customize password reset processes and integrate third-party credential services
To customize password reset processes or to integrate them with third-party credential services such as Okta or Microsoft Azure AD, use IntegrationHub capabilities. Use Action Designer to create or modify actions like user unlock, change password, and get user status. Use Flow Designer to create or modify subflows that perform the actions.

Before you begin
Role required: admin, password_reset_admin, or password_reset_credential_manager

About this task
• The base system provides actions, subflows, and credential store types for the "Local ServiceNow Instance" identity provider.

• For Microsoft Active Directory, the subflows are available when you activate the Password Reset - Orchestration Add-on plugin.

• To use any other identity provider such as Okta, you must use IntegrationHub to create the required actions, subflows, and custom credential store types.

• For Microsoft Azure AD, the subflows are available when you activate the Password Reset - Microsoft Azure AD plugin.
**Procedure**

1. Use Action Designer to create password reset actions like user unlock, change password, and get user status. See *Action Designer* for more information.

2. Use Flow Designer to create the following subflows. Use the specified names, inputs, and outputs for the subflows. See *Subflows* for more information.

<table>
<thead>
<tr>
<th>Subflow name</th>
<th>Input</th>
<th>Input type</th>
<th>Output</th>

</tr>
</tbody>
</table>

3. For third party providers, create a credential store type.
   a. Select the **Use Flow** check box.
   b. Select the password reset subflows that you created for the provider. See Password Reset application for more information.

4. Create password reset credential store. Select the credential store type created for the provider.

5. Create a password reset process. Select the credential store created for the provider.

**Results**
The password reset mechanism for the required third-party application is set up.

**Add a custom question to the Security Questions verification**
To enroll for the 'Security Questions' verification, the user selects several questions and supplies confidential answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

**Before you begin**
Role required: password_reset_admin or admin

**About this task**
The base system provides a large set of default questions in all supported languages. Questions are presented to each user in the language that the user requested during login. Creating a custom English language question is a one-step process. To create a custom question in a non-English language, you can use either of the following options:

- Create a custom question in the non-English language.
- Create a custom English language question plus one or more translations of the question into other languages.
Procedure

1. Navigate to **Password Reset > Security Questions**.

   - **Note:** Each question in the list is presented to users when they enroll for the Password Reset process. The user selects each question to use by providing a confidential answer to the question.

2. Follow this procedure to create a custom question in a single language.

   - **Note:** To enter non-English question text, you must request the language when logging in.

   a. On the Password Reset Questions page, click **New**.

   b. Enter the text in the **Question (Translated field)** field and then click **Submit**. The question is added to the list of questions that is presented to users when they enroll. No additional steps are needed and you can skip the remaining steps.

3. Follow this procedure to create a custom question in English and the same question in one or more other languages:

   a. Click **New**, enter English language text in the **Question (Translated field)** field, and then click **Submit**.

   b. Create a record in the **sys_translated** table for the non-English language question. Details appear at and .

c. Repeat the process for each language that users might request.

**Add a custom header or footer to the user pages for Password Reset**

You can specify UI macros that add a header or footer to the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages).

**Before you begin**

Role required: password_reset_admin

**About this task**

![Diagram showing a custom header and footer]

**Procedure**

1. Configure a UI macro for the header or footer: Navigate to System UI > UI Macros, click New, and then enter a meaningful Name and Description.

2. In the XML text box, enter the macro text. The example macro adds the text "Trust Acme to Deliver!" to the footer of the page that users work in while resetting a password.
3. Select the **Active** check box and then click **Submit**.

4. Navigate to **Password Reset > Processes** and select the process to update.

5. On the **Advanced** tab, click ( ) for the **Header UI macro** or **Footer UI macro** and select the macro that you created.

6. Click **Save**.

7. Verify the appearance of the end-user pages.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the reset pages are Public Access</td>
<td>On the <strong>Password Reset Details</strong> tab, click the <strong>Public URL</strong>.</td>
</tr>
<tr>
<td>If the reset pages are not Public Access</td>
<td>Log in as an end user and request password reset.</td>
</tr>
</tbody>
</table>

**Create a Password Reset verification from an existing verification**

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

**Before you begin**

Role required: password_reset_admin
About this task

Note: The Password Reset Windows Application does not support custom verifications.

Procedure

1. Navigate to **Password Reset > Verifications** and select a verification.
2. If needed, modify the parameters on the **Password Reset Verification Parameters** tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click **Submit**.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Before you begin

Role required: password_reset_admin or admin
Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

Procedure

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when <strong>Automatic Enrollment</strong> is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If <strong>Automatic enrollment</strong> is not selected, then</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

<td><strong>Note:</strong> The Password Reset Windows Application does not support the Mock verification type.</td>
<td></td>
</tr>
</tbody>
</table>

### SMS Code

When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page.

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Create verifications based on one of the verification types in the base system.</td>
</tr>
</tbody>
</table>

---

### Mock

Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.

**Procedure**

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

### Field Description

Password Reset supports the following types. You can create multiple instances of any type.

- Personal Data Confirmation Verification
- Personal Data Verification
- Security Question Verification
- SMS Code Verification

The Password Reset Windows Application supports the following types:

- Personal Data Verification. You can create only a single instance.
- Security Question Verification. You can create multiple instances.
- SMS Code Verification. You can create only a single instance.

<table>
<thead>
<tr>
<th>Order</th>
<th>Position of the verification as it appears on the Enrollment form and Password Reset form.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset Verification Parameters</td>
<td>Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties. The available parameters are described separately for each verification type.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

### Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

**Before you begin**

Role required: password_reset_admin or admin
About this task

Procedure

1. Navigate to Password Reset > Extensions > Identification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.

</tbody>
</table>
Unlock user workflow

Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset.

5. Click Submit.

Password Reset script includes

The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke "extension scripts" that you customized.

The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>
Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- **params.processId**: The sys_id of the calling Password Reset process (table: [pwd_process]).
- **param request**: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.

- **params.userId**: The sys_id of the user trying to enroll (table: [sys_user]).
- **params.verificationId**: The sys_id of the verification used to enroll (table: [pwd_verification]).
- **params.enrollmentId**: The sys_id of this enrollment process.
- **request**: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`.

You should add the following information to the state of the enrollment process:

- `gs.getSession().putProperty("result.status",status)`: Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)`: An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)`: A custom value associated with the enrollment.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

**'User account lookup' script includes**

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.

- `params.userId`: The sys_id of the user being checked (table: `[sys_user]`).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

**'Password generator' script includes**

Password generator script includes take the following parameter, and return an auto-generated string password.

- `params.credentialStoreId`: The sys_id of the calling Password Reset process (table: `[pwd_process]`).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>

**'Verification processor' script includes**

If the user identity is verified, the verification processor script includes return `true`.

Verification processor script includes take the following parameters:
• `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).

• `params.userId`: The sys_id of the user to be verified (table: [sys_user]).

• `params.verificationId`: The sys_id of the verification (table: [pwd_verification]).

• `request`: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user's answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

• `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).

• `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

**Related information**

- Using scripted extension points in server-side scripts
- Using UI extension points in server-side UI macros
- Using client extension points in client-side UI scripting

**Example custom scripts for Password Reset**

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

**Perform a user account lookup and process an identification form**

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId = getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId = getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identificationExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
```

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Simple account lookup that returns the supplied user id</description>
    <name>SampleUserAccountLookupExtension</name>
    <script><![CDATA[var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
  category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

  /***
   * Returns the credential-store account id for a given user
   */
]]>
```
* @param params.userId  The sys-id of the user being checked (table: sys_user)
* @return               The credential-store account-id (string) for a given user

**********/

process: function(params) {
    return params.userId;
},

type: 'SampleUserAccountLookupExtension'

};]]></script>
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script.

```xml
<?xml version="1.0" encoding="UTF-8"?
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Script that processes an identification form. Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.</description>
        <name>SampleIdentificationProcessorExtension</name>
        <script><![CDATA[
            var SampleIdentificationProcessorExtension = Class.create();
            SampleIdentificationProcessorExtension.prototype = {
                category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

                //**********
                // Process the identification form request, and returns the user's sys_id. if user was not identified return null.
                //
                // * @param params.processId   The sys-id of the calling password-reset process (table: pwd_process)
                // * @param request            The form request object. fields in the form can be accessed using: request.getParameter('<element-id>')
                // * supported request parameters:
                //   * @return The sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.
                //**********
                processForm: function(params, request) {
                    return request.getParameter('sysparm_user_id') + '_' + params.processId;
                },

                type: 'SampleIdentificationProcessorExtension'
            };
        ]]>></script>
    </sys_script_include>
</record_update>
```
Use the **process** and **processForm** extensions

This example shows a script that uses two sample extensions, one **process** extension and one **processForm** extension.

```plaintext
// User account lookup
var lookupExtensionSysId = 
getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
```
// Form processor sample - Identification form processor
var identExtensionSysId = getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor'); var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter();// A real life case will inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script function
function getExtensionScriptSysId(scriptName, category) {
  var result;
  var now_GR = new GlideRecord('sys_script_include');
  gr.addQuery('name', scriptName);
  gr.addQuery('script', 'CONTAINS', 'category: ' + category + '\');
  gr.query();
  if (gr.next()) {
    result = gr.getValue('sys_id');
  }
  return result;
}

process function:

```xml
<record_update table="sys_script_include" action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description><name>SampleUserAccountLookupExtension</name><script><![CDATA[
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype={
    category:'password_reset.extension.user_account_lookup',// DO NOT REMOVE THIS LINE!
    
    //**********
    * Returns the credential-store account id for a given user
    * @param params.userId  The sys-id of the user being checked (table: sys_user)
    * @return  The credential-store account-id (string) for a given user
]]>
```

Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

⚠️ Note: To use a script include as an extension script, you must set it to Active status.

Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, category: 

'password_reset.extension.enrollment_check'. The ServiceNow platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in Password Reset extension scripts.
<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

**Related information**

**Password Reset extension scripts**

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.
Password Reset extension script includes

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

> Note: Create extension scripts only from the Password Reset Extension Script form (Password Reset > Extensions > New extension script). Extension scripts are special purpose script includes that are not created in the System Definition > Script Includes interface. To use a script include as an extension script, you must set it to Active status.

'Enrollment Check' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.userId - The sys_id of the user to check (table: sys_user).</td>
<td>(boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• params.verificationId - The sys_id of the verification to check (table: pwd_verification).</td>
<td>true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the Script field of an extension script named SampleEnrollmentCheck:

```javascript
var SampleEnrollmentCheck = Class.create();
SampleEnrollmentCheck.prototype = {
  category:'password_reset.extension.enrollment_check', // DO NOT REMOVE THIS LINE!

  process: function(params)

  /**********
  * Returns boolean telling whether the user is enrolled.
  * This sample returns true if both parameters are supplied, false otherwise.
  *
  * @param params.userId The sys-id of the user being checked (table: sys_user)
  * @param params.verificationId The sys-id of the verification being checked (table: pwd_verification)
  * @return Boolean indicating whether the user is enrolled into the specified verification
```
```
process:function (params) {return (params.userId && params.verificationId)?
    true:false; },
type:'SampleEnrollmentCheck'};
```

### 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td>process(params)</td>
<td>Parameters:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• params.userId - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;').</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>The following information should be added to the state of the enrollment process:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• gs.getSession().putProperty(&quot;result.status&quot;,status) - Whether the user was successfully enrolled.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• gs.getSession().putProperty(&quot;result.message&quot;,message) - An associated message to be returned to the user, such as a detailed error message.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• gs.getSession().putProperty(&quot;result.value&quot;,value) - A custom value associated with the enrollment.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the `Script` field of an extension script named `SampleEnrollmentProcessor`:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category: 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!
};
```
Process the enrollment form request, and return whether the user was successfully enrolled.

- @param params.userId The sys_id of the user trying to enroll (table: sys_user)
- @param params.verificationId The sys_id of the verification to be enrolled into (table: pwd_verification)
- @param params.enrollmentId The sys_id of this enrollment process
- @param request The form request object. Fields in the form can be accessed with
- @return boolean telling whether the user was successfully enrolled

The following information should be added to the state of the enrollment process
- gs.getSession().putProperty("result.status",status) - whether the user was successfully enrolled
- gs.getSession().putProperty("result.message",message) - an associated message to be returned
- to the UI. Eg. a detailed error message
- gs.getSession().putProperty("result.value",value) - custom value associated with the enrollment

processForm: function (params, request) {var verificationId = params.verificationId; var sampleInput = request.getParameter ('sample_input');

if (gs.nil (verificationId) || (sampleInput!= 'success')) { return false; }

var now_GR = new GlideRecord ('sys_user');
now_GR.get (params. userId);
now_GR.print ('User:' + now_GR.getValue ('user_name') + ' successfully enrolled'); return true; },

'Identification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script Include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>Parameters:</td>
</tr>
<tr>
<td>Script include category</td>
<td>Description</td>
<td>Method signature</td>
<td>Input fields</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------</td>
<td>------------------</td>
<td>--------------</td>
</tr>
</tbody>
</table>

- **params.processId** - The sys_id of the calling Password Reset process (table: pwd_process).

- **request** - The form request object. Fields in the form can be accessed with request.getParameter('<element-id>'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered in the form.

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the **Script** field of an extension script named `PwdIdentifyViaUsername`:

```javascript
var PwdIdentifyViaUsername = Class.create();
PwdIdentifyViaUsername.prototype = {
    initialize: function () {
    },

    **********
    * Process the identification form request, and returns the user's sys_id. If user was not identified return null.
    *
    * @param params.processId The sys_id of the calling Password Reset process (table: pwd_process)
    * @param request The form request object. fields in the form can be accessed with
    * request.getParameter('<element-id>')
    * Supported request parameters: sysparm_user_id - the user identifier value entered in the form
    * @return The sys_id of the user that corresponds to the requested input; if no user was found, null should be returned
    **********

    processForm: function (params, request) {
        var processId = params.processId;
        var sysparm_user_id = request.getParameter('sysparm_user_id');
        var now_GR = new GlideRecord('sys_user');
        now_GR.addQuery('user_name', sysparm_user_id);
        now_GR.query();
        if (!now_GR.next()) {
            return null;
        }
        return now_GR.sys_id;
    }

};
```
'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class.create();
SamplePasswordGenerator.prototype = {
    category: 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

    process: function (params) {
        var basePassword;

        var now_GR = new GlideRecord('pwd_cred_store');
        now_GR.addQuery('name', 'Local ServiceNow Instance');
        now_GR.query(); if (now_GR.next()) { if (params.credentialStoreId == now_GR.getValue('sys_id'))
            basePassword = "Password"; else
            basePassword = "Dorwssap"; } return this.generateSimple(basePassword);
    },
```

generateSimple:function (base) {var pwd = base; var numbers = '0123456789'; var length = 4;

    for (var i = 0, n = numbers.length; i < length; i++) {
        pwd += numbers.charAt(Math.floor(Math.random() * n) + 1); } return pwd;},
type:'SamplePasswordGenerator'};

'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Post Reset              | Performs additional operations after the completion of the Password Reset process. | process(params) | Parameters:
  • params.resetRequestId - The sys_id of the calling Password Reset process (table: pwd_process).
  • params.wfSuccess - A flag indicating whether the workflow completed successfully. True if, and only if, successful. | Returns: void |

This example adds failed reset requests to the system log. The code would be contained in the Script field for an extension script named PwdPostProcessor:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
    category: 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!

    initialize:function () { },

    /**********
    * Execute custom actions after the Password Reset process has completed.
    *
    * @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
```
* @param params.wfSuccess  A flag indicating if the workflow completed successfully.
*  True if (and only if) successful.
* @return no return value
**********/

process: function (params) {
  if (!params.wfSuccess) {
    now_GS.log ('[PwdPostProcessor.process] failure post processing for request [' +
    params.resetRequestId + ']');
  }

  // We could place actions here that we always want executed return;
},

type:'PwdPostProcessor' }

'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| User Account Lookup    | Gets the credential store account ID for a given user. | process(params) | Parameters:
  • params.userId - The sys_id of the user being checked (table: sys_user). | Returns: (String) the credential store account ID for the given user. |

This example gets the credential store account for a user. This code would be contained in the Script field of an extension script named SampleUserAccountLookupExtension:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = { 
  category:'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!

  **********
  * Returns the credential store account id for a given user.
  * This sample echoes the user_id supplied as the credential store account id for that user.
  *
  * @param params.userId The sys_id of the user being checked (table: sys_user)
  * @return The credential store account id (string) for a given user
  **********/
```
'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output</th>
</tr>
</thead>
</table>
| Verification Form Processor | Processes a verification form request and indicates whether the user was verified or not. | processForm(params, request) | Parameters:  
  - `params.resetRequestId` - The sys_id of the current Password Reset request (table: pwd_reset_request).  
  - `params.userId` - The sys_id of the user to be verified (table: sys_user).  
  - `params.verificationId` - The sys_id of the verification to be processed (table: pwd_verification).  
  - `request` - The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. | Returns: (boolean) true, if the user is verified; otherwise, false. |

This example shows a verification processor that returns true only if the user sent `ok` in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named `SampleVerificationFormProcessor`:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
    category:'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

