Improve employee engagement with an AI-based catalog search experience in Service Portal and Now Mobile. Intelligent query features enable users to quickly and easily find the answers they need.

Before you begin
Role required: admin

About this task

You can configure AI-based catalog search experience in portals and Now Mobile. Following are the default search application configurations for Service Portal and Now Mobile:

- **Service Portal Default Search Application.** For information about AI Search in Service Portal, see [AI Search in Service Portal](#).
- **NowMobile App Search Configurations.** For information about AI Search in Now Mobile, see [AI Search in mobile](#).

Each of these search application configurations have an associated search profile based on which the search results are filtered and displayed.

**Note:** If the AI Search is enabled for Now Mobile, the **Experience for items not available in NOW Mobile** (`glide.sc.mobile.unsupported_discover`) property is not applicable. For information on Now Mobile properties, see [Service Catalog properties](#).

Following are a few limitations for AI-based catalog search experience:

- The facets in Service Portal always show the primary category of the catalog item (even if the user does not have access to the primary category and the accessible path to the item is via another category that the item is associated with).

- If the user does not have read permissions for the category record and its fields, the search results cards in Now Mobile do not show the category of the item.

Procedure

1. Navigate to **AI Search > Search Experience > Search Applications**.

2. To edit the searchable catalogs in a portal or Now Mobile, perform the following steps.
Note: Items are searched for only in the catalogs configured in the search source, irrespective of the catalogs associated with the portal. For information on associating a catalog with a portal, see Configure a catalog in Service Portal.

a. In the Search Application Configurations list, select the search application configuration associated with the portal. For example, Service Portal Default Search Application for Service Portal.

b. On the Search Application Configuration form, open the search profile. For example, Service Portal Default Search Profile specified for Service Portal.

Note: To avoid conflicts with future upgrades, it is recommended that you create a search profile instead of using the search profile available in the base system.

c. From the Search Sources related list, select a search source. For example, Service Portal Catalogs.

d. In the Conditions field, add catalogs where you want the items to be searched for.
e. Click Update.

**Related information**

**AI Search**

**Configure preview**

Configure the number of items that have the Preview section expanded to display item details. You can also change the default number (5) of items and categories that display, and hide the Exists in categories information.

**About this task**

By default, if not showing item details using pop-ups, the first two items listed in the category display have the Preview section expanded to display item details.

To change the number of items with this information expanded, set the Number of Catalog Items to expand in browsing and search when not using pop-up icons to view details (glide.sc.auto_expand) property to the number required.

| Expanding to 2 items | Expanding to 1 item |
Set number of items and categories to preview

By default, up to five items or categories appear in each category on the homepage.

About this task

To change this number, set the **Number of Catalog Items/Categories to preview in a section** (glide.sc.max_items) property to the required value.

Hide the existing categories in the categories display

By default, catalog items that are in several categories show **Exists in categories** information that shows other categories that the items are available in. You can hide this information.

Procedure

Set the **Show the additional categories section when viewing a catalog item** (glide.sc.show_additional.cats) property to **No**.
Create a renderer

Create or modify renderers using UI macros to provide the rendering instructions. Renderers define a specific look and feel for a catalog or category.

Before you begin
Role required: catalog_admin or admin

About this task
Use renderers to specify the following formats:

- How categories appear on a catalog homepage.

For example, you can create a renderer showing the category homepage image, the description, and the first two catalog items in a category.

Procedure
1. [Optional] Create a UI macro to define specific rendering instructions.
2. Navigate to Service Catalog > Catalog Definition > Renderers.
3. Click New.
4. Select to create a catalog or category renderer.
5. Enter the renderer details.

Renderer Details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name for the renderer.</td>
</tr>
<tr>
<td>Macro</td>
<td>The UI Macro to use.</td>
</tr>
<tr>
<td>Render catalog title</td>
<td>Appears for catalogs renderers. A check box to display the catalog title bar on the multi-catalog homepage.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Render title</td>
<td>Appears for category renderers. A check box to display the category title bar on the catalog homepage.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** The **admin** and **catalog_admin** roles can view the **Render title** even when the check box is not selected.

#### Service Catalog Renderers

- **Name**: All Details
- **Macro**: sc_catalog_homepage_ce
- **Render catalog title**: OFF

#### 6. Click **Submit**.

ℹ️ **Note:** To modify a default catalog or category renderer, follow a similar process, by selecting one of the default renderers listed.

This new renderer is added to the list of available choices when applying a renderer.

## Select a renderer for a catalog

Select a renderer and apply them to a catalog to change its appearance.

### Before you begin

**Role required:** catalog_admin or admin

### About this task

The following default catalog renderer schemes are available:

- **All Details**: shows desktop image, title, and categories.
- **Image Only**: shows desktop image only.
- **Title and Image**: shows title and desktop image.
- **Title Only**: shows title only.
Procedure

1. Navigate to **Service Catalog > Catalogs**.
2. Click the add content icon (+) on the upper right.
3. Select a catalog in the middle panel of the pop-up window.

   ![Service Catalog home page layout](image)

4. Select a renderer from the list displayed in the right-hand panel, for example **Title Only**.
5. Click **Close** to save the catalog with the renderer settings you defined.

**Select a renderer for a category**

Select a renderer scheme for your categories.

**Before you begin**

Role required: catalog_admin or admin
About this task
The following default category renderer schemes are available:

• **Category Items**: shows desktop image, title, and description.
• **Category Items No Title**: shows desktop image and description.
• **Category Details**: shows the subcategories and items in that category.

**Procedure**
1. Navigate to **Service Catalog > Catalog**.
2. Click the add content icon (+) on the upper right.
3. Select a category in the middle panel of the pop-up window.
4. Select a renderer from the list displayed in the right-hand panel, for example **Category Items**.
5. Click the close icon (x) to save the catalog with the selected renderer.

**Customize a catalog homepage**
Customize a catalog homepage to provide end users with access to catalogs from one homepage.

**Procedure**
1. Navigate to **Service Catalog > Catalog**.
2. Click the add content icon (+) at the top of the page to add a category.
3. Select a category in the middle panel of the pop-up window that appears.
4. Click **Add here** in the location where the category appears on the homepage.

5. **Optional:** Repeat steps 3–4 to add more categories.

6. Close the pop-up window.

7. **Optional:** To change a category location, drag it to the appropriate place.

8. **Optional:** To remove a category, click the (X) icon on the top right of the category header.

9. **Optional:** Add a shopping cart on the page.

Display subcategories in a panel

By default, subcategories are displayed in a panel at the bottom of the category page. You can change a system property to list subcategories at the top.

Before you begin
Role required: admin
**Procedure**

Use the **In category view display subcategories in a panel** property (*glide.sc.use_sub_cat_section*).

<table>
<thead>
<tr>
<th>Name of form</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>When set to <strong>Yes</strong>, the subcategories appear in a panel at the bottom.</td>
<td>When set to <strong>No</strong>, the subcategories appear as a list at the top.</td>
</tr>
</tbody>
</table>

**Set to Yes**

![Office](image)

- **Packaging and Shipping**
  - Package and Ship inter-office or to external addresses
- **Paper and Supplies**
  - Order office supplies such as paper, stationery and computer supplies
- **Videoconferencing**
  - Setup inter-office or external videoconferencing

**Set to No**

![Office](image)

- **Packaging and Shipping**
  - Package and Ship inter-office or to external addresses
- **Paper and Supplies**
  - Order office supplies such as paper, stationery and computer supplies
- **Videoconferencing**
  - Setup inter-office or external videoconferencing

**Customize the multi-catalog homepage**

Customize the multi-catalog homepage to provide end users with access to multiple catalogs from one homepage.

**About this task**

This task is similar to customizing the homepage for an individual catalog. In this task, you are adding catalogs, not catalog categories.

**Procedure**

1. Navigate to **Service Catalog > Catalogs**.
2. Select **Add Catalogs** at the top of the page to add catalogs to this page.
3. Select a catalog in the middle panel of the pop-up window.
Multi-catalog home page arrangement

Note: Only administrators can see catalogs that do not contain active categories or items.

4. [Optional] Select a renderer from the right-hand panel, for example Title Only.
5. Click Add here in the location where the catalog appears on the homepage.
6. [Optional] Repeat steps 3–5 to add more catalogs.
7. Close the pop-up window to save the changes.

You can modify the arrangement of catalogs within the homepage:
To change a catalog location, drag it to the appropriate place.

To remove a catalog, click the X in the catalog title bar.

To edit details for a catalog, click the pencil icon in the catalog title bar. The catalogs appear on the homepage.

Show item details in sections or pop-ups

By default, a service catalog category displays the first two items with the preview section expanded to show item details. You can change the number of items that are previewed, or change the preview to appear in a pop-up window.

Before you begin

Role required: admin

Procedure

1. Navigate to Service Catalog > Catalog Administration > Properties.

2. To change the number of items previewed, set the Number of Catalog Items to expand in browsing and search when not using pop-up icons to view details (glide.sc.auto_expand) property to the desired number.

Example

<table>
<thead>
<tr>
<th>Expanded to 2 items</th>
<th>Expanded to 1 item</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 items</td>
<td>1 item</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. To use the preview icon, set the **When browsing a category use the pop-up icon to show item details** (`glide.sc.cat_view_use_popup_for_details`) property to **Yes**.

When set to **No**, the item details appear when you click **Preview**. When set to **Yes**, the item details appear as a pop-up when the cursor hovers over the item icon.

### Configure Classic Mobile devices

When you configure Service Catalog on a Classic Mobile device, you can define the layout and presentation of catalogs. You can then perform actions such as ordering products and services, submit incidents and problems using record producers.

**About this task**

Users can access the service catalog on Classic Mobile devices to:

- View and order products and services.
- Submit incidents and problems using record producers.

**Note:** Users cannot access order guides, wizards, or content items from Classic Mobile devices.

Administrators and catalog administrators can configure the layout, presentation, and other aspects of the service catalog for Classic Mobile devices.

Including:
• Defining rendering options for Classic Mobile categories.
• Defining rendering options for Classic Mobile catalog items.

Accessing the Service Catalog on Mobile Devices
To access the service catalog, navigate to **Self-Service > Catalog**.

Catalog items are grouped into categories, which can also contain one or more subcategories.
You can browse and select an item. To browse for an item within a category, tap the category filter to select the category or subcategory.
Sample service catalog category

To request an item:
Procedure

1. Select an item.

2. Tap any field with an arrow (>) to add information, such as the name or location of the requestor, the need-by date, or item quantity.

3. Tap Add to Cart to add the item to your cart. The order screen appears.
4. Tap **Edit** to edit your order, if required.

5. To order the item as specified, tap **Order**, then tap **OK** when prompted to confirm ordering. A confirmation message appears.
6. Tap the item to see further details.
7. Tap the back arrow to return to the confirmation message.

8. Tap **Continue Browsing** to return to the service catalog.

   After the request is submitted, ServiceNow follows request fulfillment processes to fulfill the ordered item.

**Define the mobile layout**

You can configure the Classic Mobile layout for categories within a service catalog.

**Before you begin**

Role required: admin

**About this task**

By default, service catalog categories appear on mobile devices in the same order as on desktop devices.
Procedure

1. Navigate to Service Catalog > Classic Mobile Admin > Classic Mobile Layout to display a list of service catalogs.

2. Click the lookup icon for the service catalog you want to configure. The mobile layout displays details for the catalog.

3. Click Edit to select which categories appear on mobile devices, and in which order.

4. Add, remove, or reorder the selected mobile categories, and then click Save.

Note: To return the display to the default desktop layout settings for the portal page associated with that catalog, click the Replace categories with desktop layout related link.

Limit description sizes in the Classic Mobile UI

By default, item descriptions in the smartphone interface are truncated to a maximum of two lines.
Procedure

1. Navigate to Service Catalog > Catalog Administration > Properties.

2. Set the Limit descriptions in category and item listings to two rows in the Mobile UI property (glide.sc.mobile.limit.description) to No.

<table>
<thead>
<tr>
<th>If set to Yes</th>
<th>If set to No</th>
</tr>
</thead>
<tbody>
<tr>
<td>descriptions are limited to two lines</td>
<td>the full descriptions are given</td>
</tr>
</tbody>
</table>

Using the content management system with the service catalog

Use the content management system (CMS) to create a custom interface for the service catalog.

You must request the Content Management System (CMS) application from ServiceNow personnel. Instead of activating CMS, use Service Portal for new development. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. See Service Portal and Content Management and Service Portal.

Manage catalogs in CMS sites

When your organization uses the content management system (CMS) as well as Service Catalog, you can select which catalogs are supported within the CMS sites.
Before you begin
Role required: catalog_admin or admin

About this task
Associating catalogs with sites ensures that users can always access an appropriate catalog.

Procedure
1. Navigate to Service Catalog > Catalog Definitions > Maintain Catalogs and open the catalog to associate with a site.
2. In the Sites related list, click Edit, select the site to associate with the catalog, and then click Save.
3. Click the reference icon beside the site name, and then click Open Record.

Service catalog details - catalog sites details

4. Enter values in the fields, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMS homepage</td>
<td>The homepage for this site.</td>
</tr>
<tr>
<td>CMS search page</td>
<td>The location of the search page for the site.</td>
</tr>
<tr>
<td>CMS 'Continue Shopping' page</td>
<td>The location to direct end users to when they click the Continue Shopping button in that CMS site. This field is designed to reference a content page URL suffix.</td>
</tr>
</tbody>
</table>

5. Click Update.
Set up catalog portal pages

The Catalog Portal Page [sc_catalog_view_mtom] table links catalogs to CMS portal pages and defines the default catalog to portal page combination used by URLs.

For example, the default portal page for the service catalog is the catalog_default page.

Catalog portal page records appear in the Catalog Portal Pages related list on the Catalog form. The Catalog Portal Page table generates two values in a URL: sysparm_catalog_view and sysparam_catalog. Use the Catalog Portal Page form to enter a custom link, if required.

Resolve missing catalog portal pages

If a catalog record is not associated to a catalog portal page record, ServiceNow attempts to present a view based on a set prefix of: catalog_<catalog name>.

For example, if the default service catalog has no catalog portal page record, the system sets sysparm_view to catalog_Service_Catalog. With this setting, when you navigate to Self-Service > Service Catalog, you view a new and apparently blank catalog_Service_Catalog portal page, instead of the existing and populated catalog_default portal page.

To correct, go to the Sites related list on the Catalog form and add a new catalog portal page record manually.

For example, for the default service catalog, add a record with the following values:

- **Catalog**: Service Catalog
- **Portal Page**: Catalog (catalog_default)
- **Default**: true

Manage catalog portal pages

Using Service Catalog, you can create and manage multiple portal pages for a catalog.

About this task

A catalog portal page provides a homepage for a specific catalog. You can use portal pages to create different catalog views for different user groups. Each portal page accesses the same catalog content and presents that content in different ways.
Catalog portal page details include the owner, title, and view to use for that page.

**Procedure**

1. The Catalog Portal Pages related list shows portal pages available for that catalog. Each catalog has a default page, created automatically when the catalog is created.
2. Select an appropriate action:
   - Click **New** to create a new portal page.
   - Click **Edit** to select another portal page for the catalog.
   - Select a portal page to view and edit details for that page.

**Define filters for My Requests**

Define request filters to filter incidents, requests, or tasks under the **Self-Service > My Requests** module in Now Platform, the **My Requests** widget in Service Portal, and the My Requests applet in the Now® Mobile app.

**Before you begin**

Role required: catalog_admin or admin

Since the My Request Filter [request_filter] table has been reparented to the Filter [sys_filter] table, a few fields from the My Request Filter table have been migrated to fields in the Filter table. The **Short Description** field from the My Request Filter table has been migrated to the **Title** field in the Filter table. The **Table Name** field from the My Request Filter table has been migrated to the **Table** field in the Filter table.

**Note:** If the My Request Filter form is modified, the form still displays the **Short Description** and **Table Name** fields that are no longer valid. Delete these invalid fields from the form and add the **Title** and **Table** fields to the form.

**Procedure**

1. Navigate to **Service Catalog > Catalog Administration > My Request Filter**.
2. On the form, fill the fields.

**My Request Filter form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the filter.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Table on which the filter condition is applied.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the filter.</td>
</tr>
<tr>
<td>Active</td>
<td>If set to true, the filter is active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Interface for which the filter is applicable. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• Desktop</td>
</tr>
<tr>
<td></td>
<td>• Service Portal</td>
</tr>
<tr>
<td></td>
<td>• Desktop/Service Portal</td>
</tr>
<tr>
<td></td>
<td>• Mobile</td>
</tr>
<tr>
<td>Filter</td>
<td>Conditions to filter requests.</td>
</tr>
<tr>
<td>Portal Settings</td>
<td>This section is displayed when the <strong>Applies to</strong> field is set to <strong>Service Portal</strong> or <strong>All</strong>.</td>
</tr>
<tr>
<td>Portal page</td>
<td>Portal page that opens when you click the request.</td>
</tr>
<tr>
<td>Primary field to display</td>
<td>Primary information displayed for the request.</td>
</tr>
<tr>
<td>Secondary fields to display</td>
<td>Secondary information displayed for the request.</td>
</tr>
</tbody>
</table>

**Note:**
- Add a maximum of three secondary fields.
- Do not add an image field.
- If the Request [sc_request] table is selected, secondary field is not configured. If the request contains only one item, the Requested Item name is displayed. Else, it contains the requested item count.

3. Click **Submit**.

**Related information**
- **My Requests widget**
- **Activate the page route map for the standard ticket page**
Catalog Builder

You can create or edit a catalog item (catalog item or record producer) using a visual and guided experience along with specified restrictions. The catalog builder experience enables you to delegate the creation and maintenance of the catalog.

You can also create a template that can be used to create catalog items. While creating the template, you can specify values or restrictions for items created using the template, for example, restrictions to catalogs, categories, variable types, and portal settings.

From the home page of the catalog builder, you can do the following:

• Create a catalog item
• Create a catalog item template
• View the available catalog items
• View the available catalog item templates
• View catalog items that are recently updated
• View the configured content that describes the catalog building process in your organization.

How does the catalog builder work

Catalog administrator creates templates for a business or service group. The business owner or service owner gathers catalog requirements and creates catalog items from these templates. All advanced capabilities are added by the catalog administrators or developers.

Catalog builder overview

[Image of catalog item creation process]
Catalog item states

A catalog item goes through various states during the item creation and maintenance process.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>A catalog item is in the Draft state in one of these scenarios:</td>
</tr>
<tr>
<td></td>
<td>• A new item is being created in catalog builder.</td>
</tr>
<tr>
<td></td>
<td>• An existing published item has been checked out for editing in catalog builder. When the item is being edited, catalog builder checks out the item and creates a copy of the item and its associated records (variables, UI policies, client scripts). The item copy is in the Draft state. The published item remains in the Published state and the <strong>Checked out</strong> field is set to <strong>True</strong>. Once the editing is done and the item is submitted, the edits to the draft item are merged with the associated published item and the draft item is deleted.</td>
</tr>
</tbody>
</table>

**Note:**

• You can only edit a draft item but not a published item that has been checked out.
• A draft item is always inactive and does not show up in the search or browse experience.
• You cannot modify the **Active** flag of a draft item.
• Any changes to the draft item are not available until it is submitted.

<table>
<thead>
<tr>
<th>Publishing</th>
<th>A catalog item is in this transient state for a while just after its submission and before its state changes to Published. You cannot check out an item in the Publishing state.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Published</td>
<td>When a new item is submitted, the item finally moves to the Published state. This state indicates that it is the item version being used by the application and available in the catalog. When you edit a published item, it is checked out in catalog builder and the item’s draft copy is created.</td>
</tr>
</tbody>
</table>
Limitations

Catalog builder is designed to support the most common and simple use cases so that it can easily be used by business users, while the complex functionality can be added to the item in Now Platform by catalog administrators.

When creating a record producer in a specific scope, you can only select tables in that scope for selecting a record submission table.

Catalog builder does not allow creation and editing of the following entities, but they can be set in Now Platform either for a draft item or a published item that has not been checked out.

- Catalog item
  - Meta tags
  - Execution plans. If an item is assigned an execution plan, the process engine cannot be changed in the catalog builder.
  - Price settings
- Variable settings
  - Tool tips
  - Advanced and dynamic reference qualifiers. If a variable has advanced or dynamic reference qualifiers, then the reference qualifier cannot be edited in the catalog builder.
  - Attributes
  - Default value
  - Permissions
  - Availability
  - Lookup label field (defaults to lookup value field)
  - Lookup price fields
  - Unique values only
  - Always expanded help
  - Help text
  - Advanced reference qualifiers
- Question types. The following questions are supported in catalog builder, and they are grouped into types and subtypes. For the unsupported question types, you can view the questions but not edit them:
Text
- Single-line. This is the Single-line text variable type in Now Platform.
- Multi-line. This is the Multi-line text variable type in Now Platform.
- Rich text. This is the HTML variable type in Now Platform.

Option
- Check box. This is the Check box variable type in Now Platform.
- Yes/No. This is the Yes/No variable type in Now Platform.

Choice
- Dropdown (fixed values). This is the Select Box variable type in Now Platform.
- Dropdown (values from a table). This is the Lookup Select Box variable type in Now Platform.
- Record reference. This is the Reference variable type in Now Platform.
- Radio. This is the Multiple Choice variable type in Now Platform.
- Multi-select. This is the List Collector variable type in Now Platform.

Date/Time
- Date. This is the Date variable type in Now Platform.
- Date & Time. This is the Date and time variable type in Now Platform.

Display label
- Plain text. This is the Label variable type in Now Platform.
- Rich text. This is the Rich Text Label variable type in Now Platform.

Catalog UI policy
- **On Load** field (defaults to true)
- **Script** field. When a catalog UI policy has a script, it does not show up in the question's behavior settings list in the catalog builder.
- **Reverse if false** field. By default, it is set to true.
- Multiple actions. When a catalog UI policy has multiple actions, it does not show up in the question's behavior settings list in the catalog builder.

For a catalog item, the questions cannot be viewed and edited in the catalog builder in the following scenarios:
- It has more than two levels of containers.
- It has a two-column question set or two-column container within a container.
• Catalog client scripts
• Data lookup rules

Set up the catalog builder
Set up the catalog item building process.

Before you begin
Role required: admin

Procedure

1. To direct users from the catalog builder homepage to your organization-specific catalog building process documentation, perform the following steps.
   a. Navigate to sys_properties.list.
   b. Select the glide.sc.builder.content_url property.
   c. On the System Property form, in the Value field, specify the URL for the documentation of your choice. You can include both absolute and relative URLs. Following are the examples:
      • Absolute URL: https://www.youtube.com
      • Relative URL: sp?id=kb_article&sysparm_article=KBXXXXXX
   d. Click Update.

2. Optional: To preview a catalog item in a specific portal, perform the following steps.
   a. Navigate to sys_properties.list.
   b. Select the glide.sc.builder.preview_portal_id.
   c. On the System Property form, in the Value field, specify the portal name. The default value is swp.
   d. Click Update.

3. Required: Create or duplicate catalog item templates. For information on creating a template, see Create or edit a catalog item template.

4. Optional: To allow users with access to a catalog item template to edit all items created using that template, perform the following steps.
a. Navigate to sys_properties.list.
b. Select the glide.sc.builder.template_access.
c. On the System Property form, in the Value field, set the value to true. The default value is false.
d. Click Update.

5. Optional: Define and configure a pre-publish subflow that is triggered after submitting the catalog item in catalog builder. This subflow is run after the catalog item has been submitted but before it gets published. For example, an approval flow after submitting the edited catalog item in catalog builder.

a. Create a pre-publish subflow by specifying the following input and output parameters. You can also copy the Template: Catalog Builder - Item review subflow and then define your subflow. For information about subflows, see Subflows.

<table>
<thead>
<tr>
<th>Template: Catalog Builder - Item review subflow input parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>catalog_item</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Template: Catalog Builder - Item review subflow output parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>state</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

For information about subflow field types, see Field types.

b. Create the glide.sc.builder.item_review_flow property.
   i. Navigate to sys_properties.list.
   ii. Click New.
   iii. On the form, fill in the fields.
### System Property form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique identifier of the property. Specify <code>glide.sc.builder.item_review_flow</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the property. Specify <code>string</code>.</td>
</tr>
<tr>
<td>Value</td>
<td>sys_id of the review subflow.</td>
</tr>
</tbody>
</table>

iv. Click **Submit**.

6. **Optional:** To modify the content in feedback panels for catalog builder steps, perform the following steps.

   a. Navigate to `sc_wizard_feedback.list`.

   b. From the list of catalog wizard feedbacks, select the feedback panel content that you want to edit.

   c. On the Catalog Wizard Feedback form, in the **Content** field, edit the content.

   d. Click **Update**.

### Configure a step-based service fulfillment flow

Define service fulfillment steps while creating a catalog item in Catalog Builder.

**Before you begin**

Role required: admin, catalog_builder_editor, or catalog_admin

**About this task**

In the base system, the Step-based request fulfillment flow is available. It includes the Service Fulfillment Steps base flow subflow that runs all steps defined in the service fulfillment flow. Following are the input and output parameters of the subflow.

#### Service Fulfillment Steps base flow input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task</td>
<td>Reference</td>
<td>RITM record</td>
</tr>
</tbody>
</table>
Service Fulfillment Steps base flow output parameters

<table>

<td>state</td>
<td>String</td>
<td>State of the subflow. Possible values are: • completed: All steps are complete. • failed: At least one step failed because of invalid configurations such as missing subflow or step configurations.</td>
</tr>
</tbody>
</table>

For information about subflow field types, see Field types.

If your organization has processes to be run before or after the service fulfillment steps, create a flow and ensure that it is configured as a step-based service fulfillment flow.

Procedure

1. Create a Flow Designer flow (With the trigger type as Service Catalog). Ensure that the Service Fulfillment Steps base flow subflow is called from this flow.
   
   For information about creating a flow with Service Catalog trigger type, see Create a flow with a Service Catalog trigger.

2. Register the flow as service fulfillment flow.
   
   a. Navigate to Service Catalog > Catalog Administration > Service Fulfillment Steps Registry.
   
   b. Click New.
   
   c. On the form, fill in the fields.

   Service Fulfillment Flow Registry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Fulfillment Flow Registry</td>
<td>Flow Designer flow for which you want to enable service fulfillment steps.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope in which the flow is supported for service fulfillment.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the service fulfillment support for the flow.</td>
</tr>
</tbody>
</table>

   d. Click Submit.
Create a service fulfillment step type

Expand the coverage of service fulfillment use cases beyond those supported by step types in base system. Using a service fulfillment step type, catalog item owners can define multiple steps that are part of the request fulfillment process.

Before you begin
Role required: admin

About this task
The following step types are available in the base system.

- Task
- Custom approval
- Manager approval

Procedure

1. Set up a data store to store information needed for running the step. This information is provided by a catalog item owner while defining the request fulfillment process. Do one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When additional input is required from the</td>
<td>Create a table by extending the Service Fulfillment Step [sc_service_fulfillment_step] table and add fields to store the additional input. For example, to create a step type for email notifications, the email id and body are the additional input provided by the catalog item owner while defining the steps. So, fields for email id and body should be added to the extended table to store the input.</td>
</tr>
<tr>
<td>catalog item owner for a step type</td>
<td></td>
</tr>
</tbody>
</table>

Note: Ensure that the new table has similar ACLs as that of the Service Fulfillment Step [sc_service_fulfillment_step] table.

For tables extending the Service Fulfillment Step [sc_service_fulfillment_step] table, the Domain master attribute should be added and its value should be set as service_fulfillmen-
### Option Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>t_stage</td>
<td>The domain of a service fulfillment step is then inherited from the catalog item.</td>
</tr>
</tbody>
</table>

When no input is required for a step type

Use the Service Fulfillment Step [sc_service_fulfillment_step] base table. For example, a department head approval does not require any additional input from the catalog item owner and does not need a new table.

2. Create a record producer to store the values provided by the catalog item owner to the data store (base table or extended table) of that step. For information about creating a record producer, see Create a record producer.

**Note:**

- The Service Fulfillment Steps - Properties set variable set is automatically added to the record producer and it should not be removed from the record producer.
- All additional columns defined in the extended table should have corresponding variables mapped in the record producer.
- Configure the Record Producer form to display the Allow edit option and Save Options field. Also, select the Allow edit option and set the value of the Save Options field to Save in Destination.
- Ensure that the record producer is not restricted for the users with catalog_builder_editor role.

3. Create a subflow to perform a sequence of actions by copying the Template: Service Fulfillment Steps subflow and then defining your subflow. For information about subflows, see Subflows.

### Template: Service Fulfillment Steps subflow input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requested_item</td>
<td>Reference</td>
<td>RITM record</td>
</tr>
<tr>
<td>service_fulfillment_step_data</td>
<td>Reference</td>
<td>Step data record. Update the state to one of the following values before ending the subflow:</td>
</tr>
<tr>
<td>Parameter</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>service_fulfillment_step</td>
<td>Reference</td>
<td>Step defined on a catalog item. It must refer to a table in which the record producer defined in the step configuration inserts a record. Do not update the step record.</td>
</tr>
</tbody>
</table>

For information about subflow field types, see Field types.

4. Create a step configuration to define the behavior and display of a service fulfillment step type.

   a. Navigate to Service Catalog > Catalog Administration > Service Fulfillment Step Configurations.

   b. Click New.

   c. On the form, fill in the fields.

   **Service Fulfillment Step Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the step configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope in which the step configuration is supported.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the service fulfillment support for the flow.</td>
</tr>
<tr>
<td>Order</td>
<td>Order of the step configuration.</td>
</tr>
</tbody>
</table>

   Based on the order of step configurations, the corresponding service fulfillment step types are displayed in the list in the Steps region of the Fulfillment step.

   The step type corresponding to the step configuration with the least order is displayed beside the list and step types for all other step configurations are included in the list based on their order.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Order of service fulfillment step types</strong></td>
<td>Add task</td>
</tr>
<tr>
<td><strong>Custom approval</strong></td>
<td><strong>Manager approval</strong></td>
</tr>
<tr>
<td>Hide</td>
<td>Hides the step type corresponding to this step configuration in the list in the <strong>Steps</strong> region of the <strong>Fulfillment</strong> step. No impact on existing steps.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of the step configuration.</td>
</tr>
<tr>
<td>Producer</td>
<td>Record producer that creates an instance of the step type in the step’s data store.</td>
</tr>
<tr>
<td>Service fulfillment subflow</td>
<td>Subflow triggered during the request fulfillment process.</td>
</tr>
<tr>
<td>Dynamic title</td>
<td>Text that should be displayed for the corresponding service fulfillment step in the <strong>Steps</strong> region of the <strong>Fulfillment</strong> step. If you don’t provide any value, the step configuration name is displayed.</td>
</tr>
<tr>
<td></td>
<td>To display dynamic text, you can include the field name from the step’s data store (base table or the extended table) where the associated record producer creates a record.</td>
</tr>
<tr>
<td></td>
<td>For example, in the base system, the <strong>Dynamic title</strong> field for the Custom approval step configuration contains the following value: Approval from ${approval_title}</td>
</tr>
<tr>
<td></td>
<td>Here, <strong>approval_title</strong> is the field from the Service Fulfillment Approval Step [sc_service_fulfillment_approval_step]</td>
</tr>
</tbody>
</table>

Field | Description
--- | ---
 | table where the associated record producer, Add custom approval, creates a record.

**d. Click Submit.**

**Create or edit a catalog item template**

Pre-specify values or provide restrictions for attributes such as catalogs, categories, variable types, and portal settings, which are applicable during the catalog item creation or editing process. You can create a template for a catalog item or record producer.

**Before you begin**

Role required: admin or catalog_admin

Create a catalog item template in catalog builder

**Procedure**

1. Navigate to Service Catalog > Catalog Builder.
2. Select the Dashboard tab and click Create a catalog item template.
3. Select one of the following options.
   - **Standard** for a catalog item.
   - **Record Producer** for a record producer
4. In the wizard, specify the information for each step.

**Catalog item template creation wizard**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>

</tr>
<tr>
<td></td>
<td>◦ Item name</td>
</tr>
<tr>
<td></td>
<td>◦ Record submission table</td>
</tr>
<tr>
<td></td>
<td>• Restricted selections: For the attributes that allow selection of multiple values (for example, catalogs, categories, Available For, Not Available For), the user creating the item can only select or deselect the options from within the values specified in the template.</td>
</tr>
<tr>
<td>Review and submit</td>
<td>Review the template information and submit it.</td>
</tr>
</tbody>
</table>

![Information](image) Note: For each step, you can review the information in the feedback panel to know more about that step.

5. Click Submit.
6. To edit the catalog item template, navigate to the **Catalog item templates**, select the required template and perform any of these actions.

   a. To edit the item, make the necessary changes, and click **Save**.

      Note:
      - The changes to the template do not automatically apply to existing items.
      - While editing an existing catalog item, the new values in the template are not automatically updated in the item but the new restrictions apply. For example, if a new category is added to the template, that category is not automatically added to the catalog item. However, the restrictions to the categories will apply.
      - When question sets are added to the template, they do not have any impact on the existing catalog items using the template.

   b. To duplicate the catalog item template, click **Duplicate**.

      Note: You cannot delete a catalog item template in catalog builder, but it can be deleted in Now Platform. After a template is deleted, it is disassociated from all catalog items using the template and the restrictions no longer apply to those items.

### Create a catalog item using a template

Make an item available in service catalog for catalog item requests. You should create this item using one of the available catalog item templates.

**Before you begin**
Role required: catalog_builder_editor, catalog_admin, or admin

Create a catalog item in catalog builder

**Procedure**
1. Navigate to **Service Catalog > Catalog Builder**.
2. Select the **Dashboard** tab and click **Create a new catalog item**.
3. Review the steps involved in the creation process and click **Continue**.
4. Select a template from the list and click **Use this item template**.
Note:

- After you select the template, the preview of this template is available.
- You can only view templates assigned to you.
- Based on the template configuration, few attributes during the item creation or editing:
  - Have pre-specified values
  - Are not editable
  - Have limited options to select
  - Are mandatory
- When selecting a record submission table for record producers, you can only select tables in that scope.

5. Based on how each step is defined in the template, specify the required information.

Catalog builder steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| Details | - Basic info: Item name and short description.  
          - Item details: Description of the item. |
| Destination | Destination table in which a record producer creates records.  
            | Note: This step is available when using a record producer template. |
| Location | Catalogs and categories that the item can belong to. You can only view the catalogs and categories specified in the template.  
            | Note: You can add up to a maximum of 50 catalogs or categories. |
| Questions | Question sets (variable sets) or questions for the item. By default, the question sets included in the template are added and cannot be removed.  
            Available question types are restricted to those specified in the template.  
            From the Insert new question list, you can include additional question sets, questions, deactivated questions, single- |
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>column container, two-column container, and line break. For information on creating a question and supported question types, see Create a question for a catalog item in catalog builder. You can also add dynamic form behavior for a question. For information on adding dynamic form behavior, see Edit a question in catalog builder.</td>
</tr>
</tbody>
</table>
| ✉️ Note: | - The questions within a question set cannot be edited. The question sets can be reordered by dragging and dropping them.  
- Question sets specified in the template cannot be removed, while the ones added by the user can be removed.  
- Removal of question sets simply removes the association with the item and does not delete the question set.  
- A single-column question set can be added to a single-column or a two-column container. Two-column question set cannot be added to a container. |
| Settings | Settings to configure the catalog item behavior in Service Portal based on the request method. |
| Access | User criteria to specify users for whom the item is available or not available.  
 ✉️ Note: You can add up to a maximum of 50 user criteria. |
| Fulfilment | Flow or workflow that you want to associate with this item. It defines how this catalog item can be fulfilled.  
When a catalog item is associated with a Flow Designer flow that supports service fulfillment steps, the catalog item owner creating the item can configure steps within the flow.  
By default, the Step based request fulfillment flow is available in the base system.  
For information about defining service fulfillment steps, see Define a service fulfillment step.  
For information about Flow Designer flows, see Flows. |
### Step Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Review and submit</td>
<td>Review the item and submit it.</td>
</tr>
</tbody>
</table>

**Note:** A dot beside the step name indicates it has a mandatory field.

6. To save your changes in each step, click **Save**.
   All edits to the item attributes are automatically saved when you navigate to the next step.

7. To preview a catalog item in Portal, Now Mobile, or a Virtual Agent conversation, click **Preview**.

   **Note:** When you preview an item, you can interact with it but not submit it.

   a. To preview the item in Portal, select **Portal** for the **View within** field.

      **Note:** Portal preview is based on portal URL configured for the catalog builder.

   b. To view an item representation in Now Mobile, select **Now Mobile** for the **View within** field.

   c. To preview a catalog item in a Virtual Agent conversation, select **Virtual Agent** for the **View within** field.

   The Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks) and one of these plugins should be installed.

   • Glide Virtual Agent (com.glide.cs.chatbot)
   • Glide Virtual Agent Lite (com.glide.cs.chatbot.lite)

   A Virtual Agent conversation whose sys_id is specified in the `glide.sc.builder.va_preview_topic_id` property is opened. By default, the property has the sys_id of the base system Catalog builder preview topic. For information about this topic, see **Catalog builder preview topic conversation**. If the base system topic is used, the following scenarios are possible:

   • If the item is supported in the conversation mode, you can preview the item in the Virtual Agent conversation by answering the questions but cannot submit a request for the item. For information about when a catalog item is supported in the conversation mode, see **Service Catalog topic blocks in Virtual Agent**.
If the item is not supported in the conversation mode, a link is provided for the portal preview of the item.

When the required plugins are not installed, an illustration displaying a sample conversational experience for the catalog item submission appears.

d. To open the preview in a new tab, click **Open preview in a new tab**.

   ❓ **Note:** When you make any changes to the item and save it, the preview is dynamically refreshed in the opened tab.

8. To delete an unpublished draft item, click **Delete**.

   ❓ **Note:** You cannot delete a published item but can make it inactive.

9. Click **Submit**.

   ❓ **Note:** Until you submit the item, it is in the Draft state and is not available in the catalog.

**Define a service fulfillment step**

Define how a catalog item request should be fulfilled by creating simple service fulfillment steps.

**Before you begin**

Role required: catalog_builder_editor, catalog_admin, or admin

**About this task**

To configure fulfillment steps while creating a catalog item, associate it with a Flow Designer flow that supports service fulfillment steps.

Fulfillment process can contain multiple steps. These steps can run sequentially or can be grouped to run in parallel.

**Procedure**

1. In the **Fulfillment** step of creating a catalog item, for the **Selected flow** field, select a flow that supports service fulfillment steps.

2. In the **Steps** region, perform one of the following:
a. To create a task, click **Add task**.
   i. On the form, fill in the fields.

   **Task form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sequence</td>
<td>Sequence of this step relative to the previous step. Possible options are:</td>
</tr>
<tr>
<td></td>
<td>• With previous step: This step is grouped with the previous step or group. All grouped steps run simultaneously.</td>
</tr>
<tr>
<td></td>
<td>• After previous step: This step is placed after the previous step</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is not editable if it is the first step.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of the task. It appears in the <strong>Steps</strong> region.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the task.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that the task should be assigned to.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User for which the task is assigned.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the task.</td>
</tr>
</tbody>
</table>

   ii. Click **Add**.

b. To create a custom approval and define who can approve the step, perform the following:
   i. From the list beside **Add task**, click **Custom approval**.
   ii. On the form, fill in the fields.

   **Custom approval form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sequence</td>
<td>Sequence of this step relative to the previous step. Possible options are:</td>
</tr>
</tbody>
</table>
### Field Description

- **With previous step**: This step is grouped with the previous step or group. All grouped steps run simultaneously.
- **After previous step**: This step is placed after the previous step.

**Note**: This field is not editable if it is the first step.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Users that can approve this step.</td>
</tr>
<tr>
<td>Groups</td>
<td>User groups that can approve this step.</td>
</tr>
<tr>
<td>Approval</td>
<td>Type of the required approval.</td>
</tr>
</tbody>
</table>
| Approval type | • All approve: The step is approved only when all assigned users and user groups approve.  
 |             | • Anyone approves: The step is approved when any of the assigned users or any user from the assigned user groups approve. |

### iii. Click Add.

### c. To create a manager approval, from the list beside Add task, click Manager approval. An approval step is created and assigned to the manager of the requester of the requested item (RITM).

### Service fulfillment steps

3. In the **Estimated time to deliver** region, for the **Days** field, specify the time by which the RITM should be fulfilled. The due date is calculated based on when the service fulfillment flow is triggered.

4. **Optional**: To edit a step, click the edit icon (✏️).

   **Note**: You cannot edit a step that does not require any inputs, for example, manager approval.

5. **Optional**: To delete a step, click the delete icon (🗑️).
6. **Optional:** To rearrange steps, drag and drop the steps.

7. **Optional:** To group steps together, perform one of the following tasks.
   - Drag a step and drop it on another step or group of steps.
   - To group this step with the previous step or group, click the merge icon (\( \bar{V} \)).

### Merged service fulfillment steps

**Steps**

Define the different steps in your fulfillment process

- Approval from Abel Tutor: Custom approval
- Manager approval: Manager approval

---

8. **Optional:** To separate a step from a group of steps, perform one of the following tasks.
   - Click the separate icon (\( \bar{V} \)). The step is placed after the group.
   - Drag a step out of the group and drop it at a location of your choice.

### Catalog builder preview topic conversation

From the catalog builder, a user can preview a catalog item in a Virtual Agent conversation.

This conversation uses the Request Catalog Item topic block. For information on this topic block, see [Service Catalog topic blocks in Virtual Agent](#).

The Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks) and one of these plugins should be installed.

- Glide Virtual Agent (com.glide.cs.chatbot)
- Glide Virtual Agent Lite (com.glide.cs.chatbot.lite)

In catalog builder, when the user selects the required item and navigates to preview it, the following scenarios are possible:

- If the item is supported in the conversation mode, you can preview the item in the Virtual Agent conversation by answering the questions but cannot submit a request for the item. For information about when a catalog item is supported in the conversation mode, see [Service Catalog topic blocks in Virtual Agent](#).

- If the item is not supported in the conversation mode, a link is provided for the portal preview of the item.

- When the required plugins are not installed, an illustration displaying a sample conversational experience for the catalog item submission appears.

Service Catalog topic blocks in Virtual Agent

Create a question for a catalog item in catalog builder
Specify a question that the requester should answer before submitting the catalog item.

Before you begin
Role required: catalog_builder_editor, catalog_admin, or admin

About this task
If allowed in the template, the following question types can be used in the item creation process in the catalog builder. These question types are grouped into types and subtypes:

• Text
  ◦ Single-line. This is the Single-line text variable type in Now Platform.
  ◦ Multi-line. This is the Multi-line text variable type in Now Platform.
  ◦ Rich text. This is the HTML variable type in Now Platform

• Option
  ◦ Check box. This is the Check box variable type in Now Platform.
  ◦ Yes/No. This is the Yes/No variable type in Now Platform.

• Choice
  ◦ Dropdown (fixed values). This is the Select Box variable type in Now Platform.
  ◦ Dropdown (values from a table). This is the Lookup Select Box variable type in Now Platform.
  ◦ Record reference. This is the Reference variable type in Now Platform.
  ◦ Radio. This is the Multiple Choice variable type in Now Platform.
  ◦ Multi-select. This is the List Collector variable type in Now Platform.

• Date/Time
  ◦ Date. This is the Date variable type in Now Platform.
  ◦ Date &Time. This is the Date and time variable type in Now Platform.

• Display label
  ◦ Plain text. This is the Label variable type in Now Platform.
  ◦ Rich text. This is the Rich Text Label variable type in Now Platform.
For detailed information about these question types, see Types of service catalog variables.

**Procedure**

1. In the **Question** step of creating a catalog item, click **Insert new question**.
2. On the Create question form, specify the required details.

**Note:**
- The fields on the form vary based on the question type and subtype.
- While you configure each question, its preview is available.
- The question preview does not show interactions for the following question types till the question is saved and then edited.
  - Record reference
  - Multi-select
  - Dropdown (values from a table)
- The question preview does not show annotations.

a. Specify the details in the **Question** tab.

### Question tab

<td>Direction in which the choices should be displayed. Possible options are Down and Across. This option is available only for the Radio question subtype.</td>
</tr>
<tr>
<td>Do not select first choice</td>
<td>Option to ignore the first choice. This option is available only for the Radio question subtype.</td>
</tr>
<tr>
<td>Available Choices</td>
<td>Available for the Dropdown (fixed values) and Radio question subtypes. You can add a name value pair for each choice.</td>
</tr>
<tr>
<td>Display name</td>
<td>Label for a choice.</td>
</tr>
<tr>
<td>Value</td>
<td>Value of the choice.</td>
</tr>
</tbody>
</table>

3. Click **Insert Question**.

**Note:**
- If there are two consecutive check boxes, then a virtual container is created for a group of check boxes. Only check box variable types can then be added inside that group.
- Even if a check box variable is added immediately after a group of check boxes, it is automatically added to the group.

**Edit a question in catalog builder**

Make changes to an existing question, for example, deactivate it or add dynamic form behavior (catalog UI policy in Now Platform).

**Before you begin**

Role required: catalog_builder_editor, catalog_admin, or admin

**About this task**

You cannot edit questions that are not specified in the template and questions within a single-row or multi-row variable set.

A question can be removed in the question designer and the following scenarios are possible:
• If the question is used in a published catalog item, it cannot be deleted but can only be marked inactive. Such questions can be included again in the catalog item by using the **Insert De-activated questions** option.

• Removing a new question that has never been published deletes the question.

• Questions of types not allowed in the template or supported in the catalog builder cannot be removed.

**Procedure**

1. Select a catalog item and navigate to the **Questions** tab.

2. To deactivate a question, perform the following steps.
   a. Point to the question and click the deactivate icon (🗑).
   b. In the dialog box, click Deactivate.

3. To edit a question, perform the following steps.
   a. Point to the question and click the edit icon (>Edit).
   b. Make the required changes and click Save.

4. To add dynamic form behavior to a question, perform the following steps.
   a. Point to the question and click the UI policies icon (🔗).
   b. In the Dynamic behavior dialog box, click **Define new behavior**.
   c. In the **Actions** tab, fill the required information.

**Actions tab**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outcome</td>
<td>Specify the behavior of this question when the trigger conditions are met</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Specifies how the dynamic behavior setting affects the mandatory state of the field. Following are the options:</td>
</tr>
</tbody>
</table>

- Leave alone
- True
- False
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visible</td>
<td>Specifies how the dynamic behavior setting affects the visible state of the field. Following are the options:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
<tr>
<td>Read-only</td>
<td>Specifies how the dynamic behavior setting affects the read-only state of the field. Following are the options:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
<tr>
<td>Clear value</td>
<td>Option to clear the question value.</td>
</tr>
</tbody>
</table>

d. In the **Conditions** tab, add conditions that trigger the action on this question.

e. In the **Settings** tab, fill the required information.

### Settings tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicability</td>
<td>Scenarios where this dynamic behavior applies</td>
</tr>
<tr>
<td></td>
<td>Applies when the item is being requested</td>
</tr>
<tr>
<td></td>
<td>Option to specify if the dynamic behavior applies when the item is being requested.</td>
</tr>
<tr>
<td></td>
<td>Applies while viewing the catalog tasks after the request is submitted</td>
</tr>
<tr>
<td></td>
<td>Option to specify if the dynamic behavior applies while viewing the catalog tasks after the request is submitted</td>
</tr>
<tr>
<td></td>
<td>Applies while viewing the submitted record</td>
</tr>
<tr>
<td></td>
<td>Option to specify if the dynamic behavior applies while viewing the submitted record</td>
</tr>
</tbody>
</table>

f. Click **Add policy**.

**Note:** When dynamic behavior is added, a catalog UI policy and action is created and a short description is automatically generated.
Edit a catalog item in catalog builder

Make changes to an existing catalog item if you have permissions to edit it.

Before you begin
Role required: catalog_builder_editor, catalog_admin, or admin

About this task
Following are the various scenarios in which a user can edit or view a catalog item:

• A user has permissions to edit an item in any of the following scenarios:
  ◦ The user has the catalog_admin role
  ◦ The user has the catalog_builder_editor role and any of the following scenarios is true:
    ▪ The user is the owner (updated in the Owner field) of the item. When the item is created in catalog builder, the owner is automatically updated as the user creating the item.
    ▪ The template access property, glide.sc.builder.template_access, is set to true and the item is associated with a template that the user has access to. By default, this property is set to false.
  
• In the catalog item list view in the catalog builder, a user can view all the items that the user has read access to. These items also include the items that the user may have read access to as a requester. However, if the user does not have permissions to edit an item, the user cannot view its details and edit it.

When a user is editing a published item in catalog builder, it creates a copy of the item and its associated records such as variables, UI policies, and client scripts.

• A draft version (a new item) of the item is created and it is inactive.

• The published item remains in the Published state and the Checked out field is set to True.

• Once the editing is done and item is submitted, the following scenarios are possible:
  ◦ A review subflow is not configured:
    ▪ The edits to the draft version are merged with the associated published item.
    ▪ The draft item and the associated records are deleted.
    ▪ The Checked out field of the published item is set to False.
A review subflow is configured. For information about configuring a review subflow, see Set up the catalog builder.

- The draft item’s state is changed to In review.
- If the state variable of the subflow output returns Completed:
  - The draft item’s state is changed to Reviewed and edits to the draft version are merged with the associated published item.
  - The published item’s state changes to Publishing, and then to Published and the Checked out field of the published item is set to False. The state change from Publishing to Published may not happen instantaneously.
  - The reviewed draft item and the associated records are deleted.
- If the state variable of the subflow output returns Failed, the draft item’s state is reverted to Draft and the item is ready for editing.

Procedure

1. To edit a catalog item in catalog builder, perform these steps.

   a. Navigate to Service Catalog > Catalog Builder.
   
   b. Select the Catalog Items tab.
   
   c. Select the item you want to edit and click Edit.

   Note:
   
   To edit an item in the In review state, you have to cancel the review. After you cancel the review, the item’s state is reverted to Draft.

   d. Make the required changes and click Save. For information on editing a question and catalog item fields, see Edit a question in catalog builder and Create a catalog item using a template.

   e. To make an item inactive, deselect the Item is active check box in the Basic info section of the Details step.

   f. To publish the modified item, navigate to the Review and submit step and click Submit.

2. To add advanced capabilities, such as catalog client scripts, data lookup rules, and advanced reference qualifiers, edit a catalog item in Now Platform. A user with the admin or catalog_admin role can perform this step.
a. Navigate to Service Catalog > Catalog Definitions > Maintain Items.

   Note:
   - A • beside a catalog item indicates that it is the published version of the item that has been checked out for editing in catalog builder.
   - A △ mark beside the item indicates that it is the draft version of the item that can be directly edited in Now Platform.

b. Open the published item you want to edit.

c. Select the Edit checked out item in advanced view related link to open the draft version of item and then add the required capabilities.

   Note:
   - When a published item is checked out for editing, you cannot edit the published version of the item in Now Platform, unless you cancel the checkout in Now Platform. Canceling the checkout cancels all changes made after the item was checked out.
   - To edit an item in the In review state, you have to cancel the review. After you cancel the review, the item’s state is reverted to Draft.

d. Make the required changes and click Update.

e. To edit the same item in catalog builder, click Edit in Catalog Builder.
   If the item has not already been checked out, this step checks out the item.

Service Catalog in Service Portal

Use Service Portal to configure an improved version of Catalog. You can customize Service Portal where your customers can request catalog items such as service and product offerings. You can use the Service Catalog widgets to build a catalog for your portal.

The Catalog landing page provides an interface from where you can access the catalog items, requests, approvals, popular items, recent items, and saved bundles. This page is available by default for zBoot users.

   Note: Upgrade users need to activate the Service Portal - Service Catalog v2 plugin (com.glideapp.servicecatalog.portal).
Overview of configurable options in the Service Catalog on the Service Portal and explains how to perform those configurations.

You can access the Catalog landing page in Service Portal using the Catalog option from the main menu header of Service Portal.

The landing page has:

• A search bar to search within all configured catalogs in Service Portal. When you search for a specific item, the search results page displays results based on the configured catalogs and categories. Only the items associated with a catalog and category are searchable. The primary category of the item is displayed under the Category filter. The catalog where the primary category is defined for the item is displayed under the Catalog filter.

• The Browse by Categories option to navigate to the list of categories in Service Catalog and the items within. Click this option to navigate to the categories landing page.

• The Requests and Approvals widget to display the list of requests and approvals associated with the user. The list is based on the configurations available in the My Request Filter module in Platform. For information about the My Request Filter module, see Define filters for My Requests.

• The My Saved Bundles widget to display the saved bundles associated with the user. You can remove a bundle, or open a bundle to add or replace the cart with the items in the bundle.

• The My Recent Items widget to display catalog items, record producers, or order guides that are most recently viewed or requested by the user. An instance option on the widget allows you to display either the viewed or requested items. This widget is not displayed when it has no data.

• The Popular Items widget to display the most popular catalog items ordered across the organization by other users. These items are displayed based on the Top Requests dynamic category. This widget is not displayed when there is no data.
Note:

- In the order status page of a request, stage renderer displays the current stage in a collapsed view. You can expand this view for all stages.
- These pages have dynamic titles to display the name of the selected entity.
  - Catalog Item [sc_cat_item]
  - Catalog Categories [sc_category]
  - Order Guide [sc_cat_item_guide]

Access Service Catalog categories in Service Portal

Access Service Catalog categories to access the catalog items within.

Before you begin
Role required: requester

Procedure

1. Navigate to Service Portal > Service Portal Home.
   The Service Portal homepage is displayed.
2. Click any of the following:
   - The Request Something link from the Service Portal landing page.
   - The Catalog option from the main menu header of Service Portal and then the Browse by Categories option.
   The popular items from all categories are displayed.
3. In the Catalogs section, select the required catalog from the list. For information on how you can configure a catalog, refer to Configure a catalog in Service Portal

Note:

- The Catalogs section is available only when you have multiple catalogs and have access to items of multiple catalogs.
- The list contains all catalogs configured for Service Portal.

The following information is displayed:
• Categories of the selected catalog in the Categories section.
• Popular items of the selected catalog.

4. In the Categories section, click the required category. The category details and the items within are displayed.

   Note:
   • You can click the category count or anywhere in the row to view the category details.
   • For a category with a long name, additional text is displayed as ellipses. Point to the category name to view the additional text.

5. To change the display of category items, click the Card View icon (GridView) or the Grid View icon (CardView).

   Note: When you access a catalog item from the Catalog landing page or type ahead search results, the breadcrumb of the item displays the path based on the primary category configured on that item. When you access the item from a specific category, the breadcrumb of the item displays the path based on that category.

SC Categories widget

Add an item to the wish list in Service Portal
Add catalog items or record producers to the wish list to review them when required.

Before you begin
Role required: requester

Procedure

1. Navigate to Service Portal > Service Portal Home. The Service Portal homepage is displayed.
2. Select a catalog item or record producer from Service Catalog.
3. Click the Add to Wish List icon (WishList) in the Ordering widget.

   Note: When you edit an item that is added to the wish list, the Update Wish List icon (WishList) is displayed in the corresponding Ordering widget.

4. Click View Wish List from the confirmation message or the Wish List menu option on the main navigation bar.
The wish list details page is displayed.

5. If required, perform any of these actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove Item</td>
<td>To remove an item from the wish list, click the Remove Item icon (🗑️).</td>
</tr>
<tr>
<td>Clear Wish List</td>
<td>To clear the wish list, click <strong>Clear Wish List</strong>.</td>
</tr>
<tr>
<td>View the Catalog</td>
<td>To navigate to the Service Catalog landing page, click <strong>View the Catalog</strong>.</td>
</tr>
</tbody>
</table>

6. To navigate to any wish list item page, click the image or name of the item in the wish list details page.

⚠️ Note: This does not open a new instance of the item, but the instance that is in the wish list, where you can edit the details.

**Related information**

**SC Wish List Cart widget**

**Add a catalog item to the shopping cart**

Add a catalog item or order guide to the shopping cart to store at one place and checkout.

**Before you begin**

Role required: requester

**Procedure**

1. Navigate to Service Portal > Service Portal Home.
   The Service Portal homepage is displayed.

2. Select a catalog item or order guide from Service Catalog.

3. Click the Add to Cart icon (🛒) in the Ordering widget.

⚠️ Note:

- You can add the same item to the cart multiple times. Every time you add an item to the cart, a new instance of the item is created.
- The cart information is automatically updated in all open tabs or windows.
4. Click View Cart from the confirmation message or the Cart menu option on the main navigation bar. The cart details page is displayed.

5. To navigate to any cart item page, click the image or name of an item in the cart details page.

   Note: This step does not open a new instance of the item, but the instance that is in the cart, where you can edit the details.

6. If required, edit the quantity of items.

7. To remove an item from the cart, click the Remove Item icon (🗑).

8. To navigate to the Service Catalog landing page, click Continue Shopping.

9. To clear the cart, click Clear Cart.

10. To create a bundle from the cart:

    a. Click Save as Bundle.

    b. In the Create New Bundle window, specify the Bundle Name and select the items that you want to include.

    c. Click Save.

    Note: When you create a bundle from the cart, which includes an order guide, the association of the items to the order guide is lost.

11. To add a saved bundle to the cart, open the bundle from the My Saved Bundles section and click Add to Cart.

12. To replace the cart items with a saved bundle, open the bundle from the My Saved Bundles section and click Replace Cart.

13. Click Proceed to Checkout. The Order Confirmation window is displayed.

14. From the Request for list, select the user for whom you are requesting.
Note:

- By default, the user who is logged in is selected in this list.
- The search in this choice list is performed for the User [sys_user] table columns specified in the Service Catalog property, Additional columns for the "request for" Service Catalog widget. Choose fields in the sys_user table. Must be semicolon separated(glide.sc.request_for.columns).
- You can provide additional widget options to control the Request for default value. For example:

```
"requested_for_id": {
  "value": "62826bf03710200044e0bfc8bcbe5df1"
},
"requested_for_display": {
  "value": "Abel Tuter"
}
```

15. If required, specify the Delivery Information and Special instructions.

16. To add an attachment for the cart, click Add attachments and select the required attachment.

17. Click Checkout. The corresponding request is displayed in the Order Status page with the request number, estimated delivery date for the entire order, price, and the order status of individual ordered items.

Note:

- Use the instance options on the Order Status page to display the pre-defined columns.
- You can display either the RITM number or the name of the catalog item. By default, the name of the catalog item is displayed.

SC Shopping Cart widget

Request a catalog item from Service Portal

Use the SC Catalog Item widget in Service Portal to request a catalog item.

Before you begin

Role required: requester

Select the Allow Cloning instance option on the Order Status page to display the Additional Actions section after placing the request.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
For information about the SC Catalog Item widget, see SC Catalog Item widget

**Procedure**

1. Navigate to Service Portal > Service Portal Home.
   The Service Portal homepage is displayed.
2. Select a catalog item or record producer from Service Catalog.
3. Enter the required information in the catalog item form.
4. Enter the number of items in the Quantity field.
5. If required, perform any of these actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add attachments</td>
<td>To add attachments to the catalog item, click the Add attachments icon (_attach).</td>
</tr>
<tr>
<td>Add to Cart</td>
<td>To add the catalog item to the shopping cart, click the Add to Cart icon ( ShoppingCart).</td>
</tr>
<tr>
<td>Add to Wish List</td>
<td>To add the catalog item to the wish list, click the Add to Wish List icon ( Wish List).</td>
</tr>
</tbody>
</table>

6. Click Order Now.
   The Order Confirmation window is displayed.

> **Note:** For a record producer, you can edit the label of the Submit button by using the widget instance options. For example, if you want to change the label to Request, press Ctrl+click on the catalog item widget, select Instance in Page Editor, and specify the following parameters in the Additional options, JSON format field.

```json
"record_producer_label":{
  "value" : "Request"
}
```

7. From the Request for list, select the user for whom you are requesting.
Note:

- By default, the user who is logged in is selected in this list.
- The search in this choice list is performed for the User [sys_user] table columns specified in the Service Catalog property, Additional columns for the “request for” Service Catalog widget. Choose fields in the sys_user table. Must be semicolon separated (glide.sc.request_for.columns).
- You can provide additional widget options to control the Request for default value. For example:

```json
"requested_for_id": {
  "value": "62826bf03710200044e0bfc8bcbe5df1"
},
"requested_for_display": {
  "value": "Abel Tuter"
}
```

8. If required, specify the Delivery Information and Special instructions.

9. Click Checkout.
   The corresponding request is displayed in the Order Status page with the request number, estimated delivery date for the order, price, and the order status.

Note:

- Use the instance options on the Order Status page to display the pre-defined columns.
- You can display either the RITM number or the name of the catalog item. By default, the name of the catalog item is displayed.
- When a service catalog item is ordered from an existing record, a link is added between the order item request and the parent record.

10. Optional: To clone a request for other users, perform the following steps.

   a. In the Additional Actions section, from the Also request for list, select the required users and click Submit.

   b. In the Cloning Requests window, click Ok.
Note:

• The logged in user should be specified in the List of roles (comma-separated) that can use bulk ordering functionality. Blank means all users (glide.sc.allow.clone.roles) property.

• You can clone the request for multiple users.

• When you clone a request that contains a multi-row variable set, the information that is specified in the multi-row variable set is available in all cloned requests. All UI policies and client scripts on the multi-row variable set are also cloned.

• A separate request is created for each specified user and that user is displayed in the Requested For field of the request.

• The Opened By field of the cloned requests is updated with the logged in user.

• Select the Requests menu option or the My Requests widget on the catalog homepage to view the cloned request created for the user.

Request an order guide from Service Portal

Use the SC Order Guide widget on Service Portal to request an order guide with several catalog items for a specific purpose.

Before you begin
Role required: requester
Select the Allow Cloning instance option on the Order Status page to display the Additional Actions section after placing the request.

For information about the SC Order Guide widget, see SC Order Guide widget.

Procedure

1. Navigate to Service Portal > Service Portal Home.
The Service Portal homepage is displayed.

2. Select an order guide from Service Catalog.

3. In the Describe Needs section, enter the required information and click Next.
4. In the Choose Options section, enter the requirements for catalog items and click Next.

- **Note:**
  - If a catalog item has fields that need user inputs, **Options** is displayed on the accordion.
  - If the fields are mandatory, a red asterisk is displayed beside **Options**.

- **a.** To expand or collapse the catalog item information, click the accordion.

- **b.** To include or exclude the catalog item from the order guide request, click the toggle on the accordion.

  - **Note:** When the item is excluded from the order guide request, the item is not editable and the corresponding mandatory field restrictions are ignored.

- **c.** To add an attachment for the catalog item, click the Add attachments icon (_attach) and select the required attachment.

- **d.** Click **Previous** to navigate to the Describe Needs section.

5. In the Summary section, review the order guide summary.

6. To add the order guide to the shopping cart, click the Add to Cart icon (🛒).

- **Note:**
  - When you add an order guide to the cart, you can only edit the order guide instance in the cart.

7. To go to the Choose Options section and edit the order guide items, click **Edit Options**.

8. Click **Order Now**.
   
   The Order Confirmation window is displayed.

9. From the **Request for** list, select the user for whom you are requesting.
Note:

- By default, the user who is logged in is selected in this list.
- The search in this choice list is performed for the User [sys_user] table columns specified in the Service Catalog property, Additional columns for the “request for” Service Catalog widget. Choose fields in the sys_user table. Must be semicolon separated (glide.sc.request_for.columns).
- You can provide additional widget options to control the Request for default value. For example:

```
"requested_for_id": {
  "value": "62826bf03710200044e0bfc8bcbe5df1"
},
"requested_for_display": {
  "value": "Abel Tuter"
}
```

10. If required, specify the Delivery Information and Special instructions.

11. To add an attachment for the order guide, click the Add attachments icon and select the required attachment.

12. Click Checkout.
   The corresponding request is displayed in the Order Status page with the request number, estimated delivery date for the entire order, price, and the order status of individual ordered items.

Note:

- Use the instance options on the Order Status page to display the pre-defined columns.
- You can display either the RITM number or the name of the catalog item. By default, the name of the catalog item is displayed.

13. Optional: To clone a request for other users, perform the following steps.

   a. In the Additional Actions section, from the Also request for list, select the required users and click Submit.

   b. In the Cloning Requests window, click Ok.
Note:

- The logged in user should be specified in the List of roles (comma-separated) that can use bulk ordering functionality. Blank means all users (glide.sc.allow.clone.roles) property.
- You can clone the request for multiple users.
- If a record producer is included in the order guide, a request is created for all items other than the record producer.
- When you clone a request that contains a multi-row variable set, the information that is specified in the multi-row variable set is available in all cloned requests. All UI policies and client scripts on the multi-row variable set are also cloned.

- A separate request is created for each specified user and that user is displayed in the Requested For field of the request.
- The Opened By field of the cloned requests is updated with the logged in user.
- A user can view the cloned request created for the user from the Requests menu option or the My Requests widget on the catalog homepage.

Standard ticket page for a requested item

In Service Portal, you can configure the ticket page of a requested item to display the related information, while still having a consistent layout that is similar to other request types. This configuration ensures a consistent experience when viewing submitted requests in Service Portal.

In Service Portal, you can access the ticket page for a requested item by using the Requests option from the main menu header.

For new instances, the standard ticket page for a requested item is available by default. For upgraded instances, you need to activate the Standard Ticket Route page route map. For information about activating this page route map, see Activate the page route map for the standard ticket page.

Standard ticket page configuration for a requested item

The layout of the standard ticket page can be configured for a requested item. Navigate to Standard Ticket > Standard Ticket Configurations and edit the
sc_req_item ticket configuration. For information about configuring the standard ticket page, see Configure the standard ticket page.

Service Catalog in mobile
You can use a mobile and track request and approval flows of Service Catalog.

Fulfiller experience in ServiceNow Agent
Approve catalog requests, requested items, or change requests from anywhere using the ITSM ServiceNow Agent application.

As an ITSM agent or technician, you can use the mobile app when connected online to accomplish the following:
- Accept or reject the pending approval requests.
- View the completed approval requests.

Note:
- The request experience is not available in this mobile app.
- On-load catalog UI policies (non-scripted) are supported for variables in record views, for example, requested item and incident.
  - Only the visibility condition is considered.
  - A variable with no value is not displayed.
  - These policies are also applicable for container variables and a group of check boxes.
  - Since the multi-row variable set is displayed with a message that it is not viewable, these policies can be used to display or hide that message.

Watch this three-minute video to learn how to manage approval requests in the mobile app. This video covers: Accessing the Approvals mobile app and viewing and approving or rejecting requests.

Activation information
This mobile application runs on the ServiceNow® mobile platform. You should activate the ITSM Mobile Experience (com.sn_itsm_mobile) plugin that enables the ITSM mobile application.
Get started with the mobile app for Approvals

Access the My Approvals application instance on your mobile app to manage approval requests using your mobile device.

Before you begin
Role required: business_stakeholder or approver_user

About this task
Download the ServiceNow® mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

Procedure
1. Open the mobile app and tap the plus icon (➕).
2. Add a ServiceNow instance. For more information on adding the instance, refer to Add a ServiceNow instance.
3. Tap My Approvals to start managing your requests.

Related information
Agent mobile app

Manage a catalog request approval

Manage your assigned catalog request or requested item by approving or rejecting it from anywhere using your mobile device.

Before you begin
Role required: business_stakeholder or approver_user

Procedure
1. Tap My Approvals on your mobile app.
2. To approve or reject a pending approval request, perform the following steps.
   a. Tap the Pending Approvals applet. All approvals in the Requested state are displayed.
   b. Swipe a request and tap Approve or Reject.

   Note: You should specify the reason while rejecting a request.
c. **Optional:** To view the details of a pending approval request, tap it.

   ![](image)

   **Note:** To approve or reject a request, tap the menu icon (ображення) and tap **Approve** or **Reject**.

3. To view a completed approval request, perform the following steps.

   a. Tap the Completed Approvals applet. All approval requests that are either accepted or rejected are displayed.

   b. To view the details of the request, tap it.

### Request experience in Now Mobile

You can enable users to request for an item or service, and track or approve requests on mobile using the Now® Mobile app.

### Activation of Now Mobile for Service Catalog

If you have the admin role, activate the ServiceNow Mobile Request Native Application Screens and Applet Launcher plugin (com.glide.mobile-employee). See [Now Mobile app](#). This plugin enables the Service Catalog functionality by default.

### For Me tab

When you log into Now Mobile, the following functionality related to Service Catalog is available:

- **My To-Dos:** Displays approval records of requests and requested items assigned or delegated to the user.

- **My Requests:** Displays requests based on the filters defined for mobile in the **My Requests Filter**. By default, the Incident Mobile and Service Catalog Request Mobile filters are available. For information about configuring filters, see [Define filters for My Requests](#) and [Configure My Requests](#).

   ![](image)

   **Note:** It is recommended to include only open requests.

### Services tab

You can submit or track requests.
• **Recent Services**: Displays the items and services (10 items and services in the last 12 months) that were requested recently by the logged-in user.

• **Popular Services**: Displays the most requested items and services (10 items and services in the last 12 months) that are visible to the user. Displays the 10 recent items and services in the last 12 months.

• **Browse Services**: Displays the categories of items and services that you can browse through and order.

⚠️ **Note:**

◦ If a category contains both items and sub-categories, the items specific to the category are displayed under **Others**.

◦ The category listings do not display the catalog information for users who do not have the roles that have permissions to read the records in the sc_category table. For such users, an ACL can be added to provide read permission for the Title field of the sc_catalog table.
Note:

- You cannot request these item types in the mobile app.
  - Content items
  - Wizard
  - Standard change template
- All items hidden in Service Portal are also hidden in the mobile app.
- In the RITM and record view, these variable types are not supported.
  - HTML
  - Macro
  - Macro with Label
  - UI Page
- In the RITM and request view, a multi-row variable set is not supported. A message is displayed in this view that this variable set is not viewable.
- On-load catalog UI policies (non-scripted) are supported for variables in record views, for example, requested item and incident.
  - Only the visibility condition is considered.
  - A variable with no value is not displayed.
  - These policies are also applicable for container variables and a group of check boxes.
  - Since the multi-row variable set is displayed with a message that it is not viewable, these policies can be used to display or hide that message.

From Now Mobile, you can also perform the following tasks:

- Browse catalog items using the catalog hierarchy in addition to the category hierarchy. For information about its configuration, see Browse catalog items using the catalog hierarchy.

- Change the label of the Submit button for a record producer. For information on editing the button label, see Edit the label of Submit button for a record producer.

- Use the mobile camera to scan bar codes for identifying a variable value of a catalog item. This is only applicable by using the barcode attribute for the Single Line Text variable. For information about this variable attribute, see Service catalog variable attributes.
Quick actions
You can provide easy access to a catalog item by creating a quick action. For information on creating a quick action in Now Mobile, see Create a quick action.

Siri shortcuts
iOS users can use Siri shortcuts to open the following pages in the mobile app.
- Browse items and services.
- Open my requests

See Siri shortcuts.

Now Mobile properties
You can define the following behavior for various catalog entities by configuring the Now Mobile properties. For information about configuring these properties, see Configure Now Mobile properties.

- Sort categories by the Order field.
- Define the availability of a catalog item in one of the following ways:
  - Include the catalog item with Availability set to Desktop only in Now Mobile.
  - Specify catalog item types to exclude in Now Mobile.
- Define the non-availability behavior of a catalog item by making it discoverable but not viewable, or not available at all.
- Specify colors for buttons to match your mobile theme.

Configure catalogs
Enable your users to view and request their associated items in the Now Mobile app. If no catalogs are selected, users can view and request items from all catalogs in the system. By default, the app uses Service Catalog.

Before you begin
Role required: admin

About this task
Procedure
1. Navigate to Now Mobile App > Catalogs.

2. Optional: In the portal catalogs [m2m_sp_portal_catalog] table, add a catalog in addition to the base system catalog, or change the catalog that is associated with the base system record:
   
a. Click New or open the base system record.

b. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal</td>
<td>Portal that you select. Select Employee Center.</td>
</tr>
<tr>
<td>Catalog</td>
<td>Catalog that you would like to associate with the app.</td>
</tr>
<tr>
<td>Order</td>
<td>Number that indicates the order that the configurations should run. If there are multiple configurations on a portal, the system runs the configurations from the lowest to the highest order that you selected.</td>
</tr>
</tbody>
</table>

Results
Your users can view and request items from all added catalogs.

Browse catalog items using the catalog hierarchy
In addition to the category hierarchy, browse catalog items using the catalog hierarchy for proper context.

Before you begin
Role required: admin

Procedure
1. Navigate to System Mobile > Now Mobile app > Applet Launchers.
2. Select the Services applet launcher.
3. Replace the Browse Services applet launcher section with the Browse Catalog applet launcher section.
   
a. On the Applet launcher form, navigate to the Body section.

b. Under the Section column, click Browse Services.
c. On the Item Section form, set **Destination screen** as **Browse Catalog**.

d. **Click Update.**
   After the **Browse Catalog** applet launcher section is enabled, the catalog appears as the first level of browsing and then the categories.

**Submit and track a request**
Submit a request for an item or service and track the progress of your request with the Now Mobile app.

**Before you begin**
Role required: none

**Procedure**
1. In the navigation bar, tap **Services**.
2. Browse items and services, or search for an item.
3. Tap the item or service that you would like to request.

   **Note:** If configured by your administrator, the related items and articles area provides alternatives and additional information.

4. Select **ORDER NOW**.
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request for</td>
<td>Change this field if ordering the item for someone else.</td>
</tr>
<tr>
<td>Delivery Information</td>
<td>Confirm the shipping address for the item.</td>
</tr>
<tr>
<td>Special instructions (Optional)</td>
<td>Add any special instructions for the item.</td>
</tr>
</tbody>
</table>

6. **Tap CHECKOUT.**
   The app displays a confirmation that your request is submitted.

7. To return to the list of items, tap **Close**.
8. In the navigation bar, tap **For Me**.
9. To view all your requests, tap **My Requests**.
10. To view the status of your request, tap the item that you ordered.
a. To view information about the request, use the Details tab.

   Note: You can add comments for an open incident.

b. To view field changes and comments about your request, use the Updates tab. Tap to add comments and work notes, or to attach a file.

   Note: When you add comments for a resolved incident, you can reopen it.

Create a quick action in your mobile applications

Provide easy access to an important item by creating a quick action. For example, you can create a quick action that opens a Service Catalog item.
Before you begin
Role required: admin

Procedure
1. Create a function for the quick action.

   a. Navigate to **System Mobile > Functions**.
      The Function [sys_sg_button] table opens.

   b. Click **New**.

   c. On the form, fill in the fields.

**Button fields form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the function record.</td>
</tr>
<tr>
<td>Description</td>
<td>Description to enable other users to easily understand the purpose of the function.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of quick action that you want to create.</td>
</tr>
<tr>
<td>Context</td>
<td>Whether the function applies at the record or table level.</td>
</tr>
<tr>
<td></td>
<td>• Record: Action only applies at the record level. For example, updating a field.</td>
</tr>
<tr>
<td></td>
<td>• Global: Action that only applies at the table level. For example, creating or deleting a record. For this example, select <strong>Global</strong>.</td>
</tr>
<tr>
<td>Link Label</td>
<td>Label for the link. This value does not display in the user interface.</td>
</tr>
<tr>
<td>Link URL</td>
<td>Relative URL for the item that you want to open when the user clicks the function. For example, to open a Service Catalog item in the Now Mobile portal, enter <code>/mesp?id=sc_cat_item&amp;sys_id=060f3afa3731300054b6a3549dbe5d3e</code>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Relative URL</strong></td>
<td>This field only displays if the Type field is URL. Option that is selected to determine whether the URL is relative. For this example, choose Selected. This field only displays if the Type field is URL.</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td>Table on which the condition runs.</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td>Condition that should be met for the action to be successful. For a catalog item, enter <code>var item = new sn_sc.CatItem('3f1dd0320a0a0b99000a53f7604a2ef9'); answer = item.canView() &amp;&amp; item.isVisibleServicePortal();</code> to display the quick action only when the end user has permissions to view the item.</td>
</tr>
<tr>
<td><strong>Roles</strong></td>
<td>Roles that you want the user to have to view the quick action.</td>
</tr>
</tbody>
</table>

2. Add an instance of the function that you created to the page.

   a. In the native UI, navigate to **Now Mobile App > Applet Launchers**.

   b. Open the applet launcher record that you would like to add the quick action to.

   c. Select the **Body** tab.

   d. Insert a new row in the Quick Actions Menu Maps related list. If you're not able to insert a row, make sure that you're in the **ServiceNow Now Mobile App Screens and Applet Launcher** application scope.

   e. Click the magnifying glass to look up an item.

   The Function Instances [sys_sg_button_instance] table opens.

   f. Click **New**.

   g. On the form, fill in the fields.
### Function instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the function instance.</td>
</tr>
<tr>
<td>Description</td>
<td>Description to enable other users to easily understand the purpose of the function instance.</td>
</tr>
<tr>
<td>Parent</td>
<td>Page on which you are adding the quick action. For example, select <strong>Applet Launcher: Homepage</strong> to add the quick action to the home page. Select a value in the <strong>Parent table</strong> field first.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope.</td>
</tr>
<tr>
<td>Parent table</td>
<td>Table that contains the record type where the button appears. For this example, select <strong>applet Launcher</strong> to add the quick action to an applet launcher page.</td>
</tr>
<tr>
<td>Function</td>
<td>Function record that you created earlier.</td>
</tr>
<tr>
<td>Label</td>
<td>Label to help the user understand what the quick action opens. For example, <strong>Report an outage</strong>.</td>
</tr>
<tr>
<td>Location</td>
<td>Location where the button appears in the UI. For this example, select <strong>Quick Action</strong>.</td>
</tr>
</tbody>
</table>
| Icon         | Icon to display next to the label. For more details on mobile icons, see .LOCATIONS:  

  > **Note:** Not all listed icons work with quick actions. To see a list of compatible icons, filter your list where the **Icons** field contains **now-mobile-icons-buttons**.  

  > **Note:** The **Icons** field is not on the icon list by default. To add the **Icon** field to your list, right-click the list header and select **Configure > List Layout**. Then, add the **Icon** field to the selected list. You should see the icon field on your reference field list.  

| Order        | Number that indicates the order that the functions are listed. If there are multiple instances in the same location, the app displays them from the lowest to the highest. |
h. Click Submit.

i. Save the applet launcher record.

Results

Your users can open the quick action by selecting the + icon on the applet launcher page.

Enable notifications in Now Mobile

Allow push notifications on your mobile device when there is an update for a request.

Procedure

1. Tap Notifications in the navigation bar.
2. Tap the Enable notifications radio button.
   You'll receive a notification in any of the following scenarios.
   • Request Completed (one RITM)
   • Request Completed (multiple RITM)
   • Request not Processed
   • Approval Record Assigned - RITM
   • Approval Record Assigned - Request
   • Request Rejected
   • Agent adds comment to Requested Item

Enable the cart in Now Mobile

Allow a requester to add or edit items in the cart. By default, the cart is disabled in Now Mobile.

Before you begin

Role required: admin

Procedure

1. Navigate to sys_properties.list.
2. For the glide.sc.cart.enabled property, specify Value as true.
3. Click Update. The Cart icon is displayed at the top of the app and the Add to Cart button is enabled for items.
Edit the label of Submit button for a record producer

For a record producer submission experience that you can relate to, edit the label of the Submit button.

Before you begin
Role required: admin

Procedure
1. Navigate to Service Portal > Widgets.
2. Select the SC Catalog Item (widget-sc-cat-item-v2) widget.
3. From the Instances related list, preview and open the instance for the ServiceNow NowMobile App – Catalog Screens and Applet Launcher application.
4. In the Additional options, JSON format field, specify the record_producer_label parameter.
   For example, if you want to change the label to Request, press Ctrl+click on the catalog item widget, select Instance in Page Editor, and specify the following parameters in the Additional options, JSON format field.

   ```json
   "record_producer_label":{
     "value": "Request"
   }
   ```
5. Click Update.

Configure Now Mobile properties
Define the behavior of various catalog entities in Now Mobile.

Before you begin
Role required: admin

Procedure
1. Navigate to Service Catalog > Catalog Administration > Properties.
2. On the Service Catalog Configuration form, select the Mobile section.
3. Configure the required properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog category sort option in NOW Mobile (glide.sc.mobile.category.order_by)</td>
<td>Sort option for categories in Now Mobile.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>• Title:</strong> Categories are sorted by their title. By default, categories are sorted alphabetically by their title.</td>
<td></td>
</tr>
<tr>
<td><strong>• Order:</strong> Categories are sorted by their order</td>
<td></td>
</tr>
<tr>
<td>Include 'Desktop only' Items in NOW Mobile ([glide.sc.mobile.include_desktop_only_items])</td>
<td>Option to include the catalog item with Availability set to Desktop only in Now Mobile.</td>
</tr>
<tr>
<td>Catalog item classes not available in NOW Mobile (comma separated list) ([glide.sc.mobile.item_class_not_supported])</td>
<td>Catalog item types to exclude in Now Mobile. For example, sc_cat_item_content, sc_cat_item_producer</td>
</tr>
<tr>
<td>Experience for items not available in NOW Mobile ([glide.sc.mobile.unsupported_discover])</td>
<td>Option to define the non-availability behavior of a catalog item. Possible options are:</td>
</tr>
<tr>
<td>• Discoverable-show message that item is not viewable in the mobile: Item is discoverable in the search and browse experience but not viewable.</td>
<td></td>
</tr>
<tr>
<td>• Not discoverable-do not show in search and browse experience: Item is neither discoverable in the search and browse experience nor viewable.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td></td>
</tr>
<tr>
<td>• If the AI Search is enabled for Now Mobile, this property is not applicable.</td>
<td></td>
</tr>
<tr>
<td>• This property is supported only when one of the following properties are applicable:</td>
<td></td>
</tr>
<tr>
<td>◦ Include 'Desktop only' Items in NOW Mobile ([glide.sc.mobile.include_desktop_only_items])</td>
<td></td>
</tr>
<tr>
<td>◦ Catalog item classes not available in NOW Mobile (comma separated list) ([glide.sc.mobile.item_class_not_supported])</td>
<td></td>
</tr>
<tr>
<td>Primary color for buttons in the catalog request experience in NOW Mobile ([glide.sc.mobile.primary_color])</td>
<td>Color for buttons in the catalog request experience.</td>
</tr>
</tbody>
</table>
**Important:** The following properties are interdependent.