    /**********
    * Process the verification form request, and return whether the user was successfully verified.
    * This is a sample verification processor returns true only if the user sent "ok" in the input field;
    * otherwise, it returns false.

```

- Implementing client extension points in custom code

Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition > Script Includes interface.

Before you begin
Role required: password_reset_admin or admin

Note: To use a script include as an extension script, you must set it to Active status.

Procedure

1. Navigate to Password Reset > Extensions > New extension script.

2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.

3. Select an Extension script category.
• Enrollment check
• Enrollment form processor
• Identification form processor
• Password generator
• User account lookup
• Verification form processor

4. Click **Submit**.
   A new instance of the script include for the selected category opens.

5. Edit the script by providing an implementation in the body of the process or `processForm` function, depending on the script category. You can add additional functions as long as the process or `processForm` function accepts the defined parameters and returns the expected results.

   **Note:** Do not edit or delete the `Category` declaration.

6. Click **Update**.

**Service desk: Reset a password or unlock a user account**

In a service desk-assisted Password Reset process, service desk agents with the `password_reset_service_desk` role reset user passwords—users cannot reset passwords.

**Before you begin**

Role required: `password_reset_admin` or `password_reset_service_desk`

Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).
Note:

• You must clear the Public access property to enable the service desk-assisted process. See Configure your Password Reset process.

• You can perform this activity on a mobile device.

Procedure

1. Navigate to Password Reset > Service Desk.

2. Select a user and the Password Reset process to use.

3. Click Verify Identity.

4. On the Verify Identity form, enter the answers that the user provides and then click Continue.

   If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.

5. Perform one of the following actions.

   • If the user is not locked, the form displays the Reset password button. Enter the new password and click Reset password.

   • If the user is locked, the form displays the Reset password and Unlock account buttons. You can enter a new password and click Reset password to reset the password and unlock the account. If the Enable account unlock check box is selected for the password process, you can unlock the account without resetting the password by clicking Unlock account.

6. To reset the password for a different user, you must first navigate out of the Service Desk and then navigate to Password Reset > Service Desk.

View user requests for password reset

The Reset Requests module displays the status of each password reset request from the Password Reset Request table [pwd_reset_request].

Before you begin

Role required: password_reset_admin or password_reset_service_desk

Procedure

Navigate to Password Reset > Reset Requests.
### Password Reset request fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>User whose password is being reset or changed.</td>
</tr>
<tr>
<td>Process</td>
<td>Process that implements this password reset request.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of Password Reset request:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Change Password</strong>: Request to change a password.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Help Desk</strong>: Request opened on behalf of the requesting user by a service desk agent.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Self Service</strong>: Requesting user opened the reset request.</td>
</tr>
<tr>
<td>Action Type</td>
<td>Corrective action performed during the Password Reset request.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Change Password</strong>: Update the credential store with the new password.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reset and Unlock Account</strong>: Generate a new password for the user and unlock the user account.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reset Password</strong>: Generate a new password for the user.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unlock Account</strong>: Unlock the user account.</td>
</tr>
<tr>
<td>Status</td>
<td>Result of the Password Reset request:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Completed With Failure</strong>: User completed all steps in the Password Reset process, but the password was not reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Completed With Success</strong>: User completed all steps in the Password Reset process and the password was reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Expired</strong>: User did not complete all steps in the Password Reset process in the time allowed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>In Progress</strong>: User is working through the steps to reset the password.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Max Number of Attempts</strong>: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Verified</strong>: User has completed the identity verification step and is verified. The user can move to the Password Reset step.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the request is open or closed.</td>
</tr>
<tr>
<td>Retry</td>
<td>Total number of times the user has attempted to complete a password reset request.</td>
</tr>
</tbody>
</table>
Unblock a Password Reset user

If a user is manually banned or is flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Before you begin
Role required: password_reset_admin or password_reset_service_desk

About this task
Blocking events include:
• The user exceeded the limit for the number of failed password attempts.
• The most recent password reset occurred before the wait time required until the next reset.
• The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked or locked users and the time interval required to generate the log event by setting the password_reset.activity_monitor.incident_threshold and password_reset.activity_monitor.incident_window properties.

Procedure
1. To view the list of blocked users, navigate to Password Reset > Blocked Users.
2. To unblock a self-service user:
   a. Navigate to Password Reset > Blocked Users.
   b. Select a user from the list.
   c. Select Delete on the Actions on selected rows list.
3. To unblock a user whose password was reset by a service desk agent:
   If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

   In contrast, service desk agents are allowed any number of retries. The max_attempt_reached limit does not apply and the Blocked status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.
If the user is not unblocked manually, then the system resets the blocked state only when the `max_attempt_window` time period elapses and the user tries to reset the password using self-service.

**a.** After you successfully reset a user password, navigate to **Password Reset > Blocked Users**.

**b.** Change the **Blocked** setting for the user from true to false.

**Related information**

Configure Password Reset properties

Password Reset and Password Change reports and logs

**Integrate Password Reset with a Service Portal widget**

You can enable a Password Reset process in a Service Portal page by adding a widget that opens the password reset pages inside the portal.

**Before you begin**

Role required: admin or sp_admin

**Procedure**

1. On the Service Portal Designer for the portal, create a new page — the page where the user will perform the password reset process.

2. On the **Widget** tab, under Layouts, select the 12-column layout and drop it onto the page.

3. Drop the **Pwd reset** widget into the 12-column layout and then save the page. The three tabs of the password reset process appear in the layout.

4. In the "Reset my password" link on the login page for the portal, specify the URL of the new password reset page. The URL must include one required parameter and may contain one optional parameter:
   - **Required**: `sysparm_show_custom_header_footer=false`. This parameter disables the native header and footer feature of the password reset page.
   - **Optional**: `sysparm_redirect_url=<portalName>?id=<pageName>`. This parameter specifies the page to go to after a successful reset — typically the login page for the portal.

For example, `https://server.acme.com/acme_community?id=password_reset_page&sysparm_show_custom_header_footer=false&sysparm_redirect_url=acme_community?id=communities_login`
Integrate Password Reset with a CMS integration

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Before you begin
Role required: content_admin

About this task
Each Password Reset process requires a separate CMS page.

Procedure
1. Navigate to Content Management > Specialty Content > iFrames and create an iFrame record.
2. Go to Content Management > Sites and create a site that has no login page.
3. Go to Content Management > Pages and create a password reset page.
4. Enter the name of the site that you created in the Content site field (Password Reset self-service in the example).
5. Right-click the form header and click Save.
6. Click the Edit Page related link and then click Add content.
7. In the Content Blocks section, select the iFrame that you created. Add more content as needed.
8. Click Update.
Password Reset and Password Change reports and logs

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.

The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

Password Reset Overview module

The Password Reset > Overview module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

### Password Reset reports

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>Status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: <strong>Reset Password</strong>, <strong>Unlock Account</strong>, or <strong>Reset and Unlock</strong>.</td>
</tr>
</tbody>
</table>
Password Reset reports (continued)

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset Top Users (last 30 days)</td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td>Password Reset Failed Verifications (last 7 days)</td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td>Password Reset Enrollment By Verification</td>
<td>Number of users by verification type who enrolled and did not enroll in the password reset program. A large number for users who did not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

Password Reset activity log

The activity log ([Password Reset > Activity Log](#)) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log [pwd_reset_activity] table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

Password Reset event log

The event log is a valuable resource for troubleshooting. On the Start menu, click Programs (or All Programs) > Administrative Tools > Event Viewer.

If the log does not appear, then, on the Windows Logs menu, click Applications > Service Logs.

You must have the admin role to view the log.
To write to the Password Reset event log

Edit the DebugFlag registry key entry at: Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}

By default, the key is set to 0. Set the key to 1 to write log entries to the ServiceNowPwdReset event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the Password Reset-Activity Monitor Lockout notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge.

Users with the password_reset_credential_manager or password_reset_admin role can follow this procedure to modify the purge interval:

1. On a non-production instance: Navigate to Automated Test Framework > Administration > Table Cleanup.
2. Modify the designated tables.
3. Test all changes on the non-production instance.
4. Modify the tables on your production instance and test.

Alternatively, contact ServiceNow Technical Support to modify the purge interval.

User guide: Resetting your password

Your experience might differ, but the self-service process is a typical process that you might follow to reset your password.

Example experience of the self-service process

Your experience might differ, but here:
1. On the login page, you click the **Forgot Password?** link to start the process.

2. The Identify page opens and you enter your identifying information (typically username or email address). The example includes the default Google reCAPTCHA security feature:

3. On the Verify page, you verify your identity by providing information that proves that you are who you say you are. The admin configured the method of verification and can require multiple verifications. In the example, the admin has configured the Security Question verification. You must answer a question to prove your identity. (Earlier, while enrolling for the password reset process, you selected the question and provided a secure private answer.) Other possible verifications require you to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.
4. The system checks the credential store to verify your identity and then displays, on the Reset page, the new password.

Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer end users the option to enroll for one or more methods of verifying identity when resetting the password. End users can enroll for most Password Reset programs on a mobile device.

End users might enroll for any combination of the following methods:
Verify your identity using security questions (QA verification)

- To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely.
- Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity. See

Verify your identity using an SMS code (SMS verification)

- To enroll, you authorize a device like a cellular phone for SMS verification.
- Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

Verify your identity using an Emailed code

- To enroll, you authorize one or more email addresses.
- Later, when you want to reset your password, the system sends a code number to the email address. You then enter the code on the web page to verify your identity.

Verify your identity using the Google Authenticator app

- You enroll on a computer that you normally use to access the instance (you use Google Authenticator to reset your password, but cannot use Google Authenticator to enroll for Password Reset Windows Application.). After you have enrolled, you load the Google Authenticator app on one or more devices and then authorize the devices for Google Authenticator verification.
- Later, when you want to reset your password, read the Google Authenticator code on your device and then enter the code on the web page to verify your identity.

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you
know. At another time, when you reset your password, your answers verify your identity. You can enroll on a mobile device.

**Before you begin**
Role required: none

**About this task**
The list of questions is presented in the language that you requested while logging in.

**Procedure**
1. Navigate to **Password Reset > Enroll** and then click the **QA Verification** tab.
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each **Question** field, select a question from the list and then enter the **Answer** field. Repeat the process until the required number of **Question** and **Answer** fields are filled in.
3. Click **Submit**.
4. **Optional:** Enroll for an extra identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using Google Authenticator
   - Users: Enroll in the Password Reset program using emailed codes

**Users: Enroll in the Password Reset program using SMS codes**
To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device. You can enroll on a mobile device.

**Before you begin**
Role required: none

**Procedure**
1. Navigate to **Password Reset > Enroll** and then click the **SMS Verification** tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).
2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click **Add Device** and
then follow the instructions. Provide a meaningful Name for each device. Repeat the process for as many devices as you need.

3. After you verify each device, select the Authorized check box for each device that you expect to use to change or reset your password.

❗ Note: You can deauthorize a device at any time by clearing the Authorized check box.

4. Click Submit.

5. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using Google Authenticator
   - Users: Enroll in the Password Reset program using emailed codes

**Users: Enroll in the Password Reset program using emailed codes**

To prove that you are who you say you are (verify your identity) while resetting your password, you enter a code that was sent to your email address. You can enroll for this program on a mobile device.

**Before you begin**
Role required: none

**About this task**
During this enrollment process, you add the email address, the system sends you a code so you can verify the address, and then you authorize the address to be used for the Password Reset process. By default, the system sends the code to the email address that is associated with your ServiceNow profile. You can send the code to additional email addresses.

**Procedure**

1. Navigate to Password Reset > Enroll and then click the Email Verification tab. If your organization requires you to enroll for the Email verification method, then the tab is marked with an asterisk (*). Email addresses that were added previously are listed on the tab.

2. Click Add Email, enter the Email address and a meaningful Email name to associate with the address and then click Add Email. Repeat the process for as many email addresses as you need.

3. On the Email Verification tab, for each email that should receive Password Reset codes, click Verify.
The system sends an email message with a code and then displays the **Verify the Email Address** pop-up.

4. On the **Verify the Email Address** pop-up, enter the code and click **Verify**. If this process fails, click **Send a New Code** to send a different code and try again.

5. After you verify each email address, select the **Authorized** check box for each address that you expect to use to change or reset your password.

   **Note:** To deauthorize an email address so that it does not receive Password Reset codes, clear the **Authorized** check box.

6. Click **Submit**.

7. **Optional:** Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using Google Authenticator

**Users: Enroll in the Password Reset program using Google Authenticator**

To prove that you are who you say you are (verify your identity) while resetting your password, you get a code number from Google Authenticator on your cell phone or mobile device and then enter the code on the Password Reset web page. If you already paired a device (for example, to log in to the ServiceNow instance), you can skip this enrollment process.

**Before you begin**

Role required: none

**About this task**

You cannot enroll for the Password Reset program on a mobile device.

**Procedure**

1. Navigate to **Password Reset > Enroll** and then click the **Google Authenticator Verification** tab.

   **Note:** If your organization requires you to enroll for the Google Authenticator verification method, then the tab is marked with an asterisk (*).

2. Download the Google Authenticator app to your device.

3. Open the app and then use the device to scan the QR code on the tab.
4. When the device generates a code, enter the code in the text box and then click **Pair Device**.

5. Click **Submit**.

6. **Optional:** If the system displays a success message, click **Submit**. If the system displays a failure message, enter the code again, click **Pair Device**, and then click **Submit**.

   When you submit the enrollment, the tab displays the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate New QR Code</td>
<td>Enables you to pair a device with a new code. This option is useful if you have a new device. Existing multi-factor authentication data is replaced with the new data.</td>
</tr>
<tr>
<td>Disable Multi-factor Authentication</td>
<td>Deletes existing multi-factor authentication data. The Google Authenticator verification is no longer available.</td>
</tr>
</tbody>
</table>

7. **Optional:** Enroll for an additional identity verification using any of the other methods that your organization offers. See:

   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using emailed codes

---

**Instructions for users: Reset your password on Windows systems**

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

**Before you begin**

Role required: none
Procedure

1. Start your computer or press **Ctrl+Alt+Delete** to go to the Windows login screen.

2. Click the **Forgot Password?** link. (Your administrator may configure different text for the link.)

3. On the **Identify** page, enter the requested information and then click **Next**.
4. On the **Verify** page, enter the requested information, and then click **Next**.

    **Note:** You might be given the option to choose the method used to verify your identity.

If your identity is verified, the **Reset** page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:

   - If your account is not locked, the page displays the **Reset Password** button. Enter and reenter the new password and then click **Reset Password**.
   - If your account is locked, the page displays the **Reset Password** and **Unlock Account** buttons.
     - You can enter a new password and click **Reset password** to reset the password and unlock the account.
     - If your administrator has selected **Enable account unlock** for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

### Process Automation Designer

ServiceNow® Process Automation Designer enables process owners to author cross-enterprise workflows and create a single, unified process. You can also use Process Automation Designer to provide end users with a simplified, task-oriented view of your process.

#### Process Automation Designer benefits

Process Automation Designer is a Now Platform® feature that enables you, as a business process owner, to organize Flow Designer content into unified and digitized cross-enterprise processes. With Process Automation Designer, you gain these benefits:

   - Connect multiple flows and actions into an end-to-end business workflow.
   - Reuse existing Flow Designer flows, subflows, or actions to automate process activities.
   - Organize process activities in a digitized task board interface.
   - Guide end users to complete a process in a task-oriented interface, such as a playbook.
   - Consolidate separate business processes across the organization.
   - Define a consistent record life cycle from creation to completion.
   - Pass data between the activities and stages of a business process.
• Specify the conditions and the order in which activities and stages run.
• Visualize and manage the activities and stages of your process.

Creating a well-designed process
The automated business processes that you design guide your end users and help them focus on the tasks and information that matter to them. A well-designed process can do these things:

• Start up, or trigger, automatically for the types of records that your end users care about
• Reuse activities from existing Flow Designer content
• Has well-defined lanes that end users can follow for a record
• Clearly show the next steps that end users must take to move through a record’s life cycle

Process Automation Designer content
Process Automation Designer has these components:

Processes
A process is a Now Platform® representation of a cross-enterprise business process for your organization. A process owner is responsible for creating and maintaining a process.

Triggers
A trigger specifies when to start running your process.

Lanes
A lane is a grouped sequence of activities in a process. A process owner creates a lane to specify a logical grouping of activities. A lane represents one stage in your overall business process.

Activities
An activity defines the Flow Designer content that powers the process’s automation. An activity can also specify the user-facing experience that the process produces when it runs.

For more information about how to use and navigate the Process Automation Designer user interface, see Exploring Process Automation Designer.

Getting started
Before you get started with Process Automation Designer, familiarize yourself with any features that your business uses to automate operations on the Now
Platform, such as Flow Designer, business rules, and workflows. Learning about these concepts can help you avoid creating any conflicting logic in your processes.

If you’re a process owner who wants to learn the basics of digitizing your business process, check out the following resources:

• Get started with ServiceNow® Process Automation
• Get started with processes
• Design your first automated process
• View your process executions

If you’re a ServiceNow Process Automation administrator who wants to set up and customize Process Automation Designer, check out the following resources:

• Triggers
• Process definitions
• Activity definitions

**Activate Process Automation Designer**

Activate Process Automation Designer to create processes for your subscribed applications.

Each application subscription entitles you to create processes for its associated tables.

• Application tables
• Custom tables that extend the application tables
• Custom tables authorized by the application subscription

You can activate Process Automation Designer for the application that you want your processes to run in by purchasing a subscription for the appropriate application. If you already have a subscription to your application but you still can’t create processes for your application’s tables, enable the appropriate plugin.

ℹ️ **Note:** The Process Automation Designer plugins you enable determine which tables are available for you to create processes.

See the following sections to learn how to activate Process Automation Designer for your application.
Activate Process Automation Designer for App Engine

Activate Process Automation Designer on your instance to create processes triggered by Now Platform® tables.

About this task
In order to create processes in Process Automation Designer that are triggered by Now Platform tables, you must purchase a subscription to the Now Platform App Engine.

To purchase this subscription, contact your ServiceNow account manager. Your account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps to enable the Process Automation Designer for App Engine [com.glide.pad.license] plugin:

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>this plugin to be enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

<table>
<thead>
<tr>
<th>Reason/Comments</th>
<th>Information that would be helpful for the ServiceNow personnel who are activating the plugin.</th>
</tr>
</thead>
</table>

5. Click **Submit**.

**Results**

You can create triggers in Process Automation Designer for **custom tables that you create**. Enabling the **Process Automation Designer for App Engine [com.glide.pad.license]** plugin lets you create processes for these tables and their **extensions**.

Activate Process Automation Designer for Customer Service Management (CSM)

Activate Process Automation Designer on your instance so that you can create processes triggered by CSM tables.

About this task

In order to create processes in Process Automation Designer that are triggered by CSM tables and custom tables that extend from them, you'll need to purchase a subscription to CSM.

Note: If you create a custom table such as My Table [x_my_table], you can create processes that trigger from it. However, you cannot create a process that triggers from a table belonging to another Process Automation Designer plugin.
To purchase this subscription, contact your ServiceNow account manager. Your account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps to enable the Playbooks for Customer Service Management [com.sn_csm_playbook] plugin:

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.
## Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>this plugin to be enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Results**

Enabling the **Playbooks for Customer Service Management [com.sn_csm_playbook]** plugin lets you create processes for these tables and their extensions:

- Account [customer_account]
- Case [sn_customerservice_case]
- Change Request [change_request]
- Consumer [csm_consumer]
- Contact [customer_contact]
- Escalation [sn_customerservice_escalation]
• Household [csm_household]
• Incident [incident]
• Interaction [interaction]
• Order [csm_order]
• Order Line Item [csm_order_line_item]
• Problem [problem]
• Request [sc_request]
• Service Organization [sn_customer_service_organization]
• Task [sn_customerservice_task]

⚠️ Note: If you create a custom table that extends a CSM table such as Case, you can create processes that trigger from it.

Activate Process Automation Designer for Field Service Management

Activate Process Automation Designer on your instance so that you can create processes triggered by tables.

About this task

In order to create processes in Process Automation Designer that are triggered by Field Service Management tables, you must purchase a subscription to Field Service Management.

To purchase this subscription, contact your ServiceNow account manager. Your account manager can arrange to have the plugin activated on your organization’s production and subproduction instances, generally within a few days.

If you don’t have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps to enable the Playbooks for Field Service Management [com.sn_fsm_playbook] plugin:

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>

Activate Process Automation Designer for IT Service Management (ITSM)

Activate Process Automation Designer on your instance so that you can create processes triggered by ITSM tables.

About this task
In order to create processes in Process Automation Designer that are triggered by ITSM tables and custom tables that extend from them, you'll need to purchase a subscription to ITSM.

To purchase this subscription, contact your ServiceNow account manager. Your account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps to enable the Process Automation Designer for ITSM [com.snc.itsm.playbook] plugin:

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Activate Plugin request form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>

<td>Target Instance</td>
</tr>
<tr>
<td>Plugin Name</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
</tr>
<tr>
<td>Reason/Comments</td>
</tr>
</tbody>
</table>

5. Click Submit.

Results
Enabling the Process Automation Designer for ITSM [com.snc.itsm.playbook] plugin lets you create processes for these tables and their extensions:
Getting started with Process Automation

Learn how Process Automation applications can help you use the Now Platform® to transform your manual business processes into digitized, automated workflows.

ServiceNow Process Automation applications help you digitize, visualize, and manage the cross-enterprise workflows for your business. Digitizing your business processes with Process Automation applications gives you these benefits:

- Management of process compliance
- Ownership of continual process improvement
- Collaboration across divisions and departments
- Visibility into process outcomes

Process Automation applications

The ServiceNow Process Automation applications that you can use to digitize your business processes into automated workflows on the Now Platform include:

**Flow Designer**

ServiceNow® Flow Designer enables process owners to use natural language to automate approvals, tasks, notifications, and record operations without having to code. You can use the Flow Designer design environment to author flows and actions and to manage flow executions.

**Process Automation Designer**

ServiceNow® Process Automation Designer enables process owners to author cross-enterprise workflows and create a single, unified process. You can also use Process Automation Designer to provide end users with a simplified, task-oriented view of your process.

Roles involved in Process Automation

Depending on the Process Automation application that you use, you may need to coordinate with other teams or individuals to ensure that your automated processes run smoothly. One possible way in which you could organize the roles for Process Automation applications is:
A developer uses Flow Designer to work on flows, actions, and activity definitions to automate individual pieces of a business process.

A process owner uses Process Automation Designer to organize the pieces of the business process into a digitized, cross-enterprise workflow.

A Workspace administrator uses Playbook Experience to work on Playbooks to configure the appropriate views of the business process for the right system users.

An agent, the end user in this case, uses Agent Workspace to work on the individual tasks within the business process. In this case, the end user of the business process interacts with a Playbook, which is a graphical view of the business process on the Now Platform.

Learn more about Process Automation
To find out more about how you can use Flow Designer and Process Automation Designer to digitize your business processes, try checking out these resources:

- Flow Designer fundamentals course
- Flow Designer
- Getting started with processes

Getting started with processes
Learn the basics of designing an automated process for your organization. Get an overview of how processes work on the Now Platform.

Processes
Processes are Now Platform representations of your manual cross-enterprise workflows. By creating a process record on the platform, you’re digitizing
these workflows. A process has two dimensions: the process definition and the associated process executions.

**Process definitions**

A *process definition* is where a process owner configures and organizes multiple instances of Flow Designer content into a coherent business process. A process definition consists of a trigger, a sequence of lanes, and a sequence of activities.

**Process executions**

A process execution is a single, runtime instance of a process definition.

**Designing a process**

When you design your business process in Process Automation Designer, you’re creating a process definition.

Each process definition consists of a trigger as well as lanes and activities. Triggers define the conditions that, when met, start running your process. Lanes and activities represent stages and individual steps in your overall business process. In the Process Automation Designer design environment, you can organize these lanes and processes into a sequence that reflects how your business process runs.

When you’re done creating your process definition, activate it so that it runs when triggered.

![Process Definition](image)

**What happens when a process runs**

When your activated process definition is triggered, the system creates a process execution, which represents a single, running instance of your process definition.
After you create the process execution, the system evaluates each activity within your process. The system iterates through each activity in your process until the final activity finishes running, which means that the process execution is completed. As each activity runs, automated record operations occur on the Now Platform.

If a Workspace administrator has set up a Playbook experience for your process, then your process execution renders as a Playbook. A Playbook is a visual representation of your process, which is associated with a record in a Workspace.

In summary, your process runs when:

1. The system creates a process execution.
2. Any configured Workspace Playbook for your process renders for agents.
3. Automated operations on records that are associated with your process execution occur on the Now Platform.

Learn more about processes
If you’re ready to start digitizing your business process with Process Automation Designer, try checking out these resources:

• Design your first automated process
• Create a process definition

Design an automated process
Transform an example manual business process into a well-designed, automated process that runs on the Now Platform®.
Before you begin

- Enable the Process Automation Designer for App Engine [com.glide.pad.license] plugin with a subscription to the Now Platform App Engine. For more information, see Activate Process Automation Designer.
- Follow the steps to Configure a Playbook user experience.
- Ensure that your current application is set to Global. For more information, see Application picker.
- Role required: admin or pd_admin

About this task

In the following procedure, you can step through an example of how to digitize a manual business process on the Now Platform using Process Automation Designer. In this example, you can use Process Automation Designer to standardize and automate how Service Desk agents handle chat interactions with VIP users.

The manual business process for this example consists of the following stages:

1. **Identify and Log:** A Service Desk agent learns of an issue that a VIP user is facing while chatting with the user in a messaging application. The Service Desk agent creates an interaction record to track this issue.

2. **Classify and Diagnose:** The Service Desk agent associates an incident record with the interaction and sets the incident’s priority to High. The agent then enters the Assigned To user for the incident.

3. **Communicate Work in Progress:** The assignee updates the incident record’s state to Work in Progress and emails the VIP user when progress is made on the incident.

4. **Resolve:** When the incident is resolved, the assignee emails the resolution information to the VIP user.

Procedure

1. Create a process named **Handle Interactions with VIPs.**

   b. In the main header, click **Create a new process.**

   c. On the form, fill in the fields.
### Field | Action
---|---
Label | Enter Handle Interactions with VIPs.
Description | Enter This process defines how Service Desk agents can handle interaction records that are created for VIP users.
Application | Select Global.

**d. Click Select a trigger.**

**e. Click the Define your own trigger conditions for when your process runs option.**

**f. From the list of trigger options, select Record Create.**

**g. Click Set your trigger conditions.**

**h. In the Table list, select Interaction [interaction].**

**i. Use the condition builder to add the following condition to your trigger:**

- ![Condition Example](https://via.placeholder.com/150)

**j. Click Go to Designer.**

The Process Automation Designer design environment appears.

### 2. Add a lane for each stage in your process.

**a. Click + Add new lane to add the first lane to your process.**

**b. In the lane properties panel's Label field, enter Classify and Diagnose.**

**Note:** Because the Identify and Log stage triggers this process, don't add a lane for that stage.

**c. In the Description field, enter Associate an incident with the interaction.**

**d. In the When to start field, leave Immediately selected, and then click Save.**
e. Click + Add new lane to add another lane to your process.

f. In the lane properties panel's Label field, enter Communicate Work in Progress.

g. In the Description field, enter Notify VIP of work in progress.

h. In the When to start field, leave After Previous selected, and then click Save.

i. Click + Add new lane to add the final lane to your process.

j. In the lane properties panel's Label field, enter Resolve.

k. In the Description field, enter Resolve incident and share resolution details.

l. In the When to start field, leave After Previous selected, and then click Save.

3. Add the Create incident from interaction activity to the Classify and Diagnose lane.

a. Under the Classify and Diagnose lane, click + Add an activity.

b. In the activity picker, select Common Activities, and then select Automated Create Record under Non-Interactive.

c. In the activity properties panel's Label field, enter Create incident from interaction.

d. In the When to start field, leave Immediately selected, and then click Save.

e. Click the Create incident from interaction activity card.

f. In the activity properties panel, click Configure activity.

g. On the Configure your activity screen, locate the Variables section under Inputs.

h. In the Table Name list, select Incident [incident].

i. From the Fields list, select Assigned To.

j. Next to the Assigned To field, select the data pill picker icon ( ).

k. Dot-walk to the Interaction record's Assigned To field by selecting Context > Input Record - interaction > Assigned To.

l. In the Fields list, select Impact and then select 2 - Moderate.

m. Under Fields, select Urgency and then select 1 - High.

n. In the Fields list, select Short Description.
o. Dot-walk to the Interaction record’s Short description field by selecting Context > Input Record - interaction > Short Description.

p. In the Fields list, select Caller.

q. Dot-walk to the Interaction record’s Opened for field by selecting Context > Input Record - interaction > Opened for.

r. In the Wait for user input field, leave No selected.

s. In the Fields to show after creation field, enter priority.

t. Click Update to finish updating the inputs for the activity.

The Create incident from interaction activity automatically maps the Assigned To and Short Description fields from the interaction record to the incident record when your process runs.

4. Add the Wait for assignee to update activity to the Communicate Work in Progress lane.

a. Under the Communicate Work in Progress lane, click + Add an activity.

b. In the activity picker, select Common Activities, and then select Wait For Condition under Interactive.

c. In the activity properties panel’s Label field, enter Wait for assignee to update.

d. In the When to start field, leave Immediately selected, and then click Save.

e. Click the Wait for assignee to update activity card.

f. In the activity properties panel, click Configure activity.

g. On the Configure your activity screen, locate the Variables section under Inputs.

h. Next to the Record field, select the data pill picker icon ( )

i. Dot-walk to the Create incident from interaction activity’s record output by selecting Activities > 1:1 - automated_create_record > Outputs > record.

j. In the Table list, select Incident [incident].
k. Use the condition builder to add the following condition to your activity:

• [Updated by][is][Activities > 1:1 - automated_create_record > Outputs > record > Assigned to].

l. Click Update to finish updating the inputs for the activity.

The Wait for assignee to update activity pauses the process until the Assigned To user for the Incident record updates the record.

5. Add the Send update to VIP activity to the Communicate Work in Progress lane.
   a. Under the Communicate Work in Progress lane, select + Add an activity.
   b. In the activity picker, select Common Activities, and then select Instruction under Default.
   c. In the activity properties panel's Label field, enter Send update to VIP.
   d. In the When to start field, leave After Previous selected, and then select Save.
   e. Click the Send update to VIP activity card.
   f. In the activity properties panel, select Configure activity.
   g. On the Configure your activity screen, locate the Variables section under Inputs.
   h. In the Message field, enter Notify the VIP user that work on their issue is in progress.
   i. Leave the Wait for user input field's value as Yes.
   j. Click Update to finish updating the inputs for the activity.
   The Send update to VIP activity prompts the agent to send an email to the VIP user when the assignee for the incident record makes an update.

6. Add the Wait for incident resolution activity to the Resolve lane.
   a. Under the Resolve lane, select + Add an activity.
   b. In the activity picker, select Common Activities, and then select Wait For Condition under Interactive.
   c. In the activity properties panel's Label field, enter Wait for incident resolution.
   d. In the When to start field, leave Immediately selected, and then click Save.
e. Click the **Wait for incident resolution** activity card.

f. In the activity properties panel, click **Configure activity**.

g. On the Configure your activity screen, locate the Variables section under Inputs.

h. Next to the **Record** field, select the data pill picker icon (🔧).

i. Dot-walk to the **Create incident from interaction** activity's **record** output by selecting **Activities > 1:1 - automated_create_record > Outputs > record**.

j. In the **Table** field, select **Incident [incident]**.

k. Use the **condition builder** to add the following condition to your activity:

   • [State][is][Resolved].

l. Select **Update** to finish updating the inputs for the activity.

The **Wait for incident resolution** activity pauses the process until the Incident’s state becomes **[Resolved]**.

7. Add the **Share resolution details with VIP** activity to the **Resolve** lane.

   a. Under the **Resolve** lane, select **+ Add an activity**.

   b. In the activity picker, select **Common Activities**, and then select **Instruction** under Default.

   c. In the activity properties panel's **Label** field, enter **Share resolution details with VIP**.

   d. In the **When to start** field, leave **After Previous** selected, and then click **Save**.

   e. Click the **Share resolution details with VIP** activity card.

   f. In the activity properties panel, click **Configure activity**.

   g. On the Configure your activity screen, locate the Variables section under Inputs.

   h. In the **Message** field, enter **Provide the Resolution Notes from the Incident record in an email to the VIP user**.

   i. Leave the **Wait for user input** field's value as **Yes**.

   j. Click **Update** to finish updating the inputs for the activity.
The **Share resolution details with VIP** activity prompts the agent to send the issue resolution details to the VIP user.

8. In the main header, click **Activate** so that your process runs when triggered.

9. View your activated process as a playbook in Workspace.

   a. Close the Process Automation Designer tab and navigate to **Workspace Experience > Agent Workspace Home**.

   b. In the side menu, click the lists icon (ಠ‿↼ಠ).

   c. In the **Lists** tab under Interactions, click **My Interactions**.

   d. In the form header, click **New**.

   e. On the form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select <strong>Chat</strong></td>
</tr>
<tr>
<td>Opened for</td>
<td>Select a VIP user.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Select a user that can make updates to Incident records.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter <em>Testing out the Handle Interactions with VIPs playbook.</em></td>
</tr>
</tbody>
</table>

   f. In the form header, click **Save**.

   g. In the Contextual side panel, click the playbook icon (ಠ‿↼ಠ).

**Results**

Your process appears in the Workspace Contextual side panel as a playbook. Here, Workspace agents can get a task-oriented view of the automated business process. Agents can step through the activities that you set up to see where the record is in the overall process.
Process Automation Designer architecture

Understand how Process Automation Designer works in the Now Platform® to automate cross-functional processes and consolidate them into task-oriented views for your end users.

Process Automation Designer consists of a design time environment that lets you produce a runtime view of a record’s life cycle. The design time environment is a space where process owners can create process definitions. Meanwhile, the runtime experience is where end users, such as Workspace agents, follow the process to complete records.

Design time environment

The Process Automation Designer design time environment consists of these components:

Process definitions

A process definition is where a process owner configures and organizes multiple instances of Flow Designer content into a coherent business process. A process definition consists of a trigger, a sequence of lanes, and a sequence of activities.

Trigger definitions

A trigger definition specifies the conditions that must be met to run a process definition. A user with the admin, pd_admin, or pd_trigger_author role typically creates and configures a trigger definition that process authors can use as a template. A trigger
definition specifies the record operation and table conditions that must be met to start running a process definition. A process owner typically selects a trigger template when creating a process definition.

**Trigger instances**

A *trigger instance* is produced when you select a trigger template. The trigger instance stores the conditions that a record must meet to start running the process.

**Lanes**

A *lane* is a logical grouping of activities in a process definition. A process owner creates a lane to group activities and specify the *start rule* for when the lane should start running. A lane represents one stage in your overall business process.

**Activity definitions**

An *activity definition* maps Flow Designer inputs and outputs to an activity instance. An activity definition contains:

- The *automation plan* to map the triggering input record data to action or flow inputs
- The *activity experience* to map action or flow outputs to a user-facing view of the process definition

A user with the admin, pd_admin, or pd_content_author roles typically specifies the automation plan and activity experience when creating an activity definition.

**Activity instances**

An *activity instance* is produced when you add an activity to a process definition. The activity instance stores the automation plan data mappings from the activity definition. You can change these data mappings when the default values do not fit your process. The process can specify the start rules for when the activity should start running.

**Start rules**

A *start rule* specifies when a lane or an activity starts running. A process owner can use start rules to specify what parts of a process run simultaneously and what parts run serially.

For more information about how to use and navigate the Process Automation Designer user interface, see Exploring Process Automation Designer.
Runtime experience

Process Automation Designer produces these runtime components:

**Process executions**

A process execution stores the details of running a process definition in a context record. You can use a process execution to troubleshoot and verify that process definitions run as expected.

**Activity executions**

An activity execution stores the details of running an activity instance in a context record. You can use an activity execution to troubleshoot and verify that process definitions run as expected.

**User-facing views**

A user-facing view is a user interface that displays the output or results of a process definition, such as a Playbook. A workspace administrator can specify a user-facing view as part of setting up a Playbook experience. See Set up a Playbook.

During runtime for a process definition, your instance:

1. Evaluates any conditions specified in the trigger definition and processes the trigger.
2. Processes the event and starts running the process definition in the background.
3. Builds the automation plans from each activity into an entire process plan.
4. Runs the process plan for your process definition.
5. Stores the process execution information in the Process Execution [sys_pd_context] table.
6. Supplies data for a user-facing view of your process execution.

Data security and HTML sanitization

Process Automation Designer protects against cross-site scripting and code injection by evaluating all string data for HTML markup. The system only preserves HTML markup that is present in its inclusion list. All other HTML markup is removed from string data.

The inclusion list supports these HTML elements and attributes, which cannot be modified.
### HTML inclusion list

Exploring Process Automation Designer

Get an overview of the Process Automation Designer landing page and design environment.

Process Automation Designer landing page

You can view the Process Automation Designer landing page by navigating to Process Automation > Process Automation Designer. The landing page displays a list view of process definitions that are available for you to view or edit. For more information on creating a process definition to add to this list, see Getting started with processes.
Process Automation Designer gives you a simple, interactive way to design digitized, automated processes for your business in a task board view. The Process Automation Designer design environment consists of the main header, activity design space, and configuration panel.

**Main header**

The main header displays information about the process definition that you're currently designing. In the main header, you can:

- Access the properties for your process definition. For more information, see [Process definition properties](#).
- Confirm your process definition's status and activation state, created or updated date and time, and application scope.
- Activate your process definition so that it runs when triggered. For more information, see [Process definition statuses and activation states](#).

**Activity design space**

Organize activities into lanes to design your process definition.

- An activity represents one step within your overall business process. An activity can automate operations on the Now Platform, such as creating or updating records, displaying record information, and running automated actions in the background.
- A lane is a set of activities that represents one stage within your business process.
For more information, see Process Automation Designer lanes and activities.

Properties panel

The properties panel lets you set various options for your process definition, activities, and lanes. In the properties panel, you can:

• Add or edit the name for your process definition, lane, or activity.
• Add or edit the description for your process definition, lane, or activity.
• Define the start rule for your lane or activity.
• Access the configuration options for your lane or activity.

Process Automation Designer system properties

Review the system properties for Process Automation Designer. You can configure these properties to control how the system handles Process Automation Designer events.

The system properties for Process Automation Designer provide advanced configuration options for how the system handles Process Automation Designer events. To set Process Automation Designer system properties, access the System Properties [sys_properties] table.

The following system properties relate to the Process Automation Designer configuration:
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.event_manager.process_automation.claim_limit</td>
<td>Number of Process Automation events that the event handler can process in a single transaction.</td>
</tr>
<tr>
<td>sn_agent_workspace.default_view_editable_tables</td>
<td>Default table views, as a comma-separated list, that you want to allow Workspace to render within a playbook card.</td>
</tr>
</tbody>
</table>

### Process definitions

Process definitions are Now Platform® representations of cross-enterprise processes for your organization. Create and activate a process definition to run your digitized business process on the Now Platform.

Each process definition that you design in Process Automation Designer has a trigger, a sequence of lanes, and a sequence of activities.

You can view your list of process definitions by navigating to Process Automation > Process Automation Designer. Clicking one of the process definitions in this list allows you to edit the process definition in Process Automation Designer. If there are no process definitions in this list, you can create a new one by clicking Create a new process. For more information on creating process definitions, see create a process definition.

### Process definition properties

After you create a process definition, you can access its properties by clicking Process properties in the Process Automation Designer main header. In the resulting Process properties screen, you can edit the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name of the process to display to users in Process Automation Designer and the Workspace Playbook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of what your process does.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions that must be met to run your process definition.</td>
</tr>
<tr>
<td>Run my trigger</td>
<td>Option that defines how many times your trigger can run for your process definition. Choices include:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• <strong>Once</strong>:</td>
<td>Triggers the process definition once for the life of the triggering input record.</td>
</tr>
<tr>
<td>• <strong>For each unique change</strong>:</td>
<td>Triggers the process definition for every unique update to a non-system field even if the flow is currently running.</td>
</tr>
</tbody>
</table>

**Note:** The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record's **State** field changes from **In Progress** to **On Hold**, the process definition runs. However, if the **State** field then changes back to **In Progress**, the process definition doesn’t run.

**Note:** Process definitions that have a trigger that runs **For each unique change** can produce recursions when run in a non-interactive session. When such processes make a change to the trigger record, the change meets the process definition’s trigger conditions and causes a recursion.

• **Only if not currently running**: Triggers the process definition for every unique change if a process execution is not currently running.

• **For every update**: Triggers the process definition every time the input record is updated, regardless of whether there has already been or there currently are any running process executions.
Run on extended
Option to trigger your process definition when record operations occur on tables that extend the input table. For example, if your selected table is the Task [task] table and you select this option, your process definition triggers when a Problem [problem] record is created or updated. For more information, see Process Automation Designer triggers.

Note: After you create a process definition, you can’t change the trigger’s input table or trigger type. For more information, see Process Automation Designer triggers.

Design considerations
Refer to these design considerations when working with process definitions:

Avoid duplicating business logic used in Flow Designer, Workflow, and business rules
Replace separate business logic such as business rules, flows, and workflows with a consolidated process definition. Make sure that you deactivate any external business logic you replace to avoid duplication of effort.

Ignore records added or updated by import and update sets
Record triggers ignore records added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table rather than an individual record.

Create a process definition
Enable process owners to configure and organize multiple instances of Flow Designer content into an automated business process on the Now Platform®.

Before you begin
• Activate Process Automation Designer for your appropriate application.
• Familiarize yourself with the tables and relationships that your application uses for the process that you want to create.
• Make sure to familiarize yourself with any features that your business uses to automate operations on the Now Platform, such as Flow Designer, business...
rules, and workflows. Learning about these concepts can help you avoid creating any conflicting logic in your processes.

- Learn how to get started with ServiceNow® Process Automation.
- Role required: admin or pd_admin

**Procedure**

2. In the landing page's main header, click **Create a new process**. The Basic process details screen appears.

3. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique, user-facing name for your process. This name appears in user-facing views of your process, such as a Workspace playbook.</td>
</tr>
<tr>
<td>Description</td>
<td>Optionally, enter some descriptive details about your process.</td>
</tr>
<tr>
<td>Application</td>
<td>Choose an application scope that you want your process to run in. Selecting <strong>Global</strong> lets your process run in any application scope. For more information, see <strong>Application scope</strong>.</td>
</tr>
</tbody>
</table>

4. Select **Select a trigger** to go on to the next step. The Select a trigger screen appears.

5. Select one of the following options:

   - **Define your own conditions for when your process runs**: If you want to create your own custom conditions for when your process should run, select this option, choose a trigger type, and then select **Set your trigger conditions**. On the next screen, select a **Table** to trigger your process and the **Conditions** that cause your process to run. Finally, you can choose to run your trigger on extended tables. When you’re done adding conditions to your trigger, click **Go to Designer**.

   - **Choose an existing trigger**: If you want to use a trigger that has all of the conditions you need for your process, select this option. Then, choose an existing trigger from the list and select **Go to Designer**. The Process Automation Designer design environment appears.
6. Click + Add new lane to add the first lane to your process. The lane properties panel appears.

7. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique name for your lane. This name appears in user-facing views of your process, such as a Workspace playbook.</td>
</tr>
<tr>
<td>Description</td>
<td>Optionally, enter some descriptive details about your lane.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>After the lane starts, the lane runs only if specific conditions are met.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choose when you want your lane to start running. Options include:</td>
</tr>
<tr>
<td></td>
<td>• After Previous: Your lane starts running as soon as all of the activities in the immediately preceding lane have a state of Skipped or Complete.</td>
</tr>
<tr>
<td></td>
<td>• Immediately: Your lane starts running as soon as your process definition is triggered. Your lane doesn't depend on the state of any preceding lanes.</td>
</tr>
<tr>
<td></td>
<td>• With Previous: Your lane starts running as soon as the immediately preceding lane starts running.</td>
</tr>
</tbody>
</table>

8. Click Save to finish adding the lane to your process. At any point while in the Process Automation Designer design environment, you can add more lanes to your process by clicking + Add new lane and then filling in the fields as described in the previous step.

9. Under your lane, click + Add an activity to add the first activity to your lane. The activity picker appears.

10. In the activity picker, search for an activity to add or select one from the list of Common Activities. To choose an activity for a custom application, first select the application and then select the activity from the resulting list within the picker.
Your selected activity appears under the lane, and the activity properties panel appears.

11. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique name for your activity. This name appears in user-facing views of your process, such as a Workspace playbook.</td>
</tr>
<tr>
<td>Description</td>
<td>Optionally, enter some descriptive details about your activity.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>After the activity starts, the activity runs only if specific conditions are met.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choose when you want your activity to start running. Options include:</td>
</tr>
<tr>
<td></td>
<td>• After Previous: Your activity starts running as soon as the immediately preceding activity has a state of Skipped or Complete.</td>
</tr>
<tr>
<td></td>
<td>• Immediately: Your activity starts running as soon as its lane starts running. Your activity doesn’t depend</td>
</tr>
<tr>
<td>Field</td>
<td>Action</td>
</tr>
<tr>
<td>-------</td>
<td>--------</td>
</tr>
<tr>
<td></td>
<td>on the state of any preceding activities.</td>
</tr>
<tr>
<td></td>
<td>• <strong>With Previous</strong>: Your activity starts running as soon as the immediately preceding activity starts running.</td>
</tr>
</tbody>
</table>

12. Click **Save** to finish adding the basic details for your activity. At any point while in the Process Automation Designer design environment, you can add more activities to a lane by clicking **+ Add an activity** under the lane, and then filling in the fields as described in the previous step.

13. Click the card for the activity that you just added. The activity properties panel appears.

14. In the properties panel, click **Configure activity**. The Configure your activity screen appears.

15. In the Variables section under Inputs, add the values for the activity's inputs. You can add static data to an input by entering text next to the label for the input. To add dynamic data to an activity input, click the data pill picker icon and navigate, or dot-walk, to the data pill whose dynamic value you want to use when your activity runs. You can select dynamic data from fields in the input record. If your activity has a start rule of **After Previous**, you can also select dynamic data from the outputs of other activities in your process. For more information on dot-walking to related fields and records on the Now Platform, see [selecting fields on related tables using dot-walking](#).
16. Click **Update** to finish updating your activity’s inputs.

17. Keep adding lanes and activities according to your manual business process. For an example of how to design an entire digitized process with Process Automation Designer, see **Design an automated process**.

18. After you’ve added all of the appropriate lanes and activities to your process, click **Activate** in the main header.

Activating your process publishes it so that it runs when triggered.

**Note:** If you make changes to your process definition after activating it, the system saves your changes but deactivates your process definition. You must click **Activate** again to publish any new changes to your process definition. For more information, see **Process definition statuses and activation states**.

**Results**

When your process definition’s trigger conditions are met, your process runs. As a result, the system creates a Process Execution record and renders any previously configured user-facing views of your process, such as a Workspace playbook. For an example of how to digitize a manual business process that renders as a playbook, see **Design an automated process**.
Test a process

Verify that your process works as expected by running the process with test trigger data. Identify and resolve all errors before activating your process.

Before you begin

- Set up an application in Guided Application Creator to store Process Automation Designer content.
- Create a process definition
- Role required: admin or pd_admin

About this task

Testing a process bypasses the normal process trigger to run it with the sample data you provide. Every test you run creates or changes records on your instance. To avoid unwanted record changes, test processes on a non-production instance that contains relevant demonstration data.

Procedure

   The Process Automation Designer landing page appears.

2. Select the process you want to test.
   The process details screen appears.

3. Select Test.
   The system displays the Test your process dialog. The contents of the dialog depend on the type of trigger record your process uses.
4. Select a process trigger record to use for testing.  
   The process uses this record as if it met your process trigger conditions.

5. Select Run Test.  
   The system runs the process using the record you selected as test data. When the test is complete, the system displays options to view process execution details and a playbook preview.

6. From Process execution details, select View for information about the process state, activities run, and log messages produced.  
   The system opens a Process Execution form in a new tab.

7. From Playbook preview, select a playbook experience type, and select View.  
   The system opens a sample playbook in a new tab.

8. Identify and resolve any errors in your process. Update and test your process until it is ready for release.

What to do next  
Publish your process to a production instance and activate it.

Process definition statuses and activation states  
View your process definition's status in the Process Automation Designer main header. This status indicates whether the process definition is active or inactive.

The Status label in the main header of Process Automation Designer describes the current state of configuration changes that were made to your process definition. The status also indicates whether your process definition is active or inactive. If your process definition is active, you can add it to an end user-facing view, such as a playbook.

Process definition statuses include:

Draft  
Your process definition is inactive. Any changes that you make are automatically saved to your draft process definition.

Published  
Your process definition is active, and you can add it to an end user-facing view, such as a playbook. Any changes that you make after clicking Activate are automatically saved. However, these changes aren't activated in your published process definition until you click Activate again.
Process definition status and activation state flow

Process executions

A process execution is a single, runtime instance of a process definition. Process execution records provide runtime information about process definitions, such as the current state and input record.

A process execution represents a runtime execution of your process definition. Each time a process definition is triggered, Process Automation Designer automatically creates a record in the Process Executions [sys_pd_context] table.

To access the records for an In Progress process execution, navigate to Process Automation > Process Automation Administration > Active Processes. Alternatively, you can see the process executions for all processes that ran today by navigating to Process Automation > Process Automation Administration > Today's Executions.

Fields

By default, each process execution record contains the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the process definition that triggered this process execution</td>
</tr>
<tr>
<td>Created</td>
<td>Date and time when the process definition triggered</td>
</tr>
<tr>
<td>Input Record</td>
<td>Table name and record number that triggered this process execution</td>
</tr>
<tr>
<td>State</td>
<td>Current status of the overall process execution. For more information, see Process execution states.</td>
</tr>
</tbody>
</table>

Process execution states

A process execution record can have one of the following states:
<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queued</td>
<td>The process definition triggered, but the system hasn’t started running the process execution yet.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The process definition triggered, and the process execution is currently running. One or more activities in the process definition have a state of Ready or In Progress.</td>
</tr>
<tr>
<td>Complete</td>
<td>The process definition triggered, and the process execution is done running. All activities in the process definition have a state of Skipped or Complete.</td>
</tr>
<tr>
<td>Error</td>
<td>The process definition triggered, but an activity has an Error state. Errors can occur when the action, subflow, or flow specified in the activity definition's automation plan fails to run.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>A user with the admin or pd_admin role explicitly canceled the process execution, and the execution has stopped running.</td>
</tr>
</tbody>
</table>

**Process Automation Designer triggers**

Process Automation Designer triggers specify when to start running your process.

In Process Automation Designer, triggers indicate when your process should start running. Each trigger has a type and conditions that, when met, start running your activated process definition.

You can choose a trigger when you create a process definition in Process Automation Designer. Start by adding a trigger, which defines the trigger type. Then, set conditions and other options to refine your trigger so that it fires in a way that makes sense for your business process. For more information, see [Create a process definition](#).

If there are no triggers that fit your use case, you can create your own trigger definition instead. For more information, see [Create a trigger definition](#).
How triggers work

1. User with the pd_admin or pd_trigger_owner role creates the new trigger.
2. Create a new process and add a trigger to your process.
3. Design and activate your process.
4. The trigger conditions are met.
5. Your process runs.

Trigger types

In your Trigger Definition [sys_pd_trigger_definition] record, you can choose a trigger type, which determines when your trigger fires. These trigger types represent record operations that can occur in the Now Platform®. The following trigger types are available in your instance by default:

**Record Created**

The process runs when a user creates a record anywhere in the Now Platform.

**Record Updated**

The process runs when a user updates an existing record anywhere in the Now Platform.

**Record Created or Updated**

The process runs when a user creates a record or updates an existing record anywhere in the Now Platform.

*Note:* Triggers only fire for record operations that are interactive, or made by users. Triggers don't fire for non-interactive record operations. For more information, see Non-interactive sessions.

Conditions to run

After you add a trigger to your process, you can then set conditions and other options that determine when and how your trigger fires.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Use the condition builder to create field conditions for when your process runs. See Condition builder.</td>
</tr>
<tr>
<td>Run my process</td>
<td>Choose an option for when your process runs. Options include:</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• <strong>Once</strong>:</td>
<td>Triggers the process definition once for the life of the triggering</td>
</tr>
<tr>
<td></td>
<td>input record.</td>
</tr>
<tr>
<td>• <strong>For each unique change</strong>:</td>
<td>Triggers the process definition for every unique update to a non-system</td>
</tr>
<tr>
<td></td>
<td>field even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>🔄 <strong>Note</strong>: The system stores a history of every change to a record</td>
</tr>
<tr>
<td></td>
<td>and determines whether the change is unique. For example, if an</td>
</tr>
<tr>
<td></td>
<td>incident record's <strong>State</strong> field changes from <strong>In Progress</strong> to</td>
</tr>
<tr>
<td></td>
<td><strong>On Hold</strong>, the process definition runs. However, if the <strong>State</strong></td>
</tr>
<tr>
<td></td>
<td>field then changes back to <strong>In Progress</strong>, the process definition</td>
</tr>
<tr>
<td></td>
<td>doesn't run.</td>
</tr>
<tr>
<td>• Only if not currently running:</td>
<td>Triggers the process definition for every unique change if a process</td>
</tr>
<tr>
<td></td>
<td>execution is not currently running.</td>
</tr>
<tr>
<td>• For every update:</td>
<td>Triggers the process definition every time the input record is</td>
</tr>
<tr>
<td></td>
<td>updated, regardless of whether there has already been or there</td>
</tr>
<tr>
<td></td>
<td>currently are any running process executions.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on extended</td>
<td>Select this option to trigger the process on tables that extend from your selected table. For example, if you enable this option and select the Configuration Item [cmdb_ci] table, your process runs when record operations occur on the Server [cmdb_ci_server], Computer [cmdb_ci_computer], and other extended tables. For more information, see Table extensions and classes.</td>
</tr>
</tbody>
</table>

**Design considerations**

Refer to these design considerations when working with triggers:

**Create unique filter conditions for record triggers on the same table**

To prevent processes from overwriting each other, create unique filter conditions for each process that runs on the same table. If multiple processes on the same table have the same filter, there is no way to know the order in which the processes will run.

**Avoid duplicating triggers used in Flow Designer flows**

Process Automation Designer triggers do not override Flow Designer triggers. For both applications, when the trigger conditions are met, the automated processes run.

**Ignore records added or updated by import and update sets**

Record triggers ignore records that were added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table instead of an individual record.

**Create a trigger definition**

Define the type of trigger that determines when to start running your process.

**Before you begin**

- Make sure to set your current application to the application that you want your process to run in. For more information, see Application picker.
- Role required: admin, pd_admin, or pd_trigger_author
Procedure

2. In the context header, click New.

3. On the Process Automation Designer Trigger Definition form, in the Label field, enter any label for your trigger definition. This label appears as a trigger option when you Create a process definition.

4. Next to the Trigger Type field, click the lookup using list icon (🔍).

5. In the Process Automation Designer Trigger Types list, select a trigger type to use for your trigger definition. Options include:
   - **Record Created**: The process runs when a user creates a record anywhere in the Now Platform.
   - **Record Updated**: The process runs when a user updates an existing record anywhere in the Now Platform.
   - **Record Created or Updated**: The process runs when a user creates a record or updates an existing record anywhere in the Now Platform.

   **Note**: Triggers only fire for record operations that are interactive, or made by users. Triggers don't fire for non-interactive record operations. For more information, see Non-interactive sessions.

6. Click Next to go on to the next step.

7. In the Table list, select a table whose record operations you want to trigger your process.

8. Under Condition, use the condition builder to add field conditions for when you want to trigger your process.

9. To trigger your process for tables that extend your selected table, select the Run On Extended check box. For more information, see .

10. Click Update to finish creating your trigger definition.
Results
Your trigger definition is added to the Trigger Definition [sys_pd_trigger_definition] table. You can now select your preset trigger when you Create a process definition.

Process Automation Designer lanes and activities
In Process Automation Designer, an activity represents one step in your overall business process. You can sequence many activities together in a lane, which represents one stage in your process.

Lanes
A lane represents one stage in your business process. Use lanes to sequence process activities in an order that makes sense for your cross-enterprise workflow. A lane is made up of many sequenced activities that are grouped in a logical way. In the Process Automation Designer design environment, you can add a lane to your process by clicking + Add new lane.

The visual separator for your lane depends on the start rule that you select. For example, choosing for Lane 3 to start immediately after Lane 2 causes the visual separator to appear as dotted lines. Choosing for Lane 4 to start with Lane 3 causes the visual separator to appear as a chevron. For more information, see Lane and activity properties.

Activities
In Process Automation Designer, an activity represents one step in your overall business process. In the system, an activity is one instance of an activity definition. For more information on activity instances and activity definitions, see the Process Automation Designer architecture and activity definitions.
Adding an activity to your process

In the Process Automation Designer design environment, you can add an activity to a lane by clicking **+ Add an activity**, which causes the activity picker to appear. In the activity picker, you can search for an activity to add or select one from the list of Common Activities. To choose an activity for a custom application, first select the application and then select the activity from the resulting list within the picker.

If there isn’t an activity that fits your use case, you can create your own activity definition to add to the activity picker. For more information, see **create an activity definition**.

Interactive and Non-Interactive activities

Activity categories include:

- **Interactive Activities**
  
  When an interactive activity runs, it prompts a user for input in a Workspace playbook experience. For more information, see **Interactive activities**.

- **Non-Interactive Activities**
  
  When a non-interactive activity runs, it runs entirely behind-the-scenes and requires no user input. For more information, see **Non-Interactive activities**.
Lane and activity properties

In the properties panel, you can add names, descriptions, and start rules to the lanes and activities in your process. Click the show or hide properties panel icon ( ) to show or hide the basic properties for your currently selected lane or activity. If you don’t select an activity or lane, your process definition’s properties appear in the configuration panel instead. The basic properties for each lane and activity include:

Label

You can enter a display name for your lane or activity. This name appears in any user-facing view of your process definition, such as a Workspace Playbook.

>Note: Keep your lane and activity names brief, as the system truncates long names.

Description

Optionally, enter a description for your activity or lane. This description only appears within Process Automation Designer and isn’t visible in user-facing views of your process definition.

Condition to run

Conditions that must be met to run an activity or lane. You can use data from prior activities to build conditions.

When to start

Select a start rule for when your activity or lane should start running, from the following options:

• **After Previous**: Your activity or lane starts running when the immediately preceding activity or lane has a state of Skipped or Complete.

• **Immediately**: Your activity starts running as soon as its lane starts running. Your lane starts running when your process definition is triggered. Your activity or lane doesn’t depend on the state of any preceding activities or lanes.

• **With Previous**: Your activity or lane starts running when the immediately preceding activity or lane starts running.
Activity inputs

Each activity has inputs that you can configure. Activity inputs are data that you provide so that the activity runs and performs its function appropriately. For example, the Instruction activity when a Message input, whose data displays a message within a Workspace Playbook card. You can view each activity's inputs by opening the properties panel for the activity and clicking Configure activity. On the Configure your activity screen, the activity's inputs appear in the Variables section under Inputs.
Creating static and dynamic values for activity inputs

You can add static data to an input by entering text next to the label for the input. To add dynamic data to an activity input, click the data pill picker icon ( cười ) and navigate, or dot-walk, to the data pill whose dynamic value you want to use when your activity runs. You can select dynamic data from fields in the input record. If your activity has a start rule of After Previous, you can also select dynamic data from the outputs of other activities in your process. For more information on dot-walking to related fields and records on the Now Platform, see selecting fields on related tables using dot-walking.
An example using static and dynamic data for the Message input

![Configure activity interface](image)

ℹ️ Note: You can dot-walk to fields in a Reference but not in a Document ID or Sys ID.

The inputs for interactive activities typically provide data that renders in a Playbook for a Workspace agent to interact with. The inputs for non-interactive activities can render in a Playbook but don’t require any user input in order to run. For more information, see Interactive activities and Non-Interactive activities.

Editing activity inputs and outputs
You can change the default inputs and outputs for an activity definition by selecting the Activity actions icon (:flexbox:) on an activity, and then selecting Edit subflow in Flow Designer or Edit action in Action Designer. For more information on how to work with the default inputs and outputs for activities in Process Automation Designer, see Create an action as an activity automation plan.

ℹ️ Note: You must have the appropriate user roles to access Flow Designer and Action Designer. For more information, see User access to Flow Designer.

Design considerations
Refer to these design considerations when working with lanes and activities:

Keep Now Platform state models in mind when designing your process
Some record types already have state models that describe their life cycle. Use any existing state model as a template for the design of your process. For more information, see State Management.

Create Task activity
Create a task record from previously gathered or generated data.

Roles and availability
- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

Inputs
Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
</tr>
</tbody>
</table>
### Input | Type | Description
--- | --- | ---
Immediately - the activity runs immediately without waiting for other activities

<table>
<thead>
<tr>
<th>Assigned To</th>
<th>Reference.User [sys_user]</th>
<th>User responsible for completing the task associated with the activity.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description</td>
<td>String</td>
<td>Summary of the task to complete.</td>
</tr>
<tr>
<td>Wait for user input</td>
<td>Choice</td>
<td>Option to pause the process until the end user manually completes or skips the activity.</td>
</tr>
</tbody>
</table>

### Advanced inputs
After configuring the required inputs for your activity, you can also choose to configure advanced inputs. On the Configure your activity screen, select **Advanced View** to display these advanced inputs. The advanced view also lets you access the Activity Experience section. In this section, you can set values for the activity's properties and components that render in user-facing views of your process. For more information, see [Activity experience](#).

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Group for this Process Step</td>
<td>Reference.Group [sys_user_group]</td>
<td>Assignment group allowed to perform this process activity.</td>
</tr>
<tr>
<td>Assigned to this Process Step</td>
<td>Reference.User [sys_user]</td>
<td>User allowed to perform this process activity.</td>
</tr>
<tr>
<td>Task Table</td>
<td>Table Name</td>
<td>Name of the task table extension in which you want to create a task.</td>
</tr>
<tr>
<td>Add Field</td>
<td>Template Value</td>
<td>Field values to assign when creating the task record.</td>
</tr>
</tbody>
</table>
### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields to show after creation</td>
<td>String</td>
<td>Comma-separated list of fields to display for a created record.</td>
</tr>
<tr>
<td>Wait for Task completion</td>
<td>True/False</td>
<td>Pause the process until the created Task record is complete.</td>
</tr>
</tbody>
</table>

### Outputs

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing new record.</td>
</tr>
<tr>
<td>Record</td>
<td>Reference.Task[task]</td>
<td>Reference to record created.</td>
</tr>
</tbody>
</table>

### Instruction activity

Display a simple message to guide end users through your process.

### Roles and availability

- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

### Inputs

Open the activity properties panel and configure your activity to add values for the following inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Input</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include • With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running • Immediately - the activity runs immediately without waiting for other activities</td>
</tr>
<tr>
<td>Message</td>
<td>String</td>
<td>Message text to display to end users.</td>
</tr>
<tr>
<td>Wait for user input</td>
<td>Choice</td>
<td>Option to pause the process until the end user manually completes or skips the activity.</td>
</tr>
</tbody>
</table>

### Outputs

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Reference to the record associated with the activity.</td>
</tr>
</tbody>
</table>
**Placeholder activity**
Display an activity card in Process Automation Designer to indicate what a future activity does.

**Roles and availability**
- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**
Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>Choice</td>
<td>Activities that you can select to replace the placeholder.</td>
</tr>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome. You can use this input to describe the activity needed to replace this placeholder.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity.</td>
</tr>
<tr>
<td>Input</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Immediately - the activity runs immediately without waiting for other activities</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Outputs**
This activity does not produce output.

**Design considerations**

**Add placeholders activities to skip activity configuration**

Process designers can use placeholder activities to communicate the intent of an activity or process without having to do any configuration. Process designers can defer configuration to another time or delegate the configuration to another user who may better understand the process data model.

**Edit placeholder activities to replace them with other activities**

Placeholder activities help process designers create process definitions, but do not produce any output or advance a process when run. Edit Placeholder activities when you are ready to replace them with another activity type and configure them.

**User Form activity**

Display a form in a user-facing view to collect input values for your process.

**Roles and availability**

• This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**

Open the activity properties panel and configure your activity to add values for the following inputs.
<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Immediately - the activity runs immediately without waiting for other activities</td>
</tr>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing activity or process data.</td>
</tr>
<tr>
<td>Record</td>
<td>Reference</td>
<td>Reference to the record you want to display.</td>
</tr>
<tr>
<td>Form View</td>
<td>String</td>
<td>Form view to use for data collection. If you don’t provide a form view, the system uses the default view.</td>
</tr>
</tbody>
</table>
## Advanced inputs
After configuring the required inputs for your activity, you can also choose to configure advanced inputs. On the Configure your activity screen, select Advanced View to display these advanced inputs. The advanced view also lets you access the Activity Experience section. In this section, you can set values for the activity's properties and components that render in user-facing views of your process. For more information, see Activity experience.

<table>
<thead>
<tr>
<th>Input</th>

### Outputs

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Name of the table associated with the activity.</td>
</tr>
<tr>
<td>Record</td>
<td>Reference.Task[task]</td>
<td>Reference to the record associated with the activity.</td>
</tr>
</tbody>
</table>

### Interactive activities

An interactive activity prompts a user for input in a Workspace playbook experience when your process runs.

An interactive activity requires user input and can’t proceed to completion without processing that user input. Agents can provide input for an interactive activity within an activity card for a Workspace Playbook. For example, if your activity requires a user to enter work notes for a record, you can configure the activity inputs to prompt a Workspace agent to add work notes information in the Playbook card.
To learn how to design a process with interactive activities, see design an automated process.

**Advanced Instruction activity**

Display detailed instructions to guide end users through your process.

**Roles and availability**

- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>Input</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>

<tbody>
<tr>
<td>Assignment Group</td>
<td>Reference.Group</td>
<td>Group responsible for completing the task</td>
</tr>
</tbody>
</table>
## Checklist Task activity

Pause the process and prompt the end user to complete all items in a task checklist.

## Roles and availability

- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

## Inputs

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
</tbody>
</table>

## Outputs

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Reference.Task [task]</td>
<td>Reference to the record associated with the activity.</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>Skip Assignment Group</td>
<td>Reference.Group [sys_user_group]</td>
<td>Group that is allowed to skip this activity when the Can Skip option is enabled.</td>
</tr>
<tr>
<td>Skip Assigned To</td>
<td>Reference.User [sys_user]</td>
<td>User that is allowed to skip this activity when the Can Skip option is enabled.</td>
</tr>
</tbody>
</table>

**Outputs**
These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist Task</td>
<td>Reference.Task [task]</td>
<td>Task record to update when this activity completes.</td>
</tr>
</tbody>
</table>

**Collect User Data activity**
Pause the process and prompt the end user to enter data for use later in the process.

**Roles and availability**
- This activity is available as a Process Automation Designer common activity.
  - Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**
Open the activity properties panel and configure your activity to add values for the following inputs.
<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>

<td>Choice</td>
<td>Option to pause the process until the end user manually completes or skips the activity.</td>
</tr>
</tbody>
</table>

**Outputs**

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Reference.Flow Data</td>
<td>Reference to record containing collected data.</td>
</tr>
</tbody>
</table>

**Create Record activity**

Pause the process and prompt the end user to create a record in a form view.

**Roles and availability**

- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**

Open the activity properties panel and configure your activity to add values for the following inputs.
<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>

<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Template Fields</td>
<td>Template Value</td>
<td>Field values to set during record creation.</td>
</tr>
</tbody>
</table>

**Note:** Many form views are not supported in Workspace.

### Outputs

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing new record.</td>
</tr>
<tr>
<td>Create Record View</td>
<td>String</td>
<td>Form view used for record creation.</td>
</tr>
<tr>
<td>Record Created</td>
<td>Sys ID</td>
<td>Unique identifier of the record that this activity created.</td>
</tr>
</tbody>
</table>

### Design considerations

**Create form views for activities that you want to render in a Workspace playbook**

Use a form view to display only the fields your users need to create a record. Your view should display required fields or those fields validated by other business logic. See View Management.

**Run non-interactive activities before interactive activities**

While a Create Record activity interactively gathers data from users, it prevents the process from starting any dependent activities. For example, a Create Record activity would prevent starting **After Previous** activities, which may be in other lanes. Where possible, design your processes to run non-interactive activities before interactive activities that could block them.

**Guided Decision activity**

Choose a decision tree from your Guided Decisions framework to step agents through how to proceed with a task.
Roles and availability

This activity is available with a subscription to Customer Service Management (CSM). For more information on how to enable this activity for use in Process Automation Designer, see Activate Process Automation Designer for Customer Service Management (CSM).

Inputs

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
</tr>
<tr>

<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for user input</td>
<td>Choice</td>
<td>Option to pause the process until the end user manually completes or skips the activity.</td>
</tr>
</tbody>
</table>

**Advanced inputs**

After configuring the required inputs for your activity, you can also choose to configure advanced inputs. On the Configure activity screen, select **Advanced View** to display these advanced inputs. The advanced view also lets you access the Activity Experience section. In this section, you can set values for the activity’s properties and components that render in user-facing views of your process. For more information, see **Activity experience**.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment Group</td>
<td>Reference.Group</td>
<td>Group responsible for completing the task associated with the activity.</td>
</tr>
<tr>
<td></td>
<td>[sys_user_group]</td>
<td></td>
</tr>
<tr>
<td>Assigned To</td>
<td>Reference.User</td>
<td>User responsible for completing the task associated with the activity.</td>
</tr>
<tr>
<td></td>
<td>[sys_user]</td>
<td></td>
</tr>
<tr>
<td>Fields to show after update</td>
<td>String</td>
<td>Comma-separated list of fields to display for an updated record.</td>
</tr>
</tbody>
</table>

**Outputs**

These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing updated record.</td>
</tr>
<tr>
<td>Record</td>
<td>Document ID</td>
<td>Reference to record updated.</td>
</tr>
</tbody>
</table>
Design considerations

Create form views for activities that you want to render in a Workspace playbook

Use a form view to display only the fields your users need to update a record. Your view should display required fields or those fields validated by other business logic. See View Management.

Run non-interactive activities before interactive activities

If an Update Record activity interactively gathers data from users, it prevents the process from starting any dependent activities. For example, an Update Record activity would prevent starting After Previous activities, which may be in other lanes. Where possible, design your processes to run non-interactive activities before interactive activities that could block them.

Wait For Condition activity

Pause the process until a record has field values that match a set of conditions.

Roles and availability

• This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

Inputs

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>Input</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Immediately - the activity runs immediately without waiting for other activities</td>
</tr>
<tr>
<td>Record</td>
<td>Reference</td>
<td>Reference to the record that pauses the process until conditions match.</td>
</tr>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing the record to update.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Template Value</td>
<td>Criteria that a record must meet for the process to continue.</td>
</tr>
</tbody>
</table>

**Advanced inputs**

After configuring the required inputs for your activity, you can also choose to configure advanced inputs. On the Configure your activity screen, select **Advanced View** to display these advanced inputs. The advanced view also lets you access the Activity Experience section. In this section, you can set values for the activity’s properties and components that render in user-facing views of your process. For more information, see **Activity experience**.
<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Date/Time</td>
<td>Amount of time to wait before the activity times out and its state is set to Skipped. This input requires setting the Enable timeout input.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Choice</td>
<td>Schedule used to compute duration values. This input requires setting the Enable timeout input.</td>
</tr>
</tbody>
</table>

**Outputs**

The Wait for Condition activity has no outputs.

**Non-Interactive activities**

A non-interactive activity runs entirely behind-the-scenes on the Now Platform® and doesn't require any user input.

A non-interactive activity is an entirely automated operation on the Now Platform which doesn't require any user input to proceed to completion. Non-interactive activities still render in a Workspace Playbook, but only display information to agents. Configure the activity inputs for an interactive activity so that the activity is a fully automated operation on the Now Platform.

When non-interactive activities run, they automatically proceed to completion or are skipped. For example, if your activity automatically updates the Assigned To user for a record, the Playbook card can display the newly updated Assigned To user's name to the Workspace agent, but the card's status is automatically set to Complete.
To learn how to design a process with non-interactive activities, see design an automated process.

**Automated Create Record activity**

Create a record without pausing the process to ask for user input. When the activity runs, it immediately creates the record and continues to the next activity in the process. The record must meet server-side validation rules such as data policies, business rules and dictionary-defined mandatory fields but ignores UI policies.

**Roles and availability**

• This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

**Inputs**

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>

<td>Table containing new record.</td>
</tr>
<tr>
<td>Record</td>
<td>Reference.Task [task]</td>
<td>Reference to record created.</td>
</tr>
</tbody>
</table>
Automated Send Email activity

Create an email from previously gathered or generated data without pausing the process to ask for user input. When the activity runs, it immediately sends the email and continues to the next activity in the process.

Roles and availability

• This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

Inputs

Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>

</tr>
</tbody>
</table>

Automated Update Record activity
Update a record without pausing the process to ask for user input. When the activity runs, it immediately updates the record and continues to the next activity in the process. The record must meet server-side validation rules such as data policies, business rules and dictionary-defined mandatory fields but ignores UI policies.

Roles and availability
- This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

Inputs
Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>Information to display about activity usage or outcome.</td>

<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing the record to update.</td>
</tr>
<tr>
<td>Fields</td>
<td>Template Value</td>
<td>Field values to change during record update.</td>
</tr>
</tbody>
</table>

**Outputs**
These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

<table>
<thead>
<tr>
<th>Output</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table Name</td>
<td>Table containing updated record.</td>
</tr>
<tr>
<td>Record</td>
<td>Reference,Task[task]</td>
<td>Reference to record updated.</td>
</tr>
</tbody>
</table>
Look Up Records activity
Find system records that match a set of conditions.

Roles and availability
• This activity is available as a Process Automation Designer common activity. Users with the admin, pd_admin, pd_author, or pd_content_author can add this activity to a process definition.

Inputs
Open the activity properties panel and configure your activity to add values for the following inputs.

<table>
<thead>
<tr>
<th>Input</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>String</td>
<td>Title to display as activity and playbook card.</td>
</tr>
<tr>

<td>String</td>
<td>Information to display about activity usage or outcome.</td>
</tr>
<tr>
<td>Condition to run</td>
<td>Condition Builder</td>
<td>Criteria that must be met to run the activity. You can use the output data from prior activities to build the conditions to run this activity.</td>
</tr>
<tr>
<td>When to start</td>
<td>Choice</td>
<td>Option to specify when the activity runs. Options include</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• With Previous - the activity runs at the same time as the previous activity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• After Previous - the activity only runs after the previous activity completes running</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Immediately - the activity runs</td>
</tr>
</tbody>
</table>
immediately without waiting for other activities

Table Name
Table whose records you want to look up

Condition Builder
Criteria that you want your list of records to meet.

Advanced inputs
After configuring the required inputs for your activity, you can also choose to configure advanced inputs. On the Configure your activity screen, select Advanced View to display these advanced inputs. The advanced view also lets you access the Activity Experience section. In this section, you can set values for the activity’s properties and components that render in user-facing views of your process. For more information, see Activity experience.

Order by
Field you want to use to sort a list of records.

Sort Type
Option to sort records alphabetically or reverse alphabetically.

Max Results
Maximum number of results to display to end users.

Outputs
These outputs can provide data to other activities in your process. You can access this data as activity inputs when you configure your activity:

Records
References to the records that meet your specified conditions

Count
Number of records found
Activity definitions

Activity definitions describe how the activities in your process definition get the data that they need when your process runs.

Activity definitions provide default configurations and values for your activities so that they can run properly when your process definition is triggered. Each activity definition contains some basic configuration details, as well as an automation plan and activity experience.

The Activity Definition [sys_pd_activity_definition] table lists the definitions for the activities that you can add to a process definition in Process Automation Designer. To access these activity definitions, navigate to Process Automation > Process Automation Administration > Activity Definitions.

Fields
Each activity definition record has these basic fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name of the activity to display to users in Process Automation Designer.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table whose records the activity can access as inputs. Typically, this table is either the Task [task] or Global [global] table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that the activity can run in.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Options include:</td>
</tr>
<tr>
<td></td>
<td>* All application scopes - Users can access this activity from any application scope.</td>
</tr>
<tr>
<td></td>
<td>* This application scope only - Users can access this activity from the application scope that you specify in the Application field only.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional description for the activity.</td>
</tr>
</tbody>
</table>

Automation plan
Each activity definition has an automation plan. The automation plan for an activity definition specifies:
• The Flow Designer flow or action, which drives the activity's automation
• The activity's inputs, which are the data that the activity needs to run your process

Activity designers can configure the visibility of each activity input.

**Include in standard modal**

Hides the input from the properties panel. Process designers can only see the input from the standard modal when they select the **Show advanced properties** option.

**Include in standard modal and configuration panel**

Displays the input in the properties panel. Process designers can also see the input from the standard modal when they select the **Show advanced properties** option.

**Admin visibility only**

Hides the input from users who do not have the admin or pd_admin roles.

**Activity experience**

Each activity also has an optional activity experience. The activity experience specifies an experience type, associated record, and details for what data to render in the activity's associated Workspace Playbook card. Activity experience configurations only apply to activities that you add to a process definition which has an associated Playbook user experience in a Workspace. For more information, see [Set up Playbook Experiences](#).

**Experience type**

An experience type defines the data, or properties, that describe how the activity renders as a Workspace Playbook card at runtime. For example, a Record experience type tells the system that the activity can display a title, tagline, description, footer, and service level agreement (SLA) information in the Playbook card when your activated process runs. For more information, see [Experience types](#).

**Associated record**

The associated record defines the record whose data can render within a Playbook card at runtime. The associated record is dynamic, which means that it changes frequently as the process progresses. Because of this dynamic nature, you may want to use the data pill picker (🔗) to map the associated record to output.
record data within the underlying subflow or action specified in the automation plan.

**Data to render in the Playbook card**

You can specify the data to render in the Playbook card in the sections under the Associated Record section. To add dynamic data to fields that render in this user-facing view, use the data pill picker next to a data field and navigate, or dot-walk, to the appropriate data pill. The data pill should point to data within the subflow or action specified in the activity definition's automation plan.

**Note:** An activity experience contains many sections where you can specify the data to appear within the Playbook card. These sections vary depending on the experience type that you select. For example, a Record experience type has Details, Form, Attachments, and Features sections, while a Knowledge experience type has Knowledge, Details, and Features sections. For more information, see [Experience types](#).

**Actions to render in the Playbook card**

You can specify the Playbook actions that you want to render in an activity's Playbook card using the Playbook Experience Action Assignment Map related list. A Playbook action displays as a button in the Playbook card's footer. Playbook actions can run server scripts, dispatch client actions, or render UI components. For more information, see [Custom Playbook actions](#).

To add a Playbook action to your activity definition, select **New** in the Playbook Experience Action Assignment Map related list. Then, choose a Playbook action from the Action Assignment list. Next, choose a Playbook user experience that you want the Playbook action to appear in from the Playbook Experience list, and then click **Submit**.

**Design considerations**

Refer to these design considerations when working with activity definitions:

**Avoid calling triggered Flow Designer flows in an activity’s automation plan**

To prevent unintentionally running a flow outside of Process Automation Designer, you can use only subflows or actions in activity automation plans. Alternatively, you can set the flow's trigger to only run if not already running. For more information, see [Flow trigger types](#).
Specify default input values in your activity definitions

Preconfiguring default input values for your activity definitions reduces the time and complexity needed for a process owner to create a process definition.

Create an action as an activity automation plan

Create an example action to configure and run as an activity from Process Automation Designer.

Before you begin

Role required:

- This task requires some knowledge of creating flows in the Flow Designer environment. For more information, see Flow Designer.
- This task requires some knowledge of server-side scripting. For more information, see Server-side scripting.
- admin

About this task

Each activity definition requires an automation plan to run Flow Designer content. The automation plan tells Process Automation Designer what input values to use when running an action or subflow. An automation plan can specify static default values or can prompt process owners to provide dynamic values when they add an activity to a process.

In this example, you create a reusable Flow Designer action to use as an activity’s automation plan. The action you create associates a Task [task] record with a parent record.

Procedure

2. In the main header, click + New > Action.
   The Action Properties screen appears.
3. In the Action Properties screen, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Associate Record with Parent.</td>
</tr>
<tr>
<td>Application</td>
<td>Leave Global selected.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Leave All application scopes selected.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.
   The Flow Designer design environment appears.

5. Under the Action Outline, click **Inputs**.

6. In the Action Input header, click **+ Create Input**, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter Record.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter record.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Reference.Task[task]</td>
</tr>
</tbody>
</table>

7. In the Action Input header, click **+ Create Input**, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter Parent Record.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter record.</td>
</tr>
<tr>
<td>Type</td>
<td>Select Reference.Task[task]</td>
</tr>
</tbody>
</table>

8. Click the add a new step icon (➕).
   The Select Step to add screen appears.

9. Under ServiceNow Data, select the **Update Record** step.
   The **Update Record** step appears in the Action Outline under Inputs.

10. In the **Record** field, click the data pill picker icon (🔍), and then dot-walk to **Inputs > Record**.

11. Under Field Values, click **+Add Field Value**, and then select **Parent** from the list.

12. Next to the **Parent** field, click the data pill picker icon (🔍), and then dot-walk to **Inputs > Parent Record**.

13. Under the Action Outline, click **Outputs**.

14. Under Action Output, click **+ Create Output**, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter Record.</td>
</tr>
<tr>
<td>Field</td>
<td>Action</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Enter record</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Reference.Task[task]</strong></td>
</tr>
</tbody>
</table>

**15.** In the Action Output header, click **+ Create Output**, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter <strong>Parent Record</strong></td>
</tr>
<tr>
<td>Name</td>
<td>Enter record</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Reference.Task[task]</strong></td>
</tr>
</tbody>
</table>

**16.** In the Action Output header, click **Exit Edit Mode**.

**17.** Next to the **Record** output’s Value column, click the data pill picker icon ( ), and then dot-walk to **Inputs > Record**

**18.** Next to the **Parent Record** output’s Value column, click the data pill picker icon ( ), and then dot-walk to **Inputs > Parent Record**.

**19.** In the main header, click **Save > Publish** to make your action available to add to an activity definition’s automation plan.

**Results**
You can now add your custom Flow Designer action to an automation plan for your custom activity definition.

**What to do next**
Add your custom action to an automation plan when you **Create an activity definition**.

**Create an activity definition**
Specify the action or subflow you want an activity to run. Configure the inputs you want process designers to set when adding the activity to a process. Select the experience you want end users to have when the activity runs.
Before you begin

- Create a Flow Designer subflow or action that you want to use as the automation plan for your activity. For example, see Create an action as an activity automation plan.
- Make sure to set your current application to the application that you want your activity to run in. For more information, see Application picker.
- Role required: admin, pd_admin, or pd_content_author

Procedure

1. To start creating a new activity definition, do one of the following:
   - Follow the steps to Create a process definition. Then in the Process Automation Designer activity design space, click Add an activity > Create a new activity.

   The Activity Definition form view appears.

2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique name for your activity. This name appears in the Process Automation Designer design environment as well as in any user-facing views of your process, such as a Workspace playbook.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table whose records the activity can access as inputs. When adding inputs to your activity in Process Automation Designer, you can dot-walk to dynamic record data from this table. See Dot-walking to data in related tables.</td>
</tr>
</tbody>
</table>

Note: The table specified for a process definition's triggering input record overrides the activity definition table at design time. See Process Automation Designer triggers.
<table>
<thead>
<tr>
<th>Field</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Optionally, enter some descriptive details about your activity.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Choose one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes - You can add this activity to a process definition in any application scope.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only - You can only add this activity to process definitions within the same application scope specified in the Application field.</td>
</tr>
</tbody>
</table>

3. Under the Automation Plan section next to the **Flow or Action** field, click the lookup documents using list icon (🔍). The Select the document screen appears.

4. In the Table Name list, select one of the following options:
   - To use a Flow Designer subflow to automate your activity, select **Flow**.
   - To use a Flow Designer action to automate your activity, select **Action Type**.

   **Note:** You can only use published actions or subflows for an activity definition’s automation plan.

5. Next to the **Document** field, click the lookup documents using list icon (🔍). The Flows or Action Types screen appears.

6. From the list, select the subflow or action that you want to use to automate your activity. Then, click **OK**.

7. From the list, select an experience type for the properties and components that you want your activity to use when it renders in a user-facing view of your process. For more information, see **Experience types**.

8. Click **Submit** to save and create your activity definition record. The Activity Definitions list view appears.

9. Under the **Label** column in the list, select your activity definition. The Activity Definition form view appears.

10. Select the Automation Plan section. The system displays the available variables for the action or subflow. Process Automation Designer displays a variable for each action or subflow input.
11. For each variable, configure the default value you want each variable to have.
   Leave a variable blank when you want a process designer to configure the value when adding the activity to a process.

12. For each variable, select where it is visible.

<table>
<thead>
<tr>
<th>Visibility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include in standard modal</td>
<td>Only displays the variable as an input from the Advanced properties modal.</td>
</tr>
<tr>
<td>Include in standard modal and configuration panel</td>
<td>Displays the variable as an input in the properties panel and the Advanced properties modal.</td>
</tr>
<tr>
<td>Admin visibility only</td>
<td>Only displays the variable as an input from the Advanced properties modal to users that have the admin or pd_admin roles.</td>
</tr>
</tbody>
</table>

Process designers can only set values for variables that they have access to.

13. Select the Activity Experience section.

14. For Experience Type field, select the lookup documents using list icon (🔍). The Activity Types list appears.

15. Under the Associated Record section, select values for the Associated table and Associated record fields.
   These values are typically Record and Table Name outputs for the Flow Designer subflow or action specified in your activity's automation plan. For example, you can click the data pill picker icon (🔍) next to the Associated record field and dot-walk to the Table Name output by selecting VL > My Activity > Outputs > Record.
   The system associates a record with your activity so that, when the activity runs, it knows which record's data to output.
16. If you want to set up the default activity data that renders in user-facing views of your process, enter the values for that data in the other sections under Activity Experience. The sections and fields that appear under Activity Experience vary depending on the experience type that you select. For more information, see Experience types.

17. Click **Update** to finish creating your activity definition.

**Results**
You can now select your custom activity from the activity picker in the Process Automation Designer design environment. Select the appropriate application scope for your activity to view it in the picker.
Experience types

An experience type describes what properties and components to use when an activity renders as a card in a Workspace playbook.

When creating an activity definition, you must select an experience type to associate your activity definition with. Process Automation Designer comes with the following experience types that are available in your instance by default:

- Approval
- Catalog Item
- Create Record
- Instructional
- Knowledge
- List
- Notification
- Record

Depending on the experience type that you choose, different sections and fields appear under the activity definition’s Activity Experience. These sections
and fields let you set up the activity data that renders in user-facing views of your process, such as a Workspace Playbook.

⚠️ **Note:** Each experience type also displays an Associated Record section. For more information on how to set up the Associated Record section for an activity definition, see [Create an activity definition](#).

**Approval**

If you choose the Approval experience type, the following sections appear in the Activity Experience section for your activity definition:

- **Record**
  - Displays the following fields:
    - Record fields

- **Details**
  - Displays the following fields:
    - Tagline
    - Icon
    - Title
    - Description
    - Footer

- **Form**
  - Displays the following fields:
    - Form View
    - Form fields

- **Attachments**
  - Displays the following fields:
    - Attachment source
    - Attachments read only

- **Features**
  - Displays the following fields:
    - Is Automated
Catalog Item
If you choose the Catalog Item experience type, the following sections appear in the Activity Experience section for your activity definition:

Service Catalog
Displays the following fields:
• Service Catalog Table
• Service Catalog Record

Details
Displays the following fields:
• Tagline
• Description
• Record fields
• Footer

Form
Displays the following fields:
• Form View
• Form fields

Attachments
Displays the following fields:
• Attachment source

Features
Displays the following fields:
• Show SLA
• Show Checklist
• Is Automated

Create Record
If you choose the Create Record experience type, the following sections appear in the Activity Experience section for your activity definition:

Details
Displays the following fields:
- Tagline
- Icon
- Title
- Description
- Pending State Title
- Pending State Description
- Record fields
- Footer

**Form**

Displays the following fields:
- Form View
- Form fields

**Attachments**

Displays the following fields:
- Attachment source
- Attachments read only

**Features**

Displays the following fields:
- Show SLA
- Show Checklist
- Is Automated

**Guided Decision**

ℹ️ **Note:** The Guided Decision experience type is available with a subscription to Customer Service Management (CSM). For more information on how to enable this activity for use in Process Automation Designer, see [Activate Process Automation Designer for Customer Service Management (CSM)](#).

If you choose the Guided Decision experience type, the following fields appear in the Activity Experience section for your activity definition:

- Decision Tree Execution
- Decision Tree
**Instructional**

If you choose the Instructional experience type, the following sections appear in the Activity Experience section for your activity definition:

**Details**

Displays the following fields:
- Tagline
- Icon
- Title
- Description
- Footer

**Features**

Displays the following fields:
- Is Automated

**Knowledge**

If you choose the Knowledge experience type, the following sections appear in the Activity Experience section for your activity definition:

**Knowledge**

Displays the following fields:
- Knowledge Table
- Knowledge Record

**Details**

Displays the following fields:
- Title
- Footer

**Features**

Displays the following fields:
- Is Automated

**List**

If you choose the List experience type, the following sections appear in the Activity Experience section for your activity definition:
Details
Displays the following fields:
• Tagline
• Icon
• Title
• UI View

List Details
Displays the following fields:
• List Title
• Record fields
• Max Columns

Table Details
Displays the following fields:
• Table
• Query
• Columns
• Row Count

Features
Displays the following fields:
• Is Automated

Notification
If you choose the Notification experience type, the following sections appear in the Activity Experience section for your activity definition:

Form
Displays the following fields:
• To
• Subject
• Body

Features
Displays the following fields:
  • Is Automated

**Record**
If you choose the Record experience type, the following sections appear in the Activity Experience section for your activity definition:

**Details**
Displays the following fields:
  • Tagline
  • Icon
  • Title
  • Description
  • Pending State Title
  • Pending State Description
  • Record fields
  • Footer

**Form**
Displays the following fields:
  • Form View
  • Form fields

**Attachments**
Displays the following fields:
  • Attachment source
  • Attachments read only

**Features**
Displays the following fields:
  • Show SLA
  • Show Checklist
  • Is Automated
Activity executions

Activity execution records provide runtime information about activities in a process definition, such as the activity’s current state and associated record.

An activity execution represents a runtime execution of your activity. Each time one of your process definitions triggers, Process Automation Designer automatically creates records for each activity that runs within the triggered process definition.

To access the activity execution records for an In Progress process execution, navigate to Process Automation > Process Automation Administration > Active Processes. Alternatively, you can see the activity executions for all processes that ran today by navigating to Process Automation > Process Automation Administration > Today’s Executions. Select a process execution record from the list. Then, you can view the associated activity execution records in the Activity Executions related list.

Fields

By default, each record in the Activity Executions related list contains the following fields:

<table>
<thead>
<tr>
<th>Activity Execution fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>Lane</td>
</tr>
<tr>
<td>State</td>
</tr>
<tr>
<td>Activity Type</td>
</tr>
<tr>
<td>Associated Record</td>
</tr>
<tr>
<td>Execution index</td>
</tr>
</tbody>
</table>

Activity execution states

Activity execution states indicate the status of an activity in a triggered process definition. Activities that render in a Workspace Playbook card can display this state to agents. An activity execution record can have one of the following states:
<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>The process definition triggered, but the activity execution is waiting on preceding activities to complete before it can start running.</td>
</tr>
<tr>
<td>Ready</td>
<td>The process definition triggered, and the activity will start running soon.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The process definition triggered, and the activity execution is running.</td>
</tr>
<tr>
<td>Complete</td>
<td>The process definition triggered, and the activity execution is done running.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The process definition triggered, but a user chose to skip this activity execution and move on to the next activity. Also, if the activity contains a condition that evaluates to false, the system skips the activity.</td>
</tr>
<tr>
<td>Error</td>
<td>The process definition triggered, but an error with the activity's automation plan or activity experience occurred. Errors can occur when the underlying action or subflow in the activity's automation plan fails to run.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>A user with the admin, flow_designer, or action_designer role explicitly canceled the underlying action or subflow in the activity's automation plan.</td>
</tr>
</tbody>
</table>

**Process Automation Designer roles**

Grant users one or more Process Automation Designer roles to enable them to create triggers, process definitions, and activity definitions.

System administrators can grant users access to Process Automation Designer by assigning delegated development permissions or directly assigning user roles. The following user roles are available for Process Automation Designer:
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pd_admin</td>
<td>Enables users to create, update, and delete trigger definitions. Also enables users to launch the Process Automation Designer environment to create, activate, edit, and delete process definitions, activity definitions, and trigger definitions.</td>
</tr>
<tr>
<td>pd_author</td>
<td>Enables users to launch the Process Automation Designer environment to create, activate, edit, and delete process definitions.</td>
</tr>
<tr>
<td>pd_content_author</td>
<td>Enables users to create, edit, and delete activity definitions and trigger definitions.</td>
</tr>
<tr>
<td>pd_trigger_author</td>
<td>Enables users to create, update, and delete trigger definitions.</td>
</tr>
<tr>
<td>pd_operator</td>
<td>Enables users to view process executions, activity executions, and execution logs only.</td>
</tr>
</tbody>
</table>

**Note:** Granting users Process Automation Designer roles does not automatically allow them to access the Flow Designer design environment. Granting users access to Flow Designer may be helpful when creating activity definitions. For more information on Flow Designer roles, see user access to Flow Designer.

**Domain separation and Process Automation Designer**

Process Automation Designer supports data separation. The domain value of the triggering input record determines the domain context. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Basic**
• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.

• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.

• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Process Automation Designer
The system domain separates Process Automation Designer content according to these rules:

**Process Automation Designer content runs from the domain it is triggered from**

Activities and process definitions run from the domain of the record or user who initiates them. For example, when a user from the child domain ACME triggers a process definition belonging to the parent domain TOP, the process definition runs in the context of the child domain ACME.

**Flow Designer content runs in the domain of the calling Process Automation Designer activity**

Whenever an activity definition calls an action or flow, the system runs the Flow Designer content in the same domain context as the triggering Process Automation Designer content. If the Flow Designer content has a matching domain-specific process override, then the system runs the override version instead. While Process Automation Designer does not support process overrides, it uses any process overrides defined within Flow Designer.

**Process Automation Designer configuration files are visible to all domain users**

Process Automation Designer configuration files are not domain separated. Any user with the appropriate roles can view all process definitions, trigger definitions, and activity definitions.

Domain separation for service providers

Remote tables

Connect the Now Platform to third-party sources, or to another instance, so that you can retrieve external data and optionally cache it in the memory. You can view external data in lists or forms and process it with standard Glide scripts. You can also group, sort, aggregate, and filter the data just like you would for standard internal tables.

Remote table components

Use the following components to build an external data framework:

Remote tables

You create remote tables to describe the schema for the data that you want to retrieve from an external source.

The table definition is in the Now Platform, but its rows, or external records, live in the memory. You create a remote table the same way that you would create a standard internal table. You define columns and controls and designate application access for it just like you would do for an internal table. Unlike an internal table, a remote table does not get its records from the Now Platform database. It gets its records from running an associated script against an external data source.

To learn more about creating remote tables, see Create a remote table.

Script definitions

You create and associate a script definition with a remote table. The external data that you’ve retrieved using the script can be cached in the memory. You can also designate how this data is cached and how long the data is cached in the memory. Every time that you refresh a list that contains the external data from a remote table, the associated script runs again.

To learn more about script definitions and how to associate them with a remote table, see Create a script definition for a remote table.

How remote tables work

By using a remote table, you can retrieve the data from external sources or from another instance with REST or SOAP services. The external data lives in the
memory in read-only mode, which makes the data temporary, or transient, within the Now Platform. You can then view and manipulate the external data without importing or storing it.

You view the external data in lists or forms in the same way that you view internally stored data. You can manipulate this data by using standard Glide records, business rules, remote APIs, scripting, table reference fields, services, and development tools in the Now Platform.

**Important:** All data that is retrieved from the external source lives in the memory, so make sure that your data set is small. To minimize query times, don’t add more than 1000 rows to a remote table.

### External data life cycle within the Now Platform

The data that you retrieve from an external source has a finite duration, or life cycle, within the Now Platform.

- When you run a script that is associated with a remote table, the retrieved data lives in the memory for as long as the list or form appears. After you close the list or form, that external data is purged from the memory. The next time that you use or views the external data in this remote table, the memory is repopulated from the external system.

- However, if you have defined caching parameters for the script, the external data remains cached in the memory for the specified caching duration.

  For example, if you designate that the external data should be cached for 300 seconds, it remains cached in the memory for 5 minutes. After that time expires, the cached data is purged from the memory. The next time that you use or views the external data in this remote table, the cache is refreshed from the external system.

### Practical applications for remote tables

Set up and use remote tables in your enterprise when:

- You want to fetch external data for temporary use without storing it in the Now Platform. For example, you can create a remote table that fetches weather-related data that appears on a homepage when a user logs in. You would then create an associated script definition that retrieves this data from a third-party weather source that is based on the user’s location.

- You want to retrieve customer details that are stored in an external Customer Relationship Management (CRM) application for viewing in Customer Service Management functions such as Agent Workspace.
Note: To learn more about data retrieval for Customer Service Management, see Third-party data integration for CSM.

• You want to retrieve and view personnel data from Human Capital Management (HCM) applications such as Workday or SAP SuccessFactors for use in HR Service Delivery functions.

Post-filtering and sorting
When you run a remote table script, it applies post-filtering and sorting query conditions after it adds rows to a table. These applied conditions support any other required queries that the script does not handle. When you apply post-filtering and sorting, the remote table queries work like standard internal table queries.

When you create remote table scripts, you generally handle the most frequent and expansive queries in the script. Post-filtering queries and sorting can take a long time and may adversely affect how your instance performs. Use a small data set instead so that it doesn’t take much time to do post-filtering and sorting.

Based on your use cases, determine if you should try a narrower query in the external call or a more expansive query. Because the internal filtering and sorting can be expensive to run on large result sets, use a narrower query when the data doesn’t require extra filtering. Use a more expansive query when a more general query would return a small result set and would require extra filtering and sorting.

Differences between remote tables and the IntegrationHub
Choose whether to use a remote table or IntegrationHub to process external data.

• When you want to temporarily cache external data, use remote tables.

• If you want more advanced importing and transformation options, including Flow Designer, or if you want to develop custom integrations, use the IntegrationHub.

Note: If you create a remote table that uses the data from an external source that is outside of the Now Platform, you must have an IntegrationHub subscription entitlement. To learn more about the IntegrationHub, see IntegrationHub.

Activate the remote tables plugin
If you have the admin role, you can activate the Remote Tables plugin (com.glide.script.vtable). This plugin includes demo data and activates related plugins if they are not already active.
Before you begin
Role required: admin

About this task
Remote Tables activates these related plugins if they are not already active.

Plugins for Remote Tables

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Tables [com.glide.script.vtable]</td>
<td>Supports remote tables and associated script definitions that can be used to retrieve and optionally cache data from external sources.</td>
</tr>
<tr>
<td>Transformation Service [com.glide.transform]</td>
<td>Supports use of Transform APIs that are associated with the remote tables.</td>
</tr>
</tbody>
</table>

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Related information

Create a remote table
Create a remote table so that you can see the data that you retrieved from an external source.

Before you begin
Role required: admin
About this task
When you designate a table as a remote table, keep the following points in mind:

• You can create a remote table using this form, or by using the standard Create Tables form that you access from System Definition > Tables.

  Note: To learn more about creating tables in an instance, see Create a table.

• Before you create a remote table, you must have a good understanding of external data sources.

  For example, if you want to retrieve CRM data for use in Customer Service Management, you must understand how the data is structured in the external CRM source.

• Unlike standard internal tables, you can’t extend a remote table from another table.

• A remote table needs an external primary key to relate its temporary data to the data that is stored in the external source. When you designate a table as remote, only a sys_id field is auto-generated and appears in the Columns section, which it uses as its primary key for use in Glide records. All external table primary key values are converted to string values. CRUD (Create, Read, Update, Delete) fields are not generated for a remote table, as they are for standard internal tables.

Procedure
1. Navigate to System Definition > Remote Tables > Tables.
2. Click New.
3. On the form, fill in the fields.

  Note: You create a remote table in the same manner as a normal table, but designate it as a remote table. The following controls differ in how they operate and what you enter into them when you create a remote table:

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Table name, which is automatically populated based on the table label and a prefix as follows:</td>
</tr>
</tbody>
</table>
Control | Description
--- | ---
• For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string `st_` to indicate that it is remote and part of an application.
• For a remote table in the global application, the name is prefixed with the string `u_st_`.
You can’t modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).

Extends Table | Option that is not available if you select the Remote Table option to designate that this table is remote. It no longer appears because you can’t extend remote tables from other tables.

Remote Table | Option to designate this table as a remote table. A remote table is a table to which you can associate a script definition for retrieval of data from an external data source. Unlike a standard internal table, the data does not come from records in the current instance.

ℹ️ Note: To learn more about remote tables, see:
- Remote tables
- Create a remote table

4. In the Columns section, use the Table Columns embedded list to add columns to the remote table like you do when you create columns for a standard internal table.

5. In the Controls section, define additional remote table options like you do when you define additional table options for a normal table.

6. In the Application Access section, define the scope protection for the remote table like you do when you define additional table options for a normal table. For more information, see Application access settings.

7. Click Submit.

Results
A remote table is created in the instance.

Create a script definition for a remote table
Define and associate a script with a remote table so that you can retrieve data from an external source with it. The Now Platform retrieves and caches the data for the remote table by running the script against an external data source so
you can view or modify it. You can also designate how this external data is cached and how long the data is cached in the memory until the script must run again.

Before you begin
Role required: admin

About this task
You create script definitions for remote tables like you do for other scripts. To learn more about entering, modifying, and debugging scripts, see JavaScript syntax editor.

Procedure
1. Navigate to **System Definition > Remote Tables > Definition**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the script that you are creating to associate with the selected remote table.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the remote table that you want to associate the script that you are creating.</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string <code>st_</code> to indicate that it is remote and part of an application.</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in the global application, the name is prefixed with the string <code>u_st_</code>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that is associated with this remote table. If you are working on an application or are creating a remote table from an application record, the field defaults to that application. Otherwise, the field defaults to <code>Global</code>. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the script that you are associating with the remote table. You can have multiple inactive script definitions for a remote table, but can only have one active script definition.</td>
</tr>
</tbody>
</table>
Control | Description
--- | ---
Advanced | Option to access the Caching section to designate how the memory caching should operate in the Now Platform for this remote table.

**Note:** Only advanced users should set caching parameters for a remote table.

4. In the Script section, add your JavaScript syntax to the skeleton template:

```javascript
(function executeQuery(v_table, v_query) {
  // Main API:
  v_table.addRow({ ... }) - adds a row to the result set

  // There are also query helper methods
  v_query.getEncodedQuery() - returns encoded querystring
  v_query.getCondition(field) - returns encoded querystring for the given field (includes field name, operator, and value)
  v_query.getParameter(field) - returns parameter for the given field (only includes value for equality conditions)

  v_query.isGet() - returns whether the query is a single get by sys_id
  v_query.getSysId() - returns parameter for sys_id field
  v_query.isTextSearch() - returns whether the query contains a text query parameter
  v_query.getTextSearch() - returns text search query parameter (internal field name 123TEXTQUERY321)
  v_query.getFirstRowWanted() - returns the first row to include
  v_query.getLastRowWanted() - returns the last row to include

  // Your code goes here
  v_table.addRow({...})
})(v_table, v_query);
```

**Note:** To learn more about entering, modifying, and debugging scripts, see JavaScript syntax editor.

5. In the Caching section, designate how this data is cached and how long the data is cached in the memory of the Now Platform:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache TTL</td>
<td>Cache time to live, expressed in seconds, that external data is cached in memory for this remote table script definition. For example, enter 300 to cache the data in the memory for 5 minutes. The maximum value you can enter is 60 minutes (3600 seconds).</td>
</tr>
</tbody>
</table>

**Note:** By default, the external data is cached in the memory by user.

6. Click Submit.
Results
When you activate a script definition, you associate it with the remote table so that you can retrieve and cache the external data.

Related information

Example 1: Retrieving all incident records from an external source
These are examples of script definitions you might create for retrieval and caching of data from sources external to your current instance. In this first example, we create a script to load all incident records from an external source.

For Remote Table API information, refer to:
• `v_table()`
• `v_query()`

```javascript
/**
 * Using `v_query`, add the rows to `v_table`
 */
(function executeQuery(v_table, v_query) {
    fetchAllIncidents(v_table, v_query);
    /**
     * fetch all incidents records from the remote instance
     */
    function fetchAllIncidents(v_table, v_query) {
      // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
      // Create a RestMessage first which calls an external REST service
      try {
        var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
        var response = restMessage.execute();
        var responseBody = response.getBody();
        // if REST call ends up in an error, set the last error message which shows up
        // at the bottom of the list view
        if (response.haveError()) {
          v_query.setLastErrorMessage(response.getErrorMessage());
          // can use gs.error() or gs.addErrorMessage() while debugging
          // gs.debug() messages visible in session debugger
          // gs.debug(response.getErrorMessage());
          return;
        }
      } catch (ex) {
        v_query.setLastErrorMessage(ex.message);
      }
    }
```
function fetchAllIncidents(v_table, v_query) {
  // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
  // Create a RestMessage first which calls an external REST service
  try {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
  }
})

These code snippets are of note in this script:

function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJson() // the response body is a JSON
    // 'active' field maps to path '$.active'
    .addRule("active", "$.active")
    .addRule("caller_id", "$.caller_id.value")
    .addRule("number", "$.number")
    .addRule("short_description", "$.short_description")
    .addRule("sys_id", "$.sys_id")
    .addRule("updates", "$.sys_mod_count");
  var recordPath = "$result";
  return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
If no problems are encountered in the data retrieval, it gets the data body for the records.

```javascript
var transformerDefinition = getTransformerDefinition();
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);
// transformer parses the responseBody and extracts rows
while (transformer.transform()) {
    // row is field-value map e.g. { active:"true", number: "INC0000001"}
    var row = transformer.getRow();
    // you may do any additional transformations to the row like GlideDuration,
    GlideDataTime etc. For example,
    // row.duration = new GlideDuration(row.duration);
    // finally add the row to the remote table
    v_table.addRow(row);
}
```

It then uses the Transformer API to perform any required data transformations, extracts rows, and then adds a row for each record to the remote table.

Note: To learn more about use of RESTMessageV2 and how to define a direct message, see RESTMessageV2 - Scoped, Global and Direct RESTMessageV2 example.
/**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of the table fields
 * and elements in the response body
 */
function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
      .fromJson() // the response body is a JSON
      // 'active' field maps to path '$.active'
      .addRule("active", "$.active")
      .addRule("caller_id", "$.caller_id.value")
      .addRule("number", "$.number")
      .addRule("short_description", "$.short_description")
      .addRule("sys_id", "$.sys_id")
      .addRule("updates", "$.sys_mod_count");
  var recordPath = "$ .result";
  return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
})(v_table, v_query);

getTransformerDefinition defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not supported or retrieved.

⚠️ Note: You must map a sys_id in the transformer definition to an element in the external data. In this case, the sys_id is mapped to the external incident sys_id. The maximum length of the sys_id is 32 characters. You do this sys_id mapping so forms that use the external data can operate properly.

Example 2: Retrieving specific records from a third-party source

In this example, we create a script to retrieve specific types of incident records from a third-party source.
For Remote Table API information, refer to:

- `v_table()
- `v_query()

```javascript
/**
 * Using `v_query`, add the rows to `v_table`
 */
(function executeQuery(v_table, v_query) {
  if (v_query.isGet()) {
    bySysId(v_table, v_query, v_query.getSysId());
  }
  else if (v_query.getParameter("caller_id")) {
    byCallerId(v_table, v_query, v_query.getParameter("caller_id"));
  }
  else {
    fetchAllIncidents(v_table, v_query);
  }
  /**
   * fetch all incidents records from the remote instance
   */
  function fetchAllIncidents(v_table, v_query) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
    // Create a RestMessage first which calls an external REST service
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
    loadData(v_table, v_query, restMessage);
  }
  /**
   * fetches a specific record from the remote instance with Sys Id being `sys_id`
   */
  function bySysId(v_table, v_query, sys_id) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'By SysId'
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By SysId');
    // sets variable 'sys_id'
    restMessage.setStringParameterNoEscape("sys_id", sys_id);
    loadData(v_table, v_query, restMessage);
  }
  /**
   * fetches records from the remote instance with Caller (caller_id) being `caller_id`
   */
  function byCallerId(v_table, v_query, caller_id) {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By CallerId');
    restMessage.setStringParameterNoEscape("caller_id", caller_id);
    loadData(v_table, v_query, restMessage);
  }
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
function loadData(v_table, v_query, restMessage) {
    try {
        var response = restMessage.execute();
        var responseBody = response.getBody();

        // if REST call ends up in an error, set the last error message which shows up
        // at the bottom of the list view
        if (response.haveError()) {
            v_query.setLastErrorMessage(response.getErrorMessage());
            // can use gs.error() or gs.addErrorMessage() while debugging
            // gs.debug() messages visible in session debugger
            // gs.debug(response.getErrorMessage());
            return;
        }
    } catch (ex) {
        v_query.setLastErrorMessage(ex.message);
        // gs.debug(ex.message);
        return;
    }

    var transformerDefinition = getTransformerDefinition();
    var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);
    // transformer parses the responseBody and extracts rows
    while (transformer.transform()) {
        // row is field-value map e.g. { active:"true", number: "INC0000001"}
        var row = transformer.getRow();
        // you may do any additional transformations to the row like GlideDuration,
        GlideDataTime etc. For example,
        // row.duration = new GlideDuration(row.duration);
        // finally add the row to the remote table
        v_table.addRow(row);
    }
}

/**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of the table fields
 and elements in the response body
 */
function getTransformerDefinition() {
    // create a rule list to map a field to its element path
    var ruleList = new sn_tfrm.TransformerRuleList()
        .fromJson() // the response body is a JSON
// 'active' field maps to path '$.active'
.addRule("active", "$.active")
.addRule("caller_id", "$.caller_id.value")
.addRule("number", "$.number")
.addRule("short_description", "$.short_description")
.addRule("sys_id", "$.sys_id")
.addRule("updates", "$.sys_mod_count");
var recordPath = "$.result";
return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
})(v_table, v_query);

These code snippets are of note in this script:

function fetchAllIncidents(v_table, v_query) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
    // Create a RestMessage first which calls an external REST service
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
    loadData(v_table, v_query, restMessage);
}

function bySysId(v_table, v_query, sys_id) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'By SysId'
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By SysId');
    // sets variable 'sys_id'
    restMessage.setStringParameterNoEscape("sys_id", sys_id);
    loadData(v_table, v_query, restMessage);
}

function byCallerId(v_table, v_query, caller_id) {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By CallerId');
    restMessage.setStringParameterNoEscape("caller_id", caller_id);
    loadData(v_table, v_query, restMessage);
}

You can create a RestMessage and directly use it in the script. In this example, it uses a RESTMessageV2 API with the name of Remote Instance Incidents, and the function All Incidents, which gets all incident data. Once a response is returned from the server, an error message appears if problems are encountered in the data retrieval.

When you query a specific record using GlideRecord.get("<sys_id>"), then v_query.isGet() is 'true'. It fetches the specific record from the external service.
You can also handle any other specific query conditions in the script, such as using `caller_id` in the preceding code snippet. The remainder of this script operates in a manner similar to Example 1.

```javascript
function getTransformerDefinition() {
// create a rule list to map a field to its element path
var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJson() // the response body is a JSON
    // 'active' field maps to path '$.active'
    .addRule("active", ".active")
    .addRule("caller_id", ".caller_id.value")
    .addRule("number", ".number")
    .addRule("short_description", ".short_description")
    .addRule("sys_id", ".sys_id")
    .addRule("updates", ".sys_mod_count");
var recordPath = ".result";
return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
})(v_table, v_query);
```

If no problems are encountered in the data retrieval, it gets the data body for the records. It then uses the Transformer API to perform any required data transformations, extracts rows, and then adds a row for each record to the remote table.

getTransformerDefinition defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not available in the remote table.

### Debugging remote table script definitions

You can enable session debugging for remote table script definitions. To enable script definition logging in a session debug log, set the `glide.script.vtable.log.debug` property to `true`.

When you create remote table script definitions, you can use the `gs.debug()` command to add debug logs that are visible in the session debugger. The session debugger also contains debug logs with [RemoteTable] tags, each with the following information:

- Query definition
- Number of rows loaded in the remote table
- Number of aggregate rows (if GlideAggregate)
Prolonged use of the glide.script.vtable.log.debug property can affect performance, so it is best to set its value to **false** when you finish a debugging session.

**Note:** If you are not on the application node that processed your remote table script, you may not see the resulting log statements. In this case, contact Technical Support.

Use the `v_query.setLastErrorMessage(message)` API to set the last error message that appears at the bottom of the list view. In script, you can retrieve this message using the `glideRecord.getLastErrorMessage()` API. To learn more about these APIs, see Text-To-Display.

- Available system properties
- Script Debugger and Session Logging

**Domain separation and remote tables**

Domain separation is unsupported in remote tables. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: No support**

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

**Overview**

Domain separation provides complete data isolation for domain-specific users.

**How domain separation works with remote tables**

When you create standard internal tables, you can add a sys_domain field, which results in domain separation of the data that is stored in the table. This functionality is not supported when you natively create remote tables, which results in lack of domain separation for rows that are added to a remote table.

However, script definitions that you create and associate with a remote table can be domain (data) separated. When you create the script, you can include
DomainSupport APIs that provide domain separation support. If the script definition is domain separated, only users that belong to the designated domain can view the data in the remote table.

**Related information**

Create a script definition for a remote table

Domain separation

**Response templates**

Resolve cases or support issues faster and more efficiently with response templates. Response templates (formerly known as templated snippets) are reusable messages that can be copied to case or task forms to provide quick and consistent messages to users, or to display standard chat response messages to requesters in Agent Chat.

**Assign response template roles**

The following roles are installed when you activate the response templates plugin.

<table>
<thead>
<tr>
<th>Response template role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response template administrator [sn Templated_snip.template_snippet_admin]</td>
<td>Grants access to scoped administration of the response templates feature.</td>
</tr>
<tr>
<td>Response template writer [sn Templated_snip.template_snippet_writer]</td>
<td>Grants access to create, read, update, and delete (CRUD) response template content.</td>
</tr>
<tr>
<td>Response template reader [sn Templated_snip.template_snippet_reader]</td>
<td>Grants access to read response template content.</td>
</tr>
<tr>
<td>System Administrator [admin]</td>
<td>Response template administrator [sn Templated_snip.template_snippet_admin]</td>
</tr>
<tr>
<td>Response template role</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Note:</strong> Admin inherits this role by default. When the Templated Responses [com.sn_templated_snip] plugin is activated without activating related HR applications, you can still use response templates.</td>
<td></td>
</tr>
<tr>
<td>• Admin can reassign this role to other users.</td>
<td></td>
</tr>
<tr>
<td>• Admin can also remove the Contained Role [sys_user_role_contains] table so Admin users do not inherit this role by default. Or:</td>
<td></td>
</tr>
<tr>
<td>1. Enter <code>sys_store_app_list.do</code> in the Filter navigator search bar of an instance, or <code>https://YOUR_INSTANCE/sys_store_app_list.do</code> from a web browser.</td>
<td></td>
</tr>
<tr>
<td>2. Search for and select <strong>Templated Snippets</strong>.</td>
<td></td>
</tr>
<tr>
<td>3. Scroll down to <strong>Related Links</strong>.</td>
<td></td>
</tr>
<tr>
<td>4. Click <strong>Remove from the role contained by admin</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

Before you begin using response templates, you must assign these roles to the appropriate roles, groups, or users in your application.

• To assign a role to another role, see **Add a role to an existing role**.
• To assign a role to a group, see **Assign a role to a group**.
• To assign a role to a user, see **Assign a role to a user**.

For example,

• In the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.
In the Customer Service Management application, users with the customer service manager role (sn_customerservice_manager) inherit the response template writer role. Users with the customer service agent role (sn_customerservice_agent) inherit the response template reader role and can access response templates assigned to all groups to which they belong.

How to use response templates
Users with the response template writer [sn_templated_snip.template_snippet_writer] role can create response templates. Each template is associated with a table that is an extension of the Task [task] or Interaction [interaction] table. Response templates include a short name for specifying a shortcut that can be used to identify the message. For chat response templates used in Agent Workspace, agents use the slash command with a short name to present the standard message during a chat. You can also configure the template to

• Include variables pulled from a table
• Specify a condition builder to specify the conditions that must be met for the template to be available for use, such as for a specific HR service

• Create or modify a response template

Users with the response template reader [sn_templated_snip.template_snippet_reader] role can then copy response template content and use it in their responses to users when working on case or task forms that meet the specified conditions. For example, a response template for payroll discrepancy cases enables HR agents to use a standardized message when responding to that case type. See Copy a response template to an HR case for an HR-specific example.

Example: Response template to escalate payroll discrepancy cases
You are part of an enterprise HR organization using the HR Service Delivery application. You want your HR agents to respond to and, when necessary, escalate payroll discrepancy cases quickly and consistently. Create a response template so that HR agents have a reusable message to use when responding to employees about that case type.

One of your HR managers with the response template writer role is responsible for creating the template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case [sn_hr_core_case_payroll] table, and a condition filters on cases that match the appropriate HR service called Payroll Discrepancy. In the template body, the response text appears with variables, such as the subject person name in the salutation.
HR case writers with the response template reader role can copy the response template content and use it in their responses to employees when working on cases. Response templates provide a faster and efficient way to resolve cases.

**Activation information**

To use response templates in your application, you must activate response templates. For information on what components are installed with the feature, see Components installed with response templates.

**Activate response templates**

You can activate response templates (formerly known as templated snippets) [com.sn_templated_snip] if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

**Before you begin**

Role required: admin

> **Note:** If you are using Agent Chat, the Agent Chat (com.glide.interaction.awa) plugin automatically activates response templates.

**About this task**

Response templates activate these related plugins if they are not already active.

**Plugins for response templates**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scoped Application Restricted Caller Access</td>
<td>Allows scoped applications to restrict access to public tables and script includes.</td>
</tr>
<tr>
<td>[com.glide.scope.access.restricted_caller]</td>
<td></td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to **System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Related information**

**List of plugins (Madrid)**

**Components installed with response templates**

Several types of components are installed with activation of the Templated Responses (com.sn_templated_snip) plugin, including tables and user roles.

**Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

**Roles installed**

By default, the following HR roles contain the following response template roles.

**Note:** The Templated Responses [com.sn_templated_snip] plugin activates the sn_templated_snip.min_admin_count system property [sys_properties.list]. This property prevents you from deleting your only Response Template admin user by requiring a minimum number (default is two) of active users with this role.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response templates administrator [sn_templated_snip.template_snippet_admin]</td>
<td>Grants access to scoped administration of the response templates feature.</td>
<td>• sn_templated_snip.template_snippet_admin</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response templates writer [sn_templated_snip.template_snippet_writer]</td>
<td>Grants access to</td>
<td>• sn_templated_snip.template_snippet_writer</td>
</tr>
</tbody>
</table>
### Role title [name]

<table>
<thead>
<tr>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>create, read, update, and delete (CRUD) response template content.</td>
<td></td>
</tr>
</tbody>
</table>

### Response templates reader

**[sn_templated_snip.template_snippet_reader]**

- Grants access to read response template content.
- None

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For further information on user administration and how to manage users, see User administration.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response Template [sn_templated_snip_note_template]</td>
<td>Table for .</td>
</tr>
<tr>
<td>M2M Response Template to Channel [m2m_response_template_to_channel]</td>
<td></td>
</tr>
</tbody>
</table>
For further information on table administration and how to manage data, see Table administration.

**Create or modify a response template**

Create or modify a response template (formerly known as a templated snippet) to define a reusable message that can be copied to case or task forms or used in Agent Chat sessions to provide quick and consistent messages to users.

**Before you begin**

Role required: sn_templated_snip.template_snippet_writer

**About this task**

Each response template is associated with a table that is an extension of the Task [task] table or, if using Agent Workspace, the Interaction [interaction] table. The template can be configured to include variables pulled from that table. You can also use a condition builder to specify the conditions that a case must meet for the template to be available for use, such as for a specific HR service or for chat. For chat response templates, you specify a short name (shortcut) that is used with the slash command as a quick way to present the response message to a user.

**Procedure**

1. Navigate to System Definition > Response template configuration.
2. Click **New** or open a record.
3. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the response template.</td>
</tr>
<tr>
<td>Short Name</td>
<td>Short description that identifies the response template when using chat in Agent Workspace. Use the short name with a quick command (/) to show the text from the template body of the response template while in chat. This feature provides a fast and consistent way to populate text while in chat.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>For example, the short name \texttt{gm} identifies the chat response template for a Good Morning greeting. Enter \texttt{/gm} in a chat window to show the text from this response template.</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table that the response template is associated with.</td>
</tr>
<tr>
<td>\textbf{Note:}</td>
<td>If you are creating a response template for Agent Workspace chat, the associated table is the Interaction [interaction] table. For other response templates, the table must be an extension of the Task [task] table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that determine when the response template is available for use.</td>
</tr>
<tr>
<td></td>
<td>When defining conditions like case sensitivity or null values, see API\texttt{GlideFilter - Scoped, Global}.</td>
</tr>
<tr>
<td>\textbf{Note:}</td>
<td>The conditions available depend on the table you select. For chat response templates, specify the condition: \texttt{[Type] [is] [Chat]}</td>
</tr>
<tr>
<td>Application</td>
<td>The application that created the response template.</td>
</tr>
<tr>
<td>Group visibility</td>
<td>Indicates what groups have access to the response template. Adding groups filters who can view the response template.</td>
</tr>
<tr>
<td>\textbf{Note:}</td>
<td>Leaving this field empty makes the response template available to all groups.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Template body</td>
<td>Text of the response template providing instructions to the agent on how to respond to a specific case or task. You can reference field values by selecting variables from the variables list based on the table you select. You can manually enter custom variable references:</td>
</tr>
<tr>
<td></td>
<td>• Current user: <code>${current_user}</code></td>
</tr>
<tr>
<td></td>
<td>• Current date: <code>${Date}</code></td>
</tr>
<tr>
<td></td>
<td>Or, place your mouse where you want the custom variable reference to appear and select the Insert Current User or Insert Current Date buttons.</td>
</tr>
<tr>
<td></td>
<td>✋ Note: Response templates do not support rich text.</td>
</tr>
<tr>
<td>Select variables</td>
<td>Variables you can add to the template body.</td>
</tr>
<tr>
<td></td>
<td>✋ Note: The variables available depend on the table you select.</td>
</tr>
</tbody>
</table>

**Example**

The following GIF shows an example of an HR manager in the HR Service Delivery application creating a response template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case `[sn_hr_core_case_payroll]` table, and a condition is set to filter on cases that match the Payroll Discrepancy HR service. The template text is pasted into the body, and then a variable for the subject person is added to the salutation.
4. Click **Submit** or **Update**. The Channels related list appears. Channels limit the response template to only the channels you add. If you leave this blank, the response template is available to no channels. This feature allows you to have different messages for chats, emails, or form. For more information, see.
What to do next
You can copy response template content to any field on a form that meets the specified conditions.

The following GIF shows an example of an HR case writer in the HR Service Delivery application opening a payroll discrepancy case and copying a payroll discrepancy escalation template to the comments field in the HR case form for the employee to read.

![GIF of HR case writer]

Self-service
The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

Service catalog requests
This page contains links to content on service catalog requests.

Add new request items
Use ServiceNow's web-based interface to add new items to a request.
Before you begin
Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

About this task
Modifying a request does not resubmit it to the approval process.

Procedure
1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.
2. Click **Add New Item**.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click **OK**.

**Amazon EC2 instance request from the Service Catalog**

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

**Request an instance**
Request the provisioning of a new Amazon EC2 instance through the service catalog.

**Procedure**
1. Navigate to **Self-Service > Service Catalog**.
2. Select **Amazon EC2 Instance** from the **Request Application Infrastructure** category.
3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.

   See the specifications for Large and Small instances in Amazon EC2 Instance Types.

4. Type a reason for the request.

5. Click Order Now to order the instance.

   The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

Terminate an instance
Shut down an Amazon EC2 instance through the service catalog.

Procedure
1. Navigate to Service Catalog > Routine Changes > Terminate Amazon EC2 Instance.
   A list appears displaying the instances that are assigned to you.
2. Select an instance from the list and click Order.
   This list does not support multi-line selection, and there is no undo feature.

Check-out redirect property
A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.
By default, this property is set to false, which redirects the view to the Order Status form when the requester clicks Order Now. When this property is set to true, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in Cloud Management > Administration > Properties.

Delete request items
Use ServiceNow's web-based interface to delete items from a request.

About this task
All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.
Procedure

1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.

2. In the **Requested Items** related list, select the check box beside the item to delete.

3. In the **Actions** choice list, select **Delete**.

   ServiceNow recalculates the price and delivery date for the order.

---

Place a request

Use ServiceNow's web-based interface for ordering predefined goods and services.

Procedure

1. Navigate to **Self-Service > Service Catalog**.

   The default catalog view organizes items in categories and subcategories.

   **Default catalog view**

   ![Service Catalog]

2. Select an item to order.
**Note:** Some items are order guides, which combine related items for easier ordering. For example, an order guide called New Employee Hire presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

The order screen requests any additional information that's needed, such as the requester's name or location and the date the item is needed. It also displays the item's delivery time after approval.

### Delivery time

![Delivery time](image)

3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.

ServiceNow displays a confirmation screen for your order:

![Order submitted](image)
You can view the order's progress in the **Stage** column.

ℹ️ **Note:** It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

### Create incidents and change requests from a requested item

You can quickly open an incident or a change request from a requested item. It also maintains a relationship between the requested item, and its associated incidents or change requests.

**Before you begin**
The administrator must enable the **Create Change** and **Create Incident** UI actions for the Requested Item [sc_req_item] table. The administrator must set the **Active** field to **true** when **editing these UI actions**.

Role required: itil

**Procedure**
1. Navigate to **Self-Service > Requested Items**.
2. Open a requested item.
3. Click the Additional actions menu icon and select **Create Change** or **Create Incident**.

**Related information**
- Record Producer
- Service catalog requests

**View request status**

View the status of a request to see its progress, and determine when it may be fulfilled.
Procedure
1. Navigate to Self-Service > Requested Items.
2. Click your order number to view details.
3. View the order's progress in the Stage field.

4. Check the Backordered field, and if the item is backordered, review comments for information about its return to stock.

Customize homepages
If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

About this task
The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

Procedure
1. Navigate to Self-Service > Homepage.
2. Add any item to the homepage by clicking the add content icon ( ) or the Add content link at the top.
A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the [X] on the right side of the item's header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

Procedure

1. Click the Delete page link at the bottom of the homepage.

2. Click OK to confirm the deletion.

Service Delegation

Service delegation is the ability to designate other users to view and interact with approvals sent or tasks assigned to you, and to receive copies of all email notifications sent to you.

Note: Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

Note: Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications. Delegation does not grant the delegate access to tasks where the caller or requester is the user for whom the delegate was created.
Add the Delegates related list to a user profile

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Before you begin
Role required: personalize_form or admin.

Procedure
1. Navigate to Self-Service > My Profile.
2. On the form context menu, navigate to Configure > Related Lists, and then add the Delegate->User related list.

Results
The Delegates related list displays at the bottom of the user profile form.

Delegate approvals and tasks to another user

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

Procedure
1. Navigate to Self Service > My Profile.
2. In the Delegates related list, click New.
If the list is not visible, configure the form to add the Delegate->User related list.

3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the following check boxes. You can delegate:

- **Approvals**: The delegate can approve items on your behalf.
- **Assignments**: The delegate can view and work on tasks assigned to you.
- **CC notifications**: The delegate receives a copy of email notifications sent to you, except those marked as Meeting Invitation.

⚠️ Note: If the Approvals check box is selected but CC notifications is not, the delegate does not receive approvals.

- **Meeting invitations**: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

⚠️ Note: You must select an active user as your delegate. The instance only delegates to active users. You can remove delegates from this list at any time.

**Example:**
A sample delegation looks like this:

![Delegation options](image)

Note: If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to see "Incident assigned to you" emails, so make sure they know they are a delegate.
Service administration
Configure settings for services that support business applications or the platform.

Assessments
Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor’s goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.

The Assessments plugin is enabled by default.

You can only edit an assessment that has the same application scope as that of your current session.

The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

Installed with Assessments
Several types of components are installed with activation of Assessments.

• Demo data is available for assessments and surveys.
• Vendor Performance offers an additional set of vendor assessment demo data.

</table>

Assessment administrator tasks

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization’s options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.
# Assessment terminology

Assessment admins use several terms when working with assessments.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A <em>metric type</em> defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An <em>assessable record</em> links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A <em>metric category</em> represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Metric</td>
<td>A <em>metric</em> is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A <em>category user</em> is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A <em>stakeholder</em> is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
<tr>
<td>Assessment instance</td>
<td>An <em>assessment instance</em> represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:</td>
</tr>
<tr>
<td></td>
<td>• The assessment generation scheduled job runs.</td>
</tr>
<tr>
<td></td>
<td>• An assessment administrator creates an on-demand assessment.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scorecard</td>
<td>A scorecard provides a visual illustration of an assessable record’s performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>A decision matrix is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrices to determine the relative standing of assessable records in selected categories.</td>
</tr>
<tr>
<td>Bubble chart</td>
<td>A bubble chart is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category.</td>
</tr>
</tbody>
</table>

**Assessment roles**

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Assessment administrator | assessment_admin | Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.  

**Note:** By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.  

<p>| ITIL user  | itil            | ITIL users perform basic technician operations in the system. In the Assessments |</p>
<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.</td>
</tr>
</tbody>
</table>

**Assessment methods**

The available methods are **Assessment**, for non-scripted metrics, and **Script**, for scripted metrics. Each method serves a different function and can be used with certain data types.

Use the **Method** field to specify how to use the metric.

**Assessment method**

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these **Data type** values:

- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

**Script method**

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.
You can use the Script method with these **Data type** values:

- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:

You must use the following variables in your script:

- **primary**: Input variable used to access the sys_id of the record being assessed.
- **actual_result**: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each actual_result, you must specify a corresponding **scaled_result** value.
- **scaled_result**: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the **Min** and **Max** values for the metric. The Scale definition field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

**Script example**

The metric Number of active devices uses the script pictured below. The **primary** variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the Scale definition is set to **High**, the greatest scaled values are best.
meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.

**Scripted metric example**

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Data type: Number</th>
<th>Min: 0</th>
<th>Max: 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependent plugin: CMBD</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Scale definition: High</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

```javascript
var gr = new GlideRecord('mdm_ci');
gr.addQuery('Vendor', 'primary');
gr.addQuery('Install_status NOT IN100,7,8');
gr.query();

actual_result = gr.getNowCount();
if (actual_result < 1) {
  scaled_result = 0;
} else if (actual_result < 1000) {
  scaled_result = 1;
} else if (actual_result < 10000) {
  scaled_result = 2;
} else if (actual_result < 25000) {
  scaled_result = 3;
} else if (actual_result < 50000) {
  scaled_result = 4;
} else {
  scaled_result = 5;
}
```

- Match to least and greatest scaled values.
- Specify how to calculate the actual_result value.
- Specify each return value or range of return values you want to score.
- Specify a numerical scaled value for each return value.

**Assessment generation**

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.
The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- Assessment group
- Assessment instances
- Assessment results

**Assessment groups**

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in Assessments > Assessment Groups.

The Assessment Group form displays the group **Number**, the associated **Metric type**, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all **metric results** for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all **category results** for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.
Note: To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics in generating the bubble charts on the Demand Workbench. The bubble charts help the demand managers to visually assess the demands.

Before you begin
Role required: it_pps_admin

About this task
The Demand Management application comes with an assessment metric type named Demand, five default assessment metric categories, and assessment metrics.

Procedure
1. Navigate to Project Administration > Settings > Assessments Metric Categories.
2. Open an assessment metric category to review it.
   The following default assessment metric categories are available with the Demand Management.

<table>
<thead>
<tr>
<th>Assessment metric category</th>
<th>Data source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size</td>
<td>T-Shirt size field on the Demand form.</td>
<td>Assesses demand size relative to the size of other demands.</td>
</tr>
<tr>
<td>Strategic Alignment</td>
<td>Rating field in the assessment category result for the Strategic Alignment metric category.</td>
<td>Assesses how closely the demand aligns with strategic goals of the organization compared to other demands.</td>
</tr>
<tr>
<td>Risk</td>
<td>Rating field in the assessment category result for the Risk metric category.</td>
<td>Assesses demand risks compared to other demands.</td>
</tr>
</tbody>
</table>
### Assessment metric categories

In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

### Weight categories and metrics

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- **Determine a weighting scale and use it consistently.** In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.

- **Use the same weighting scale for metric categories and metrics.** Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

<table>
<thead>
<tr>
<th>Assessment metric category</th>
<th>Data source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROI</td>
<td>Impact and Financial return fields on the Demand form.</td>
<td>Assesses demand return on investment compared to other demands.</td>
</tr>
<tr>
<td>Cost</td>
<td>Labor costs, Capital expense, and Operating expense fields on the Demand form.</td>
<td>Assesses demand cost compared to other demands.</td>
</tr>
</tbody>
</table>
Note: If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records
After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Before you begin
Role required: none

Procedure
1. Navigate to Assessments > Metric Definition > Categories.
2. Click New to create a new metric category and then complete the Metric Category form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Type</td>
<td>[Required] Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>[Read-Only] Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a Type is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>[Required] Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see weight categories and metrics. The default value is 10.</td>
</tr>
</tbody>
</table>
| Scoring type | Scoring method for an attestation category. This field appears only when the metric type is an attestation with a Scoring type of Percent. Use this field to configure different scoring types for specific attestation categories. Possible selections are:  
  • Percent: Attestation score as a weighted percentage of correct answers for scored questions.  
  • All or nothing: All answers for attestation type questions must be correct or the score is zero for the entire category. |
<p>| Total metrics| [Read-Only] Number of metrics associated to this category.                                                                                                                                               |
| Filter       | Filter conditions that assessable records must meet to be evaluated using metrics in this category. The filter operates on fields on the selected table. If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions. This field is visible only when a Type is selected. |
| Description  | Descriptive information about the category that appears on assessment questionnaires.                                                                                                                  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles</td>
<td>Only those users with the specified roles can perform the assessment for this category. If no role is specified, then users with any role can perform the assessment for this category.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the Roles property does not appear on the form, ask your admin to add the property.</td>
</tr>
<tr>
<td>Details</td>
<td>Text field containing an HTML editor. Use this field to present important details about this category to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. You may need to configure the form to see this field.</td>
</tr>
<tr>

Assessable record associations

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Note: You can also manage which categories an assessable record is associated to using the Assessable Record form.

Related information

Assessment metrics
Create a category for assessable records

Manage an assessable record automatically

You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Filter field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.

For example, for a category in the Vendor type, you might create the condition [Country] [is] [Germany]. Metrics in the category will be used only to evaluate vendors that meet this condition.

4. Save the record.
   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to this category. If you change the filter
condition, the system removes and creates assessable record associations, as appropriate. Note the following:

- The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
- The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
- The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the Country of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

Note: To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example, if the Vendor metric type has the condition [Vendor] [is] [true], create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition [Sys ID] [is not empty], which includes all records from any table.

Assessment metrics
Create a category for assessable records

Manage an assessable record manually

You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Before you begin
Role required: assessment_admin or admin

About this task
Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.
Procedure
1. Navigate to **Assessments > Metric Definition > Categories**.
2. Open a category.
3. In the **Assessable records** related list, click **Edit** and use the slushbucket to add or remove one or more assessable records.
   Only assessable records associated to this category's metric type are available for selection.

**Related information**
- Assessment metrics
- Create a category for assessable records

**Delete a category**
When you delete a category, the system also deletes the associated category users and stakeholders.

**Before you begin**
Role required: assessment_admin or admin

Procedure
1. Navigate to **Assessments > Metric Definition > Categories**.
   Alternatively, navigate to a record that contains a related list for categories.
2. Open a record from the list.
3. On the Metric Category form, click **Delete**.
4. Click **OK** when asked to confirm the action.
   The system displays messages at the top of the form describing the actions taken.

**Related information**
- Assessment metrics
- Create a category for assessable records

**Assessment metrics**
In the Assessments application, a metric is a trait or value used to evaluate assessable records.
Depending on the metric method, a metric can be used as either of the following:

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one metric category and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors' customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

**Note:** Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

**Related information**
- Create a metric template
- Update a metric minimum and maximum value to match a template

**Create an assessment metric for a category**

After you create a category, create metrics you can use to evaluate the assessable records for that category.

**Before you begin**
Role required: assessment_admin or admin

**About this task**
When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess.
Procedure

1. Navigate in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessments &gt; Metric Definition &gt; Categories</td>
<td>Open a category, and locate the Assessment Metrics related list.</td>
</tr>
<tr>
<td>Assessments &gt; Metric Definition &gt; Metrics</td>
<td>This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
</tbody>
</table>

2. Click New.

3. Fill in the fields, as appropriate.

Assessment Metric form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Category</td>
<td>Metric category that the metric belongs to. The system automatically populates the category if you create a new metric from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the Depends on field is set or if another metric depends on this metric

<table>
<thead>
<tr>
<th>Method</th>
<th>Determines how to use the metric.</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Assessment</td>
<td>Non-scripted metric. Make the metric available as a question on an assessment questionnaire. The Assessment method is compatible with all data types except Duration.</td>
</tr>
<tr>
<td>• Script</td>
<td>Scripted metric. Obtain values by writing a custom script. The Script method is compatible with the Duration, Number, and Percentage data types.</td>
</tr>
</tbody>
</table>
| • Default answer from field | This option appears only if you have selected an Assessment Metric Type that contains a table. The General tab adds two fields:  
  ◦ Default answer: Select the default answer for the question. The list comes from the selected table.  
  ◦ Ask question: Specifies when to ask the question: always or only if the default answer is empty. |
### Field Description

**• Default answer from script:** The General tab adds a field:

- **Ask question:** Specifies when to ask the question: always or only if the script does not contain a default answer. The script is defined on the Field Type tab.

> **Note:** If you select a Data type that is incompatible with the selected Method, the system automatically changes the Method to the correct value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>Numeric value that represents the importance of this metric relative to other metrics in the same category. By default, the weight is 10. For weighting suggestions, see Weight Metrics and Metric Categories. This field is visible and required unless the Data type is Date, Date/Time, or String. These data types are not included in results calculations.</td>
</tr>
<tr>
<td>Order</td>
<td>Numeric value that determines the order of the metric question on assessment questionnaires, relative to other metric questions in the same category. The metric with the smallest order value appears as the first question in the category section. By default, the order is 100. For more information about questionnaire layout, see Complete Assessment Questionnaires.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this metric is used to gather assessment results. If a non-scripted metric (Assessment method) is inactive, the question does not appear on assessment questionnaires generated after the metric becomes inactive. If a scripted metric (Script method) is inactive, the script does not run.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the metric question mandatory (selected) or optional (cleared) on assessment questionnaires. Users cannot submit questionnaires unless they provide valid responses to all mandatory questions, which display a red field status indicator. This field is visible only if the Method is Assessment, the Depends on field is empty, and the data type is not Checkbox.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option on this metric question on assessment questionnaires. Users can select Not Applicable if they do not have sufficient information to respond to a question or if a question does not apply to a particular assessable record. User responses of Not Applicable are excluded from results calculations. This field is visible only if the Method is Assessment and certain data types are selected.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on</td>
<td>Setting used to make this metric a conditional question. Select an existing metric question from the list, which displays Checkbox, Choice, Likert Scale, Template, and Yes/No metrics of the same category as this metric. Then, use the Displayed when field to set the conditions that display this metric question on questionnaires. The system prevents the creation of recursive dependencies between metrics. For example, if Metric A depends on Metric B, Metric B cannot depend on Metric A. This field is visible only if the Method is Assessment.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on metric question that, when chosen on questionnaires, display this metric question. This field is visible and required only if the Depends on field is set.</td>
</tr>
<tr>
<td>Field Type Section</td>
<td></td>
</tr>
</tbody>
</table>
| Data type        | [Required] Format of the expected response data. The function of the data type depends on the selected Method. If the method is Assessment, the data type determines how users answer the corresponding question on questionnaires. If the method is Script, the data type determines how the system calculates assessment results.  

**Note:** If another metric depends on this metric, you cannot change the data type. |
| Randomize answers | Check box that determines whether to present the answer options for this metric question in a random order. The order of answer options can influence users, which creates biased results. Randomizing answer options can help prevent this bias. This field is visible only if a data type that requires metric definitions is selected.  

**Note:** Randomizing answer options for certain questions can make those questions confusing for the person answering. In general, only randomize options that do not follow a logical order. For example, the following question is confusing when randomization is enabled: |
| Template         | Metric template to use for the metric question. A metric template is a set of predefined answer options. This field is visible and required only if the Data type is Template.  

**Note:** If another metric depends on this metric, you cannot change the template. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependent plugin</td>
<td>Plugin that contains the tables queried in the script. The system executes the script only if the plugin is active. The default available values are Asset Management, CMDB, Core, Cost Management, Procurement, and Software Asset Management. If the Method is Script, select a plugin. This field is visible only if the Method is Script.</td>
</tr>
<tr>
<td>Note</td>
<td>An administrator may need to add more choices of plugins to the field.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select Low if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select High if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is High. This field is visible and required unless the Data type is Date, Date/Time, or String. Results for these data types are not included in results calculations.</td>
</tr>
<tr>
<td>Note</td>
<td>For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data Types.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that obtains the desired system information. This field is visible and required only if the Method is Script. For more information about using this field, see Script methods.</td>
</tr>
<tr>
<td>Related List</td>
<td>Assessment Metric Definitions lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click New to create a new metric definition. This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

4. Save the record.

When you create a Choice or Likert Scale question, reopen the Assessment Metric form after you submit it to create a metric definition. If you distribute
a questionnaire without creating the answers for questions with these data
types, recipients are unable to answer the questions. If the questions are
mandatory, the recipients are unable to submit their questionnaires.

Related information

Assessment metrics
Create an assessment metric definition
Create a metric template
Update a metric minimum and maximum value to match a template

Create an assessment metric definition

Metrics with Choice or Likert Scale data types must have metric definitions
defined to represent answer options on questionnaires.

Before you begin

Role required: assessment_admin or admin

About this task

Each metric definition appears as one answer option for a question on an
assessment questionnaire. For example, a metric for the question "How satisfied
are you with the quality of this vendor?" has three metric definitions to create
these answer options: **Very satisfied, Somewhat satisfied, and Not at all satisfied.**

Procedure

1. Open the metric record you want to edit.

2. In the **Assessment Metric Definitions** related list, click **New** to create a new
metric definition.

3. Fill in the fields:
   - **Display:** Enter the text you want to appear as the answer option.
   - **Value:** Enter the numeric value, greater than or equal to zero, to which the
     answer option equates. Values are used to calculate metric results. When
     you view assessment questions, metric definitions appear in order from least
to greatest value.
     - The system sets the minimum and maximum values according to the
       metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric
       should have the same Value.

4. Click **Submit**.
Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of Choice or Likert Scale.

Before you begin
Role required: assessment_admin or admin

About this task
The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the Value setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the Order field and not the Value field.

The Order column is hidden in the base system.

Procedure
To edit these records, configure the Assessment Metric Definitions related list in the question record to show the Order column, and then edit the order number in the list. The Value setting remain the same for each answer option after reorganization.

Related information
Assessment metrics

Metric types and assessable records
In the Assessments application, assessment administrators create and administer metric types and assessable records.
A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See Customize the mobile list title for more information.

Related information

Use update sets for surveys and assessments
Metric types and assessable records
View an assessable record
Customize the mobile list title

Create metric types and generate assessable records

Each metric type sets a table and filter conditions that define a set of records to evaluate.
**Before you begin**
Role required: assessment_admin or admin

**About this task**
For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company [core_company] table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

**Procedure**
1. Navigate to Assessments > Metric Definition > Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

   You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

   **Note:** Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record.

</tbody>
</table>
| Scheduled job | [Admin only] Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format <type name> Assessment Creation. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is **Scheduled**.  

**Note**: If you change the schedule type from **Scheduled** to **On demand**, the system deletes the scheduled job. If you change the schedule type back to **Scheduled**, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired. |
| Evaluation method | [Admin only] Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are:  

- **Assessment**: Default filter value for metric types. Only this evaluation method uses assessable records, conditions, and stakeholders.  
- **Attestation**: For details, see Attestations - Legacy.  
- **Survey**: For details, see Survey definitions. |
| Scale factor | [Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. **10** is generally a good scale factor.  

**Note**: This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type. |
<p>| Allow retake | Check box that allows users to modify their answers to a completed assessment, quiz, survey, or attestation. After the due date, the system removes the assessment from the user’s My Assessments and Surveys page. |
| Active | Check box that determines whether the metric type is active. When the metric type is inactive (cleared), assessment generation is disabled and users cannot take existing assessments. |
| Description | Helpful information about this type. Enter a clear description of the type and its purpose. |</p>
<table>

**Condition section**

| Table                  | [Required] Table that contains the records you want to evaluate. The system creates assessable records for records on this table that meet the conditions you specify, if any. The number of matching records appears as a link by the **Condition** field. The link dynamically updates if you change the table selection. Click the link to open the list of matching records in a new tab or window. | **Note:** Additional roles are required to view the records on certain tables. If you select a table that you do not have access to, a warning message appears by the **Condition** field where the number of matching records would be. You cannot generate assessable records for tables you do not have sufficient roles for. |
| Enforce condition      | Check box that determines what happens to assessable records when you change the selected table or conditions.                                                                                                   |
| Condition              | Condition builder that defines specific records to assess from the selected table. If you do not specify any conditions, the system creates assessable records for all records on the selected table. Click the refresh icon to update the adjacent record count. | **Note:** If you change the table or conditions, you must click **Generate Assessable Records** to create new assessable records. |

**Decision Matrix section**

<p>| Filter field           | [Required] Field on the selected table that can be used to filter results on decision matrixes and scorecards. For example, if the selected |</p>

**Delete a metric type**
Deleting a metric type entails deleting many related records.

**Before you begin**
Role required: assessment_admin or admin

**About this task**
You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

**Procedure**
1. Delete the records associated with the type to delete:
   - *Assessment results* (metric and category results)
   - *Assessment instance* (questions and assessment instances, in that order)
   - *Assessment groups*
2. Delete the type.
A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. **Click OK** to delete the type and these related records:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
   - Stakeholders
   - Metrics
   - Metric definitions
   - Decision matrixes

Metric types and assessable records

**Export an assessment**

You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

**Before you begin**

Role required: assessment_admin or admin

⚠️ **Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

**About this task**

⚠️ **Note:** The system exports a single XML file that does not contain result data.

The XML file contains a metric type `[asmt_metric_type]` and the following records that are associated with the type:

- Assessable records `[asmt_assessable_record]`
- Metric categories `[asmt_metric_category]`
- Metrics `[asmt_metric]`
- Metric definitions `[asmt_metric_definition]`
- Category users `[asmt_m2m_category_user]`
• Stakeholders [asmt_m2m_stakeholder]

• Decision matrixes [asmt_decision_matrix], [asmt_m2m_xcategory_matrix], and [asmt_m2m_ycategory_matrix]

Procedure
1. Navigate to Assessments > Metric Definition > Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Related information
Import an assessment
Metric types and assessable records

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.

Before you begin
Role required: admin

⚠️ Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

Procedure
1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import a Record as XML Data.

Related information
Export an assessment

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Before you begin
Role required: admin or survey_admin
When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a
production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Create an assessment signature

A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Before you begin
Role required: assessment_admin or admin

About this task
You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

Procedure

1. Navigate to Assessments > Metric Definition > Signatures.
   All signatures in the system appear in this list.
2. Click New.
3. Complete and submit the form using the fields in the table.
Assessment signature fields

<table>

<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are <strong>Checkbox</strong>, <strong>Full name</strong>, or <strong>Assertion only</strong>. If <strong>Assertion only</strong> is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See [Customize the mobile list title](#) for more information.

### Enforce a condition to delete an assessable record

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

#### Before you begin

**Role required:** assessment_admin or admin

#### About this task

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.
Procedure

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.

   The system does not automatically delete assessable records, even if the **Enforce condition** check box is selected. You must click **Generate Assessable Records** with the check box selected every time you want the system to delete non-matching assessable records.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Before you begin

Role required: assessment_admin or admin

About this task

- **Note:** If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Procedure

Delete the assessable record:

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

Related information

Add a metric category and metric in the question bank for assessments

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for assessments. You can add metric categories or metrics from the question bank to an assessment, or from the assessment to a question bank.

Before you begin
Role required: admin or assessment_admin

Procedure
1. Navigate to Assessments > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click Save.
5. In the Assessment Metrics related list, click New.
6. In the Assessment Metric form, fill the fields. For more information on assessment metric fields, refer to Create an assessment metric for a category.
7. Click Submit.

Configure metric categories or metrics for an assessment using the question bank

Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating an assessment.

Before you begin
Role required: admin or assessment_admin
Procedure

1. Navigate to **Assessments > Metric Definitions > Types**.

2. Open an assessment definition.

3. **Optional:** To add metric categories to an assessment from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b. Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metrics is created in the Metric Categories related list.

4. **Optional:** To add metrics to an assessment from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

   c. Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. **Optional:** To add a metric category to the question bank from an assessment in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. Click **Add to Question Bank**.
      A copy of the category is created along with its metrics and metric definitions in the question bank.

6. **Optional:** To add a metric to the question bank from an assessment in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, open the required metric definition.
c. Click **Add to Question Bank**.
   The Add to Question Bank dialog box is displayed.

d. In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
   A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

**Copy an assessment**
Create a copy of an assessment with at least one category to reduce the effort of creating another assessment with similar data.

**Before you begin**
Role required: assessment_admin or admin

**About this task**
All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

**Procedure**
1. Navigate to **Assessments > Metric Definition > Types**.
2. Select an assessment metric type.
3. In the title bar, click **Copy**, or click the menu icon, and select **Copy**.

**Create a metric template**
Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

**Before you begin**
Role required: assessment_admin or admin

**Procedure**
1. Navigate to **Assessments > Metric Definition > Templates**.
2. Click **New**.
3. Fill in the **Name** field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select **Allow Image**.
5. Click Submit.

6. Under the Assessment Template Definitions related list, click New. Create a template definition for each answer option you want to appear on an assessment question.

7. Fill in the following fields:

   - **Display:** Enter the text to appear as the answer option.
   - **Value:** Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - **Selected Image:** Click to add the image to use for selected state.
   - **Unselected Image:** Click to add the image to use for unselected state.

When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

♀ Tip: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click Update.

Related information

Metric templates

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

Metric templates are available for metrics that have **Template** as the Data type. The following metric templates are available by default.

### Default metric templates

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
</tbody>
</table>
Default metric templates (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
</tbody>
</table>

Create an assessment metric definition

Update a metric minimum and maximum value to match a template

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Before you begin
Role required: assessment_admin or admin

About this task
The system sets the Min and Max fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

Procedure
1. Navigate to Assessments > Metric Definition > Metrics.
2. Configure the list to show the Min and Max columns.
3. Run the following list filter condition: [Template] is [select the template you updated]

4. Ensure the Min and Max values match the smallest and largest template definition value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

**Related information**

**Category users and stakeholders**

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

   **Note:** Category users and stakeholders are used only for scheduled assessments.

**Category users**

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.
Stakeholders
A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association. There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

⚠️  Note: Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

Create a category user
Create category users by associating users in the system to metric categories.

Before you begin
Role required: assessment_admin or admin

About this task
When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor's discount practices.

Procedure
1. Navigate to Assessments > Metric Definitions > Categories.
2. Open a category record.
Note: The category must be associated to a metric type that has the Schedule type set to Scheduled.

3. In the Users related list, click Edit.
4. Select the appropriate users for this category.

Create stakeholders automatically
You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the Create stakeholders check box on the Metric Category form.

Before you begin
Role required: assessment_admin or admin

About this task
If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

Note: Use the Create stakeholders check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.
**Procedure**

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the **Create stakeholders** check box.
5. Click **Update**.
   All the category users are associated to all the assessable records as stakeholders.
6. In the **Assessable Records** related list, click **Edit**.
7. Using the slushbucket, associate an assessable record to the category.

![](image)

8. Click **Save**.
   The system makes all category users stakeholders for the new assessable record.
9. Delete stakeholders as needed.

**Related reference**

**Associate multiple category users to multiple assessable records**
The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

**Before you begin**
Role required: assessment_admin or admin
About this task
You can select category users from one category at a time.

小编一起Note:  You cannot edit or delete stakeholders using the list helper.

Procedure
1. Navigate to Assessments > Advanced > Create Stakeholders. The stakeholder list helper appears.