- Include 'Desktop only' Items in NOW Mobile
- Catalog item classes not available in NOW Mobile (comma separated list)
- Experience for items not available in NOW Mobile

### Dependency between the Include 'Desktop only' Items in NOW Mobile property and Experience for items not available in NOW Mobile property

<table>
<thead>
<tr>
<th>Availability value of the catalog item</th>
<th>Include 'Desktop only' Items in NOW Mobile (true)</th>
<th>Include 'Desktop only' Items in NOW Mobile (false) Desktop only</th>
</tr>
</thead>
<tbody>
<tr>
<td>Desktop only</td>
<td>Viewable in search and browse experience</td>
<td>If set as discoverable using the <strong>Experience for items not available in NOW Mobile</strong> property, viewable in search and browse experience, but not available when you click the item.</td>
</tr>
<tr>
<td>[Desktop and Classic Mobile]</td>
<td>Always viewable in search and browse experience</td>
<td>If set as not discoverable, not viewable in search and browse experience</td>
</tr>
<tr>
<td>Classic Mobile only</td>
<td>Not viewable in search and browse experience</td>
<td>Not viewable in search and browse experience</td>
</tr>
</tbody>
</table>

### Dependency between the Experience for items not available in NOW Mobile property and Items excluded using the Catalog item classes not available in NOW Mobile (comma separated list) property

<table>
<thead>
<tr>
<th>Experience for items not available in NOW Mobile property value</th>
<th>Items excluded using the Catalog item classes not available in NOW Mobile (comma separated list) property</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discoverable-show message that item is not viewable in the mobile experience</td>
<td>Item types are viewable in search and browse experience, but not available when you click them.</td>
</tr>
<tr>
<td>Not discoverable-do not show in search and browse experience</td>
<td>Item types do not appear in search and browse experiences</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Service Catalog topic blocks in Virtual Agent**

You can design a topic conversation in Virtual Agent by including reusable topic blocks to perform request submission tasks.

Activate these plugins:

1. Glide Virtual Agent plugin (com.glide.cs.chatbot) or Glide Virtual Agent Lite plugin (com.glide.cs.chatbot.lite)
2. Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks)

**Search Catalog Item**

You can use this topic block to search for a catalog item based on the search criteria. If there are multiple search results, you can select one from a carousel view.

**Input parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_term</td>
<td>Keyword to search for a catalog item. For information on configuring keyword search for a catalog item, see Configure keyword search for catalog items.</td>
</tr>
<tr>
<td>catalogs</td>
<td>Comma-separated list of catalogs where a catalog item should be searched for.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Number of search results that should be displayed. By default, this number is set to 5.</td>
</tr>
</tbody>
</table>

**Output parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>catalog_item_id</td>
<td>If a catalog item is selected, sys_id of the item is returned. If no catalog item is selected, that is, <strong>None of these</strong> option is selected, -1 is returned.</td>
</tr>
<tr>
<td>item_type</td>
<td>sys_class_name of the catalog item that the user selected.</td>
</tr>
<tr>
<td>is_conversational</td>
<td>Specifies if the catalog item can be requested in the conversation mode in Virtual Agent. This is dependent on the <strong>glide.sc.conversational.request.question.limit</strong>.</td>
</tr>
</tbody>
</table>
Request Catalog Item
You can use this topic block to request for a catalog item.

Input parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>catalog_item_id</td>
<td>sys_id of the catalog item that should be requested.</td>
</tr>
<tr>
<td>execute_contextual_search</td>
<td>Option to specify if the contextual search should be run for a record producer based on its configuration. For information on defining contextual search for a record producer, see Define contextual search for record producer.</td>
</tr>
<tr>
<td>confirm_catalog_item</td>
<td>Option to specify whether the user must confirm the catalog item before continuing with the next step. If this is set to false, user can answer the catalog items questions by skipping the confirmation.</td>
</tr>
</tbody>
</table>

Output parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>record_id</td>
<td>sys_id of the record that is generated after the item submission.</td>
</tr>
<tr>
<td></td>
<td>If the catalog item is not supported in the conversation mode or if the user does not have access to the item, -1 is returned.</td>
</tr>
<tr>
<td>record_table</td>
<td>Name of the table in which the record is generated.</td>
</tr>
<tr>
<td>variables</td>
<td>Questions related to the catalog item.</td>
</tr>
</tbody>
</table>

Conditions for requesting a catalog item in a conversation mode
A user can submit a request in the conversation mode (by answering the questions in line).

⚠️ Note: The user can skip non-mandatory questions.

- A catalog item cannot have more than the number of questions specified in the glide.sc.conversational.request.question.limit property. By default, this number is set to 10. For more information about this property, see Service Catalog properties.
• A catalog item can have non-scripted catalog UI policies. These UI policies should be defined such that variables are affected sequentially, that is, only a variable with the lower order affects a variable with the higher order.

• A catalog item cannot have catalog client scripts that are defined for Now Mobile or Service Portal.

• These catalog item types are not supported:
  ◦ Content Item
  ◦ Order Guide
  ◦ Wizard Launcher
  ◦ Standard Change Template

• Only the following variables are supported:
  ◦ Attachment
  ◦ Date
  ◦ Date/Time
  ◦ Email
  ◦ IP Address
  ◦ Label
  ◦ Lookup Multiple Choice
  ◦ Lookup Select Box (without pricing implications and advanced reference qualifier)
  ◦ Multiple Choice (without pricing implications and advanced reference qualifier)
  ◦ Multi Line Text
  ◦ Numeric Scale (without pricing implications)
  ◦ Reference (without pricing implications and advanced reference qualifier)
  ◦ Requested For (without pricing implications and advanced reference qualifier)
  ◦ Select Box (without pricing implications)
  ◦ Single Line Text
  ◦ URL
  ◦ Wide Single Line Text
  ◦ Yes / No
  ◦ Container variables
• The following variable attributes are supported:
  ◦ ref_ac_order_by
  ◦ allowed_extensions
  ◦ max_file_size

• A catalog item can have a variable set.

  Catalog builder preview topic conversation

Submit a request topic conversation

Users can submit a request in a Virtual Agent conversation.

The Submit a request topic conversation uses the following topic blocks:

• Search Catalog Item
• Request Catalog Item

Using the Submit a request topic conversation, users can submit a request by choosing from all available options. For example, when a user is requesting an item, the Virtual Agent prompts the user to enter a search keyword. After the user enters the keyword, the Virtual Agent responds with available choices in a carousel view.

When the user selects the required item, the following scenarios are possible:

• A user can submit a request in the conversation mode (by answering the questions in line). After the request submission, a URL, which opens up the ticket page, is provided.

  Note: In Now® Mobile, the URL opens the native screen.

• In all other cases, Virtual Agent provides a link for the user to submit the request in the Service Portal defined in the sn_itsm_va.com.snc.itsm.virtualagent.portal_url property.
Note: Now Mobile opens the item in Mobile Employee Service Portal (mesp).

ITSM Virtual Agent conversation flows

Delegated request experience
You can request a catalog item on behalf of another user or multiple users using the Requested For variable.

Delegated request experience comprises of the following entities:

• Requested For variable for a catalog item. For information about this variable, see Requested For.
• Requested For field on a requested item (RITM)

Note: The form views, list views, and email notifications are not updated to reflect the Requested For field on a RITM.

Configuration options
The following configuration options are available:
• Specify who you want to submit the request for using the Requested For variable. You can also map the Requested For variable to a field on the table for record producers.

• If required, configure the Requested For field on the RITM form. This field automatically stores the value of the Requested For variable.

• Allow delegated requests for a catalog item using its Access Type field, where you can specify if a request can be submitted for a user who does not have access to the catalog item.

• Submit a single request for an item on behalf of multiple users in Service Portal

⚠️ Important: If two-step checkout is enabled, the delegated request experience is not supported.

Request Management
After you submit a catalog item request, the Requested For variable value is copied to the Requested For field of the RITM. In case this field is not available on the RITM form, you should configure it.

⚠️ Note: After you submit a catalog item, the Requested For field value is not automatically updated when the Requested For variable is modified, and vice versa.

In Service Portal,

• If RITMs have different Requested For users, the following information is displayed in the order status page.
  - The Requested For column to display the RITM's Requested For user.
  - When the user viewing the Order Status page is not the user who submitted the request, the Requestor information to display the request's Requested For user. This is also applicable in Now Mobile, when the user viewing the RITM is not the user who requested it.

• If the RITM's Requested For user is different from the request's (REQ) Requested For user, My Requests menu displays the RITM records to the user who the RITM is being requested for. If the RITM Requested for is the same as the REQ requested for user, My Requests menu displays REQs.

• When you create a bundle from the cart by adding a catalog item with a Requested For variable, the item preserves the variable value. When you later add it to the cart to request for another user, you should edit the Requested For variable value as required.
Request experience for a record producer
After you submit a record producer, the Requested For variable value is copied to the target record's field based on the Map To Field configuration.

Request experience for an order guide
This experience is supported in an order guide only if the following conditions are met:

- Order guide has a Requested For variable
- All items in the order guide have a Requested For variable

A catalog item is included in an order guide based on the Requested For user’s access to a catalog item.

- When the user has no access to the catalog item and its Access Type is set as Restricted, that item is not included in the order guide.
- When the user has no access to the catalog item and its Access Type is set as Delegated, that item is included in the order guide.

The Requested For variable value from the Describe Needs section is always cascaded to the Requested For variable of catalog items in rule bases.

- The cascading of the Requested For variable value depends just on the variable type, but not the variable name.
- The Requested For variable value is cascaded even when the Cascade Variables check box is not selected for the order guide.
- The Requested For variables in the included catalog item cannot be edited.

Submitting a catalog item request for multiple users
To support submitting a request for multiple users, you can configure the Requested For variable of a catalog item.

1. From the Type Specifications tab, select the Enable also request for check box.

2. Specify the roles in the Roles to use also request for field that can submit a catalog item request for multiple users. If no role is specified, anyone who has access to the catalog item can submit the request.

After you configure the Requested For variable of a catalog item, the Also request for field is displayed for that item in Service Portal. After you specify multiple users in this field, you can:
• Add the item to the cart
  ◦ Separate cart items are created for each user specified in the Also request for field.
  ◦ The Requested For variable of each cart item is populated with the corresponding user.

• Submit the request
  ◦ A single request is created and assigned to the current logged-in user requesting the item
  ◦ Separate RITMs are created, one for each user specified in the Enable also request for field and the Requested For variable.

Note:
  • This experience is available in Service Portal.
  • This experience is not available in Now Mobile and Workspace.
  • This experience is not available for a record producer and order guide.
  • The Also request for field is not displayed in the wish list and cart.
  • Catalog client scripts, catalog UI policies, and g_form() APIs are not applicable for the Also request for field.
  • The Also request for field is displayed only if the Requested For variable is editable. For example, the field is not displayed if the requesting user has no write permissions for the Requested For variable, or if the variable is made read-only via catalog client scripts.
  • You can add up to a maximum of 50 users in the Also request for field.
  • If any of the users does not have access to a catalog item with Access Level set as Restricted, then the item cannot be added to cart.

Request cloning
When you clone a request:

• The Requested For value for the cloned request is updated with the user for whom the request is being cloned.

• The Requested For value for cloned RITMs (with or without a Requested For variable) is updated with the user for whom the request is being cloned for the following entities:
  ◦ RITM Requested For user
  ◦ Requested For variable value
For information about cloning requests, see Clone requests.

**Important:**

- You can clone a request only when all RITMs are requested for the same user.
- You cannot clone a request for a user who does not have access (based on Access Type) to any item in the request.
- Variable dependencies on the Requested For variable are not considered when a request is cloned.

**Cart behavior**

Using the Requested For variable, you can add multiple catalog items to the cart for different users and submit the cart as one request. When you submit a request for a cart with multiple items, a single request is created with separate RITMs, one for each catalog item. In this case, the Requested for field of each RITM inherits the corresponding Requested For variable value.

When you add multiple items to the cart for different users and submit the request, a single request is created with a separate RITM for each catalog item with the corresponding Requested For user.

**Cart submission scenarios**

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Cart behavior</th>
</tr>
</thead>
</table>
| All items in the cart have a Requested For variable and are requested for the same user | - Requested For value of the RITM is the Requested For variable value.  
- Requested For value of the request is the Requested For variable value. |
| All items in the cart have a Requested For variable and are requested for different users | - Requested For value of the RITM is the Requested For variable value.  
- Requested For value of the request is the logged-in user or the default Requested For user specified in the cart. |
| No items in the cart have a Requested For variable | - Requested For value of the RITM is the default Requested For user specified in the cart.  
- Requested For value of the request is the logged-in user or the default Requested For user specified in the cart. |

</thead>
</table>
| Few items in the cart have a Requested for Variable while others do not  | • Requested For value of the RITM is one of the following:  
  ◦ If a Requested For variable exists, it is the variable value.  
  ◦ If no Requested For variable value exists, it is the logged-in user or the default Requested For user specified in the cart.  
  • Requested For value of the request is the logged-in user or the default Requested For user specified in the cart. |

**Passing parameters for the Requested For variable**
You can use parameters in Now Platform and Service Portal to specify the default Requested For variable value for a catalog item.

- In Platform, pass a user's sys_id as the `sysparm_requested_for` value in the URL.
- In Service Portal, specify the `requested_for_id` and `requested_for_display` parameters in widget instance options.

For example, navigate to a catalog item widget, press Ctrl+click to select **Instance in Page Editor**, and specify the following parameters in the **Additional options, JSON format** field.

```json
"requested_for_id": "a8f98bb0eb32010045e1a5115206fe3a
"requested_for_display": "Abraham Lincoln"
```

⚠️ **Note:** The Requested For value is set after the catalog form is loaded.

Types of service catalog variables

**Configure the default behavior to request items for other users**
Define the default behavior when no roles are specified in the `glide.sc.req_for.roles` property.

**Before you begin**
Role required: admin
About this task
The `glide.sc.req_for.roles` property specifies the list of roles who can request items for other users. When no roles are specified, then the default behavior is defined by the `glide.sc.req_for.roles.default` property. For information about the `glide.sc.req_for.roles` property, see Service Catalog properties.

Following are the possible values for the `glide.sc.req_for.roles.default` property.

- When the property is set to `allow`, then any user can request items for other users.
- When the property is set to `deny`, then no user can request items for other users.

The value of the `glide.sc.req_for.roles.default` property is considered as `allow` in any of the following scenarios and any user can request an item for other users:

- The `glide.sc.req_for.roles.default` property is not defined.
- The value of the `glide.sc.req_for.roles.default` property is empty, `allow`, or any string other than `deny`.

A user with the admin role can request an item for other users. In this case, values of both the properties, `glide.sc.req_for.roles` and `glide.sc.req_for.roles.default`, are not considered.

For zBoot customers, the `glide.sc.req_for.roles.default` property is available in the base system with the default value as `deny`. Upgrade customers can add and modify the property if required.

Procedure
1. Navigate to `sys_properties.list`.
2. Select the `glide.sc.req_for.roles.default` property.
3. On the System Property form, in the **Value** field, specify the value.
4. Click **Update**.

Service Catalog request fulfillment
When a user orders a catalog item, a request is created that follows a fulfillment process. A fulfillment process defines the steps to request approval, assign fulfillment tasks, and fulfill requests. Execution plans or workflows are used to define fulfillment processes.
Introduces request fulfillment in Service Catalog, provides a comparison of execution plans versus workflows, and demonstrates creating an execution plan and a workflow.

Preparing to fulfill catalog item requests involves the following activities.

- Set up fulfillment groups to assign to tasks.
- Define the fulfillment processes using execution plans or workflows.
- Assign the fulfillment process to catalog items.

**Using workflows**

Workflows provide greater flexibility than execution plans, which are linear. Workflows allow for different paths to the end of the process. For example, an approver can reject a request, ending the process. If the request is approved, the process continues through fulfillment to the end of the process.

Use the Workflow Editor to define fulfillment workflows. The Workflow Editor offers the following features.

- Edit workflows graphically.
- Modify activities and conditions.
- Define transitions between workflow activities.
- Summarize workflow progress through stages.
- Validate workflows to identify potential problems.
- Publish workflows for other users.

**Service catalog workflows**

Two service catalog workflows are provided in the base system. Use the Graphical Workflow Editor to modify the default workflows or to create additional service catalog workflows. Service catalog workflows support domain separation.

**Default service catalog workflows**

- **Service Catalog Request**: a simple workflow that fulfills a simple order.
- **Service Catalog Item Request**: a more complex workflow that fulfills a more complex order.
Defining service catalog workflows
Creating a workflow involves the following processes:

- Create a workflow to process the catalog item.
- Define the workflow activities to process the catalog item.
- Publish the catalog item workflow.
- Create or edit a catalog item to call the catalog item workflow

Note: If your catalog workflow requires catalog tasks to access catalog variables, create the catalog tasks from a parent workflow. A catalog workflow cannot access catalog variables from catalog tasks created by a subflow.
Deleting catalog workflow records
Workflow stage fields for service catalog workflows display when a user deletes a record required by the workflow. If a user deletes a catalog item and that catalog item has active request workflows running, the workflow stage field displays **Catalog item removed**. Similarly, deleting the associated workflow context causes the stage field to display **Workflow context removed**.

Associating items with the domain-specific workflow
When using service catalog workflows with domain separation, ensure your catalog items use the domain-specific workflow. If you create a domain-specific version of a workflow, existing catalog items continue to use the original workflow. To configure the catalog item to use the domain-specific workflow, select the new workflow in the **Workflow** field on the catalog item record.

Create a catalog workflow
Create service catalog workflows when the default workflows are not appropriate for a fulfillment process.

**Before you begin**
Role required: workflow_creator, workflow_admin, or admin

**About this task**
This example describes the procedure to set up fulfillment for a laptop request.

**Procedure**
1. Navigate to **Workflow > Workflow Editor**
2. Click **New Workflow**.
3. Complete the form with the following information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Laptop Fulfillment</td>
</tr>
<tr>
<td>Table</td>
<td>Requested Item [sc_req_item]</td>
</tr>
</tbody>
</table>

Consider the following information:

- Workflows on the Service Catalog Requested Item [sc_req_item] table fulfill the request of a single catalog item. Each requested item triggers its own fulfillment workflow when the item is ordered. Use the Requested Item table to add workflows for requested items.

  **Note:** To enable approval-type workflows to operate smoothly, make sure that the appropriate users have the correct role to access necessary tables in all domains.

- Use caution when using `before query` business rules, as they can restrict access to the requested item record.

- Workflows on the Request [sc_request] table always run when a service catalog request is submitted, regardless of what item was ordered. These workflows control the entire request process, which can involve delivering several requested items.
Therefore, Request table workflows are not assigned to a specific item from the maintain item form. If you do use the Request table for service catalog requests, add conditions to the workflow to ensure it runs when the correct item is requested.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expected time</td>
<td><strong>Days 7, Hours 00:00:00.</strong> Workflows cannot calculate the end time because not all the activities within the workflow have defined times. Therefore, the Expected time on the workflow becomes the Delivery Time on the catalog request.</td>
</tr>
<tr>
<td>Schedule</td>
<td><strong>8–5 weekdays.</strong></td>
</tr>
<tr>
<td>Timezone</td>
<td><strong>US/Pacific.</strong> The timezone that the schedule applies to.</td>
</tr>
<tr>
<td>Description</td>
<td>A workflow for the fulfillment of laptop requests.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
What to do next
After initiating a workflow, add workflow activities to it. Workflow activities are listed on the Core tab in the right pane.

Add an activity to a catalog workflow
You can add activities to a workflow to perform tasks such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

Before you begin
Role required: workflow_creator, workflow_admin, or admin

About this task
After creating the workflow to add a laptop fulfillment process, add the activities.

Procedure
1. Complete the following steps to add an activity that requests manager approval.
   a. In the Core pane, expand Approvals and drag the activity Approval - User onto the arrow between Begin and End. This activity generates an approval from the manager of the person requesting the laptop.
   b. Complete the form with the following information.
      • Name: Manager Approval
      • Stage: Waiting for Approval
      • User: Click the lock icon in the Approvers section, and then click the select fields icon. Expand Requested > Requested For, and then select Manager.
   c. Click Submit.
2. Complete the following steps to add an action for when the approver rejects the request.
   a. Expand Utilities in the Core pane and drag the activity Set Values to the space below the approval.
   b. Complete the form with the following information.
• Name: Rejected
• Stage: Completed
• Values condition builder: [Approval] [Rejected]

c. Click Submit.

d. Drag from the yellow box beside Rejected on the Approval - User activity to the new Set Values activity.

e. Drag again from the yellow box beside Always on the Set Values activity to End.
This activity marks the request as rejected if the manager rejects the request and then ends the workflow.

3. Complete the following steps to add an action for when the approver approves the request.

a. Drag the activity Set Values onto the arrow between Approval - User and End.

b. Complete the form with the following information.
• Name: Approved
• Stage: Fulfillment
• Values condition builder: [Approval] [Approved]
This activity marks the request as approved once a manager approves it.

c. Click Submit.

4. Expand Tasks and drag the activity Create Task onto the arrow between Approval - User and End, add the following information, and click Submit.
• Name: Laptop Procurement
• Stage: Fulfillment
• Task Type: Catalog Task [sc_task]
• Priority: 3 - Moderate
• Fulfillment group: Procurement
• Short description: Procure a Laptop
This task tells Procurement to procure a laptop for the user.
5. Expand Notifications and drag the activity Notification onto the arrow between Laptop Procurement and End, add the following information, and click Submit.

- **Name**: Procurement
- **Stage**: Fulfillment
- **To**: Click the lock icon in the Addressee(s) section, and then click the select fields icon. Expand Requested and select Requested For.
- **Subject**: Your laptop has been procured.

This activity marks the request as approved if a manager approves it.

6. Drag the activity Create Task onto the arrow between Procurement and End, and then fill in the form.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Set Up Laptop</td>
</tr>
<tr>
<td>Stage</td>
<td>Fulfillment</td>
</tr>
<tr>
<td>Task Type</td>
<td>Catalog Task</td>
</tr>
<tr>
<td>Priority</td>
<td>3 - Moderate</td>
</tr>
<tr>
<td>Fulfillment Group</td>
<td>Hardware</td>
</tr>
<tr>
<td>Short Description</td>
<td>Set up laptop.</td>
</tr>
</tbody>
</table>

This task tells Hardware to configure the laptop and prepare it for use.

7. Drag the activity Create Task onto the arrow between Set Up Laptop and End, add the following information, and click Submit.

- **Name**: Pickup Laptop
- **Stage**: Delivery
- **Task Type**: Catalog Task [sc_task]
- **Priority**: 3 - Moderate
- **Assigned to**: Leave the field blank, as the script in the Advanced field assigns this task to the requester.
- **Short description**: Pick up laptop.
- **Advanced**: Select the check box and set the Advanced Script value to:

  ```
  task.assigned_to=current.requested_for;
  ```

This task informs the requester to come pick up the laptop.
8. Drag the activity **Log Message** onto the arrow between **Pick Up Laptop** and **End**, add the following information, and click **Submit**.

- **Name**: Delivered
- **Stage**: Completed
- **Message**: The laptop delivery workflow is complete.

Leaves a message in the log to record the successful completion of the workflow.

**Publish a catalog workflow**

Publish the catalog workflow to make it available for use in the system.

**Before you begin**

Role required: workflow_creator, workflow_admin, workflow_publisher, or admin

**About this task**

After adding activities to your workflow, publish it to make it available for use.
Procedure

1. Open the workflow actions menu on the left beside the workflow name.
2. Click **Publish** to publish the workflow.

Execution Plans

An execution plan describes how a catalog item is procured, configured, and installed.

Execution plans enable you to describe simple, linear processes. Each execution plan contains one or more tasks. For example, an organization could create an execution plan for delivering a corporate standard PC that contains these tasks:

1. Procure the PC from a supplier.
2. Configure the PC according to requester specifications.
3. Deliver the PC to the requester.
An execution plan is not specific to any one catalog item. There could be many different models of PC that a user can order, all using the same execution plan. It is not necessary to create a new execution plan for each individual catalog item in a mature service catalog.

**Note:** Execution plans are not as powerful or flexible as workflows, and cannot be designed using a graphical editor. Execution plans are useful in some circumstances, for example, if you want to build your processes programmatically or through imports. ServiceNow recommends using workflows for request fulfillment processes.

Create an execution plan
Administrators and catalog administrators can create and manage execution plans and the associated variable tasks.

**Procedure**
1. Navigate to Service Catalog > Catalog Administration > Execution Plans.
2. Click New.

   ![New execution plan](image)

3. Enter a **Name** and **Short description** for the execution plan.
4. Specify **delivery information** in the Total delivery time and On Calendar fields.
5. Click **Submit**.

Add catalog item variables to a task
You can add variables of a catalog item to a task to specify information about the requested catalog item.

About this task
For example, when a user requests a laptop, the fulfillment group can need to know what screen size and how much memory to order.
Each catalog item can contain one or more variables for gathering information from the user who requests the item. Assuming that the relevant catalog items have been associated to the execution plan, you can associate these variables to the specific created tasks that need the information.

**Procedure**

1. Navigate to **Service Catalog > Catalog Administration > Execution Plans**.
2. Open an execution plan.
3. In the **Execution Plan Tasks** related list, open a task.
   - Ensure that the form shows the Plan view. If not, right-click the header bar and select **View > Plan**.
4. Go to the **Available Variables** related list and click **Edit**.
5. Use the slushbucket to select the variables that are appropriate for the task.
   - Consider all the types of catalog items that could use this execution plan, and select all the variables that can be assigned to them.
6. Click **Save** to associate these variables to the execution plan task, making them accessible.

**Execution plan tasks**

An execution plan contains one or more execution plan tasks, such as for obtaining approval. Execution plan tasks are assigned to a fulfillment group. Each task represents work to be completed by a specific group as part of the overall request fulfillment process.

Administrators create templates for tasks as part of defining an execution plan. The catalog tasks themselves are then created when the relevant item is requested, based on these task templates.

**Set up an execution plan approval task**

Approval tasks are specific types of tasks within execution plans.

**About this task**

If an approval task is rejected, the execution plan can roll back to a previous task, but the approval record does not roll back.

To set up an approval task including a rollback action:
Procedure

1. Navigate to Service Catalog > Execution Plans.
2. Select an execution plan.
3. From the Execution Plan Tasks related list, select New Approval to create the approval task.
4. Fill in the fields for that approval task.

Upon Reject

5. Use the Upon reject field to define the action to take if the task is rejected:
   • Cancel all future Tasks: [default] cancels all future tasks in the execution plan and also cancels the parent request item.
   • Go to a previous Task: displays the Rejection goto field where you can select which task this execution plan rolls back to.

6. Save the task, then scroll down to the Approved By list and select one or more approvers for the tasks.
   You can also use an Approval script to select approvers.

7. Select Update to add the task to the execution plan.
   This example shows how the process works in practice, using a request to order a Blackberry phone.
   First, the request is ordered:
Next, complete the first two steps, which leads to the approval task.

Reject the request to roll back the execution plan to a previous task, and reset any intermediate tasks to pending:
Rollback 3

After a plan has been rolled back, ServiceNow adds to the rolled-back task a note indicating that it was rolled back and why.

ℹ️ **Note:** Rolling back reverts all intermediate tasks within the execution plan. Other plans within the same request are not rolled back, however.

**Set up a fulfillment group**

Fulfillment groups perform the tasks related to fulfilling an order.

**About this task**

This group setting can include approving an order based on characteristics such as content and price, or any direct action required to complete the order. For example, loading software or installing hardware. Any existing user group (in **User Administration > Groups**) can be assigned fulfillment tasks.

To create a group specifically for order fulfillment:

**Procedure**

1. Navigate to **Service Catalog > Catalog Policy > Fulfillment Groups**.
2. Click **New**.
3. Fill in the Group form as described under creating groups.
   These groups have the type **catalog** and are assigned the catalog and itil roles, but are otherwise normal groups.
Delivery information for tasks

When managing execution plans, catalog administrators can specify the delivery information to provide an estimated date of delivery based on the execution plan.

Use the **Total delivery time** field to specify an estimated delivery time for each task in your execution plan. This estimate is calculated based on the combined total of times for the tasks in that execution plan.

By default, time estimates do not use a “working days” calendar system, but are based on simple elapsed time. For example, for a 5-day execution plan, if you submit the request on a Friday, the delivery date is Wednesday of the following week. This estimate means five elapsed days later, even if your organization does not work on weekends.

Setting the calendar to Monday through Friday (9-5) defines each day as being eight hours long, but the task delivery time day is 24 hours. If you create a task that takes one day (24 hours), the plan calculates the task as needing three work days (which are eight hours each) for the total delivery time. Similarly, if a task takes two days (48 hours), the plan calculates eight days of total delivery time. This total breaks down as six work days of eight hours each and, because six days are longer than the five-day work week, two weekend days. When assigning delivery times, keep this calculation process in mind.

Use the **On Calendar** field to specify a calendar system to apply to the execution plan, to help estimate more accurate delivery times.

If using this calendar system for estimated delivery time, ensure that estimates are expressed in working hours and days. For example, a task which is supposed to take one day on a 9-5 calendar is assumed to take 24 working hours. This process takes three working days.

**Note:** This calendar system is used to help provide delivery estimates only, and is not linked to any SLAs you have set on execution tasks.

Skipped tasks

If a task is skipped, the request fulfillment process moves on to the next task.

If the last task in an execution plan is skipped, the process is finished and the appropriate request item is closed as complete. Skipped tasks have their state set to **Closed Skipped** and display as gray boxes on a requested items list.
Creating execution plan tasks

An execution plan contains one or more task templates. Each task template defines work that can be completed by a specific fulfillment group.

Execution plans are associated with catalog items. When the relevant catalog item is requested, these task templates are used to generate tasks. That is, tasks to be performed as part of the request fulfillment process for that requested item. Each generated task within that requested item is assigned a catalog task number.

Example

The execution plan for an executive desktop computer catalog item could define the following task templates in the execution plan:

- Obtain managerial approval
- Order hardware
- Install standard corporate applications
- Deliver computer to requester

When this catalog item is ordered, the following request, requested item, and tasks are then created:
• Request REQ0002 -- 1 PC
  ◦ Requested Item ITEM0004 -- 1 X executive desktop
    ▪ Catalog Task0001 -- Obtain managerial approval
    ▪ Catalog Task0002 -- Order hardware
    ▪ Catalog Task0003 -- Install standard corporate application
    ▪ Catalog Task0004 -- Deliver computer to requester

Define task templates
Each execution plan contains one or more task templates that define actions that must be taken to fulfill a request.

About this task
After creating the execution plan, define these task templates.
When the relevant catalog item is ordered, request tasks are generated for that requested item, based on this information.

To define an execution plan task template:

Procedure
1. Navigate to Service Catalog > Catalog Policy > Execution Plans.
2. Open an execution plan.
3. In the Execution Plan Tasks related list, click New.
4. Fill in the fields on the Execution Plan Task form (see table).
5. Click Submit.
Defining Task Templates

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the task. This name becomes the created task name.</td>
</tr>
<tr>
<td>Fulfillment group</td>
<td>The group that performs the task. Whenever a user requests a catalog item associated with this execution plan, the task is automatically assigned to the fulfillment group. Leave blank if automatic assignment to a group is not required.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The individual who performs the task. Leave blank if automatic assignment to a user is not required.</td>
</tr>
<tr>
<td>SLA</td>
<td>The service level agreement that applies to catalog items associated with this execution plan.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is normally left blank, as the functionality was superseded by the service level management functionality.</td>
</tr>
<tr>
<td>Delivery plan</td>
<td>The parent execution plan for this task.</td>
</tr>
<tr>
<td>Order</td>
<td>A number representing the task sequence in the execution plan. It is good practice to &quot;leave gaps&quot; between order numbers (for example, 100, 200, 300). That way you can insert new tasks without changing the order number of existing tasks. (If the order for several execution plan tasks is the same, each of these tasks starts at the same time.)</td>
</tr>
<tr>
<td>Delivery time</td>
<td>Amount of time the task is expected to take. This value becomes a component of the overall time to complete the execution plan.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the task is performed (if the condition is not met, the task is skipped).</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of the task activity. This information populates the created task short description field.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Details of the activities to be performed for the task. This information populates the created task description field.</td>
</tr>
<tr>
<td>Work notes</td>
<td>A journal field for entering comments about the task template. Note: this information is separate from the created task work notes field.</td>
</tr>
</tbody>
</table>

**Conditions to run execution plan tasks**

Administrators and catalog administrators can define conditions under which a particular execution plan task runs, or is skipped, when the relevant item is requested.

For example, an execution plan can contain the following tasks:

1. Order hardware
2. Receive hardware
3. Configure hardware
4. Deliver hardware
If the hardware requested is already on-site, it does not need to be ordered. The first task in the list can be skipped.

**Note:** Skipped task records are still created, but are marked as skipped, and are not processed within the execution plan.

### Conditional Tasks

To make an execution plan task conditional, defining the conditions under which the task runs.

1. Navigate to **Service Catalog > Execution Plans**.
2. Open an execution plan, and then open a task within that plan.
3. Use the **condition** field to select the condition under which the task runs.

If no conditions are set, the task runs every time a user orders an item associated with this execution plan.

Here is an example of conditional task for an IT lab based in Atlanta:

**Applying Conditions to Execution Plan Tasks**

In this example, the **Deliver to IT Labs** step does not run if the request itself is in Atlanta. There is no need to deliver something to the IT lab if it is already there.
Condition scripts to run tasks

Administrators can use a condition script in addition to or instead of any condition to determine whether a task runs.

⚠️ **Note:** If you are using both a condition (via the condition field) and a condition script, both must be true before the task runs.

To use a script, you must configure the Execution Plan Task form to add the "Condition script" field. If the script returns true, the task runs. If the script returns false, the task does not run.

Ensure that you add the variable used in the script to the execution plan task.

Service catalog execution plans

Service catalog enables you to associate execution plans with catalog items.
Once you have created the execution plan record, you can associate it with catalog items, create task templates, and associate any catalog item variables to tasks, if required.

You can also:

• Apply conditions to tasks
• Create approval tasks, enabling you to step back to a previous step if the approver rejects the request.

## Associate execution plan with items

After you submit the execution plan record, you select a catalog item to use the execution plan.

### About this task

This association can be done later, but doing it at this stage enables you to access relevant catalog item variables in the execution plan.

### Procedure

1. Navigate to Service Catalog > Catalog Definition > Maintain Items.
2. Select a catalog item.
3. In the Execution Plan field, select the new execution plan.
4. Click Update.

### Service Catalog checkout models

The service catalog defaults to one-step checkout model, but also allows two-step checkout. Administrators and users with the catalog_admin role can enable and configure the two-step checkout model and control how the delivery address is populated.

The service catalog defaults to a one-step checkout model. When a user clicks Proceed to checkout or Order now, items in the shopping cart are ordered and the order summary or status screen appears. The one-step checkout model runs in the following order:

- Press Checkout > Order Summary

The service catalog also supports a two-step checkout model. Under this model, when a user clicks Proceed to checkout or Order now, an order confirmation screen appears. You can edit the order, choose a delivery location, or upload an attachment before submitting the order. The two-step checkout model runs in the following order:
Press Checkout Order > Confirmation Screen > Submit Order > Order Summary.

Access check for a catalog item is performed during its checkout. This check is also applicable in scripts and APIs.

Enable the two-step checkout process

You can enable the two-step checkout to specify a recipient, delivery address, and special instructions for an order.

Procedure

1. Navigate to Service Catalog > Catalog Administration > Properties.
2. Locate the property Use the two step catalog checkout model (default false).
3. Select the Yes check box to enable the two-step process.
4. Locate the property Show the 'Back to Catalog' button on the two step checkout screen.
5. Select the Yes check box to provide a button that navigates back to the catalog from the order confirmation screen (default). Clear the check box to hide the button.

Specify requester location

Administrators can control how the delivery address is populated. By default the delivery address is defined by the client script called set location.
When the two-step checkout process is enabled, the set location script retrieves the address of the user and enters formatted details in the Deliver to field.

Create a catalog request from another flow

You can create a catalog request to join the Service Catalog flow from a different flow. For example, from an incident flow, you can create a request, and associate the request with the incident. It helps you in tracking the requests associated with an incident and vice versa.

Before you begin

Role required: itil

- To associate a request with any parent table record, the corresponding mapping configuration should be available in the Catalog Administration > Request Parent Mapping submodule.
- To associate a record producer request with the parent table record, retrieve the sysparm_parent_sys_id and sysparm_parent_table parameters from the URL using the RP.getParameterValue() method in the Script field of the record producer.

Note: If you set the Use the sc_layout driven cart macros (default true) (glide.sc.use_cart_layouts) property to false and create a request from a parent table record, the request is not associated with the parent table record.
Procedure

1. Navigate to the required table and select a parent record.

2. Click the additional actions menu icon and select Create Request. The Catalogs home page is displayed with all active catalogs that you can access.

   Note: If there is only one active catalog, then that catalog page is displayed with available categories.

3. Select the required catalog and navigate through its categories and items.

4. Checkout the required catalog item, order guide, or record producer. For information on checkout models, see . For a catalog item or order guide, a request is created and displayed under the Requests tab of the parent table record. For a record producer, the corresponding task is created and displayed under the Problems tab of the parent table record, for example, an incident.

   Note:
   - The associated incident is specified in the annotation message throughout the request process.
   - Both for the one-step and two-step checkout, the caller of the incident is automatically set as the Requested For user for the request. If the two-step checkout is enabled, the fulfiller can change the Requested For.

   Note: For delegated request experience, the caller of the incident is populated in the Requested For variable. For information on delegated request experience, see Delegated request experience.

   - You cannot add items to the wish list, or save a record producer in this flow.

Configure a parent mapping for a request

You can configure a mapping that specifies the association between the parent record and the request record.

Before you begin
Role required: admin or catalog_admin
Procedure

1. Navigate to Catalog Administration > Request Parent Mapping.

   ⚠️ **Note:** The Incident request configuration that creates a mapping between the incident table and the request table is available by default.

2. Click **New** and specify the field information.

**Request Parent mapping fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the mapping configuration for a request.</td>
</tr>
<tr>
<td>Parent table</td>
<td>Table from which the request is created.</td>
</tr>
<tr>
<td>Request Parent</td>
<td>Request table field that specifies the association with the parent table.</td>
</tr>
<tr>
<td>Parent requestor</td>
<td>User reference field on the parent table that is specified as the requestor of the request.</td>
</tr>
</tbody>
</table>

   ⚠️ **Note:** For delegated request experience, the user from the parent table record is populated in the Requested For variable. For information on delegated request experience, see Delegated request experience.

3. Click **Submit**.

**State closure in the request fulfillment execution plan**

The state closure in the request fulfillment process of a catalog item depends on the status of the associated catalog tasks, request items, and the request. It is applicable only for execution flows.

**State closure dependency between a catalog task and RITM**

- If all catalog tasks are closed as **Closed Complete**, the RITM is closed as **Closed Complete**.
- If there is at least one catalog task closed as **Closed Incomplete**, the RITM is closed as **Closed Incomplete**.
- If all catalog tasks are closed as **Closed Skipped**, the RITM is closed as **Closed Skipped**.
State closure dependency between a RITM and request

- If all RITMs are closed as **Closed Complete**, the request is closed as **Closed Complete**.
- If there is at least one RITM closed as **Closed Incomplete**, the request is closed as **Closed Incomplete**.
- If all RITMs are closed as **Closed Skipped**, the request is closed as **Closed Skipped**.

Service Catalog for managers and end users

Every user with a login can view and order items from the Service Catalog from departments within your organization. These catalog items can include goods, services, and information.

Anything that can be ordered individually can be ordered as a catalog item. Anything that only exists as a part of a larger whole cannot be a catalog item. For example, a laptop can be a catalog item, but a high-resolution display for a laptop cannot.

After placing an order, its progress can be tracked by the requester. Fulfillment groups complete a predefined series of tasks in a fulfillment process that includes required approvals.

Managers can review record history and run reports to improve the service catalog process. For example, the manager can see most commonly ordered items, or those that are on backorder.

Service Catalog home page

The home page for a service catalog lists the goods and services available to order from that catalog.

Catalog items are grouped into categories, which can also contain one or more subcategories. By default, the first 10 items in a category appear under the category name on the service catalog home page.

To access the default service catalog home page, navigate to **Self-Service > Service Catalog**.
Click a category name to see a list of all subcategories and items in the category.
Searching a service catalog

If your organization has multiple service catalogs, you can search for the required catalogs using the Search field. The search results list items in active categories along with their short description.

Note: If your organization has multiple service catalogs, searches return results only from the currently viewed catalog.

To find a specific item in a catalog, use the Search field. Click the down arrow to see a list of previous searches. Catalog search is available on catalog and category pages.
Search results list items in active categories along with their short description. Use the breadcrumbs in the header bar or below the short description to quickly navigate to a different page. The **Found In** list shows the categories related to the search results in hierarchical format.

You can control the number of results shown on one page with the search results selection list.

In the catalog listing, click a link in the breadcrumbs at the top of the screen to quickly navigate back one or more levels in the hierarchy.

To remove the search term from the breadcrumbs, click the **x** next to the term.
If a search returns multiple results, obtain details about a specific catalog item by clicking **Preview**.

**Note:** The system performs the type-ahead search based on keywords only.

**Related information**

- Service Catalog for managers and end users

**Service Catalog request screens**

To place a request from a service catalog, navigate to the catalog home page and select the item to order.

When an item is ordered, the base system generates a request to track the order and displays a summary that includes the order status in the **Stage** column:

![Service Catalog Request Status](image)

Each individual catalog item in a request creates a discrete request item. For example, a request for 2 PCs, 1 chair, and 1 desk would produce four request items on a single request.

**Shopping cart screens**

The shopping cart screen displays previews of the cart immediately before an order is placed.

You can configure the layout for either the one-step or two-step catalog checkout process.

**Order status screens**

The order status screen is the final summary screen a user sees in the service catalog after placing an order successfully.
Request generation for a Service Catalog item

When a customer orders something from the catalog, a request is generated to track the order.

The user specified in the **Opened By** field of a Requested Item (sc_req_item) record has read access to it.

Each individual catalog item that is part of a request creates a discrete request item with the request.

For example, a request for 2 PCs, 1 Chair, and 1 Desk would produce:

- Request REQ0000001 -- 4 Things
  - Requested item RITM0000001 -- 2 X PC
  - Requested item RITM0000002 -- 1 X Chair
  - Requested item RITM0000003 -- 1 X Desk

After a service catalog request is submitted, a fulfiller may determine that the item is not in stock. The full filler can select the **Backordered** check box, and enter comments about when the item may be back in stock. The backorder status can be used in reports and dashboards.

If a service catalog request is canceled, all associated purchase orders and transfer orders that have not been received are canceled.

**Clone a request**

You can clone a request for up to 10 users on the notification list.
About this task
When you clone a request that contains a multi-row variable set, the information that is specified in the multi-row variable set is available in all cloned requests. All UI policies and client scripts on the multi-row variable set are also cloned.

Procedure
1. Create a Service Catalog request.
2. On the checkout page, enter the users for whom to copy the request, up to a maximum of 10, in the Copy this Request for: reference fields.
3. Click Order Now.

View catalog item audit history
You can view the audit history of changes to items you requested. For example, you can view changes to variable values to find out who made the changes. Fulfillers and administrators can view history for any requested item.

Before you begin
Role required: admin (history list or calendar), itil (calendar only)

Procedure
1. Complete one of the following actions for the history to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View history for your requested items</td>
<td>Navigate to Self-Service &gt; Requested Items and open the item you requested.</td>
</tr>
<tr>
<td>View history for any requested item</td>
<td>Navigate to Service Catalog &gt; Open Records &gt; Items and open the requested item to view.</td>
</tr>
</tbody>
</table>

2. Open the form context menu and select History > Calendar, or History > List (with permission).
   The history calendar shows you the days where the record was changed, who made the change, and when. The history list displays each change in a list view. History records of variables are prefixed with "VARIABLE::".

3. Click the day number to get a view of the changes for that day, or click the week number to get the week view.
Saving catalog items to a wish list

You can save catalog items to your wish list and visit them later to complete the ordering process.

For example, you need a laptop with specific software installed on it. Add the laptop to your wish list, then visit it when you have the complete software configuration list. Data you enter is saved when you add items to your wish list.

Users with catalog_admin or admin role can enable/disable the wish list feature and configure the wish list cart for end users. By default, the wish list is always disabled for a catalog.

To enable the wish list feature for catalog end users, select the check box for Enable Wish List in the catalog record.

The wish list feature does not function if the property glide.ui.doctype is set to false.

Catalog homepage displaying wish list feature

![Catalog homepage displaying wish list feature](image)

**Note:** When the wish list feature is disabled for a catalog, any items in its wish list are deleted. The items in the wish list are retained only if the item is associated with another wish list-enabled catalog.

Working with wish lists

To save an item to your wish list, click Add to Wish List on the catalog item page. A pop-up dialog informs you that the item is added to your wish list. Duplicate entries of an item are not added to your wish list. If you try to add an item that is already in your wish list, the latest entry of that item gets updated in the wish list.
Wish list popup dialog

Added to Wish List

Apple iPad 3

Continue Shopping  View Wish List

To access your wish list of catalog items, click View Wish List on the popup dialog. You can also click the link to wish list items on the header. The wish list cart allows you to update or delete wish list items.

To update a wish list item, go to wish list cart and click View for the item. Change the information, and then click Update to save the changes. To proceed with ordering the item, click Add to Cart. The item is removed from your wish list and added to the shopping cart for final checkout.

Debug UI customizations for a Service Catalog page

Perform the health check of a Service Catalog page. The UI Page Customization Diagnostics window displays the UI macros applicable for the Service Catalog page and their corresponding states. For issues on a Service Catalog page due to customized UI macros, you can identify the source of broken functionality.

Before you begin
Role required: admin or catalog_admin.
Watch this seven-minute video to learn more about UI customization debugging, variable action logger, variable watcher, and the Item Diagnostic report. Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report

Procedure
1. Navigate to Service Catalog > Catalog Administration > Debug UI Customization.
   The UI Page Customization Diagnostics window is enabled.
2. Navigate to a Service Catalog page that you want to debug.
3. Review the information in the UI Page Customization Diagnostics window at the bottom of the page.
   To maximize the UI Page Customization Diagnostics window, click . The following information is displayed:
• Name of the current Service Catalog page.
• State of the Service Catalog page.
• All UI macros applicable for the Service Catalog page.
• State of each UI macro. For details on possible states, click the Help icon (❓).
• Number of occurrences of each UI macro in the Service Catalog page.

### Possible states for a UI macro and a Service Catalog page

<table>
<thead>
<tr>
<th>State</th>
<th>Color indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unchanged</td>
<td>Green</td>
<td>Created by ServiceNow and one of the following scenarios is applicable:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• It has never been customized by the customer.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• It has been customized by the customer and then reverted to the latest ServiceNow upgrade.</td>
</tr>
<tr>
<td>Skipped</td>
<td>Red</td>
<td>Created by ServiceNow and then customized by the customer, and hence skipped the latest ServiceNow upgrade. The customer should resolve a skipped update after an upgrade.</td>
</tr>
<tr>
<td>Customized</td>
<td>Orange</td>
<td>Created by ServiceNow, and then customized by the customer after the latest ServiceNow upgrade. The customer can revert a customization to implement the latest ServiceNow upgrade.</td>
</tr>
<tr>
<td>New</td>
<td>Blue</td>
<td>Created by the customer. The top element of the UI macro should have the following attribute:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>data-sn-macro-sys-id=&quot;${jvar_macro_sys_id}&quot;</td>
</tr>
</tbody>
</table>

⚠️ **Note:** The top element can be a div, span, or table.
Note:

- When you click the Service Catalog page name or the UI macro name, the corresponding UI page or the macro page is displayed.
- When you point to a macro in the UI Page Customization Diagnostics window, the corresponding UI elements are displayed with a pink border.
- The state-based color indication is applicable only for UI macros that have a visible UI.

**UI Page Customization Diagnostics window**

4. To minimize the UI Page Customization Diagnostics window, click

**Service Catalog item designer**

The Service Catalog item designer enables non-administrators to create, maintain, and publish catalog items. It uses a structured design and publishing process to ensure consistency of usage.
The item designer is best suited to manage items that have basic questions, approvals, and tasks.

**Note:** To create and manage more complex items, use the Service Catalog features for creating items.

**Item designer process flow**

- Administrators or catalog administrators set up the design environment to enable a controlled item design process, and process category requests.
- Catalog managers request categories, then manage their categories.
  - A user requests a category, either requesting to become the manager of that category, or assigning another user as the category manager.
  1. An administrator or catalog administrator processes that request, creating the category with a selected category manager.
  2. The category manager optionally assigns catalog editors to a category they manage.
- Catalog managers and catalog editors use the catalog item design to perform the following activities.
  1. Create items within a category they are assigned to.
  2. Create questions, approvals, tasks, and sections, for the item.
  3. Publish items to the category after review.
- Self-service users can use the service catalog to request items in the category, like any service catalog item.

**Catalog item designer roles**

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator [admin]</td>
<td>Can set up the catalog item designer environment and process requests for categories. Can also perform other service catalog management functions.</td>
</tr>
<tr>
<td>Catalog administrator [catalog_admin]</td>
<td></td>
</tr>
<tr>
<td>Catalog Item Designer [catalog_item_designer]</td>
<td>Can view the status of category requests.</td>
</tr>
<tr>
<td>Catalog Manager [catalog_manager]</td>
<td>Can view and assign catalog editors to their categories. Can also create, modify, and publish items within their categories.</td>
</tr>
</tbody>
</table>
Catalog item designer roles (continued)

<table>
<thead>
<tr>
<th>Role title [name]</th>

</tr>
</thead>
<tbody>
<tr>
<td>Catalog Editor [catalog_editor]</td>
<td>Can create, modify, and publish items within categories they are assigned to.</td>
</tr>
</tbody>
</table>

Configuring catalog item designer options

Administrators and catalog administrators can control the options for catalog managers and editors who use the catalog item designer.

Configuration includes defining question types, approval types, and task assignment types. You can restrict these options to ensure that items are designed consistently and with few variations, or expand them to enable greater design flexibility.

You can also process category creation requests and view or modify definitions of notifications used by the catalog item designer.

Process Flow

The catalog item designer uses the records in three distinct areas for creating, publishing, and requesting items:

1. Creating: The catalog item designer uses staging records for items that are being created, with staging records for any associated questions, approvals, and tasks. For example, a staging item [sc_ic_item_staging] record can have associated staging approval [sc_ic_aprvl_defn_staging] records. These records are staging only, and are not available to order from the Service Catalog.

2. Publishing: A published item can be requested from the Service Catalog. When item editors publish an item, the following actions occur:
   - Staging items create or update the corresponding catalog items.
   - Questions are copied into variables on that catalog item.
   - Associated approvals and tasks are copied into corresponding published tables. For example, approval [sc_ic_aprvl_defn_staging] records are copied to equivalent approval definition [sc_ic_aprvl_defn] records for the item.

3. Requesting: Requested items and associated records are created when a published catalog item is ordered by a self-service user.
• A requested item is generated based on the last-published item and the last-published versions of any variables used by that item.

• Associated approvals and tasks are copied from the published records into equivalent requested item tables. For example, Approval Definition [sc_ic_aprvl_defn] records are copied to equivalent Approval Definition (Requested Item) [sc_ic_req_item_aprvl_defn] records.

Define question types
Question types define the options available to catalog editors or catalog managers when they create questions for a catalog item.

About this task
To meet requirements for your design environment, you can modify question types by expanding or restricting the list of types available. For example, you can deactivate date-based question types.

Note: This list of available question types is also used when you create a new service in service creator. For example, if you deactivate Multi-Line Text, it is deactivated for both the catalog item designer and the service creator.

Procedure
1. Navigate to Item Designer > Administration > Question Types.
2. Click New or open an existing question type.
3. Fill in the fields, as appropriate.

**Question Type form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The question type name.</td>
</tr>
</tbody>
</table>
| Question class   | The base variable type to use as the class for this question type. The most common variable types are available, but some complex types, such as macros, are available only when you use the Catalog Item form. The following classes are available:
  * Checkbox
  * Date
  * Date/Time
  * Label
  * Multi-Line Text
  * Multiple Choice
  * Numeric Scale |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Reference</td>
<td>![Note:](https:// Raw Text) Reference fields are only available as preconfigured questions. If you set the question class to Reference, the <strong>Preconfigured Question</strong> check box is automatically selected and made read-only.</td>
</tr>
<tr>
<td>• Select Box</td>
<td></td>
</tr>
<tr>
<td>• Single-Line Text</td>
<td></td>
</tr>
<tr>
<td>• Yes / No</td>
<td></td>
</tr>
<tr>
<td>Order</td>
<td>The sequence in which the question type appears.</td>
</tr>
<tr>
<td>Active</td>
<td>A check box to indicate whether the question type is active or not. Clear this check box to deactivate a question type, so that it cannot be used when creating a question or a new service.</td>
</tr>
<tr>
<td></td>
<td>![Note:](https:// Raw Text) Deactivating a question type that is in use does not affect catalog items that are already using that question type.</td>
</tr>
<tr>
<td>Preconfigured question</td>
<td>A check box to indicate whether users can select this question as a preconfigured type when defining a question. This field is checked by default, and only one active non-preconfigured question type is available per question class. Some preconfigured question types are provided by default, such as a list of users. If <strong>Preconfigured Question</strong> is selected, the <strong>Read only</strong>, <strong>Question</strong>, <strong>Help text</strong>, and <strong>Default value</strong> fields also appear. Depending on the question class, additional fields can also appear to define variable attributes for that class. For example, if you select a preconfigured question type based on the <strong>Multiple Choice</strong> question class, the <strong>Question Type Choices</strong> field appears, allowing you to select the choices available for that question type.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the question type.</td>

<td>Help text to appear with the question. Appears if Preconfigured Question is selected.</td>
</tr>
<tr>
<td>Default value</td>
<td>The default value for the question. Appears if Preconfigured Question is selected.</td>
</tr>
</tbody>
</table>

4. Click **Submit** or **Update**.

**Manage approval types**

Approval types are available to catalog editors or catalog managers when they define approvals for an item. Add and change approval types, publish them, and expire them when they are no longer useful.

**About this task**

For example, you can define **Facilities Items Approvers**, a specific list of approvers for facilities items.

**Procedure**

1. Navigate to **Item Designer > Administration > Approval Type Definitions**.
2. Click **New**.

3. Fill in the fields, as appropriate.
### Approval Type form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name for the approval type.</td>
</tr>
<tr>
<td>Version</td>
<td>[Read-Only] The version of the approval type. The version number gets incremented whenever you save a change to that type.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-Only] The approval type state. It is initially set to <strong>Draft</strong>. When you publish the approval type, the state changes to <strong>Published</strong>.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the approval type.</td>
</tr>
<tr>
<td>Type</td>
<td>The method for approving items that use the approval type. Can be <strong>User</strong>, <strong>Group</strong>, or <strong>Script</strong>. This selection determines which other fields are available.</td>
</tr>
<tr>
<td>User(s)</td>
<td>The individual users who can approve catalog items that use this approval type. This field is available only if the <strong>Type</strong> is set to <strong>User</strong>.</td>
</tr>
<tr>
<td>Group(s)</td>
<td>The groups who can approve catalog items that use this approval type. This field is available only if the <strong>Type</strong> is set to <strong>Group</strong>.</td>
</tr>
<tr>
<td>Script output</td>
<td>The result of the script, creating either a set of users or groups. This field is available only if the <strong>Type</strong> is set to <strong>Script</strong>.</td>
</tr>
<tr>
<td>Approver script</td>
<td>A script to define that approval type, such as a script to define the manager of the requester. This field is available only if the <strong>Type</strong> is set to <strong>Script</strong>.</td>
</tr>
</tbody>
</table>

### 4. Click **Submit**.

### Publish approval types

Publish an approval type after it is defined correctly for catalog editors or catalog managers to use when they create items.

- To publish an approval type, navigate to **Item Designer > Administration > Approval Type Definitions**, open an entry, and then click **Publish**.
- To view a list of published approval types, navigate to **Item Designer > Administration > Published Approval Type Definitions**.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Change approval types

Service Catalog enables you to change the details of an approval type.

• To change details for an approval type, navigate to **Item Designer > Administration > Approval Type Definitions**, open an entry, then edit the details and save your changes.

  ➤ **Note:** After you save your changes, the version number for that approval type increases by 1.

• To make your changes live, publish the changed approval type.

Expire approval types

To remove an approval type from use, you can expire it, making it inactive.

To expire an approval type, navigate to **Item Designer > Administration > Approval Type Definitions**, open an entry, and then click **Expire**.

Manage task assignment types

Task assignment types define the assignment options available to catalog editors and catalog managers when they define tasks for an item. You can add, change, publish, and expire task assignment types.

**About this task**

When a user then requests that item, these assignment options determine which users are assigned to complete these tasks. For example, you can use information the user enters when requesting an item to dynamically assign a task to the on-call IT support contact of the requester.

**Procedure**

1. Navigate to **Item Designer > Administration > Task Assignment Definitions**.
2. Click **New**.
3. Fill in the fields as appropriate.

### Task Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description</td>
<td>A brief summary of the task assignment type.</td>
</tr>
<tr>
<td>Description</td>
<td>A longer description of the task assignment type.</td>
</tr>
<tr>
<td>Active</td>
<td>[Read Only] A check box that indicates whether the task assignment type is active or not. To deactivate a task assignment type, expire it.</td>
</tr>
<tr>
<td>Assignment type</td>
<td>The type of assignment. Set to <strong>Direct assignment</strong> to define users or groups explicitly, or <strong>Scripted assignment</strong> to calculate assignments dynamically using a script.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the task definition. Set to <strong>Draft</strong> if the record is being created or modified, or <strong>Published</strong> if the task assignment type is published.</td>
</tr>
<tr>
<td>Group</td>
<td>The group to assign to tasks that use this assignment type. This field is available only if the <strong>Assignment type</strong> is set to <strong>Direct assignment</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User</td>
<td>The specific user to assign to tasks that use this assignment type. This field is available only if the Assignment type is set to Direct assignment.</td>
</tr>
<tr>
<td>Assignment script</td>
<td>A script to determine who performs tasks that use this assignment type. This field is available only if the Assignment type is set to Scripted assignment. For example, a script to identify the on-call support team for the requestor as the group to assign.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Publish task assignment types**

You can publish task assignment types after defining them.

- To change details for a task assignment type, navigate to Item Designer > Administration > Task Assignment Definitions, open an entry, then edit the details and save your changes.

  ⚠️ **Note:** After you save your changes, the version number for that task assignment type increases by 1.

- To make your changes live, publish the changed task assignment type.

**Change task assignment types**

Service Catalog enables you to change the details of a task assignment type.

- To change details for a task assignment type, navigate to Item Designer > Administration > Task Assignment Definitions, open an entry, then edit the details and save your changes.

  ⚠️ **Note:** After you save your changes, the version number for that task assignment type increases by 1.

- To make your changes live, publish the changed task assignment type.

**Expire task assignment types**

To remove an assignment type from use, you can expire it, making it inactive.
To expire an assignment type, navigate to Item Designer > Administration > Task Assignment Definitions, open an entry, and then click Expire.

Review category requests from self-service users

The Item Designer Category Request catalog item can be enabled to allow self-service users to request service catalog categories. If the category request is approved, the Item Designer application becomes available for the user to create and manage catalog items in the category.

Before you begin
Role required: catalog_admin or admin

About this task
A catalog administrator reviews category requests and takes an action to create the category or reject the request. For example, a category request is rejected if it duplicates an existing category.

Procedure
1. Navigate to Item Designer > Administration > All Category Requests.
2. Open a category request.

3. Perform one of the following actions:
Option | Description
--- | ---
To approve the request | Click **Create Category**. The category is created, the nominated category manager receives an email notification, and is granted the catalog manager role for that category. The category manager can then manage the new category and create catalog items in it.

To reject the request | Click **Reject**. Category request rejections cannot be reversed. To create a new category, the original requester must submit a new request.

Using the catalog item designer

Users with the catalog_manager role use the catalog item designer to manage their categories, assign editors to those categories, and create, modify, and publish catalog items.

For example, a facilities team leader can manage a **Facilities** category. Facilities team members with the catalog_editor role can create, edit, and publish items within the **Facilities** category.

> **Note:** You can only manage standard catalog items using the catalog item designer, not more complex items such as order guides. In addition, UI policies and client scripts are not supported by the item designer. To implement these more advanced functions, use the service catalog features for creating items.

To view and manage catalog items created with the item designer, navigate to **Item Designer > Administration > All Items**.

For an overview of the catalog item designer process flow, see **Service Catalog item designer**.

Request a category

Self-service users can request a new category within a service catalog.
About this task
For example, a facilities team leader who manages office furniture could request the **Office Furniture Requests** category within the **Facilities** catalog.

To request a category:

**Procedure**
1. Navigate to **Self-Service > Service Catalog**.
2. Select the **Can We Help You? > Item Designer Category Request** item.
3. Fill in the request form.

![Request a category that you can use to create your own catalog items](image)

4. Click **Submit**.
   The catalog request record state is set to **Requested**, and you are granted the catalog item designer role so you can view the status of the request. Log out and back in to access the Item Designer application in the navigator.

5. Navigate to **Item Designer > My Item Categories** to view the status of the request.
Results
After the category is approved, new modules under Item Designer are provided to create and manage catalog items in the category.

Manage a category
After an administrator approves a category request, the category is immediately created with the selected category manager. The category manager can create and manage items in the category.

About this task
New categories do not appear in the catalog until items are added to them. Category managers can also create and manage items in their categories, and publish items to make them available to users.

Procedure
1. Navigate to Item Designer > My Item Categories to view and edit categories you manage.
2. Click the category number to open that category.
3. Complete any of the following actions.

Item designer category form

3. Complete any of the following actions.
<table>
<thead>
<tr>
<th>Action</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign editors to a category</td>
<td>Select users in the Editors field of the category form, and then click Update.</td>
</tr>
<tr>
<td>Deactivate a category</td>
<td>Click Deactivate. The category no longer appears in the service catalog.</td>
</tr>
<tr>
<td>Reactivate a category</td>
<td>In the category form, click Activate.</td>
</tr>
</tbody>
</table>

Create an item
Category managers and catalog editors can create items using the item designer.

Procedure
1. Navigate to Item Designer > Create New.

2. Fill in the fields as appropriate.
Item designer view

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the item.</td>
</tr>
<tr>
<td>State</td>
<td>[Read-Only] The state of the item. Initially the state is set to Draft. When you publish the item, the state changes to Published.</td>
</tr>
</tbody>
</table>

Details tab or section

<table>
<thead>
<tr>
<th>Availability</th>

<tr>
<td>Desktop image</td>
<td>An image of the item. This field is available only if Availability is set to either Desktop Only or Desktop and Mobile.</td>
</tr>
<tr>
<td>Mobile image</td>
<td>An image of the item for the smartphone interface. This field is available only if Availability is set to either Mobile Only or Desktop and Mobile.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the item. This description appears in the catalog when a user selects the item or clicks the associated More Information link.</td>
</tr>
</tbody>
</table>

Costs tab or section

| One off cost               | The price for the item and the currency for that price.                                               |

3. Click **Next** to save the record.

4. Under **Related Links**, click the appropriate link to add questions, approvals, sections, or tasks for the item.

**Define an item question**

Item questions appear in the catalog when a user requests the item.
About this task

The user answers the questions to provide the information to fulfill the request. For example, a request for a new laptop can have a multiple choice question to specify the screen size. The requester can select one from a set of options.

You can organize questions into sections, to provide a logical flow for a multi-question item. If you plan to use sections, consider creating the sections so that you can select the appropriate section when defining the questions.

To add a question:

Procedure

1. On the Item form, click the Add a Question related link.

2. Fill in the fields, as appropriate.
## Add question

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Type** | The type for the question, defining the format you would like to receive the information in. By default, the options are:  
- Checkbox  
- Date  
- Date/Time  
- Label  
- Multi Line Text  
- Multiple Choice  
- Numeric Scale  
- Reference  
- Select Box  
- Single Line Text  
- Yes/No  
Each type allows you to create your own option, using the **Option** field.  
Administrators and catalog administrators determine the question types available. |
| **Option** | The standard questions available within the selected question type, as set by the value of the **Type** field.  
By default, all question types contain **Create your own <type>** as an option, allowing you to define your own question of that type. These types can contain additional fields, allowing you to further define the question options. For example, **Create your own Numeric Scale** allows you to define **Scale Min** and **Scale Max** values.  
Some types also have additional preconfigured options available. By default, the following extra options are available:  
- **Comments**: allow the user to enter a short message. Available if the Type is **Multi Line Text**.  
- **Contact preference**: ask the user to select a preferred contact method: email, telephone, or SMS. Available if the Type is **Multiple Choice**. |
Field | Description
--- | ---
| • Configuration item: allow the user to select a single configuration item from those items defined in the system. Available if the Type field is Reference.
• Active user: allow the user to choose from a list of active user records. Available if the Type is Reference.
| Administrators and catalog administrators define the options available for each question type.
| Mandatory | A check box to indicate whether users are required to provide an answer before they can submit the request. Only available for some question types.
| Read only | A check box for indicating whether the question is read only. Only available for some question types.
| Section | The section this question appears in. Sections allow you to group questions logically. Choose from the sections that have already been defined for the item.
| Column | The column this question appears in within the selected section. Fields appear in the left column by default, but can be moved to a right column.
| Question | The text of the question.
| Order | The numeric sequence for the question. Questions appear in the selected column in the order defined here.
| Default value | The default answer for the question, if any. Only available for some question types.
| Note: If you use a choice list, ensure that the default value matches a choice list value.
| Help text | Text that helps the user decide how to answer this question. Help text appears under the More information link below the question.
| Question Choices | The choices a user can choose for answering the question. Double-click the row to add an entry to the list. This field appears only for question types which have choices, such as Multiple Choice.

3. Click Submit.
The new question is added to the **Questions** related list.

4. To edit a question, open it from the related list.

**Define an item approval**

An approval for an item identifies a user or group that must approve each request for this item.

**About this task**

An approval for an item identifies a user or group that must approve each request for this item. All listed approvers must approve this request for it to be fulfilled. A rejection halts the process immediately. For example, you could define approvers for a facilities item to be the facility management team.

Users can view their open approvals by navigating to **Self-Service > My Approvals**, or by opening the requested item and viewing the approval in the **Group approvals** related list.

To add an approval to an item:

**Procedure**

1. On the Item form, click the **Add an Approval** related link.

2. Fill in the fields, as appropriate (see table).

3. Click **Submit**.

The new approval is added to the **Approvals** related list.
4. To edit an approval, open it from the related list.

**Define an item approval**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>A check box for indicating whether this approval is active.</td>
</tr>
<tr>
<td>Order</td>
<td>The sequence in which the approvals are requested. Approvals are only created when any approvals with lower-order numbers are completed. For example, if Approval 1 has order 100 and Approval 2 has order 150, Approval 2 is only created when Approval 1 is completed. If multiple approvals have the same order number, they are requested at the same time.</td>
</tr>
<tr>
<td>Type</td>
<td>The approval type. Set to <strong>User</strong> for a specific user, <strong>Group</strong> for a specific group, or <strong>Predefined Approval</strong> to select approvers from a predefined list.</td>
</tr>
<tr>
<td>User</td>
<td>A specific user to be the approver. Appears if the approval type is set to <strong>User</strong>.</td>
</tr>
<tr>
<td>Group</td>
<td>A specific group to be the approver. Appears if the approval type is set to <strong>Group</strong>. The first group member who responds to the approval request responds for the entire group.</td>
</tr>
<tr>
<td>Predefined</td>
<td>A check box allowing you to select an approval type created by the administrator or catalog administrator. Appears if the approval type is set to <strong>Predefined</strong>. For example, if you select the default predefined approval of <strong>Requester's Manager</strong>, the approval is sent to the manager of the person who requests the item.</td>
</tr>
</tbody>
</table>

**Define an item task**

Item tasks describe the work required to fulfill a request for an item.

**About this task**

Item tasks are generated as standard catalog tasks when an item is ordered, like the tasks generated by workflows. Tasks are assigned to users or groups as part of the fulfillment process when that item is ordered. For example, an item to request a laptop can have a task to deliver the laptop to the user.
Users can view their open tasks by navigating to Service Catalog > Open Records > Tasks, or can open the requested item and view the task in the Catalog Tasks related list.

To add a task to an item:

Procedure
1. On the Item form, click the Add a Task related link.

2. Fill in the fields, as appropriate (see table).

3. Click Submit.
   
   The new task is added to the Tasks related list.

4. To edit a task, open it from the related list.
Add task

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short</td>
<td>Description A brief description of the task.</td>
</tr>
<tr>
<td>Description</td>
<td>A more detailed description that provides details and instructions for the people performing the task.</td>
</tr>
<tr>
<td>Assignment</td>
<td>The assignment type. Select <strong>User specified</strong> to select your own assignment options, or <strong>Predefined</strong> to select from predefined task assignment definitions set by an administrator.</td>
</tr>
<tr>
<td>Group</td>
<td>The group to perform the task. Appears if the assignment is set to <strong>User specified</strong>.</td>
</tr>
<tr>
<td>User</td>
<td>The user to perform the task. Appears if the assignment is set to <strong>User specified</strong>. If you select a group first, only users from that group are available in the <strong>User</strong> selection list.</td>
</tr>
<tr>
<td>Assign to</td>
<td>A predefined assignment option. Appears if <strong>Assignment</strong> is set to <strong>Predefined</strong>. Select from the task assignment types created by the administrator or catalog administrator. Assignment types commonly base the task assignment on information provided with the request. For example, if you select <strong>Local database team for the requestor</strong>, the system assigns the task to someone from the designated team.</td>
</tr>
<tr>
<td>Order</td>
<td>The sequence in which tasks are created. Tasks are only created when any tasks with lower-order numbers are completed. For example, if Task 1 has order 100 and Task 2 has order 150, Task 2 is only created when Task 1 is completed. If multiple tasks have the same order number, they are created at the same time, so the tasks can be performed at the same time.</td>
</tr>
</tbody>
</table>

**Define an item section**

You can add sections to organize questions into logical groups, each with its own heading, which can streamline the request process.
About this task
For example, an item to request a new laptop can have sections for the hardware specifications and software requirements. Add the sections before you add the questions to simplify the layout process.

Procedure
1. On the Item form, click the Add a Section related link.

2. Fill in the fields as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The section title that describes the type of questions in the section. For example, you can define sections such as User Details.</td>
</tr>
<tr>
<td>Position</td>
<td>A number indicating the vertical position of the section. Position 1 shows at the top, position 2 is below Position 1, and so on.</td>
</tr>
</tbody>
</table>

3. Click Submit.
The new section is added to the Sections related list.

4. To edit a section, open it from the related list. By default, a single two-column section is created for each item.

Publish an item
When you publish an item, it is available in the catalog for ordering.

About this task
When you create an item, it is in a Draft state. You can review the item, make changes, and refine the layout as many times as necessary to get the details exactly right.
When the item is ready, a category manager or catalog editor can publish it, making it available as a catalog item in the service catalog.

**Procedure**

1. Navigate to **Item Designer > Administration > All Items**.
2. Open the item record.
3. Click **Publish**.
   The item is now a live catalog item, available for ordering.
4. To view a list of published catalog items, navigate to **Item Designer > Published Items**.
   It is best not to edit an item record from the Published Items module. Doing so directly accesses that catalog item using standard service catalog functions, not the catalog item designer, losing the benefits of the controlled publishing environment.

   For example, if you copy an item, the copied catalog item is not listed in the Published Items module. To access this copy, navigate to **Service Catalog > Catalog Definition > Maintain Items** and locate the item named **Copy of [item name]**. The copied item is an active catalog item. Consider deactivating it by clearing the **Active** check box until your changes are complete.

**Republish an item**

Each time you make changes to an item, you must republish it in order for the changes to reflect in the item catalog.

**About this task**

When you edit an item, the item state returns to **Draft**. The live catalog item remains available to order, but does not have the changes you made. This process enables you to make changes to the item in a staging area, then apply those changes to the live catalog item after review.

**Procedure**

1. Navigate to **Item Designer > Administration > All Items**.
2. Open and edit the item record.
3. Click **Publish**.

**Unpublish an item**

When you unpublish an item, it is removed from the service catalog.
Procedure

1. Navigate to Item Designer > Administration > All Items.
2. Open the item record and select Unpublish.
   The item is then inactive within the service catalog, but remains available for editing and republishing. This state is useful if you do not want customers to order the catalog item while you are making changes to them.

**Expire an item**

When you expire an item, it is removed from both the service catalog and the item designer.

Procedure

1. Navigate to Item Designer > Administration > All Items.
2. Open the item record.
3. Click Expire.
   The item is removed from the list of active items, and cannot be edited or republished.

**Item version**

The system can create a new version of the item and deactivate the previous version to ensure that items currently being requested are not affected by these changes.

If you alter a question associated with an item, then you can republish the item. For example, if you change the default value of a question associated to an item, a new version of that item is automatically created when the changed item is published.

As a result, you can see multiple records with the same item name in the Catalog Item Table [sc_cat_item] when viewing all items. The published version of the item is the only active one.

**Installed with catalog item designer**

The catalog item designer adds or modifies tables, user roles, script includes, and other components.

Demo data is available with the catalog item designer.
Tables installed with catalog item designer

Tables are added with activation of the catalog item designer.

</table>

**Table relationships installed with catalog item designer**

Some equivalent information is stored as records in different tables in creating, publishing, or requesting areas to provide a controlled environment for item design.

For example, catalog items are stored as Item [sc_ic_item_staging] records in the creating area, as Catalog Item [sc_cat_item] records in the publishing area, and as Requested item [sc_req_item] records in the requesting area.

This table illustrates the relationships for these records.

<table>
<thead>
<tr>
<th>Creating</th>

### Service Catalog configuration for Universal Request

You can configure a catalog item or record producer to create a universal request when a request is submitted. The associated requested item (for catalog item) or task-based record (for record producer) becomes the primary ticket for that universal request.

**Related information**

- Create or edit a catalog item
- Create a record producer
- Configure a catalog item or record producer to create a universal request

**Configure all catalog items or record producers to create a universal request**

Reduce the implementation time by configuring all catalog items or all record producers at a time for universal request creation.

**Before you begin**

Role required: admin

**About this task**

For catalog items, RiTM should be registered as a service in Universal Request.

For record producers, the target table should be registered as a service in Universal Request.

For information about service configurations, see [Service Configuration form](#).

**Procedure**

1. Navigate to sys_properties.list.
2. Click **New**.
3. To configure all catalog items to create a universal request:
a. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique identifier of the property. Specify <code>sn_uni_req.enable_ur_all_cat_items</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the property. Specify <code>boolean</code>.</td>
</tr>
<tr>
<td>Value</td>
<td>Option to specify if all catalog items can be configured at a time to create a universal request. Possible values are <code>true</code> or <code>false</code>.</td>
</tr>
</tbody>
</table>

b. Click Submit.

4. To configure all record producers to create a universal request:

a. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique identifier of the property. Specify <code>sn_uni_req.enable_ur_all_rec_prod_items</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the property. Specify <code>boolean</code>.</td>
</tr>
<tr>
<td>Value</td>
<td>Option to specify if all record producers can be configured at a time to create a universal request. Possible values are <code>true</code> or <code>false</code>.</td>
</tr>
</tbody>
</table>

b. Click Submit.

Installed with Service Catalog Management

Several types of components are installed with the Service Catalog Management.

Activating the Service Level Management plugin adds or modifies several tables, user roles, and other components.

Script includes installed with Service Catalog Management

Script includes are added with activation of Service Catalog Management.
Service Catalog management adds the following script includes.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DemoSCCreateItem</td>
<td>Demonstrates the use of service catalog scoped API.</td>
</tr>
</tbody>
</table>

Sample ATF tests for Service Catalog in Service Portal

Validate the continued functionality of Service Catalog after any configuration change such as an upgrade or after developing an application. All test suites and tests should pass on a default implementation. To validate a custom implementation, copy the automated tests and configure them for your customizations.

Service Catalog sample tests require activating the Service Catalog - ATF Tests plugin (com.glideapp.servicecatalog.atf.test) along with the demo data. To run these tests using a suite, follow the procedure described in Run an automated test suite by selecting the Service Catalog - ATF Tests test suite. These sample tests are dependent on the demo data items.

Service Catalog Tests test suite

<table>

</tr>
</tbody>
</table>

### Domain separation and Service Catalog

Domain separation is supported in Service Catalog. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.
Support level: Standard

• Includes Basic level support.

• Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.

• The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Activation information

You should activate the Service Catalog - Domain Separation plugin (com.glideapp.servicecatalog.domain_separation) to enable domain separation for Service Catalog. For information on how you can request for the plugin activation, see Request for domain separation in Service Catalog.

This plugin should only be activated if there is a need for the following scenarios:

• Isolate items to requesters in a specific domain.

• Make items unavailable for request in any other domain irrespective of the domain hierarchy.

If Service Catalog has already been domain separated as a custom solution, activating this plugin may override the existing behavior to enforce the plugin-specific isolation.

How domain separation works in Service Catalog

Service providers supporting multiple customers in a single ServiceNow instance can ensure data privacy across domains using domain separation. Service providers can ensure that items created or published in a specific domain can only be requested by users in that domain without adding additional user criteria to the individual catalog items.

In Service Catalog, catalog items (catalog items, record producers, content items, and order guides) are domain-separated as data. Catalogs, categories, and variables are not domain-separated, and belong to the global domain. Also, items that need to be shared across multiple domains must be published in the global domain and restricted by user criteria.
Domain separation in Service Catalog is applicable to all requester views in the Now Platform, Service Portal, Agent Workspace, mobile application, as well as to all API calls requesting for items.

**Domain-separated tables**

The **Domain** (sys_domain) and **Domain Path** (sys_domain_path) columns are added to the following tables that are domain-separated:

- sc_cat_item
- sc_item_option
- sc_multi_row_question_answer
- question_answer

**Effective domain for a user**

For users with visibility to a single domain, the effective domain is the user’s domain. For users with visibility to multiple domains, the effective domain is the domain selected in the domain picker.

**Visibility of catalog items - Item creation and maintenance**

A catalog item can be created or published in any domain in the hierarchy. For information on creating a catalog item, see [Create or edit a catalog item](#). The item is created in the effective domain of the user. For information on enabling the domain picker, see [Enable domain selection menus in UI16](#). Once the item is created in a specific domain, all future edits to the item are done in that domain itself.

If a catalog item is published using Item Designer, the domain of the item is the domain selected in the domain picker while publishing the item. Once the item is published, it can only be modified and re-published in the domain it was originally published in.

Catalog items are domain separated as data. Only for maintenance and administration, the visibility of the catalog items follows the data domain hierarchy rules. For information on domain separation hierarchies, see [Domain separation hierarchies](#).

User criteria associated with a catalog item must be visible in the domain of the catalog item. If not visible, catalog item is considered to be not associated with that user criteria.

**Visibility of catalog items - Item request flow**

The catalog item created in a specific domain is available in the browse, search, and request experience only in that domain and not available in the peer domains, child domains, and parent domains irrespective of the hierarchy
and visibility of the domains. So, requesters can only request for items in their
domain as well as in the global domain.

For users with access to multiple domains (for example, IT fulfiller), the items are
available for request based on the domain selected in the domain picker. To
view or request an item of a specific domain, the user should switch to that
domain. For information on enabling the domain picker, see Enable domain
selection menus in UI16.

When a requester submits a request using an order guide which has items from
multiple domains, only the items in the effective domain and the global domain
are ordered.

The target records such as requests, requested items, or records created by
record producers are created in the effective domain.

**Request fulfilment flow and reporting for a domain-separated
catalog item**

The target records such as requests, requested items, or records created by
record producers can be accessed by a fulfiller who has visibility to the domain
that the record has been generated in. For information on visibility in domain
hierarchies, see Visibility domains and Contains domains. Even when the fulfiller
modifies the requested item from a domain other than the requested item’s
domain, the modifications are recorded in the target record’s domain. Since the
target records are separated as data, the reports retrieve data based on the
effective domain of the user requesting the report.

**Request flow by a fulfiller from a different domain**

When a fulfiller creates a request from a parent record such as an incident
in Agent Workspace or in Now Platform, the fulfiller can only request for an
item from the parent record’s domain or from the global domain. Also, the
corresponding target records are created in the parent record’s domain.

⚠️ **Note:** Items from multiple domains cannot be added to the cart.

**Catalog client scripts and catalog UI policies**

Since the catalog client scripts and catalog UI policies are domain-separated
as processes, scripts and policies in the parent domain can be overridden in the
child domains. However, these scripts and policies are applicable based on the
domain of the catalog item or the domain of the target record.

For example, consider that A is the parent domain and B is its child domain. A
catalog item in domain B is associated with a catalog client script defined in
domain A. If this catalog client script is overridden in the child domain B, the
overridden script in domain B is applicable while fulfilling the requested item in
domain B. Even when a fulfiller from the parent domain A fulfills the requested item in the child domain B, the overridden script in domain B is applicable.

⚠️ Note: It is recommended to not override catalog client scripts and catalog UI policies.

**Catalog builder**
An item can only be edited in the domain that it has been created. Catalog UI policies and actions added in catalog builder are created in the same domain as that of the item.

**Related information**
- Domain separation for service providers

**Request for domain separation in Service Catalog**
Enable domain separation in Service Catalog by requesting for the activation of the Service Catalog - Domain Separation plugin (com.glideapp.servicecatalog.domain_separation).

**Before you begin**
Role required: admin

**About this task**
There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by clicking **Service Catalog > Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

**Procedure**
1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>
### Field Description

Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

### Service Catalog parameters

You can use the Service Catalog parameters to identify the parent mapping configuration for a request, and join the service catalog flow from any other flow. For example, from an incident flow, you can create a request, and associate the request with the incident.

These parameters are passed in the application URL.

<table>
<thead>
<tr>
<th>Service Catalog parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_parent_sys_id</td>
<td>sys_id of the source record that is passed to the target record generated. Format is <code>sysparm_parent_sys_id=&lt;sys_id of the parent&gt;</code>. For example, <code>sysparm_parent_sys_id=85071a1347c12200e0ef563dbb9a71c1</code>.</td>
</tr>
<tr>
<td>sysparm_parent_table</td>
<td>Name of the parent table from which the catalog request is created. Format is <code>sysparm_parent_table=&lt;name of the parent table&gt;</code>. For example, <code>sysparm_parent_table=incident</code>.</td>
</tr>
<tr>
<td>sysparm_view</td>
<td>Type of the catalog view. Format is <code>sysparm_view=&lt;name of the catalog view&gt;</code>. For example, <code>sysparm_view=catalog_default</code>.</td>

### Order Guides

**General**

- **List of class names for catalog items that cannot be included in an order guide.** (glide.sc.item.order_guide_exclusion)
  - Comma-separated list of class names for catalog items that cannot be included in an order guide. For example, sc_cat_item_guide and sc_cat_item_content.

- **Validate mandatory fields when switching tabs in 'Choose Options' section of Order Guides.** (glide.sc.guide.tab.validate)
  - Validate mandatory fields when switching tabs in the Choose Options section of order guides:
    - **Type:** true | false
    - **Default value:** true

- **Render order guide on cart preview and order status page.** (glide.sc.render_order_guide_column)
  - Render the order guide on cart preview and order status page. If an item is part of an order guide, the order guide is listed next to the item. If a user attempts to delete an item belonging to an order guide, a confirmation message appears.