2. Select a metric type from the list of available types.

一起Note:  Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

一起Note:  Only categories within the selected metric type are available.

The system populates the Category User and Assessable Records lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the Category Users list.

5. Select one or more assessable records from the Assessable Records list.

6. Click the Associate arrow between the lists to complete the association. A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records

You can delete stakeholders for multiple assessable records.

**Before you begin**
Role required: assessment_admin or admin

**Procedure**

1. Navigate to **Assessments > Advanced > Assessment Stakeholders**.
2. Sort the list by **Assessable Record** or **Category User** depending on the perspective you want.
3. Select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.
   The system deletes the stakeholders.

**Related reference**
- Category users and stakeholders

**Related information**

- Delete a stakeholder for one assessable record

Associate one category user to one assessable record

You can create a single stakeholder using the list in the Assessment Stakeholders module.

**Before you begin**
Role required: assessment_admin or admin
Procedure

1. Navigate to **Assessments > Advanced > Assessment Stakeholders.**
2. Click **New.** On the Assessment Stakeholders form, fill in these fields:
   - **Category user:** Select a category user.
   - **Assessable record:** Select an assessable record.
3. Click **Submit.**

The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

ℹ️ **Note:** Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record

You can create many stakeholders for a single assessable record from the Assessable Record form.

**Before you begin**

Role required: assessment_admin or admin
About this task
You can also edit or delete stakeholders from the form.

Procedure
1. Navigate to **Assessments > Assessable Records**.
2. Open a record from the list.
3. In the **Category users** related list, click **Edit**. These category users are the stakeholders for this assessable record.

![Category users related list](image)

4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders.

   The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

**Generate an on-demand assessment**
Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

**Before you begin**
Role required: assessment_admin or admin
About this task
Select the assessable records to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured stakeholders are not used for on-demand assessments.

Procedure
1. Create a metric type and set the Schedule type to On demand to allow for testing of your assessment configuration.
2. Generate the assessable records for the metric type you created.
3. Create the metric categories required to evaluate the assessable records selected.
4. Create one or more assessment questions, or metrics, for each category.
5. Publish the assessment.
6. Perform an on-demand assessment to test your categories and metrics.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Related reference
Assessments

On-demand assessments
On-demand assessments can be generated for metric types with the Schedule type field set to On demand.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or multiple assessable records.

Related information
Assessment generation
Scheduled assessments
Generate an on-demand assessment for multiple assessable records
Generate an on-demand assessment for one assessable record

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Before you begin
Role required: assessment_admin or admin
Publish the assessment.

Procedure
1. Navigate to Assessments > Assessable Records.
2. Open an assessable record associated to a metric type that has the On demand schedule type.
3. To assign the assessment to users configured in the Assessors tab of the assessment, and other specified users, perform these steps.
   a. On the Assessment Metric Type form, click Assign Assessment.
   b. Select a user from the Recent Assessors list or select a different user.
   c. Click OK.
4. To assign the assessment to users configured in the Assessors tab of the assessment, click Assign to Assessors.

Results
The system generates an assessment instance assigned to the selected users.

Related information

Generate an on-demand assessment for multiple assessable records

When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.
Before you begin
Role required: assessment_admin or admin
Publish the assessment.

About this task
For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

Procedure
1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type that has the **On demand** schedule type.
3. To assign the assessment to users configured in the **Assessors** tab of the assessment, and other specified users, perform these steps.
   a. On the Assessment Metric Type form, click **Assign Assessment**.
   b. Select a user from the Recent Assessors list or select a different user.
   c. Click **OK**.
4. To assign the assessment to users configured in the **Assessors** tab of the assessment, click **Assign to Assessors**.

Results
The system generates an assessment instance assigned to the selected users.

Related information

**Generate an assessment with the on-demand API**
The Assign Assessment buttons call an API to generate on-demand assessments.

Before you begin
Role required: assessment_admin or admin
About this task

Procedure

1. To generate an assessment, call the AssessmentCreation API from any script in the system, such as a business rule or client script.

2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.

Related information

Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Open the metric type you created for the on-demand assessment and set the Schedule type to Scheduled.

2. Make sure the categories and metrics you created for the on-demand assessment are correct.

3. Create category users who have special knowledge of your categories.
4. Create **stakeholders** by associating category users to specific assessable records.

5. **Set a schedule** for automatic assessment generation or **generate the assessment manually**. This procedure must be done by a system administrator.

6. **Configure email notifications** to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.

7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

**Related reference**

**Assessments**

**Schedule types**

You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or **stakeholders**, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to **Key Terms** for definitions of the terms used in these procedures.

**Related reference**

**Assessments**

**Set an assessment generation schedule**

You can set assessment generation schedules. You must set a schedule for each metric type individually.

**Before you begin**

Role required: assessment_admin or admin

**Procedure**

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open the appropriate metric type record.
3. Click the reference icon next to the **Scheduled job** field to open the Schedule Item record.
4. Locate the **Trigger type** field and set a recurring schedule for the scheduled job.

For example, if you want to generate assessment components each month, select the **Interval** or **Repeat** trigger type and specify a **Repeat** value of 30 days. Alternatively, select **Day in Month** and specify a Run time and Run day of month.

The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

**Publish a metric type**

Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

**Before you begin**

Role required: assessment_admin or admin

**About this task**

The **State** field on the Assessment Metric Type form indicates whether the type is published. The default state is **Draft**, which disables the system from generating assessments.

**Procedure**

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type record, and click **Publish**.

   The **Publish** button is available only if the state is **Draft** and there is at least one metric associated with the type.

   **Note:** A metric type cannot be moved back to the **Draft** state after it has been published.

**Scheduled assessments**

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**.

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs
when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Stakeholder associated to one of the assessable records
- Metric

Related information

Assessment metrics

Generate a scheduled assessment manually

Administrators can generate scheduled assessments manually.

Before you begin
Role required: assessment_admin or admin

About this task
Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

Procedure
1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click Generate Assessments to trigger the scheduled job immediately.

Note: Be careful to click Generate Assessments, not Generate Assessable Records.

Generate a vendor type assessment manually

The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.

Before you begin
Role required: admin
Procedure

1. Navigate to Vendor Performance > Admin > Generate Assessments.

2. Click Generate Assessments to execute the scheduled job for the Vendor type.

Clean up assessment data

The assessment process generates a considerable amount of data, some of which is not useful after a short time.

Before you begin

Role required: assessment_admin or admin

About this task

The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called Remove Old Assessment Data that is available to administrators only. The scheduled job removes these items if they are more than a year old:

• Assessment instance questions
• Assessment instances
• Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

Procedure

1. Navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs.

2. Open the Remove Old Assessment Data record.

3. On the Schedule Item form, set the Trigger type field to run the scheduled job on a recurring schedule.
   It is recommended to set the scheduled job to run on a weekly or monthly basis.

4. Optional: Click Execute Now to run the scheduled job.

Assessment instances

An assessment instance represents one occurrence of a questionnaire assigned to one user.
The system generates assessment instances only when the required conditions are met, as described in Scheduled assessments and On-demand assessments, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

Example:

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the Vendor metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance to evaluate Amazon, Acme, and Cisco by answering questions from the categories as a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh's questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type's assessable records and their associated categories.

**View an assessment instance**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

**Before you begin**

Role required: admin, survey_admin, or assessment_admin
Procedure

1. Navigate to **Assessments > Assessment Instances**. The following sub-modules are available based on the state of the instances:

- **Ready to take**: Displays assessment instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.

- **In progress**: Displays assessment instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.

- **Completed**: Displays assessment instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.

- **Cancelled**: Displays assessment instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.

- **All**: Displays assessment instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Click an assessment instance number to open the record from the required sub-module. By default, the following fields are displayed in the Assessment Instance form for all sub-modules other than **Completed**.

   里程碑: When you open an instance in the **Completed** sub-module, you are redirected to the User’s Response page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type <strong>Assessment duration</strong> field. The system generates email notifications related to the due date.</td>
</tr>
</tbody>
</table>

   里程碑: By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.

<p>| State | State of the assessment. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is In progress, Complete, or Canceled.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User [sys_user] table or checked, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

3. **Click Take assessment** to open the questionnaire. This button is available if all the following conditions are true for the assessment instance:
   - It is **Assigned to** you.
   - The **State** is **Ready to take** or **In progress**.
   - The associated metric type is **Active**.

**Related information**

- **Assessment generation**
  - Generate a scheduled assessment manually

**Configure trigger conditions for an assessment**

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

**Before you begin**

Role required: assessment_admin or admin

**Procedure**

1. Navigate to **Assessments > Admin > Trigger Conditions**.
2. Complete the fields as described in the table:
### Trigger Condition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>[Required] Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the <strong>On demand</strong> schedule type.</td>
</tr>
</tbody>
</table>
| Table       | [Required] Table to run the trigger condition on. You can select only tables in the current application scope.  

The table must have a connection to the assessable records for the selected **Assessment**. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident [incident] table. After you select a table, ensure there is at least one option for the **Assessable Record Field**. If there is not, select a different table. |
<p>| User field  | [Required] Field that stores the users you want to send the assessment. You can select any field, on the selected <strong>Table</strong> or on a related table, that references the User [sys_user] table. Use the tree picker to select a field. |
| Repeat Interval | Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days. |
| Active      | Check box that determines whether this trigger condition is active (selected).                                                                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>[Required] Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table. If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>[Required] Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition [State] [is] [Closed].</td>
</tr>
</tbody>
</table>

**Related reference**
- Assessment trigger conditions
- Survey trigger conditions
- Assessable records

**Assessment trigger conditions**
A trigger condition tells the system who to send a designated assessment to and when, based on specific conditions.

With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

**Trigger condition configuration**

<table>
<thead>
<tr>
<th>Assessment</th>
<th>Vendor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>User field</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>30 days</td>
</tr>
<tr>
<td>Active</td>
<td>true</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>false</td>
</tr>
</tbody>
</table>
Trigger condition configuration (continued)

<table>
<thead>
<tr>
<th>Assessable Record Field</th>
<th>Vendor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Field 1</td>
<td>Caller</td>
</tr>
<tr>
<td>Related Field 2</td>
<td>Vendor</td>
</tr>
<tr>
<td>Condition</td>
<td>[State] [is] [Closed] and [Vendor] [is not empty]</td>
</tr>
</tbody>
</table>

**Trigger condition example**

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto's issue and sets the Vendor field to Microsoft. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- **Related record 1**: User: Modesto Scroggie
- **Related record 2**: Company: Microsoft

**Note**: Even though the trigger condition is set to be triggered every time the conditions are met, the Repeat Interval setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

**Related information**

- View an assessment metric category

**Enable manager notifications**

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

**Before you begin**

Role required: assessment_admin or admin

**About this task**

This notification sends emails to assessors' managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type.
3. Select the Notify if overdue check box.

To disable manager notifications, clear the check box.
4. Save the record.

Note: The assessor’s user record must have a manager specified in the Manager field to use this notification. You might need to configure the form to use this field.

Assessment notifications

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

- Notify assessment user: This message notifies you of an assigned assessment and includes the type, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

Note: If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- Remind assessment user: This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

- Notify manager assessment is overdue: If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

Note: By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the Work in progress or Ready to take states.
Related information
Create metric types and generate assessable records

Assessment notification workflow
The system sends assessment notifications according to the Notify assessment user workflow. Users with the workflow_admin, workflow_creator, or workflow_publisher roles can view workflows.

1. To open the graphical Workflow Editor, navigate to Workflow > Workflow Editor.
2. In the activity menu, click the link to choose an existing workflow.

![Workflow Window]

3. Select Notify assessment user from the Workflow Versions list. The workflow appears.

![Notify Assessment User Workflow]

Assessment notifications

View a metric result
Metric results contain values that represent an evaluated record’s performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Before you begin
Role required: assessment_admin or admin

About this task
If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user’s responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

Procedure
1. Navigate to Assessments > Results > Metric Results.
2. Open the metric result record you want to view.
   All fields on the form except Updated and String value are read-only.

Metric Result form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Instance</td>
<td>Assessment instance completed by the Assigned to user. This field is blank when the method is Script.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Unscaled value from a user response or script, depending on the method:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Assessment</strong>: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Checkbox</strong>: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Date, Date/Time, or String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>◦ <strong>Yes/No</strong>: The actual value is 0 if the response is <strong>No</strong> and 1 if it is <strong>Yes</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Script</strong>: Value the script placed in the actual_result variable. This field is hidden and left blank when the data type is Duration.</td>
</tr>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is Duration. The duration value is the value obtained by the script query from the actual_result parameter, such as the average duration of outages for a vendor.</td>
</tr>
<tr>
<td>Scaled value</td>
<td>Appropriate value from the scaled_result variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where actual_result is the number of CIs, and scaled_result is a representation of the quantity of CIs:</td>
</tr>
</tbody>
</table>
If the script detects 315 CIs for the vendor, the Actual value is 315 and the Scaled value is 1 for this metric result.

Note: Although this field is visible only when the method is Script, the system populates the field with the Actual value when the method is Assessment, as the scaled value is used in the Normalized value calculation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for Normalized value in View an assessment category result.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage. The string value is N/A for unanswered questions of certain data types. For the Attachment data type, the names of the attached files are displayed as comma-separated values.</td>
</tr>
</tbody>
</table>

Assessment results

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.
The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

⚠️ **Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in **scorecards** and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

### Excluded Responses

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.
- The user does not answer the question and the **data type** is not Checkbox.
- The question data type is one of the following: **Date**, **Date/Time**, or **String**.
- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to -1.

### Metric Attachments

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

⚠️ **Note:** You cannot add or remove attachments from a metric result.

### Assessments overview module

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.

### Prerequisites

You can view the overview page and refresh, add, delete, and rearrange report widgets.

Role required: assessment_admin
To use the Assessments Overview module, navigate to **Assessments > Overview** and click elements within the reports to obtain more information.

The available reports are:

**Assessments overview module reports descriptions**

</tr>
</tbody>
</table>

Assessment results calculation

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

View a bubble chart for assessments

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Navigate to **Assessments > Admin > Bubble Charts**.
2. Click a **Name** to open the bubble chart record.
3. Under **Related Links**, click **View Bubble Chart**.

![Image]

**Note:** Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See **Project Portfolio Suite** for more information.

### Bubble charts for assessments

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records. Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

### Create a bubble chart

Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to **Assessments > Admin > Bubble Charts** and create a record (see table for field descriptions).

![Image]

**Note:** For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.
## Bubble Chart form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for the bubble chart. Bubble Chart is appended to the name when you view the bubble chart.</td>
</tr>
<tr>
<td>Top left label</td>
<td>Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results.</td>
</tr>
<tr>
<td>Top right label</td>
<td>For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores:</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>• Top left label: Resource</td>
</tr>
<tr>
<td>Bottom right label</td>
<td>• Top right label: Essential Partner</td>
</tr>
<tr>
<td></td>
<td>• Bottom left label: Poor Performer</td>
</tr>
<tr>
<td></td>
<td>• Bottom right label: Reevaluate</td>
</tr>
<tr>
<td>Top left color</td>
<td>Border colors for the top left, top right, bottom left, and bottom right quadrants, respectively. Bubbles are the color of the quadrant they are in.</td>
</tr>
<tr>

<td>Default</td>
<td>Check box that enables (selected) or disables (cleared) the bubble chart</td>
</tr>
<tr>
<td></td>
<td>as the default. There can be only one default bubble chart per metric type.</td>
</tr>
</tbody>
</table>

**Bubble chart components**

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:
• **Bubble Chart**
  ◦ **X- and Y-axes**: Each axis represents a metric category.
  ◦ **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

• **Source record list**: List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.

**Assessable record score summaries**

Point to a bubble to display a score summary for the assessable record the bubble represents.
The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

Bubble chart score summary

View an assessment scorecard

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Before you begin
Role required: assessment_admin or admin

About this task
Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

See Vendor Performance in Project Portfolio Suite.
Procedure
1. Navigate to **Assessments** > **Assessable Records**.
2. Open a record.
3. Under **Related Links**, click **View Scorecard**.

Create a link to a scorecard
Users with the admin role can create UI actions that allow users to view scorecards from tables.

**Before you begin**
Role required: assessment_admin or admin

Procedure
1. Generate **assessable records** you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.
2. Navigate to **System Definition** > **UI Actions**.
3. Open the View Scorecard record.
4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.
5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select Project [pm_project].

6. Do not edit the **Action name** field or the **Condition** script.
7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a. In this example, navigate to **Project > Projects > All**.
   b. Open any record in the list.
   c. Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record.

   The scorecard appears with the title in the form of `<table display name> Scorecard`. For example, a scorecard for an assessable record in the Project [pm_project] table is named **Project Scorecard**.

   - **Note**: Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new **View Scorecard** UI action record for each table where you want the related link to appear.

**Export a quiz scorecard as an image**

You can export scorecards as images.

**Before you begin**

Role required: assessment_admin or admin
**Procedure**

1. Click the menu icon and select **Save as PNG** or **Save as JPEG** as the download format.

2. When the export is complete, select **Download** to save the scorecard image to a storage location.

---

**Assessment scorecard averages**

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).

Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the **Filter field** field in the Assessment Metric Type form.

Rating variances are highlighted as follows:
• **Red**: Ratings are below average in this category. The **Diff** value displays a negative number.

• **Green**: Ratings are above average in this category. The **Diff** value displays a positive number.

• **White**: Ratings are average in this category. The **Diff** value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

**Group scorecard with ratings filter**

![Group scorecard with ratings filter](image)

**Assessment scorecard categories**

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

• All History

• Last 3 Months

• Last 12 Months
Scorecard categories

Assessment scorecard category metrics

The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.
Assessment scorecard head-to-head compare view

The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

**Head to head compare**

The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.

**Scorecard head to head compare**

![Scorecard head to head compare diagram]

**Overall Rating**

The Overall Rating is calculated as:

\[
\text{Overall Rating} = \frac{\text{sum of normalized values in category result}}{\text{number of assessment groups}}
\]

In the following example, the calculation is

\[
\frac{(2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7)}{2} = 8.15
\]

Assessment scorecard history

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current assessment against the previous assessment.
• **3 Years:** To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.

![Scorecard history - 3 years](image)

• **4 Quarters:** Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

![Scorecard history - 4 quarters](image)

**Live feed view of assessable records**

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.

To configure a live feed view, an assessment administrator selects the **Live feed** check box on the **Assessable Record** form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:
• **My Feed**: Displays the user's My Feed preferences.

• **Company**: Displays the user's company feed.

• **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group’s conversations.

• **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.

---

**Live Feed group scorecard**

---

**Assessment scorecard ratings**

The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record
has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Set up and administer quizzes
Set up and administer quizzes.

Before you begin
Role required: assessment_admin or admin
The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

Procedure
1. **Optional:** Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   
   You can create unique answers or select preconfigured answers from a template.

What to do next
Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

Related information

Quizzes
Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

• An administrator can create a quiz for any purpose and assign it to a single user or multiple users.

• A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.

• The system can send email notifications to these users:
Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.

Recipient’s manager: The recipient's manager can receive notification when a quiz is overdue.

Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:

- Checkbox
- Choice
- Duration
- Likert Scale
- Numeric Scale
- Template
- Yes/No

A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

**Important terms**

The quiz application involves several terms.

**Terms used in quiz application**

<table>
<thead>
<tr>
<th>Quizzes</th>
<th>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Categories</td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   *Note:* When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

Quiz Overview module

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Before you begin
Role required: assessment_admin or admin

About this task
Users with the **assessment_admin** role can view the overview page and refresh, add, delete, and rearrange widgets.

Procedure

1. Navigate to **Quizzes > Overview**.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
</tbody>
</table>

</tbody>
</table>

**Quiz designer**

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes. You can also use it to edit existing quizzes and change scoring parameters. Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

**Tools on the Quiz Designer**

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to Quizzes > Quiz Designer.

The designer contains the following elements:

- Controls tab
- Questions tab
- Categories tab
- Header bar
- Design canvas

**Controls tab**

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
<th>Scored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>

<td>Date and time field.</td>
<td>N</td>
</tr>
</tbody>
</table>
### Questions tab

This tab displays all metrics added to the question bank for quizzes. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

### Categories tab

This tab displays all metric categories added to the question bank for quizzes. All metrics in the question bank are grouped under the corresponding metric category. Use the **Filter** field to search for categories or questions.

### Header Bar

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
<th>Scored</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>

<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>
• **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.

• **Configuration**: Create introductions and end notes for quizzes, and select a signature.

• **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.
- **Copy Quiz**: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

**Design Canvas**

New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.

**Before you begin**

Role required: assessment_admin or admin
About this task
Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories
A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Before you begin
Role required: assessment_admin or admin

About this task
When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

Procedure
1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.

2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.

3. To configure the category, click the gear icon in its title bar.

   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.

4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

Related information
- Quiz designer
- Create a quiz

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Before you begin
Role required: assessment_admin or admin

About this task
The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.
Procedure

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.

3. Fill in the fields on the form, as appropriate.
## Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red Introduction_to_Fields#Field_Status_Indicator&quot; --&gt; field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question <strong>data type</strong> is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <strong>Date</strong>, <strong>Date/Time</strong>, and <strong>String</strong>. Multiple correct answers are supported for a few data types. See <strong>data types</strong>.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Dependency</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of <strong>Boolean</strong>, <strong>Choice</strong>, <strong>Scale</strong>, or <strong>Template</strong>. Create the condition that must exist for recipients to see the dependent question, using the <strong>is</strong> or <strong>is one of</strong> operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the **Dependency** tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the **Displayed when** field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.

9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

**Configure a quiz**
You can configure an entire quiz.

**Before you begin**
Role required: assessment_admin, survey_creator, or admin

**About this task**
The values you enter and select on this page are applied to the entire quiz.

**Procedure**
In the quiz designer, click **Configuration** and then fill in the fields as described in the table.
## Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>

Select a quiz recipient

When the system distributes a quiz, it sends email notifications to the category users and their managers.

Before you begin
Role required: assessment_admin or admin

About this task
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

Procedure
To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Related information
Quiz designer
Publish a quiz

When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient’s My Assessments & Surveys portal displays a link to the quiz.

Before you begin
Role required: assessment_admin or admin

Procedure
1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Related information
Quiz designer

Create quizzes with forms

As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

• Create the quiz.
• Set up the categories.
• Create the questions for the quiz.
• Create the answers for the questions.
• Distribute the quizzes to recipients.

Note: The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.
Related information
Create a quiz
Create a category for assessable records

Set up a category
A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

About this task
When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.

Categories have weighting values that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

Procedure
You can create a new category or edit an existing one from the Metric Categories related list of a quiz record.

Related reference

Select a user for a category
Create questions
Create answers for questions
Change the order of an answer
Distribute a quiz
Modify a published quiz

Select a user for a category
Category users are the recipients of the questions for each category.

About this task
A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

Procedure
To select users for a category, select the Users related list in a category record, and click Edit.

Distribute a quiz
Modify a published quiz

Create questions
A category can have multiple questions associated with it.

About this task
Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

Procedure
To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management > Questions and create a new record (see table).

⚠️ Warning: When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
<table>

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

About this task
When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question What type of men's trousers are not permitted by company policy? might have these three answers configured as metric definitions: Slacks, Jeans, and Casual cotton.

Procedure
To create an answer option, open the question record you want to edit and click New in the Assessment Metric Definitions related list. Be sure to give each option a Value. The system uses this number to establish the order in which the answers appear in the quiz.

Distribute a quiz
Modify a published quiz

Distribute a quiz
When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

About this task
You can send the quiz to all the category users configured for the quiz or to a single category user.

Procedure
1. Navigate to Quiz Management > Quizzes.
2. Open the quiz record, and click Publish. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
   - Assign Quiz: Send the quiz to one category user.
   - Send Quizzes: Send the quiz to all of its category users.
Note: These buttons are hidden if there are no category users defined for the quiz.

Related information

Create a quiz
Modify a published quiz

Modify a published quiz
Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

Procedure
You can edit a quiz even after it has been distributed, with these results:
• Added questions are available only on quizzes that are distributed after this change.

• Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.

• Deleted questions are also deleted from the distributed quizzes in users' queues.

**Add a metric category and metric in the question bank for quizzes**

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for quizzes. You can add metric categories or metrics from the question bank to a quiz, or from the quiz to a question bank.

**Before you begin**
Role required: admin or assessment_admin

**Procedure**

1. Navigate to **Quizzes > Question Bank**.
2. Click **New**.
3. In the Metric Category form, fill the fields.

<table>
<thead>
<tr>
<th>Metric Category fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Total metrics</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Assessment Metric form, fill the fields. For more information on these fields, refer to Create questions.

7. Click Submit.

**Configure metric categories or metrics for a quiz using the question bank**

Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating a quiz.

**Before you begin**

Role required: admin or assessment_admin

**Procedure**

1. Navigate to Quizzes > Quizzes.

2. Open a quiz definition.

3. **Optional:** To add metric categories to a quiz from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b. Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. **Optional:** To add metrics to a quiz from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

   c. Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. **Optional:** To add a metric category to the question bank from a quiz in Platform, perform the following steps.
a. In the Metric Categories related list, open a metric category definition.

b. Click **Add to Question Bank**.
   A copy of the category is created along with its metrics and metric definitions in the question bank.

6. **Optional:** To add a metric to the question bank from a quiz in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, open the required metric definition.

   c. Click **Add to Question Bank**.
      The Add to Question Bank dialog box is displayed.

   d. In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. **Optional:** To add a metric category or metric to a quiz from the question bank in Quiz Designer, perform the following steps.

   a. Open the quiz in Quiz Designer.

   b. **Optional:** To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.

   c. **Optional:** To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

**Note:**

- When you drag and drop a metric category, all dependencies within the category are also added to the quiz.

- From the Categories tab, you can drag and drop an individual metric within a metric category.

- When you drag and drop a parent metric, all dependent questions are also added to the metric category.

- When you drag and drop a child metric, only the child question is added to the metric category.
Edit a quiz
You can update a quiz after the quiz has been distributed.

Before you begin
Role required: assessment_admin or admin

About this task
You can only edit a quiz that has the same application scope as that of your current session.

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Procedure
Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select <strong>Load Quiz</strong>.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select <strong>Quiz Designer</strong>.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click <strong>Quiz Designer</strong> in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Quiz designer

Configure a scored question
Only scored questions are considered when calculating category and quiz results.

Before you begin
Role required: assessment_admin or admin
About this task
A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

Procedure
1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
   This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.

   Note: Multiple correct answers are supported for a few data types. See Data types for quizzes.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question
You can configure template questions when designing quizzes.

Before you begin
Role required: assessment_admin or admin

Procedure
1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.

5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

**Enable a quiz retake**

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

**Before you begin**

Role required: assessment_admin or admin

**About this task**

Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.
Procedure

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

Related information
- Quiz designer
- Publish a quiz

View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Before you begin
Role required: assessment_admin or admin

About this task
Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients' answers to each question in a category.

Procedure

Navigate to Quizzes > Quiz Results.

### View a quiz scorecard

You can view scorecards for a quiz record.

**Before you begin**

Role required: assessment_admin or admin

**About this task**

For detailed information about scorecards, see Quiz scorecards.

**Procedure**

1. Navigate to **Quizzes > Quizzes**.
2. Open a quiz record.
3. Under **Related Links**, select **View Scorecard**.
   - The scorecard link is hidden if there are no quiz results to report.
4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   - Category Results
   - Question Results
   - Average Ratings
   - History

### Quiz scorecards

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.
Category results

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.
**Pie chart**
The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

?? **Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer

**Bar chart**
A bar chart appears when question results use this data type:

- Percentage
By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.

Average Ratings view

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

• **3 Years:** To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Scorecard history - 3 years

<table>
<thead>
<tr>
<th>Category</th>
<th>Current</th>
<th>Diff</th>

<td>0.00</td>
</tr>
</tbody>
</table>

- **4 Quarters**: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Scorecard history - 4 quarters

</tbody>
</table>

View an assessment category result

Category results contain values that represent an evaluated record's performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based...
on category and metric weights and from metric result values for the same category.

**Before you begin**

Role required: assessment_admin or admin

**About this task**

⚠️ **Note:** The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

**Procedure**

1. Navigate to **Assessments > Results > Category Results**.
2. Click the reference icon (🔍) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form. All fields on the form are read-only.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
</tbody>
</table>
| Rating  | Rating is used on scorecards and decision matrixes. Rating is updated dynamically as:

\[
\text{Rating} = \frac{\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}}{\text{Number of assessment instances for the assessment group}}
\]

For example: In the Assessment Category Results table example, the assessment group **NY DB** (the assessable record) has a **Rating** value **8.86**.
On the associated Metric Results table, you can see that there are 4 instances of this group: `AINST0000801`, `AINST0000802`, `AINST0000803`, and `AINST0000804`.

The system calculated the rating using:

\[
\frac{(5.14+5.14+1.43+5.71+5.14+4.29+4.29+4.29)}{4} = 8.86
\]

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the category result is associated. The category result and metric results in this assessment group only.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Calculated value that measures the Rating relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows: [ \text{Normalized value} = \frac{\text{Rating} \times (\text{Associated category weight} / \text{Sum of weights of all categories the source record has category results for in this assessment group})}{\text{Assessment group}} ]</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories:

- Importance Rating (weight = 10)
- Product Reliability (weight = 9)
- Company Alignment (weight = 9)
- Compliance Score (weight = 9)

If this source record's category result for Product Reliability has a Rating of 7.81, the normalized value calculation is:

\[ 7.81 \times \left[ \frac{9}{10+9+9+9} \right] = 1.9 \]

### Field Description

<table>
<thead>

**Create a decision matrix**

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

**Before you begin**

Role required: assessment_admin or admin

**Procedure**

1. Navigate to **Assessments > Admin > Decision Matrixes**.
2. Click **New** and then select the metric **Type** to plot results for.
3. Right-click the form header and select **Save**.
   The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.
   The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.
5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.

Note: For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the decision matrix, which appears as the title on the decision matrix page. It is recommended to include the axis categories in the name. For example, if you selected <strong>Importance Rating</strong> as the X-axis and <strong>User Satisfaction</strong> as the Y-axis, you might name the matrix <strong>Importance vs. User Satisfaction</strong>.</td>
</tr>
<tr>
<td>Type</td>
<td>Metric type associated with this decision matrix. Only results for assessable records of the selected metric type are plotted on the decision matrix.</td>
</tr>
<tr>
<td>Default</td>
<td>Determines whether or not this is the default decision matrix. The default decision matrix opens when you click <strong>View Matrix</strong> on a scorecard. Select the check box to set the matrix as the default decision matrix. If there is already a default decision matrix for the type and you try to save a different matrix with the check box selected, an error message appears. The maximum values for the default decision matrix are controlled by the <strong>Maximum number of items to show for a decision matrix field filter</strong> property (<code>com.snc.assessment.decision_matrix_filter_max_entries</code>), which has a default value of 1000.</td>
</tr>
</tbody>
</table>

**Quadrant Design Section**

<table>
<thead>
<tr>
<th>Quadrant label color</th>
<th>Color of the label text for the quadrants. Each quadrant label displays in the center of the quadrant. You can enter an HTML color name or hex value for this and the other color fields.</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Axis label</td>
<td>Label text for the X-axis of the decision matrix. It is recommended to include the metric category name in the label text. For example, for an X-axis category of <strong>Importance Rating</strong>, the X-axis label is <strong>Importance</strong>.</td>
</tr>
<tr>
<td>Plotted item color</td>
<td>Color used to display plotted items.</td>
</tr>
<tr>
<td>Top left label</td>
<td>Label text for the top left quadrant. For an X-axis labeled <strong>Importance</strong> and Y-axis labeled <strong>Support</strong>, you might label the top left quadrant <strong>Low importance, high support</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Top left color</td>
<td>Fill color for the top left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Y-Axis label</td>
<td>Label text for the Y-axis of the decision matrix.</td>
</tr>
<tr>
<td>Highlight item color</td>
<td>Color of highlighted plotted items. When you view a decision matrix from an assessable record's scorecard, the assessable record plotted item appears in the highlight color. Specify a highlight color that is different than the <strong>Plotted item color</strong>.</td>
</tr>
<tr>
<td>Top right label</td>
<td>Label text for the top right quadrant.</td>

<tr>
<td>Bottom right label</td>
<td>Label text for the bottom right quadrant.</td>
</tr>
<tr>
<td>Bottom right label</td>
<td>Fill color for the bottom right quadrant.</td>
</tr>
</tbody>
</table>

![Diagram of decision matrix](image)
### Decision matrixes

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes.

Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.

**Note:** Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the Vendor Performance application.

### Decision matrix components

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Options</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the Filter field and Filter condition field settings for each metric type. The maximum values in the filter are controlled by the <strong>Maximum number of items to show for a decision matrix field filter</strong> property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
<tr>
<td><strong>Scale</strong></td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Each axis represents one or more metric categories. If multiple categories are used for an axis, their respective weights determine the positioning of the plotted items.</td>
</tr>
<tr>
<td>X- and Y-axes</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>

**Plotted item rating summaries**

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record's average ratings for...
each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

**Take an assessment**

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click **Take Survey** when you are ready.

**Before you begin**

Role required: none

**About this task**

Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before
you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

Procedure

1. Navigate to **Self-Service > My Assessments & Surveys**.

   - **Note:** Users with the assessment_admin role can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   - **Note:** Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click **Take Assessment** to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon (Collapse) or expand icon (Expand) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select Not Applicable, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.

6. Save or submit the assessment.

- **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.

- **Submit**: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.

If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the
top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click **Modify Assessment**.

**Related information**

- Survey definitions

**Assessment questionnaires**

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.

No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

**Metric types and assessable records**

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see *Assessment administrator tasks*.

**Assessable records**

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the *On demand* schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See *Customize the mobile list title* for more information.

- View an assessable record
- Customize the mobile list title
Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Before you begin
Role required: assessment_admin or admin

About this task

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Procedure

Delete the assessable record:

• To delete a single record, open the record and click Delete.
• To delete multiple records, use the Assessable Records list.

Related information

- Metric types and assessable records
- Assessable records

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).
### Viewing Assessable Records

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>[Read-Only] Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td><img src="Image" alt="Amazon" /></td>
<td></td>
</tr>
<tr>
<td><strong>Source</strong></td>
<td>[Read-Only] Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the <strong>Name</strong> field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value <strong>Company: Amazon</strong>.</td>
</tr>
<tr>
<td><strong>Live feed</strong></td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>[Read-Only] Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td><strong>Decision matrix</strong></td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the <strong>View Matrix</strong> related link on the assessable record's scorecard.</td>
</tr>
<tr>
<td><strong>Live feed group</strong></td>
<td>[Read-Only] Live feed group for this assessable record. When you select the <strong>Live feed</strong> check box and save the record, the system populates this field.</td>
</tr>
</tbody>
</table>

#### Related Links

- **View Scorecard**: Opens the scorecard for the assessable record.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click <strong>Edit</strong> to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.</td>
</tr>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click <strong>Edit</strong> to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see <strong>Stakeholders</strong>. This related list is available only when the associated metric type has the <strong>Scheduled</strong> schedule type.</td>
</tr>
</tbody>
</table>

**Related information**
- Metric types and assessable records
- Assessable records

### Domain separation and Assessments

Domain separation is supported for Assessments. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Standard**
- Includes **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see **Application support for domain separation**.

**Related information**
- Domain separation for service providers
Approvals

Approvals require authorization on tasks before the work is done. You can define approvals for all tasks and associate users or groups to a task to approve or reject them.

Approvals are defined by navigating to System Policy > Approvals.

The following information defines an approval:

### Approval definition information

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record.</td>
</tr>
</tbody>
</table>
| State             | Choices are:  
|                   | • Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to **Requested** they will receive no email notifications about the request.)  
|                   | • Requested  
|                   | • Approved  
|                   | • Rejected |
| Approving         | A document_id reference field to the record being approved, on any table.    |
| Comments          | A journal field for storing comments regarding the approval.                 |
| Approval Summarizer | A formatter that displays key fields relevant to the approval from the referenced document. This summarizer will not display if there is no record referenced. |

### Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an “approval engine” that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.
### Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to System Policy &gt; Approvals.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table.</td>
</tr>
</tbody>
</table>

⚠️ **CAUTION:** Not turning off the approval engines might have a performance or behavioral impact on your instance.

### Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

#### Procedure

1. Navigate to **System Properties > Approval Engines**.

   The following page appears with the Approval Engine option for each Task table in the system. If the Approval Engine option is greyed out and shows Turn engines off, read the Notes in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the approval engine option for each Task table from the choice list.

3. Click Save.
   
   These preferences are saved as system properties that are named `glide.approval_engine.<table_name>`.

Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization’s budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gating approvals</td>
<td>Must occur before a request can be initiated. For example, allow a manager to reject an employee's request for a company car.</td>
</tr>
<tr>
<td>Process approvals</td>
<td>Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee's manager approved it.</td>
</tr>
</tbody>
</table>
Note: To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules
Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

Prerequisites
Role required: admin
Approval rules have two new fields:

• Run rule before: If true, the approval rule runs before the record is inserted/updated.

• Set State: If this rule applies, then the task record's approval state is automatically set to this value.

Note: The Set State field only behaves as expected if the Run rule before check box is enabled.

• In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.

Approval Rules fields

Gating approvals
A gating approval acts as a gate through which a request must pass before it can start.

Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:
Gating approvals

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule

You can set up a gating approval via an approval rule.

**Before you begin**

Role required: admin

**Procedure**

1. From the left navigation pane, select **System Policy > Approval Rules**.
2. Click **New**.

Set these to auto start the approval process

**Approval rules**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select <strong>Request</strong>.</td>
</tr>
<tr>
<td>Note: The list shows only tables and database views that are in the same scope as the approval rule.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run Rule</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>Before</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>User</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Set State Value of the approval field on the task in after this rule runs. In most cases, select Requested.</td>
</tr>
<tr>
<td>Set State</td>
<td>Condition Condition under which the rule applies.</td>
</tr>
<tr>
<td>Condition</td>
<td>Script An optional server script to programmatically specify who the approver should be. For example, for the one-line script <code>current.requested_for.manager</code>, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

Notes and limitations:

a. You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.

b. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.

c. By default all requests start out in a Not yet requested approval state. Approval notifications will not go out until the request's approval state is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.

Set up a gating approval based on the item being ordered

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:
• **Approved By Group**: A list of groups that have to approve requests for this item

• **Approved By**: A list of users who have to approve requests for this item

---

**Approve list**

<table>
<thead>
<tr>
<th>Approved By Group</th>
<th>New</th>
<th>Edit...</th>
<th>Sc cat item = Backberry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Approval group**
  - Hardware

- Actions on selected rows...

<table>
<thead>
<tr>
<th>Approved By</th>
<th>New</th>
<th>Edit...</th>
<th>Sc cat item = Backberry</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **Approver**
  - David Loo

- Actions on selected rows...

---

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

**Notes and limitations:**

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated.

Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog > Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.
Add approval

The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete
In the example above, this security approval task must be approved by Fred Luddy.

**Note:** When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

**Approve with a process guide**

Process guides work similarly to approval rules in that their execution is controlled via a condition.

**About this task**

The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people

You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:
1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.

**Procedure**
1. From the left navigation pane, select **System Policy > Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.
   
   **Example #1:** Apply to all "Capacity Review" tasks.

   ![Add Condition](image1)

   **Example #2:** Apply to all "Capacity Review" tasks where the requester is in Atlanta.

   ![Add Condition](image2)

**Process guide tips and tricks:**

- **a.** All catalog tasks are generated when a request is first submitted, but tasks which aren't active yet have a state of "pending". So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.

- **b.** There is a "Default" process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

**Schematic of a hypothetical approval process**

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.

The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.
Note: When the overall request is approved, you must ensure this Reject button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the Accept button on requested items should only appear before the overall request is approved or rejected.

Summarizers
Approval summarizers are stored in the Macro [sys_ui_macro] table.
From the left navigation pane, select System UI > UI Macros. Summarizers use a naming convention of approval_summarizer_ + `<table_name>` (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).
Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

Change an approval summarizer
You can modify existing approval summaries to include additional information.

About this task
These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

Procedure
1. Navigate to System UI > UI Macros.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click Update.

Create a new custom approval summarizer
After you add a new table that has approvals to an instance, you can add a custom activity formatter by creating a new UI macro and then add it to the appropriate form.

About this task
approval_summarizer can only be used on approval forms in the global scope.
Procedure

1. Navigate to System UI > UI Macros
2. Click New.
3. Give the macro a name that follows the summarizer naming convention:
   approval_summarizer_<tablename>
4. Complete the rest of the form and click Submit.
5. Create an activity formatter and add it to the appropriate form.
   To learn more about activity formatters, see Activity formatter.

Approval with e-signature

Approval with e-signature allows users to approve requests by re-entering their login credentials.

Approval with e-signature supports the following authentication credentials:

- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

Activate Approval with e-Signature plugin

The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Before you begin
Role required: admin

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.
De-activate e-signatures

Use this procedure to de-activate e-signatures.

Although plugins cannot be removed, e-signatures can be disabled.

1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to False on any tables where e-signatures are no longer required.

Use e-signature approvals

Users can approve requests with an e-signature.

Users can approve requests with an e-signature by:

- Selecting the Approve or Reject option on a list context menu.
- Clicking the Approve or Reject button on a form.
- Changing a request record's State to Approved in either the list-editor or form.

Selecting any of these options presents the user with an Approver Authentication window, which requests the user’s credentials again.

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User
Installing the plugin also disables the two out-of-the-box Approve UI Actions on the `sysapproval_approver` table.

**Select an approval table**

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

**About this task**

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

**Procedure**

1. Navigate to **System Definition > E-Signature Registry**.
2. In **Table name**, use the drop-down list to select a specific table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
<tr>
<td>Enabled</td>
<td>If selected, e-signature is required. Clear this option to remove the e-signature requirement.</td>
</tr>
</tbody>
</table>

Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication
An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance.

About this task
The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature does not function without this IdP setting. Set up an approval with e-signature using credentials from a SAML 2.0 authentication.

Procedure
1. Activate or upgrade to SAML 2.0 with the Integration - Multiple Provider Single Sign-On Installer plugin.
2. Activate the Approval with E-Signature plugin.
3. Navigate to Multi-Provider SSO > Identity Providers and verify your 2.0 SAML IdP configuration Advanced tab shows the Force AuthnRequest attribute checked.
   Your SAML 2.0 IdP must support the Force AuthnRequest attribute, or e-signature is not supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion Consumer URL for eSignature auth</td>
<td>This property defaults to the appropriate URL. To configure this property,</td>
</tr>
<tr>
<td></td>
<td>click the lock icon to make this field</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Assertion Consumer Index for eSignature authentication</strong></td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>

</tbody>
</table>

---

The table and diagram above illustrate the options and their descriptions in the context of eSignature authentication settings.
5. Click the **Generate Metadata** button underneath the tabs to regenerate the service provider metadata. Copy this data and update it on the SAML IdP.

**Set up e-signature approvals**

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- Setting up approvals from a local database
- E-signature SAML properties

⚠️ **Note:** ADFS 2.0 does not support re-authentication requests that E-Signature requires.

**Related reference**

- Approval with e-signature
- De-activate e-signatures
- Installed with approval with e-signature

**Related information**

- Set up an approval from a local database
- Select an approval table
- Active Approval with e-Signature plugin

**Approval status**

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an "one of" approval where only one person of a group of approvers needs to approve, consider using **Workflows**.

**Related reference**

- Approvals
Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.

In the sample below, a change opened in the category **network** is assigned to the System Administrator:

![Approval Rules](image)

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

**Related reference**

Approvals

Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the **Edit** button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to **Not Yet Requested**. When the status of the approver changes to **Requested**, the approver is sent an email requesting approval action.

**Related reference**

Approvals

Generate approvals using workflows

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow...
activity generates an approval record, the system populates the **Workflow activity** field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see [Approval and Rollback Activities](#).

**Note:** Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the **approval engine** should be turned off for that table.

**Related reference**

Approvals

**Multiple approvers**

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

**Related reference**

Approvals

**Receive notifications**

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.

Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using [System Definition > Business Rules and System Policy](#).

**Note for Blackberry users:** In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of
their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the “mailto” links. However, as a workaround, users can reply to the email and add the statements `state:approved` or `state:rejected` within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple “yes” or “no” answer.

**Embed an approval request within the Outlook email client**

Embed an interactive approval request for service catalog requests in the email notification sent to a user. The user can accept or reject the approval request from the email client.

**Before you begin**

Role required: admin  
The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

**Note:**

- The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft documentation.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the `sn_ms_oam.outlookactionable.originator` property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may not be rendered as adaptive cards.
- You cannot customize the default actionable message templates.

**Procedure**

1. Navigate to **System Notification > Email > Notifications**.

2. For the approval notification that requires user approval, in the **What it will contain** tab, add the following script in the **Message** field in addition to the existing information, or to the **Message** field in the configured email template if applicable.

```
${mail_script:include_approval_actionable}
```
For example, for the Catalog Approval Request and Approval Request notifications, you can include the script in `request.itil.approve.role` and `change.itil.approve.role` email templates.

This script includes the Outlook actionable message in the email notification sent to the user for approvals.

3. Click **Update**.

**Dynamic approval forms**

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

*Change request approval example*

![Change request approval example](image)

*Rollback Oracle Version*

Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

*Update*  *Approve*  *Reject*  *Delete*
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. **Before** business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. **Before** engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)
3. **Before business rules:** Scripts configured to execute before the database operation with an order greater than or equal to 1000.

4. **The database operation (insert, update, delete).**

5. **After business rules:** Scripts configured to execute after the database operation with an order less than 1000.

6. **After engines.** The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Flow Designer flows)

7. **Email notifications.** The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications

8. **After business rules.** Scripts configured to execute after the database operation with an order greater than or equal to 1000.

**Fulfiller experience in ServiceNow Agent**

Approve catalog requests, requested items, or change requests from anywhere using the ITSM ServiceNow Agent application.

As an ITSM agent or technician, you can use the mobile app when connected online to accomplish the following:

- Accept or reject the pending approval requests.
- View the completed approval requests.
Note:

- The request experience is not available in this mobile app.
- On-load catalog UI policies (non-scripted) are supported for variables in record views, for example, requested item and incident.
  - Only the visibility condition is considered.
  - A variable with no value is not displayed.
  - These policies are also applicable for container variables and a group of check boxes.
  - Since the multi-row variable set is displayed with a message that it is not viewable, these policies can be used to display or hide that message.

Watch this three-minute video to learn how to manage approval requests in the mobile app. This video covers: Accessing the Approvals mobile app and viewing and approving or rejecting requests.

**Activation information**

This mobile application runs on the ServiceNow® mobile platform. You should activate the ITSM Mobile Experience (com.sn_itsm_mobile) plugin that enables the ITSM mobile application.

**Get started with the mobile app for Approvals**

Access the My Approvals application instance on your mobile app to manage approval requests using your mobile device.

**Before you begin**

Role required: business_stakeholder or approver_user

**About this task**

Download the ServiceNow® mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

**Procedure**

1. Open the mobile app and tap the plus icon ().[1]
2. Add a ServiceNow instance. For more information on adding the instance, refer to **Add a ServiceNow instance**.[2]
3. Tap **My Approvals** to start managing your requests.
Related information

Agent mobile app

Manage a catalog request approval
Manage your assigned catalog request or requested item by approving or rejecting it from anywhere using your mobile device.

Before you begin
Role required: business_stakeholder or approver_user

Procedure
1. Tap **My Approvals** on your mobile app.
2. To approve or reject a pending approval request, perform the following steps.
   a. Tap the Pending Approvals applet.
      All approvals in the Requested state are displayed.
   b. Swipe a request and tap **Approve** or **Reject**.
      Note: You should specify the reason while rejecting a request.
   c. Optional: To view the details of a pending approval request, tap it.

3. To view a completed approval request, perform the following steps.
   a. Tap the Completed Approvals applet.
      All approval requests that are either accepted or rejected are displayed.
   b. To view the details of the request, tap it.

State flows
State flows enable an administrator to customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the **State** field in an incident changes from **Active** to **Awaiting User Info**. An administrator might want to trigger an...
event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see State Flow Customization.

Installed with state flows

Several types of components are installed with state flows.

### Tables installed with state flows

Tables are added with state flows.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow [sf_state_flow]</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Work Order Flow [sf_work_order]</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow [sf_work_task]</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

### Business rules installed with state flows

Business rules are added with state flows.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Field Uniqueness in State Flow</td>
<td>State Flow [sf_state_flow]</td>
<td>Ensures that business rules and UI actions are not accidentally copied to new state flows.</td>
</tr>
<tr>
<td>Check Client Script</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds a client script to new records.</td>
</tr>
<tr>
<td>Check Event Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow [sf_state_flow]</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow [sf_state_flow]</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow [sf_state_flow]</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow [sf_state_flow]</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow [sf_state_flow]</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
<tr>
<td>Update dependent records</td>
<td>State Flow [sf_state_flow]</td>
<td>When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.</td>
</tr>
</tbody>
</table>

**Script includes installed with state flows**

Script includes are added with state flows.

**Script includes for state flows**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StateFlow</td>
<td>Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.</td>
</tr>
<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>
Use state flows

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

• Limit the choice list for the State field to contain only those states that are valid for the flow.

• Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.

• Configure events that are triggered when a task changes states.

• Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

Dictionary overrides for state flows

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an Ending state.

   This is the override value which becomes the starting state for all new records in the table named.

2. Click Create Default Value.

   The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.

Events triggered on state changes

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.
For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

Field controls

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

When creating field controls, configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This configuration ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record's State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

Note: State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects, as needed, to enforce field properties in state flows:

<table>
<thead>
<tr>
<th>Field Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Business rule</td>
</tr>
</tbody>
</table>
Field Controls (continued)

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client script (onLoad)</td>
<td><code>&lt;table name&gt;</code> state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td><code>&lt;table name&gt;</code> change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

**Rebuild state flows**

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to *State Flows > Admin > Rebuild State Flows*. This module runs a script that compares the numerical value of each item in the *State* field choice list until it finds a match in the imported state flow record.

**State flow cleanup**

**Work notes**

**Related information**

- Use state flows
- Create a state flow

**Create a state flow**

Creating State Flows.

**Procedure**

1. Navigate to *State Flows > State Flows* and click *New*.
2. Fill in the fields, as appropriate.
The system enforces the field controls with the same client script that filters the choice list for the State field.

### Creating state flows

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number</td>
</tr>
<tr>
<td>Table</td>
<td>[Required] Table on which the state flow record runs. Only tables that extend the Task [task] table are available in the list.</td>
</tr>
<tr>
<td>Starting state</td>
<td>Name of the state at the beginning of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Ending state</td>
<td>Name of the state at the end of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Client script</td>
<td>Client script to run for this transition. The client script controls the available states you can select by limiting the contents of the State choice list to valid states. This client script also controls specific field behavior configured for state changes in the Field Controls section of the form.</td>
</tr>
<tr>
<td>Event</td>
<td>Name of an existing event to trigger when this transition occurs. See <code>events triggered on state changes</code> for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of this record. Make sure the name is descriptive of the state transition or the processing that the record is performing. This name does not have to be unique.</td>
</tr>
<tr>
<td>Roles</td>
<td>Not used for any processing.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this state flow record.</td>
</tr>
<tr>
<td>Class</td>
<td>Defines the state flow class for this record. The system selects the appropriate class from these options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>State Flow</strong>: Records created for state flows in all task-based tables except those in work management.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Work Order Flow</strong>: Records created for state flows in the Work Order [wm_order] table. This class is available when work management is activated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Work Task Flow</strong>: Records created for state flows in the Work Order Task [wm_task] table. This class is available when work management is activated.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Dictionary override</td>
<td>Sets the starting value for the State field on all new records for the table named in the state flow record. See dictionary overrides for configuration procedures.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Noteworthy comments about this state flow transition. For details about how these notes are used, see Work Notes.</td>
</tr>
<tr>
<td>Comment</td>
<td>Details about the customized record.</td>
</tr>
<tr>
<td>Manual (Runs scripts from a UI action that require the user to click a button or related link.)</td>
<td></td>
</tr>
<tr>
<td>Manual condition string</td>
<td>Conditions for enabling a UI action that cannot be defined with the condition builder. For example, you can use this string to define UI actions for mobile devices. This condition has an [and] relationship with the condition in the Manual condition field.</td>
</tr>
<tr>
<td>Manual condition</td>
<td>Conditions for enabling a UI action that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Manual condition string field.</td>
</tr>
<tr>
<td>Manual script</td>
<td>Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.</td>
</tr>
<tr>
<td>UI action</td>
<td>[Read Only] Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.</td>
</tr>
<tr>
<td>Automatic (Runs a business rule automatically when a task record is changed and updated.)</td>
<td></td>
</tr>
<tr>
<td>Automatic condition string</td>
<td>Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an [and] relationship with the condition in the Automatic condition field.</td>
</tr>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the Automatic condition string field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
</tbody>
</table>
### Field Description

**Business rule**

Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the Automatic condition must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.

### Field Controls (Determines field properties when a record transitions between states or reaches a specific end state.)

<table>
<thead>
<tr>
<th>Mandatory fields</th>
<th>Makes the selected fields required when this transition occurs, or when the end state is the current state.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not mandatory</td>
<td>Makes the selected fields optional when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

### 3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.

- **Manual**: Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the Name field as the label for the UI action. The UI action executes the script in the Manual Script field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the New state that enables a user to mark the incident as active.

- **Automatic**: Click **Create Business Rule** to create the business rule. The business rule executes the script in the Automatic Script field when the conditions are true. For example, a business rule created by the system can set an incident state to **Assigned** when the Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see Business Rules.
4. **Optional:** Click **Create Client Script** to create the script that limits the values offered in a task record’s State field to valid states for that transition.

5. Configure the fields in the **Field Controls** section to control how specific fields display when a task record changes states.

**Related information**

Use state flows

**State flow cleanup**

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

**State Flow Cleanup**

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Dictionary override</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted</td>
</tr>
</tbody>
</table>

**Related information**

Use state flows
Create a state flow
Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the Work notes field of any task making this transition.

These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Create a state flow

Domain separation and State Flows

Domain separation is unsupported in State Flows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation provides complete data isolation for domain-specific users.

Domain separation for service providers
Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

Related information

- Activate geolocation

Activate geolocation

An administrator can activate the Geolocation plugin.

Before you begin

Role required: admin

Procedure

1. Navigate to System Applications > All Available Applications > All.
2. Find the Geolocation plugin (com.snc.geolocation) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for \(<\text{plugin name}>\).

Installed with geolocation
Geolocation Google key

Geolocation functions in the Now Platform® require a Google Maps API for Business license, or a Google Maps Javascript API Key, to enable use of Google Maps.

The auto-routing or auto-dispatch functions in Field Service Management require this license or Javascript API Key to calculate precise travel time estimates. Without these values, precise driving times cannot be calculated, and it uses rough estimates or fixed times instead.

In System Properties > Google Maps, enable the Geolocation feature using the appropriate entries from a Google Maps API for Business license, or a Google Maps Javascript API Key. To learn more, see Set up Google Maps API.

Geolocation

Geolocation history

The Geolocation History [geo_history] table contains the history of each tracked user's location over time.

To view geolocation history, navigate to Geolocation > Geolocation History. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in Geolocation > Administration > Geolocation Properties, control the data that appears in this table.

• Minimum distance an agent must move to be considered in a new location (in meters): Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.

• Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.

• Number of days to keep history data: Time period for which the system retains history data.

• Minimum amount of time between updating the user's location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.
Location tracking

Geolocation adds the **Geolocation tracked** field to the User form. In the default view of a user record, select the **Geolocation tracked** check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user’s geographic coordinates whenever the user opens, or loads, a record from the Task [task] table or from a table that extends Task. After this initial update, the system continues to update the user’s geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to **Geolocation > Administration > Geolocation Properties** and change the setting for the property that regulates the update interval for the user’s location. The default setting for this property is 300 seconds (5 minutes).

![Note:](image)

The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the **Geolocation tracked** check box selected may be prompted by their browsers to share or withhold their location.

Get started with Survey Management

Two versions of the application are supported. Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

Configuring surveys

There are many options for advanced configuration in Survey Management:

• Create a survey, add questions, and choose recipients, all in one interface.
• Create conditional questions, which appear only when users answer other questions a certain way.
• Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

Tip: The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

• Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
• Customize the look and feel of survey questionnaires.
• Save anonymous survey responses.
• Convert survey responses to numerical scores and view them on scorecards.
• Deactivate a survey for maintenance or to retire it without deleting it.

Note: Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys
Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

Note: The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

</tr>
</tbody>
</table>

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Before you begin

Role required: none

About this task

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

Procedure

1. Navigate to **Self-Service > My Assessments & Surveys**.
   
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to
show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire. If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save your responses without submitting them</strong></td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><img src="https://example.com" alt="Note:" /> <strong>Note:</strong> The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
<td></td>
</tr>
<tr>
<td><strong>Submit the survey after answering all questions</strong></td>
<td>Click <strong>Submit</strong>. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td><img src="https://example.com" alt="Note:" /> <strong>Note:</strong> If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
<td></td>
</tr>
</tbody>
</table>

**Domain separation and Survey Management**

Domain separation is supported in Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Basic**
• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.

• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.

• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response. For more information on support levels, see Application support for domain separation.

Overview
As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management
There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances
The following domains are available by default after activating the Domain Support-Domain Extensions Installer [com.glide.domain.msp_extensions.installer] plugin. Only ServiceNow employees can activate this plugin.

• Global
• Acme
• Cisco

Access to surveys in domain-separated instances
Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.
Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global, Acme, Cisco</td>
</tr>
<tr>
<td>Global</td>
<td>Yes, Yes, Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes, Yes, No</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes, Yes, Yes</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

Note: When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

Trigger conditions in domain-separated instances

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the User field under Caller. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the asmt_condition table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.
Related information

Domain separation for service providers

Survey responses and results

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

Survey responses

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients' answers to each question in a category. To view general results, navigate to Survey > Survey Responses. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.

Survey metric results

Category results

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the [Type.Evaluation method] [is] [Survey] condition.
Assessment category results

Survey scorecards
A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

Related information
- View a survey scorecard
- Survey designer elements
- Configure category weights for a survey

View results for all surveys
You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Before you begin
Role required: survey_admin or survey_reader

Procedure
1. Navigate to Survey > Survey Responses.
   Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.
   The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.
View the results for a survey
You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Before you begin
Role required: survey_admin or survey_reader

Procedure
1. Navigate to Survey > View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results. The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail. The metric result contains the user’s response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Example

Metric result fields

<tbody>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in Normalized value for an assessment.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

Normalized value for an assessment

The normalized value is calculated based on a linear equation and the scale definition of the metric. This value can be used for risk assessment.

Normalized value for any metric

The normalized value is directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then

Normalized value = 1.0 – Normalized value.

For reporting purpose, use the Metric Result [asmt_metric_result] table.

\[
\text{Normalized value} = \frac{\text{Input Value} - \text{Min value defined in metric}}{\text{Max value defined in metric} - \text{Min value defined in metric}} \times \frac{\text{current metric weight}}{\text{sum of valid metric weight in the metric category}} \times \text{scale_factor}
\]

**Note:**

- If a metric is skipped when taking the assessment, its weight is excluded when calculating \text{sum of valid metric weight in the metric category}.
- The following metric types are excluded in the normalized value calculation:
  - String
  - Date
  - Date/Time
  - Reference
  - Attachment
  - Ranking

For example, consider the following scenario.

Calculate the normalized value for the Please rate the competency of the technician metric.
### Values of the metric

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>• 4 of type=number</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

Normalized value = \( \frac{(3 - 1)}{(6 - 1)} \times \frac{(10)}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8 \)

**Normalized value for a multiple selection metric**

The normalized value for a multiple selection metric is calculated by using the weight of the metric and the score for each choice of the metric.

In a multiple selection metric, for each choice that should be used for the normalization calculation, define the normalization input value.

Normalized value = (Score of all choices) \times \frac{(current metric weight)}{(sum of valid metric weight in the metric category)) \times scale_factor

Here, score of all choices of the metric is the sum of individual scores of each choice.

- Score of each choice in a multiple selection metric = Normalization input of the choice / max value of the metric
- Max value of the metric = Sum of the normalization input for all choices of the metric
- Min value of the metric is always 0

For example, consider the following scenario.

Calculate the normalized value for the multiple selection metric, **Please rate the competency of the technician**, with three choices, A, B, and C.
Values of the metric

<table>
<thead>
<tr>
<th>Choice</th>
<th>Normalization input is 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice A</td>
<td></td>
</tr>
<tr>
<td>Choice B</td>
<td></td>
</tr>
<tr>
<td>Choice C</td>
<td></td>
</tr>
</tbody>
</table>

Minimum value 0

Maximum value 4

Current metric weight 10

Number of metrics in the metric category 5

Valid metric weight of each metric 10

Scale factor 10

If Choice A and B are selected, Normalized value = \(((1 / 4) + (1 / 4)) * (10 / (10 + 10 + 10 + 10 + 10)) \times 10 = 1

Weighted value for a risk assessment

For a risk assessment, the weighted value from metric results table is calculated as following.

\[
\text{weighted_value} = \text{metric.weight} \times \text{result.actual_value}
\]

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Before you begin

Role required: survey_admin or survey_reader

About this task

A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.
Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Under Related Links, click View Scorecard. The interactive scorecard displays the following filters:
   - Question Results: Displays the result of all questions or an individual question.
   - Category Results: Displays the results of all questions associated with an individual category or all categories.
   - Average Ratings: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - History: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - Sentiment Analysis Results: Displays the results of sentiment analysis for the survey.

   Note: The scorecard link is hidden if there are no survey results to report.

Survey scorecard category results
The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.

Survey category results

Scorecard Customer Satisfaction Survey

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail

Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.
• Checkbox.
• Boolean.
• Choice.
• Likert Scale.
• Number.
• Percentage.
• Yes/No.
• Image Scale.
• Multiple Selection.
• Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

<table>
<thead>
<tr>
<th>Net promoter score categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question score</td>
</tr>
<tr>
<td>9 or 10</td>
</tr>
<tr>
<td>7 or 8</td>
</tr>
<tr>
<td>0 to 6</td>
</tr>
</tbody>
</table>

The result is calculated as:
- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- NPS = %Promoters - %Detractors

⚠️ Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.
Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.

**Survey scorecard trend chart**

![Chart showing Politeness Overall Trend from 1/2011 to 1/2014.](chart-image)

**3 years**

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year’s ratings.
4 quarters
Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Survey scorecard history - 4 quarters

Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Before you begin

Role required: admin or survey_admin
Procedure

1. Click the menu icon (≡) and select Save as PNG or Save as JPEG and wait for the export to complete.

Example

2. Click Download and save the scorecard image to a storage location.

Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

• Create, customize, and publish surveys.
• Write and maintain survey questions.
• Define trigger conditions for when surveys are sent to users, such as when an incident closes.
• Maintain surveys and survey questions as the organization's needs change.
To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

**View the overview of all surveys**

Use this homepage to view various survey reports such as results by metric type and state.

**Before you begin**

Role required: admin or survey_admin

**About this task**

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

**Procedure**

1. Navigate to **Survey > Overview**.

   The following reports are available:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group Customer Satisfaction 90 day average</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Timely Response' 90 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Service Desk Survey 'Overall Experience' 60 Days</td>

<tr>
<td>Service Desk Survey 'First Call Resolve' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Competence' 60 Days</td>
<td>Metric Result [asmt_metric_result]</td>
</tr>
</tbody>
</table>

2. To view the required information, click elements within the reports.

3. To refresh, edit, or close a widget, point to the widget and select the required option.
Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

Note: The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

Related information

- Create a survey designer template question
- Select recipients for a survey in the Survey Designer
- Publish a survey in the Survey Designer

Survey designer elements

The survey designer is accessible from Survey > Survey Designer.

The survey designer contains the Controls tab, the Questions tab, the Categories tab, a header bar, and the design canvas.

Controls tab

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

### Question data types

<table>

<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
</tbody>
</table>
Questions tab
This tab displays all metrics added to the question bank for surveys. Use the Filter field to search for questions. Each metric is displayed with its name and type.

Categories tab
This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are group under the corresponding metric category. Use the Filter field to search for categories or questions.

Header bar
The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

• **Design**: Add and configure the properties of categories and questions. This is the default view.

• **Configuration**: Create introductions and end notes for surveys and select a signature.

• **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey.

• **Save**: Save the current survey without changing its state.

• **Preview**: Display a preview of the survey as it appears to recipients.

• **Publish**: Distribute the survey to the selected recipients.

• **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.

• **New Survey**: Open a fresh canvas for a new survey.

• **Load Survey**: View the list of existing surveys.

• **Copy Survey**: Copy the current survey.

Design canvas
New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer

Configuration settings apply to the entire survey.

Before you begin
Role required: admin, survey_creator, or survey_admin

Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition in Survey Designer.
3. Select the Configuration tab and complete the Survey Designer Configuration form.

Configuration tab fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

- Create a survey designer template question
- Select recipients for a survey in the Survey Designer
- Publish a survey in the Survey Designer
- Create an assessment signature

**Survey categories**

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.
• Separate groups of questions into collapsible sections by category on the survey questionnaire.

• Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Before you begin
Role required: admin or survey_admin

About this task
When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

Procedure
1. Navigate to Survey > Survey Designer.
2. Enter the name of the survey in the Name field. The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a. Enter a new name and a description for the category.
   b. Enter text in the Details field that introduces or explains the category to recipients.
   c. Click the X icon to close the Properties dialog box and save your settings.
4. To add a new category, click the + icon in the title bar of an existing category. The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey

You can modify an existing survey to add one or more survey categories.

Before you begin
Role required: admin or survey_admin
About this task
Only one category is required for each survey, but you can add additional categories as needed.

Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New. Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description. The category name appears on questionnaires when either of the following is true.
   • There is more than one category for the survey.
   • There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save. The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer
You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Before you begin
Role required: admin or survey_admin

About this task
The data type that you select for each question determines how it can be answered by survey recipients.

Procedure
1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.
### Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
</tbody>
</table>
| Mandatory           | Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted.  
This field is available when the question does not have a dependency and the question type is not **Boolean** with a check box option. |
| Allow Additional Information | If selected, the **Additional Information Label** field is enabled. The **Additional Information Label** field value is displayed as a field on the survey response page to provide additional information for a question.  

**Note:** This is not applicable for the String and Template data types. |
| Boolean option      | Whether a check box or a **Yes/No** list appears as the option for a Boolean question.                                                      |
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options include the following.  
- **Single line**: Single-line text field 40 characters in length that allows strings of any length.  
- **String line wide**: Full page width text field that allows a single-line entry of any length.  
- **Multiline**: Full page width multiline text field that allows word wrap and returns |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>{param}</code> placeholder is added at the end of the question label. <strong>Note:</strong> You can move this placeholder anywhere in the question label. When a user takes the survey, the question with dynamic value is included in the survey instance and <code>{param}</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>${param}</code> placeholder is not replaced by any value and is displayed as is. For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>${param}</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. The question must have a data type of **Boolean, Choice, Scale, or Template**.

5. Select a question in the **Displayed when** field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition. You can select more than one answer. Selected answers are indicated by a check mark.

   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

- Create a survey designer template question

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:
• View a list of the attached files.
• View an attached file in a separate window.
• Rename an attached file.
• Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ℹ️ **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.
**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date**: On questionnaires, users select a date.

  ![Date selection example](image1)

- **Date/Time**: On questionnaires, users select a date and time.

  ![Date/Time selection example](image2)

**Likert Scale data type**

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options **Easy**, **Average**, and **Difficult**.

![Likert scale example](image3)
If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ℹ️ **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Number data type**

On questionnaires, users enter a number.

If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.

- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.

- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.
Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

ℹ️ Note: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.

String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:
• **Single line**

  ![Additional comments](image)

• **Single line wide**

  ![Additional comments](image)

• **Multiline**

  ![Additional comments](image)

**Template data type**

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

**Yes/No data type**

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to "Select all that apply" in a multiple selection question.
**Ranking data type**

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

**Related information**

Survey question template

**Edit a survey in the survey designer**

You can modify surveys using the survey designer.

**Before you begin**

Role required: admin or survey_admin

**About this task**

You can edit a survey even after it has been distributed, with the following results.
• Added questions are available only on surveys that are distributed after this change.

• Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.

• Deleted questions are also deleted from the distributed surveys in user queues.

Note: You can only edit a survey that has the same application scope as that of your current session.

Procedure
1. Navigate to Survey > Survey Designer.

2. Point to the menu icon in the survey header bar, and select Load Survey.

3. Select a survey from the list and modify it as needed.

4. Point to the menu icon in the survey header bar, and select Save or Save and Publish.
   When you publish the edited survey, the system generates survey instances for any associated survey users.

Configure category weights for a survey
You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Before you begin
Configure the Survey Category form to display the Weight field.

Role required: admin or survey_admin

About this task
Weights are set to a value of 10 by default but can be changed.

Procedure
1. Navigate to Survey > View Surveys and select a survey from the list.

2. In the Survey Definition form, select a category from the Metric Categories related list.

3. Edit the default weight value.

4. Click Update.
View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to Survey > Survey Instances. The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the Number field.
   - **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the Number field.
   - **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the Taken on field.
   - **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the Number field.
   - **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the Number field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than Completed.

Note:
- When you open an instance in the Completed sub-module, you are redirected to the User's Response page.
- Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

Survey Instance form

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Survey definition this survey instance was created from. Survey definitions are stored on the Assessment Instance table, and the field label on that table is Metric type.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Due date         | Date by which the survey instance should be completed. The system populates the due date based on the **Assessment duration** of the associated survey definition, which is set to 14 days by default. The survey due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.  
  
  **Note:** By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
Related information

Schedule periods

Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

Note: If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group

Survey user groups are groups that have the Type field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.
Before you begin
Role required: admin or user_admin

About this task
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

Procedure
1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a. In the Group Members related list, click Edit.
   b. Select users from the list on the left and add them to the Group Members List on the right.
   c. Click Save.

Related information

Select recipients for a survey in the Survey Designer
You can assign survey users while designing or modifying the survey.

Before you begin
Role required: admin or survey_admin

Procedure
1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the **Survey groups only** check box, then select survey user groups or other groups.

4. Click **Save**.

**Designate a survey user**

You can designate one survey user at a time from the Survey Definition form.

**Before you begin**

Role required: admin or survey_admin

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
   - There must be at least one category.
3. In the **Survey Users** related list, click **New**.
4. Select a **User**.
5. Click **Submit**.
   - The Survey Definition form reopens.
6. Optional: To remove survey users, in the **Survey Users** related list, select the check box beside the user, and then select **Delete** from the action list below the list.

**Designate or remove multiple survey users at one time**

Use the Survey Category form to designate or remove multiple survey users at a time.

**Before you begin**

Role required: admin or survey_admin

**Procedure**

1. Open a survey definition.
2. In the **Metric Categories** related list, open a category.
   - You can choose any category. The system applies survey user changes to all the survey’s categories automatically.
3. In the **Users** related list, click **Edit**.
4. Use the slushbucket to add or remove survey users.
5. Click **Save** to return to the survey category.
   The changes are also reflected in the **Survey Users** related list on the survey definition.

**Allow recipients to retake a survey**

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

**Before you begin**

Configure the Survey Definition form to display the **Allow retake** field. For more information, see

Configure the form .

Role required: admin or survey_admin

**About this task**

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

**Procedure**

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. Select the **Allow retake** check box.
4. Click **Update**.

**Copy a survey**

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

**Before you begin**

Role required: survey_admin or admin

**About this task**

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.
Procedure

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td><strong>a.</strong> In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td><strong>b.</strong> In the Survey Designer title bar, point to the menu icon (≡) on the header bar and click <strong>Copy Survey</strong></td>
</tr>
</tbody>
</table>

Publish a survey
You must publish a survey to enable people to receive and complete survey instances.

Before you begin
Role required: admin or survey_admin

About this task
The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state.

⚠️ Note: You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

Procedure

1. Navigate to **Survey > View Surveys** and select a survey to publish.
2. Click **Publish**.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.
Publish a survey in the Survey Designer

You must save changes to a survey before you can publish it to the specified recipients or groups.

Before you begin
Role required: admin or survey_admin

Procedure
1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.

When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Before you begin
Role required: admin or survey_admin

About this task
For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.

For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

Procedure
1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties
2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
You may need to clear the browser's cache to see updates.

**Assessment and survey properties**

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

<table>
<thead>
<tr>

Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Related information

Send survey invitations to users

Modify a survey definition

You can configure additional options for a survey definition.

Before you begin

Role required: admin, survey_creator, or survey_admin

Procedure

1. Navigate to Survey > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition.
   The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form.

   Note: You can only edit a survey that has the same application scope as that of your current session.
### Survey Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the <strong>Active</strong> check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the <strong>Active</strong> check box to deactivate or activate a published survey.</td>
</tr>
<tr>
<td>Owners</td>
<td>Owners of the survey. You can add a user with the survey_creator, survey_admin, or assessment_admin role.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the <strong>Assigned to</strong> field for the associated survey instance. Also, survey responses for anonymous surveys do not contain <strong>Assigned to</strong> values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <strong>Assigned to</strong> field is cleared. However, each response record includes the <strong>Created By</strong> and <strong>Updated By</strong> fields that are accessible to users with the survey_admin role.</td>

4. Save the record.

**Related information**

- Survey trigger conditions
- Publish a survey

**Schedule periods**

The available schedule periods are **Only Once, No Limit, Daily, Weekly, Monthly,** and **Yearly.**

The default schedule period is **No Limit.** When you set the schedule period to anything except **Only Once** or **No Limit,** the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete.**
For example, if you set the schedule period to **Monthly** and someone attempts to **send survey invitations** twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

**Before you begin**

Role required: admin or survey_admin
Procedure

1. Navigate to Survey > Survey Designer and load a survey or create a new survey.

2. Drag the Template data type icon into a category container.

3. Click the gear icon in the question title bar to open the template properties dialog box.

4. Select a predefined scale from the list.

Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.

7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions
Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.

Before you begin
Role required: admin or survey_admin

About this task
Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.

4. In the **Assessment Metrics** related list, open an existing question or click **New**. Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.

5. Complete the Survey Question form. The fields that appear depend on the selected **Data type**.

### Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required only if the data type is <strong>Template</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another question depends on this question, you cannot change the template.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the <strong>Depends on</strong> field is empty and the data type is not <strong>Checkbox</strong>. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this question on survey questionnaires. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Template</strong>, or <strong>Yes/No</strong>.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the <strong>Additional Information Label</strong> field is enabled. The <strong>Additional Information Label</strong> field value is displayed as a field on the survey response page to provide additional information for a question. <strong>Note:</strong> This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays <strong>Checkbox</strong>, <strong>Choice</strong>, <strong>Template</strong>, and <strong>Yes/No</strong> questions of the same category as this question. Then, use the <strong>Displayed when</strong> field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected <strong>Depends on</strong> question which, when chosen on surveys, display this question. This field is visible and required only when the <strong>Depends on</strong> field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is <strong>String</strong>.</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ${param} placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and ${param} placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the ${param} placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a <strong>PRB</strong> record and the survey question is configured with a dynamic value from <strong>Incident</strong>, the ${param} placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When survey questions are translated to other languages by a survey admin, the ${param} placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition to filter the reference records from the table specified in the Reference field.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** This field appears only for the Reference metric type.

<table>
<thead>
<tr>
<th>Field validation</th>
<th>Validate the value entered for a String type metric of a survey. Possible validations are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Email</td>
</tr>
<tr>
<td></td>
<td>• IP Address (IPV4, IPV6)</td>
</tr>
<tr>
<td></td>
<td>• Phone Number (E.164)</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
</tbody>
</table>

⚠️ **Note:** This field appears only for the String metric type.

<table>
<thead>
<tr>
<th>Related Lists</th>
<th>Answer options for this question. This related list is available only if the Data type is Choice or Likert Scale.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment Metric Definitions</td>
<td></td>
</tr>
</tbody>
</table>

6. Save the record.

⚠️ **Note:**

• Be sure to create answer options if you select the Choice or Likert Scale data type.

• You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

Survey question template

Survey trigger conditions
Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type
On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

• View a list of the attached files.
• View an attached file in a separate window.
• Rename an attached file.
• Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type
On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type
On questionnaires, users select a value from a list of choices.
If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ℹ️  **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.
• **Date/Time:** On questionnaires, users select a date and time.

![Date/Time Example](image)

### Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options **Easy, Average, and Difficult**.

![Likert Scale Example](image)

If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

### Number data type

On questionnaires, users enter a number.

![Number Example](image)

If you select **Number**, you must fill in these additional fields:
• **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.

• **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type
On questionnaires, users enter a number.

![Percentage example](approximately what percent of the time are your incidents resolved in a week or less? 50 %)

If you select **Percentage**, you must fill in these additional fields:

• **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.

• **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type
On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

ℹ️ **Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type
On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Single line

- Single line wide

- Multiline

Template data type
On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- Template: Select a template.
- Scale definition: Select High if the answer option with the largest template definition Value is best.

Yes/No data type
On questionnaires, users select Yes or No from a list.
If you select **Yes/No**, you must fill in the **Scale definition** field. Select **High** if **Yes** is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** N/A option is not supported for image scale type question.
Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.

![Multiple Selection](image)

Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

![Ranking](image)

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Related information

Survey question template

Survey question template

Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the...
following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

**Template definition**

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in **Create a survey question template**.

**Default question templates**

**Create a survey question template**

You can create and administer question templates.

**Before you begin**

Role required: admin or survey_admin

**About this task**

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.
Procedure

1. Navigate to Survey > Templates.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.

2. Click New.

3. Enter a Name.

4. Right-click the form header and click Save.

5. In the Assessment Template Definitions related list, click New.
   Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

Update min and max values to match templates

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Before you begin
Role required: admin or survey_admin

About this task
When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.
Procedure
1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.
   
   Note: When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Add a metric category and metric in the question bank for surveys
Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Before you begin
Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

Procedure
1. Navigate to Survey > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click Save.
5. In the Assessment Metrics related list, click New.
6. In the Survey Question form, fill the fields. For information on these fields, see Create or modify survey questions.

7. Click Submit.

Configure metric categories or metrics for a survey using the question bank

Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating a survey.

Before you begin
Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

Procedure

1. Navigate to Survey > View Surveys.

2. Open a survey definition.

3. Optional: To add metric categories to a survey from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, click New Category from Bank. The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b. Select the required categories and click Add Selected. A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. Optional: To add metrics to a survey from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, click New Metric from Bank. The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

   c. Select the required metrics and click Add Selected. A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from a survey in Platform, perform the following steps.
a. In the Metric Categories related list, open a metric category definition.

b. Click Add to question Bank.
   A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a survey in Platform, perform the following steps.

a. In the Metric Categories related list, open a metric category definition.

b. In the Assessment Metrics related list, open the required metric definition.

c. Click Add to Question Bank.
   The Add to Question Bank dialog box is displayed.

   d. In the Choose a question bank to add this question/metric field, select a metric category that you want to add this metric to, and click OK.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.

a. Open the survey in Survey Designer.

b. Optional: To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.

c. Optional: To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

Note:

- When you drag and drop a metric category, all dependencies within the category are also added to the survey.
- From the Categories tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.
Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have **Data type** set to **Choice** or **Likert Scale**.

**Before you begin**
Role required: admin or survey_admin

**About this task**
Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

**Procedure**

1. Navigate to **Survey > Questions**.
2. Open a choice or Likert scale survey question.
3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

**Assessment Metric Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different <strong>Value</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Example:**
On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc. in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Answer option order based on value

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

### Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

**Before you begin**
Role required: admin or survey_admin

**About this task**
You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the **Order** field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the **Order** is set to 100 by default, which means it appears before all questions generated by the survey creator.

**Procedure**

1. Navigate to **Survey > View Surveys** and open the appropriate survey definition.
2. In the **Metric Categories** related list, edit the values in the **Order** column.
3. To change the order of questions within a category, complete the following steps.
   a. Open the **Assessment Metrics** related list.
   b. Edit the values in the **Order** column.
4. Click **Update**.
**Survey trigger conditions**

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

 articulate p Note: Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

**Configure a trigger condition for a survey**

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

**Before you begin**

Role required: admin or survey_admin

**Procedure**

1. Navigate to Survey > Trigger Conditions.
2. Click New.

 articulate p Note: Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

**Trigger condition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| whenever an incident closes, select the Incident [incident] table. | User field: Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User [sys_user] table. Use the tree picker to select a field.  
- **Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to **Public**.

Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.  
- **Note:** Ensure that the Schedule period of the selected survey definition is set to **No Limit**. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.

[Admin only] Application is set to Core.  

Check box that determines whether this trigger condition is active (selected).  

[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.  

Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).  

Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when **Trigger randomly** is selected.  

Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance,
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>the system stores the value from the triggering record. Specify up to four fields.</td>
</tr>
<tr>
<td></td>
<td>For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
<tr>
<td>Note</td>
<td>You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Note</td>
<td>For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <strong>[State] [is] [Closed]</strong>.</td>
</tr>
<tr>
<td>Note</td>
<td>When defining conditions like case sensitivity or null values, see API GlideFilter - Scoped, Global.</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
Related information

Schedule periods

Trigger condition example

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident [incident]
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.
Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): **Boris Catino**
- Problem (Related Field 2): **PRB010101**
- Task (automatically created): **INC00004305**

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users.
Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Before you begin
Role required: admin or survey_admin

About this task
Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
- State is Published.
- Survey is associated with at least one question.
Note: You (or a trigger) can send more than one instance of a survey to a user at any time.

Procedure
1. Navigate to Survey > View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

Define a recipients list for surveys
Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to Survey > Administration > Recipients Lists.
2. Click New.
3. In the Recipients List form, add the field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipients list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of users to include in the list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Contacts</td>
</tr>
<tr>
<td></td>
<td>• Internal Users</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>State</td>
<td>State of the recipients list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: List has not yet been generated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>In Progress</strong>: List is currently being generated. (You can see this state only when generating a very large list of recipients.)</td>
</tr>
<tr>
<td></td>
<td>• <strong>Complete</strong>: List is generated.</td>
</tr>
<tr>
<td>Setup</td>
<td>Method used to generate the recipients list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Upload File</strong>: Upload an Excel file with the recipients list using the specified template.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic Condition</strong>: Run a script or condition builder to create the recipients list.</td>
</tr>
<tr>
<td>Choose File</td>
<td>Allows you to download an Excel template, and then upload the Excel file with user information using the specified template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td></td>
<td>• The templates vary based on the entity selected in the <strong>Type</strong> field. For accounts, the template includes columns for sys_id and account number values. For contacts, consumers, and internal users, the template includes columns for sys_id and email values.</td>
</tr>
<tr>
<td>Show Script</td>
<td>If selected, displays the script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong> and the <strong>Show Script</strong> check box is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the user information. The table is selected based on the <strong>Type</strong> field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>User Field</td>
<td>Table field that refers to users.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the Method is Dynamic Condition.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the Method is Dynamic Condition.</td>
</tr>
</tbody>
</table>

Note: When the Method is Dynamic Condition, you can either use a script or a condition builder to create the recipients list.

4. Click **Submit**.
   For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. **Optional:** To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

Add a recipients list to a survey
Send the survey invites to targeted sets of users by adding a recipients list to a survey.

**Before you begin**
Role required: admin or survey_admin
Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see Define a recipients list for surveys.

**Procedure**
1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>a. Under the <strong>Survey Recipients Lists</strong> related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>b. In the Survey Recipients Lists form, from the <strong>Recipients List</strong> list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>c. Click <strong>Submit</strong>.</td>
</tr>
<tr>
<td>From Survey Designer</td>
<td>a. Under the <strong>Availability</strong> tab, for the <strong>Accessible By</strong> field, select <strong>Specific users</strong>.</td>
</tr>
<tr>
<td></td>
<td>b. In the <strong>Add recipients lists</strong> list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>c. To send the survey to users, click <strong>Save and Publish</strong>.</td>
</tr>
</tbody>
</table>

4. To send survey invites to all survey users and recipients lists, click **Send Invitations**.

**Note:**
- The **Send Invitations** UI action is available when there is at least one recipients list or survey user for the survey.
- If a user is available in the **Survey Users** related list and multiple recipients lists, the survey invite is sent only once to the user.

**Embed a survey within the Outlook email client**

Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

**Before you begin**
Role required: admin or survey_admin
The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.
Note:

- The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft website.

- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the sn_ms_oam.outlookactionable.originator property.

- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may are not rendered as adaptive cards.

- You cannot customize the default actionable message templates.

Procedure

1. Navigate to System Notification > Email > Notifications.

2. For the Survey User Invite notification, in the What it will contain tab, add the following script in the Message field in addition to the existing information.

   ```
   ${mail_script:include_survey_actionable}
   ```

   This script includes the Outlook actionable message in the email notification sent to the user.

3. Navigate to Survey > View Surveys, and open a survey.

4. To send an email notification to the survey user, select the Send notifications check box.

5. Select the Outlook Actionable Message check box and save the survey.
Note:

- The following questions are not supported for an embedded survey:
  - Attachment
  - Date
  - Datetime
  - Template
  - Reference
  - Image Scale
  - Ranking
- Dependent questions are not supported.
- Signature is not supported.
- Mandatory questions are supported.

In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.

6. Click Assign Survey and assign the survey to a user. An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

Enable localization for a survey

Enable a survey user to take a survey in multiple languages.

Before you begin

Role required: admin or survey_admin
The plugin for the language that you want the survey to be available in should be installed.

Note: Localization is applicable only for public surveys.

Procedure

1. Navigate to Survey > Administration > Properties.

2. Enable the Enable/Disable whether to show language picker when a public survey is taken (show_lang_picker_for_publicsurveys) property.

3. In the System Settings window, from the Language list, select the language that you want the survey to be available in.
Note: The Language list is available only when a language plugin is installed.

4. Navigate to Survey > View Surveys and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

Note: The localization is also applicable in Service Portal if the Assessment Properties Allow survey link from email to open in service portal view (applies only for surveys) (sn_portal_surveys.sp_survey.email_redirection) property is enabled.

- The survey is available for survey users in the translated language.
- Users can change the language of the survey using the language picker.

Survey URLs
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).
### Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take:</strong></td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>User has not saved any responses.</td>
<td></td>
</tr>
<tr>
<td><strong>In progress:</strong></td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td>User has saved at least one response.</td>
<td></td>
</tr>
<tr>
<td><strong>Complete:</strong></td>
<td>If the schedule period is <strong>No Limit</strong> or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin.</td>
</tr>
<tr>
<td>User has submitted all required responses.</td>
<td></td>
</tr>
<tr>
<td>If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
<td></td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

### Obtain and distribute a general survey URL

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

**Before you begin**

Role required: admin or survey_admin

**About this task**

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link.
   This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email. The Email button is visible only for a public survey that is published.

What to do next
When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to System Notification > Email > Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Before you begin
Role required: admin or survey_admin

About this task
The survey instance URL is available on the survey instance record.
Procedure
1. Navigate to **Survey > Survey Instances**.
2. Open the instance for the survey.
3. To view or copy the URL, click **View Instance URL** related link.
   The related link is available only when the survey instance **State** is **Ready to take** or **In progress** and the associated survey definition is **Active**.
4. In the dialog box, select and copy the URL then click **OK** or **Cancel**.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

**Before you begin**
Role required: admin or survey_admin

Procedure
1. Navigate to **Survey > View Surveys** and open a survey for which you are not a survey user.
2. Under **Related Links**, click **View Survey URL**.
3. Copy the URL and click **OK** or **Cancel**.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

**Before you begin**
Role required: admin or survey_admin

**About this task**
When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.
• Creates a new survey instance
• Opens an existing survey instance
• Displays an error message.

**Procedure**

1. Perform the appropriate action for your version of the UI:
   - **UI16**: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - **UI15**: Right-click the application menu you want to add the module to and select *Edit Application Menu*

2. In the **Modules** related list, click **New**.

3. Complete the following fields.
   - **Link type**: Assessment
     Do not select **Survey**, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.

4. Complete and save the form.

**Sharing surveys: export and import**

You can export a survey and then import it to a different ServiceNow instance.

⚠️ **Note**: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see *System update sets*.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

• Assessment Metric Template [asmt_template]
• Assessment Template Definition [asmt_template_definition]
• Metric definitions [asmt_metric_definition] (survey question answer options)
• Scheduled Jobs associated with the Survey [sys_trigger]
• Survey categories [asmt_metric_category]
• Survey questions [asmt_metric]
• Survey users [asmt_m2m_category_user]
• Trigger Condition [asmt_condition]
Export a survey
You can export a survey and then import it to another instance.

Before you begin
Role required: admin, survey_reader, or survey_admin
For information about update sets, see System update sets.

Procedure
1. Navigate to Survey > View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Before you begin
Role required: admin or survey_admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

About this task

Procedure
1. Verify that the target instance has assessments enabled.
2. Follow the steps in to import the assessment.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Before you begin
Role required: admin or survey_admin
When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.
The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Configure a survey in the Connect chat support

Enable a user to take a survey after chatting with a survey agent.

Before you begin
Role required: admin or survey_admin

⚠️ Note: The Connect Support plugin (com.glide.connect.support) should be activated.

Procedure

1. Navigate to Connect Support > Support Administration > Chat Survey.
2. Click New.
3. In the Chat Survey form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey</td>
<td>Survey whose instance should be available in Connect Support.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of chat where the survey is available.</td>
</tr>
<tr>
<td></td>
<td>• Connect: Survey is available in Connect Support.</td>
</tr>
<tr>
<td>Chat queue</td>
<td>Chat queue where the survey is available.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the chat survey configuration is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the chat survey configuration.</td>
</tr>
</tbody>
</table>
4. Click Submit.
   When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.

Outlook Actionable Messages
Outlook actionable messages plugin enables users to respond to the survey from within the Microsoft Outlook application.

Install Outlook Actionable Messages plugin
Install Outlook Actionable Messages(sn_ms_oam) plugin to configure actionable messages.

Before you begin
Role required: oam_admin

Procedure
1. Navigate to System Application > All Available Applications > All.
2. In the search field, enter Outlook Actionable messages.
   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
3. Click Install.

Customize fields for the approval message
Customize the body message for a request, change, and request item approval sent in Microsoft Outlook.

Customize fields in the approval message for request
Customize the body message for a request and request item sent in Microsoft Outlook.

Before you begin
Role required: oam_admin
Procedure

1. Navigate to **Actionable Messages > OAM Definition**.

2. Choose one of the following:

<table>
<thead>
<tr>
<th>OAM definition</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>Click <strong>OAM Request Approval</strong></td>
</tr>
<tr>
<td>Request Item</td>
<td>Click <strong>OAM RITM Approval</strong></td>
</tr>
</tbody>
</table>

3. In the OAM Container section, customize the following fields as required:
   
   a. **Title**: Title of the Outlook approval notification.
   
   b. **Requester info**: User who created the request.
   
   c. **Request Details**: This field can be customized. You can also add additional fields as per the requirement.

4. Click **Update**.

The approval message is displayed in Microsoft Outlook as shown below. Click **View Details** button to view the request in ServiceNow instance.

---

**Customize fields in the approval message for change request**

Customize the body message for a change request approval sent in Microsoft Outlook.

**Before you begin**

Role required: oam_admin
Procedure
1. Navigate to Actionable Messages > OAM Definition.
2. Click OAM Change Approval.
3. In the OAM Container section, customize the following fields as required:
   a. Title: Title of the Outlook approval notification.
   b. Requester info: User who created the request.
   c. Request Details: This field can be customized. You can also add additional fields as per the requirement.
4. Click Update.

The approval message is displayed in Microsoft Outlook as shown below. Click View Approval Request to view the request in ServiceNow instance.

Enable Advanced view for Outlook Actionable Message definition
Enable the advanced view to customize the actionable message as per the requirement for Microsoft Outlook.

Before you begin
Role required: oam_admin

Procedure
1. Navigate to Actionable Messages > OAM Definition.
2. Choose one of the following:
### OAM definition

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>Click OAM Request Approval</td>
</tr>
<tr>
<td>Request Item</td>
<td>Click OAM RITM Approval</td>
</tr>
<tr>
<td>Change</td>
<td>Click OAM Change Approval</td>
</tr>
</tbody>
</table>

3. Click **Advanced OAM** under **Related Links**.

4. In the OAM Definition form, perform the following actions:
   
   a. Modify the script as required.
   
   b. Click **Update**.

### Sentiment analysis for surveys

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the third-party platforms for analysis through the specified connector configurations.

**Note:** You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under **Survey > Question Sentiment Results**. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

### Configure a sentiment connector

Specify the service URL and other configuration information for third-party APIs that are used for sentiment analysis.

**Before you begin**

Role required: admin
Procedure

1. Change the scope of the current session to **Sentiment Analysis**.

2. Navigate to **Sentiment Analysis > Sentiment Connector Configurations**.

3. Add or edit the connector configuration for a third party vendor such as Google, IBM Watson, and MS Azure.

   **Note:** By default, placeholders are available for configuring connectors for Google, IBM Watson, and MS Azure.

   **Sentiment connector fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to call the Sentiment Analysis API and the normalize the values.</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials

   a. Open the record referred in the **Credential Alias** field.

   b. Under the **Connections** tab, select the connection.

   c. In the **Connection URL** field, enter the value.

   d. Open the record referred in the **Credentials** field.

   e. Enter the credential information.
Note:

- You should obtain the connection credentials from the respective third-party vendors.
- If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

f. Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

Sentiment analysis properties

You can use the sentiment analysis properties to customize the Sentiment Analysis module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it’s timeout.</td>
</tr>
</tbody>
</table>

Sentiment analysis results

The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators

Following are the color indicators in the bar chart:

- Green: Positive
- Red: Negative
- Blue: Neutral
Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.

To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the View all link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: My Surveys</td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the Pagination setting for Service Portal view survey designer property is set to one question per page by default.

**One Click survey**

A One Click survey has no introduction page in Service Portal. This survey does not have the **Submit** and **Cancel** buttons in the desktop and iPad view.
Note:
- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

Note:
- A kiosk survey does not have any Submit or Cancel buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

URI parameters for One Click survey

Pass these URI parameters through the `createAssessment()` API to store their values in the `asmt_assessment_instance` table for both platform view and Service Portal view.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, <code>sysparm_refresh_interval=5</code>.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the Trigger Table field in the <code>asmt_assessment_instance</code> table. For example, <code>sysparm_trigger_table=incident</code>.</td>
</tr>
</tbody>
</table>
URI parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the Trigger ID field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>

Surveys in ITSM Virtual Agent

You can use surveys in ITSM Virtual Agent to collect survey responses from users through conversational questionnaires (pre-chat and post-chat surveys) in the chat client.

A chat survey is available in ITSM Virtual Agent through the Provide Virtual Agent Feedback topic. The logic that renders the survey dynamically is called from the re-usable Survey topic block. It is common to use the Provide Virtual Agent Feedback topic as the survey setup topic in the general definitions of ITSM Virtual Agent, so that users automatically receive a survey at the end of their conversations. For information about the Survey topic block, see ITSM Virtual Agent.

When you select the Chat Survey check box for a survey, the following conditions are validated for surveys on ITSM Virtual Agent.

- Survey should contain only one metric category.
- Survey can contain only these metric types.
  - Attachment
  - Boolean
  - Check box
  - Choice
  - Date
For information on configuring a survey, see Modify a survey definition and Configure a survey in the survey designer.

The following capabilities are supported for the survey:

- Dependent survey fields
- Introduction and end notes

**Association between a survey and Virtual Agent chat**

After a survey is submitted in a Virtual Agent conversation, a survey instance is created. This instance displays the following information:

- Trigger ID, which is the sys_id of the associated interaction ID created in the Virtual Agent chat
- Trigger table, which is the interaction table

**Related information**

- ITSM Virtual Agent

**Quick start tests for Assessments and Surveys**

Validate that Assessments and Surveys still work after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Assessments and Surveys quick start tests require activating the Automated Test Framework for Survey plugin (com.glide.automated_testing_impl.Survey).

### Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.
The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

⚠️ Note:

- The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Before you begin
Role required: admin or survey_admin

About this task
To avoid timing out for very large surveys, you can disable the transaction quota. See .
Procedure

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.
   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a. Navigate to Survey > Legacy Administration > Survey Conditions.
   b. In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey > Administration > Trigger Conditions to create new trigger conditions for the migrated survey.

Results
The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.
Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>
<th>Legacy survey type</th>
<th>Assessment data type</th>
</tr>
</thead>
<tbody>

<td>Not available</td>
</tr>
<tr>
<td>Wide Single Line Text</td>
<td>String <em>(String option set to Single line wide)</em></td>
</tr>
<tr>
<td>Yes / No</td>
<td>Yes/No</td>
</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master [survey_master]</td>
<td>• Survey definition [asmt_metric_type]</td>
</tr>
<tr>
<td></td>
<td>• Assessable record [asmt_assessable_record], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category [asmt_metric_category]</td>
</tr>
<tr>
<td>Survey question [survey_question_new]</td>
<td>• Survey question [asmt_metric]</td>
</tr>
<tr>
<td>Question choice [question_choice]</td>
<td>• Assessment metric definition [asmt_metric_definition]</td>
</tr>
<tr>
<td>Survey instance [survey_instance]</td>
<td>• Assessment group [asmt_assessment], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Survey response [survey_response]</td>
<td>• Survey instance question [asmt_assessment_instance_question]</td>
</tr>
<tr>
<td></td>
<td>• Survey response [asmt_metric_result]</td>
</tr>
<tr>
<td></td>
<td>• Category result [asmt_category_result], for system use only</td>
</tr>
</tbody>
</table>
Migrated question review

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

Note: The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metic] table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

### Comparable metric definitions and survey question choices

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to 1. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is 2, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value.
**Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to **1**. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.

**Legacy question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no **Order** values for the legacy survey question choices, the system sets each corresponding metric definition **Value** based on the alphanumeric order of the legacy **Text** value.

**Migrated question:** Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the **Scale definition** setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.
Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

• An administrator can create a quiz for any purpose and assign it to a single user or multiple users.

• A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.

• The system can send email notifications to these users:
  ◦ Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  ◦ Recipient's manager: The recipient's manager can receive notification when a quiz is overdue.
  ◦ Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

• Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  ◦ Checkbox
  ◦ Choice
  ◦ Duration
  ◦ Likert Scale
  ◦ Numeric Scale
• Template
• Yes/No

• A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

**Important terms**
The quiz application involves several terms.

<table>
<thead>
<tr>
<th>Terms used in quiz application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes</td>
</tr>
<tr>
<td>Categories</td>
</tr>
<tr>
<td>Questions</td>
</tr>
<tr>
<td>Category user</td>
</tr>
<tr>
<td>Templates</td>
</tr>
</tbody>
</table>

**Quiz roles**
The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator [assessment_admin]</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
</tbody>
</table>

Set up and administer quizzes
Set up and administer quizzes.

Before you begin
Role required: assessment_admin or admin
The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

Procedure
1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.
What to do next
Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.
Review the results from the submitted quizzes in reports and scorecards.

Create a quiz

Activate the quiz designer
Administrators can activate the Quiz Designer plugin.

Before you begin
Role required: assessment_admin or admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Quiz Overview module
The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Before you begin
Role required: assessment_admin or admin
About this task
Users with the `assessment_admin` role can view the overview page and refresh, add, delete, and rearrange widgets.

Procedure
1. Navigate to Quizzes > Overview.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Quiz designer
The quiz designer provides a single interface that users with the `assessment_admin` role can use to create, edit, and distribute quizzes.
You can also use it to edit existing quizzes and change scoring parameters.
Alternatively, you can use the modules of the `assessment engine` to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

Tools on the Quiz Designer
The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.
To open the quiz designer, navigate to Quizzes > Quiz Designer.
The designer contains the following elements:
• Controls tab
• Questions tab
• Categories tab
• Header bar
• Design canvas

Controls tab
Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.

## Questions tab

This tab displays all metrics added to the question bank for quizzes. Use the Filter field to search for questions. Each metric is displayed with its name and type.
Categories tab
This tab displays all metric categories added to the question bank for quizzes. All metrics in the question bank are grouped under the corresponding metric category. Use the Filter field to search for categories or questions.

Header Bar
The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.
- **Copy Quiz**: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Design Canvas
New quizzes open in the Design view. The quiz Name field appears above the first category in the canvas. A blank question field appears in the category container.

Create a quiz
Edit a quiz

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Before you begin
Role required: assessment_admin or admin

About this task
Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Before you begin
Role required: assessment_admin or admin

About this task
When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

Procedure

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.

2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.

3. To configure the category, click the gear icon in its title bar.

   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.

4. Click the X icon to close the category properties dialog box and save your settings.
5. To add a new category, click the + icon in the title bar of an existing category.

**Related information**
- Quiz designer
- Create a quiz

**Create quiz questions**
You can create multiple questions for each category but each question can be associated with only one category.

**Before you begin**
Role required: assessment_admin or admin

**About this task**
The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

**Note:**
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.
Procedure

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.

3. Fill in the fields on the form, as appropriate.
## Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>[Read-only] Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>• Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>• String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>• Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question <strong>data type</strong> is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.  <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <strong>Date</strong>, <strong>Date/Time</strong>, and <strong>String</strong>. Multiple correct answers are supported for a few data types. See <strong>data types</strong>.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. Click the <strong>+</strong> icon to add an option, or click the <strong>X</strong> icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of <strong>Boolean</strong>, <strong>Choice</strong>, <strong>Scale</strong>, or <strong>Template</strong>. Create the condition that must exist for recipients to see the dependent question, using the <strong>is</strong> or <strong>is one of</strong> operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the **Dependency** tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.
7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.

9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

Configure a template question
You can configure template questions when designing quizzes.

Before you begin
Role required: assessment_admin or admin

Procedure
1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.
Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.

5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.

7. Configure the properties for the remaining questions.

8. Click the X icon to close the template properties dialog box and save your settings.

Create a quiz

Configure a scored question
Only scored questions are considered when calculating category and quiz results.

Before you begin
Role required: assessment_admin or admin

About this task
A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

Procedure
1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the **Metric Categories** related list on the **Assessment Metric Type** form, select the category for the questions you want to mark as scored.

4. In the **Assessment Metrics** related list on the **Metric Category** form, select a question from the list.

5. In the **Question Type** section of the **Assessment Metric** form, select the **Scored** check box.
   
   This check box is not available if the question’s data type is not supported for scoring.

6. Select the **Correct answer** for the question.

   **Note:** Multiple correct answers are supported for a few data types. See **Data types for quizzes**.

7. Click **Update**.

8. Repeat the process for all the questions in the category that you want the system to score.

9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

### Configure a quiz

You can configure an entire quiz.

**Before you begin**

Role required: assessment_admin, survey_creator, or admin

**About this task**

The values you enter and select on this page are applied to the entire quiz.

**Procedure**

In the quiz designer, click **Configuration** and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

- You must opt in to Benchmarks to view the dashboard. See [Enable Benchmarks](#).
- This is applicable only for a published quiz.
Select a quiz recipient

When the system distributes a quiz, it sends email notifications to the category users and their managers.

Before you begin
Role required: assessment_admin or admin

About this task
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

Procedure
To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
</tbody>
</table>
| From quiz designer | a. In the title bar, click **Quiz Designer**.  
|                 | b. In the Quiz Designer title bar, point to the menu icon on the header bar and click **Copy Quiz** |

**Edit a quiz**

You can update a quiz after the quiz has been distributed.
Before you begin
Role required: assessment_admin or admin

About this task
You can only edit a quiz that has the same application scope as that of your current session.

• Questions that you add are available only on quizzes that are distributed after the update.

• Before a quiz is submitted or during the retake period:
  ◦ Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  ◦ Deleted questions are deleted from distributed quizzes in users' queues.

Procedure
Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz's due date.

Before you begin
Role required: assessment_admin or admin
About this task
Results are not calculated until the quiz's configured duration has elapsed. The card in the user's queue remains visible until the quiz's due date and displays a button to allow retakes.

Procedure
1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

Quiz designer
Publish a quiz

View a quiz designer scorecard

The quiz scorecard opens in the Category Results view.

About this task
For detailed information about scorecards, see Quiz Scorecards.

Procedure
1. Navigate to Quizzes > Quizzes.
2. Open the quiz whose results you want to view.
   The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
Related information
Quiz designer

View a quiz category result
Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question.

Procedure
1. To view category results, navigate to **Quizzes > Category Results**.

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:

3. Navigate to **Quizzes > Categories**, and select a category from the list.
4. In the Metric Category form, edit the default value in the **Weight** field.
5. Click **Update**.

   Note: You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz
All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Before you begin
Role required: none
About this task
No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

Procedure
1. Navigate to Self-Service > My Assessments & Surveys.
2. Click Take Quiz on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.
3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.
4. Click Save at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.
5. When you are ready to submit the completed quiz, read any assertions that require your attention.
6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.
7. Click Submit.
8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a Modify Quiz button after submission. If retakes are not permitted, the card disappears from your queue.
9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.

10. To edit your answers and resubmit a quiz that permits retakes, click Modify Quiz. You can modify your responses to the quiz until its due date.

**View a quiz instance**

View an instance to verify that quiz instances were created, to check the state of a quiz instance, or to reassign a quiz instance. A quiz instance represents one questionnaire assigned to one user.

**Before you begin**

Role required: admin or assessment_admin

**Procedure**

1. Navigate to **Quizzes > Quiz Instances**.
   
   The following submodules are available based on the state of the instances:
   
   - **Ready to take**: Displays quiz instances that the user can take. By default, these instances are sorted in ascending order by the **Number** field.
   
   - **In progress**: Displays quiz instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   
   - **Completed**: Displays quiz instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   
   - **Cancelled**: Displays quiz instances that are canceled. By default, these instances are sorted in ascending order by the **Number** field.
   
   - **All**: Displays quiz instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. From the required submodule, click a quiz instance.

   **Note**: When you select an instance in the **Completed** submodule, you are redirected to the User's Response page.

3. In the form, fill the fields. By default, the following fields are displayed for all submodules other than the **Completed** submodule.

   **Quiz instance form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this quiz.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Date by which the quiz instance should be completed. The system populates the due date based on the <em>Assessment duration</em> of the associated quiz definition, which is set to 14 days by default. The quiz due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td></td>
<td>Note: By default, the system runs the <em>Cancel Expired Assessments</em> script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.</td>
</tr>
<tr>
<td>State</td>
<td>State of the quiz.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User that the quiz instance is assigned to. This field becomes read-only when the state is <em>In progress</em>, <em>Complete</em>, or <em>Canceled</em>.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Related Link</td>
<td></td>
</tr>
<tr>
<td>View User's Response</td>
<td>Shows a read-only version of the survey responses completed by the user.</td>
</tr>
<tr>
<td>Related List</td>

</tr>
<tr>
<td>Assessment Instance Questions</td>
<td>All instance question records that store user response values for each question on the quiz questionnaire. The following columns are relevant to quiz:</td>
</tr>
<tr>
<td>Category</td>
<td>Displays the quiz categories the questions belong to.</td>
</tr>
<tr>
<td>Metric</td>
<td>Displays the quiz questions.</td>
</tr>
</tbody>
</table>

**Related information**

**Quiz scorecards**

The Quizzes application prepares printable scorecards.
A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

ℹ️ **Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

**Quiz category result details**

**Question results**

The Question Results view shows the results for all questions in a quiz.

Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.
Pie chart
The pie chart shows question results for these data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer

Bar chart
A bar chart appears when question results use this data type:

- Percentage
By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

**Average ratings**

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.

To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

Wizards

The Wizards functionality, which enabled administrators to create wizards that provide a step-by-step sequence of dialog boxes that lead the user through a procedure, was deprecated in the Eureka release. However, some users are still able to access this functionality if they enabled its plugin in previous releases.

For more information about this functionality, see https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html.

Service Catalog

With the ServiceNow® Service Catalog application, create service catalogs that provide your customers with self-service opportunities. Customize portals where your customers can request catalog items such as service and product offerings. You can also standardize request fulfillment to ensure the accuracy and availability of the items in the catalogs.

**Service Catalog management terms and roles**

The Service Catalog management application uses these roles to manage different aspects of the application.

**Service Catalog terms**

*Execution Plans*
Define how something gets delivered. For example, a PDA could go through procurement / activation / and installation of the desktop software.

**Execution Plan Tasks**

Plan Tasks represent a step in the Execution Plan, are associated with a Fulfillment Group, and have an approximate duration.

**Fulfillment Groups**

Fulfillment Groups work execution tasks. For example, one group can activate a cell phone while a different group installs the desktop software.

**Tickets**

Tickets represent work done by Fulfillment Groups as part of an Execution Plan.

**Service Catalog Management Roles**

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator [admin]</td>
<td>Can manage all aspects of the Service Catalog application, including scripting functions such as creating UI macros or business rules.</td>

<td>Can manage the Service Catalog application, including catalogs, categories, and items, but not including scripting functions available to administrators.</td>
</tr>
<tr>
<td>Catalog manager [catalog_manager]</td>
<td>Can edit and update a service catalog, as well as the categories and catalog items within the catalog. The manager can assign editors and also a different manager for the service catalog.</td>
</tr>
<tr>
<td>Catalog editor [catalog_editor]</td>
<td>Can edit and update a service catalog, as well as categories and catalog items within the catalog. The editor can assign other editors, but cannot change the catalog manager.</td>
</tr>
<tr>
<td>Catalog builder editor [catalog_builder_editor]</td>
<td>Can create and maintain items in the catalog builder using the templates that the user has access to.</td>
</tr>
</tbody>
</table>
Service catalog setup

Service Catalog enables users with the Catalog Administrators role (catalog_admin) to set up the service catalog.

Service Catalog enables you to set up one or more service catalogs and provides self-service opportunities. You can organize your catalog offerings by using the ability to publish multiple catalogs targeted to specific audiences.

An overview of ServiceNow service catalog administration.

Set up a service catalog

To set up a Service Catalog, plan the way your organization defines and maintains Service Catalog items, and how it fulfills them.

About this task

Administrators and catalog administrators, users with the catalog_admin role, can use the Service Catalog application to define service catalog content and layout. Catalog managers, users with the catalog_manager role, can define and manage a single service catalog. Catalog editors, users with the catalog_editor role, can manage a single service catalog.

Administrators and catalog administrators can define and manage multiple service catalogs. A catalog manager can define and manage a single catalog. One or more catalog editors can manage a single catalog.

Follow these steps to plan for your service catalog:

Procedure

1. Assign roles to the users working with the service catalog.
2. Define content to provide in the service catalog:

<table>
<thead>
<tr>
<th>Catalog items</th>
<th>The goods and services available within the catalog.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Categories</td>
<td>The groups of items displayed on the catalog home page</td>
</tr>
<tr>
<td>Variables</td>
<td>The options available for tailoring a catalog item to meet specific needs.</td>
</tr>
</tbody>
</table>

3. Customize the service catalog homepage to meet your requirements such as defining a Classic Mobile layout.
4. Define the request fulfillment processes your organization uses to deliver ordered catalog items.
5. [Optional] Create a navigation module for the new catalog.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
What to do next
Administrators and catalog administrators can further extend the service catalog to provide more powerful features, using specialized catalog items, configuration options, and scripting functions. For example, administrators can customize the checkout process used when ordering catalog items.

Set up Platform URLs for catalog modules
You can direct users to a specific catalog via a URL to a module in that particular catalog.

About this task
When you create a module for your catalog page, you can direct users to a specific catalog and view from this module via a URL.

Procedure
In the Link Type section, select URL (from Arguments), then in the Arguments field, enter a URL of the form `catalog_home.do?sysparm_catalog=id of sc_catalog record&sysparm_catalog_view=view name of sys_portal_page`.

For example, `catalog_home.do?sysparm_catalog=742ce428d7211100f2d224837e61036d&sysparm_catalog_view=catalog_technical_catalog`.

⚠️ Note: If you make the default catalog inactive, then deactivate the Catalog module otherwise users can continue to access the inactive catalog using that module.

If a URL has a valid `sysparm_catalog` parameter, but an invalid or missing `sysparm_catalog_view` parameter, the view with the default value from the corresponding Catalog Portal Page record is used.

If a URL has a valid `sysparm_catalog_view` parameter, but an invalid or missing `sysparm_catalog` parameter, the corresponding Catalog Portal Page record is used to set the catalog.

⚠️ Note: To ensure peak performance, define both parameters correctly.

Multiple service catalogs setup
Multiple service catalogs enable your organization to offer different sets of services to different teams within the organization, such as IT services, human resources, and facilities management.

Administrators and catalog administrators can define and manage multiple service catalogs. End users can access multiple catalogs from a single
homepage, can search across all catalogs, or can search directly within each catalog.

**Enabling access for catalogs**

You can enable read access to the catalogs by applying the rule **read ACL** on Catalog (sc_catalog) table. See [Access Control Rules](#) for more information.

**Create a catalog**

Using Service Catalog, you can create a catalog and define items and categories within the catalog.

**Procedure**

1. **Navigate to Service Catalog > Catalog Definitions > Maintain Catalogs.**
2. Select **New**.