- **On an order guide, reset cascading or assigned variable values on an item when a user goes back using the "describe needs" button.** (glide.sc.reset_cascade)
  - On an order guide, reset cascading variable values on an item when a user navigates back and forth between the Describe Needs and Choose Options screens.

- **On an order guide, reset all variables when cascading variables or assigned variable values are reset on an item after a user goes back using the "describe needs" button.** (glide.sc.reset_cascade_all)
  - In an order guide, reset the cascading variables and non-cascading variables when a user navigates back and forth between the described needs and choose options screens. If set to false, only the values for the cascading variables are reset.

### Scriptable Order Guides

- **During the processing of a scriptable order guide, create a failure record when the JSON payload is empty.** (glide.sc.sog.empty_payload)
  - If selected, creates a failure record when the JSON payload is empty during the processing of a scriptable order guide.
### Service Catalog properties (continued)

<table>

Service Portal

Service Portal allows you to build a mobile-friendly self-service experience for your users. It interacts with parts of the Now Platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the Now Platform.

Understanding Service Portal

Service Portal provides a modular user interface framework for quick and easy building of application portals and dashboards for the platform. It helps developers and non-technical administrators create attractive and engaging user experiences that drive employee adoption of critical enterprise applications.

How do you use Service Portal?

Service Portal is an application included in the platform UI, however it includes a visual layer for you to do most of your configuration. In the application navigator, navigate to Service Portal > Service Portal configuration to view the configuration page.

The Service Portal configuration page provides a unique, intuitive way of viewing all the pieces of your portal and how they interact with one another. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

If you prefer the platform layout for configuring Service Portal, you still have the option of creating your portal components within the platform UI. The two options are not separate. Everything you create in the Service Portal configuration page also appears in a table in the platform UI.

Watch this five-minute video for an introduction to the Service Portal user interface, guided tours of the Service Portal, using the Service Portal, chat support, and Virtual Agent. Provides an overview of service portals and their components: the portal itself, pages, widgets, and widget instances.
Also describes the differences between service portals and the Content Management System, or CMS.

**Who uses Service Portal?**
Several different kinds of users can configure a portal.

- **Limited coding:** Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.

- **ServiceNow Experts:** Users with an understanding of the ServiceNow platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.

- **Developers:** Advanced customizations and new widget creation are tasks for a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the `admin` or `sp_admin` role.

**Basic concepts**
You should have a basic understanding of all the following components that make up a portal:

- **Themes:** Themes define the look and feel of the whole portal, but can be overridden by other style configurations.

- **Pages:** Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist.

- **Widgets:** Components in Service Portal are called widgets. You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.

- **Most of the data in Service Portal is managed in different locations throughout the system.**

  For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. Take time to understand which tables contain and control the data you are working with in Service Portal.

**Additional resources**
Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:
• Twitter Bootstrap
• CSS 3 Flexbox
• AngularJS

Service Portal core concepts

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. The portal is a group of pages linked by page IDs.

After you enter a URL, the framework uses the suffix and picks the appropriate portal to determine the theme and configurations. Then it loads the configured default portal homepage unless the URL has a specified ID.

Each widget added to a page becomes its own instance. A widget instance is basically the application of a widget in a page. Because widgets are reusable and can appear on different pages to do different things, the manifestation of a widget on a page is referred to as a Widget Instance. The page loads with content represented by widgets.

Widget instances get their logic from the base widget template, client scripts, server scripts, and depending on the widget, CSS.

Activate Service Portal

If Service Portal is not active on your instance, you can activate it from the plugin module. You must have the administrator role to activate a plugin.
Locate the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin in the list of plugins. Activate the plugin and select the option to include demo data. For more information on activating a plugin, see the topic.

Activating Service Portal automatically activates the following plugins:
- Service Portal - Knowledge Base [com.glide.service-portal.knowledge-base]
- Service Portal - Service Catalog [com.glide.service-portal.service-catalog]
- Service Portal - Service Status [com.glide.service-portal.service-status]
- Service Portal Configuration Pages [com.glide.service-portal.config]
- Service Portal Designer [com.glide.service-portal.designer]
- Service Portal Surveys [com.glide.service-portal.survey]

**Content Management and Service Portal**

Service Portal is a compelling alternative to the Content Management System (CMS) with a refined user experience. It does not duplicate CMS or platform UI functionality. Users who have sophisticated experiences delivered through CMS may need to invest time into transitioning to Service Portal, especially if the CMS implementation includes complex and customized Service Catalog forms.

**Service Portal compatibility with existing CMS sites**

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

**Differences between Service Portal and CMS**

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

**Underlying technology**

CMS uses Jelly, which is not a widely used technology. Service Portal instead uses AngularJS, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.

**Visual layer**

CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Alternatively, Service Portal is a self-contained application that accesses data...
from other tables on the platform. This enables fine-tuned control over style and responsive design.

**Mobile first**

Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:

- Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see Service Portal and client scripts.
- Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: .

To understand how core CMS components are configured in Service Portal, refer to the following table.

### CMS and Service Portal components

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content site</td>
<td>Portal</td>
</tr>
<tr>
<td>Content page</td>
<td>Page</td>
</tr>
<tr>
<td>Content types</td>
<td>Content types link a table to a content page. In Service Portal, content types are no longer required. Record data is queried and displayed using base system widgets. You can add widgets to any number of Service Portal pages. Learn more: <a href="#">Service Portal widgets</a>.</td>
</tr>
<tr>
<td>Layout and dropzones</td>
<td>In Service Portal, pages are made up of containers, rows, and columns. Learn more: <a href="#">Pages</a>.</td>
</tr>
<tr>
<td>Content block</td>
<td>A content block is a reusable piece of content. In Service Portal, content blocks are replaced by widgets. Learn more: <a href="#">Service Portal widgets</a>.</td>
</tr>
</tbody>
</table>
### CMS and Service Portal components (continued)

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Catalog</td>
<td>Service Catalog pages are rendered using the SC Catalog Item widget in Service Portal. For this reason, Service Catalog forms such as catalog items and record producers are shared between your CMS implementation and Service Portal. If you have a highly customized Service Catalog, you may need to invest time in simplifying your Service Catalog items and client scripts so that they render as expected in Service Portal. Learn more: Service Catalog forms in Service Portal.</td>
</tr>
<tr>
<td>Theme</td>
<td>Theme</td>
</tr>
<tr>
<td>CSS</td>
<td>CSS</td>
</tr>
</tbody>
</table>

### CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.

However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see Service Portal and client scripts.
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: Replace a Service Catalog form script with a widget.
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.
CMS to Service Portal transition

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the support level and transition actions.

**Support level and transition actions**

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Because UI Macros use Jelly, they are not supported in Service Portal.</td>
<td>• In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can...</td>

**Service Catalog forms in Service Portal**

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

**Recommendations when creating Service Catalog forms**

Use the following recommendations as a guide to building scalable forms that can be used in both applications:

- Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.

- Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: .

**Form rendering in Service Portal**

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

- Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.
• There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.

• Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.

• Default variable size is not supported in Service Portal.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

Example layout conversions

The following examples demonstrate how Service Catalog forms display in Service Portal.

Single-column form

A Service Catalog form with:

• Two containers.
• A single-column layout.

![Service Catalog form example](image-url)
In Service Portal, the single-column layout renders as expected.

Service Portal result

Container1
Variable1
Variable2

Container2
Variable3
Variable4

Two-column layout with subcontainers

A Service Catalog form with:

- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.

In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.
Two-column layout with variable sets and subcontainers

A Service Catalog form with:

- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.
Containers within variable sets

A Service Catalog form with:

- Variable sets with single-column layouts.
- A container with a single-column layout with a container split within a single-column variable set.
- A container with a two-column layout within a single-column variable set.
In Service Portal, the container split and two-column container settings are ignored when inside a single-column variable set.
Service Portal result

Variable1

VariableSet1
  Container1
  Variable2

Variable3

Variable4

VariableSet2
  Container1
  Variable5

Variable6

Variable7

Variable8

**Nested containers**

A Service Catalog form with:

- Containers that contain variable sets.
- Variable sets that contain nested containers.

**Service Catalog form**

In Service Portal, nested container formatting is ignored and displays as a single-column.
### Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: [Service Catalog on Service Portal](#).

> **Note:** Be sure to make changes in a test environment before updating your production instance.
Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Before you begin
Role required: admin or sp_admin

Procedure
1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the Widget field.
5. In the Type field, select Macro.
6. In the Widget field, select a widget that performs the desired action.
7. Optional: Use the $scope.page.g_form() or $scope.page.field syntax in the embedded widget to access the catalog item values.

Example
This example shows how to modify the value of a single-line text variable with the name color associated with the catalog item.

Widget HTML Template

```html
<div>
  Data from catalog variable:
  <h1>{{ c.data.message }}</h1>
</div>
```

Widget client script

```javascript
function($scope) {
  var c = this;

  //Watch for changes in the color variable
  $scope.$watch(function () {
    return $scope.page.g_form.getValue('color');
  }, function (value) {
```
// Update local data object with data from variable
    c.data.message = value ? 'Content of color variable: ' + value : ''; 
});
}

You can use the following to access variable or catalog item fields:

• $scope.page.g_form(): The g_form instance on the form. You can use all supported g_form methods described in Service Portal and client scripts. For example, g_form.setValue('variable_name', 'new value');.

• $scope.page.field(): The object that represents the variable. When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

What color would you like?

Blue

Data from catalog variable:

**Content of color variable: Blue**

**Supported features in Service Portal**

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments.

**Not currently supported**

• Domain separation at Levels 1-3. However, Service Portal does include support for domain separation at the Data only level. For more information, see Application support for domain separation and Domain separation and Service Portal.

**No plans to support**

• @ Mentions
• Click-through/pop-ups
• Embedded HTML outside of HTML fields
• Embedded lists
• UI macros
• Formatters
• UI actions marked as Client
• Nested container Catalog variables
• Survey wizards
• OpenFrame

Service Portal and client scripts
You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile / Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.

The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

Checking desktop vs mobile runtime
You might want to mark a client script compatible with both desktop and mobile, but include behavior that depends on the runtime. You can use this script:

```javascript
if (window === null)
  // Write your mobile compatible code here
else
  // Write your desktop compatible code here
```

Unsupported client scripting globals
The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:

• $
• $$
• $j
• angular
• control
• document
• jQuery
• window

⚠️ **Note:** Widget client controllers are full Angular controllers and are not subject to the unsupported client script globals listed here. Use jQuery and Angular as needed.

**Embedded widgets & g_form**

When using the Service Catalog variable type **Macro** and **Macro with Label**, you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item g_form instance using:

- `$scope.page.field`
- `$scope.page.g_form()`

**Example: Client scripts used with Service Portal**

The g_list global helps you set the filter of a Glide list element or a list collector variable. Use this API in place of the g_filter API on desktop client scripts.

```javascript
function onLoad() {
    var myListCollector = g_list.get("my_list_collector");
    myListCollector.reset();
    myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");
    myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
    myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

**g_service_catalog** is only available in Service Portal service catalog item scripts. Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
    if (window) // if CMS, don't run this
        return;

    // g_service_catalog api for Service Portal and Mobile
    var isOrderGuide = g_service_catalog.isOrderGuide();
    g_form.setValue("is_order_guide", isOrderGuide ? "Yes!" : "Nope :(");
}
```
**Supported client script types and APIs**

Some client scripts are not supported in Service Portal. Others must have a UI type set to **All** or **Mobile / Service Portal**. If using a client script in the Service Portal, only client-side APIs supported in a mobile environment can be used.

### Client script support in Service Portal

<table>
<thead>
<tr>
<th>Client script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog client scripts</td>
<td>Service Portal requires that the <strong>UI Type</strong> field be set to <strong>All</strong> or <strong>Mobile / Service Portal</strong>. Client Scripts marked as <strong>Desktop</strong> rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs.</td>
</tr>
<tr>
<td>Validation scripts</td>
<td>Service Portal requires that the <strong>UI Type</strong> field be set to <strong>All</strong> or <strong>Mobile / Service Portal</strong>. **Activate Service Portal validation scripts**

Validate user input in a specific field type using a validation script. In new instances, Service Portal includes XML, Script, Script (Plain), Email, and Version validation scripts by default. If upgrading from a previous release, the Mobile and Service Portal version is not active by default. You must activate the Mobile and Service Portal version of the validation script to validate user input in the Service Portal.

**Before you begin**

Role required: admin

**About this task**

Service Portal requires that the **UI Type** field be set to **All** or **Mobile / Service Portal**. Client Scripts marked as **Desktop** rely on legacy APIs that are not
supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs. See Supported client script types and APIs.

⚠️ Note: To change the UI Type from Mobile / Service Portal to All, delete the Desktop version from your instance to avoid activating conflicting scripts. Before deleting the Desktop version, make a backup in case you need to revert any changes.

Procedure

1. Navigate to System Definition > Validation Scripts.

2. Open the Mobile / Service Portal version of the validation script you would like to use in the Service Portal.

3. Click the Active flag to activate the validation script.

4. Optional: Set the UI Type to All to use the validation script in desktop, mobile, and Service Portal environments. To avoid activating conflicting validation scripts, you must first delete the Desktop version of the script.
   a. Navigate to the desktop version of the validation script you would like to replace. Desktop versions have the UI Type field set to Desktop.
   b. Open the record.
   c. Right-click the header menu and select Export > XML (This Record) to create a backup of the record.
   d. Once the export completes, click Delete and confirm the selection.
   e. Navigate back to the validation script set to Active in earlier steps and change the UI Type to All.

Results

User input into the designated field type in the Service Portal and Mobile environments is validated for correct formatting. For example, if you activated the Email validation script for use in the Service Portal, invalid user input into an Email field generates an error and prevents the browser from submitting the form.

⚠️ Note: On a desktop browser, the field is validated when you submit the record. On a mobile browser, the field is validated when you navigate away from the field.

Portal Analyzer

Get a summary of all widgets that appear on Service Portal pages. Use this data to better understand widget customizations and page usage.
The Portal Analyzer is a scheduled job that runs on-demand. After you select to run the Portal Analyzer job, the system produces a list of each widget and the page that it appears on.

The list also includes the following information:

- Level of customization of each widget
- Number of views on each page
- Number of user visits on each page

You can export the list as a CSV, Excel, XML, JSON, or PDF file. Use the exported list to consider which pages and widgets to focus on while redesigning your portal. For example, you might consider removing a page that has less user visits or replacing a customized widget with a cloned widget.

The Portal Analyzer is active by default on your instance.

Related information

Scheduled jobs

Run the Portal Analyzer

Run a scheduled job to get a summary of all widgets that appear on pages.

Before you begin
Role required: admin or sp_admin
Procedure

1. Navigate to System Definition > Scheduled Jobs.
2. Open the Portal Analyzer record.
3. On the form header, select Execute Now.

Results

The system creates a list of all the widgets on each page in your instance. You can view this list by entering sp_portal_analyzer.list in the application navigator.

What to do next

Export the list as a CSV, Excel, XML, JSON, or PDF file to reference during a system upgrade. For more information on exporting list data, see List export.

Domain separation and Service Portal

Domain separation is unsupported in Service Portal. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation provides complete data isolation for domain-specific users.

How domain separation works in Service Portal

Elements of the Service Portal platform such as settings, portals, pages and widgets are not domain-separated. However, the data within widgets does display when based on the appropriate domain. To provide different experiences, admins should create separate service portals, each with unique URLs, that they can redirect users to.

Domain separation for service providers
Antivirus Scanning in Service Portal

View the health status of file attachments in Service Portal. Antivirus Scanning scans files in the Attachments [sys_attachments] table by default. When viewed from a Service Portal page, attachments may not be available for download depending on their health status.

⚠️ Note: Antivirus Scanning is a Now Platform feature. For more information, see Antivirus Scanning.

Scanning scenarios

Review these scanning scenarios to understand how Antivirus Scanning interacts with attachments in Service Portal.

Upload a file

1. A user uploads an infected file to a record in Service Portal.
2. The system scans the file, moves it to quarantine, and displays a message. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.
3. The system sends an email notification to the user and the antivirus administrator.
Download a file

1. A user opens a record with an attachment in Service Portal.
2. The system scans the file and moves it to quarantine. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.
3. The system sends an email notification to the user and the antivirus administrator.
View a file

1. A user opens a record with an infected attachment.
2. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.

Set up Service Portal

Set up a site for your users using Service Portal.

Requirements

Role required: admin or sp_admin

Before you begin

Take the following into consideration before configuring Service Portal:

• Who are you building your site for and why?
• What information do you want to include in your site?
• What do you want the mobile experience to be for users?
• Which platform applications do you plan to use in your portal?
You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

- How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

### What to do

#### Create a portal

A portal is the engine that houses all the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding.

  - Create a portal

#### Create a page

Pages are the centerpiece of the end user experience. Page definitions not only control the layout of the content, they craft the experience for the user. Pages also help define mobile responsiveness, which is a key component in the user experience.

Use any existing page included with Service Portal as an example for your own creation.

Use the Service Portal Designer to create pages, assign layouts, and add widgets.

  - Create and edit a page using the Service Portal Designer

#### Create a widget

Widgets are the power behind the portal. Widgets are highly customizable and can be used to provide an endless variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself. Each widget instance has its own record so you can configure it specifically for each use. For example, you can add several Icon Link widgets to a page and
configure them to link to different areas with different icons. None of the widgets are affected by the others.

You can start by cloning an existing widget and making changes to your cloned version. Developers with an advanced understanding of AngularJS can create widgets from scratch.

Create a portal homepage

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

• Assign a homepage to a portal

Configure the header menu

The header menu in a portal is comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. Configure both widgets for the header menu to appear and act like a header menu in your portal.

• Create a portal header menu
• Add a header or footer to a portal

Configure the branding for the portal

With the Branding Editor, you can configure the styles and theme of your portal in a view with real-time updates. You can see how your portal appears to users with the click of a button. More advanced users still have the option of creating CSS style sheets for the portal theme. However, they cannot take advantage of the real-time update that the Branding Editor provides. Changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

• Configure portal branding
• Create a portal theme

Next steps

• Configure search in the portal.
• Limit user access to specific components.
• Set up URL redirects.
Service Portal configuration page

Most Service Portal configuration is accessible through the Service Portal configuration page landing page.

In your instance, access the Service Portal configuration page by navigating to Service Portal > Service Portal configuration. The Service Portal configuration page opens in a new tab in your browser.

You can also access the configuration page by appending your URL with sp_config. For example, https://<instance name>.service-now.com/sp_config.

Use each option on the Service Portal config page to set up the different parts of your portal.

Service Portal properties

The Service Portal properties page provides several configuration options for Service Portal.

Administrators can access these properties by navigating to Service Portal > Properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Default 404 page (page ID or sp_page sys_id) for Service Portal glide.service_portal.default_404_page | Set the default page that your users see whenever a page cannot load properly.  
- Type: string  
- Default value: 404  
- Learn more: Assign a default error page  
The string must match the name of the page exactly. |
| Show a message to admin users in Service Portal pages if a browser error is encountered glide.sp.show_console_error | • Type: true | false  
• Default value: true |
| Maximum number of stream entries displayed in Service Portal (activity widget, conversation widget, and so on) glide.service_portal.stream_entry_limit | Limit the number of entries users can see in the ticket conversation widget. Users only see the most recent entries and cannot go further back in the history than the max allowed amount.  
- Type: integer  
- Default value: 100 |
| Duration (in seconds) info and error messages persist in the Service Portal before auto-dismissal glide.serviceportal.notification_timeout.seconds | Set the duration in seconds that error and info messages remain on the screen before they are auto-dismissed. If set to 0, messages do not auto-dismiss and require that a user close them.  
- Type: integer  
- Default value: 5  
If the glide.ui.accessibility preference is enabled, messages do not auto-dismiss, regardless of the system |
### Service Portal Properties (continued)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default sort order for announcements</strong>&lt;br&gt;<code>glide.service_portal.announcement.default.sort_order</code></td>
<td>Define the sort order for banner announcements.&lt;br&gt;• Type: choice list&lt;br&gt;• Default value: Start Date Descending&lt;br&gt;Options include:&lt;br&gt;• Start Date Ascending: The oldest start date appears first.&lt;br&gt;• Start Date Descending: The most recent start date appears first.&lt;br&gt;• End Date Ascending: The oldest end date appears first.&lt;br&gt;• End Date Descending: The most recent end date appears first.</td>
</tr>
<tr>
<td><strong>Enable debug runtime information</strong>&lt;br&gt;<code>glide.sp.debug</code></td>
<td>Controls whether the Angular.js flag <code>$compileProvider.debugInfoEnabled</code> is set to true or false. This option allows debug runtime information in the compiler, such as adding binding information and a reference to the current scope on to DOM elements. This property is disabled by default to improve performance on the instance.&lt;br&gt;• Type: true</td>
</tr>
</tbody>
</table>

If user criteria `[com.glide.service-portal.user-criteria]` is enabled, the following properties also appear in the Service Portal properties page:
User criteria properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable use of User Criteria records instead of Roles fields for Service Portal entitlements | Define permissions for Service Portal widgets, widget instances, pages, and search sources.  
  - Type: true | false  
  - Default value: true  
  - More information: User criteria for Service Portal |
| List of roles (comma-separated) that bypass User Criteria validation in Service Portal | Allow users with a specific role to see any page, widget, widget instance, or search source regardless of user criteria.  
  - Type: string  
  - Default value: admin |

Create a portal

Create a portal for users to browse company resources, discover articles, and get help.

**Before you begin**
Role required: admin or sp_admin

**Procedure**
1. Navigate to Service Portal > Portals, then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

3. Save the form.

4. In the Knowledge Bases related list, select **Edit** and then select which knowledge bases appear for the knowledge base page. For example, if you select **IT** and **Instance Security Center**, only the article categories defined for these knowledge bases appear in the **KB categories widget**.

5. In the **Catalogs** related list, click **Edit** to select one or more catalogs listed in the sc_catalog table to use in the portal.

### Configure a catalog in Service Portal

Associate a portal with multiple catalogs. By default, Service Portal is associated with Service Catalog.

**Before you begin**

Role required: admin or sp_admin

**Procedure**

1. Navigate to **Service Portal > Portals**.
2. Click the **Service Portal** record.
3. To associate a portal with a catalog, perform the following steps.
a. In the **Catalogs** related list, click **Edit**.

b. Select one or more catalogs to add to the portal. The categories and catalog items associated with the selected catalogs are displayed in Service Portal.

**Note:**

- If no catalogs are selected, all active catalogs accessible to the requester are available in Service Portal.
- Irrespective of the catalogs associated with the portal, items are searched for only in the catalogs configured in the search source in AI Search. For information on configuring AI-based catalog search experience, see *Configure AI-based catalog search experience*.

4. **Optional:** To edit the label for a catalog, perform the following steps.
   a. For the **Main menu** field, click **Open Record**.
   b. From the **Menu Items** section, Click the **Catalog** record.
   c. In the **Label** field, specify the label for the catalog. The catalog label is displayed in the main menu of Service Portal.

5. Click **Update**.

**Related information**

- **Service Catalog in Service Portal**

**Associate a portal with a knowledge base**

You can associate a portal with any knowledge base. Multiple knowledge bases can be associated with a portal.

**Before you begin**

Role required: admin or sp_admin

**Procedure**

1. Navigate to **Service Portal > Portals**.
2. In the **Knowledge Bases** related list. Click the **Edit** button.
3. Select one or more knowledge bases to add to the portal. The knowledge bases are displayed in Service Portal page listed in the **KB Home page** for the
portal. If no knowledge bases are selected, all knowledge bases are available in the portal.

4. Click **Update**.

**Related information**

Configure the Knowledge Management Service Portal

**Configure Agent Chat in Service Portal**

Your end users can initiate and maintain an Agent Chat conversation in any portal page. Write a script to pass portal-specific data to Agent Chat. For example, pass the name of your knowledge base to a Virtual Agent conversation.

**Before you begin**

Role required: admin

- Activate the Glide Virtual Agent (com.glide.cs.chatbot) or the Agent Chat (com.glide.interaction.awa) plugin. You can activate the Glide Virtual Agent plugin only if you have a subscription.

**Procedure**

2. Click **New**.

3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select to make the configuration active.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a unique name for the configuration record.</td>
</tr>
<tr>
<td>Portals</td>
<td>Select the portals in which you would like to use the specified chat configuration. If no portal is selected, the configuration applies to all portals in the system.</td>
</tr>
<tr>
<td>Application</td>
<td>Read-only application scope for the record.</td>
</tr>
<tr>
<td>Public</td>
<td>Select to make Agent Chat available to users before they log in.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the roles a user must have to use Agent Chat. If you don’t select a role, Agent Chat is available to all users regardless of their role.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number indicating the order that the configurations should run. Only one configuration applies per portal. If there are multiple configurations on a portal, the system runs the first configuration found from lowest to highest.</td>
</tr>
<tr>
<td>Server script</td>
<td>Write a script that passes page and widget data to an Agent Chat conversation when a user initiates the conversation. For example, pass a field to the chat conversation to enable Agent Chat to access the value. Data passed in this script is available to every page in the portal associated with this record. This script has access to the GlideSPScriptable API. Note: The portal suffix, page ID, and language are automatically available to Agent Chat and do not require a custom script. Sys ID and table are automatically available to Agent Chat when they are present in the URL. This example returns an object containing the list of catalogs associated with the portal to the current conversation.</td>
</tr>
</tbody>
</table>

```javascript
(function ($sp) {
    return {
        catalogs: $sp.getValue('catalogs')
    };

})(sp);  
```

When Agent Chat opens in an iframe HTML element, the list of catalogs is included in the iframe URL. Parameters from this field override any conflicting page data passed to Agent Chat.

4. Click Submit.

Results

Users can initiate and maintain an Agent Chat conversation from any page in the selected portal.
Customize the Agent Chat button

You can change the color and images that are used in the Agent Chat button in your portal.

Before you begin
If you plan to replace one or both of the images that are used in the Agent Chat button, upload the images to your instance. For more information on uploading an image, see Storing images in the database.

Role required: sp_admin or admin

About this task
You can configure the following elements of the Agent Chat button:

• The image to indicate that the chat window is open
• The image to indicate that the chat window is closed
• The button background color

These elements are determined in the portal theme. To customize the Agent Chat button, update the relevant SCSS variables in the portal theme record.

Procedure
1. Navigate to Service Portal > Themes.
2. Open a theme record.
3. In the CSS variables field, add the following variables:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$sp-agent-chat-btn-close</td>
<td>Image to indicate that the chat window is closed. Use an image URL that contains:</td>
</tr>
<tr>
<td></td>
<td>• Your instance address</td>
</tr>
<tr>
<td></td>
<td>• The name of the Image [db_image] record to reference</td>
</tr>
<tr>
<td></td>
<td>For example, to reference the tack-icon.png image in the database, enter the following:</td>
</tr>
<tr>
<td></td>
<td>$sp-agent-chat-btn-close:</td>
</tr>
<tr>
<td></td>
<td>url(&quot;https://&lt;instance-name&gt;.service-now.com/tack-icon.png&quot;);</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| $sp-agent-chat-btn-open | Image to indicate that the chat window is open. Use an image URL that contains:  
  • Your instance address  
  • The name of the Image [db_image] record to reference  
For example, to reference the book-icon.png image in the database, enter the following: |

```plaintext
$url("https://<instance-name>.service-now.com/book-icon.png");
```
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
</table>
| $sp-agent-chat-bg | Button background color. Use a Hex code to set the color. For example, to use red, enter the following:  

$sp-agent-chat-bg: #ff0000;

To use the default image, remove the variable.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To use the default background color, remove the variable.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**Migrate from the Virtual Agent Service Portal widget**

If you are upgrading from a previous release, your portal implementation may include the Virtual Agent Service Portal widget. Migrate widget options to the Agent Chat in Service Portal configuration and remove all instances of the widget to enable your users to initiate and maintain an Agent Chat conversation in any portal page.

**Procedure**

1. Record instance options and delete instances of the Virtual Agent Service Portal widget.
   a. Locate each instance of the Virtual Agent Service Portal widget and open the instance options.
   b. Record the values.
   c. Delete the widget instance.

2. If your widget instance included a color instance option, add the color variable to the portal theme record.
   a. Navigate to **Service Portal > Themes**.
   b. Open the theme record for the portal.
   c. In the **CSS variables** field, add the `$sp-agent-chat-bg` variable and set the value to the desired color.

**Example**

```
$sp-agent-chat-bg: #ff0000
```
3. If your widget instance options included URL parameters, add them to the Service Portal Agent Chat Configurations form **Server script** field.

**Note:** The portal suffix, page ID, and language are automatically available to Agent Chat and do not require a custom script. Sys ID and table are automatically available to Agent Chat when they are present in the URL.

b. In the **Server script** field, write a custom script to pass the parameters to Agent Chat.

**Example**

This example returns the value of the chat_queue field to the current conversation.

```javascript
(function ($sp) {
  return {
    chat_queue: $sp.getValue('chat_queue')
  }

})(sp);
```

**Results**

Widget instances are removed from individual portal pages. Instead, the portal applies the Service Portal Agent Chat Configurations record to every portal page.

**Pass page data to Agent Chat**

Use the `spContextManager` class in a widget client script to pass dynamic page data to Agent Chat. For example, pass the number of approvals in the Approvals widget to Agent Chat when a user initiates a conversation from the Service Portal homepage.

**Before you begin**

Role required: admin

Examine the widget to understand how data is passed to the widget client script. To make data available to Agent Chat, you must pass it to the `spContextManager` service. You can then access the data in a Virtual Agent topic using the `vaContext` object. For more information about using context variables in Virtual Agent scripts, see Virtual Agent scripts.
Procedure

1. Open the widget in the widget editor.
2. Update the widget client script.
   a. Inject the `spContextManager` service into the widget client script function.
   b. Pass variables to Agent Chat using the `spContextManager` API.
      This example passes `approval_count` to Agent Chat. When a user initiates a conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat iframe URL.

```javascript
function ($scope, spContextManager) {
  spContextManager.addContext('agent-chat', {
    'approval_count': 5
  });
}
```

Keys passed to this API are unique per page. For example, if the `agent-chat` key is already initialized by another widget on the page through the `addContext()` method, you must use the `updateContextForKey()` method to update the key’s data. For more information about the `spContextManager` class, see `spContextManager`.

3. Click Save.
4. Use Service Portal data in a Virtual Agent topic.
   a. Navigate to Virtual Agent > Designer and open the topic in which you would like to use Service Portal data.
   b. Click Edit Topic Flow.
   c. Configure the topic as needed. In a script field, use the `vaContext` object to access the context variable passed from the Service Portal.
      For more information about creating a Virtual Agent topic, see Create a Virtual Agent topic.

Example

For example, this script accesses the value of the `approval_count` variable in the Approvals widget.

```javascript
(function execute() {
  return "Your approval count is: " + vaContext.approval_count;
}
```
d. Save and publish the topic.

**Results**
Agent Chat can access the variables when an end user initiates a conversation from the Service Portal page.

---

**Remove Live Chat link from the header menu**
If your portal includes a Live Chat link in the header menu, you can remove it by updating the widget's option schema.
Before you begin
Role required: admin

About this task
Adding the **Chat Queue** field to a portal record adds the Live Chat link to the portal’s header menu. If you integrate your portal with Agent Chat, the Live Chat link is no longer needed.

Procedure
1. In the Service Portal configuration page, navigate to **Portal Tables > Instance with Menu**.
2. Open the record for your portal’s header menu. For example, open **SP Header Menu** if using the base system portal.
3. In the **Additional options, JSON format** field, add the following JSON key-value pair.

```json
"enable_live_chat": {
    "displayValue": "false",
    "value": false
}
```

The final JSON looks like this.

```json
{
    "enable_cart": {
        "displayValue": "true",
        "value": true
    },
    "enable_wishlist": {
        "displayValue": "true",
        "value": true
    },
    "enable_live_chat": {
        "displayValue": "false",
        "value": false
    }
}
```

4. Click **Update**.

Results
When you navigate to the portal, **Live Chat** does not appear in the header menu.
Service Portal styles

Pages are made up of containers, columns, rows, widgets, and widget instances. You can configure the CSS of each component, or use the CSS defined in theme and branding as global definitions for the portal. If you do not define CSS in theme or branding, Bootstrap defaults are used.

You can define CSS in your portal at multiple levels.

**Bootstrap defaults**

If no other CSS is defined, all elements use Bootstrap version 3.3.6 defaults. You can use Bootstrap CSS Helper Classes with any Service Portal field that accepts CSS as a value. To show or hide Service Portal containers, use Bootstrap CSS Responsive Utilities Helper Classes such as `visible-lg` or `hidden-md`.

**Branding editor theme colors/Portal CSS**

CSS defined in the Branding Editor Theme Colors tab. Changes made to the theme colors in the Branding Editor appear in the CSS variables field in the portal table `[sp_portal]`.

Customizing the theme colors overwrites the Bootstrap defaults.

**Theme CSS**

CSS defined in the CSS variables field in the Themes table `[sp_theme]`. Use the Theme CSS as much as possible to allow for more flexible evolution of your portal in the future.

Using a theme overwrites the Portal CSS/Branding Editor theme colors.

**Page CSS**

CSS defined in the Page Specific CSS field in the Pages table `[sp_page]`. 
Page-specific CSS overwrites the theme CSS.

**CSS classes**
You can define CSS classes elements on the page within each respective record.

**Widget CSS**
CSS defined in the CSS field in the Widgets table [sp_widget].
Widget CSS overwrites container, column, and row CSS.

**Widget instance CSS**
CSS defined in the CSS field in the Instance table [sp_instance].
Widget instance CSS overwrites all other CSS definitions.

Configure portal branding

Use Branding Editor to give your portal its own look and feel.

To access the Branding Editor, navigate to **Service Portal > Service Portal Configuration**, then click **Branding Editor**.

Select the portal you want to customize the theme for from the portal list. Then use the options on the Quick Setup and Theme Colors tabs to customize your portal.
Quick Setup tab options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Title</td>
<td>The name of your portal. Changing the name of the portal in the Branding Editor also changes the title on the portal form field in the platform UI.</td>
</tr>
<tr>
<td>Logo</td>
<td>The logo that appears in the header for your portal. This image is scaled to a maximum height of 46 px and a maximum width of 200 px.</td>
</tr>
<tr>
<td>Logo padding</td>
<td>Where you want the logo to sit in location to the edge of the header. This information is stored in the CSS variables section on the portal form.</td>
</tr>
<tr>
<td>Tag line &amp; background</td>
<td>Fields defined by the JSON schema in the <code>Quick start config</code> field on the portal record in the platform UI. The sample Service Portal adds <strong>Tag Line</strong> and <strong>Background</strong> to the Branding Editor using the following schema:</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
<tr>
<td></td>
<td>[ {</td>
</tr>
<tr>
<td></td>
<td>&quot;tagline&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_instance&quot;,</td>
</tr>
<tr>

<td>&quot;hero_background&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;table&quot;: &quot;sp_container&quot;,</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>]</td>
</tr>
<tr>
<td></td>
<td>```</td>
</tr>
</tbody>
</table>
Quick Setup tab options (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag line</td>
<td>Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.</td>
</tr>
<tr>
<td>Tag line color</td>
<td>Select a color for the tag line.</td>
</tr>
<tr>
<td>Homepage background color</td>
<td>Add a color for your background. You can type in a color name, hex color, decimal (RGB), or select from the color palate.</td>
</tr>
<tr>
<td>Background image</td>
<td>Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.</td>
</tr>
</tbody>
</table>

For any colors on the theme tab, you can use the standard color name, hex code, decimal (RGB) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

Theme colors tab

<table>
<thead>
<tr>

</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>

Changes made to the theme colors in the Branding Editor appear in the CSS variables field of the portal form in the platform UI.

Activate La Jolla theme branding

Activate the Service Portal La Jolla Brand to apply the latest ServiceNow branding, which includes WCAG-AA compliance for contrast. This plugin is
active by default on new instances, but admins must activate the plugin on instances upgraded from earlier versions.

**Before you begin**
Role required: admin

**About this task**
The **Service Portal La Jolla Brand Update** activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugins for Service Portal La Jolla Brand Update</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Plugin</strong></td>
</tr>
<tr>
<td>Service Portal La Jolla Brand</td>
</tr>
</tbody>
</table>

**Note:** If you have modified the /sp or sp_config portal pages before installing the plugin, you may not see all elements of the La Jolla branding. All branding images are located in the db_image table for manual updates to your custom portals.

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance. You can evaluate the feature on a sub-production instance without charge by requesting it from the HI Customer Service System.

**Procedure**

1. Navigate to **System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin.**
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   ! **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

**Related information**

**Create a portal theme**

If you need more customization than Branding Editor can provide, you can create your own custom theme.

Only users with an understanding of CSS should create custom themes.

1. Navigate to **Service Portal > Themes**, then click **New**.

2. Complete the form fields and select **Save**.
### Theme form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:</td>
</tr>
</tbody>
</table>

```bash
$sp-logo-margin-x: 15px !default;
$sp-tagline-color: $text-color !default;
$navbar-inverse-bg: #3a3f51 !default;
```

**Note:** Use the CSS variables field to define CSS variables only. Use CSS Includes to define CSS rules. As of the Madrid release, Sass and LESS can be used within CSS Includes. For more information on CSS Includes, see [Create a portal theme](#).

3. To add a style sheet to the theme, in the **CSS Include** related list, click **New**.
4. Complete the style sheet form fields, the click **Save**.

**Style sheet form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Style Sheet</strong>: Add an internal style sheet that has been uploaded to the CSS table [sp_css]. For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>URL</strong>: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.</td>
</tr>
<tr>
<td>Style sheet</td>
<td>Associate a style sheet or CSS file URL, depending on which option you select in the Source field.</td>
</tr>
</tbody>
</table>

5. To add a JavaScript include to the theme, in the **JS Include** related list, click **New**.
6. Complete the JS Include form fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the JS Include. Remember this name to associate the JS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• <strong>UI Script</strong>: Add an internal UI script that has been uploaded to the UI script table [sys_ui_script]. UI scripts allow you to create client-side JavaScript and reuse it in multiple locations. For more information on UI scripts, see .</td>
</tr>
<tr>
<td></td>
<td>• <strong>URL</strong>: Link to an external JavaScript file. Use external URLs to use the same JavaScript as a corporate website or other online resource.</td>
</tr>
<tr>
<td>UI Script or Java file URL</td>
<td>Associate an internal UI script or Java file URL, depending on which option you select in the Source field.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that the JS Include was last updated</td>
</tr>
<tr>
<td>Package</td>
<td>The Service Portal package that the JS include is associated with. For example, Service Portal Configuration Pages. This field is populated by default.</td>
</tr>
</tbody>
</table>
Configure a portal header menu

Service Portal is designed to allow customers to have deep control over the behavior of their portals. One of the main navigation controls for users is the header main menu. The menu options are determined by the assignment of a main menu to the portal, but the look and behavior of the menu is defined within the theme and associated header.

About this task
Configuring a portal header with a menu involves several steps.

Procedure
1. Create a header and add it to a theme.
   Until you add a theme with a header to a portal, the header menu does not display.

2. Create a main menu with menu items and assign it to the portal.
   The main menu record is where you assign which navigation options appear in the header. For example, you can add a menu item that links to another page within your portal, such as the service catalog.

Results
The main menu and header form a header menu when associated with a theme and a portal.

Add a header or footer to a portal

Use the theme to add a header or footer to your portal.

Procedure
1. Navigate to the portal theme (Service Portal > Service Portal Configuration > Portal Tables > Themes) then click the theme you want to add the header or footer to.

2. In the header or footer field, select the header or footer you want to use for your portal.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
If you are just getting started, you can reuse the base system Stock Header or Sample Footer widgets.

3. **Optional:** Select **Fixed Header** or **Fixed Footer** to lock the header or footer in one place so when users scroll up or down they remain in the same location on the page.

4. To configure the appearance of the header, in the Service Portal configuration page, open the Branding Editor. Under the **Theme Colors** tab, use the color selectors in the Navbar section to control the colors in the header.

Create a portal header menu

Create a menu with menu items to display in the header of a portal.

**Procedure**

1. In the Service Portal configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Instance with Menu and click **New**.

2. Complete the fields in the menu form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the header menu. You need to know this when you associate the menu with your portal.</td>
</tr>
<tr>
<td>Additional options, JSON format</td>
<td>Advanced configuration options. For example, use this field to enable the shopping cart in the header menu with the following code:</td>
</tr>
</tbody>
</table>
|                                            | `{  
  "enable_cart": {  
  "displayValue": "true",  
  "value": true  
  }
  }
| Application                                | The record scope. The header menu record and the source table must have the same application scope. |
| Widget                                     | The widget that the header menu is based on. Select a menu-type widget from the list. For example, the header menu widget that is included as a base system widget. |

3. Save the form, and then click **Menu Items** from the related lists.
4. Click **New** and complete the menu item form.