   ![Catalog configuration form](image)

3. Enter the new catalog details (see table).
4. Right-click the form header and select **Save**.
5. Define catalog items and categories to include in the catalog.
6. **Optional**: Define additional portal pages for the catalog.
7. **Optional**: Manage sites if you are using a CMS system.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Descriptive name for the catalog.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope for this catalog. For information on the application scope, see <a href="#">Application scope</a>.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Manager</td>
<td>Name of the catalog manager assigned to this catalog. (Optional) The manager is able to edit and update the catalog, as well as the categories and catalog items within the catalog. The manager can assign editors and also a different manager for the catalog, if desired. Only one manager can be assigned to a catalog and must have the catalog manager role or catalog_admin role assigned.</td>
</tr>
<tr>
<td>Active</td>
<td>Select the check box to make the catalog available to end users.</td>
</tr>
<tr>
<td>Editors</td>
<td>Name of the catalog editor. (Optional) The editor is able to edit and update the catalog, as well as categories and catalog items within the catalog. The editor can assign other editors, but cannot change the manager. Multiple editors can be assigned to a catalog. Each user must have the catalog editor role assigned.</td>
</tr>
<tr>
<td>Enable Wish List</td>
<td>Select the check box to enable the wish list feature for the catalog.</td>
</tr>
<tr>
<td>Description</td>
<td>Information about the catalog, displayed on the multi-catalog homepage.</td>
</tr>
<tr>
<td>Background Color</td>
<td>The background color used for the catalog on the multi-catalog homepage.</td>
</tr>
<tr>
<td>Desktop image</td>
<td>The larger image to display with the catalog on the multi-catalog homepage. This image is only shown if image display is included in the renderer selected, such as the default Title and Image renderer.</td>
</tr>
<tr>
<td>'Catalog Home' page</td>
<td>The location to direct service catalog users to when they click the Catalog Home button. This field is designed to reference a content page url suffix.</td>
</tr>
<tr>
<td>'Continue Shopping' page</td>
<td>The location to direct service catalog users to when they click the Continue Shopping button. This field is designed to reference a content page url suffix.</td>
</tr>
</tbody>
</table>

**What to do next**

To add a module in the navigator for the new catalog, see [Create a module](#).
Manage items in a catalog

Using Service Catalog, you can view and manage items within a catalog.

About this task

Use the Catalog Items related list on the Catalog form to view and manage the items available in the catalog.

To define a new catalog item for the catalog, click New and enter the details for the item.

Manage catalog portal pages

Using Service Catalog, you can create and manage multiple portal pages for a catalog.

About this task

A catalog portal page provides a homepage for a specific catalog. You can use portal pages to create different catalog views for different user groups. Each portal page accesses the same catalog content and presents that content in different ways.

Catalog portal page details include the owner, title, and view to use for that page.
Procedure

1. The Catalog Portal Pages related list shows portal pages available for that catalog. Each catalog has a default page, created automatically when the catalog is created.

2. Select an appropriate action:
   - Click **New** to create a new portal page.
   - Click **Edit** to select another portal page for the catalog.
   - Select a portal page to view and edit details for that page.

Tables provided with multiple service catalogs

Administrators and catalog administrators must consider these points before they upgrade to multiple service catalogs.

Before upgrading, be aware of changes made to the underlying Service Catalog data model. These changes are made to implement multiple catalogs and do not affect a standard upgrade. However, if you have made customizations, such as changes to the data model, the changes can impact the instance.

The following tables are provided with multiple service catalogs:

<table>
<thead>
<tr>
<th>Table [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog Site [sc_catalog_site]</td>
<td>Associates catalogs to sites.</td>
</tr>
<tr>
<td>Catalog Portal Page [sc_catalog_view_mtom]</td>
<td>Links catalogs to CMS portal pages. Defines the default catalog to portal page combination used by default links.</td>
</tr>
<tr>
<td>Catalog Items Catalog [sc_cat_item_catalog]</td>
<td>Stores the catalogs an item is available in.</td>
</tr>
<tr>
<td>Catalog Item Category [sc_cat_item_category]</td>
<td>Stores the categories an item is available in.</td>
</tr>
</tbody>
</table>

Catalog site records

Catalog site records appear in the **Sites** related list on the Catalog form.
The Catalog Site [sc_catalog_site] table associates catalogs with CMS web sites. Several service catalog system properties are used to specify values for different sites used by different catalogs.

### Catalog site records properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Catalog site field [name]</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.sc.home.cms_page</td>
<td>CMS homepage [cms_home]</td>
</tr>
<tr>
<td>glide.sc.search.cms_page</td>
<td>CMS search page [cms_search]</td>
</tr>
<tr>
<td>glide.sc.continue.shopping.target</td>
<td>CMS 'Continue Shopping' page [cms_continue_shopping]</td>
</tr>
</tbody>
</table>

### Service catalog categories

Categories organize service catalog items into logical groups. Administrators and catalog administrators can create and configure categories, defining their characteristics and adding content such as catalog items to them.

Categories can have a parent-child relationship, for example, **IT** and **Laptops**. A child category is a subcategory of its parent category. Each catalog item, order guide, record producer, content item, and subcategory appears as a single item within the category. A catalog item can exist in multiple categories, giving you the flexibility to offer the same service from multiple places within your catalog.

Introduces creating categories in a ServiceNow Service Catalog.

---

Certain system properties control the following Service Catalog category configuration.
• How categories are displayed to users. For example, are subcategories displayed in a panel or as a list in the category view.

• What content types and search and navigation elements are available on the homepage. For example, searching the service catalog can be enabled or disabled for all users.

• How catalog items, item class names and item categories appear to users. For example, what number of catalog items or categories are previewed in a section.

Catalog managers and catalog editors can also configure categories, but only categories to which they are assigned.

Note:

• If there are no active items in a category’s hierarchy, that category does not appear in the catalog, and cannot be added to the catalog.

• Users with the admin or catalog_admin roles can view categories only if there is an active item in the category and Availability is set to either Desktop or Both.

• Configure the glide.sc.category.canview.override property to change the roles for this behaviour.

Create a category

Administrators and catalog administrators can create or edit a category.

About this task
To create or edit a category:

Procedure

1. Navigate to Service Catalog > Catalog Definition > Maintain Categories.
   A list of existing categories appears. If the Parent field is blank, the category does not have a parent category.

2. Click New or select the category to edit.
Note: The visibility of a category is controlled by user criteria. See Apply user criteria to items and categories.

### Service Catalog categories

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Descriptive name for the category.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope in which the category is applicable.</td>
</tr>
</tbody>
</table>

3. Fill in the fields on the form, as appropriate.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog</td>
<td>The catalog this category belongs to.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to indicate that the category is available to add to the service catalog homepage.</td>
</tr>
<tr>
<td>Location</td>
<td>Any location information relevant for the category.</td>
</tr>
<tr>
<td>Parent</td>
<td>Any parent category for which this category is a subcategory.</td>
</tr>
<tr>
<td>Description</td>
<td>Information about the category. The description appears when the category is collapsed on the service catalog homepage. The description also appears in the Related Categories list when a user clicks the parent category title.</td>
</tr>
<tr>
<td>Icon</td>
<td>The small icon displayed beside the category name, when the category is listed as a subcategory.</td>
</tr>
<tr>
<td>Header icon</td>
<td>The icon displayed beside the category header, when the category is a top-level category.</td>
</tr>
<tr>
<td>Desktop image</td>
<td>A larger image to display with the category on the Service Catalog homepage. This image is visible only if the relevant renderer defines it to be used (the default renderer does not display this field).</td>
</tr>
<tr>
<td>Classic Mobile image</td>
<td>A picture to use on Classic Mobile devices for this category. If a mobile image is not selected, the Desktop image appears if the Classic Mobile Subcategory Render Type is set to Cards.</td>
</tr>
<tr>
<td>Classic Mobile Subcategory Render Type</td>
<td>The rendering option to control how subcategories are displayed. Select List for a single-column list, or Cards for a multi-column display.</td>
</tr>
<tr>
<td>Hide description (classic mobile browsing)</td>
<td>Option for displaying the description at the top of the list on Classic Mobile devices.</td>
</tr>
</tbody>
</table>

### Configure dynamic categories

Dynamic categories let you organize and display commonly requested items and knowledge articles. Dynamic categories appear on the right side of the service catalog homepage by default.
About this task
Use dynamic categories to provide users with an access option that automatically adjusts to changing request trends.

To configure dynamic catalog categories:

Procedure
1. Navigate to Service Catalog > Catalog Definition > Maintain Dynamic Categories.
2. Select New or open an existing dynamic category.
3. Fill in the fields on the Dynamic category form, as appropriate.
   The Dynamic category form contains many of the same fields as the Category form. Additional fields are:

   **Name of form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The kind of items to display. Can be Requested items or KB Articles</td>
</tr>
<tr>
<td>Search how long?</td>
<td>For catalog items only, the period during which to search for the most common requests. For example, enter 7 00:00:00 to display the most commonly requested items in the previous seven days.</td>
</tr>
<tr>
<td>Number of Entries</td>
<td>The number of items to display in the dynamic category.</td>
</tr>
</tbody>
</table>

4. Use this example of a step with additional info.
   The results displayed are limited to those items or knowledge articles available in the currently viewed catalog.

Service catalog items
The overall catalog is made up of a collection of discrete catalog items.

The basic Service Catalog item types include:

- Standard catalog items
- Record producers: giving alternative ways of adding information such as Incidents via the service catalog.
• Order guides: to group multiple catalog items in one request.
• Content Items: catalog items which provide information instead of goods or services.

Standard catalog item

A catalog item can be a good or service. If something can be ordered by itself, it is a catalog item. If something only makes sense as part of a greater whole, it is part of an item, rather than an item in and of itself. For example, a new Dell server is a catalog item, as is a new Executive Desk.

Use a catalog item to publish a service to your users. Add a service description, images, and a workflow to determine the approval and fulfillment processes for the catalog items.

Use the variables to present and gather information from the users. Catalog UI Policies and Catalog Client Scripts can also be added to control the item behavior based on user input.

An overview of catalog items in the Service Catalog: what they are, and how to create them and define variables for them.

Types of catalog items

Service Catalog offers a few types of catalog items.

The basic Service Catalog item types include:
• Record producers: giving alternative ways of adding information such as Incidents via the service catalog.
• Order guides: to group multiple catalog items in one request.
• Content Items: catalog items which provide information instead of goods or services.

Record Producer

A record producer is a specific type of catalog item that allows end users to create task-based records, such as incident records, from the service catalog.

Use record producers to provide a better end-user experience instead of using the regular task-based form for creating records. The look and feel of a record producer is similar to that of a catalog item. But the record producer generates a task record such as incident, instead of a requested item.

You can create a record producer for tables and database views that are in the same scope as the record producer. You can also create a record producer for tables that allow create access from applications in other scopes.

Define a record producer in the service catalog or from the table record.

Note:

• Use a record producer to create task-based records only.
• To ensure that standard service catalog processes are followed, such as initiating workflows as expected, do not create requested item records from record producers. Instead, create requested item using catalog items.
• If the record producer script aborts the record generation, no record is generated in the Item Produced Record [sc_item_produced_record] table.

Note: Do not call the update, setAbortAction method, or set the sys_class_name on current record to avoid unexpected behavior.

Create a record producer

You can create a record producer for tables and database views that are in the same scope as the record producer. Also for tables that allow create access from applications in other scopes.

Before you begin
Role required: catalog_admin or admin
About this task
An overview of record producers in the Service Catalog: what they are, and how to create them and define variables and templates for them.

Procedure
1. Navigate to Service Catalog > Catalog Definition > Record Producers.
2. Click New or select the record producer to edit.
3. Complete the Record Producer form.

Record Producers in the Service Catalog

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The descriptive name for the record producer.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The list shows only tables and database views that meet the scope protections for field styles.</td>
</tr>
<tr>
<td>Table name</td>
<td>The table in which the record producer creates records.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box for making the record producer active. Only active record producers are available to users if they meet the role criteria.</td>
</tr>
<tr>
<td>Preview Link</td>
<td>A link that opens a preview of the item.</td>
</tr>
<tr>
<td>Post insert script</td>
<td>Script that operates on the submitted record, after the record is inserted in the associated table.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Post insert script overrides the target record values and record producer template values.</td>
</tr>
<tr>
<td>Accessibility</td>
<td></td>
</tr>
<tr>
<td>Catalogs</td>
<td>The service catalog this record producer belongs to.</td>
</tr>
<tr>
<td>Category</td>
<td>The service catalog category this record producer belongs to. When users perform catalog searches, only items that are assigned to a category appear in search results.</td>
</tr>
<tr>
<td>View</td>
<td>The CMS view in which the item is visible.</td>
</tr>
<tr>
<td>Roles</td>
<td>The roles required to use the record producer.</td>
</tr>
<tr>
<td>Availability</td>
<td>The interface the record producer is available from: Desktop and Classic Mobile, Desktop Only, or Classic Mobile Only.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Can cancel</td>
<td>A check box for displaying a <strong>Cancel</strong> button on the record producer. Users can click <strong>Cancel</strong> to cancel the record producer and return to the last-viewed screen</td>
</tr>
</tbody>
</table>
| What it will contain  | **Short description**  
A short summary of the record producer.                                                                                                           |
|                       | **Description**        
The full description of the record producer. You can embed videos, images, links to internal knowledge base (KB) articles, and links to external sources of information and instruction documentation.  
The description appears under a **More information** link on the record producer to give users any additional information they need. |
<p>| Meta                  | Comma-separated list of tags used to search for the record producer. See <a href="#">Configure keyword search for catalog items</a>.                                                                                      |
| Hide on Service Portal| If selected, the record producer is not available on Service Portal.                                                                                                                                         |
| Redirect To           | Specifies the redirect behavior of the record producer after its generation. Possible values are:                                                                                                       |
|                       | • <strong>Generated Task record</strong>: Redirects to the task record created using the record producer.                                                                                                               |
|                       | • <strong>Catalog Homepage</strong>: Redirects to the service catalog where the order for the record producer is placed.                                                                                               |
|                       | The default value is based on the <strong>Specifies the default behavior of record producer after record generation</strong> property in the <strong>Service Catalog &gt; Catalog Administration &gt; Properties</strong> page. |
| Script                | Scripts that are run to dynamically assign values to specific fields on the created record.                                                                                                               |
| Icon                  | The small icon that appears on the list of service catalog items. <strong>Click the Click to add</strong> link and upload the photo.                                                                                  |</p>
<table>
<thead>
<tr>

<td>This section is available only when the Universal Request plugin (com.snc.universal_request) is activated. For information about this configuration, see <strong>Service Catalog configuration for Universal Request</strong>.</td>
</tr>
<tr>
<td>UR certified/enabled item</td>
<td>Option to specify that a universal request should also be created along with a task-based record.</td>
</tr>
<tr>
<td></td>
<td>In the universal request, a reference is created to the associated task-based record, which becomes the primary task of the universal request.</td>
</tr>
<tr>
<td>Requires Additional Review</td>
<td>Option to automatically select the <strong>Needs resolution review</strong> check box on the corresponding universal request. For information about the universal request fields, see <strong>Universal Request form</strong>.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Requires Additional Review</strong> field appears only when the <strong>UR certified/enabled item</strong> check box is selected.</td>
</tr>
</tbody>
</table>

4. To add attachments such as information and instruction documentation to the catalog item, see **Add an attachment**.
5. Click **Submit**. After you submit the form, the **Variables, Variable Sets, Categories,** and **Catalogs** related lists become available.

6. Open the record again to define variables for the record producer.

**Create record producers from tables**

You can create Service Catalog record producers directly from a table record.

**About this task**

To create a record producer from a table record:

**Procedure**

1. Navigate to **System Definition > Tables** and open the table record.

   - **Note:** When using a workflow with a Record producer, set the condition to Run the workflow.

2. Under **Related Links**, click **Add to Service Catalog**.

3. Complete the **Name, Short Description,** and **Category** fields as you would for service catalog items.

4. Use the slushbucket to select the fields and the order in which you want them to appear. To use container variables, select `- container start -` and `- container start -`.
5. Click **Save and Open** to open the record producer and define additional options. Alternatively, click **Save** to return to the table record.

- A record producer is created with these values:
  - **Table name**: table record opened in step 1
  - **Name**, **Short Description**, and **Category**: information entered in step 3
- A variable is created for each of the selected fields with these values:
  - **Name**: Column name of the field
  - **Type**: Variable type that corresponds to the field type
  - **Order**: Position selected in the slushbucket (for example, 100 for the first field and 200 for the second field)
  - **Question**: Column label of the field
- If the field type is **Choice**, a corresponding question choice is created for each field choice.
- The new record producer is added to the **Record Producers** related list on the table record.

### Populate record producer data and redirect users

You can enter data for all records created by the record producer, and redirect an end user to a particular page after the record producer is submitted.

To enter data with a record producer, use any combination of the following methods:

- Create a variable on the record producer with the same name as the field in the target record. For example, a variable named `caller_id` on a **Create a New Incident** record producer populates the `caller_id` field on the new incident record. Use a variable type that corresponds to the field type.

- Define a **template** to assign a static field value for all records created by the record producer.

- Define a script that uses any variable or server-side objects and functions to assign values.
  - Use `current.*FIELD_NAME*` to reference fields on the record being created.
  - Use `producer.*VARIABLE_NAME*` to reference values entered by the end user.
  - Use `RP.getParameterValue` to return specified parameter values passed on the URL. The RP stands for Render Properties, not Record Producer.
Redirect after submitting a record producer

To redirect an end user to a particular page after the record producer is submitted, define the redirect link in the **Script** field using any of the following:

- `producer.redirect`: Enables the redirect behavior within the Platform UI.
- `producer.portal_redirect`: Enables the redirect behavior within Service Portal.

For example, the following code redirects users to their homepage after the record producer is submitted:

- **Within the Platform UI:**
  
  ```
  producer.redirect="home.do";
  ```

- **Within Service Portal:**
  
  ```
  producer.portal_redirect = "sp?id=sc_home"
  ```

The following code gives the id of the record producer:

```
RP.getParameterValue('sysparm_id')
```

**Variables to collect data for record producer fields**

Use variables to collect data for record producer fields.

You can use the following variable types to collect data for the corresponding record producer fields.

**Variables for record producer fields**

<table>
<thead>
<tr>
<th>Field type</th>
<th>Recommended variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>True/False</td>
<td>Yes/No</td>
</tr>
<tr>
<td>Reference</td>
<td>Reference</td>
</tr>
<tr>
<td>Date or Due Date</td>
<td>Date</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Date/Time</td>
</tr>
<tr>
<td>Choice or any field with an associated choice list</td>
<td>Select Box</td>
</tr>
<tr>
<td>Email address</td>
<td>Email</td>
</tr>
<tr>
<td>URL</td>
<td>URL</td>
</tr>
<tr>
<td>HTML</td>
<td>HTML</td>
</tr>
<tr>
<td>List or UI Action List</td>
<td>List Collector</td>
</tr>
</tbody>
</table>
Variables for record producer fields (continued)

<table>
<thead>
<tr>
<th>Field type</th>
<th>Recommended variable type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String with length greater than 256</td>
<td>Multi-Line Text</td>
</tr>
<tr>
<td>String, Integer, Decimal, Floating Point Number</td>
<td>Single-Line Text</td>
</tr>
<tr>
<td>File Attachment</td>
<td>Attachment</td>
</tr>
<tr>
<td>All other field types</td>
<td>Multi-Line Text</td>
</tr>
</tbody>
</table>

Note:

- If the record producer variable is mapped to an encrypted field of another table, then this variable value is not stored in Question Answer [question_answer] table. So, it is also not available in the variable editor of the target record.

- If the record producer variable is masked and encrypted, and also mapped to an encrypted field of another table:
  - The variable value is not stored in Question Answer [question_answer] table.
  - The decrypted value of the variable is copied to the encrypted field of the target record.

Values Returned

When you construct a record producer, be aware of the return value.

Most of these field types return a string. However, there are some exceptions. For example, a Reference value returns the sys_id of the target object, and a List value returns a comma-separated list of sys_ids.

Example 1: For a List value, return an array which can be iterated to retrieve the individual values submitted by your user:

```javascript
var sys_id_string = producer.glide_list_field;
var sys_id_list = string.split (',');
```

Example 2: For a Date or Date/Time value, return a date which GlideDate can evaluate.

```javascript
var glideDateTime = new GlideDateTime(producer.date_field);
```

Order guides

Order guide submits a single service catalog request that generates several items.
For example, a New Employee Hire order guide can contain several items that new employees commonly need, such as business cards, computer, and cell phone. After selecting this order guide, the customer can then provide information about the new employee, including location and job title. The order guide then submits an order for catalog items like business cards, based on the details provided.

Order guides determine which catalog items to order by evaluating order guide rule conditions. Information the customer enters within the order guide can be passed as cascading variables to the ordered items, allowing common information to be reused across multiple items.

Administrators and catalog administrators can create order guides for the service catalog.

Order guides can be run automatically, generating a set of ordered items without needing to manually submit a service catalog request. For example, an onboarding workflow for a new employee can automatically run an order guide to order items for that employee.

The script field in an order guide can be used to add or remove catalog items to or from the order guide. It can be added to the order guide form by configuring the form layout.

- To add a catalog item that is not added to the order guide via a rule base, write the following code in the script field:

  ```java
  guide.add("<sys_id_of_cat_item>")
  ```

- To remove a catalog item that is added to the order guide via a rule base, write the following code in the script field:

  ```java
  guide.remove("<sys_id_of_cat_item>")
  ```

**Video tutorial about order guides**

Shows how an order guide works from the self-service user perspective, and demonstrates how to create an order guide.

**Create an order guide**

You can create an order guide with a two-step or three-step ordering process.

**Procedure**

1. Navigate to **Service Catalog > Catalog Definition > Order Guides**.
2. Click **New**.
3. Fill in the fields as appropriate.
## Order guide

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Order guide name that appears in the catalog.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to indicate whether the order guide is active or not.</td>
</tr>
<tr>
<td>Category</td>
<td>Category heading under which the order guide appears in the catalog.</td>
</tr>
<tr>
<td>Two step</td>
<td>Check box to enable two step ordering instead of the default <strong>three-step ordering</strong>, omitting the final step. With two step ordering, selecting <strong>Check out</strong> submits the request immediately, then displays the order confirmation screen. This is not applicable for Service Portal.</td>
</tr>
<tr>
<td>Icon</td>
<td>A 16x16 pixel image to appear as an icon beside the order guide name in the catalog. If no image is uploaded, the default icon appears beside this order guide. To use your own default icon, upload an image, overwriting the image stored in images/service_catalog/generic_small.gif.</td>
</tr>
<tr>
<td>Cascade variables</td>
<td>Check box to select whether the variables used cascade, which passes their values to the ordered items. If this check box is cleared, variable information entered in the order guide is not passed on to ordered items.</td>
</tr>
<tr>
<td>Ordered Item Link</td>
<td>Link to more information about an ordered item. Select a predefined link item to appear on the ordered item screen. Customers can click the link to access more information. This is not applicable for Service Portal.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles that users must have to access this order guide.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary of the order guide purpose.</td>
</tr>
<tr>
<td>Description</td>
<td>Description that appears on the first page of the order guide. Apply formatting with the HTML editor.</td>
</tr>
<tr>
<td>Meta</td>
<td>Comma-separated list of tags used to search for the order guide. See <a href="#">Configure keyword search for catalog items</a>.</td>
</tr>
<tr>
<td>Hide on Service Portal</td>
<td>If selected, the order guide is not available on Service Portal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Picture</td>
<td>[Optional] Image of the item.</td>
</tr>
<tr>
<td>Order to cart</td>
<td>Check box allowing users to add order guides to their cart, then continue shopping rather than checking out immediately. This is not applicable for Service Portal.</td>
</tr>
<tr>
<td></td>
<td>Note: This setting only works when the Two step check box is also set to true.</td>
</tr>
</tbody>
</table>

### Portal Settings

Use these settings to configure the order guide behavior in Service Portal.

**Request method**

Setting that controls the label displayed for the **Order Now** button and the order submission experience.

- **Order**:
  - Button label: **Order Now**
  - Confirmation dialog box: Displayed
  - Delivery information: Editable

  Note: This is the default setting.

- **Request**:
  - Button label: **Request**
  - Confirmation dialog box: Displayed
  - Delivery information: Not displayed

  This setting can be used in scenarios such as a code access request where the delivery information is pre-determined.

- **Submit**:
  - Button label: **Submit**
  - Confirmation dialog box: Not displayed
  - Delivery information: Not displayed

  This setting can be used in scenarios such as reset password request where no further request information is required.

**Hide ‘Add to Cart’**

If selected, the **Add to Cart** button is not displayed for the order guide. If the **Show Add to Cart** instance option of the widget is set to false, then this setting is ignored.

This setting is selected by default if the **Request method** is **Request** or **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For upgrade scenarios, if the <strong>No cart</strong> field is selected in Platform, run the <code>CatalogPortalSettingsMigration</code> script include to update this setting to the <strong>Hide 'Add to Cart'</strong> field in the <strong>Portal Settings</strong> tab.</td>
<td></td>
</tr>
</tbody>
</table>

**Show Include Toggle**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If selected, a toggle is displayed for each catalog item in the <strong>Choose Options</strong> section in Service Portal. You can click this toggle to include or exclude the catalog item from the order guide request.</td>
</tr>
<tr>
<td>For zboot customers, this option is selected by default for existing order guides in the demo data and new order guides.</td>
</tr>
<tr>
<td>For upgrade customers, this option is selected by default only for new order guides.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

5. In the **Rule base** related list, define the **rules** that determine which items are included in an order.

6. **Optional:** In the **Variables** related list, define any variables required.

**Request an order guide**

Once created, order guides present the customer with a three-step ordering process by default.

**Procedure**

1. **Describe Needs:** Enter information as prompted. Order guide rules evaluate this information to determine which catalog items to order.

2. **Choose Options:** Select configuration options for the ordered items and provide any additional information needed, including attachments.

3. **Check Out:** Review and edit item information, then click **Submit Order** to place the request. If the requested item was ordered as part of an order guide, the **Order Guide** field on the Requested Item form shows the order guide name.

**Note:** The Check Out step can be omitted from an order guide to provide a quicker two-step process. To omit this third step, select the **Two step** check box when creating the order guide.
Review an order guide example

Consider a scenario where you have a New Employee Hire order guide that provides services and items as part of the onboarding process.

About this task

Procedure

1. **Describe Needs**: The order guide prompts the end user for information.

![Order guide example](image)

2. **Choose Options**: The order guide uses the information entered and predefined rules to generate options.

![Order guide example](image)

The end user selects configuration options for the ordered items, and provides any additional information needed.
3. Check Out: The end-user reviews and edits item information, then click **Submit Order** to place the request.

---

**Create an order guide rule to add a catalog item**

You can add a catalog item to an order guide using specific rules.

**About this task**

Order guide rules define conditions that must be met for a specific item to be included in an order. For example, a New Employee Hire order guide rule can state that if the new employee job title is CTO or Director, and the department is IT, then add an executive desktop item to the order.

**Procedure**

1. Navigate to **Service Catalog > Catalog Definition > Order Guides**.
2. Open an order guide.
3. In the **Rule base** related list, click **New**.
4. On the form, fill in the fields.

---

**Rule guide**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Guide</td>
<td>The order guide to which the created rules are applied.</td>
</tr>
<tr>
<td>At this position</td>
<td>Tab positions are numbered in order from left to right, with the lowest number appearing at the left of the screen.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that is being used.</td>
</tr>
<tr>
<td>If this condition is true</td>
<td>Conditions that must be true for this rule to apply. Create conditions using the <strong>condition builder</strong>. Conditions can be evaluated against <strong>Keywords</strong>, <strong>Requested By</strong>, <strong>Requested For</strong>, or any variables defined for that order guide.</td>
</tr>
<tr>
<td>Include this item</td>
<td>Item to include in the order if all conditions defined in <strong>If this condition is true</strong> are matched.</td>
</tr>
<tr>
<td><strong>Note:</strong> You can also include record producers in the order guide.</td>
<td></td>
</tr>
<tr>
<td>Ignore Mandatory Evaluation</td>
<td>Check box to allow customers to proceed without completing mandatory fields for the Describe Needs and Choose Options screens. The mandatory status of a field is determined by the variable defining that field. If mandatory fields are not enforced, then relevant information is not passed on to the ordered items. For example, in a New Employee Hire order guide, if the address is not provided then this information is not included in business cards ordered.</td>
</tr>
<tr>
<td>Use cart layout</td>
<td>Check box to use the cart layout that has been configured. Uncheck this check box to access the <strong>Show quantity</strong> check box option.</td>
</tr>
<tr>
<td>Show quantity</td>
<td>Check box to show the quantity ordered within the order confirmation. (Only visible if <strong>Use cart layout</strong> is unchecked.)</td>
</tr>
<tr>
<td>Quantity</td>
<td>Default quantity for the order guide. When quantity is shown, this value can be modified during checkout.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Create an order guide variable**

You can create variables within an order guide.

To create or edit order guide variables, open an order guide, then select an entry from the **Variables** related list.

Service catalog variables within order guides define the questions and potential answers presented to the customer while ordering. This information is used by order guide rules. Variables can also be cascaded, which passes the variable values along to individual ordered items.
Pricing is not supported for an order guide variable, even when you define the pricing for the variable though a variable set, and associate the variable set to the order guide.

Create an item variable assignment

Create an item variable assignment that enables the catalog admin set up a default value mechanism in the order guide context so that the user can focus only on required values.

About this task

For example, you can set the default storage of an iPhone to 64 GB for Sales, and to 16 kB for Development. This setting is configured in the new hire order guide by using mutually exclusive rules and setting the storage variable accordingly for Sales and Development.

The value for an item variable is determined in the following order:

1. Item variable assignment
2. Cascading value (if no item variable assignment exists)
3. Default value defined in the variable definition (if no cascading value or item variable assignment exists)

Procedure

1. Navigate to Service Catalog > Catalog Definition > Order Guides.
2. Open an order guide.
3. Open a rule.
4. In the Item Variable Assignments related list, click New.
5. On the form, fill in the fields.

Item Variable Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item Variable</td>
<td>Name of the Item variable. Select an item variable from the list or create one.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the record active.</td>
</tr>
<tr>
<td>Assignment Type</td>
<td>Name of the assignment type. Select either Order Guide Variable or Value. When Order Guide Variable is selected, the Order Guide Variable field is enabled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order Guide Variable</td>
<td>Name of the order guide variable. Select an order guide variable from the list or create one. (This field is only visible if Assignment Type is Order Guide Variable.)</td>
</tr>
</tbody>
</table>

6. Click Submit.

What to do next
Set an item variable value to match an order guide variable value, or an order guide default value, using an item variable assignment.

**Cascade an order guide variable**
Cascading enables values entered for variables in the initial order form to be passed to the equivalent variables in the ordered catalog items.

Cascading allows values entered for variables in the initial order form to be passed to the equivalent variables in the ordered catalog items. For example, a variable on the initial order form prompts the customer to enter a delivery location value. If you enable cascading, the value for this variable then populates delivery location fields on each of the ordered items.

To enable cascading, select the **Cascade variables** check box when creating the order guide. Then, create variables on the catalog items that match the names of the corresponding variables in the order guide. When a customer places an order, the variables on the ordered items inherit the values of the identically named variables in the order guide.

**Use a variable set**
You can use a variable set with an order guide.

**About this task**
Cascading variables require that the same variable be on both the order guide and the ordered items. It can be useful to define each variable once in a variable set, then assign the variable set to both the order guide and the individual catalog item. This approach avoids duplication and ensures that the variable is the same in both locations.

To use a variable set with an order guide:

**Procedure**
1. Create the variable set.
2. In the Variable Set form, create each variable.
3. Add the variable set to the order guide and to each catalog item involved.

⚠ Note: The individual variables in a variable set do not appear in the Order guide or Catalog Item forms. To view the variables in a variable set, open the variable set record.

**Hide cascaded variables**

You can hide the duplicated variables on the **Choose Options** screens to keep your screen clean.

When cascading variables, you can hide the duplicated variables on the Choose Options screens, making these screens simpler.

To hide duplicate variables on all screens after the initial Describe Needs screen in the Service Catalog Platform UI, run an **onLoad catalog client** script.

Example:

```javascript
function onLoad(){
    var item = $('current_item');
    var guide = $('sysparm_guide');

    if (item == null && guide == null)
        return;

    if(item != null && guide != null && item.value == guide.value)
        return;
    g_form.setDisplay('YOUR_VARIABLE_NAME',false);
}
```

To hide duplicate variables on all screens after the initial Describe Needs screen in Service Portal, use the **isOrderGuide()** API.

Example:

```javascript
if(g_service_catalog.isOrderGuide())
    g_form.setDisplay('variable_name', false);
```

**Avoid enforcement of a mandatory field**

You can avoid enforcing a mandatory field within tabs.

**About this task**

By default, mandatory fields must be filled in before switching tabs in the **Choose Options** section of order guides.
**Order guide mandatory fields**

In this example, if the customer attempts to select another tab without filling in the *Street Address* field, a warning prompt appears. The customer cannot switch tabs without entering this information.

To avoid this enforcement in all order guides:

**Procedure**

1. Navigate to **Service Catalog > Catalog Administration > Properties**.
2. Locate the property *Validate mandatory fields when switching tabs in 'Choose Options' section of Order Guides* (*glide.sc.guide.tab.validate*).
3. Clear the *Yes* check box.

   If you make this change, mandatory fields are still mandatory, but the customer can switch between tabs before filling in the mandatory fields. Enforcement is then checked when the customer chooses to proceed to the next step.

   To avoid enforcement of mandatory fields altogether, use the *Ignore Mandatory Evaluation* check box within the relevant order guide rule.

**Run order guides automatically**

You can run an order guide automatically from within a workflow or a server script, passing parameters to that order guide to define variable values.

Automatically generate a set of ordered items as part of a wider process, without needing to manually submit a service catalog request and reenter existing information.
For example, you can run an order guide to fulfill HR onboarding requests, passing parameters such as the new employee’s position and department. The order guide then generates a set of requested items such as laptop and email account, based on those parameters.

**Define a content item**

A content item is a service catalog item that provides information instead of goods or services.

**About this task**

Content items can reference knowledge articles, static blocks of text, or external web-based content.

To define content items:

**Procedure**

1. Navigate to **Service Catalog > Catalog Definition > Content Items**.
2. Click **New**.
3. Fill in the form to define the item.

**Content Item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name, Category, Icon, Roles, Active,</td>
<td>As for standard catalog items.</td>
</tr>
<tr>
<td>Content type</td>
<td>The type of information to display when a user selects the item.</td>
</tr>
<tr>
<td></td>
<td>• <strong>KB Article</strong>: a ServiceNow knowledge article available to users with the specified roles.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Catalog Content</strong>: a static block of text, formatted with HTML.</td>
</tr>
<tr>
<td></td>
<td>• <strong>External Content</strong>: documents or web pages stored outside the base system instance.</td>
</tr>
<tr>
<td>Target</td>
<td>Location where the content appears.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
• **Within Catalog**: displays the content within the catalog iframe window (which may not render some external websites properly).  
• **New Window/Tab**: displays the content in a new browser window or tab. Choose this option if the content does not display properly within the catalog.

**URL** | The full URL (including the prefix http:// or https://) for external content to display when a user selects the item. This field is available only if the **Content type** is **External Content**.

**Note**: Since base system instances are accessed via HTTPS, links to HTTP sites could result in a mixed mode content error or warning, depending on browser security settings.

**KB article** | The knowledge article to display when a user selects the item. This field is available only if the **Content type** is **KB Article**.

**Short description, Description, Picture** | As for standard catalog items. These fields are only available if the **Content type** is **Catalog Content**.

**Meta** | Comma-separated list of tags used to search for the content item. See **Configure keyword search for catalog items**.

**Hide on Service Portal** | If selected, the content item is not available on Service Portal.

4. Click **Submit**.

### Create or edit a catalog item
Define individual catalog items using Service Catalog. You can create, edit, and copy catalog items.

**Before you begin**
Role required: admin

© 2021 ServiceNow, Inc. All rights reserved.  
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. Navigate to Service Catalog > Catalog Definition > Maintain Items.
2. Click New.
3. Enter the catalog item details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to appear in the catalog.</td>
</tr>
<tr>
<td>Catalogs</td>
<td>Catalogs this item appears in.</td>
</tr>
<tr>
<td>Category</td>
<td>Category for the item. Categories can only be selected after the Catalogs field is populated. Catalog searches find only items that are assigned to a category.</td>
</tr>
<tr>
<td>Model</td>
<td>Product model to which the item is linked. This field is visible by default only for items created by publishing models. Click the reference icon to view the product model.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the item active (available to be ordered).</td>
</tr>
</tbody>
</table>

**Note:** Inactive catalog items added to order guides do not appear in the order guide. Use Visible On Guide, Visible elsewhere to hide the item and show only in the order guide.

<table>
<thead>
<tr>
<th>Access Type</th>
<th>Option to specify if a request can be submitted for a user who does not have access to the catalog item. Possible options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Restricted: The request can only be submitted for users who have access to the catalog item.</td>
</tr>
<tr>
<td></td>
<td>• Delegated: The request can be submitted even for users who do not have access to the catalog item.</td>
</tr>
</tbody>
</table>

By default, this field is set to Restricted. For information about delegated request experience, see Delegated request experience.

**Note:** This functionality is only applicable when the catalog item has a Requested For variable.

<p>| Owner       | Owner of the catalog item who has edit access to it.                                                                    |
| Template    | Template using which the item is created.                                                                               |</p>
<table>

4. Click **Submit**.

**What to do next**

- Assign the item to additional catalogs and categories, if required.
- Define **variables** for the item, if applicable.
- To add attachments such as information and instruction documentation to the catalog item, see [Add an attachment].

**Related information**

- [Create a service catalog variable](#)
- [Apply user criteria to items](#)
- [Set a recurring price](#)
**Edit a catalog item**

Catalog administrators can edit an item from the service catalog listing. Catalog managers and catalog editors can also edit an item if they are assigned to the item.

**About this task**
To edit a catalog item from the service catalog listing:

**Procedure**
Right-click the header and select one of the following options:
- **Configure Variables**: Add or remove variables from an item.
- **New Variable**: Create a new variable for the item.
- **Configure Item**: Edit the item definition.
- **Configure Client Scripts**: Edit the catalog client scripts for the item.
- **Configure UI Policies**: Edit the catalog UI policies for the item.

**Copy a catalog item**
Copy an item to create a full duplicate of the item, including the item details, attachments, variables, client scripts, and approvals.

**About this task**
Copying can be more useful than using the Insert function because the function only copies the item details.
Procedure

1. Open a catalog item form.
2. Use the Copy button to create a new copy of a catalog item, named Copy of [item name].

Note:
- If you copy an active catalog item, the copy is also active. Consider deactivating the copy by clearing the Active check box until your changes are complete.
- When you specify a table in the Relationship tables which should be part of the Copy Item Action. Table names should be comma separated property in the Service Catalog > Catalog Administration > Properties page, the table records that have a reference to a catalog item are also copied. It is applicable only when you copy the catalog item using the Copy UI action. Table names should be comma-separated without any spaces.

Add a catalog item

Service catalog enables you to add a catalog item to multiple catalogs and categories.

About this task
A catalog item may be available in more than one catalog and category. For example, a laptop carrying case can be available from both Laptops and Cases and Accessories categories.

Within an item:
- The Catalogs related list defines the catalogs where the item is available.
- The Categories related list defines the categories where the item is available.

Procedure

To assign an item to another category or catalog, enter the new details in the appropriate related list.

Note: The values in these lists override the values of the Catalogs and Category fields in the catalog item form. If you change values for either related list, these changes automatically update the values in those fields.
Share catalog items across catalogs

You can share a catalog item, enabling users to order that item from different catalogs. For example, you can share a Password Reset item across catalogs serving different teams.

About this task

To share a catalog item across several catalogs:

Procedure

1. Navigate to Service Catalog > Catalog Definition > Maintain Items
2. Open the item to share.
3. Select the additional catalogs for that item in the Catalogs field.

Shared Catalog Item
4. Select Update.

The shared item then appears in the Catalog Items related list for each catalog selected.

Item diagnostic report

For a catalog item data and configuration, you can identify possible violations from the ServiceNow recommended practices.

The item diagnostic report includes a score that measures the health of the item, and a list of diagnostic result entries. These entries consist of a rule, a document (record that violates the rule), and a count (the number of violations in the record).

Correct violations for best performance and to maintain expected behavior.

The lower the score, the better (0 is ideal). A higher score means that an item has more violations from the ServiceNow recommended practices. Each rule has a different weight and level of importance. For example, a violation of duplicate
variables is more likely to result in user issues. An AJAX usage violation is less likely to cause issues since the result could simply cause a delay in the UI.

Default diagnostic rules
These diagnostic rules are designed as per ServiceNow recommended practices.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkUserCriteriaUsage</td>
<td>Identifies if the item is using entitlements instead of user criteria</td>
</tr>
<tr>
<td>checkBalancedContainers</td>
<td>Checks if the Container Start and Container End variables are balanced.</td>
</tr>
</tbody>
</table>
Default diagnostic rules (continued)

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>checkDuplicateVariables</td>
<td>Identifies variables with the same name associated to a catalog item (or an associated variable set).</td>
</tr>
<tr>
<td>checkDOMManipulation</td>
<td>Identifies any DOM violation in catalog client scripts. The DOM is not guaranteed to be the same between releases and can affect catalog client scripts during upgrades. Therefore, it is not recommended for customers to do any kind of DOM manipulation. You can view detailed information for each client script by clicking the information icon.</td>
</tr>
<tr>
<td>checkLookupVariableRowCount</td>
<td>Checks if the Lookup variable is run on tables with many records as it can lead to slower load times.</td>
</tr>
<tr>
<td>checkAJAX</td>
<td>Identifies all AJAX calls in catalog client scripts because, although AJAX calls in catalog client scripts are allowed, they must be asynchronous. All AJAX calls are listed because even asynchronous calls can cause some delay. You can view detailed information for each client script by clicking the information icon.</td>
</tr>
<tr>
<td>checkSelectBoxUnique</td>
<td>Identifies Select Box type variables that have the attribute enabled to show only unique entries in the select box.</td>
</tr>
<tr>
<td>checkOrderGuideRuleBaseCount</td>
<td>Checks for high number of active rule bases in an order guide as higher number of rule bases can lead to slower load times</td>
</tr>
<tr>
<td>checkFormatterVariablesUsage</td>
<td>Checks if the item has the following variable types:</td>
</tr>
</tbody>
</table>
### Default diagnostic rules (continued)

</table>

For information on the variable availability across various channels, see [Variable support in various channels](#).

---

### Run the Item Diagnostic Results report

Identify the catalog items that are not designed per ServiceNow recommended practices to run your catalog efficiently.

**Before you begin**

Role required: admin or catalog_admin
About this task
This report runs every weekend on all catalog items of all types.

Procedure
1. Navigate to Service Catalog > Catalog Administration > Request Reports.
2. Select the [Catalog] Item Diagnostics Results report.
   A report is displayed with all active catalog items with a non-zero score. These catalog items are grouped by score and each score has a different color.
3. Click the score to diagnose the associated catalog items.

   Note:
   • Any item with a score greater than zero indicates a recommended practice rule violation.
   • The higher the score, the more is the catalog item deviating from ServiceNow recommended practices.
4. Click the score of the required catalog item.
   Diagnostic results are displayed for the catalog item with violated rules.
   For information on default diagnostic rules per ServiceNow recommended practices, see Item diagnostic report.
5. To understand details of each violated rule, click the Count value for that rule.

Specify related items and articles for a catalog item
Specify related items and articles for a catalog item to provide alternatives and additional information. These items and articles are displayed in the catalog item page in Service Portal and Now Mobile.

Before you begin
Role required: admin, catalog_admin, or catalog_editor

About this task
You cannot specify related items and articles for an order guide.
You cannot specify these types of items as related items for a catalog item.
• Wizard Launcher
• Content Item
• Standard Change Template
• Any item in Admin Home catalog
Procedure

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. Select the required catalog item.
3. To specify a related article, perform these steps.
   a. In the Related Articles related list, click Edit.
   b. On the Edit Members form, move the required articles from the Collection column to the Related Articles List column.
   c. Click the up or down icon to arrange articles in the required order and click Save.
4. To specify a related catalog item, perform these steps.
   a. In the Related Catalog Items related list, click Edit.
   b. On the Edit Members form, move the required items from the Collection column to the Related Catalog Items List column.
   c. Click the up or down icon to arrange items in the required order and click Save.

   Note: In Service Portal, use the instance options to configure the number of articles and items shown in the Related Articles and Related Items section. See Configure related catalog item widget instance options or Configure knowledge related articles widget instance options.

Related information

Map related articles

Add an ordered item link to an item

Use ordered item links to provide a link on the ordered item screen that provides more information about an item.

Before you begin
Role required: Catalog administrator

About this task
After you order the catalog item, you can click the link to see relevant information about the item ordered, for example, for standard delivery terms and conditions. The URL text and link can be defined once and reused across multiple items.

Links are rendered with an added parameter providing the sys_id of the requested item. For example, if the link is mylink.com, it is rendered as
mylink.com?req_item=abcde12345. This added parameter can be useful for virtual provisioning situations.

⚠️ Note: Ordered item links cannot be configured for Classic Mobile devices.

Procedure
1. Navigate to Service Catalog > Catalog Definition > Ordered Item Links.
2. Click New.
3. Enter a Name for the ordered item link.
4. Enter Link text to display as the link. For example, click here to see more information about the iPhone.
5. Enter the exact Link URL. For example, http://www.mylink.com.
6. Select the Target. You can choose to open the link in a new window or tab, or within the catalog. If Within Catalog is chosen, the link must be within the same site. An HTTP site cannot be called from within HTTPS.
7. Click Submit.
8. Navigate to Service Catalog > Catalog Definition > Maintain Items.
9. Click an item Name.
10. In the Ordered Item Link field, click the reference lookup icon.
11. Click an ordered item link Name.
12. Click Update.

Service catalog UI policy
UI policies can be used to define custom process flows for tasks.

Catalog UI policies control the behavior of catalog item forms when presented to your users. Catalog UI policies can be applied to a catalog item or a variable set.

UI policies are useful when applied to service catalog items. Keep the following points in mind when creating service catalog UI policies:

- A catalog UI policy applies to either a specific catalog item or any item that uses a specific variable set.
- A catalog UI policy can only contain and reference variables that are defined for the catalog item or variable set.
- Like UI policy conditions, the variables in a service catalog UI policy condition must be visible (even if hidden by UI policy or read-only) on the form for the
condition to be tested. Also, ensure that the variables have names. For more information, see Create a catalog client script.

- Limited UI policy functionality applies to following variables:
  - The Mandatory and Read Only policy do not apply to the following variable types: Break, Container Split, Container End, UI Macro, UI Macro with Label, Label, UI Page.
  - The Set visible policy does not apply to the following variable types: Break, Container Split, Container End.

- Service catalog UI policies are applied to variables and variable sets of catalog items ordered in the service catalog. Policies can also be applied when the variables are present in a Requested Item or Catalog Task form.

- Catalog UI policy actions can be applied on a variable set. The actions on a variable set are applied on all variables within the variable set. If different catalog UI policy actions are applied on a variable or a variable set, the action with the lowest order is considered.

- The priority order for UI actions types is:
  1. Mandatory (highest)
  2. ReadOnly/Display

If a variable is set to mandatory and does not have value, readonly or hide do not work on that variable. If a variable is hidden or readonly, and then set to mandatory, the variable field becomes visible or editable.

This priority order is also applicable for variable sets and containers. If a variable set or container has a mandatory variable without any value, then the container or variable set cannot be hidden.

- Catalog UI policies are supported for catalog items viewed in a service catalog wizard.

> **Note:** The UI policy for catalog items always takes precedence over UI policy for variable sets. You can change this behavior by editing the glide.sc.ui_policy.variable_set_run_first property.

**Create a UI policy for catalog items**

You can apply UI policies for catalog items ordered in the service catalog.

**Procedure**

1. Navigate to Service Catalog > Catalog Administration > Catalog UI Policies.
2. Click New.
3. In the **Applies to** field, select **A Catalog Item**.
4. Fill in the remaining fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Applies to**               | Select the type of item this UI policy applies to:  
  • **A Catalog Item**: enables the **Catalog item** field.  
  • **A Variable Set**: enables the **Variable set** field.                                                                                   |
<p>| <strong>Catalog Item or Variable Set</strong> | Select the catalog item or a variable set this UI policy applies to. The field name and options available depend on the <strong>Applies to</strong> selection. |
| <strong>Short description</strong>        | Enter a brief description (example, Out-of-state move).                                                                                     |
| <strong>Active</strong>                   | Select the check box to enable the UI policy. Clear the check box to disable it.                                                            |
| <strong>When to Apply</strong>            |                                                                                                                                              |
| <strong>Catalog Conditions</strong>       | Create conditions for the UI policy using catalog item variables. The policy is applied if the conditions evaluate to true. For example, a catalog item of <strong>Schedule a Move</strong> may have a condition of <strong>move_from &gt; is &gt; San Diego</strong>. The UI policy is applied when an employee schedules a move from San Diego to any other company location. |
| <strong>Note</strong>: The label of a variable associated with a variable set reflects the variable set name. The format is <code>variable_set_name » variable_name</code>. |
| <strong>Applies on a Catalog Item view</strong> | Select the check box to apply the UI policy to catalog items within the order screen. Available in the requester view.                        |
| <strong>Applies on Catalog Tasks</strong> | Select the check box to apply the UI policy on a Catalog Task form. Available in the fulfiller view. See <strong>VEditor</strong>.                                |
| <strong>Applies on Requested Items</strong> | Select the check box to apply the UI policy on a Requested Item form. Available in the fulfiller view. See <strong>VEditor</strong>.                          |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies on the Target Record</td>
<td>Select the check box to support the catalog UI policy on a record created for task-extended tables via record producers. See Default variable editor.</td>

5. Click **Submit**.

ℹ️ **Note:** Configure the variable form to display all fields.

**Service Catalog UI policy examples**

The following is an example of how Service Catalog UI policies work.

The following UI policy makes it mandatory for any department to specify the name of the department if **Department** is selected for the question **Department or group?**.
Catalog UI policy

Create a Service Catalog client script

You can create client scripts to customize the catalog.

About this task

Use catalog client scripts to control the behavior of the catalog items when presented to your users. Catalog client scripts can be applied to a catalog item or a variable set. These scripts run on the browser instead of the server, allowing you to better control the information that the user submits.

The priority order for g_form APIs is:

1. Mandatory (highest)
2. ReadOnly/Display
If a variable is set to mandatory and does not have value, readonly or hide do not work on that variable. If a variable is hidden or readonly, and then set to mandatory, the variable field becomes visible or editable.

This priority order is also applicable for variable sets and containers. If a variable set or container has a mandatory variable without any value, then the container or variable set cannot be hidden.

Procedure
1. Navigate to Service Catalog > Catalog Administration > Catalog Client Scripts. A list of current custom catalog client scripts appears.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the catalog client script.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Item type this client script applies to:</td>
</tr>
<tr>
<td></td>
<td>• A Catalog Item: enables the Catalog item field.</td>
</tr>
<tr>
<td></td>
<td>• A Variable Set: enables the Variable set field.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to enable the client script. Clear the check box to disable the script.</td>
</tr>
<tr>
<td>UI Type</td>
<td>Whether to apply this field to desktop, Classic Mobile, or both.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter the client script to run on the service catalog item.</td>
</tr>
<tr>
<td>Type</td>
<td>Select when the script runs, such as onLoad or onSubmit.</td>
</tr>
<tr>
<td>Catalog item or Variable set</td>
<td>Select a catalog item or variable set from the list. The field name and options available depend on the selection in the Applies to field.</td>
</tr>
<tr>
<td>Applies on a Catalog Item view</td>
<td>Check box to apply the catalog client script to catalog items displayed within the order screen on the service catalog. Available in the requester view.</td>
</tr>
<tr>
<td>Applies on Requested Items</td>
<td>Check box to apply the catalog client script on a Requested Item form, after the item is requested. Available in the fulfiller view. See VEditor.</td>
</tr>
<tr>
<td>Applies on Catalog Tasks</td>
<td>Check box to apply the catalog client script when a Catalog Task form for the item is being displayed. Available in the fulfiller view. See VEditor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Applies on the Target Record</td>
<td>Check box to support the catalog UI policy on a record created for task-extended tables via record producers. See Default variable editor.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Debug performance diagnostics of a catalog item

Analyze the impact of the variable setup in a catalog item on its runtime performance, and identify any issues. You can review the processing time of the catalog item and its variables based on the triggered SQL queries.

#### Before you begin

Role required: admin or catalog_admin

#### About this task

The variable SQL debugger is not applicable for the following variables:

- Container Start
- Container End
- Container Split
- Break

#### Procedure

1. Enable the variable SQL debugger by navigating to **Service Catalog > Catalog Variables > Enable Variable SQL Debugger**.

   **Note:**
   - The variable SQL debugger is applicable for catalog items and record producers.
   - After you enable the variable SQL debugger, if you disable the display of the troubleshooting information on a catalog page by navigating to **System Diagnostics > Session Debug > Disable All**, the variable SQL debugger is still active.
   - To disable the variable SQL debugger, navigate to **Service Catalog > Catalog Variables > Disable Variable SQL Debugger**.

2. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**, select a catalog item that you want to debug, and click **Try It**.

3. Click the more options icon (•••) and select **Show Variable SQL Debugger**. The following information is displayed in the Variable SQL Debugger window:
• Number of variables included in the catalog item.
• Number of SQL queries triggered for the catalog item.
• Time taken to process and load the catalog item page.
• Time taken to run all SQL queries of the catalog item.

### Variable SQL debugger fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Catalog item variable for which the performance diagnostics are displayed.</td>
</tr>
<tr>
<td>Processing</td>
<td>Time taken to process and load the variable.</td>
</tr>
<tr>
<td>Time</td>
<td></td>
</tr>
<tr>
<td>SQL Count</td>
<td>Number of SQL queries triggered for the variable.</td>
</tr>
<tr>
<td>SQL Time</td>
<td>Time taken to run SQL queries for the variable.</td>
</tr>
<tr>
<td>SQLs</td>
<td>Details of the SQL queries triggered for the variable.</td>
</tr>
</tbody>
</table>

4. To sort by any field, click the field name.

⚠️ **Note:**

- By default, variables are sorted in descending order by their processing time.
- Variables within a single-row or multi-row variable set are displayed in hierarchical order.

5. To view the configuration of a variable, click the variable name.

6. To view a detailed summary of all SQL queries triggered for a variable, click **View Details** in the **SQLs** field of the variable.

7. To change the sort order, Use the **Sort By** list.

⚠️ **Note:** By default, triggered SQLs are sorted in descending order by their execution order.

### Debug user criteria of a catalog item

Debug whether a user can access a catalog item based on the matched user criteria and fix any issues.

**Before you begin**

Role required: catalog_manager, catalog_admin, or admin
About this task
You can only debug access issues based on user criteria, but not based on
access control list rules (ACLs). For information about user criteria, see Set
security for items and categories.

For any scripted user criteria that uses a session api such as gs.getUserID(), the
session of the logged-in user is used. Edit the behavior of the scripted user criteria
using the pre-defined user_id variable in the Script field of a user criteria. For
information about the Script field, see Create a user criteria record in Service
Catalog.

Procedure
1. Navigate to Service Catalog > Catalog Administration > User Criteria
   Diagnostics.
   The User Criteria Diagnostics form is displayed.
2. In the Select user field, select the user whose access you want to debug.
3. In the Select catalog item field, select the required catalog item.
4. Click Diagnose.

<table>
<thead>
<tr>
<th>User Criteria Diagnostics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select user</td>
</tr>
<tr>
<td>System Administrator</td>
</tr>
<tr>
<td>Select catalog item</td>
</tr>
<tr>
<td>Samsung Galaxy S7 Edge</td>
</tr>
<tr>
<td>Diagnose</td>
</tr>
</tbody>
</table>

Cannot View
System Administrator cannot view Catalog Item: Samsung Galaxy S7 Edge

User Criteria definition for Samsung Galaxy S7 Edge

<table>
<thead>
<tr>
<th>User Match</th>
<th>Association</th>
<th>User Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>✗</td>
<td>Not Available</td>
<td>Non-availability of the Item</td>
</tr>
<tr>
<td>✗</td>
<td>Available</td>
<td>Availability of the Item</td>
</tr>
</tbody>
</table>
• The item hierarchy is displayed along with an indication of the user's access to each node (catalog, category, or catalog item) based on the user criteria associated with the node.

**Note:**
- If the item is available in multiple catalogs or nested categories, the corresponding catalogs and categories are displayed as nodes in a tree format.
- If the user matches multiple user criteria associated with the node, then the user can access the node only if the following conditions are met:
  - The user matches at least one of the user criteria in the **Available For** list.
  - The user does not match any user criteria in the **Not Available For** list.

• All user criteria defined for the item is displayed. For each user criteria, the following information is available:

  **User Match**
  - is displayed if the selected user matches the user criteria.

  **Association**
  - Association of the node with the user criteria, that is, **Available for** or **Not Available for**.

  **User Criteria**
  - Name of the user criteria.

5. To verify if the user can view a node of the hierarchy, click the node. User criteria defined at the node is displayed. For example, when you click a node representing a category, the user criteria defined for the category is displayed.