### Menu item fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name that appears for the item in the menu</td>
</tr>
<tr>
<td>Parent menu</td>
<td>This field should already contain the name of the menu you are adding items to. You can change the value as needed to other menus.</td>
</tr>
<tr>
<td>Parent menu item</td>
<td>Use this field to nest menu items within other menu items</td>
</tr>
<tr>
<td>Order</td>
<td>Value that determines where the item appears in the menu in relation to other menu items</td>
</tr>
<tr>
<td>Type</td>
<td>The kind of page the item links to. Form fields vary depending on the option that you select from this list. Choose from:</td>
</tr>
<tr>
<td></td>
<td>• Page: Link to another page in the Service Portal.</td>
</tr>
<tr>
<td></td>
<td>• URL: Link to an external website. To have the URL open on a new browser tab or window, enter _blank in the <strong>URL target</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• Service Catalog: Link to the Service Catalog.</td>
</tr>
<tr>
<td></td>
<td>• Catalog Category: Link to a specific catalog category within the Service Catalog.</td>
</tr>
<tr>
<td></td>
<td>• Catalog Item: Link to a specific catalog item.</td>
</tr>
<tr>
<td></td>
<td>• Knowledge Base: Link to the knowledge base that you previously configured as the portal's default knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• KB Topic: Link to a KB topic page.</td>
</tr>
<tr>
<td></td>
<td>• KB Article: Link to a KB article by number.</td>
</tr>
<tr>
<td></td>
<td>• KB Category: Link to a specific KB category within the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Filtered List: Set conditions to determine which page to link to.</td>
</tr>
<tr>
<td></td>
<td>• Scripted List: Enter a script to determine which page to link to.</td>
</tr>
<tr>
<td>Page</td>
<td>Name of the portal page the item links to. This option is available if you select <strong>Page</strong> as the menu item type.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For example, the condition <code>gs.hasRole(&quot;sp_admin&quot;)</code></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>restricts access to menu items to users with the sp_admin role. Hide a menu item by setting this value to false. For more information on what conditions to use in the Condition field, see Create a UI Action.</td>
<td></td>
</tr>
</tbody>
</table>

Glyph          Icon that appears beside the menu item

5. Click Submit.

6. After you create a menu and menu items, add the menu to a portal.
   a. Navigate to Service Portal > Portals, then open the portal you want to add a menu to.
   b. From the main menu field, click the reference lookup icon, then select the appropriate menu by name.

   c. Click Save.
What to do next
Associate the menu you created with a portal, then create a header with a theme for your menu.

Service Portal pages
Use pages to organize content, ensure responsive mobile optimization, and design meaningful portal user experiences for your customers. A page houses containers and rows, which then contain widgets. By manipulating the layout of the page, and the widgets within it, you can construct your desired user experience.

- Pages are referenced using the page ID.
- Pages can be referenced in more than one portal.
- Use base system pages as templates.
Containers

Containers are markup artifacts that are put on a page to contain the layouts that house the widgets.

You can view containers and how they make up a page in the Service Portal Designer (Service Portal > Service Portal Configuration > Designer). Open a page in the Service Portal Designer, then click anything on the page. In the top left corner, breadcrumbs appear to show you which element on the page you have selected. Use the breadcrumbs to select a container, then click the edit icon.

You can also edit a container by navigating to the Page Editor and selecting the container node in the tree view. In this view, you can:

• Change the layout of widgets on a page.
• Determine the number of columns on a page.
• Determine whether to scale with changes to the browser window.
• Add a background color to a portion of a page.
• Add an background image to a portion of a page.
• View the current layout of the widgets within the page.

Create and edit a page using the Service Portal Designer

Create or edit a page and use layouts to organize the columns that house the widgets.

About this task

These steps are intended for users with little to no coding experience. The Service Portal Designer includes several layers of customization from simply adding widgets in a particular configuration on a page, to adding CSS classes.
Procedure

1. Navigate to Service Portal > Service Portal Configuration.

2. Click Designer.

3. Switch to the portal you want to design pages for by selecting the portal name in the header.

4. From the Service Portal Designer, select a page to customize or click Add a new page.

5. Under Layouts, select Container and drag it onto the page.

6. Drag one of the other layouts and drop it in the container. This layout defines the structure of your page and the space available to drop widgets. The structure of the layout aligns with the Bootstrap grid template and always adds up to 12.

7. Use the filter to search for a widget, then drag the widget to the layout.

   b. Edit the form.
### Page fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Internal name of the page. Use the title to search for a page in the Service Portal Designer.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example [<a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page](<a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page), where doc_page is the page ID.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Public</td>
<td>Enables the page to be accessed without the need for authentication. If <strong>Public</strong> is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless a page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Dynamic page title</td>
<td>Create variables to generate descriptive titles depending on the content loaded into a page.</td>
</tr>
<tr>
<td>Clone Page</td>
<td>Enables you to make a copy of a page that can be modified. If you clone a base system page, a new widget instance is created for each widget on the page.</td>
</tr>
<tr>
<td>Use SEO script</td>
<td><em>(Optional)</em> Option to enable a script include that adds SEO tags for canonical URLs and hreflang tags. For more information, see Enable SEO for localized versions of a portal page.</td>
</tr>
<tr>
<td>SEO script</td>
<td><em>(Optional)</em> Script include to apply to the page. By default, the system uses the SPSEOScriptHeaderTags script.</td>
</tr>
</tbody>
</table>
include, which includes the default implementation for the canonical URL and hreflang tags for Service Portal Analytics pages.

   a. Click within the container you would like to edit, or select Container in the breadcrumbs.

   b. Click the edit icon [ ].
   The container record from the Containers table [sp_container] opens.

   c. Edit the form.

## Container fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the container.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the containers appear on a page. To set a container to appear above all other containers, give the container the lowest number in the Order field.</td>
</tr>
<tr>
<td>Page</td>
<td>The page in which the container appears.</td>
</tr>
<tr>
<td>Screen reader title</td>
<td>The title used by a screen reader.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Width</td>
<td>Width of the container. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Fixed</td>
</tr>
<tr>
<td></td>
<td>• Fluid</td>
</tr>
<tr>
<td>Parent class</td>
<td>Parent CSS class for the container.</td>
</tr>
<tr>
<td>CSS class</td>
<td>The CSS classes for the container. Overwrites page-specific CSS.</td>
</tr>
<tr>
<td>Background color</td>
<td>The background color of the container.</td>
</tr>
<tr>
<td>Background image</td>
<td>Background image for the container.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Background style      | The display style of a background image. Options include:  
• Default  
• Cover  
• Contain  
• Repeating |
| Bootstrap alternative | Selecting this field removes the standard Bootstrap grid classes and disables the Bootstrap grid system in the container. If selected, the following are not applied:  
• The **Width** field in the container record.  
• Standard Bootstrap class in the row record within the container.  
• The **Size - xs**, **Size - sm**, **Size - md**, and **Size - lg** fields in column records within the container.  
Only select this field if you plan to provide custom CSS classes and CSS for the container, row, and column records. |
| Move to header        | If selected, the container sticks to the header and does not scroll. Use this option to create a subheader.                                |

**10. Optional:** To switch to a different page, click the **Pages** tab in the left pane, then select the next page you want to configure.

**11. Optional:** Use the Preview button in the header to view your page as you design it.
You can also use **Preview** to view your page in mobile or tablet mode through the controls presented in the header.

### Designer tablet view

![Designer tablet view](image)

---

**Add a subheader to a page**

Select a container record to serve as a page subheader. A subheader sticks to the page header and does not scroll.

**Before you begin**

Role required: admin

**Procedure**

1. From the Service Portal configuration page ([Service Portal > Service Portal Configuration](#)) open the Service Portal Designer.
2. Open the page you want to add a subheader to.
3. Click the container that you would like to use as a subheader, or select the container using the breadcrumbs.
4. Click the edit icon ().
5. Select **Move to header**.

**Container record**

<table>
<thead>
<tr>
<th><strong>Name</strong></th>
<th>Service Portal - Container 1</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Order</strong></td>
<td>1</td>
</tr>
<tr>
<td><strong>Page</strong></td>
<td><strong>index</strong></td>
</tr>
<tr>
<td><strong>Background color</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Background style</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Results**

As a subheader, the container sticks to the header and does not scroll.

**Assign a homepage to a portal**

Edit your portal record to specify any page as your homepage.

**About this task**

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled **index** in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.
Procedure

1. From any page in the Service Portal Designer, click **Edit Portal Properties**.

2. From the Homepage list, select the page you want for your portal homepage and click **Save**.

**Assign a default error page**

Create a default 404 error page for your portal using a system property.
You can assign an error page to a portal using the portal form. If you do not assign an error page using that form, the system uses the default 404 page containing the breakout game widget. Use the default 404 page property [glide.service_portal.default_404_page] to configure the default error page.

Create a page before adding it as the default error page.

1. Navigate to Service Portal > Properties.
2. In the Default 404 page for Service Portals, type the page ID found in the ID field of the page form.

Add SEO information to Service Portal pages

Improve the searchability of Service Portal pages by adding meta tags and descriptive titles.

You can add SEO information to Service Portal pages by:

- Associating public pages with meta tags to optimize search from external search engines.
- Using record data loaded in a page to dynamically generate descriptive page titles and meta tags.

Dynamic meta tags and titles

Some pages in the Service Portal load record data based on a URL parameter. You can add meta tags and page titles that vary depending on the record loaded in the page.

Using Service Catalog as an example, the following URL includes a sys_id parameter in addition to the page ID. Different content is loaded depending on the value of the sys_id parameter.

https://<yourInstance>.service-now.com/sp?id=sc_cat_item&sys_id=060f3afa3731300054b6a3549de5d3e

If a page loads dynamic content, you can:

- Add meta tags to the page.
- Add meta tags that vary based on content.
- Add variables that generate descriptive page titles based on content.
- Add dynamic content to a page title.
- Create targeted page titles for use with a screen reader.
For example, you can set a Service Catalog page to generate a dynamic title and meta tag based on record data associated with the URL parameter.

Add meta tags to a public page

Improve the searchability of Service Portal pages by adding meta tags. You can add the meta name and description attributes to a page, define the robots attribute, or create dynamic meta tags for pages that load record data based on a URL parameter.

**Before you begin**
Role required: admin or sp_admin

**Procedure**

1. Navigate to **Service Portal > Pages**.
2. Open a page.
3. Check that **Public** is selected.
   * Pages that are not public are not indexed by external search engines.
4. Click the **Meta tags** related list tab.
5. Click **New** to create a new meta tag.
6. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>Page to apply the meta tag to.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
</tbody>
</table>
| Name       | The HTML meta name attribute.  
To define the meta robots attribute, add **ROBOTS**. |
| Content    | The HTML meta description attribute.  
If **ROBOTS** is defined in the **Name** field, you can add one of the following content values:  
- **INDEX, FOLLOW**: The search engine shows the page in search results and trusts any links in the page. This is the default value.  
- **NOINDEX, FOLLOW**: The search engine does not show the page in search results, but trusts any links in the page.  
- **INDEX, NOFOLLOW**: The search engine shows the page in the search results, but does not trust links in the page.  
- **NOINDEX, NOFOLLOW**: The search engine does not show the page in search results and does not trust links in the page.  
Alternatively, you can pass a variable into this field based on record data. For example, you can define a **%description** variable in this field, and create a content variable to populate the content tag with record data. |

**Example**

![Meta Tag form](image)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td><code>sc_home</code></td>
</tr>
<tr>
<td>Application</td>
<td><strong>Global</strong></td>
</tr>
<tr>
<td>Name</td>
<td><code>description</code></td>
</tr>
<tr>
<td>Content</td>
<td><code>Order something from the Service Catalog</code></td>
</tr>
</tbody>
</table>

7. Click **Submit**.
The meta information is added to the page header. For example:

```html
<meta name="description" content="Order something from the Service Catalog">
```

8. **Optional:** Create a content variable to populate the content tag with record data.
If the page loads record data based on one or more URL parameters, you can add meta tags generated from the record data.

**a.** Open a meta tag record and check that the **Content** field contains a variable, or add a variable.
Depending on the available URL parameters and the meta tag you would like to define, you can add the following types of values:

<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Populates the content tag with the value defined in the associated content variables record.</td>
<td>%description</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Populates the content tag with the values defined in the associated content variables records.</td>
<td>%description %price</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Populates the content tag with a static value and the associated content variables record.</td>
<td>Catalog item: %description</td>
</tr>
</tbody>
</table>

**b.** In the **Content variables** related list, click **New**.
The **Content variables** related list is only available after saving the meta tag record.

**c.** Complete the form.
Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the content tag. You can define the field to generate the content tag through the **Table field** field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>one of the variables defined in the <strong>Content</strong> field in the Meta tag record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
<tr>
<td>Metatag</td>
<td>The meta tag to apply the dynamic variable to.</td>
</tr>
<tr>
<td>URL query parameter</td>
<td>URL parameter to indicate the record that is being displayed. You can enter any string.</td>
</tr>
<tr>
<td><strong>Tip:</strong> To create a URL parameter that is meaningful and easily identifiable, use a field name from the record. For example, to refer to a knowledge article, you can enter <code>number</code> to reference the article by its number.</td>
<td></td>
</tr>
<tr>
<td>Relevant table column</td>
<td>Table field to match the URL query parameter. For example, if you entered <code>number</code> to reference a knowledge article by its number, select <code>Number</code>. If left blank, the system uses the record <code>sys_id</code>.</td>
</tr>
<tr>
<td>Table</td>
<td>The source table of the URL query parameter record.</td>
</tr>
<tr>
<td>Table field</td>
<td>Select a field from the table defined in the <strong>Table</strong> field. This field is used to generate the value of the content tag.</td>
</tr>
<tr>
<td><strong>Important:</strong> To support SEO, ensure that the referenced table field is public. For more information on granting access to a table field, see Create an ACL rule.</td>
<td></td>
</tr>
</tbody>
</table>

If more than one content variables match a variable defined in the **Content** field of the meta tag record, the record with the earliest Created date is used.
d. Click Submit.

The content tag loads record data. For example:

```html
<meta name="description" content="Apple iPad 3">
```

Add dynamic titles to a page

Create variables to generate descriptive titles depending on the content loaded into a page.

Before you begin
Role required: admin

About this task

Note: The dynamic titles don’t apply to the knowledge article view page in the Knowledge Management Service Portal.

Procedure

1. Navigate to Service Portal > Pages.
2. Open a page.
3. Add one or more variables to the Dynamic page title field.
Depending on the available URL parameters and the dynamic title you would like to define, you can add the following types of values:

<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Generates a page title using the associated record of one URL parameter.</td>
<td>%first_name</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Generates a page title using the associated records of multiple URL parameters.</td>
<td>%first_name %last_name</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Generates a page title using a static value and the associated record of a URL parameter.</td>
<td>Employee: %first_name</td>
</tr>
</tbody>
</table>

Enter the variables in the intended syntax of the title. For example, to have an employee’s name and title separated by a hyphen, you would enter `%first_name - %title`.

In the page title, this syntax would render as something like "Beth - System Administrator".
4. Click the **Dynamic page title variables** related list tab.

5. Click **New** to create a new variable.

6. On the form, fill in the fields.

   Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the title. You can define the field to generate the title through the **Table field** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Variable to store the value. Must begin with % and cannot contain spaces. This value must match one of the variables defined in the <strong>Dynamic page title</strong> field.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
<tr>
<td>Page</td>
<td>Page to apply the dynamic variable to.</td>
</tr>
<tr>
<td>URL query parameter</td>
<td>URL parameter to indicate the record that is being displayed. You can enter any string.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> To create a URL parameter that is meaningful and easily identifiable, use a field name from the record. For example, to refer to a knowledge article, you can enter number to reference the article by its number.</td>
</tr>
<tr>
<td>Relevant table column</td>
<td>Table field to match the URL query parameter. For example, if you entered number to reference a knowledge article by its number, select <strong>Number</strong>. If left blank, the system uses the record sys_id.</td>
</tr>
<tr>
<td>Table</td>
<td>The source table of the URL query parameter record.</td>
</tr>
<tr>
<td>Table field</td>
<td>Field from the table defined in the <strong>Table</strong> field. This field is used to generate the dynamic page title.</td>
</tr>
</tbody>
</table>

If more than one dynamic page variables match a variable defined in the **Dynamic page title** field, the record with the latest Updated date is used.

Variables with same name aren’t supported and won’t be created multiple times. Each variable should be unique.
In this example, the value of the Title field in the User [sys_user] table populates the page title. The %title variable must also be defined in the Dynamic page title field in the page record.

7. Click Submit.

Results
When the page loads, the record defined in the URL query parameter displays. The field defined in Table field determines the title of the page.

Enable SEO for localized versions of a portal page
Allow users to discover portal pages in their preferred language by adding hreflang tags.

Before you begin
Role required: sp_admin

Procedure
1. Navigate to Service Portal > Pages and open a page record.
2. On the form, select the Use SEO script check box. Selecting this check box causes the SEO script field to appear. By default, the system uses the SPSEOHeaderTags script include. You can use a different script include by updating this field.
3. Click **Update**.

**Results**
The system adds default `hreflang` tags for each active language in your instance.

**What to do next**
You can override the default `hreflang` tags, add a canonical URL, or add custom header tags by updating the script include that is referenced in the **SEO script** field. This needs to be set by the page or content author.

To specify a canonical URL for the page, update the `generateCanonicalURL` function in the script include.

To specify custom header tags for the page, update the `generateCustomTagsForSEO` function in the script include.

For an example of inserting custom SEO tags into the knowledge article view page, see Configure custom SEO tags for canonical URLs and localized knowledge articles.
Page navigation by URL
You can navigate to a portal or a page using the URL.
A Service Portal URL contains the following elements.
https://<base instance url>/<sp url suffix>?id=<page id>&<page parameters>

Element

Description

Base Instance URL

Unique, secure web address for each instance. The
default format is: https://<instance name>.servicenow.com.

sp url suffix

Suffix established for the Service Portal. For example /sp.

id

The id of the Page to navigate to within the portal
frame. For example, ?id=index.

page parameters

Some pages require additional parameters to look
up a record (table, sys_id). Find the $sp.getParameter
calls in a widget server script to see what parameters
a widget uses. For more detail on this method see
GlideSPScriptable - Scoped

For example, https://<instance name>.service-now.com/sp?id=kb_view2
Note: If you use article versioning with the Knowledge Management
- Service Portal (com.snc.knowledge_serviceportal) plugin enabled,
you must add the article version number to the URL to open a
knowledge article in the base system or knowledge portals. For
example, instead of accessing an article using the URL https://
<instance name>/sp?id=kb_article&sys_id=KB0000005, you must
include the article version number: https://<instance name>/sp?
id=kb_article&sys_id=KB0000005%20V1.0. To learn more, see Article
versioning.

Referencing a page id
Widgets and widget instance options reference Service Portal pages using
the page id. For example, a link to the sc_home page within a widget HTML
template might appear as:
<div><a href="?id=sc_home">${Order something...}</a></div>

Redirect a reference to a page ID

Multiple widgets in the Service Portal may link to a single page using a hard-coded page ID. If you want to replace the page, all widgets that reference the page must be updated with the new page ID. Instead of cloning and updating each widget with the new page ID, you can create a single record that automatically redirects all references to the original page to point to the new page. This way, you can replace a page without locating and replacing all references to the page ID.

Before you begin
Role required: sp_admin

About this task
To redirect all references to a page, create a record in the Page Route Maps table [sp_page_route_map]. This table enables you to redirect a reference to a page without cloning base system widgets.

Creating a record in the Page Route Maps table only redirects references to a page. It does not redirect navigation to a page ID within a URL.

Note: You don’t need to create a page route map to redirect users to a 404 page. To specify the 404 page for your portal, update the 404 page field in the Portal [sp_portal] record.

Procedure
1. Navigate to Service Portal > Page Route Maps.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description</td>
<td>Optional short description to describe the redirect.</td>
</tr>
<tr>
<td>Service Portal(s)</td>
<td>Portals that apply the redirect. If you don’t select a portal, the redirect applies to all portals in the instance.</td>
</tr>
<tr>
<td>Route from</td>
<td>Original page you are redirecting from.</td>
</tr>
<tr>
<td>Route to</td>
<td>Page you are redirecting to.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the Page Route Map record is active. The redirect only applies when the record is active.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority of the Page Route Map record. If more than one active record has the same value in the Route</td>
</tr>
</tbody>
</table>
from field, the record with the lowest order applies. The system evaluates records from lowest to highest. If multiple records have a matching order, the system honors the oldest record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from</td>
<td>from field, the record with the lowest order applies. The system evaluates</td>
</tr>
<tr>
<td></td>
<td>records from lowest to highest. If multiple records have a matching order,</td>
</tr>
<tr>
<td></td>
<td>the system honors the oldest record.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**Results**

All references to the page listed in the **Route from** field redirect to the page in the **Route to** field.

**Activate the Knowledge Article View page on upgrade**

If upgrading from a previous release, take advantage of the latest article view features by activating the **Knowledge Article View** page route map. This map routes the **kb_article** page to the **kb_article_view** page, which includes new capabilities such as including links and images in article feedback and article versioning. This map is active by default in new instances and applies to all portals in the system.

**Before you begin**

Role required: admin

**About this task**

By default, users with the public role cannot access the **kb_article_view** page. However, your administrator can modify this behavior. For more information, see **Enable external or public users to view knowledge articles from the Knowledge Management Service Portal**.

After activating the **Knowledge Article View** page route map, you can:

- Comment on a knowledge article
- Create an article version by importing a Word document
- Create a version of a knowledge article from a managed document

**Procedure**

1. Navigate to **Service Portal > Page Route Maps**.
2. Open the **Knowledge Article View** record.
3. Select **Active**.
4. Click **Update**.
Results

Your end users view knowledge articles in the Service Portal using the **kb_article_view** page.

<table>
<thead>
<tr>
<th>Options</th>
<th>How to</th>
</tr>
</thead>
<tbody>
<tr>
<td>To add an electronic business card</td>
<td>Click <strong>Business Card</strong>, and then click a contact in the <strong>Filed As</strong> list. Then click <strong>OK</strong></td>
</tr>
<tr>
<td>To add a hyperlink</td>
<td>Click <strong>Insert Hyperlink</strong>, type in the information or browse to a hyperlink, click to select it, and then click <strong>OK</strong></td>
</tr>
<tr>
<td>To add a picture</td>
<td>Click <strong>Picture</strong>, browse to a picture, click to select it, and then click <strong>OK</strong>. Common image file formats for pictures include .bmp, .gif, .jpg, and .png.</td>
</tr>
</tbody>
</table>

1. To finish creating the signature, click **OK**.

**NOTE:**
The signature that you just created or modified won’t appear in the currently open message; it must be inserted into the message.

**Include font icons on a page**

Include font icons on a page so that all the widgets on the page have access to the font-icon set.

1. In the platform UI, navigate to **Service Portal > Pages** and click the page you want to add font icons to.

2. Attach the font-icon file to the page record.
3. In the Page Specific CSS field for the page, add the CSS for the font-icon definition. Use the sys_id of the attachment as the `src` in the CSS.

```css
/* fallback */
@font-face {
  font-family: 'Material Icons';
  font-style: normal;
  font-weight: 400;
  src: url('/42aead5e64fc32008a959a211310c748.iiix') format('woff2');
}

.material-icn {
  font-family: 'Material Icons';
  font-weight: normal;
  font-style: normal;
  font-size: 24px;
  line-height: 1;
  letter-spacing: normal;
  text-transform: none;
  display: inline-block;
  white-space: nowrap;
  word-wrap: normal;
  direction: ltr;
  -webkit-font-feature-settings: 'liga';
  -webkit-font-smoothing: antialiased;
}
```

**Result**

You can select an icon from the icon set for any widget on this page. For example, in the HTML widget you can use the source code option to use an icon.
Standard ticket page

In Service Portal, you can configure individual request types to display the request-specific information, while still having a consistent layout that is similar to other request types. This configuration ensures a consistent experience when viewing submitted requests.

For new instances, the standard ticket page is available by default. For upgraded instances, you need to activate the Standard Ticket Route page route map. For information about activating this page route map, see Activate the page route map for the standard ticket page.

The information displayed in each section of a standard ticket page depends on the individual request type. If a configurable section has no specified values or if a user does not have access to the information, it is not visible.
Standard ticket page for an incident

**Header section**
By default, this section displays the following information for a submitted request:

- Identification number
- Created and updated dates
- State. Instead of the State field, you can also configure any other field that represents the state of the ticket.

**Info section**
If configured, this section displays the following regions for a submitted request:

- Ticket description region with the short description, and optionally the description
- Fields region where the associated fields are configured. A configured field is not visible when it has no value or when a user does not have access to the field.

**Note:** A field of the Workflow type is not supported for any table. Only for the Requested Item [sc_req_item] table, the Workflow type field is supported, for example, the Stage field. This field is displayed at the last irrespective of the field position in the configuration.

- Actions region
Tabs section
If configured, this section displays the following types of tabs for a submitted request:

- Activity
- Attachments
- Variable editor
- Variable summarizer
- Associated Requests. Displays all associated requests (visible in the My Requests widget in Service Portal) for which the current ticket is the parent. It is applicable in any of the following scenarios:
  - If the current ticket is a universal request, then all requests associated (through the Parent field on the task table) with child tickets of the universal request are displayed.
  - If the current ticket is not a universal request, then all requests associated (through the Parent field on the task table) with the current ticket are displayed.

For information on defining filters for the My Requests widget, see Define filters for My Requests.

- Custom tab

By default, the Activity and Attachments tabs are available.

Configurations for a cross-scope application
For each request type of a cross-scope application, the following configurations are required:

- Restricted caller access privileges for the following standard ticket page widgets so that these widgets can access the application tables. For information about these privileges, see Set application scope, application resource, and event access.

  - Widget: Standard Ticket Header
  - Widget: Standard Ticket Attachments
  - Widget: Standard Ticket Tab

- Restricted caller access privileges for the Description field in the application. This field is displayed on the standard ticket page header.

- Page route map to route all the requests of that application to the standard ticket page
Domain separation for a standard ticket page

Tab configurations are not domain-separated.

Ticket configurations are process domain-separated. For any request type record, when a user opens the standard ticket page, it checks for ticket configurations in the following order irrespective of the user's domain:

1. In the record’s domain
   a. Ticket configurations for the record table
   b. Ticket configurations for the parent table of the record table
2. In the record domain’s parent hierarchy
   a. Ticket configurations for the record table
   b. Ticket configurations for the parent table of the record table

ℹ️ Note: For a table, only one active configuration is allowed per domain.

Configure the standard ticket page

Give Service Portal users a consistent way to view their submitted requests. You can configure the standard ticket page for different request types.

Before you begin
Role required: admin or sp_admin

About this task
You can add a standard ticket configuration only for a task-extended table.

Procedure

2. Click New.
3. On the form, fill in the fields.

### Ticket Configuration form

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
7. Click **Submit**.
8. On the Ticket Configuration form, click **Update**.

**Enable instance options for the Activity tab**

Format the work notes and add @mentions in the Activity tab on a standard ticket page.

**Before you begin**

Role required: sp_admin or admin

You should add the **Activity** tab in the standard ticket configuration of a request type. For information on configuring tabs, see Configure the standard ticket page.

**Procedure**

1. Navigate to the request in Service Portal.
2. Press Control and right-click anywhere in the **Activity** tab.
3. Click **Instance Options**.
4. Configure settings for the **Activity** tab.

**Activity tab instance options**

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Rich Text Editor</td>
<td>Option to enable formatting the work notes.</td>
</tr>
<tr>
<td>Enable @ Mentions (works only when Rich Text Editor is enabled)</td>
<td>Option to enable mentioning the relevant people in work notes.</td>
</tr>
</tbody>
</table>

**Note:** This option is applicable only when the **Enable Rich Text Editor** instance option is selected.

5. Click **Save**.

**Activate the page route map for the standard ticket page**

If you have upgraded your instance, redirect the ticket page to standard_ticket page in Service Portal and view requests on the standard ticket page.

**Before you begin**

Role required: admin or sp_admin
Procedure
1. Navigate to Service Portal > Page Route Maps.
2. Select Standard Ticket Route.
3. Select the Active check box.
4. Click Update.

Service Portal widgets
Widgets are what define the content in your portal. You can use the base system widgets provided with Service Portal, clone and modify widgets, or develop custom widgets to fit your own needs.

Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don't benefit from future updates to the widgets they were cloned from.

Provides an overview of service portal widgets and their components, and the life cycle of a widget.

Widget library
You can use base system widgets as-is in your Service Portal or clone them to suit your own business needs.

Note: Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don't benefit from future updates to the widgets they were cloned from.

Due to the ever-changing number of widgets that exist at any given time in Service Portal, this widget library is not a definitive list. You can find more widget descriptions as they become available.

Depending on your configuration, widgets that do not contain any information do not appear in your Service Portal page.
To view the instance options for a widget, use the widget context menu.

Approval Record widget

The Approval Record widget shows the full record for an approval including the activity stream. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Instance options

The approval record widget does not include instance options.

Breadcrumbs widget

The breadcrumbs widget allows users to easily navigate around a portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

The breadcrumbs widget displays information based on where a page is located in a portal. For example, if you navigate to the Knowledge Base from the home page, then the breadcrumb reads as **Home > Knowledge Base**. Each subsequent page that you open expands the breadcrumb.
Click a page name on the breadcrumbs widget to navigate to that page. For example, to return to the home page, click **Home**.

You can customize this widget to change the breadcrumb path. For more information, see [KB0719179](#).

**Instance options**

The breadcrumbs widget does not have instance options.

**Breakout Game widget**

Add a fun, interactive 404 page to pages that do not exist using the Breakout Game widget. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

![Breakout Game widget](image-url)
Instance options
The Breakout Game does not have instance option. You can use it as an example of how to use the Link Function as part of an Angular Directive.

Calculator widget
The calculator widget does simple calculations. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Use the calculator widget as an example of how to pass data between the client and server.
Instance options
The calculator widget does not include instance options.

Carousel widget
Showcase specific items in your catalog using a scrolling list of images in the carousel widget. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Use the carousel widget to showcase items on your portal page. For example, display items available in a service catalog at the top of the service catalog page.

Add slides to the carousel widget

Use the related lists for an instance of the carousel widget to add images for the carousel widget to scroll through.

Before you begin
Role required: Admin or sp_admin

Procedure
1. Navigate to Service Portal > Widgets.
2. Open the Carousel widget record.
3. From the carousel form, on the Instances related list, under instances, open a carousel instance.
4. From the instance of carousel form, click New on the Carousel Slides related list.
5. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the carousel slide. Use the name to differentiate the slide from other slide records.</td>
</tr>
<tr>
<td>Order</td>
<td>Where the slide appears in the list of slides</td>
</tr>
<tr>
<td>HREF/URL</td>
<td>Link to the item in the slide. For example, for a slide with a catalog item, link to page for the catalog item using the HREF ?id=&lt;page name&gt;&amp;sys_id=&lt;sys_id for item&gt;. For more information on linking to a page within a portal, see Page navigation by URL. You can also link to other sites using the URL.</td>
</tr>
<tr>
<td>Background</td>
<td>Upload an image for the slides. Carousel images should be 1022x300 pixels.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically populated with the name of the application the portal falls under.</td>
</tr>
<tr>
<td>Carousel</td>
<td>Name of the instance of the carousel widget you are adding the slide</td>
</tr>
</tbody>
</table>
Repeat this step for as many slides as you want to appear in the carousel widget.

**Change Password widget**

Users can change their passwords using the Change Password widget.

![Change Password widget](image)

> **Note:** Updated credentials are stored in the User [sys_user] record in the local instance.

**Instance Options**

The Change Password widget does not have instance options.

**Cool Clock widget**

Show different times around the world using the Cool Clock widget. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Cool clocks demonstrates how to use instance options in a widget. The time zone is loaded using an instance option. If you do not select a time zone, the widget uses a default time zone.

**Cool Clock widget**

![Cool Clock widget](image)

### Instance options

**Cool clock widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the clock, for example New York, NY. The name appears below the clock so it helps to use a name related to the time zone.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The location from which the time is displayed. Use the local full name, for example, America/New York, instead of the abbreviated time zone. Using the full name allows time zones to stay consistent with daylight savings time. The default value is America/Los Angeles.</td>
</tr>
<tr>
<td>Second hand color</td>
<td>Color of the second hand using the hex code, RGB, or color name. The default value is red.</td>
</tr>
</tbody>
</table>
Data table from instance definition widget

Display a filtered list on your portal using the data table from instance definition widget. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

After you add the data table from instance definition widget to a page, use the instance options to configure the appearance of the table.

Data table from instance definition widget

<table>
<thead>
<tr>
<th>Number</th>
<th>Category</th>
<th>Short description</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0000001</td>
<td>Network</td>
<td>Can’t read email</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>INC0000004</td>
<td>Inquiry / Help</td>
<td>Forgot email password</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>INC0000005</td>
<td>Hardware</td>
<td>CPU load high for over 10 minutes</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>INC0000006</td>
<td>Software</td>
<td>Hang when trying to print VISIO document</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>INC0000008</td>
<td>Inquiry / Help</td>
<td>Printer in my office is out of toner</td>
<td>1 - Critical</td>
</tr>
</tbody>
</table>

Instance options

Data table instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. If you leave this field empty the name of the table displays as the widget name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the widget displays records from.</td>
</tr>
<tr>
<td>Filter</td>
<td>Text field from the condition builder that you can use to limit the items returned in the table. To create a filter, use the context menu to open the widget instance in the platform. Then use the condition builder to create a filter.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Limits the number of items displayed in the table. If there are more entries than allowed in the table, users can scroll to the next page.</td>
</tr>
</tbody>
</table>
Data table instance options (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
</tbody>
</table>

Data Table from URL definition widget

The Data Table from URL definition widget displays the table you select from the list. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Instance options

Complete the instance options to define the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. Select the <strong>Use Instance Title</strong> check box to use this title instead of the name of the table.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when the click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table. For example, short description or priority.</td>
</tr>
<tr>
<td>Use Instance Title</td>
<td>Select to use the title in the Title field instead of the table title</td>
</tr>
<tr>
<td>Enable Filter</td>
<td>Select this check box to allow users to create their own filter for the table</td>
</tr>
</tbody>
</table>

If **Enable filter** is enabled in the instance options, users can add custom conditions to filter the results.

![Data Table URL with condition builder](image)

For more information on using the condition builder, see .

ℹ️ **Note:** The condition builder is only available in the desktop view.
Form widget
The form widget is a platform form within the Service Portal UI with a few differences. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Form widget

URL Parameters
The form widget accepts the following parameters within the URL.

Form widget URL parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id or sl_sys_id</td>
<td>Sys_id for the record to be displayed</td>
</tr>
<tr>
<td>table, sl_table, or t</td>
<td>Table for the record to be displayed</td>
</tr>
<tr>
<td>view or v</td>
<td>View used to display the record</td>
</tr>
</tbody>
</table>

In the following example, the URL would display an incident with a sys_id of 1c741bd70b2322007518478d83673af3 in the portal view.

https://example.service-now.com/sp?id=form&table=incident&sys_id=1c741bd70b2322007518478d83673af3&view=portal

Scripting
Not all client scripts are supported in the Service Portal. To understand how client scripts interact with forms in the Service Portal, see Service Portal and client scripts and Supported client script types and APIs.
Header menu widget

The Header Menu widget controls which options appear in the page header. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Unlike other widgets in Service Portal, the header menu widget is not something you drag onto a page. Instead you configure the header menu by associating the header menu with a portal. For more information on configuring a header menu, see Configure a portal header menu.

Instance options

The header menu widget does not include instance options.

Hello World widgets

The Hello World widgets are included with Service Portal as examples of how to use and create widgets. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

All three Hello World widgets display the same way. The real difference between them is in their underlying code base. Each version of the widget uses a different method of using the server and client script.

To view the Hello World widgets, navigate to Service Portal > Service Portal Configuration then click Widget Editor. In the Widget Editor, click Check out the Hello World Example.
Hello World 1

Hello world 1 displays how the HTML template and the client script communicate. For more information on using the client script in Service Portal, see Widget developer guide.

Use the widget list to switch to Hello World 2 or 3.

Hello World 2

Hello World 2 includes an example of how the server script can be used as well.
For more information on Service Portal APIs, see the GlideSPSriptable API.

**HTML widget**

Use the HTML widget to directly inject HTML, text, lists, or content in general into a page. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Because the HTML widget can contain content of any kind, any example may just appear as regular text. For example, the HTML widget appears as a box of text on the 404 page.

**Instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name for the HTML text. Users do not see this information.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td></td>
<td>• Color box</td>
</tr>
</tbody>
</table>
**Icon menu list widget**

A simple list with a glyph icon next to each link. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Configure the icon information using the Menu Items related list.

1. From the instance options for the icon menu list widget, under Related Lists, click **Menu Items**.
2. Click **New**.
3. Use the fields on the New Menu Items form to configure the icons for the icon menu list widget.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name or description of the icon</td>
</tr>
<tr>
<td>Parent Menu</td>
<td>The name of the menu that the icon appears in. This automatically populates with the name of the icon menu list widget that you created but you have the option to switch it to another menu.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the icons appear in the icon menu list widget.</td>
</tr>
<tr>
<td>Parent menu Item</td>
<td>Nest menu items within a parent menu.</td>
</tr>
<tr>
<td>Page</td>
<td>The page within Service Portal that the icon links to. Select <strong>Page</strong> from the Type list to enable this option.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of link you want the icon to have. You can link to pages within Service Portal, external URLs, KB articles, Service Catalog, or lists. Different fields will appear on the form depending on the option you select from the list.</td>
</tr>
</tbody>
</table>
## Icon menu list widget instance options (continued)

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### Language Switch widget

Add the Language Switch widget to a landing or homepage to allow your users to change the language of the page. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

#### Language Switch widget

![Language Switch widget](image)

**Current Language:** en

[Apply]

### Instance options

The Language Switch widget does not include any instance options.

### Link button widget

The Link Button widget is a button you can nest in any other widget that links to another destination. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

#### Link Button widget

![Link Button widget](image)

<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link for button</td>
<td>Page that the button links to. Use <code>?id=&lt;page_name&gt;</code> to link to another page in the portal.</td>
</tr>
<tr>
<td>Contents of button</td>
<td>The button text.</td>
</tr>
</tbody>
</table>

Login widget

The login widget controls user access to your site. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

Users log in to a portal by entering their credentials in the login widget.

The widget uses credentials from the User [sys_user] record. In the User name field, the user enters the User ID from their user record. In the Password field, the user enters the password from their user record.
The login widget by default includes a **Forgot Password?** link that enables users to reset their password using the Password Reset application. For more information about Password Reset configuration, see [Password Reset](#).

**Note:** When the user selects **Forgot Password?**, the system redirects the user to the page value specified in the `glide.security.password_reset.uri` system property.

If you don’t want to include the **Forgot Password?** link, set the `glide.security.forgot_password.display.link` system property to false.

**External user self-registration**

External user self-registration enables a large group of users to register to a ServiceNow app without the help of an administrator. Users register to the app via a link on the login widget.
For more information on external user self-registration, see Enable external users to self-register to your ServiceNow instance.

**PIV/CAC authentication**

With certificate-based authentication activated in your instance, users can register their Personal Identity Verification (PIV) or Common Access Card (CAC) card for Service Portal login.

After self-registering their PIV/CAC card, a user can log in by inserting their card into a card reader and then selecting **Login with PIV/CAC card** on the login widget.

Before a user can register their PIV/CAC card, an administrator must activate certificate-based authentication and then set up PIV/CAC authentication. For
more information on this setup process, see Personal Identity Verification (PIV) card or Common Access Card (CAC) based authentication. For more information on how a user self-registers their PIV/CAC card, see Register your PIV/CAC card for Service Portal login.

**Instance options**

Use the instance options to configure the login widget for a portal page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show panel</td>
<td>Show or hide the panel that appears behind the login widget. The panel helps the widget stand out from the page background rather than blending in.</td>
</tr>
<tr>
<td>Use Advanced View</td>
<td>Changes the widget layout. Adds the <strong>Forgot Password?</strong> link to the left of the <strong>Login</strong> button and adds field names for <strong>User name</strong> and <strong>Password</strong> instead of hint text.</td>
</tr>
</tbody>
</table>

**My Requests widget**

The My Requests widget stores all of your open requests in one place. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The list is updated in real time so you can see your requests getting processed. The widget pulls open request information from the sc_request table.

**My Requests widget**

<table>
<thead>
<tr>
<th>My Requests</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Sales Laptop</strong></td>
</tr>
<tr>
<td>REQ00100002 • about an hour</td>

</tr>
</tbody>
</table>

My Requests widget

Use the My Requests widget (my-requests-v2) to enable requesters to view open or closed requests in Service Portal. Requests, incidents, and tasks are displayed in a single view that is based on the filter conditions and display settings in the My Request Filter module. For information on defining filters for this module, refer to the Related information section.
**Instance options**

Use the widget instance options to customize the settings for the My Requests widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select **Instance Options**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Presentation</td>
<td></td>
</tr>
<tr>

<tr>
<td>Show View</td>
<td>If selected, displays the <strong>View</strong> list. Using this list you can filter for closed or open requests. If deselected, only open requests are displayed.</td>
</tr>
<tr>
<td>Items per page</td>
<td>Number of records displayed per page.</td>
</tr>
</tbody>
</table>

**Related information**

Define filters for My Requests

**Enable the My Requests menu for an upgrade scenario**

Enable the My Requests menu that uses the My Requests (my-requests-v2) widget for an upgrade scenario.

**Before you begin**

Role required: admin

**About this task**

The My Requests menu that is based on the My Requests (my-requests-v2) widget is available by default for zBoot users. For more information about this widget, refer to My Requests widget.

**Procedure**

1. Navigate to **Service Portal > Portals**.
2. Select a portal.
3. Next to the **Main menu** field, click **Preview this record** and open the record.
4. In the Menu items related list, perform the following steps.
a. For the Requests menu item of the Page type, set Active as true.

b. For the Requests menu item of the Scripted List type, set Active as false.

5. Navigate to Service Portal > Page Route Maps.
6. For the My Request page route map, set Active as true.
7. Click Update.

Organization Chart widget

The Organization Chart widget shows employees in a tree structure relative to their manager. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

In the text input field, enter or select a user to see their manager and subordinates. The widget uses information from the User [sys_user] record to display the organization hierarchy relative to the selected user.
Click a card to open the profile page for that user. To reconfigure the card link, change the **URL** or **Page** in the widget instance options.

You can drag individual cards to rearrange the chart.

You can zoom in or out of the chart view by clicking the magnifying glass icons or by scrolling.
Instance options
Use the instance options to configure the Organization Chart widget for a portal page.

ℹ️ **Note:** There are no valid values for several instance options. By default, you can set only the following instance options:

- User Background Color
- Node Background Color
- URL
- Page

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>Fields from the user record that appear on each card. By default, each card displays the name, title, department, email, phone, and location of each user.</td>

</table>

Sample Footer widget

The Sample Footer widget is an example of a footer you can use in your portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Unlike other widgets in Service Portal, you add a footer to your portal by configuring it in the Theme form. For more information on adding a footer to a portal, see Add a header or footer to a portal.

Instance options

The Sample footer widget does not include instance options.

Ticket Attachments widget

Use the attachment widget to attach items to tickets. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Attachments should be less than 24MB. You can drag files into the Attachments widget to add them to a record.
Ticket Attachments widget

Instance options

Ticket attachments widget instance options

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record ID</td>
<td>The ID number of the record for the attachment.</td>
</tr>
<tr>
<td>Record table</td>
<td>Limit the records users can add an attachment to by adding a table to the attachment widget. Users can then only add attachments if they are in a record for that table.</td>
</tr>
</tbody>
</table>

Ticket Conversations widget

Record of ticket items. Users can use this widget to communicate back and forth with the fulfiller and the receiver. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The Ticket Conversations widget displays journal entries from the activity formatter of the target record. Journal entries are presented in chronological order, with the oldest entries appearing at the bottom of the widget. Entries made by the user that created the record appear on the right side of the center divider. Entries made by other users appear to the left.

The Ticket Conversations widget is intended only for tables that extend task.

Limit the number of journal entries that appears in the ticket conversation widget using the glide.service_portal.stream_entry_limit system property. The default number is 100. Change the number by navigating to Service Portal > Properties, and enter the new number in the Maximum number of stream entries displayed in Service Portal field.

<td>Use dynamic placeholder</td>
<td>Use a placeholder for journal fields. The default value is false.</td>
</tr>
<tr>
<td>No readable journal field message</td>
<td>The message that displays when there are no readable journal fields. Forms that have added journal fields may not display in the Ticket Conversation widget.</td>
</tr>
</tbody>
</table>

Ticket Fields widget

The Ticket Fields widget displays information about a request that a user has made. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

After a user submits a request, they can track their request on a ticket page in Service Portal. The user can consult the Ticket Fields widget to review the details of their request and check its resolution status.
Fields for the Ticket Fields widget are defined by the HTML template and the server.

If a user entered variables when submitting the request, they can view those variables in the Options section.

<table>
<thead>

*Tickets are picked up within 4 hours (M-F 9-5)*

- I agree to the term: false
- desktop: false
- explorers: false
Note: The values that appear in the Options section are not field values from the ticket. They are Service Catalog variables that are associated with the ticket. For more information, see Service catalog variables.

Instance options
Use the instance options to configure the Ticket Fields widget for a portal page.

### Field Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pickup message</td>
<td>Text to communicate the expected resolution time of the ticket. This text is displayed below the ticket fields. The default is <code>${Tickets are picked up within &lt;br/&gt; 4 hours (M-F 9-5)}</code>. Ensure that any changes you make are within the curly braces.</td>
</tr>
</tbody>
</table>

**Ticket Location widget**
Share your location in a ticket. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Location Shared

San Diego Fwy, Del Mar, CA 92014, USA
Instance options
The Ticket Location widget does not include any instance options.

User Profile widget
Display user profile information. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Users can use the User Preferences section to enable accessibility in a portal.

Search widgets
Several search widgets are provided with Service Portal. You can configure search in Service Portal using any of the search widgets.

AI Search Assist widget
Improve incident deflection for Service Portal users by displaying the most relevant search results within a record producer.
Using the widget

The widget is included in the **Create Incident** record producer form to display items based on keywords entered in the description. These items can be knowledge articles or Service Catalog items. These search results appear as the user types the information.

**AI Search Assist widget**

* Please describe your issue below

email

---

**Instance options**

The AI Search Assist widget doesn’t include instance options.

**Contextual Search widget**

Contextual Search is an embedded widget that can be added to a record producer. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

By default, the widget is included in the **Create Incident** record producer form to display items based on keywords entered in the description. These items can be knowledge articles or Service Catalog items. These search results appear as the user types the information.
The Faceted Search widget displays search results and search facets defined for a search source. The Faceted Search widget enables end users to filter search results for a more meaningful result set.

Using the widget
You can use facets, tabs, and breadcrumbs to refine your search in Service Portal. For example, you can filter search results to only knowledge articles by selecting the Knowledge tab. Or, to filter search results by certain knowledge categories, you can select one or more facets.
Faceted Search widget

The available facets are dynamic and based on the search. As you select facets, the search narrows and the number of available facets decreases. You can see which facets you've selected by viewing the pills in the facets panel. If you select a different tab, the selected facets are carried over and applied to the search criteria.

You can broaden your search by clearing an individual facet selection or selecting the All tab. To clear all facet selections, select Clear all.

You can initiate a new search by entering a new search term in the typeahead search box. After you enter the new search term, the system clears the facet and tab selections from the previous search. You can refine your new search by selecting new facets or tabs.

For more information on configuring the available facets, see Create a facet in an AI Search application configuration.

Instance options
Use the instance options to configure the Faceted Search widget for a portal page.

### Knowledge Management widgets

Use Knowledge Management widgets to build a knowledge base for your portal.

Knowledge Management widgets are included as part of the Service Portal - knowledge base plugin [com.glide.service-portal.knowledge-base], which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

For more information on knowledge management, see [Knowledge Management](#).

### KB also in Category widget

List of articles also included within a particular category. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The information that appears in the KB also in Category widget is determined by the knowledge article child categories. For more information, see [Define a knowledge article category](#).

KB Article Page widget

Use the Article page widget to view Knowledge Base articles within Service Portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Any specialized font or formatting added in the text field for the knowledge article within the platform, appears the same way in the portal.

Getting Around in Windows

Windows 8.x

Windows 8.x is designed for using touch, mouse, and keyboard together, on hardware ranging from touch-enabled tablets and laptops to PCs and all-in-one computers, including those without touch capability.

Start screen and Desktop

1. Microsoft updated the Windows 8.1 interface by returning the Start button, providing its ease of access along with the option of the Metro interface. The intent is to provide a seamless experience on desktops, laptops, tablets, and phone devices.

   By default, the Start screen is displayed. Move your mouse pointer to the bottom left corner of the screen to make the Start button appear. Click it to display the desktop; click it again to display the Start screen.

2. The Start screen has a default application display you can customize:

   1. Right-click any app and the Application bar will appear at the bottom, with options for the application you have selected.
   2. To add an app to the Start screen, click Pin to Start.

   If an application is already on the Start screen, you’ll see Unpin from Start instead.

Power User menu

The Power User menu displays the most commonly used applications from the Control Panel, File Explorer, and Task Manager, as well as Restart, Run, Search, and Shutdown/Update. Access it in one of the following ways:

- Press Win + X
Instance Options

KB article page widget instance options

<table>
<thead>

</tr>
<tr>
<td>IT</td>
<td>7</td>
</tr>
<tr>
<td>Operating Systems</td>
<td>12</td>
</tr>
<tr>
<td>Suppliers</td>
<td>1</td>
</tr>
</tbody>
</table>

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to **Knowledge > Administration > Knowledge bases** then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see [Define a knowledge article category](#).

The knowledge base that a portal uses is determined in the portal form. If your portal uses multiple knowledge bases, you can use the **KB Knowledge Bases widget** to filter the content of the KB Categories widget.

For more information on associating your portal with a knowledge base, see [Associate a portal with a knowledge base](#).

**Instance options**
The KB categories widget does not include instance options.
KB Category Page widget

Articles and article preview within a particular category. Categories are specified within the Knowledge Base module. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The KB Category Page widget works together with the KB Categories widget. When you select a category in the KB Categories widget, the KB Category page widget lists articles within that category.

To have the KB Categories and KB Category Page widgets work in tandem, add the two widgets to the same page.

If you add the KB Category Page widget to a page without adding the KB Categories widget, the KB Category Page widget displays an uncategorized list of all articles within the knowledge base.

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge > Administration > Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category.

</tbody>
</table>

**KB Knowledge Bases widget**

Give users the option to select which knowledge base to browse on your portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
**Using the widget**

If you associate your portal with multiple knowledge bases, the KB Knowledge Bases widget provides users with a menu to select a knowledge base. After a user selects a knowledge base, other KB widgets on the page filter their content accordingly.

For example, if a user selects to browse only the IT knowledge base, then the KB Categories widget shows only the categories within the IT knowledge base.

If you associate your portal with only one knowledge base, then the KB Knowledge Bases widget remains hidden on the page.

For more information on associating your portal with knowledge bases, see [Associate a portal with a knowledge base](#).

**Instance options**

The KB Knowledge Bases widget doesn't include instance options.

**KB Most Viewed widget**

List of most viewed knowledge base articles, based on user feedback. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

### Instance options

The KB view widget does not have any included instance options.

### KB View 2 widget

The KB View 2 provides an alternative structure to the KB View widget to show a different example of how to display knowledge articles. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The KB View 2 widget displays each knowledge category as a card. Click a card to access the articles within that category.
Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to **Knowledge > Administration > Knowledge bases**, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see [Define a knowledge article category](#).

The knowledge base that a portal uses is determined in the portal form. For more information on associating your portal with a knowledge base, see [Associate a portal with a knowledge base](#).

**Instance options**

The KB View 2 widget does not have any included instance options.

**Knowledge Breadcrumbs widget**

Help users navigate a knowledge base by adding the Knowledge Breadcrumbs widget. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

**Using the widget**

The knowledge breadcrumbs widget displays information based on where an article is located in a knowledge base. For example, if you open an article on "How to Deal with Spam," the breadcrumbs show that the article is located in the Email category of the IT knowledge base.
You can broaden your search of the knowledge case by selecting the titles in the breadcrumbs. For example, to see all articles in the Email category, you would select Email. To see all articles in the knowledge base, you would select IT (Knowledge Base).

The widget also includes a search box so that you can search for an article by name.

**Instance options**

Use the instance options to configure the Knowledge Breadcrumbs widget for a portal page.

ℹ️ **Note:** The AI Search instance options apply only if AI Search is enabled in your portal. For more information on enabling AI Search for Service Portal, see [Enable and configure AI Search in Service Portal](#).

</tr>
</tbody>
</table>

**Service Catalog widgets**

Use the Service Catalog widgets to build a catalog for your portal.

Most service catalog widgets are part of the Service Portal Service Catalog [com.glide.service-portal.service-catalog] plugin that is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.

The Service Portal - Service Catalog v2 plugin (com.glideapp.servicecatalog.portal) provides an enhanced Service Catalog experience. This plugin is active by default and enables the following widgets:

- Catalog Homepage Search (ID: cat-homepage-search)
- SC Scroll to top (ID: sc-scroll-to-top)
- Requests and Approvals (ID: sc_request_and_approvals)
- Recent & Popular Items (ID: sc-recent-popular)

Most of the configuration for the Service Catalog widgets takes place in the Service Catalog application of the platform. For more information on Service Catalog, see Service Catalog.

**Related information**

Service Catalog in Service Portal

**Catalog Content widget**

The Catalog Content widget is part of the Service Catalog and includes a tiled list of all the content items available in the catalog. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The items that appear on the page are grouped by category alphabetically. Catalog items and categories are defined in the Service Catalog application in the platform. For more information on creating catalog items to appear in the catalog, see Create a catalog item.

Instance Options

The Catalog Content widget does not include instance options.

Catalog Homepage Search widget

Give your users the option to search the Service Catalog as soon as they log in. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

Add the Catalog Homepage Search widget on your Service Catalog landing page. When users navigate to the Service Catalog, they can use the Catalog Homepage Search widget to find what they are looking for.
Users can enter a keyword in the search bar. The Catalog Homepage Search widget uses a predictive search feature that shows words as users type.

Alternatively, to navigate to a list of Service Catalog categories, users can select **Browse by Categories**.

**Instance options**
Use the instance options to configure the Catalog Homepage Search widget for a portal page.

⚠️ **Note:** The AI Search instance options apply only if AI Search is enabled in your portal. For more information on enabling AI Search for Service Portal, see [Enable and configure AI Search in Service Portal](#).

### Other Options

| Typeahead Search       | Configuration of the search bar. You configure the search bar by using the instance options for the Typeahead Search widget. Use the syntax `{field1: 'value1', field2: 'value2'}`). For example, to configure the title, color, and size of the search bar, enter the following: `{title: 'Search...', color: 'default', size: 'lg'}). |

### Recent & Popular Items widget

Allow a user to browse recent and popular catalog items. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

#### Using the widget

The Recent & Popular Items widget includes two tabs: **My Recent Items** and **Popular Items**.

A user opens the My Recent Items tab to see catalog items that they recently viewed or requested.

![Recent & Popular Items widget](image)

A user opens the Popular Items tab to see catalog items that have been widely requested by other users.
Each item card displays basic information about the catalog item, such as the item name, image, and price.

To navigate to the item listing, the user selects View Details.

**Instance options**

Use the instance options to configure the Recent & Popular Items widget for a portal page.

Requests and Approvals widget

Allow a user to refer to their open requests and approvals in the Service Catalog. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Using the widget

The Requests and Approvals widgets includes two tabs: My Requests and My Approvals.

A user opens the My Requests tab to see data from the Task [task] table. If the user has opened any task record, such as an incident or a change request, the record is displayed in the widget.
A user opens the My Approvals tab to see data from the Approvals [sysapproval_approver] table. If the user has been assigned to approve a request, the approval record is displayed in the widget.

If the user doesn't have any open requests or approvals, the widget remains hidden on the page.
**Instance options**

The Requests and Approvals widget doesn't include instance options.

**SC Catalog Item widget**

Use this widget (widget-sc-cat-item-v2) to view the information about a catalog item and order the item. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Configure catalog items using the Service Catalog in the platform UI by navigating to *Service Catalog > Catalog Definitions > Maintain Items*.

Catalog variables determine what information your users are allowed to select from, for example, color, size, or price. For more information on defining the variables for a catalog item, see *Create a service catalog variable*.

**Instance options**

Use the widget instance options to customize the settings for the SC Catalog Item widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select **Instance Options**.

ℹ️ **Note:** For a record producer, you can edit the label of the **Submit** button by using the widget instance options. For example, if you want to change the label to **Request**, press Ctrl+click on the catalog item widget, select **Instance in Page Editor**, and specify the following parameters in the **Additional options, JSON format** field.

```
"record_producer_label": {
  "value": "Request"
}
```

### Related information

**Request a catalog item from Service Portal**

**SC Categories widget**

The SC Categories widget displays Service Catalog categories. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The system renders the categories available in this widget from the Categories table in Service Catalog [sc_category].
If you associate your portal with multiple catalogs, then the SC Categories widget also includes a menu to select which catalog to browse.
For more information on associating your portal with catalogs, see Configure a catalog in Service Portal.

### SC Order Guide widget

Use this widget (widget-sc-order-guide-v2) to request an order guide, that is, a single service catalog request for several catalog items with a specific purpose. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Configure order guides using the Service Catalog in the platform UI by navigating to Service Catalog > Catalog Definitions > Order Guides.

The order guide form comprises the following sections:

#### Describe Needs

This section displays the following that are associated with the order guide:

- Image
- Description
- Variables

#### Choose Options

This section displays a list of catalog items included in the order guide based on the information provided in the Describe Needs section and the rule base configured for the order guide. Each catalog item is displayed with its name and description on an accordion.

Each accordion displays:

- **Options**, if a catalog item has fields that need user inputs.

  **Note:** If the fields are mandatory, a red asterisk is displayed beside Options.
• A toggle to include the catalog item in the order guide request. You can make it mandatory to include all items in the order guide request by not displaying the toggle. You can make it optional to include items in the order guide request by displaying the toggle. To display the toggle for each catalog item of the order guide, select the **Show Include Toggle (Service Portal)** check box while configuring the order guide. For more information, see Create an order guide.

**Note:** When an item is excluded from the order guide request, the item is not editable and the corresponding mandatory field restrictions are ignored.

**Summary**
This section provides a summary of the order guide that you can review before requesting the order guide.

**Instance options**
Use the widget instance options to customize the settings for the SC Order Guide widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select **Instance Options**.

SC Shopping Cart widget

The SC Shopping Cart widget (sc-shopping-cart-v2), used with Service Catalog, stores all your orders at one place. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Use the shopping cart widget to:

• Control the quantity of items in the cart.
• Add items to a cart. This information is stored in the sc_cart table.
• Define who the items are being requested for.
• Save specific items together as a bundle, which can be reloaded later. You can replace the cart items with the saved bundles, or add the bundles to the cart items.
• Remove all items from your cart.

Instance options

Use the widget instance options to customize the settings for the SC Shopping Cart widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.

### Related information

**Add a catalog item to the shopping cart**

**Enable the Shopping Cart widget**

The shopping cart widget is enabled automatically for instances upgrading to Istanbul, however, there are several ways to manually enable or disable the widget.

To enable the shopping cart for a catalog item:

1. Navigate to a catalog item on the Service Catalog page in Service Portal.
2. CTRL+right-click a catalog item widget to open the widget instance options.
3. Select or clear the **Show Add Cart Button** option to enable or disable the shopping cart for that particular catalog item.
To enable the shopping cart in the portal header:

1. From the Service Portal configuration page, select the Portal editor.
2. Select the SP Header Menu in the portal hierarchy.
3. In the **Additional options** section, make sure the enable cart value is set to **true**.

```json
{
   "enable_cart": {
       "displayValue": "true",
       "value": true
   }
}
```

Set the value to **false** to hide the shopping cart.
Enable automatic updates to the shopping cart

Update the shopping cart automatically with user-specific changes from multiple tabs and platforms.

**Before you begin**

Role required: admin or sp_admin

**Procedure**

1. Navigate to Service Portal > Service Portal Home. The Service Portal homepage is displayed.
2. In the banner, click Cart.
3. Press and hold the Ctrl key, click the wish list widget, and select Instance Options.
4. Select the **Auto update cart** check box and click **Save**.
5. Perform these steps only for upgrade customers.
   

   b. In the banner, click Portals.
c. In the list, ensure that Service Portal is selected.

d. In the portal hierarchy chart, select SP Header Menu.

e. In the Additional options, JSON format field, set the auto_update_cart value as true.

```
"auto_update_cart": {
  "displayValue": "true",
  "value": true
}
```

Automatic updates to the shopping cart

SP Variable Editor widget

The Variable Editor widget allows you to change the specifications you chose for an item in the Service Catalog. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

You can embed the variable editor widget in the shopping cart widget, to allow users to edit and make changes to their cart items. The options included in the
widget are determined by the specific catalog item and the variables that have been configured for it.

For more information on the service catalog variables that are available in Service Portal, see service catalog variable types.

<table>

</tbody>
</table>

**Instance Options**

The Variable Editor widget is embedded as part of the shopping cart widget, therefore no instance options are included.

**SC Wish List Cart widget**

Use this widget to add catalog items or record producers to the wish list so that you can review them. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

If the wish list is enabled for Service Catalog, SC Wish List Cart widget (sc_wishlist_cart) is available in Service Portal. Once enabled, the following options are available:
• The **Wish List** menu option on the main navigation bar.

• The **Add to Wish List** button in the Ordering widget for catalog items and record producers.

• A wish list details page that displays all items in the **Wish List**.

From the wish list details page, you can view or delete catalog items, clear the wish list, or navigate to the Service Catalog landing page.

### SC Wish List Cart widget

### Related information

**Add an item to the wish list in Service Portal**

**Enable the SC Wish List Cart widget in Service Portal**

Add catalog items or record producers to the wish list after you enable the wish list.

### Before you begin

**Role required:** admin or sp_admin
Procedure

1. Navigate to **Service Catalog > Maintain Catalogs**.

2. From the Catalogs list, select **Service Catalog**.

3. On the catalog form, select the **Enable Wish List** check box and click **Update**. The **Wish List** menu option is displayed in the Service Portal banner.

   ✉ Note: The **Use the sc_layout driven cart macros (default true)** (**glide.sc.use_cart_layouts**) property must be set to true to enable the wish list.

4. To enable the **Wish List** menu option in the Service Portal banner, perform these additional steps only for upgrade customers.

   a. Navigate to **Service Portal > Service Portal Configuration**.

   b. In the banner, click **Portals**.

   c. In the list, ensure that **Service Portal** is selected.

   d. In the portal hierarchy chart, select **SP Header Menu**.

   e. In the **Additional options, JSON format** field, set the **enable_wishlist** value as **true**.

   ```json
   "enable_wishlist": {
       "displayValue": "true",
       "value": true
   }
   ```
5. Enable the Add to Wish List icon (.addButton) in the Ordering widget of a catalog item or record producer:

   b. Click one of the available catalog items.

   c. Press and hold the Ctrl key, click a catalog item widget, and select Instance Options.

   d. Select the Show Add/Update Wish List buttons check box and click Save.

Enable automatic updates to the wish list
Update the wish list automatically with user-specific changes from multiple tabs and platforms.

Before you begin
Role required: admin or sp_admin
Procedure

1. Navigate to Service Portal > Service Portal Home.
   The Service Portal homepage is displayed.

2. Access the wish list.

3. Press and hold the Ctrl key, click the wish list widget, and select Instance Options.

4. Select the Auto update wish list check box and click Save.

5. Perform these additional steps only for upgrade customers.

   b. In the banner, select Portals.

   c. In the list, ensure that Service Portal is selected.

   d. In the portal hierarchy chart, select SP Header Menu.

   e. In the Additional options, JSON format field, set the auto_update_wishlist value as true.
Automatic updates to the wish list

Service Portal configuration page widgets

Service Portal uses widgets for configuration. When you configure a page or a widget for a portal in the Service Portal Configuration page, you actually use Service Portal widgets to do so.

Service Portal configuration widgets are internal only and cannot be extended.

Configuration page widgets are included as part of the Service Portal Configuration Pages plugin [com.glide.service-portal.config], which is activated automatically when you activate the Service Portal for Enterprise Service Management plugin [com.glide.service-portal.esm].

Navigate to Service Portal > Service Portal Configuration to view these widgets in action.
Service Portal Config Overview widget

The Service Portal Config Overview widget is the widget that appears on the sp_config homepage. Use this widget to navigate Service Portal Configuration. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Portal config widget

The Portal Config widget is the left panel of the Branding Editor, which you use to configure themes for your portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

How can we help?
SP Page Map widget
The Page Map widget works in the Page Editor to display any Service Portal page in a tree structure. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

SP Portal Map widget
The Portal Map widget displays your portal in a tree structure.

Theme Preview widget
The Theme Preview widget appears in the Branding Editor and allows you to see any theme changes you make to your portal. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Theme Preview widget

The Theme Preview widget appears on the main page of the Widget Editor in Service Portal Configuration. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Use the Theme Preview widget to view widgets that have recently been updated, create a widget, or view an existing widget.

Widget Edit Panel widget

The Widget Edit Panel appears on the main page of the Widget Editor in Service Portal Configuration. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

Use the Widget Edit Panel to view widgets that have recently been updated, create a widget, or view an existing widget.
Service Portal service status widgets

Use the service status widgets to display current, planned, and historical outages for business services to your end users.

The service catalog widgets are part of the Service Portal Service Status [com.glide.service-portal.service-status] plugin, which is activated automatically with the Service Portal for Enterprise Service Management [com.glide.service-portal.esm] plugin.

Business Service Status widget

View how services are running on your system. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The Business Service Status widget pulls information from the cmdb_ci_service table. You can change where the data comes from in a cloned version of the widget by adjusting the settings in the widget server script.

**Current Status widget**

The Current Status widget displays any issues reported in the system. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The Current Status widget checks the Outages [cmdb_ci_outage] table to see if the system is experiencing any outages.

Service owners and service desk managers report planned or unplanned outages by creating outage records. Each outage record includes **Begin** and **End** fields to indicate the duration of the outage. If the **End** time is later or empty, then the outage is still ongoing. The Current Status widget displays all ongoing outages.

The Current Status displays outages only for services, which are tracked in the Services [cmdb_ci_service] table.

**Instance options**

Use the instance options to configure the Current Status widget for a portal page.
<table>

</tr>
</tbody>
</table>

**Planned Maintenance widget**

Describes any planned system maintenance. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The widget gathers information from the cmdb_ci_outage table. Any planned maintenance within the following five days appears in the Planned Maintenance widget.

**Instance options**

The Planned Maintenance widget does not have any included instance options.

**Service History widget**

Displays the history of specific service's status. For example, if the Bond Trading widget has a history of planned outages or degradations, the widget displays those with a varied color scheme to differentiate the outage type. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
Service History widget

From most recent to oldest, this list shows all outages, degradations and planned maintenance for this service.

Outage - Bond Trading
- 3d ago
- Started 2016-06-14 17:13:15, Duration 1 Hour 15 Minutes

Planned Outage - Bond Trading
- 7d ago
- Started 2016-06-10 14:50:26, Duration 3 Hours 31 Minutes

Planned Outage - Bond Trading
- 8d ago
- Started 2016-06-09 04:37:15, Duration 3 Hours 32 Minutes

Planned Outage - Bond Trading
- 9d ago
- Started 2016-06-08 16:08:12, Duration 3 Hours 24 Minutes

Instance options

The Service History widget does not include any instance options.

Service Status widget

The Service Status widget provides a visual representation of service availability over the past three months. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

The Service Status widget displays the history of service availability for one service from the Services [cmdb_ci_service] table. The widget uses the page URL to determine which service to represent.

Each pill represents one day. Each color correlates with a type of service availability.

<table>
<thead>
<tr>
<th>Color</th>
<th>Service availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>No issues</td>
</tr>
<tr>
<td>Color</td>
<td>Service availability</td>

</tr>
</tbody>
</table>

### Instance options

The Service Status widget does not have any included instance options.

### Service Status Legend widget

Use concurrently with the Status History widget to show what the icons in the Status History widget mean. You can use this base system widget as-is in your portal or clone it to suit your own business needs.

### Instance options

The Service Status Legend widget does not have any included instance options.

### Service Status Subscription widget

Used in conjunction with the service status widget. Users subscribe to receive updates about the service status. You can use this base system widget as-is in your portal or clone it to suit your own business needs.
**Instance options**

The Service Status Subscription widget does not have any included instance options.

**Widget instances**

When you add a widget to a page using the Service Portal Designer, it creates a widget instance. A widget instance is a reference to a widget that contains a location, properties, and CSS specific to that instance. Adding the same widget multiple times to the same page creates multiple instances.

For example, the Icon Link widget displays as many different versions of itself as you add to a page.

- **Icon link widgets**

  ![Icon Link widgets](image)

  All widget instances point to a widget. If you make changes in that specific widget, all of the widget instances receive that change as well. You can also make changes specifically to a widget instance and only the widget instance will be affected.

**Configure widget instance options**

Each instance of the widget you configure remains unique, so you can have several instances of the same widgets on a page. For example, each instance of the cool clock widget on a page shows a different time zone. Configure a widget on a page by adjusting the instance options.

**Before you begin**

Role required: admin or sp_admin

**About this task**

Each time you add a widget to a page it creates a record on the sp_instance table with the following information:

- Reference to the column where the widget is located
- Reference to a widget
- Configuration for a widget in the form of pre-defined form fields and an Additional Options field in JSON format
Procedure

1. On a page in the Service Portal Designer, point to the Edit icon (-pencil) in a widget to open the widget instance options. You can also access widget instance options using the control + right-click menu.

2. From the Instance Options window, make the selections you want to configure your widget. Instance options vary depending on which widget you select.

Results

Configure widget instance options

What to do next
Advanced users can configure the available options for a widget. For more information, see Widget option schema.

Widget context menu

From any rendered Service Portal page you can CTRL+right-click a widget to see more configuration options in a context menu.

For example, navigate to Service Portal > Service Portal Home to open a sample portal page. CTRL+right-click Knowledge Base on that page.
**Note:** You must have the admin or sp_admin role to see the widget context menu. When you impersonate a user without one of those roles, you can still see the menu. However, a regular user signed in without those roles cannot see the menu.

**Widget context menu options**

### Widget developer guide

Develop custom widgets in the Service Portal using AngularJS, Bootstrap, and the ServiceNow API.

### What to know before you begin

To develop widgets, you need ServiceNow API experience to:
• Run record queries on the server.
• Create and update records.

You need AngularJS experience to:
• Bind variables to client controllers.
• Access server objects in a widget.
• Gather user input.

Optionally, you can build on the Bootstrap template by accessing Bootstrap components. Service Portal uses Bootstrap version 3.3.6.

Parts of a widget
Like Angular directives, widgets execute a specified behavior within a Service Portal page. A widget includes mandatory and optional scripting components.

HTML template
A mandatory widget component.
The HTML template requires knowledge of AngularJS to display and gather data. Use the HTML template to:

• Render the dynamic view that a user sees in the browser using information from the model and controller.
• Bind client script variables to your markup.
• Gather data from the end user.

Client script
A mandatory widget component.
A client script requires knowledge of both the ServiceNow API and AngularJS to create a client controller. Use the client script to:

• Map server data from JavaScript and JSON objects to client objects.
• Process data before rendering it.
• Pass data to the HTML template.
• Pass user input and data back to the server for processing.

Server script
A mandatory widget component.
A server script requires knowledge of the ServiceNow API to work with record data. Use the server script to:

- Set the initial state of the widget.
- Send record data to the widget client script using the `data` variable.
- Run server-side queries.

**Link function**

An optional widget component.

The link function requires knowledge of AngularJS. Use a link function to directly manipulate the DOM.

**Option schema**

An optional widget component.

Allows a Service Portal admin to configure a widget. Use the option schema to:

- Specify the parameters for a widget.
- Allow admin users to define instance options for a widget instance.
- Develop flexible, reusable widgets.

**Angular Providers**

An optional widget component.

Angular Providers require knowledge of AngularJS. Use Angular Providers to:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create reusable behaviors and UI components and inject them into multiple widgets.

**Dependencies**

An optional widget component.

A widget dependency is an external resource used by your widget such as JavaScript or CSS files.
Global objects in widgets

When a widget begins to render for the first time on a page, the server script executes first and accesses three global objects: `input`, `options`, and `data`. Because the `input` variable is a data object sent from the client script, this variable is undefined when first initialized.

When a widget is first instantiated, the server script:

1. Initializes an empty `data` object.
2. Initializes the `input` object with any data sent from the client controller, or the `options` object with any data used to initialize the widget.
3. Sends the `data` object to the client controller as JSON.

The client script:

1. Accesses the server `data` object using `c.data`.

   - **Note:** By default, widgets use the `c` variable to represent the controller instance using `controller as` syntax. You can change this variable when creating or cloning widgets.

2. Uses `server.update()` to post changes to the data model. This method updates the server script using the `input` object.

   - **Note:** After calling `server.update()`, the client script `data` object is automatically overwritten by the server script `data` object.

3. Uses `c.options` to access the values used to invoke the widget on the server. This object is read-only.
Using the Widget Editor

When you create a widget, a record is created in the sp_widget table. However, you can use the Widget Editor in Service Portal Configuration as your scripting environment. The Widget Editor is a full page application similar to an IDE. You can show the parts of the widget you want to edit and hide the rest, while previewing your changes in real time.

Recommendations for developing widgets

When developing custom widgets, keep these recommendations in mind for optimal performance, scalable development, and a good user experience.

Create a default state that provides an example to the end user

A widget does not have instance options defined when initially added to a page. A widget in this empty state can appear blank and cause confusion. In situations where a widget requires some initial configuration, ensure that your widget has a default state that communicates to the admin what configuration is necessary.

Widgets can also be created with demo data. Demo data can also be used to:
• Clearly demonstrate the widget functionality to the user.
• Provide data when previewing the widget in the widget editor. (Demo data is not visible in the designer).

Learn more: Tutorial: Build a custom widget.

Embed a widget rather than clone when possible

Embedding an existing widget into your custom widget takes advantage of pre-existing functionality without cloning or duplicating code. You can still pass parameters into the embedded widget to control its behavior.

Learn more: Embed an existing widget

Add limits to GlideRecord queries to improve performance

If your server-side script uses GlideRecord queries, the setLimit function can restrict the number of records returned, and improve response time on queries. For added flexibility, you can tie this limit to an instance option rather than assigning a hard-coded value (for example: gr.setLimit(options.limit || 100)).

Learn more: GlideRecord setLimit Function

Create a directive instead of embedding a complex widget

When an embedded widget is called from the server, all the scripts associated with that widget are returned. If you only need a subsection of a widget, embedding the entire widget creates unnecessary overhead. Instead, use directives to share lightweight code between widgets. Directives are useful, for example, when building UI components. Complex components with server-side and client-side functionality are best left as widgets. Use a directive instead of an embedded widget to:

• Share scope or custom scope behavior with multiple widgets.
• Share a reusable, lightweight subsection of a widget.
• Share a common UI feature, such as a list or an avatar.
• Augment widget behavior.

Learn more: Reuse components with Angular Providers.

Use a service or factory to share data and persist state

Data services and factories maintain and persist state in a widget without requiring multiple calls to the server, enabling you to:
- Keep widgets synchronized when changing records or filters.
- Share data between widgets.
- Develop more performant widgets.

Learn more: Reuse components with Angular Providers.

**Handle events with a publish/subscribe service**

Avoid using `$broadcast` in the DOM. `$broadcast` dispatches the event name to all child scopes notifying registered listeners, which can be an expensive call that requires the use of the `$rootScope` global object.

Instead, use a publish/subscribe service to handle events. When using a publish/subscribe service, a clear relationship forms between your widgets through callback handlers. In this model, you can better control the state of your events.

**Use REST calls or `server.get` to fetch data from the server**

When you call `server.update()`, the entire widget is returned from the server. If your widget includes divergent code paths, multiple calls to update the server can affect performance. As a rule, use your server script to set up the initial state of your widget. For subsequent updates, use scripted REST APIs that call script includes on your instance. This practice:

- Separates business logic from UI elements.
- Centralizes your code, allowing changes to be made in one place.

You can also use `server.get` to pass information to the server. Use this function along with `input.action` to execute specific parts of the server script.

**Develop with localization, accessibility, and UI in mind**

To create the best experience for your users, follow these guidelines:

- Consider the impact of your widget in a mobile environment. For example, avoid using mouse-over and other events that do not translate to a mobile device.
- Use SCSS variables to reuse items. See SCSS variables.
• Use variable names when using colors.
• Wrap strings for translation in localization APIs. See Internationalize a widget.

Remove unused Angular Providers from client script
For easier maintenance, remove any unused Angular Providers that were injected into the client script function statement.

Avoid using <script> tags in HTML templates
To lessen the likelihood of production issues in Service Portal, avoid using inline templates using <script> tags in a widget's HTML template. Instead, create a related Angular ng-template record for the widget.

Clone a widget
Take advantage of existing code by cloning and editing an existing widget.

Before you begin
Role required: admin or sp_admin

About this task
Tip: Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don’t benefit from future updates to the widgets they were cloned from.

Procedure
1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the Select a widget list. For example, select Hello World 2.
2. From the list menu in the widget header, click Clone "Hello World 2".
3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.

4. **Optional:** Select **Create test page** to automatically create a page containing the widget.

5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
6. In order to enable a preview of your widget, use **Enable Preview** from the menu. Use the eye icon that appears to show or hide a preview of your widget.

**What to do next**

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template `menuTemplate`. If you clone the header menu widget, you must also clone the `menuTemplate` and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the `menuTemplate` in the HTML.

**menuTemplate in header widget HTML**

Create a new widget

Create a new widget to build a custom widget from scratch.
Before you begin
Role required: admin or sp_admin

Procedure
1. Navigate to Service Portal > Service Portal Configuration > Widget Editor.
2. Click Create a new widget.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select Create test page to automatically create a page containing the widget.

Note: After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.

4. Click Submit.

The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.
**Widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Use the option schema to define the parameters for your widget.

**Storing instance options**

When developing a widget, you can edit the option schema to create parameters for your widget, or you can create a table to store instance options. If you edit the existing option schema, any instance options defined are stored in JSON format in the Additional options, JSON format field in the sp_instance table. The following field types are available:

- String
- Boolean
- Integer
- Reference
- Choice
- Field_list (depends on table)
- Field_name (depends on table)
- Glide_list

To use other field types not supported in the option schema, create an extension table to store your custom widget option schema. Using a table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define a complex option schema.
- Search and filter instance options.

⚠️ **Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

**Using options in a widget**

Access options in the widget from both the client script and the server script using the `options` global variable. You can access to any option value in your widget client script or server script using `options.optionName`. 
Client script

```javascript
function() {
    /* widget controller */
    var c = this;
    console.log(c.options.text_color) //Outputs the text_color option for this instance
}
```

Server script

```javascript
(function() {
    $sp.log(options.text_color) //Logs the value of the text_color option to the browser
    console;
})();
```

Defining default options

Before an option value is set on an instance, it appears as an undefined value when you access that option variable. Use the widget server script to specify default values for your options.

```javascript
(function() {
    options.text_color=options.text_color||"blue";
    options.maximum_entry_count=options.maximum_entry_count||5;
})
```

Edit the widget option schema

Widget instances allow users to uniquely configure each widget they add to a page. Edit the option schema to define basic parameters for your widget.

Before you begin
Role required: admin or sp_admin

Procedure

1. Navigate to Service Portal > Service Portal Configuration > Widget Editor.
2. Select the widget you want to configure the option schema for.
3. Click the menu icon (≡) and select Edit option schema. This option only appears for users that have the right to edit the widget.
4. Click + to add a widget option.
5. Define a label, name, type, hint and form section. More fields appear depending on the type you select.
Adding flexible widget options allows you to create more reusable widgets. You can add default values to help users understand each widget option. If you do not select a form section, the default is set to Other options.

6. Click **Save**.
   The option schema you defined is stored in JSON format in the **Option schema** field in the sp_widget table. Based on this option schema, each instance of the widget can use individually defined instance options.

7. Test the option schema by adding the widget to a page in the Service Portal Designer.

   a. Navigate to **Service Portal > Service Portal Configuration > Service Portal Designer**.

   b. Add the widget to a page and click the edit icon on the widget instance to view the instance options.

   c. Configure the widget instance options.

   d. View the configuration by navigating to the instance record in the sp_instance table. The instance options are stored in JSON format in the **Additional options, JSON format** field.
Store instance options in a table

Create a table to store widget instance options instead of editing the existing option schema. When using a table as your widget option schema, you can define custom fields using any ServiceNow field type, add filters to fields, and search or query instance options.

Before you begin
Role required: admin or sp_admin

About this task
To define a custom option schema, add fields to an sp_instance extension table, then set your widget to use the extension table as a data source. Using an extension table enables you to:

• Add any ServiceNow field type, including fields with advanced customization, to the option schema.
• Define complex widget options.
• Search and filter instance options.

Note: While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

Procedure
1. Create a table that extends an sp_instance table to store your custom option schema.

   a. Navigate to System Definition > Tables.

   b. Click New.

   c. Define a label and name.

   d. In the Extends table field, select an sp_instance table that provides the necessary fields.
### Instance table

<table>
<thead>
<tr>
<th>Instance table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance [sp_instance]</td>
<td>Includes base instance fields.</td>
</tr>
<tr>
<td>Instance with Table [sp_instance_table]</td>
<td>Includes sp_instance fields and fields to display table data such as Table and Filter.</td>
</tr>
</tbody>
</table>

**e. Save the form.**

2. **Define custom fields in the extension table.**
   You can define any field type to use in your option schema by adding new columns in the **Columns** list.

3. **Update your widget to use the extension table as a data source.**
   
   **a. Navigate to Service Portal > Widgets.**
   
   **b. Open the widget you would like to create custom options for.**
   
   **c. In the Data table field, select your sp_instance extension table.**

4. **Configure the extension table form to display the desired fields.** Fields configured on the form are available as instance options.
   
   **a. Navigate to the extension table form: `<yourInstance>/<your_extension_table>.do`.**
   
   **b. Right-click the header menu and select Configure > Form Layout.**
   
   **c. Add the fields to the form.**
   
   **d. Click Save.**

5. **Configure the widget to display the desired fields as instance options.**
a. Navigate to Service Portal > Widgets.

b. Open the widget that has the extension table set as the data source.

c. Use the Fields slushbucket to select fields to display as instance options.

d. Save the form.

What to do next
Test the option schema by adding the widget to a page in the Service Portal Designer. Click the edit icon on the widget instance to view the instance options. After configuring the widget instance options, view the configuration by navigating to the instance record in the sp_instance extension table.

Reuse components with Angular Providers
Angular Providers are reusable components that can be injected into multiple widgets. To ensure quick loading widgets and a high performing portal, create Angular Providers instead of overloading your client controllers with persistent data and additional logic. With Angular Providers, you can maintain data for the lifetime of your Service Portal and reuse components and data objects across multiple widgets.

Before you begin
Role required: admin or sp_admin

About this task
By creating an Angular Provider, you can:

• Keep widgets in sync when changing records or filters.
• Share context between widgets.
• Maintain and persist state.
• Create behaviors and inject them into multiple widgets.

To learn more, visit Angular Providers.
Tip: For easier maintenance and troubleshooting, remove any unused providers from the Angular Providers related list in the Widget [sp_widget] table.

Procedure

   The Widget Angular Providers table opens.