6. To edit the configuration of a user criteria, click its name under the **User Criteria** column.

### Service catalog variables

Service catalog variables capture and pass on information about choices a customer makes when ordering a catalog item. Variables help define the structure of a catalog item form that is displayed to the customer.
For example, you can define a variable called **Memory** to provide users with memory options at an extra cost for a PC catalog item. An Apple iPhone catalog item can use a variable called **Color** that allows customers to select the color when they order the phone from the catalog. You can define some variables to affect an item price, depending on the choices made.

Service Catalog provides several types of variables, which are also referred to as questions. Variables can be stored, accessed from multiple places, and passed between tasks in a process when fulfilling a request. They can be displayed on the Requested Item and Catalog Task forms after an item has been ordered.

You can define service catalog variables with the catalog_admin role.

**Related information**

- Scriptable service catalog variables
- Use service catalog variables in a report – Report Designer

**Types of service catalog variables**

Variables allow you to specify questions for a catalog item. Several types of service catalog variables are provided. Some variable types accept variable attributes.

See the following sections for more details on each variable type. For details on creating a variable, see Create a service catalog variable. You can also provide help text for any service catalog variable. For information on defining help information, see Define help information for a service catalog variable.

**Support in various channels**

Service Catalog variables are supported in various channels. For information on their availability, see Variable support in various channels.

**Attachment**

When submitting a catalog item request, this variable lets you upload an attachment for a question of the item. After you upload the attachment, you can also download, update, and delete it. Even when fulfilling the request, you can download, update, and delete the attachment in a requested item or catalog task. You can specify restrictions for file size and extensions using the `max_file_size` and `allowed_extensions` variable attributes. For information on these variable attributes, see Service catalog variable attributes.
• You should specify only an integer value for the following:
  ◦ The `max_file_size` variable attribute
  ◦ The `glide.sc.variable.attachment.default_max_size` system property (catalog-level). The default value is 20.

• If the `max_file_size` variable attribute is not specified, the `glide.sc.variable.attachment.default_max_size` system property value is considered as the upper limit for the attachment file size.

• Irrespective of the file size allowed in the variable, the attachment file size cannot exceed the size specified in `com.glide.attachment.max_size` system property, which is applicable for attachments across Now Platform.

• The `g_form.setValue()` API is supported in catalog client scripts.

**Note:** When you edit an attachment, the existing attachment is removed and a new attachment is uploaded.

When you upload an attachment to this variable, an entry is created in the Attachment [sys_attachment] table. The variable is not updated until you submit the item request, add it to the cart, or save the record while editing it (in fulfills/flows). If you delete or update the attachment before submitting the corresponding catalog item, the entry in the Attachment [sys_attachment] table is cleared.

The attachment uploaded for this variable is copied in the following scenarios:

• In an order guide, when the variable is cascaded to a catalog item in the rule base

**Important:** The individual variable attributes are not honored for the catalog items in the rule base. For example, let us consider that a variable in the Describe Needs section allows a .pdf attachment and the variable of a catalog item in the rule base allows a .txt attachment. When you upload an attachment of .pdf type for a variable in the Describe Needs section, it is initially cascaded to the variable in the catalog item as well and the variable attributes specified in the catalog item are not honored. However, if you delete this initially cascaded attachment from an individual item and try to upload a new attachment, then the individual variable attributes of the catalog item are honored.

• In a record producer, when the variable is mapped to a task table field. This variable can be mapped only to the File Attachment field type of a task table.
Important: After an attachment is copied, the changes to the individual attachments are independent. For example, any change to an attachment in the order guide does not impact the same attachment cascaded to the catalog item in the rule base.

Warning: Since the attachments are copied, a larger size can lead to performance issues.

If the system-wide anti-virus check is enabled, the anti-virus check is performed on the attachment when you:

- Submit a request for the corresponding catalog item
- Add the catalog item to the cart or wish list

Note:

- This variable is not supported in a multi-row variable set.
- This variable is supported in flows and workflows.
- This variable is available in condition builder
- For this variable, item variable assignment is not supported in order guide.

### Attachment variable

**Request Credit Card**

<table>
<thead>
<tr>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Upload ID Card**

[Upload]

### Break

The break variable displays a horizontal line across the form. This line is a formatting element that does not collect data.

**Example: break variable**

Once this request is fulfilled and the category is created, you will be notified via email and sent a link to begin creating your items.

* Choose the catalog your new category will appear in
Check box

The check box variable lets you enable and disable options by selecting and clearing it.

To make a check box mandatory, select the **Selection Required** option when you create the variable. For example, use this option to require users to select the **I agree** check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.

A group of check box variables is created when you create consecutive check box variables. These check box variables are sorted by their order within the group. If you want to define a custom label for the group of check boxes, create a **label** variable at the start of the consecutive check box variables. The label is then considered a part of this group and acts a label of the group. If there is no custom label, check boxes are grouped under an **Options** label by the application.

In a group of check box variables:

- If any check box variable in the group is mandatory, the entire group becomes mandatory irrespective of the visibility of the mandatory check box variable. An asterisk (*) is then displayed next to the group label and you must select at least one of these check boxes.
- Hiding the label hides the entire group.
- If all other check box variables of a mandatory check box group are hidden and not selected, the following scenarios are applicable:
  - The group remains mandatory as long as there is one check box in the group that is visible and not selected.
  - The last check box of this group cannot be hidden if it is not selected.

In Service Portal, to make a group of check box variables mandatory, set at least one of the check box variables as mandatory. While defining the label for a group of check boxes, setting a label mandatory does not make the group of check box variables mandatory.

In catalog builder, the following scenarios are applicable:

- If there are two consecutive check boxes, then a virtual container is created for a group of check boxes. Only check box variable types can be added inside the group.
- Even if a check box variable is added immediately after a group of check boxes, it is automatically added to the group.
Under the **Type Specifications** tab, you can specify the price in different currency types. Also, you can configure the price in the following pricing models:

- Calculated
- Fixed
- Multiple

For information on the pricing models, see [Price fields](#).

### Example: check box variable

<table>
<thead>
<tr>
<th>Optional Software</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Powerpoint</td>
</tr>
<tr>
<td>Adobe Acrobat</td>
</tr>
<tr>
<td>Adobe Photoshop</td>
</tr>
<tr>
<td>Siebel Client</td>
</tr>
</tbody>
</table>

For more information on the check box variable, see the following video:

How to create and configure catalog check box variables to present options to customers when ordering items from the service catalog. Explains how to group multiple check boxes in categories, require users to select at least one item from a group, and adjust pricing based on options selected with check box variables.

### Container start, container split, and container end

The container start, container split, and container end variables define a layout for a container that can hold more variables. Use the container start and container end variables to define the start and end points of a container layout. The container end must be used along with the container start to close a container.

A container layout can be split into two or three columns using the container split variable. By default, the split is calculated at the 50% mark.

A container is similar to a variable set. Unlike a variable set, containers can be used anywhere, including inside a variable set. Containers can also be nested inside each other.

For more help with selecting the appropriate container type, see the [Determining if you are using the correct container variable](#) article in the HI Knowledge Base.
Note:

- The container variables are not yet supported on mobile devices.
- Container start, container split, and container end variables are supported in Service Portal. However, if the settings are done on the top-level container, a maximum of two-column layouts can be achieved.
- Variable sets are also considered as containers. So, a container start variable with a two-column layout under a variable set is not supported in Service Portal.

To reproduce the container shown in the following figure, enter the following settings when creating a container start variable:

- Select a Layout with 2 Columns Wide, alternating sides.
- Select the Display title check box to use a collapsible title bar.

**Example: container variable**

**Memory & CPU Options**

<table>
<thead>
<tr>
<th>CPU Speed</th>
<th>Memory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intel Xeon Processor (2.66GHz 1.33GHz FSB)</td>
<td>1GB</td>
</tr>
<tr>
<td>Intel Xeon Processor (3.73GHz 1.33GHz FSB)</td>
<td></td>
</tr>
</tbody>
</table>

**Date**

The date variable creates a widget with a field and calendar to select a date.

**Example: date variable**

Delivery date

![Calendar widget]
Date and time
The date and time variable creates a widget with a calendar and fields to select a date and time. The time value is stored in Greenwich Mean Time (GMT) and displayed in your time zone.

Example: date and time variable
Pick a suitable date and time

![Calendar widget example]

Duration
Use the duration variable to specify the duration for which a catalog item is available.

For attributes supported by this variable, see variable attributes.

ℹ️ Note: Enter the duration in the DD HH:MM:SS format when setting the default value of the variable, and specifying in the g_form.getValue() and g_form.setValue() functions.

Example: duration variable
Duration

<table>
<thead>
<tr>
<th>Days</th>
<th>Hours</th>
<th>Minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>12</td>
<td>20</td>
</tr>
</tbody>
</table>

Email
The email variable creates a widget to enter and select an email address. The variable accepts only valid email expressions containing @ and domain information.
Note: Variable validation is not supported in Service Portal.

Example: email variable

Email
user@domain.com

HTML
The HTML variable lets you provide content with advanced formatting, including images, for a catalog item.

Use the variable to create fields for user input. You can also use the variable for reusable content when put into a variable set, such as terms and conditions.

The variable is available in two modes: edit and read-only. In edit mode, a toolbar is available, and links do not work. In read-only mode, the toolbar is disabled, and links work. To switch between modes, use entitlements or create a UI policy to set the HTML field to read-only mode.

Note: HTML variables are not supported for display on the shopping cart summary or approval summary screens.

Example: HTML variable

Your comments are valuable to us.

IP Address
Use the IP address variable to specify the IPv4 and IPv6 data for a catalog item. Under the Validation Scripts submodule, a validation script type associated with this variable is available.
Note:
- Variable validation is not supported in Service Portal.
- When you set the default value for the **IP Address** variable, or specify its value in the `g_form.getValue()` and `g_form.setValue()` functions, the delimiter is `.(`.

**Example: IP address variable**

<table>
<thead>
<tr>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Label**

The label variable displays a label across the form. Labels are formatting elements. No data is collected.

You can use labels to arrange questions into sections. You can also use labels for questions with multiple options. For example, label **check boxes** for the different options for a question.

You cannot set a Label variable as mandatory. However, you can make mandatory, a group of check box variables preceded by a Label variable.

In Platform, if the `glide.ui.escape_text` property is set to false, then HTML tags are supported for the **Question** and **Help text** fields. In Service portal, the `glide.ui.escape_text` property is not applicable and HTML tags are not supported for these fields.

**Example: label variable**

<table>
<thead>
<tr>
<th>Complete your request</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Do you need this today?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Is this service category for a Department or a Group?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
</tr>
</tbody>
</table>

**List collector**

The list collector variable creates an interface that lets you select and add multiple records from a table. For attributes supported by this variable, see **variable attributes**.
Example: list collector variable

For more information on using the list collector variable, see this video: How to use Service Catalog list collector variables

Note:

- The Reference Qualifier and glide_list attribute applies to releases from Helsinki onward only. The attribute does not apply to Geneva.

- You can set a value for this variable using the `g_form.setValue()` function in a catalog client script.

- When the glide_list attribute is not true, you can only set the value that is visible in the Available list using the `g_form.setValue()` function. This functionality is not applicable when the `setValue()` function is called on Load.

- Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the glide_list attribute.

- The values in the referenced table do not appear if the user is not logged in.

- The list collector displays a maximum of 100 items in a list. After moving items to the Selected list, you can click Run Filter to refresh the Available list. This action will add more available items to the list, to a maximum of 100 items.
Lookup multiple choice

The lookup multiple choice variable creates radio buttons using data from a table. Its functionality is similar to the lookup select box variable, which creates a choice list from queried data. For attributes supported by this variable, see variable attributes.

Note:

• Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the reference type variable.

• You cannot add more than 10,000 choices.

Example: lookup multiple choice variable

Software
• Adobe Systems Acrobat 9.0
• Adobe Systems Dreamweaver 5.5
• Adobe Systems Fireworks CS6
• Apple QuickTime Pro 7
• IBM Lotus Notes 8.5.3
• Microsoft Access 2010

Lookup select box

The lookup select box variable creates a choice list using data queried from a table. Its functionality is similar to the lookup multiple choice variable, which creates radio buttons from queried data. For attributes supported by this variable, see variable attributes.

To create the lookup select box shown in the following figure, enter the following values when creating the variable:

• Lookup from table: Incident [incident]

• Lookup value field: Sys ID
• **Lookup label field:** number, category, priority

• **Reference qual:** `caller_id=javascript:gs.getUserID()&active=true`

**Note:**

• Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the reference type variable.

• You cannot add more than 10,000 choices.

**Example: lookup select box variable**

Knowledge Base

![Lookup select box example](image)

**Custom**

This variable inserts a UI macro into the catalog item.

UI macros in the service catalog do not support the following `glide_list` functions: clickthrough, slushbucket editing, and email field.

• Use **phase one** Jelly only for any UI macros added as variables. Phase two Jelly within the macro is not processed and appears on the page as standard content.

• This variable is not yet supported on Classic Mobile devices.

• This variable is supported in Service Portal through widgets. Create a widget with the same functionality as that of a macro and link the widget with the variable.

**Example: Custom variable**

![Custom variable example](image)
Custom with label
This variable inserts a UI macro with a label.

- This variable is not yet supported on Classic Mobile devices.
- This variable is supported in Service Portal through widgets. Create a widget with the same functionality as that of a macro with label, and link it with the variable.

Example: Custom with label variable

Masked
The masked variable inserts a field that masks the text entered. Each character entered is displayed as an asterisk (*). Use this variable to ask users for sensitive or confidential data such as passwords.

By selecting the Use encryption check box, you can configure the variable to encrypt its value using various encryption algorithms before storing in the database. These values can only be decrypted by using now_GR.variables.var_name.getDecryptedValue() on RITM, Catalog Task, or any task extension record created using a record producer.

On the variable editor, you can also decrypt and encrypt the values of a masked variable using the Show and Hide buttons. These buttons are not available for a fulfiller (itil) without the catalog_view_masked role. You can only view the value that you specified while requesting.

<table>
<thead>
<tr>
<th>Actions on an encrypted variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Fulfiller without the catalog_view_masked role</td>
</tr>
<tr>
<td>View or hide the encrypted</td>
</tr>
</tbody>
</table>

Actions on an encrypted variable (continued)

<table>
<thead>
<tr>
<th>Actions</th>
<th>Yes</th>
<th>Not applicable</th>
<th>Not applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit the encrypted value on catalog forms</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>View or hide the encrypted value on the variable editor</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Edit the encrypted value on the variable editor</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note:** If the masked variable is read-only on the variable editor, the variable value is not editable.

Example: masked variable

Password

```
...........
```

Multi-line text

The multi-line text variable creates a field that lets you enter multiple lines of text.

**Example: multi-line text variable**

```
Special software requirements
```

Multiple choice

The multiple choice variable creates radio buttons for question choices.
Example: multiple choice variable

Is this service category for a Department or a Group?
- Department
- Group

Numeric scale

The numeric scale variable creates a set of radio buttons for a range of options, like a Likert scale.

Example: numeric scale variable

How well did we do? 0 1 2 3 4 5

Reference

A reference variable references a record in another table. For example, a variable named `point_of_contact` references the User `[sys_user]` table. For attributes supported by this variable, see variable attributes.

Keep the following information in mind when you create a reference variable:

- Reference variables use the auto-complete feature. To ensure that users have enough information to make the selection, configure the reference lookup list.
- Reference variables store the sys_id of the selected record (like reference fields). To use the display value in a script, use the same methods as for a reference field.

```javascript
current.variables.<variable name>.getDisplayValue()
```

Example: reference variable

Callable name

Howard Johnson

Requested For

Before submitting a catalog item request, this variable helps you specify who this request can be submitted for. You should specify this information while answering catalog item questions.
Important:
• You can only specify users from the User [sys_user] table.
• If you don’t specify the default value for this variable, the current logged-in user requesting the item is considered as the default Requested For variable value.
• You can submit the request for a user based on access to a catalog item. The Access Type field of the catalog item can be used to specify if a request can be submitted for a user who does not have access to the catalog item.

Using the Enable also request for field of the Requested For variable, you can request a catalog item for different users under one request.

For information about delegated request experience, see Delegated request experience.

Important:
• You can add this variable to a catalog item or variable set. However, when submitting the request, a catalog item can have only one Requested For variable.
• You can add only one Requested For variable for a variable set.
• This variable is not supported in a multi-row variable set.
• After the request is submitted, this variable value is visible in the variable editor and variable summarizer.

Requested For variable

Rich Text Label
This variable displays a formatted label on a catalog item form. In the TinyMCE rich text editor, you can format the label and add images or links.
Note:

• You can make this variable visible using catalog client scripts and catalog UI policies.
• You cannot cascade this variable in an order guide.
• You cannot set this variable as mandatory.
• In the Automated Test Framework, this variable is only supported in the Variable State Validation step to check the visibility.
• This variable is not supported in the following:
  ◦ Variable summarizer
  ◦ Multi-row variable set
  ◦ Condition builders and reports
• You cannot specify the following for this variable:
  ◦ Help text and instructions
  ◦ Tool tip
  ◦ Permissions
  ◦ Variable width
  ◦ Example text
• The `g_form.setValue()`, `g_form.setReadOnly()`, and `g_form.setMandatory()` APIs are not supported in catalog client scripts. Only the `g_form.setVisible()` API is supported.

Rich Text Label variable

Select box

The select box variable creates a list from predefined question choices. For attributes supported by this variable, see variable attributes.
**Example: select box variable**

Do you need this today?

Yes

---

**Single-line text**

The single-line text variable creates a field to enter a single line of text. For attributes supported by this variable, see variable attributes.

**Example: single-line text variable**

Last Name

Johnson

---

**UI page**

The UI page variable inserts a UI page into the catalog item.

- Use phase one Jelly only for any UI macros added as variables. Phase two Jelly within the macro is not processed and appears on the page as standard content.

- The client scripts of a UI page are ignored when you define the associated UI Page variable for a catalog item. This behavior is applicable as long as the `glide.ui.escape_text` and `glide.ui.escape_all_script` properties are set to true. For information about these high security settings, see High Security Settings.

- This variable is not yet supported on Classic Mobile devices and in Service Portal.

---

**URL**

The URL variable creates a widget for users to enter URLs. URLs are validated for the following protocols: HTTP, HTTPS, FTP.

**Note:**

- Variable validation is not supported in Service Portal.

- This variable is not editable on Now Mobile.

**Example: URL variable**

Enter URL

http://www.servicenow.com/
Wide single-line text

The wide single-line text variable creates a field that spans the form, letting users enter longer lines of text. For attributes supported by this variable, see variable attributes.

Example: wide single-line text variable

Yes/No

The Yes or No variable creates a choice list with Yes and No as options.

Example: Yes or No variable

Variable support in various channels

Service Catalog variables are supported in various channels.

Create a service catalog variable

Create service catalogs variables to gather information from users ordering a catalog item, for example, to ask users which options they want for the item.

Procedure

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. Select the catalog item that you want to create a variable for.
3. In the Variables related list, click New.
4. Select the variable type.
   Only the applicable fields for the variable type are then displayed.
5. In the form, fill the fields.

Variable form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Read-only field that indicates which applications can use this variable.</td>
</tr>
<tr>
<td>Map to field</td>
<td>Maps the variable to a specific field on the table for the record producer.</td>
</tr>
<tr>
<td></td>
<td>This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Type</td>
<td>The variable type that you want to create.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item using the variable.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the variable available for use</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make the variable mandatory as part of the ordering process.</td>
</tr>
<tr>
<td></td>
<td>✉️ Note: This behavior is applicable only on page load, and can be changed via client APIs.</td>
</tr>
<tr>
<td>Read only</td>
<td>Option to make a variable read only or editable.</td>
</tr>
<tr>
<td>Hidden</td>
<td>Option to hide a variable.</td>
</tr>
<tr>
<td>Unique</td>
<td>Option to disallow duplicate values for this variable within a multi-row variable set.</td>
</tr>
<tr>
<td></td>
<td>✉️ Note:</td>
</tr>
<tr>
<td></td>
<td>• This field appears only for a variable created in a multi-row variable set.</td>
</tr>
<tr>
<td></td>
<td>• This behavior is applicable only in Now Platform, Service Portal, and variable editor in Agent Workspace.</td>
</tr>
<tr>
<td>Selection</td>
<td>Check box to require users to select the check box variable. For example, use this option to require users to select an I agree check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.</td>
</tr>
<tr>
<td>Required</td>
<td></td>
</tr>
<tr>
<td>Global</td>
<td>If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that the variable maps to. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Record producer table</td>
<td>Table that the record producer creates a record in. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td>Question</td>
<td>Question to ask users ordering the catalog item.</td>
</tr>
<tr>
<td>Name</td>
<td>A name to identify the question.</td>
</tr>
<tr>
<td></td>
<td>Note: If this field is empty, its value is auto-populated based on the Question field for all variable types except break, container split, and container end.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Tooltip text to display when users point to the variable. Enter a brief note to describe the purpose of the 'Question'.</td>
</tr>
<tr>
<td>Example text</td>
<td>Hint that is displayed in the question field before a user enters a value.</td>
</tr>
<tr>
<td></td>
<td>Applicable for the following variables:</td>
</tr>
<tr>
<td></td>
<td>• IP Address</td>
</tr>
<tr>
<td></td>
<td>• Email</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• Single Line Text</td>
</tr>
<tr>
<td></td>
<td>• Wide Single Line Text</td>
</tr>
<tr>
<td></td>
<td>• Multi Line Text</td>
</tr>
<tr>
<td></td>
<td>• Date</td>
</tr>
<tr>

<td>• Date/Time</td>
</tr>
<tr>
<td>Rich Text</td>
<td>Formatted label to be displayed on a catalog item form.</td>
</tr>
<tr>
<td></td>
<td>Applicable for the Rich Text Label variable.</td>
</tr>
<tr>
<td>Annotation</td>
<td></td>
</tr>
<tr>
<td>Show help</td>
<td>If selected, displays the help text and instructions for the variable.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
</tr>
<tr>
<td></td>
<td>• It is not available for break and check box variables.</td>
</tr>
<tr>
<td></td>
<td>• Help text and instructions are not available for a variable set.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Always Expanded</td>
<td>If selected, the <strong>Help text</strong> and <strong>Instructions</strong> field value are expanded by default when the catalog item page loads. This check box appears only when the <strong>Show help</strong> check box is selected.</td>
</tr>
</tbody>
</table>
| **Note:**             | • This field is also applicable in Service Portal.  
• This field is not applicable in the variable editor in Workspace and Catalog Item UIB component.  
• If the **Expand help for all questions** check box is selected at the catalog item level, then the **Always Expanded** field setting at the variable level is overridden.  
• If the **Expand help for all questions** check box is deselected at the catalog item level, then the **Always Expanded** field setting at the variable level is applicable.                                                                                                                                                                                                                                                                                                           |
<p>| Help tag              | If the <strong>Always Expanded</strong> check box is deselected, click the value specified in this field to display the <strong>Help text</strong> and <strong>Instructions</strong> field values. This field is not applicable in the variable editor in Workspace and Catalog Item UIB component.                                                                                                                                                                                                                                                                                                                  |
| Help text             | Help information for a service catalog variable. This field is applicable in Now Platform, Service Portal, and variable editor in Workspace, and Catalog Item UIB component. However, in Workspace and Catalog Item UIB component, you can view either help text or instructions. If both instructions and help text are available, you can view only the instructions. This field is not applicable for Break, CheckBox, Container End, Container Split, Macro, and UI Page variables. In Workspace and Catalog Item UIB component, this field is additionally not applicable for a Masked variable. |
| Instructions          | Information that requires rich text formatting or adding images to support help information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |</p>
<table>
<thead>
<tr>

**Default Value**

| Default value         | Default value for the variable.                                                                                                                                                                            |

**Permission**

If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the **Write roles** field, all users who can access the catalog item can edit the variable value in the variable editor.

A user with a role that does not match any of the following roles cannot set variable values even through scripting.

- This field is also applicable in Service Portal.
- The max_length attribute value is valid even when the validation regex is set.
- You cannot add a catalog item with regex validation errors to the wishlist.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.</td>
<td></td>
</tr>
<tr>
<td>Read roles</td>
<td>Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.</td>
</tr>
<tr>
<td>Write roles</td>
<td>Roles that can edit the variable in the variable editor after requesting the catalog item or record producer. If a user does not have the roles specified in this field, the variable is read-only in the variable editor.</td>
</tr>
<tr>
<td>Create roles</td>
<td>Roles that can create values for the variable before requesting the catalog item or record producer. If a user does not have the specified role, the variable is read-only before requesting the catalog item or record producer.</td>
</tr>
</tbody>
</table>

**Availability**

| Visible Elsewhere | If selected, the variable is visible in the item form before ordering the item, in VEditor after ordering the item, and in the cart view of the item. |
| Visible on Bundles| If selected, the variable is visible when the item is added to a bundle. |
| Visible on Guides | If selected, the variable is visible when it is added to an order guide, or when it is added to a catalog item that is included in the order guide. |

**Note:** If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.

<table>

<td>In Now Mobile, the variable is visible in the RITM and the Approval records.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
Define help information for a service catalog variable

Enter help information for a variable to help users determine what info they must provide for a service catalog variable.

About this task

Demonstrates these options to provide help text for service catalog item variables: tooltips, help text, instructions (HTML help text), and example text.

Procedure

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items and click the catalog item with the variable that you want to provide help for.
2. In the Variables related list, click the variable.
3. In the Annotation section of the Variable form, select the Show Help check box.
   The Help, Help text, and Instructions fields appear.
4. In the Help tag field, enter the short descriptive text that appears between the question and the responses.
   For example, Click here for help or Preview.
5. In the Help text field, enter the help text that displays for users who clicks the Help tag on the page for the catalog item.

   Note: The Help and Help text fields do not support HTML tags.

Example of help information

![Password Field Example](image)

Service catalog variable attributes

Few Service Catalog variables support specific attributes to define the behavior and restrictions for variables.

In the catalog variable form, under the Type Specifications tab, you can specify the variable attributes in the Variable attributes field.
Note:

- You can enter multiple attributes for a variable type by separating each with a comma.
- You can enter multiple values for an attribute by separating each with a semicolon.
- If you do not see the Variable attributes field, then enable the Show attributes when Type is One of Certain Values UI policy.

Variable attributes

allowed_extensions

Specifies a list of allowed file types. For example,
`allowed_extensions=txt;pdf`.

Applicable variables: Attachment

barcode

Specifies if the barcode can be scanned using the mobile camera for identifying a variable value of a catalog item. For example,
`barcode=true`.

Applicable variables: Single Line Text

max_file_size

Specifies the maximum file size in MB. For example, `max_file_size=2`.

Applicable variables: Attachment

glide_list

Changes the list collector interface from slushbucket to glide list.

Applicable variables: List collector

[Collapsed glide_list]

List Collector

Samsung SyncMaster 24" Class BackLight LED, P1000427 - Lenovo ThinkStation C20
is_searchable_choice

If set to true, allows you to search and select the required value for the variable. For example, `is_searchable_choice=true`

Note:
- For Lookup select box, a default value is available at the page load itself.
- This attribute is not applicable in Service Portal.

Applicable variables: Lookup select box, Select box

max_length

Sets the maximum number of characters allowed in the field. By default, the field accepts long strings of text, several thousand characters. Set the `max_length` attribute as appropriate for the
information the variable is collecting. For example, to allow for entry of an address, set `max_length=200`, or other appropriate length.

Applicable variables: Single-line text, Wide single-line text

**max_unit**

Sets the maximum unit of time for the duration. Possible values are `max_unit=days`, `max_unit=hours`, `max_unit=minutes`, and `max_unit=seconds`.

For example, if `max_unit=minutes`, the duration is displayed in minutes and seconds. In this case, a duration of 2 days 3 hours 5 minutes 15 seconds is displayed as 3065 minutes 15 seconds.

Applicable variables: Duration

**no_filter**

Hides the filter fields that appear above a list collector.

Applicable variables: List collector

![no_filter](image)

**ref_ac_columns**

Specifies the columns whose display values appear in an auto completion list in addition to the name. Separate column names with a semi-colon. For example, `ref_ac_columns=user_name;email;sys_created_on` allows auto-complete to match text from the user_name, email, and sys_created_on columns.

Applicable variables: Reference, Requested For
ref_ac_order_by

Specifies the column that is used to sort the auto completion list. For example, ref_ac_order_by=name sorts the auto-completion choices alphabetically by name.

Applicable variables: Reference

ref_auto_completer

Specifies the name of a JavaScript class (client-side) that creates the list for auto completion choices. Valid class values include:

- **AJAXReferenceCompleter**: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the display value column of the reference table. If there is no other auto-completion class specified, reference fields automatically use this class.

- **AJAXTableCompleter**: Displays matching auto-complete choices as rows in a table. The table displays the display value column of the reference table and any columns listed in the ref_ac_columns attribute.

- **AJAXReferenceChoice**: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the display value column of the reference table. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.

Applicable variables: Reference

ref_qual_elements

A list of fields to be sent back to the server to get an updated reference.

Applicable variables: Lookup multiple choice, Lookup select box, List Collector

⚠️ **Attention**: Attribute behavior is specific to the service catalog desktop.

Define a question choice for a variable

Define a question choice for a variable with service catalog.
About this task
Some variable types present the user with a list of choices. For example, a multiple choice variable that asks how much memory you want in a computer requires you to define the available choices, such as 1 GB and 2 GB.

Procedure
1. Open the variable definition.
2. In the Question Choices related list, click New.
3. Enter the question choice details in Question Choice form and click Submit to save the record.
   - Price and Recurring price: variables can affect the item price and recurring price (if used).
   - Order: the number defining the order in which the price appears when displayed.
   - Question: the actual question being asked for that variable.
   - Text: the choice presented to the user.
   - Value: the value stored in the database.
   - Inactive: Option to make a question choice inactive.
4. Repeat the steps for each available choice to define the full set of choices for that variable.

Note: When you modify variable choices that are attached to a catalog item, the existing requested items (RITMs) are also affected. For example, if you add a variable choice for the catalog item, the value of that choice is also considered in the existing RITMs. If you delete a variable choice that is selected for a RITM, the value of that choice still persists in the RITM.

Configure a default width for service catalog variables
Configure the default width for variables on a catalog item page to specify what percentage of the screen size that it can span.

About this task
The following figure shows how the variables for the different Apple iPhone 5 options are set to different widths.
A default width size cannot be set or does not apply to the following variables:

- The break, container end, container split, container start, and label variables.
- Any variable placed in a container with two-column layout.
- A variable set with a two-column layout.
- Any variable that is created with a custom width set in the **Variable width** field on the Variable form. For details, see Create a service catalog variable. The custom width for the variable overrides the default width set for the variable type.

**Note:** Custom variable widths are not supported in either Mobile or Service Portal.

**Procedure**

1. Navigate to **Service Catalog > Catalog Variables > Variable Default Size**.
2. For each variable type, select a default width.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>25%</td>
<td>Configures the variable to span 25% of the available screen size.</td>
</tr>
<tr>
<td>50%</td>
<td>Configures the variable to span 50% of the available screen size. By de-</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>fault, some variables require a minimum of 50% width.</td>
<td>75% Configures the variable to span 75% of the available screen size.</td>
</tr>
<tr>
<td>100% Configures the variable to span 100% of the available screen size.</td>
<td></td>
</tr>
</tbody>
</table>

3. **Click Save.**

**Define a regular expression for a variable**

Define a regular expression (regex) to validate a variable value.

**Before you begin**

Role required: catalog_admin or admin

**Procedure**

1. Navigate to Service Catalog > Catalog Variables > Variable Validation Regex.
2. Click New.
3. On the form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the regular expression.</td>
</tr>
<tr>
<td>Validation message</td>
<td>Message that appears when the validation fails.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the regex is active.</td>
</tr>
<tr>
<td>Regular Expression</td>
<td>Sequence of characters that define the format of the variable value. For example:</td>
</tr>
</tbody>
</table>

- **Invalid Regex:** `/((ftp|http|https):\/\/) | (www\.)\([-\w\./#$\?=+=@&%_::;]+)/i`  
- **Valid Regex:** `((ftp|http|https):\/\/) | (www\.)\([-\w\./#$\?=+=@&%_::;]+)`
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Note: | - Ensure that the regex does not cause catastrophic backtracking.  
      - You should not use embedded flag expressions.  
      - Use the **Regex Flag** list for the ignore case. |

<table>
<thead>
<tr>
<th>Regex Flag</th>
<th>Character set that is considered while validating the regular expression.</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>- None: No regex flags are applied.</td>
</tr>
<tr>
<td></td>
<td>- Case Insensitive: Enables case insensitive matching. Case insensitive matching assumes that only characters in the US-ASCII charset are being matched. Unicode-aware case-insensitive matching can be enabled by selecting <strong>Both</strong> as the regex flag.</td>
</tr>
<tr>
<td></td>
<td>- Unicode Case: (Reserved for future use) Same behavior as <strong>None</strong>.</td>
</tr>
<tr>
<td></td>
<td>- Both: Case insensitive matching is done in a manner consistent with the Unicode Standard.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Related information**

Create a service catalog variable

**Pass variables between tasks**

Pass variables from one step of the fulfillment process to another.

**About this task**

Variables can be processed by any workflow or execution plan that is associated with the requested items.

**Note:** To pass a variable between tasks, select the **Global** check box when you create a Service Catalog variable.

For example, consider the following tasks within the fulfillment process for a New PC catalog item.
Procedure

1. Procure a PC.
2. Install corporate standard software.
3. Set up email account.
4. Deliver and set up PC for requester.
   Step 4 may require a piece of information from step 3 (the email account credentials for setting up email on the PC). If steps 3 and 4 are executed by different fulfillment groups, you can use variables to make this information visible in the tasks for steps 3 and 4. You can then pass the information between groups so that the second group can access the email account credentials.

Service catalog data lookup

The Data Lookup and Record Matching Support for Service Catalog plugin offers similar features to the general Data Lookup and Record Matching Support plugin.

Use the plugin for service catalog to perform data lookups for variables. This lookup can be on service catalog item screens, on requested items, and on catalog tasks as a user fills out the values contained in variables.

Service Catalog data lookup roles

Service Catalog enables specific roles to participate in the process of creating and using Service Catalog data lookups.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>catalog_lookup_admin</td>
<td>Similar to data_lookup_admin. Can create, update, and delete catalog data lookup definitions, matcher variable definitions, and setter variable definitions.</td>
</tr>
<tr>
<td>catalog_lookup_manager</td>
<td>Can read catalog data lookup definitions, matcher variable definitions, and setter variable definitions. The role can be granted to anyone using catalog data lookups so they can see the definitions for which they are creating rules. As required, grant create, read, write, or delete</td>
</tr>
</tbody>
</table>
### Service Catalog data lookup roles (continued)

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>access to the individual data lookup rules tables created to delegate maintenance.</td>
</tr>
</tbody>
</table>

### Create a catalog lookup definition
Create a catalog data lookup definition record.

**Before you begin**
Role required: admin or catalog_admin

**About this task**

ℹ️ **Note:** The Run on Insert and Run on Update options are not supported for catalog data lookups. Other options operate the same as for normal data lookup.

**Procedure**

1. Navigate to **System Policy > Rules > Data Lookup Definitions**.
2. Click **New**.
3. Select **Catalog Data Lookup Rule**.
4. Enter a **Name**.
5. In **Applies to**, select catalog item or variable set.
6. In **Catalog item/Variable set**, select a specific item or set.
7. Select a **Matcher Table**.
8. Select other options, as required.
9. Right-click the form header and click **Save**.
10. From the **Catalog Matcher Variable Definitions** related list, click **New**.
11. Fill in the fields, as appropriate.

#### Catalog data lookup definitions fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name to identify the definition record.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select what the data lookup rule applies to: a catalog item or a variable set.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog item/Variable Set</td>
<td>Select the catalog item or variable set to which the data lookup rule applies.</td>
</tr>
<tr>
<td>Matcher Table</td>
<td>Any table within the current scope containing the lookup values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the catalog data lookup definition.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to run this catalog data lookup rule. Clear the check box to ignore this catalog data lookup rule.</td>
</tr>
<tr>
<td>Run on form change</td>
<td>Select this check box to automatically look up values whenever a user changes a variable value on a catalog item or form. This option is the only supported method for catalog data lookup rules.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This option does not include changes automatically made by other data lookup rules, such as the priority lookup rules.</td>
</tr>
</tbody>
</table>

12. Click **Submit**.

13. From the **Catalog Setter Variable Definitions** related list, click **New**.

14. Fill in the fields as appropriate.

### Setter variable definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Lookup</td>
<td>Displays the name of the parent data lookup definitions record.</td>
</tr>
<tr>
<td>Source variable field</td>
<td>Select the variable from the source item or variable set that the data lookup updates.</td>
</tr>
<tr>
<td>Matcher table field</td>
<td>Select the field from the matcher table that provides the new value for the update.</td>
</tr>
<tr>
<td>Always replace</td>
<td>Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.</td>
</tr>
</tbody>
</table>
15. Click **Submit**.
16. Click **Update**.

**Add a data lookup value**

The columns of a data lookup table contain both matcher and setter field data. Each data lookup is a query that searches for a row containing values that match the matcher fields.

**About this task**

The data lookup then returns the value listed in the setter fields.

For example, you can define the matching settings for bronze, silver, and gold offerings as described previously.

**Procedure**

1. In the navigation filter, enter the name of the new custom lookup table.
2. Configure the list and create appropriate fields for the lookup table.
3. From the table list, click **New** and enter appropriate matcher and setter field values. For example:

   ![Service Catalog lookup 1](image)

   ![Service Catalog lookup 1](image)

   **Note:** Each row in a data lookup table must be unique.

**Custom data lookup**

You can create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules [dl_matcher] table.

For example, you can create a Server Offering Lookups table. It stores information about matcher offerings (bronze, silver, and gold) and associated setter values (memory and disk space) for each matcher offering.
Create a custom data lookup

Creating a catalog data lookup is similar to creating a normal, custom data lookup except when creating the catalog data lookup definition record.

1. Create a custom data lookup table. It must extend the Data Lookup Matcher Rules \([\text{dl_matcher}]\) table.
2. Add data lookup values to the data lookup table.
3. Create a catalog data lookup definition record.
4. (Optional) Create a data lookup module.

Troubleshooting

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

If the custom data lookup definition rules are not behaving as expected, check for the following conditions:

• Ensure that the matcher variable is not read-only. Since users cannot change read-only variables, there cannot be an on form change event for read-only variables.
• Ensure that the data in the matcher table is correct.
• If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if it cannot find a matching value.
• If the variable is an option or check box, it always has a value, so you must select Always replace.
• Verify that you have not created a recursive rule, such as:
  If Variable A = 1, then Variable B = 2. If Variable B = 2, then Variable A = 2.

Audit service catalog variables

Audit the variables so that the audit history records all changes to the named variables.

About this task

Auditing is enabled by default for service catalog variables.

These changes are displayed in:
• The requested item history for all variables associated with the item.
• The catalog task history for all variables that are used by the task.

This auditing allows service catalog administrators to view a full history of changes to variables that can affect the parent record, including their creation.

⚠️ Note: Unnamed variables are not audited.

**Procedure**
1. Navigate to System Properties > Service Catalog.
2. Locate the line Audit changes to Service Catalog Variables.
3. Select the Yes check box to enable auditing.

**Service Catalog variable editors**
Variable editor displays variable values in fulfiller forms. A requester, while requesting the item, specifies these variable values in the catalog item questions.

Types of variable editors based on the catalog item type:

• For a catalog item, the VEditor displays the values of questions in the requested item and catalog task forms.
• For a record producer, the default variable editor displays the values of questions for records generated from a record producer for task-extended tables.

⚠️ Warning: The variable editor depends on the Variables column of the Task [task] table. By default, this column is inactive, and you should not make it active.

**VEditor**
The VEditor is applicable only for the requests created from catalog items.

In Now Platform, this editor is a formatter added on the requested item (RITM) form (Default View) and the catalog task form (Default View).

The VEditor is applicable only for RITMs and catalog tasks. It cannot be used for any other tables. To support catalog UI policies or catalog client scripts on the VEditor for the RITM and catalog task form, select the Applies on Requested Items and Applies on Catalog Tasks check boxes for the catalog UI policy or the catalog client script.
Note: The values in the VEditor are displayed from the Options [sc_item_option] table. This is an internal table and you should not add any business rules to this table.

To make the VEditor read-only in Now Platform, activate the onLoad client script, Variable Editor Readonly, for the following tables:

- Requested Item [sc_req_item]
- Catalog Task [sc_task]

Note: You can make the Variable Editor Readonly scripts conditional, by adding conditions to them.

Default variable editor

The default variable editor is applicable only for record producers. This editor is a formatter added on records that are generated by a record producer for task-extended tables. This editor displays the values of questions specified in the record producer.

By default, this editor is applicable for the Incident and Change tables. For other tables, you can configure this editor.

Catalog UI policies, catalog client scripts, catalog data lookups, reference qualifiers, and dependent reference fields are supported on the default variable editor only for task-extended tables. To support a catalog UI policy or a catalog client script on this editor, select the Applies on the Target Record check box for the catalog UI policy or the catalog client script.

Note: The values in the default variable editor are displayed in the Question Answer [question_answer] table. This is an internal table and you should not add any business rules to this table.
Default variable editor

Variable editor in Agent Workspace
In Agent Workspace, the following scenarios are possible:

• If the variable editor formatter is available in the Workspace view of the form, the variable editor is automatically added to the Variables section in the Agent Workspace UI.

• If the variable editor formatter is added inside a section in the Workspace view of the form, that section does not display the variable editor in the Agent Workspace UI.

The following variable types are not displayed in the variable editor.

• Macro
• Macro With Label
• UI Pages

The following variables are displayed as a select box in the variable editor:

• Multiple Choice
• Numeric Scale
• Lookup Multiple Choice

Variable editor in Service Portal
In the Service Portal UI, the variable editor is available for forms with the variable editor formatter.

⚠️ Note: Since Service Portal is only for requester use cases, it is recommended to use the Agent Workspace UI for the variable editor.

Making a variable editor read-only
`g_form.setVariablesReadOnly(isReadOnly)` API is supported for Now Platform and Agent Workspace forms to make the variable editor read-only. It should only be used in requested item, target record, and catalog tasks.
Note: This API is not applicable in Service Portal and not recommended for catalog forms.

To make the VEditor read-only in Service Portal, navigate to Service Portal > Portals, select Service Portal, and specify the following code in the Quick start config field:

```json
"readonly_variable_editor": "true"
```

Note: The UI Page, Macro, and Macro with Label variables are rendered even when the variable editor is read-only.

Configure the default variable editor for a task-extended table

After you configure the default variable editor for a task-extended table, you can view and edit the values of questions specified by the requester in the record producer. Applicable only for records generated by a record producer.

Before you begin
Role required: admin

Procedure
1. Create a formatter for the task-extended table.
   a. Navigate to System UI > Formatters.
   b. Click New.
   c. Fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the formatter that is displayed in the form of the task-extended table.</td>
</tr>
<tr>
<td>Formatter</td>
<td>The file name of the formatter. In this case, specify <code>com.glideapp_questionset_default_question_editor</code>.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that uses the formatter.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the formatter is active.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the formatter. In this case, specify <code>Formatter</code>.</td>
</tr>
</tbody>
</table>
d. Click Submit.

2. Add the formatter to the form of the task-extended table. The formatter is displayed on the form according to your selections.

   a. From the Additional Actions menu on the form, select Configure > Form Layout.

   b. Using the slushbucket, select the display order for the formatter field.
c. Click **Save**. The default variable editor is available on the form.

### Default variable editor

<table>
<thead>
<tr>
<th>Variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is your question?</td>
</tr>
<tr>
<td>When is the next pay date?</td>
</tr>
</tbody>
</table>

### Debug actions on catalog item variables

Analyze the client-side actions affecting the state and values of all variables. You can also get insights into the performance of each script working on the variables.

#### Before you begin
Role required: admin, catalog_admin, catalog_manager, or catalog_editor.

#### About this task
The variable action logger displays the chronology of actions that happen on all variables of a catalog item before it is submitted. These actions can happen due to catalog client scripts, catalog UI policies, or catalog data lookups. This client-side logger does not store any data in the database. Also, the information displayed is applicable only while you work on the catalog form. Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report.

#### Procedure

1. Navigate to **Service Catalog > Catalog Administration > Enable Variable Action Logger**. The UI Page Customization Diagnostics logger is enabled.

   **Note:** Perform this step before you run the logger.

2. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.

3. In the Catalog Items list, select an item that you want to log.

4. On the Catalog Item form, click **Try it**.

5. On the catalog page for the item, right-click the header and select **Show Variable Action Logger**.
Note: The variable logs are grouped by catalog UI policies, catalog client scripts, and data lookups.

The following information is displayed in the Variable Action Logger window:

- Order in which scripts and actions are executed. When a new action is triggered from an existing action, the order of the new action is tracked at a sublevel under the order of the existing action. For example, the order of a new action triggered from step 1.2 is 1.2.1.
- Source of the action taken on a variable and the variable name.
- Details of the action taken on the variable.

Variable Action Logger window

6. Review the results of the variable action logger.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search</td>
<td>To search for a variable or script, use the <strong>Search</strong> field.</td>
</tr>
<tr>
<td>Collapse All</td>
<td>To collapse variable logs within a group, click <strong>Collapse All</strong>.</td>
</tr>
<tr>
<td>Expand All</td>
<td>To expand variable logs within a group, click <strong>Expand All</strong>.</td>
</tr>
<tr>
<td>Filter</td>
<td>To filter variable logs, click the Filter icon (🔍) and select the required options.</td>
</tr>
<tr>
<td>Clear Logs</td>
<td>To clear variable logs, click the Actions icon (👀) and select <strong>Clear Logs</strong>.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Export to CSV</td>
<td>To export the variable logs to a .csv file, click the Actions icon (•••) and select Export to CSV.</td>
</tr>
<tr>
<td>Print Logs</td>
<td>To print variable logs, click the Actions icon (•••) and select Print Logs.</td>
</tr>
</tbody>
</table>

**Debug a Service Catalog variable**

Monitor changes in the state and the value of a Service Catalog variable due to catalog client scripts, catalog UI policies, and catalog data lookups. You can diagnose and resolve issues related to such changes, and track client-side scripting errors on this tab.

**Before you begin**

Role required: admin or catalog_admin  
Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report

**Procedure**

1. Enable the JavaScript log and field watcher..

   a. In the banner, click the settings icon (⚙).

   b. In the System Settings window, click the Developer tab.

   c. Enable the JavaScript Log and Field Watcher option.  
      The JavaScript Log and Field Watcher tabs are displayed in a pane at the bottom of the page. For information about JavaScript logs and fields watcher, see JavaScript log and Field Watcher.

   d. Close the System Settings window.

2. Navigate to Service Catalog > Catalog Definitions > Maintain Items.

3. In the Catalog Items list, select a catalog item to debug its variables, and click Try it.

4. On the form, right-click a variable field label and select Watch Variable.

   The debug icon (Ω) is displayed next to the variable, and the Field Watcher tab in the bottom pane is replaced with the Variable Watcher tab.
5. Edit the fields on the **Variable Watcher** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
<td>Current catalog item.</td>
</tr>
<tr>
<td>Variable</td>
<td>Variable that is being watched.</td>
</tr>
<tr>
<td>Type</td>
<td><strong>Type</strong> of the variable.</td>
</tr>
<tr>
<td>Create roles</td>
<td>User type that can create values for the variable.</td>
</tr>
<tr>
<td>Write roles</td>
<td>User type that can edit values for the variable.</td>
</tr>
<tr>
<td>Read roles</td>
<td>User type that can read values for the variable.</td>
</tr>
<tr>
<td>Reference</td>
<td>Reference table for the variable. Applicable for reference variables.</td>
</tr>
<tr>
<td>Reference Qual</td>
<td>Qualifiers to restrict data that is available in the field. Applicable for list collector, lookup multiple choice, lookup select box, and reference variables.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes of the variable.</td>
</tr>
<tr>
<td>Delete roles</td>
<td>User type that can delete values for the variable.</td>
</tr>
<tr>
<td>All</td>
<td>If selected, displays the action log of the variable due to catalog client scripts, data lookups, and catalog UI policies.</td>
</tr>
<tr>
<td>Catalog Client Script</td>
<td>If selected, displays the action log of the variable due to catalog client scripts.</td>
</tr>
<tr>
<td>Data lookup</td>
<td>If selected, displays the action log of the variable due to data lookups.</td>
</tr>
<tr>
<td>Catalog UI Policy</td>
<td>If selected, displays the action log of the variable due to catalog UI policies.</td>
</tr>
</tbody>
</table>
6. To watch another variable, right-click that variable and select **Watch Variable**.

   **Note:** You can watch only one variable at a time.

7. To stop watching a variable, right-click the variable and select **Unwatch Variable**.

8. To clear the logs, click the Clear log icon (●).

9. To resize the pane, click **Small**, **Medium**, or **Large**.

10. To close the pane, click the Close icon (○).

**Service catalog variable sets**

Administrators and catalog administrators often define multiple catalog items that use the same group of service catalog variables. Catalog managers and catalog editors can attach a variable set for items to which they are assigned. However, catalog managers and catalog editors cannot create a variable set.

For example, a catalog administrator defines 10 catalog items for types of servers. The request process for all these items asks the same five questions, using the same variables.

Associating these variables individually per catalog item is repetitive, time-consuming, and error-prone. Also, to make a single change to multiple catalog items involves manually changing each item. For example, to add a variable to
10 catalog items, you would need to manually associate the variable with each item.

Variable sets allow you to create a collection of variables that can be reused across multiple catalog items and order guides. Using variable sets saves time because you do not have to create the same variables individually for many catalog items. Also, when variables should be modified, you can modify the variable set and the changes are reflected across all the catalog items that are associated with the variable set.

Variable sets also allow you to define catalog client scripts and UI policies that are applicable to the variables in the set.

⚠️ **Note:** Variables in a set use the same rules as other variables to determine when the variables in a set appear on a task. For example, variables must either be global or be attached directly to an item.

A catalog administrator can provide read, write, and update roles to access a variable set. When you access variables of a variable set, a validation is first done at the variable set level, and then at the variable level. If the access is blocked at the variable set level, then the access settings on the variable are over-ridden. If the access is allowed at the variable set level, then access at the variable level is verified.

⚠️ **Note:** Both single-row and multi-row variable sets are supported in Now Platform, Service Portal, Now Mobile, and in the Variable editor in Agent Workspace.

### Single-row variable set

Use a single-row variable set to capture data from variables that are grouped together, while submitting a catalog item request for a single entity.

### Multi-row variable set

Use a multi-row variable set (MRVS) to capture variable data in a grid layout while submitting a catalog item request for a group of entities. For example, for HR during the reorganization of employees, a single record producer should be able to capture the relevant information such as the department and manager for a group of employees. Also, when you request a catalog item to order virtual machines and servers, configuration options should be captured as a single request. In this case, a requester can define multiple hardware units as rows and their configuration options as columns of an MRVS.

You cannot include the following variable types in an MRVS:
- Attachment
- Break
- Container End
- Container Start
- Container Split
- HTML
- Label
- Macro
- Macro with label
- Rich Text Label
- UI Page
Note:

- You can configure an MRVS variable to disallow duplicate values. For information about the **Unique** field, see Create a service catalog variable.
- You can hide a variable in the MRVS so that it does not appear when the modal is open.
- The **Map to field** functionality is not supported for variables used in an MRVS.
- Only the glide list interface is supported for the List Collector variable.
- Cascading functionality for variables in an order guide is not supported in an MRVS.
- An MRVS is not displayed when added within a container.
- You cannot add variables with read roles in an MRVS.
- When you clone a request that contains an MRVS, the information that is specified in the MRVS is available in all cloned requests. All UI policies and client scripts on the MRVS are also cloned.
- Set a limit to the number of rows that you can add to an MRVS by using the `max_rows` attribute in the **Variable Set attributes** field.
- In the RITM and request view in Now Mobile, an MRVS is not supported. A message is displayed in this view that this variable set is not viewable.
- An MRVS is supported in the variable summarizer only in Service Portal.
- You can include an MRVS in the GetCatalogVariables and CreateCatalogTask actions using Flow Designer.
- You can iterate through individual rows and access variables using the For Each flow logic.
- You can include MRVS while creating a catalog task using a workflow.

An MRVS form changes dynamically based on the data in the catalog item form that includes the following:

- Other rows of that MRVS
- Other variables outside of that MRVS on the catalog item form.

For information about accessing data in a multi-row variable set (MRVS) when a modal is open, see `g_service_catalog - Client`.

You can define catalog client scripts, catalog UI policies, and catalog data lookups for an MRVS. Visibility is honored just on the MRVS form and not in the list.
Note:

- onSubmit catalog client scripts are not supported for an MRVS.
- Catalog UI policies and catalog client scripts defined at the item level are not applicable for variables in an MRVS. Only those catalog UI policies and catalog client scripts defined within the MRVS are applicable for variables in the MRVS.
- Scripts that are not included in an MRVS cannot affect variables inside the MRVS. Similarly, the scripts included in the MRVS cannot affect the variables that are not included in the MRVS.
- Variables that are not included in an MRVS cannot be used in dependent reference qualifiers for variables in the MRVS. Similarly, the variables included in the MRVS cannot be used in dependent reference qualifiers for variables that are not in the MRVS. For a reference qualifier, the current row is the one that is being edited.

You cannot set `Global` as `True` for any variable that belongs to an MRVS. So, an MRVS is not available in catalog tasks.

If the variables included in the MRVS have price implications for a catalog item, the price of the catalog item reflects the corresponding changes when a row is added, edited, or removed from this variable set.

Note: When you disable the `glide.sc.use_cart_layouts` property, the Order Item Widget does not reflect the price changes of the item from the MRVS. However, when you add this item to the cart, these price changes are reflected.

You cannot select variables of an MRVS when defining the following for a catalog item:

- UI policy conditions
- Unsupported ATF step configurations. You can only validate if an MRVS is visible, mandatory, or read only.
- Reporting

Create a variable set and add it to an item

Create a set of variables and add them to multiple catalog items and order guides for reuse.

Before you begin

Role required: catalog_admin, admin, catalog_editor, or catalog_manager
About this task

• Variable sets within a catalog item cannot have the same internal name.

• Within a catalog item, the name of a variable cannot be the same as the title or internal name of a variable set.

Note: This condition is also applicable even when a variable is not part of the variable set.

• Any catalog client script or catalog UI policy script should refer to the internal name of a variable set instead of its name or title.

Procedure

1. Navigate to Service Catalog > Catalog Variables > Variable Sets.

2. Click New.

   The Variable Set Creation page is displayed.

3. Select any of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-Row Variable Set</td>
<td>Creates a variable set with variables that are grouped together. <strong>Type</strong> field is set to <strong>Single Row</strong>.</td>
</tr>
<tr>
<td>Multi-Row Variable Set</td>
<td>Creates a variable set with multiple rows that captures variable data in a grid layout. <strong>Type</strong> field is set to <strong>Multi Row</strong>.</td>
</tr>
</tbody>
</table>

4. Enter details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Title of a variable set. Appears if the <strong>Display title</strong> check box is selected.</td>
</tr>
<tr>
<td>Internal name</td>
<td>Variable set name for internal use. For example, to access the variable set for the front-end (through the <em>g_form</em> API) and server side scripting.</td>
</tr>
</tbody>
</table>

Note: If this field is empty, its value is auto-populated based on the **Title** field for all variable types except break, container split, and container end.

Order            | Order number for the variable set.                                                                                                             |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of the variable set. Possible choices are:</td>
</tr>
<tr>
<td></td>
<td>• Single Row</td>
</tr>
<tr>
<td></td>
<td>• Multi Row</td>
</tr>
<tr>
<td>Application</td>
<td>Applications that can use this variable set.</td>
</tr>
<tr>
<td>Display title</td>
<td>If selected, adds a title and an expandable header to the right of the variable set.</td>
</tr>
<tr>
<td>Note:</td>
<td>When a user requests the item, all check box variables are grouped under a default title of Options. To use a custom title, insert a variable of type Label, with an Order value that puts it directly above the check box variables.</td>
</tr>
<tr>
<td>Variable Set</td>
<td>Attributes for configuring a multi-row variable set. Use the max_rows attribute to set a limit to the number of rows that you can add to a multi-row variable set. For example, specify max_rows=1 as the field value.</td>
</tr>
<tr>
<td>attributes</td>
<td></td>
</tr>
<tr>
<td>Layout</td>
<td>The layout display. Set to 1 Column Wide or 2 Columns Wide, alternating sides or 2 Columns Wide, one side, then the other.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the variable set.</td>
</tr>
</tbody>
</table>

5. Right-click and select **Save**.

6. Create the variables to use in that set.

   a. In the Variables related list, click **New**.

   b. Follow the steps for creating variables.

   **Note:** For a multi-row variable set:

   • The included variables are displayed as columns of a table.
   • The column order is the order of variables defined in the variable set.

7. To create an associated catalog data lookup rule, perform the following steps.

   a. In the Catalog Data Lookup Definitions related list, click **New**.

   b. On the Catalog Data Lookup Definitions form, fill the fields. For information on creating a data lookup rule, see **Create a catalog lookup definition**.

8. Click **Submit**.

Add a variable set to a catalog item or order guide

Service Catalog enables you to add a variable set to one or more catalog items or order guides.

Before you begin
Role required: catalog_admin, admin, catalog_editor, or catalog_manager

Procedure

1. Open a catalog item or an order guide.

<table>
<thead>
<tr>
<th>Option</th>
<th>Navigation path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog item</td>
<td>Service Catalog &gt; Catalog Definition &gt; Maintain Items</td>
</tr>
<tr>
<td>Order guide</td>
<td>Service Catalog &gt; Catalog Definition &gt; Order Guides</td>
</tr>
</tbody>
</table>

2. In the Variable Sets related list, click Edit.

You can configure the form to add the Variable Sets related list.

3. Select and add a variable set.

   Note: If the Cascade Variables check box is selected for an order guide, multi-row variable set data should be cascaded to the included items.

4. Click Save.

5. Click Try.

   Note: For a multi-row variable set:
   - The associated variables are displayed as columns of a table on a catalog item or record producer. Each row corresponds to a set of data for all variables in the variable set.
   - The column order is the order of variables defined in the variable set.

a. To add a row, click **Add** within the variable set, specify the variable information in the **Add Row** window, and click **Add**.

**Note:**
- A maximum of 50 rows can be added.
- Unless default values are provided for variables or On Load scripts are used to pre-populate data, you should add variable data for each row.

b. To edit a row, click the edit row icon ✎ in the **Actions** column, specify the variable information in the Edit Row window, and click **Save**.

**Note:** When you add or edit an existing row, all catalog UI policies and client scripts associated with the multi-row variable set should be honored.

c. To remove a row, click the remove row icon ✗ in the **Actions** column and click **Remove** in the confirmation window.

d. To remove all rows of the table, Click **Remove All** within the variable set and click **Remove** in the confirmation window.

**Variable set layout**

Variable sets can have one of many layouts. You can define the order of the variables for each item.

- **1 column wide:** Variables appear in a single vertical column, ordered from top to bottom. This column is a simple way to display information, but can result in empty space to the right of questions. This order is the default layout.
- **2 columns wide, alternating sides:** Variables are laid out in two columns with variables placed alternately in the left and right columns.
- **2 columns wide, one side, then the other:** The first half of the variable set is laid out sequentially in the left column and the second half is laid out sequentially in the right column.

**Note:** Variables with several possible choices defined, such as multiple choice variables, are considered a single entity in layouts. All choices are displayed as a single, contiguous unit.
**Variable set order**

A variable set is a discrete unit with an order number by default. All variables within the set are included wherever the set is included.

For example, if you set the following order for some example variables and a variable set:

- Variable A (100)
- Variable B (200)
- Variable C (300)
- Variable Set 1 (250) - containing three variables (VS1, VS2, VS3) with incremental order values (150, 250, 350)

The variables are displayed in this order:

- Variable A (100)
- Variable B (200)
- Variable Set 1 (250): Variable VS1 (150)
- Variable Set 1 (250): Variable VS2 (250)
- Variable Set 1 (250): Variable VS3 (350)
- Variable C (300)

**Additional layout options**

For additional layout options, you can also add container variables to a variable set.

For example, create the following variables and orders:

<table>
<thead>
<tr>
<th>Order of variables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
</tr>
<tr>
<td>Alfa</td>
</tr>
<tr>
<td>Bravo</td>
</tr>
<tr>
<td>Charlie</td>
</tr>
<tr>
<td>Delta</td>
</tr>
<tr>
<td>Echo</td>
</tr>
<tr>
<td>Foxtrot</td>
</tr>
</tbody>
</table>
Order of variables in a layout

<table>
<thead>
<tr>
<th>1 Column Wide</th>
<th>2 Columns Wide, alternating sides</th>
<th>2 Columns Wide, 1 side, then the other</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alfa</td>
<td>Alfa Bravo</td>
<td>Alfa Delta</td>
</tr>
<tr>
<td>Bravo</td>
<td>Charlie Delta</td>
<td>Bravo Echo</td>
</tr>
<tr>
<td>Charlie</td>
<td>Echo Foxtrot</td>
<td>Charlie Foxtrot</td>
</tr>
<tr>
<td>Delta</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Echo</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Foxtrot</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Set an item-specific order

You can set the order value on a per item basis.

About this task

When a variable set is used by more than one catalog item, you can define item-specific ordering to provide more flexibility in the layout. You do this using the catalog variable set record associated with the item. Use the Order field in this catalog variable set record to set this order value on a per-item basis, overriding the default value defined in the variable set.

Procedure

1. Navigate to Service Catalog > Catalog Definition > Maintain Items.
2. Open the catalog item to edit.
3. Navigate to the Variable Sets related list.
4. Click the reference icon for the variable set.
5. Set the order value as required.
   The catalog variable set order is specific to the link between the item and the
   variable set. It overrides the default order defined on the variable set itself.

Examples of variable set orders

The following example demonstrates the layout of variables when variable sets
and item variables are associated with an item under different scenarios.

The order for display of the variables and variable sets is specified using the
Information icon in the Related Lists.
In Layout 1, order values are specified for both Variable Set A and Variable Set B at the Related Lists level and those order values always takes precedence. Hence, the layout is organized based on the order value specified for the variable sets at the Related Lists level.

In Layout 2, an order value is not specified for Variable Set A whereas an order value is specified for Variable Set B at the Related Lists level. In this case, the empty value for Variable Set A is considered as zero. Hence, the layout is organized based on the order value of 0 for Variable Set A and 300 for Variable Set B.

In Layout 3, order values are not specified for both Variable Set A and Variable Set B at the Related Lists level. In this case, the order values specified within the variable sets are considered. Hence, the layout is organized based on the order value of 400 for Variable Set A and 150 for Variable Set B.
Service Catalog scoping
Scoping support is available to define the limits of entities in Service Catalog.

- A catalog can have categories from different scopes.
- A category can only be in the same scope as its parent category.
- You can associate a catalog item with categories of a different scope.
- Catalog items can contain variable sets from a different scope.
- Variables can only be in the same scope as the catalog item or variable set.
- Catalog UI policies can only be in the same scope as the catalog item or variable set.
- Catalog client scripts can only be in the same scope as the catalog item or variable set.
- Catalog data lookup can only be in the same scope as the catalog item or variable set.
- The rule base of an order guide can have items from different scopes.
- The scope of the record producer and the target table should be the same.

Scriptable service catalog variables
You can use scripting to reference any request item variable from a table in scoped and non-scoped environment.

An example of a variable reference follows.

```plaintext
current.variables.<variable_name>
```

Where current refers to the current record, and `<variable_name>` is the name of your variable.

ℹ️ **Note:** In order to reference a variable from JavaScript, it must have a name.

When a variable is part of a variable set, you can reference it as `current.variables.<variable_name>` or `current.variables.<variable_set_name>.<variable_name>`.

Variable set is also a first-class citizen in Service Catalog. Like variables, a variable set has read, write, and create roles. If roles are provided for a variable set, the roles are applicable for the variables within the set. Roles of an individual variable are overridden by the roles of the variable set.
Print a variable

```javascript
var original = current.variables.original_number;
gs.print(original);
```

Set a variable

```javascript
current.variables.name = "Auto-Generated:" + current.variables.asset_tag;
```

Create an inventory item with fields set from variables

```javascript
doCreation();

function doCreation () {
  var create = current.variables.create_item;
  if (create == 'true') { // we want to create an asset
    var computer = new GlideRecord('cmdb_ci_computer');
    computer.initialize();
    computer.asset_tag = current.variables.asset_tag;
    computer.serial_number = current.variables.serial_number;
    computer.name = current.variables.name;
    computer.manufacturer = current.variables.company;
    computer.insert(); }
}
```

Get GlideElementVariable of variables and variable sets associated with a GlideRecord

```javascript
now_GR.variables
```

Get the name value pair of variables associated with a GlideRecord

```javascript
now_GR.variables.getVariableValue();
```

Get a list of GlideElementVariable for variables within a task record

```javascript
now_GR.variables.getElements();
```

Get a list of GlideElementVariable for variables (including multi-row variable set) within a task record

```javascript
now_GR.variables.getElements(true);
```
### APIs for GlideElementVariable

- `now_GR.variables.<var_name>.isMultiRow()`: Get whether the GlideElementVariable is a multi-row variable set or a variable.

- `now_GR.variables.<var_name>.getQuestion()`: Get the Question object for a variable. Applicable only for a variable (`isMultiRow()` is false) and not for a multi-row variable set.

- `now_GR.variables.<var_name>.getLabel()`: Get the label of the GlideElementVariable. For a variable, the label of the variable is returned. For multi-row variable set, the title of the variable set is returned.

- `now_GR.variables.<var_name>.canRead()`: Get whether the user can view a variable or multi-row variable set.

- `now_GR.variables.<var_name>.canWrite()`: Get whether the user can edit a variable or multi-row variable set.

- `now_GR.variables.<var_name>.getDecryptedValue()`: Get the decrypted value for a masked variable. Applicable only for a masked variable.

- `now_GR.variables.<var_name>.getRows()`: Get the list of row objects for a multi-row variable set. Applicable only for a multi-row variable set (`isMultiRow()` is true).

- `now_GR.variables.<var_name>.getRowCount()`: Get the number of rows for multi-row variable set. Applicable only for a multi-row variable set (`isMultiRow()` is true).

### Example to access variables of GlideRecord for the Task table

```javascript
var now_GR = new GlideRecord('sc_req_item');
if (now_GR.get('635af5387320300e0ef0cf888cb0b73')) {
    var variables = now_GR.variables.getElements();
    for (var i=0;i<variables.length;i++) {
        var question = variables[i].getQuestion();
        gs.log(question.getLabel() + ":" + question.getValue())
    }
}
```

### Example to access a multi-row variable set of GlideRecord for the Task table

```javascript
var now_GR = new GlideRecord('sc_req_item');
now_GR.get('02c38dcd87013300e0ef0cf888cb0bb2');
var vars = now_GR.variables.getElements(true);
```
for (var i=0; i<vars.length; i++) {
    var now_V = vars[i];
    if (now_V.isMultiRow()) {
        var rows = now_V.getRows();
        for (var j=0; j<now_V.getRowCount(); j++) {
            var row = rows[j];
            var cells = row.getCells();
            for (var k=0; k<cells.length; k++) {
                var cell = cells[k];
                gs.info(cell.getLabel() + ":" + cell.getCellDisplayValue())
            }
        }
    }
}

**Multi-row variable set**

<td><code>var row = now_GR.variables.table_var.addRow()</code></td>
</tr>
<tr>
<td>Delete a row</td>
<td><code>row.deleteRow()</code></td>
</tr>
</tbody>
</table>

Notes and limitations

// Single column of table_Var
`now_GR.variables.table_var.var1`  
`now_GR.variables.table_var.var1 = <val>`

1. You can only set a variable in a before business rule. Variables set in an after rule are not written to the database.

2. There is nothing in place to prevent namespace collision with variables. Creating two variables named `computer_speed` would result in only one of them showing up; the second one would overwrite the first one.

3. Date/time variables use the same time zone formatting and storage rules as all other dates in the system. They are stored internally in GMT, but translated into the user's local time zone and format for display.

Service Catalog security

Service Catalog enables you to set the security for catalog with user criteria.

Set security for items and categories

An administrator can control access to content in the service catalog by creating and applying user criteria records.
Catalog managers and catalog editors can apply existing user criteria for items and categories to which they are assigned. Catalog managers and catalog editors cannot create or edit user criteria directly.

You can create user criteria records that define conditions for user information and then apply these criteria records to catalog items and categories. In this way you can control access to these items and categories.

For example, create a USA Sales user criteria record matching users who are both in the sales team and based in the USA. Then apply this record to the USA IT Hardware catalog category, so only users matching the record can access that category.

The feature is active by default in new Fuji instances and upgraded instances that do not use entitlement-based access controls. If you upgrade an instance that uses entitlements, you can migrate to user criteria to take advantage of the improved control, flexibility, and reuse.

Access controls allow you to:

• Manage access to multiple items and categories in one user criteria record. For example, create a single UK Employees user criteria record and apply it to multiple items and categories that are available to employees in the UK.

• Allow access if one condition matches, or if all conditions match. For example, define that only users who are both in a specific location and who belong to a specific department can have access.

• Use Available For and Not Available For lists to allow or prohibit access to users matching the conditions in a criteria record. For example, specify that a US-based catalog category is available for the users located in the USA but is not available for users belonging to the Sales department (whether in the US or not).

• Extend matching to create conditions matching additional fields in the User [sys_user] table, without having to use a script. For example, you can add a condition to match items against the Cost center field in user records.

**Important:** After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

**Related information**

  Debug user criteria of a catalog item

  Create a user criteria record in Service Catalog

Create a user criteria record to define conditions that are evaluated against user records.
**About this task**
You can apply several user criteria records to a single catalog item or category. In this situation, users match only one of these criteria records to have access.

**Procedure**
1. Navigate to **Service Catalog > Catalog Definition > User Criteria** and create a record.
2. Fill in the fields on the form, as appropriate.

### User criteria fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>The individual user records to match.</td>
</tr>
<tr>
<td>Groups</td>
<td>The group records to match.</td>
</tr>
<tr>
<td>Roles</td>
<td>The roles to match.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A check box to display or hide the Script field.</td>
</tr>
<tr>
<td>Script</td>
<td>A script to define any additional criteria, and return true or false. This field is available only if Advanced is selected.</td>
</tr>
</tbody>
</table>

**Note:**
- The evaluation of a role is cached in the session, so any change in the role requires you to logout and login, similar to roles in ACL (Access Control List).
- User Criteria is not applicable for elevated privilege roles.
### Field Description

<tr>
<td></td>
<td>With Match All cleared, users meeting any of these conditions are matched. For example, a user with a location B.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you select Match All, ensure that you do not create contradictory conditions which can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.</td>
</tr>
</tbody>
</table>

**Implementing user criteria**

When creating user criteria for your system, consider the following recommendations.

- **Design Criteria for Reuse:**
  Ensure that you design user criteria for maximum reuse. Create user criteria records with common sets of conditions matching your organization requirements. Allow them to be shared across as many items and categories as possible, rather than creating multiple similar criteria records for individual items and categories.

- **Naming conventions:** Give each user criteria record a meaningful name, to help you determine the function for that record. For example,
  - Users in company Cloud Dimensions AND in Madrid
  - Users in company Cloud Dimensions OR in Madrid
  - Users belonging to the Group Development, IT, or Sales
  - Users with role itil, asset_manager, or catalog_admin

- **Test user criteria on a development or test instance, and then transfer the records from the user criteria tables and catalog records to your production instance using update sets.**

**Apply user criteria to items and categories**

Apply a user criteria record to items and categories, either from the item or category form or from the user criteria form.

**About this task**

The user criteria restriction applies only within Service Catalog for the specific item it is applied for. However, the user criteria restriction is not applied outside the Service Catalog where the user has access to the item via the table.
To apply criteria directly to an item or category, use the Available For or Not Available For related lists in the Item or Category form.

ℹ️ **Note:**
- When a change is made to the end-user profile, such as location, and it affects their ability to view items, those changes do not take effect until the end user has relaunched the session.
- The user criteria restrictions of a category do not automatically apply to the catalog items within the category. If required, you should apply the user criteria restrictions to the individual catalog items.

To apply criteria directly from the User Criteria form, add items to the Available For Catalog Items and Not Available For Catalog Items related lists, and add categories to the Available For Categories and Not Available For Categories related lists. You can configure the User Criteria form to add these lists.

ℹ️ **Note:**
The **Not Available For** settings override **Available For** settings. A user on the **Not Available For** list for an item cannot access that item, even if that user is also on the **Available For** list for that item.

**Apply user criteria to items**
Apply user criteria to an item to define which users can and cannot access that item.

**About this task**
You can apply user criteria to all types of catalog item, including order guides, content items, and record producers.

ℹ️ **Note:** The user criteria restriction applies only within Service Catalog for the specific item it is applied for. However, the user criteria restriction is not applied outside the Service Catalog where the user has access to the item via the table.

**Procedure**

1. In an item record, navigate to the Available For or Not Available For related lists.
2. Click **Edit** to add an existing user criteria record, or click **New** to create a new one.
3. Save the record to associate the user criteria record with the item.

⚠️ **Note:** The Not Available For settings override Available For settings. A user on the Not Available For list for an item cannot access that item, even if that user is also on the Available For list for that item.

### Apply user criteria to categories

Apply user criteria to a category to define which users can and cannot access a category.

**Procedure**

1. In a category record, navigate to the Available For or Not Available For related lists.
2. Click **Edit** to add an existing user criteria record, or click **New** to create a new one.
3. Save the record to associate the user criteria record with the category.

⚠️ **Note:**

- The Not Available For settings override Available For settings. A user on the Not Available For list for a category cannot access that category, even if that user is also on the Available For list for that category.

- The user criteria restrictions of a category do not automatically apply to the catalog items within the category. If required, you should apply the user criteria restrictions to the individual catalog items.

### Extend user criteria

Extend the user criteria table when the available user criteria fields are not sufficient. User criteria references various user fields (fields from the User [sys_user] table), such as department, company, and groups. You can extend user criteria with a custom field to include any other user reference field (field from the User [sys_user] table) of interest.

**About this task**

For example, you can extend user criteria to include the user’s cost center, and then restrict certain catalog items only to members of that cost center. Meet the following rules to extend the user criteria table.
• The field to add must be a reference field in the user record.
• The field added to the user criteria table must be List type.
• The fields must have matching names. For example, `cost_center [sys_user]` and `u_cost_center` ("u" prefix is added to custom fields in a table) are considered to be matching.

This example demonstrates how to extend the current user criteria record to include Cost center as an option.

**User criteria record before extending Cost center**

<table>
<thead>
<tr>
<th>Name</th>
<th>Users with 'snc_internal' role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td></td>
</tr>
<tr>
<td>Groups</td>
<td>snc_internal</td>
</tr>
<tr>
<td>Roles</td>
<td></td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to System Definition > Tables.
2. Open the User Criteria record.
3. In the Table Columns related list, click New.
4. Set the type to List, and then enter Cost center as the column label. The Column name field populates with `u_cost_center`.
5. In the Reference Specification form section, select Cost Center for the reference field.
6. Add any conditions or additional information to the dictionary entry as desired.
7. Click Submit.
8. Navigate to .
9. Select or create a user criteria record, and see that you can now use the new field.
What to do next
Test the user criteria record by navigating to Service Catalog > Catalog Definition > User Criteria, and opening any record. Verify that the extended field is available.

You can extend the User [sys_user] table if there are fields in other tables that you want considered in user criteria. After extending the User table, follow the steps in this procedure to extend it to user criteria.

User criteria with cost center

You can extend the User [sys_user] table if there are fields in other tables that you want considered in user criteria. After extending the User table, follow the steps in this procedure to extend it to user criteria.

User criteria migration
Service catalog user criteria records provide access control for service catalog items and categories.
You can migrate your access controls to use user criteria. The user criteria feature is automatically enabled for new instances. If you upgrade your instance, a script runs to determine current access control usage.

• If your instance does not use entitlement-based access controls, the user criteria feature is automatically enabled.

• If your instance does use entitlements, the user criteria feature is not enabled. If you want to use user criteria, use the procedure described on this page to migrate your access controls from entitlements to user criteria.

Migrate to user criteria to provide more reuse, control, and flexibility compared to entitlements.
For example, you can use a single criteria record to make multiple catalog items available to only users who meet all these requirements:
• Are located in EMEA or APAC
• Belong to ACER
• Are in the Training department

Migrate to Service Catalog user criteria

Service Catalog enables you to maintain the required access controls to your service catalog while migrating from entitlements to user criteria.

About this task

Procedure

1. Navigate to Service Catalog > Catalog Administration > Properties and verify that the user criteria feature is not already enabled on your system.
   • If the property Use "User Criteria" to define access to catalog items and categories (glide.sc.use_user_criteria) is set to true, you can skip the following steps. The user criteria feature is automatically enabled because entitlements were not used in your old system.
   • If this property is set to false, continue with the following steps. The user criteria feature has not been enabled yet on your system.

2. To preview the user criteria feature, set the service catalog property Enable both "User Criteria" and "Entitlement" related lists for catalog items and categories when migrating from entitlements (glide.sc.user_criteria_migration) to true. This option lets you compare user criteria records and entitlements before you fully switch to user criteria.

3. Inspect your service catalog items and categories to identify access control sets that you can configure user criteria records for. Review your current entitlements and record your current design for access controls. Focus on identifying patterns where multiple items have the same combination of location, group, and so on. Each combination is a possible access control set.

4. Create a user criteria record for each access control set that you identified from your inspection of the service catalog.
   You have a step with a list, note, and image.

5. Apply these user criteria records to the items and categories identified, replacing the equivalent entitlements.

6. Enable user criteria on your system by setting the service catalog property Use "User Criteria" to define access to catalog items and categories.
(glide.sc.use_user_criteria) to **true**. When this property is set to true, any remaining entitlements are no longer used.

*Note:* Scripts in user criteria cannot reference the category or catalog item as `current` as entitlement scripts do. For scripts in user criteria, use the `user_id` available for the user currently being evaluated against the category or catalog item.

**Data structure differences**

There are significant data structure differences between entitlements and user criteria, which you must be aware of while migrating.

Using entitlements, the following tables are loaded into memory and evaluated before rendering.

For catalog items:

```plaintext
Entitlements Data Structure - Catalog Items

- sc_cat_item_company_mtom
- sc_cat_item_dept_mtom
- sc_cat_item_group_mtom
- sc_cat_item_location_mtom
- sc_cat_item_user_mtom
- sc_cat_item_company_no_mtom
- sc_cat_item_dept_no_mtom
- sc_cat_item_group_no_mtom
- sc_cat_item_location_no_mtom
- sc_cat_item_user_no_mtom
```

For categories:

```plaintext
Entitlements Data Structure - Categories

- sc_category_company_mtom
- sc_category_dept_mtom
- sc_category_group_mtom
- sc_category_location_mtom
- sc_category_user_mtom
- sc_category_company_no_mtom
- sc_category_dept_no_mtom
- sc_category_group_no_mtom
- sc_category_location_no_mtom
- sc_category_user_no_mtom
```

The user criteria architecture collects all user attributes in the User Criteria [user_criteria] table.

User criteria records can link to items and categories, as follows.

For catalog items:
• Catalog Item Available for [sc_cat_item_user_criteria_mtom]
• Catalog Item Not Available for [sc_cat_item_user_criteria_no_mtom]

User Criteria Data Structure - Catalog Items

For categories:
• Category Available for [sc_category_user_criteria_mtom]
• Category Not Available for [sc_category_user_criteria_no_mtom]

User Criteria Data Structure - Categories

Legacy service catalog access controls

Service catalog supports several ways to control access to a catalog item or category. These controls are also known as catalog entitlements.

Instead of access controls, use user criteria that is the supported security model for catalog item and category. For information about user criteria, see Apply user criteria to items and categories.

A service catalog item with no specific access controls is available to all users. If access controls are specified, only users who meet all conditions have access.

The following entitlements are available:

• Role
• Custom script
• Company, Department, Group, User, or Location
Access controls are checked in the following order: roles, then scripts, then Company, Department, Group, User, or Location.

⚠️ Note: The functionality described here is superseded by access controls using user criteria. Migrate to user criteria for a more flexible and reusable way to define access controls.

**Service Catalog administration**

Service Catalog enables an administrator to configure the service catalog.

**About this task**

**Procedure**

1. Navigate to **Service Catalog > Maintain Items** or **Service Catalog > Maintain Categories**.
2. Open an item or category, and then configure the related lists in the form to add **Available for Department** and **Available for Company**.
3. Click **Update** to save the form layout.
4. Open the item or category you wish to secure and add companies and departments to related lists.

   The item or category is available only for the companies and departments listed. If no companies or departments are listed, then the item or category is available to all companies or departments.

**Restrict access**

Service Catalog enables an administrator to grant or deny access to a service catalog item or category by company, department, group, user, or location.

**Procedure**

1. Navigate to **Service Catalog > Maintain Items** or **Service Catalog > Maintain Categories**.
2. Open the relevant catalog item or category.
3. Configure the form to add the appropriate **Available** or **Not available** lists.
4. Add the companies, departments, groups, users, or locations to the appropriate list.

5. Click **Update**.

**Restrict access by role**

By default, individual catalog items and categories do not have access restrictions.

**About this task**

Administrators can grant or deny access to a service catalog item or category based on role.

**Procedure**

1. Navigate to **Service Catalog > Maintain Items** or **Service Catalog > Maintain Categories**.

2. Open the relevant catalog item or category.

3. Add the required roles to the **Roles** field.
You can, if needed, Configure the form or change to Default View to see the Roles field.

Roles Granted

---

Restrict access by a script

Service Catalog enables you to control access to a service catalog item or category with a custom script.

Procedure

1. Navigate to Service Catalog > Maintain Items or Service Catalog > Maintain Categories.
2. Open the relevant catalog item or category.
3. Configure the form to add the Entitlement Script field.
4. In the **Entitlement Script** field, enter the access control script.

**Sample Scripts**

The following example script grants access to a catalog item named French Blackberry to users with a language of Fr (French):

```java
gs.log ('Running Entitlement script for French Blackberry')

if (gs.getUser().getLanguage() == 'fr')
    answer = true; else
    answer = false;

answer;
```

The following example script could be used to distinguish between two categories of users (one with full access and one with restricted access) on the catalog of services:

```java
var userid = gs.getUserID(); var now_GR = new GlideRecord('sys_user');
now_GR.get('sys_id', userid);

if (now_GR.source)
    answer = true; else
    answer = false;

answer;
```

**Overriding Entitlement Scripts by Role**

**a.** Navigate to **Service Catalog > Properties**.

**b.** Enter the roles for which to override the entitlement script (grant access) in the property List of roles (comma-separated) that can override normal entitlement checking inside the catalog. An itil role of "itil" means that the itil role can order any catalog item, even one protected by entitlement restrictions.

**Service Catalog customization**

Service Catalog enables you to customize the catalog in various ways.

No updates are supported on the following internal service catalog tables, either directly or through business rules.

- Options [sc_item_option]
- Variable Ownership [sc_item_option_mtom]
- Question Answer [question_answer]
Cart layout
Service catalog enables catalog administrators to configure the layout and functionality of the service catalog cart used in your organization to place requests for catalog items.

You cannot check out a cart item that is no longer available.

You can perform the following:

- Remove components. For example, hide prices throughout the cart if your catalog does not use pricing.
- Change labels. For example, change the Order now button label to Request Item in the shopping cart.
- Change the order of elements. For example, change the order of the columns on the order status screen.
- Configure, hide, or create functionality. For example, add a Requested For reference field to the shopping cart.

Configure cart layout

Configure cart layout records to define functionality for widgets or screens in the shopping cart.

Procedure

1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Select a widget or screen.
   - **Cart widgets**: Item Ordering Widget, Shopping Cart Widget, or Item Ordering Widget (Order Guide)
   - **Preview screens**: Cart Preview Screen, Cart Preview Screen (Two Step), Cart Preview Screen (Wish List), or Cart Preview Screen (Classic Mobile)
   - **Order status screens**: Order Status Screen or Order, Status Screen (Classic Mobile)
3. Update the Title field to change the title that appears on the widget.
4. Leave the default Target value. Do not change this value because it identifies the cart element being defined.
5. Update the other sections of the cart layout record, as required. The availability of these sections varies for each widget and screen record.
• In the **Components** section, select the components to display, such as delivery times, item descriptions, and prices.

• In the **Columns** section, select which columns to display, such as the item description column, delivery time column, or price column.

• In the **Buttons** section, select the buttons to display, such as **Add to Cart**, **Edit Cart**, and **Delete Item**.

• In the **Button Labels** section, enter new labels to replace the default button labels.

  A new label is used on all screens that the button appears on. For example, the **Continue Shopping** button is used on several screens, so changing its label affects all those screens.

6. If required, configure the widget and column macros.

7. Save the record, and then test the results of your configuration by ordering items from your service catalog.

   Some settings and properties in your instance can override or affect your cart layout.

**Cart layout considerations**

When you enable cart layouts, service catalog properties are impacted. Consider the possible outcomes and alter the settings or properties to achieve the cart layout and functionality you require.

Some of these properties are impacted when you use cart layouts. For example, with the order status screen, the **When to show prices and sub-totals on the Service Catalog Cart** (**glide.sc.price.display**) property overrides cart layout settings for displaying prices.

<table>
<thead>
<tr>
<th>Property</th>
<th>Impact</th>
</tr>
</thead>

<tr>
<td>Show the 'Back to Catalog' button on the two-step checkout screen. [glide.sc.checkout.twostep.back]</td>
<td>Not used (deprecated) if cart layouts are enabled. Replaced by the <strong>Back to Catalog</strong> check box in cart layout settings.</td>
</tr>
<tr>
<td>When to show prices and subtotals on the Service Catalog Cart. [glide.sc.price.display]</td>
<td>Overrides any relevant cart layout settings.</td>
</tr>
</tbody>
</table>

**Configure widget and column macros**

Configure macros that define functionality for elements within each widget or screen.

**About this task**

Some widgets or screens also have column macros that define the horizontal layout and configuration of shopping cart contents.

You can configure these macros to alter the display order of elements, or hide elements, within the widget or screen. You can also create new macros to implement any extra requirements.

**Procedure**

1. Navigate to **Widget Macros > Column Macros** related list.
2. Click the order number entry of a macro to edit its display order, or to activate or deactivate it.
3. Click **Update**.

4. Click the **Widget / View Macro** entry of a macro to view its functionality settings. You cannot edit functionality settings for default macros, but these settings can be a useful reference for creating your own widget macros.

**Create macros for cart layout**

Create macros for cart layout records using Jelly scripts to define customized behavior and display within a widget or screen.

**About this task**

Macros that you create do not affect upgrades because customized widget functionality is isolated from general cart behavior.

**Procedure**

1. Open the relevant cart layout record.
2. Navigate to **Widget Macros** or **Column Macro** related list.
3. Click **New**.
4. Enter details for the macro.

**Macro form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name for the new macro.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box to indicate whether the macro is displayed or not.</td>
</tr>
<tr>
<td>Description</td>
<td>A summary of how the macro is used.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box to indicate whether the macro is displayed or not.</td>
</tr>
<tr>
<td>XML</td>
<td>The Jelly script to apply for your macro.</td>
</tr>
</tbody>
</table>

5. Save the macro record.
**Example:**
This example demonstrates the script to add a Requested for reference field as a widget macro to a cart layout record.

```xml
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
  <j:set var="ref" value="sc_cart" />
  <j:set var="jvar_ref" value="${jvar_cart.getRequestedFor()}" />
  <j:set var="jvar_ref_display" value="${jvar_cart.getRequestedForDisplayName()}" />
  <tr>
    <td colspan="3">
      <g:catalog_requested_for />
    </td>
  </tr>
</j:jelly>
```

**Configure cart layout for specific items**
Set fields in the Catalog Item form to configure the cart layout for specific items.

**About this task**
Overrides any general cart layout settings. For example, you can hide the price of an item by setting the Omit price in cart field to true for that item.

**Procedure**
1. Navigate to Service Catalog > Catalog Definition > Maintain Items.
2. Select the catalog item.
3. Configure the form to add both Use cart layout and any of the following item configuration fields you require:
   - Omit price in cart
   - No cart
   - No order
   - No order now
   - No proceed checkout
   - No quantity
4. Clear the **Use cart layout** check box to display the configuration fields for that item.

5. Set the item configuration field values as required.

6. Click **Update**.

### Override cart layouts for items

Service catalog enables you to use additional methods to configure cart behavior or layouts, which override cart layout record settings.

For example, your cart layout record settings can hide item prices, but you might decide to display the price of the **Sales Laptop**. In that case, you would set the relevant configuration values on that catalog item. Be aware of the impact of these additional methods, to ensure that your cart behaves in the way you want.

**Note:**

If you are migrating to cart layouts, you can have defined additional settings and properties that impact your cart layout settings.

### Configure Service Catalog cart widgets

You can configure widgets for the shopping cart, catalog items, and order guides.

**About this task**

Overview of configurable options in the Service Catalog on the Service Portal and explains how to perform those configurations.

### Configure order guide widgets

You can customize the widget that provides details of the current catalog item on an order guide or wizard.
Before you begin
Role required: admin, catalog_admin

About this task
Order guide cart widget is visible when an order guide item is ordered.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Item Ordering Widget (Order Guide) record.
3. You can add/remove components and rename widget title.
4. Click Update.

Cart widget displayed for an order guide item

Note: By default, order guides use a two-step process, and catalog items use a one-step checkout process. If you configure the checkout process, keep in mind that order guides and catalog items provide different cart experiences if they use different checkout processes.

Configure catalog item widgets
You can customize widgets that appear for catalog items.

Before you begin
Role required: admin, catalog_admin

About this task
Both shopping cart and item ordering widgets are visible on the standard catalog page and any ESS catalog page. The shopping cart widget is also available in additional locations, such as the catalog homepage.
Procedure

1. Navigate to **Service Catalog > Catalog Definitions > Maintain Cart Layouts**.
   
a. Open the **Item Ordering Widget** record to modify the widget for ordering item.
   
b. Open the **Shopping Cart Widget** record to modify the widget for shopping cart.

2. You can add/remove components, buttons, rename widget title and button labels.

3. Click **Update**.

### Item ordering and shopping cart widgets

![Image of Item Ordering and Shopping Cart Widgets]

**Configure Service Catalog preview screens**

You can configure shopping cart preview screens for the one-step and two-step carts, for the wish list, and for the Classic Mobile app.

### Configure wish list screen

Using Service Catalog, customize the cart preview screen for wish list items.

### Before you begin

Role required: admin, catalog_admin
About this task

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Cart Preview Screen (Wish List) record.
3. You can add/remove components, columns, buttons, and rename labels. See Configure cart layout.
4. Click Update.

Cart preview screen for wish list items

Configure Classic Mobile shopping cart screen

Using Service Catalog, customize the shopping cart screen that is displayed on mobile devices.

Before you begin
Role required: admin, catalog_admin

About this task
The shopping cart on Classic Mobile devices always uses a two-step checkout process. You cannot modify widget macros or button labels on Classic Mobile devices.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Cart Preview Screen (Classic Mobile) record.
3. You can add/remove components and buttons.
4. Click Update.

Configure one-step shopping cart screen
Using Service Catalog, customize the shopping cart display screen for a one-step checkout process.

Before you begin
Role required: admin, catalog_admin

About this task
One-step checkout is the default checkout process for catalog items.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Cart Preview Screen record.
3. You can add/remove components, columns, buttons, and rename title and button labels. See Configure cart layout.
Configure two-step shopping cart screen

Using Service Catalog, customize the shopping cart display screen for a two-step checkout process.

Before you begin
Role required: admin, catalog_admin

About this task
Changes made to the two-step record are visible only if the two-step checkout process is enabled in properties. By default, catalog items use a one-step checkout process.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Cart Preview Screen (Two Step) record.
3. You can add/remove components, columns, buttons, and rename title and button labels. See Configure cart layout.

   In the Components tab, both Shipping Location and Shipping Address are not supported simultaneously. Deselect the selected component to select the other component.

   If you enable Shipping Address in the Components tab, the editable Shipping address field is displayed in the cart preview screen. If you enable Shipping Location in the Components tab, the editable Shipping location field and a read-only Shipping address field are displayed in the cart preview screen.

4. Click Update.
Configure Service Catalog status screens
You can configure shopping cart status screens for desktop and Classic Mobile orders.
Configure desktop order status screen

Using Service Catalog, customize the order status screen that is displayed on desktops.

Before you begin
Role required: admin, catalog_admin

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Order Status Screen record.
3. You can add/remove components, columns, buttons, and rename labels. See Configure cart layout.
4. Click Update.

Configure Classic Mobile order status screen

Using Service Catalog, customize the order status screen that is displayed on Classic Mobile devices.

Before you begin
Role required: admin, catalog_admin
About this task
You cannot modify widget macros or button labels on Classic Mobile devices.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts.
2. Open the Order Status Screen (Classic Mobile) record.
3. You can add/remove components and buttons.
4. Click Update.

Migrating to cart layouts
Service catalog enables you to configure cart layouts to add, remove, or change elements of the service catalog shopping cart. Before you migrate your system to use cart layouts, familiarize yourself with existing configurations for catalog content and decide whether to discard or retain these configurations.

This feature is enabled by default in new instances and the default cart layout settings are implemented. For upgrades, an upgrade script checks to see if your current cart macros are customized. Only a user with an admin role can migrate cart layouts.
• If cart macros are not customized, cart layout configuration is enabled by default.

• If cart macros are customized, cart layout configuration is disabled. Migrate your system to use this feature.

Cart configuration settings
Check your current configurations for:

• UI macros defining custom shopping carts that have been linked to items.
• Service catalog properties impacted by cart layouts.
• Item-specific settings that can override cart layout record settings.

Item-specific settings
Some catalog items can have cart layout settings that are specific to them. For example, these items can show prices even though the general cart layout record settings hide prices.

To retain item-specific settings, clear the Use cart layout check box in the catalog item form.

Note: You can configure the form to display the Use cart layout check box.

Migrate customizations and enable cart layouts
Move customization to cart layout widgets, and then enable cart layouts.
About this task
When you customize a few UI macros, you should migrate the customizations to cart layout widgets before you enable cart layouts. Following are the UI macros whose customizations need migration before you enable cart layouts:

- `sc_catalog_homepage_cart`
- `sc_catalog_requested_for`
- `catalog_item`
- `catalog_cart_default`
- `sc_cart_main`

In addition, if you have customized the `com.glideapp.servicecatalog_category_view` UI page, or the Catalog Cart dynamic content, you must migrate these customizations before you enable cart layouts.

Procedure
1. Save copies of the customizations for later reference.
2. Revert the customizations to restore the customized macros or other content to their standard state.
4. Run the following script in Background Scripts to set the property and set the correct state for all the items in the catalog:

```javascript
var cm = new CartLayoutMigration();
    cm.configureLayoutProperty();
    cm.setLayoutFalse();
    cm.setEmptyLayout();
```

5. Reimplement any cart layout customizations that you want to maintain in the upgraded instance by configuring widget macros.
6. To enable cart layouts, set the service catalog system property `glide.sc.use_cart_layouts` to **Yes**.

Legacy flexible checkout and delivery forms
ServiceNow includes several options that provide administrators some control over content in service catalog template-driven forms.
Some service catalog forms, such as the checkout form, are generated from templates, instead of being data-driven like other forms in the system, such as the Incident form.

Template-driven forms provide enhanced look-and-feel over standard data-driven forms, but they provide more limited control over the form content.

**Note:**

It is recommended that you use cart layout records to configure cart layouts. Using cart layout records lets you configure the service catalog cart without writing and maintaining scripts.

**Modifications in the delivery screen**

In the final checkout step, a summary screen provides a list of all items and services ordered.

**Warning:** Modifying the Order Status or Summary screen requires advanced scripting and a knowledge of Jelly. Also, the upgrade process skips updates to the summary screen after a customization. With these constraints in mind, you can modify the summary screen by editing the `com.glideapp.servicecatalog_checkout_view` UI page.
Requester search results

After you enable the two-step checkout process, the Requested for field appears on the Request form.

The Requested for field references the User [sys_user] table and has an auto-complete feature. Two service catalog properties (Service Catalog > Catalog Administration > Properties) enable an administrator to add columns to the search results for this field and to order the list by one of the columns.

### Service catalog properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional columns for the &quot;request for&quot; Service Catalog widget. (glide.sc.request_for.columns)</td>
<td>Choose fields from the User [sys_user] table. Must be semicolon separated.</td>
</tr>
<tr>
<td>Ordering of matches for the &quot;request for&quot; Service Catalog widget. (glide.sc.request_for.order_by)</td>
<td>Choose fields from the User [sys_user] table.</td>
</tr>
</tbody>
</table>

Modifications in the checkout form

You can modify the checkout form to use an alternate description field or to add request item number for each line.

By default, the checkout forms list the Description, Delivery Date, Stage, Price, Quantity, and Total columns. An example of default checkout form is shown:
Add the request item number on checkout form

Add the request item number to display this number as an extra column on the checkout form. By default, the request item number is not displayed in the list.

Procedure

1. Navigate to Service Catalog > Catalog Administration > Properties.
2. Locate the property: Show the request item number for each line item on the checkout screen (default false).
3. Select the Yes check box to add the number column to the checkout form.

Checkout number

Use an alternate description field on checkout form

Use an alternate description field to describe your category item in the checkout form. By default, the short_description column of the catalog item appears as the item description.

Procedure

1. Navigate to Service Catalog > Catalog Policy > Properties.
2. Locate the property Field name to use for the description column of the checkout form. If blank, the default (short_description) is used.
3. Enter the name of the alternative field (a column in the Catalog Item [sc_cat_item] table) and save it. For example, if you selected name:

**Checkout name**

<table>
<thead>
<tr>
<th>Description</th>
<th>Delivery Date</th>
<th>Stage</th>
<th>Price (ex)</th>
<th>Qty</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blackberry</td>
<td>2007-04-08</td>
<td></td>
<td>$500.00</td>
<td>1</td>
<td>$500.00</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Total: $500.00</td>
</tr>
</tbody>
</table>

**Delivery Information**

Estimated Delivery Date of Complete Order: 2007-04-08

**Define item quantity choices**

In the Service Catalog, the default quantity choices are 1–10. You can configure the quantity selector with additional choices. This configuration is also applicable in Service Portal.

**About this task**

**Procedure**

1. Navigate to **System Definition > Choice Lists**.
2. Search for the table **sc_cart_item** and the element **quantity**. The existing quantity choices appear.
3. Add quantity choices, modeling them after the existing ones.
To reduce the quantities available for catalog items, delete the relevant quantity records. For example, to reduce the quantity range to 1-3, delete the records for 4 and 5.

To restrict the roles allowed to change quantities, edit the list of roles (comma-separated) that can use the quantity selector in the shopping cart (glide.sc.allow.quantity) service catalog property. For example, you can limit this ability to the admin and catalog_admin roles.

Related information
Service Catalog administration

Remove item restrictions

Service Catalog enables you to remove or apply restrictions on all order guides, record producers, and wizard launchers.

About this task
Catalog administrators can use Service Catalog properties to configure the behavior and usage of a catalog item.

By default, all order guides, record producers, and wizard launchers have these restrictions:

- They cannot be added to a requested item
- They do not provide a Try It action
- They are not added to the cart as items

To remove these restrictions or apply these restrictions to other types of items:

Procedure

Modify the comma-separated lists of tables in the following properties:
• List of class names for catalog items that cannot be added to an existing request (glide.sc.item.cannot_add_to_request): restricts the items that can be added to a requested item, after an end user places a request. For example, to restrict content items from being added to an existing request, add sc_cat_item_content to the list for this property.

• List of class names for catalog items that do not use the default "Try It" UI Action (glide.sc.item.cannot_try_it): restricts the items which allow you to click Try It on the item form to preview how it appears in the service catalog. Items with such restrictions do not display Try It on the form.

• List of class names for catalog items that do not generate a normal cart item (glide.sc.item.not_normal_cart_item): restricts which item types are added to the cart by default.

Using variables for price setup
You can define a price for every service catalog item. The price or recurring price of a catalog item can be modified with variables, increasing the base price for that item.

This pricing is useful if you want the price or recurring price dynamically calculated based on how a user completes the ordering form. For example, the cost of an item can be increased based on options the user selects, such as extra memory in a PC.

The following variable types can be configured to modify the total cost of an item:

• Check box
• Multiple choice
• Reference
• List collector
• Select box
• Lookup select box

Check box
A check box variable helps to set the price or recurring price of the item being ordered.

You can Create a check box variable and set the price of the item. Use the Price if checked or Recurring price if checked field to specify the price or recurring price difference for that variable when the option is selected.
Under the **Type Specifications** tab, you can specify the price in different currency types. Also, you can configure the price in the following pricing models:

- Calculated
- Fixed
- Multiple

For information on the pricing models, see **Price fields**.

**Multiple choice**

For a multiple choice variable, there are two options for pricing.

- Specify the price difference in the **Price** field on the question choices.
- Specify the recurring price difference in the **Recurring Price** field on the question choices.

ℹ️ **Note:** Select boxes operate the same as multiple choice variables but are displayed as select boxes.

**Reference**

A reference variable includes a **Pricing implications** field.

If this field is selected and there is a **price**, **u_price**, **recurring_price**, or **u_recurring_price** field on the referenced table, the value of that field is used to modify the cost of the item being ordered when a reference value is selected.

For example, suppose that computers in Phoenix cost $100 more than the ordering price, and computers in Boise cost $100 less than the ordering price.

1. Set up a reference variable to the Location [cmn_location] table.
2. Put a **u_price** field on the Location table.
3. Set that field to 100 for the Phoenix location.
4. Set that field to -100 for the Boise location.

When ordering a computer, if **Phoenix** is selected as the location for this variable, the ordering price is increased by $100. If **Boise** is selected, the ordering price is decreased by $100.
Note: List collectors operate the same as a reference variable, but use the **List table** field to specify the table being referenced. Since it is a list collector variable, multiple selections can be made that all modify the ordering price or recurring price.

**Lookup select box**

A lookup select box variable is more powerful than a reference variable.

Specify the following when creating a lookup select box variable:

- **Lookup from table**: the table from which values are queried.
- **Lookup value field**: the field on the lookup table whose value is used as the value of the variable (typically sys_id).
- **Lookup label field(s)**: a comma-separated list of fields on the lookup table whose values are used to display the selections in the select box. For example, `manufacturer,name` for the Software [cmdb_ci_spkg] table would display selections as:
  - Microsoft | Excel
  - Adobe | Photoshop Elements
- **Lookup price field**: the field whose value is used to modify the price of the item being ordered.
- **Lookup recurring price field**: the field whose value is used to modify the recurring price of the item being ordered.

**Set a recurring price**

A catalog item can have a recurring price in addition to an initial price.

**About this task**

For example, a subscription to a mobile phone contract could cost $500.00, with a $30.00 monthly recurring price.

The price and the recurring frequency are set on the catalog item record. After the price and frequency are set, the recurring price appears in the catalog, catalog search results, catalog page for the item, shopping cart, and order summary screen.
If multiple items with the same recurring price frequency are placed in the shopping cart, they are grouped. The grouping makes it easier to view how much items cost for each frequency (for example, weekly, monthly, and annually). If the shopping cart contains items with and without recurring costs, they are grouped separately.

If multiple items with the same recurring price frequency are placed in the shopping cart, they are grouped. The grouping makes it easier to view how much items cost for each frequency (for example, weekly, monthly, and annually). If the shopping cart contains items with and without recurring costs, they are grouped separately.
On a request record, recurring prices are grouped by frequency and shown in the **Recurring Prices** related list. In the example below, two items each have a monthly recurring cost of $100.00 and their prices are grouped as a single record of $200.00 monthly. Another item with an annual recurring cost of $500.00 is listed as a separate record.

If a request record contains multiple items with the same recurring frequency, click the arrow next to the corresponding recurring prices record to view details. In the example below, two items (the mobile phone and the sales laptop) each have a monthly recurring cost. They are grouped under the **Monthly** recurring prices record, but are listed separately when the recurring prices record is expanded. Only one item has an annual recurring cost.
Extend the pricing model

The pricing model is useful if you want the price or recurring price to be dynamically calculated based on how a user completes the ordering form. You can extend the pricing model of a catalog item by editing the item price or the recurring price.

Procedure

1. From the left navigation pane, select **System Definition > Script Includes**.

2. Edit the CatalogPriceCalculator script to customize the item price and the CatalogRecurringPriceCalculator script to customize the recurring price.
**Hiding prices in the service catalog**

Administrators can configure options to hide catalog item prices in the service catalog for listings of specific items, for specific types of items, or for all items. Item prices can appear in the following locations:

- A catalog item listing in the **Order This Item** panel.
- Catalog item listings in categories and subcategories.
- The **Shopping Cart** panel.
- The Edit Cart, Order Confirmation, and Order Status pages.

**Hide prices globally**

Configure service catalog properties to hide prices globally.

To view and edit service catalog properties, navigate to **Service Catalog > Catalog Administration > Properties**.

**Hiding prices by item types**

By default, prices do not appear for order guides, record producers, and wizard launchers.

You can change which catalog item types show prices using the **List of class names for catalog items that do not show the price in listings** property (`glide.sc.item.cannot_show_price`). Provide a comma-separated list of table names for item types that you want to hide prices for.

For example, to hide prices for standard catalog items, add `sc_cat_item` to the list.

You can also remove an existing entry to display prices for that item type. For example, to display prices for order guides, remove the order guide entry `sc_cat_item_guide` from the list.

**Hiding prices for all items**

By default, zero-priced items have prices hidden in listings and carts.

You can configure this behavior to always hide or show prices, using the **When to show prices and sub-totals on the Service Catalog Cart** property (`glide.sc.price.display`).

Set this property to **Always show prices** to display prices for all items on all service catalog screens, or to **Never show prices** to hide prices for all items on all service catalog screens.
**Hide prices for specific items**
You can hide prices for specific items to match your organizational requirements.

**Procedure**
1. Navigate to Service Catalog > Catalog Definition > Maintain Items.
2. Open the relevant item definition.
3. Select the Omit Price on Cart check box.
   The price does not appear in the catalog listing or when the item is added to the cart. The price is listed as "-" on the edit cart, order confirmation, and order status screens.

**Clone requests**
Clone a request to create up to ten copies (clones) of the same Service Catalog request, for different users, without having to enter the same information multiple times. For example, you can request a new piece of equipment for several specified people, generating multiple individual requests quickly from a single initial request.

**Before you begin**
Role required: admin or catalog_admin

**Procedure**
1. Navigate to Service Catalog > Catalog Definitions > Maintain Cart Layouts
2. Under the Target type: Browser Screen section, select Order Status Screen.
3. In the Components tab, select the Clone Checkout check box.
4. Navigate to Service Catalog > Catalog Administration > Properties.
5. In the Cart category, perform the following:
   • Enable the Enable cloning requests during checkout property.
   • For the List of roles (comma-separated) that can use bulk ordering functionality property, enter the roles for which you want to enable bulk request capability for all users with these roles, or leave the field blank to enable the capability for all users.
6. Click Save.
Related information

- Clone a request
- Request a catalog item from Service Portal
- Request an order guide from Service Portal
- Delegated request experience

Create scripts

Service Catalog enables you to use certain scripts.

Some functions are available, specifically for Service Catalog:

- Client-side scripting allows catalog designers to use the same functionality available on other forms.
- The Service Catalog Script API makes catalog ordering easier from inside business rules.
- Scriptable Assignment of Execution Plans allows selection of an execution plan at the time of ordering, based on scripted conditions.

Create a custom cart

Administrators with a knowledge of Jelly can customize the look and feel of service catalog carts, either globally or for specific catalog items, using the UI macro capability.

Before you begin
Role required: admin

About this task

Note: You can configure cart layouts without scripting.

Procedure

1. Navigate to System UI > UI Macros.
2. Click New to create a new macro.
3. Fill in the details and write the script to define your custom cart.

Note: Designing a custom cart requires knowledge of the Jelly expression language. For reference purposes, the default cart script appears in the list as catalog_cart_default.

4. Click Submit.
What to do next
After creating a custom card, you can reuse it and link it to catalog items.

Link a cart to an item
Link the default cart or a custom cart to an item so the requester sees the pertinent information.

Before you begin
Role required: catalog_admin or admin

Procedure
1. Navigate to Service Catalog > Catalog Items.
2. Open an item to test the new cart.
3. In the Cart field, select the cart to use.
   You can configure the form layout to add this field to the form.
4. Save the changed form.

Example:
In the example below, the HP bl35p uses the irm_technical_cart.

![Catalog Item Form](image)

This cart appears as follows:
Service catalog home page configuration

The home page for a service catalog provides the primary front end for ordering items within that catalog. You can configure various elements of the pages within the Service Catalog.

Administrators and catalog administrators can design a home page in any of the following ways.

- Customizing the catalog home page.
- Adding, removing, and arranging categories.
- Enabling content types.
- Using catalog properties to provide additional control over behavior and appearance.
- Using renderers to define the appearance of categories.

⚠️ Note: End users can access the catalog through the customizable user home page, or with content management pages that use content blocks for categories.

Configure search and navigation

You can use service catalog properties to configure search and navigation within the service catalog homepage.

Navigate to Service Catalog > Catalog Administration > Properties to view service catalog properties.
**Restrict search access**

Each catalog homepage provides a search bar to help locate items not displayed on the homepage. By default, any user who can access the catalog homepage can search using this search bar.

To restrict access to this search function by role, use the **List of roles (comma-separated) that can search the service catalog** property (glide.sc.can_search).

For example, to only allow logged-in users to access search, set this field to blank. To remove the search function for all users, set this field to **None**.

⚠️ **Note:** Search results only show items that the logged-in user can access.

**Hide search results from inactive categories**

By default, search results are returned from all categories, including inactive categories.

To avoid returning results from inactive categories, set the **Service catalog searches return items in inactive categories** property (glide.sc.search.disabled_cats) to **No**. For example, when designing a new category, you can avoid users seeing search results from this category until you are ready to make it active.

⚠️ **Note:** Security constraints can also make a category or catalog item inaccessible.

**Restrict search by item type**

By default, a search field does not appear when viewing order guides, record producers, and wizard launchers.

To define which catalog item types do not show the search field, list these types in the **List of class names for catalog items that do not have the search field displayed** (glide.sc.item.cannot_show_search) property.

For example, to enable searching when viewing record producers, remove **sc_cat_item_producer** from this list.
Enable breadcrumb links

By default, breadcrumbs appear without links when using content management pages as service catalog homepages.

To display these breadcrumbs with links, set the Use links for breadcrumbs rendered in Service Catalog pages accessed via a CMS site property (glide.sc.use_breadcrumb_links.cms) to Yes. This setting provides greater navigational control for end users.

Disable search suggestions

By default, service catalog searches display "Did you mean?" suggestions if a search does not return any results and an alternate spelling or similar recent search does.
To disable these suggestions, set the **Specify whether search suggestions should be enabled** property (`glide.sc.search.suggestions`) to **No**.

**Refine search results**

Use properties to refine search results in Service Catalog.

**About this task**

The auto-completion feature returns values that contain an exact match to the letter combination entered.

Administrators can use the **Additional columns for the "request for" Service Catalog widget** (`glide.sc.request_for.columns`) property to add columns to this list, to further refine the search results, and help determine which user to select when two users have the same name.

In this example, the property is set to display two additional columns, **Department** and **Title**.
Administrators can use the **Ordering of matches for the "request for" Service Catalog widget**. *(glide.sc.request_for.order_by)* property to configure the columns to sort by one of the values. In this example, the is set to sort the results list by **department**.
Catalog auto complete results by department

This results list is ordered by department.

Auto-completion also applies to the Request for field, which can be added to the service catalog homepage.

**Procedure**

1. Navigate to Service Catalog > Catalog.
2. Click Add Categories.
3. Select Request for.
4. Place the category on the page.

**Add requested for catalog section**

Configure keyword search for catalog items

When you search for a catalog item by a keyword in Service Catalog, the search results are displayed by considering a few fields of the catalog table. If the keyword does not have exact matches, its closest matches are displayed as *Did you mean* suggestions. This search functionality is also applicable in Service Portal.

**Before you begin**

Role required: admin

**About this task**

When you search for a catalog item by a keyword in Service Catalog, the search results are displayed by considering a few fields of the catalog table. If the keyword does not have exact matches, its closest matches are displayed as *Did you mean* suggestions. This search functionality is also applicable in Service Portal.

The search results are sorted in the following order based on the frequency of the keyword:
• Catalog items whose **Name** field contains the keyword (top).
• Catalog items whose **Meta** field contains the keyword.
• Catalog items whose **Description** or **Short description** field contains the keyword.
• Categories whose **Name** or **Description** field contains the keyword.
• Catalogs whose **Name** or **Description** field contains the key term, or the catalog items whose **Class** field contains the keyword (bottom).

⚠️ **Note:**
• If your organization has multiple service catalogs, a search returns results only from the catalog being viewed.
• Search results return an item only when the item is active, has a valid catalog and category association, and you are authorized to view the item.

**Procedure**

1. Complete the following steps to regenerate a text index for the `sys_metadata` table.
   a. Navigate to **System Definition > Text Indexes**.
   b. Open the text index for the Application File `[sys_metadata]` table.
   c. Click the **Regenerate Text Index** related link and click **OK**. The system schedules the table for the text indexing.

2. Complete the following steps to enable the **Did you mean** suggestions.
   a. Navigate to **System Properties > Text Search**.
   b. Under the **Did You Mean Properties** section, enable the **Suggest alternate search spellings for knowledge, catalog or global search** property.