2. Click New to create a new record.

3. Select the type of Angular Provider.
   - Directive
   - Factory
   - Service
   To facilitate migration to ECMAScript 6 in the future, consider using services over factories.

4. Define a name.
   You will use the name to associate the Provider with your widget.
5. Add a script in the **Client Script** field.

**Example**

A basic factory that formats a number in US currency.

```javascript
function formatterFactory(){
    var myVal = Number;
    return {
        format: function(myVal) {
            return '$' + myVal.toFixed(2);
        }
    }
}
```

6. Associate the Angular Provider with a widget.

   a. Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.

   b. Open the widget you would like to associate with the Angular Provider.

   c. Under **Related Lists**, select **Angular Providers**.

   d. In the **Angular Providers** list, click **New**.

   e. In the **Angular Provider** field, select the appropriate Provider. Check the **Widget** field to ensure that you are associating the Angular Provider with the correct widget.

   f. Click **Save**.

7. Update the appropriate scripts in your widget to inject the Angular Provider into the widget.
Example

Inject the factory into your widget client script by passing the name of the factory as an argument in your client controller function. You can then access the object defined in the factory function in your widget client script.

```javascript
function(formatterFactory) {
    /* widget controller */
    var c = this;
    console.log(formatterFactory.format(300));
}
```

If defining a directive, use the directive in the widget HTML template.

8. To edit the Angular Provider after it is registered with your widget, open the Angular Provider client script in the widget editor.

   a. Navigate to Service Portal Configuration > Widget Editor.

   b. Under Edit an existing widget, select the widget associated with your Angular Provider.

   c. In the Show menu, open the Dependencies list and select the Angular Provider.

   ![Dependencies list]

   Note: Only Angular Providers associated with the widget are displayed in the Dependencies list. This list includes any external resources your widget depends on.

   The Angular Provider client script displays in the widget editor. In the widget editor interface, you can edit and save your widget and Provider scripts at the same time.

What to do next

To use an Angular Provider with multiple widgets, register your Provider with each widget and update the appropriate scripts.

Embedded widgets

Embed a widget in the HTML template, server script, or client script.
**Embed a widget in an HTML template**

Use the `<widget></widget>` element to embed a widget in an HTML template. Pass in the ID of the widget you are trying to embed as a parameter.

```html
<div>
  <widget id="widget-cool-clock"></widget>
</div>
```

If a widget has an option schema, you can define instance options in JSON format.

```html
<widget id="widget-cool-clock" options='{"zone": "America/Los_Angeles","title": "San Diego, CA"}'></widget>
```

Alternatively, you can define options in the widget server script.

**HTML template**

```html
<widget id="widget-cool-clock" options='data.clockOptions'></widget>
```

**Server script**

```javascript
(function() {
    data.clockOptions = {"zone": "America/Los_Angeles","title": "San Diego, CA"};
})();
```

**Embed a widget in a client script**

Use `spUtil.get()` to get a widget model in the client script.

```javascript
spUtil.get("widget-sc-cat-item", {sys_id: "your_catalog_item_sys_id"}).then(function(response) {
    c.catalogItemWidget = response;
});
```

When using the `spUtil` class in a widget client script, you must inject the class into the client script function. The following example embeds the Cool Clock widget:

**Client script**

```javascript
function(spUtil) {
    var c = this;
    spUtil.get("widget-cool-clock").then(function(response) {
        c.myClockWidget = response;
    });
}
```

**HTML template**
Embed a widget in a server script

Use `$sp.getWidget()` to get a widget model in the server script.

```javascript
data.catalogItemWidget = $sp.getWidget("widget-sc-cat-item");
```

The following example embeds the Cool Clock widget:

**Server script**

```javascript
(function() {
    var coolClockOptions = {"zone": "America/Los_Angeles","title": "San Diego, CA"}
    data.coolClockWidget = $sp.getWidget('widget-cool-clock',
                                coolClockOptions);
})();
```

**HTML template**

```html
<sp-widget widget="data.coolClockWidget"></sp-widget>
```

Widget model properties

When a widget model is called from within another widget, the HTML template, client script, and link function are loaded just as they are in the `sp_widget` record. The data property is the result of the widget server script execution. Anything that you put on the data object on the server is available in the data object on the client.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_script</td>
<td>string</td>
<td>Widget client script field.</td>
</tr>
<tr>
<td>css</td>
<td>string</td>
<td>Compiled CSS output from the SASS field for the widget.</td>
</tr>
<tr>
<td>data</td>
<td>object</td>
<td>Data object containing keys and values from the widget server script.</td>
</tr>
<tr>
<td>dependencies</td>
<td>array</td>
<td>Any third-party libraries to load before the widget executes.</td>
</tr>
<tr>
<td>options</td>
<td>object</td>
<td>Options used to initialize the widget.</td>
</tr>
<tr>
<td>template</td>
<td>string</td>
<td>HTML template field for the widget.</td>
</tr>
</tbody>
</table>
Embed a widget multiple times with custom options

Embed the cool clock widget multiple times using custom options.

Before you begin
Role required: admin or sp_admin

About this task
Create a widget that embeds multiple instances of the cool clock widget, each with a different time zone and title. Open the cool clock widget in the Widget Editor to see widget options referenced in the HTML template and the Client Script.

Cool Clock widget with Options highlighted

Procedure
1. Clone the Cool Clock widget with the name Embedded clock.
2. Replace the code blocks with the following:

```html
<div class="panel panel-default">
  <div class="panel-heading">Time across the US</div>
  <div class="panel-body">
    <div class="row">
      <div class='col-sm-3' ng-repeat="myClock in c.data.clocks">
        <sp-widget widget="myClock"></sp-widget>
      </div>
    </div>
  </div>
</div>
```
### CSS

```
.panel {
    margin-top: 10px;
}
```

### Client Script

```
function() {
    // nothing to do here...
}
```

### Server Script

```
(function() {
    var options = [
        {zone: "America/Los_Angeles", title: "San Diego"},
        {zone: "America/Denver", title: "Denver"},
        {zone: "America/Chicago", title: "Chicago"},
        {zone: "America/New_York", title: "New York"}
    ];

    data.clocks = [];
    for (var i in options) {
        data.clocks.push($sp.getWidget("widget-cool-clock", options[i]));
    }

})();
```

### Results

Each instance of the clock in the embedded clock widget appears with a different time zone.

### Sample clock options

<table>
<thead>
<tr>
<th>Time across the US</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="#" alt="San Diego" /></td>
</tr>
<tr>
<td><img src="#" alt="Denver" /></td>
</tr>
<tr>
<td><img src="#" alt="Chicago" /></td>
</tr>
<tr>
<td><img src="#" alt="New York" /></td>
</tr>
</tbody>
</table>
Create a widget dependency

In Service Portal, you can link JavaScript and CSS files to widgets to create dependencies between widgets and third-party libraries, external style sheets, and angular modules.

Before you begin
Role required: admin or sp_admin

About this task
Dependencies are loaded asynchronously from the server when needed.
Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

Procedure

1. Create a dependency package.
   A dependency package is a collection of JavaScript and CSS files that can be then connected to a widget.
   
   a. Navigate to Service Portal > Dependencies.
   
   b. In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list.)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on the initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
<tr>
<td>Angular module name</td>
<td>Optional. Define the value if the linked JavaScript is an Angular module. Provide the name of the Angular module being loaded, so that it can be injected into the Service Portal Angular application.</td>
</tr>
</tbody>
</table>

2. Add files to the dependency package.
After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
<tr>
<td>Source</td>
<td>Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• UI script (for a JS Include) or Style Sheet (for a CSS Include)</td>
</tr>
</tbody>
</table>

For a JS Include, use the UI Script field to reference a UI Script found in **System UI > UI Scripts**.

For the CSS Include, use the Style Sheet field to reference a record in the **sp_css** table.

3. Add a dependency package to a widget.
   After you have created a dependency package and added files, create a relationship between the dependency and a widget.
   a. Navigate to **Service Portal > Widgets** and find the widget record you want to add the dependency to.
   b. From the Dependencies related list, click **Edit**.
   c. In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right.
   d. Save the page to return to the widget record.

Include a font icon in a single widget
If you only want one widget to have access to a font icon, include the font icon in a single widget.

**Before you begin**
Role required: admin or sp_admin

**About this task**
Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.
Procedure

1. In the platform UI, navigate to Service Portal > Widgets, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

   ```html
   <div>
   <i class='font-family'>icon_name</i> you did it!
   </div>
   ```

   Make sure the class is exactly the same as the font family called out in the CSS. For example `<i class='material-icons'>` should be the same as the `.material-icons` included in the CSS. The `icon_name` should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon sets include a CSS file similar to the material icons one used below. Use the sys_id of the attachment as the `src` in the CSS.
Results

An icon that you can select in the widget or widget instance.

What to do next
To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.

Related information
  Include font icons on a page
  Include font icons as a widget dependency

Include font icons as a widget dependency
You can include font icons wherever a widget is loaded by including them as a widget dependency.

Before you begin
Role required: admin or sp_admin

About this task
⚠️ Note: CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

Procedure
1. In the platform UI, navigate to **Service Portal > CSS** and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to **Service Portal > Dependencies** and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.

**Internationalize a widget**

Use the `{{}}` or `gs.getMessage()` syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The `{{}}` or `gs.getMessage()` searches in the messages table `[sys_ui_message]` in the platform to see what the translation would be.

Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.

```html
<div>
  <p>{{This message will be internationalized.}}</p>
  <p>However, this will NOT be.</p>
</div>
```

Writing text as `{{message}}` is the equivalent of writing `$(gs.getMessage("message"))` in other parts of the system, but written as a more legible shorthand.
Note: In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the ${} syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

Translating strings in the client script

```javascript
function() {
    var c = this;
    c.message = "${This message will be internationalized}";
}
```

HTML template:

```html
<div>
    <!-- The output of this text will be internationalized. -->
    <p>{{c.message}}</p>
</div>
```

Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

Server script

```javascript
function() {
    data.message = gs.getMessage("this message contains 'quotes'");
    // You can also translate schema options using the server script
    // For example, data.message = gs.getMessage(options.title);
}
```

HTML template

```html
<div>
    <p>{{c.data.message}}</p>
</div>
```

Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
- Queries the Service Catalog and displays available options to the user.
Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.

Uses an Angular Provider to display a category icon beside each queried item.

Create a widget and set up a template
Create the Quick Order widget to query items in the Service Catalog.

Before you begin
Role required: admin or sp_admin

Procedure
1. Navigate to Service Portal > Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

Widget Editor
Widget Editor is a development tool that allows you to view an widgets, create new widgets from scratch, and update the vari

• Check out the Hello World Example
• Create a new widget
• Edit an existing widget

Select a widget

3. Define the following values.
• Widget Name: Quick Order
• Widget ID: quick_order
Create a test page: Active
Page ID: quick_order

Adding a widget to a test page creates a record in each of the following tables:

- sp_page
- sp_container
- sp_row
- sp_column
- sp_instance
- sp_widget

Note: You can use the Page Editor in Service Portal Configuration to view the hierarchy of elements on your test page.
4. Click **Submit**.

5. From the **Widget Editor**, open the Quick Order widget.

6. Add the following simple template to the HTML field.

   ```html
   <div class="panel panel-primary">
     <div class="panel-heading">Request an item from the catalog</div>
     <div class="panel-body">
       My catalog results
     </div>
   </div>
   ```

7. Click **Save**.

8. Preview your test page in a new tab using the following URL:

    `<yourInstanceUrl>/sp?id=quick_order`.

   Your widget template displays on the test page.

Add a server script to query an instance table

After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

**Before you begin**

Role required: admin or sp_admin

**Procedure**

1. From the **Widget Editor**, open the Quick Order widget.

2. Select **Server Script** to open the server script script field.

3. Replace the default server script with the following custom script.

   ```javascript
   (function() {
     if (input.keywords != null && input.keywords != '')
       data.items = getCatalogItems(input.keywords);

   function getCatalogItems(keywords) {
     var sc = new GlideRecord('sc_cat_item');
   ```
This script performs a keyword search on the sc_cat_item table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href="{{item.name}}">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
    </ul>
  </div>
</div>
```

This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.
Angular directives used in the template

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable <code>c.data.keywords</code>.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes <code>c.server.update()</code> after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each <code>item in c.data.items</code>, an instance of the template is created and the expressions <code>{{item.name}}</code> and <code>{{item.price}}</code> are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the **CSS - SCSS** field:

```css
.result-container {
  margin-top: 10px;
}
```

6. Refresh your test page preview to view the changes.

As you type in the search box, matching catalog items appear. Try searching for **iPad**.
Manage the empty state of a widget

Display a list of popular items to the user before any search terms are entered.

Before you begin
Role required: admin or sp_admin

About this task
Because no search has been executed when the widget initializes, the server input variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To solve this issue, give your widget something to display when the input variable is empty. This initial data can guide your users when initially interacting with your widget.

Procedure
1. From the **Widget Editor**, open the Quick Order widget.
2. Replace the existing server script with the following script:

```javascript
(function() {
    if (input.keywords != null && input.keywords != '')
        data.items = getCatalogItems(input.keywords);
    else data.items = getPopularItems();

    function getCatalogItems(keywords) {
        var sc = new GlideRecord('sc_cat_item');
        sc.addActiveQuery();
        sc.addQuery('123TEXTQUERY321', keywords);
        sc.addQuery('sys_class_name', 'NOT IN', 'sc_cat_item_wizard,sc_cat_item_content');
        sc.addQuery('sc_catalogs', 'e0d08b13c3330100c8b837659bba8fb4');
        sc.setLimit(100);
        sc.orderByDesc('ir_query_score');
        sc.query();
        var results = [];
        while (sc.next()) {
            if (!$sp.canReadRecord(sc))
                continue;

            var item = {};
            $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
            item.category = sc.getValue('category');
            results.push(item);
        }
        return results;
    }

    function getPopularItems() {
```

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
function getPopularItems() {
    var items = [];
    var count = new GlideAggregate('sc_req_item');
    count.addAggregate('COUNT', 'cat_item');
    count.groupBy('cat_item');
    count.addQuery('cat_item.sys_class_name', 'NOT IN',
                   'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
    count.addQuery('cat_item.sc_catalogs', 'e0d08b13c3330100c8b837659bba8fb4');
    count.orderByAggregate('COUNT', 'cat_item');
    count.query();
    while (count.next() && items.length < 9) {
        if (!$sp.canReadRecord("sc_cat_item", count.cat_item.sys_id.getDisplayValue()))
            continue; // user does not have permission to see this item
        var item = {};
        item.name = count.cat_item.name.getDisplayValue();
        item.category = count.cat_item.category.toString();
        item.price = count.cat_item.price.getDisplayValue();
        item.sys_id = count.cat_item.sys_id.getDisplayValue();
        items.push(item);
    }
    return items;
}(i);

This script introduces a new function `getPopularItems()` to query the database and return popular items when the `input` variable is empty.

3. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
            </li>
        </ul>
    </div>
    <div class="panel-footer" ng-if="c.datakeywords">
        © 2021 ServiceNow, Inc. All rights reserved.
        ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
        Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
    </div>
</div>
```
This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.

---

**Embed an existing widget**

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

**Before you begin**

Role required: admin or sp_admin

**About this task**

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.
Procedure

1. Inspect the SC Catalog Item widget.
   Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.

   a. Navigate to <yourInstanceURL>/sp_config?id=widget_editor.

   b. Open the SC Catalog Item widget.

   c. Note that the widget ID is `widget-sc-cat-item`. You will use this ID to embed the widget model in the client script.

   d. Examine the server script.

      Notice that the `data` object includes a `sys_id` property populated by either the `input` or `options` objects. If neither `input` nor `options` include a `sys_id`, the `$sp.getParameter()` method retrieves the `sys_id` from the request query string.

      To populate the `input` object, you can pass a catalog item `sys_id` from the Quick Order widget client script.

2. From the Widget Editor, open the Quick Order widget.

3. Replace the Quick Order widget client script with the following script.
function($location, spUtil) {
  var c = this;

  c.select = function(item_id) {
    if (c.openItem == item_id) {
      c.openItem = null;
      return;
    }

    renderCatalogItemWidget(item_id);
  }

  function renderCatalogItemWidget(item_id) {
    c.catalogItemWidget = null;
    spUtil.get("widget-sc-cat-item", {sys_id: item_id}).then(function(response){
      c.catalogItemWidget = response;
      c.openItem = item_id;
    });
  }
}

This script uses `spUtil.get()` to retrieve the widget model by ID (widget-sc-cat-item) and define the {sys_id: item_id} object. This object posts to the server script as input.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
        <div class="catalog-item" ng-if="item.sys_id == c.openItem">
          <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
        </div>
      </li>
    </ul>
  </div>
  <div class="panel-footer" ng-if="c.data.keywords">
    © 2021 ServiceNow, Inc. All rights reserved.
    ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
    Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
  </div>
</div>
```
This template:

- Adds on-click behavior using the ng-click directive.
- Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

```css
.result-container {
    margin-top: 10px;
}

.catalog-item {
    background-color: #f5f5f5;
    padding: 10px;
    @include border-top-radius($panel-border-radius);
    @include border-bottom-radius($panel-border-radius);
}
```

6. Refresh your test page preview to view the changes.
When you select a search result, the item opens in the embedded SC Catalog Item widget.

![Image of SC Catalog Item widget]

Create a reusable directive and add it to a widget

Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Before you begin
Role required: admin or sp_admin

About this task
Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

Procedure
1. Navigate to **Service Portal > Service Portal Configuration > Portal Tables > Widget Angular Provider**.
   The Widget Angular Providers table opens.
2. Click **New** to create a new record.
3. Fill out the form.

a. Add the type and name.
   - **Type**: Directive
   - **Name**: categoryIcon

b. Add the client script.

```javascript
function() {
  return {
    template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-{{::icon}} fa-stack-1x fa-inverse"></i></span>',
    restrict: 'E',
    replace: true,
    scope: {
      category: '='
    },
    link: function(scope, element) {
      var _iconMap = {
        "b06546f23731300054b6a3549db8d8": "tablet", /* Tablets */
        "15706fc0a0a7007fc21e1e70c2f": "question", /* Can we help you? */
        "d6ebf4d637b130054b6a3549d6db2": "mobile-phone", /* Mobiles */
        "109cdff8c612276003b1799a09ad65": "print", /* Office and Print */
        "6d64c6a3771300054b6a3549d6db0": "print", /* Printers */
        "2c0b59874f7b4200086eed18110c71f": "plug", /* Peripherals */
        "2809952237b1300054b6a3549d6d4": "desktop" /* Software */
      };
      scope.icon = _iconMap[scope.category] || "shopping-cart";
    }
  }
}
```

This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.
c. Click Save.

4. Associate the new Angular directive with the Quick Order Widget.

a. Navigate to `<yourInstanceURL>/sp_config?id=widget_editor`.

b. Open the Quick Order widget.

c. Under Related Lists, select Angular Providers.

d. In the Angular Providers list, click New to associate an existing Angular Provider with the Quick Order widget.

e. Add the following values to the form.

• **Angular Provider**: categoryIcon

• **Widget**: Quick Order

f. Click Save.
5. Add the `categoryIcon` directive to your Quick Order HTML template.

   a. From the **Widget Editor**, open the Quick Order widget.

   b. Replace the HTML template with the following script.

   ```html
   <div class="panel panel-primary">
       <div class="panel-heading">Request an item from the catalog</div>
       <div class="panel-body">
           <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()"
                  ng-model-options="{debounce: 250}" />
           <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
           <ul class="list-group result-container">
               <li class="list-group-item" ng-repeat="item in c.data.items">
                   <a href ng-click="c.select(item.sys_id)"
                      category="item.category" style="margin-right: 10px"></a>{{item.name}}<span class="pull-right">{{item.price}}</span>
                   <div class="catalog-item ng-if="item.sys_id == c.openItem">
                       <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
                   </div>
               </li>
           </ul>
       </div>
       <div class="panel-footer ng-if="c.data.keywords">
           <ng-pluralize count="c.data.items.length"
                         when="{'0': 'No items found for ',
                         '1': 'One item matching ',
                         'other': 'Found () items matching '}">
               {{c.data.keywords}}
           </ng-pluralize>
       </div>
   </div>
   
6. Refresh your test page preview to view the changes.
A category icon displays beside each result.

Widget API reference
Service Portal includes client and server side APIs to use in widget client and server scripts.

**Service Portal client-side APIs**
These are Service Portal APIs that you can use in a widget client controller.
See the API reference for detailed class and method information.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spAriaUtil</td>
<td>Show messages on a screen reader.</td>
</tr>
<tr>
<td>spContextManager</td>
<td>Make data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>spUtil</td>
<td>Utility methods to perform common functions in a Service Portal widget client script.</td>
</tr>
<tr>
<td>spModal</td>
<td>Show alerts, prompts, and confirmation dialogs in Service Portal widgets. The SPModal class is available in Service Portal client scripts.</td>
</tr>
</tbody>
</table>
Note: g_form as a global object cannot be used in a widget client controller or in a UI script.

Service Portal server-side APIs
These are Service Portal APIs that you can use in a widget server script.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideSPScriptable</td>
<td>Interact with data and perform record operations in Service Portal widgets.</td>
</tr>
<tr>
<td>GlideSPSearchAnalytics</td>
<td>Generates search analytics from custom ServiceNow search widgets.</td>
</tr>
<tr>
<td>spScriptedFacet</td>
<td>Define facet items, filters, or mapped queries for a facets object.</td>
</tr>
<tr>
<td>spScriptedFacetService</td>
<td>Generate a multi choice or single choice facets object for an advanced search source.</td>
</tr>
</tbody>
</table>

Widget properties
Global variable and functions available in widget client and server scripts.

Server script global objects

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>
Client script global functions

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>this.server.get([Object])</code></td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td><code>this.server.update()</code></td>
<td>Calls the server and posts <code>this.data</code> to the server script. Returns Promise.</td>
</tr>
<tr>
<td><code>this.server.refresh()</code></td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see [https://promisesaplus.com/](https://promisesaplus.com/) or AngularJS documentation.

Widget troubleshooting guide

Use the following tools to investigate and resolve unexpected behavior in your custom Service Portal widgets.

Provides debugging tips for troubleshooting Service Portal configuration issues.

**Reduce complexity**

Deactivate widgets unrelated to the widget you are troubleshooting to isolate parts of the page that may be causing errors or unexpected behavior. Set the active field to false on a widget record to hide the widget on the page, and prevent associated scripts from executing.

**Use the browser developer console**

All supported desktop browsers have built in developer tools. Access your browsers developer tools to view console messages and errors thrown by client-side javascript. Many of the logging tools detailed below output information to this console.

**Use the widget context menu to access information and options**

CTRL+right-click a widget to access configuration options for the widget. There are also options to output the scope and scope data object to the browser console. For more detail on this menu, see Widget context menu.

**Use script methods to capture debugging output**
Several methods are available to output debugging information within your server and client-side code.

### Scripted debugging methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>console.log()</td>
<td>Server and client</td>
<td>Logs output to the browser developer console.</td>
</tr>
<tr>
<td>$sp.log()</td>
<td>Server</td>
<td>Logs output to the Service Portal Log Entries [sp_log] table, when the logged in user has the sp_admin or admin role.</td>
</tr>
<tr>
<td>gs.log()</td>
<td>Server</td>
<td>Logs output to the Log [syslog] table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> gs.log creates records on the syslog table. Excessive use can adversely affect performance.</td>
</tr>
<tr>
<td>gs.warn()</td>
<td>Server</td>
<td>Produces warning level output in the Log [syslog] table.</td>
</tr>
<tr>
<td>gs.error()</td>
<td>Server</td>
<td>Produces error level output in the Log [syslog] table.</td>
</tr>
<tr>
<td>gs.addInfoMessage()</td>
<td>Server</td>
<td>Displays a green information message at the top of the browser window.</td>
</tr>
<tr>
<td>gs.addErrorMessage()</td>
<td>Server</td>
<td>Displays a red error message at the top of the browser window.</td>
</tr>
<tr>
<td>spUtil.addErrorMessage()</td>
<td>Client</td>
<td>Displays an error message within the browser window.</td>
</tr>
<tr>
<td>spUtil.addInfoMessage()</td>
<td>Client</td>
<td>Displays an Info message within the browser window.</td>
</tr>
<tr>
<td>spUtil.addTrivialMessage()</td>
<td>Client</td>
<td>Displays a message which automatically disappears after a short time.</td>
</tr>
</tbody>
</table>
Scripted debugging methods (continued)

<table>
<thead>
<tr>
<th>Method</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debugger</td>
<td>Client</td>
<td>Sets a break point in Chrome and Firefox browsers, allowing you to step through a script line by line in the browsers developer console.</td>
</tr>
<tr>
<td>{{data</td>
<td>json}}</td>
<td>HTML</td>
</tr>
</tbody>
</table>

Check for security restrictions

Often, widget display issues are caused by access rules rather than the widget script. Verify that any records that are not accessible within a widget are accessible using the platform UI. Use the ACL debugger to ensure that your users have the expected access to records used by your widgets. For more detail on the debugger, see ACL debugging tools.

Create a reference to the widgets scope in the console

Use reference to a widget to manipulate scope data or manually run the widgets client and server scripts. Use the following steps to create the reference.

- 1. Right-click the widget and choose **Inspect**.
- 2. In dev tools Elements tab, click to highlight the element with attribute `widget=widget`. You can find it a few elements above the currently inspected element. This element points the $0 scripting tool at the widget.
- 3. In the Javascript console, run the following code:

```javascript
var scopeRef = angular.element($0).scope();
```

Use the reference to your widget to change data within the console. See the following example. Remember to run **AngularJS $apply()** on the scope to apply changes to the page.

```javascript
scopeRef.data.prop1 = "Pear";
scopeRef.$apply();
```
Run any function defined in the widgets client controller from your reference using the syntax below.

```javascript
scopeRef.exampleFunction();
```

Use the refresh command to manually execute the widgets server script.

```javascript
scopeRef.server.refresh();
```

**Widget diagnostics**

Resolve Service Portal page issues by identifying widget customization levels and checking widget code directly from a portal page.

If a portal page isn't working as expected, it may be because of a bug in widget code. To diagnose the page, try diagnosing the widgets on the page.

Diagnosing widgets involves:

- Identifying widget customization levels
- Checking the code that is used in each widget

**Identifying customization levels**

Customization levels describe how widgets have been modified or developed. Identifying the customization level of a widget can help you know which part of the widget code is most important to check. There are four levels of widget customization.

<table>
<thead>
<tr>
<th>Customization level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base system</td>
<td>Base system widget with no modifications, including widgets for which you have set instance options.</td>
</tr>
<tr>
<td>Cloned</td>
<td>Widget that you cloned from a base system widget.</td>
</tr>
<tr>
<td>New</td>
<td>Widget that you created.</td>
</tr>
</tbody>
</table>
| Customized          | Base system widget that you configured in any of the following ways:  
  • Modified the widget code directly  
  • Modified widget option schema  
  • Modified widget dependencies, ng-templates, or Angular Providers |
To identify the customization levels of widgets on a portal page, open the widget context menu and select **Show Widget Customizations**. Widgets are color-coded as follows:

- **Green** – base system widget
- **Yellow** – cloned widget
- **Blue** – new widget
- **Red** – customized widget

### Checking the widget code

After you've identified the customization levels of widgets on a portal page, check the code in each widget.

To view the widget code from the portal page, click the information icon (ℹ️) on a widget.
From the widget diagnostics window, you can check the widget code in several ways:

- **View a widget record from a portal page**
  View and identify potentially problematic code in the widget record without navigating away from the portal page.

- **View related records**
  View and identify potentially problematic code in the widget dependencies, Angular Providers, and ng-templates that are being used by the widget.

- **Compare changes to related records**
  Compare an Angular Provider or ng-template against its previous version so that you check if your most recent code changes are causing issues on a portal page.

- **Compare changes to a customized widget**
  Compare your most recent update of a customized widget against the previous version to check if your recent changes are causing issues on a portal page.
• Compare a customized widget against the base system

Identify customizations to a base system widget so that you can revert your customized widgets and resolve issues on a portal page.

Recommendations for diagnosing widgets

Of the four customization levels, the highest priority issue is customized widgets. These widgets aren’t supported in system upgrades. If you’re experiencing page issues during an upgrade, it may be because you have a customized widget on your portal page.

To resolve page issues that may be caused by customized widgets, identify which parts of the widget code have been customized. Then revert the code to the original configuration. For more information on identifying these code differences, see Compare a customized widget against the base system.

Tip: Even if a customized widget is not causing page issues now, you may want to revert to the original widget to prevent issues during upgrades later.

If you’re still experiencing page issues after reverting customized widgets, check your new and cloned widgets next.

With a new widget, it’s likely that your most recent code changes are causing issues on your portal page. To identify your most recent changes so that you can debug your code, follow the steps in Compare changes to related records.

If you cloned a widget prior to a system upgrade, it’s likely that the cloned widget didn’t receive the same updated code as the base system widget. In this case, it’s recommended that you clone the widget again and add your customizations to the clone.

A base system widget is least likely to cause page issues. If you’ve already checked other widgets and are still experiencing page issues, remove base system widgets from the page and add them again without any widget options set. You can also try adding base system widgets to another page instead.

Limitations

There are several known limitations using widget diagnostics from a portal page:

• Although you can view and compare widget code, you can’t fix or revert code directly. Navigate away from the portal to change the code.

• If you navigate to another portal page while using widget diagnostics, the system disables the tool.

• Because the tool uses color to categorize widgets, it may not be accessible for visually impaired users.
• The widget dependencies that are listed on the portal page reflect only the first-level dependencies. Any dependency that is nested deeper than the first level is not included. To further troubleshoot the widget, check the nested dependencies in the widget record.

• There is no way for the system to track a Widget Dependency after you’ve deleted it.

View a widget record from a portal page

View and identify potentially problematic code in the widget record without navigating away from the portal page.

Before you begin
Role required: admin or sp_admin

Procedure

1. Navigate to a portal page.

2. On the page, open the widget context menu by CTRL+right-clicking any widget.

3. On the widget context menu, click Show Widget Customizations.

   Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On any widget, click the information icon (i).

5. On the window, click Open widget in platform.
Note: The Open widget in platform button doesn’t appear for all customized widgets. The button appears for customized widgets only if you modified one or more widget dependencies, Angular Providers, or ng-templates.

Results
A new window opens with a read-only view of the widget record.

View related records
View and identify potentially problematic code in the widget dependencies, Angular Providers, and ng-templates that are being used by the widget.

Before you begin
Role required: admin or sp_admin

About this task
Your widget may be using potentially problematic code from any of the following records:

• Widget Dependencies
• Angular Providers
• Angular ng-templates
You can view these related records directly from your portal page to check the code in each record.

**Procedure**

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.

   Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On any widget, click the information icon (ℹ).
5. On the window, open links to the following related records:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependencies</td>
<td>JavaScript and CSS files that the widget uses from the Widget Dependencies [sp_dependency] table.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Note:" /> The widget dependencies listed on this window only reflect the first-level dependencies. Any dependency that is nested deeper than the first level is not included. To further troubleshoot the widget, check the nested dependencies in the widget record.</td>
</tr>
<tr>
<td>Angular Providers</td>
<td>Angular Providers that the widget uses from the Widget Angular Providers [sp_angular_provider] table.</td>
</tr>
<tr>
<td>Angular templates</td>
<td>Angular ng-templates that the widget uses from the Angular ng-templates [sp_ng_template] table.</td>
</tr>
</tbody>
</table>

Related records that you modified or developed are outlined in red.
You can open each related record by clicking the record name.

What to do next
If you're still unable to diagnose the widget, consider checking nested dependencies or URL dependencies.

Compare changes to related records
Compare an Angular Provider or ng-template against its previous version so that you check if your most recent code changes are causing issues on a portal page.

Before you begin
Role required: admin or sp_admin

About this task
Your widget may be using potentially problematic code from any of the following records:

- Widget Dependencies
- Angular Providers
- Angular templates
You can compare versions for these related records directly from your portal page to check code changes for each related record.

ℹ️ **Note:** There's no option to compare versions for Widget Dependency records. Also, there's no option to compare versions for related records that you created. You can only compare versions of a base system record that you modified.

**Procedure**

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.

Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On a widget, click the information icon (ℹ️).

Related records that you modified or developed are outlined in red.
5. Next to a Angular Provider or ng-template record, click **Compare**.

The system displays the records of the current and previous versions side by side.

Although both sides are labeled **Version**, the left-side record represents the previous version and the right-side record represents the current version.

6. For each field in which it appears, click the window icon ( görmek ) to open the code comparator.
Your most recent changes to the widget code are highlighted in the code comparator.

Compare changes to a customized widget

Compare your most recent update of a customized widget against the previous version to check if your recent changes are causing issues on a portal page.

Before you begin
Role required: admin or sp_admin

About this task
The option to compare versions is available only for customized widgets that you modified directly. There’s no option to compare versions of a customized widget for which you modified only the widget dependencies, Angular Providers, or ng-templates.

There’s no option to compare versions for new, cloned, or base system widgets.

Procedure
1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click Show Widget Customizations.
Customized widgets are outlined in red.

4. On a customized widget, click the information icon (i).

5. On the window, click **Compare with previous version**.

The system displays the widget records of the current and previous widget versions side by side.

<table>
<thead>
<tr>
<th>Action</th>
<th>INSERT_OR_UPDATE</th>
<th>INSERT_OR_UPDATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Other Applications</td>
<td>Other Applications</td>
</tr>
<tr>
<td>Client controller</td>
<td>function ($scope, spUtil, snRecordWatcher, $rootScope) { var c = this; }</td>
<td>function ($scope, spUtil, snRecordWatcher, $rootScope) { var c = this; }</td>
</tr>
<tr>
<td>controllerAs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CSS</td>
<td>.bs-callout { margin: 10px 0 !important; padding: 20px !important; }</td>
<td>.bs-callout { margin: 10px 0 !important; padding: 20px !important; }</td>
</tr>
<tr>
<td>Data table</td>
<td>Instance [sp_instance]</td>
<td>Instance [sp_instance]</td>
</tr>
<tr>
<td>Demo data</td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
<tr>
<td>Docs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Has preview</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ID</td>
<td>current-status</td>
<td>current-status</td>
</tr>
<tr>
<td>Internal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Link</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Although both widget records are labeled **Version**, the left-side record represents the previous version and the right-side record represents the current version.

6. For each field in which it appears, click the window icon (opens in a new tab) to open the code comparator.
Your most recent changes to the widget code are highlighted in the code comparator.

**Compare a customized widget against the base system**

Identify customizations to a base system widget so that you can revert your customized widgets and resolve issues on a portal page.

**Before you begin**

Role required: admin or sp_admin

**About this task**

The option to compare a widget against the base system version is available only for customized widgets. There’s no option to compare a cloned widget against the widget that you cloned it from.

**Procedure**

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**. Customized widgets are outlined in red.
4. On any customized widget, click the information icon (i).
5. On the window, click **Compare with Base system widget**.

The system displays the widget records of the base system and customized widgets side by side.

![Compare two versions](image)

Although both widget records are labeled **Version**, the left-side record represents the base system widget and the right-side record represents the customized widget.

6. For each field in which it appears, click the window icon (تحكم) to open the code comparator.
Differences between the code of current and previous widget versions are highlighted.

Service Portal search

Service Portal displays search data within a widget on the search page. To make data searchable from Service Portal, create a search source that fetches data from a single table within your ServiceNow instance, from multiple ServiceNow tables, or from an external site. Configure search options or build custom search components.

Search sources

A search source is a record that describes the behavior and source of searchable data. A search source defines:

- Where to retrieve search data from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

Simple
Define a table within your ServiceNow instance as a source of searchable data. To learn more, see Define a search source.

**Advanced**

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search executes. You are not limited to querying single tables within ServiceNow and can define a script that fetches data from multiple tables, or from anywhere on the web. To learn more, review the Tutorial: set up an external knowledge base search source.

**Note:** Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

**Text index groups**

A text index group defines how users see search results. For example, combine search results from several sources, or set the weight of certain fields. Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.

Associate a portal with a text index group to create common search rules and to combine search results from all search sources in the group. If you have a custom search source or portal, consider whether you want to use the base system **portal_index_group** text index group, or create your own text index group. The base system text index group includes the Catalog items and Knowledge tables. When a user searches for an item in Service Portal, they see combined results from these tables. To add an index group to a portal, see Add a text index group to a portal.

**Note:** Text index groups do not support external search sources.

**Typeahead settings**

Typeahead returns search results as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record.

**Simple**

Define an icon to display beside typeahead results and the target page to display typeahead selections.

**Advanced**
Define a template for the typeahead result. See Create an advanced typeahead template.

**Search facets**
Enable your end users to filter search results for a more meaningful result set. Facets can return results based on:

- Fields in a table such as **Active** or **Author**.
- Query conditions such as `[Updated][After][Last week]`.

**Note:** Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: Enable text indexing for a table.

Search facets render in the Faceted Search widget on the sp_search page. In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table. See Enable search facets.

**Simple**
Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions. See Add facets to a simple search source.

**Advanced**
Define facets for advanced search sources using the **Facet generation script** on the search source record. Use facet APIs to create facets and assign ServiceNow facet items or mapped queries to the facet.

<table>
<thead>
<tr>
<th>API</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPScriptedFacetService - Scoped</td>
<td>Creates a single or multi choice facet.</td>
</tr>
<tr>
<td>SPScriptedFacet - Scoped</td>
<td>Defines facet items, filters, or mapped queries for the facet.</td>
</tr>
</tbody>
</table>

**Search analytics and suggestions**
Generate relevant search suggestions for your users and monitor search analytics to understand what your users are searching for and whether they're
finding what they need. Search Suggestions is a Now Platform feature. For more information, see Search Suggestions.

**Populate suggestion data on upgrade**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. For more information, see Populate search suggestions in Service Portal.

**Generate suggestions from custom widgets**

By default, the Search Events [sys_search_event] and Search Source Events [sys_search_source_event] tables collect search data from base system search widgets. To generate search analytics from custom Service Portal search widgets, use the GlideSPSearchAnalytics API. For more information, see GlideSPSearchAnalytics.

**Use suggestions instead of typeahead search**

Search suggestions replaces typeahead search in Service Portal. Update the `glide.service_portal.search_as_you_type_behavior` system property to change this behavior. For more information, see Enable and disable search suggestions. Service Portal search widgets automatically use whichever feature you enable.

**Search configurations**

When you create a simple search source, Service Portal uses the search engine settings configured on your instance. To learn more, see Zing text indexing and search engine.

**Performance recommendations**

To avoid performance degradation and to ensure a fast search experience for end users, follow these recommendations.

- Limit search sources when possible to perform only the necessary query. For example, if a search only needs to return active incidents, add a condition to the search source set to `[Active] [is] [true]`. A search that queries only active incidents is faster than a search that queries all records in the incident table.

- Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

**Note:** Service Portal search results display as text only. HTML tags, images, and formatting do not display in search results.
Define a search source

Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to query data across multiple tables and data sources, or to pull data from anywhere on the web.

Procedure

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New to add a search source.
3. Define the fields on the Search Source form.

Search Source form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display value for the search category.</td>
</tr>
<tr>
<td>ID</td>
<td>The record ID. The value should be unique, and should not include any spaces or special characters.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>If the Service Portal User Criteria Support plugin is not enabled, define user roles to access this search source.</td>
</tr>
<tr>
<td>Search page template</td>
<td>The HTML template that displays the search results. If defining a basic search source, you do not need to change the default template. For an example of a modified template, see Tutorial: set up an external knowledge base search source.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the Data Source tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Adds an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>Script defining the endpoint and API calls to fetch data. This field is only visible when Is scripted source is selected. For an example of a data fetch script, see Tutorial: set up an external knowledge base search source.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td><strong>Note:</strong> If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.</td>
<td></td>
</tr>
<tr>
<td>Facet generation</td>
<td>Script defining search facets for a scripted search source. Enable your end users to filter search results for a more meaningful result set. This field is only visible when is scripted source is selected.</td>
</tr>
<tr>
<td>script</td>
<td><strong>Note:</strong> If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User [sys_user] or Knowledge [kb_knowledge].</td>
</tr>
<tr>
<td><strong>Note:</strong> Only indexed tables return search results. Learn more: Enable text indexing for a table.</td>
<td></td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters results based on defined conditions. For example, Active is True.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display on the search results page. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select additional fields to display on the search results page. For example, User ID, Email, and City.</td>
</tr>
<tr>
<td>Paginate results</td>
<td>Paginates search results. True by default. If is scripted source is selected, the value updates to false. To enable pagination for a scripted search source, see Paginate search source results.</td>
</tr>
</tbody>
</table>
5. Configure **Typeahead** settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see <a href="#">Create an advanced typeahead template</a>.</td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if <strong>form</strong> is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**What to do next**
To enable end users to refine search results, **Add facets to a simple search source**.

**Paginate search source results**
Limit the number of results that a search source displays at one time to improve performance. End users can load more results as needed.

**Before you begin**
Role required: admin or sp_admin
About this task
If adding pagination to a simple search source, set Paginate results on the search source record to true. However, if adding pagination to an advanced search source, you must also modify the data fetch script to handle multiple pages of results. When a user loads more search results, the search source re-executes the data fetch script.

**Note:** If paginating a search source with advanced facets, do not modify the facet generation script to load facets based on the results from each page. Facets should enable end users to filter results from an entire result set, rather than page-specific results.

Procedure
1. In the platform UI, navigate to Service Portal > Search Sources.
2. Open a search source to add pagination to.
3. Set Paginate results to true.
   Enabling this field adds a Load more results button to the search results page. This flag automatically enables pagination for simple search sources.
4. Optional: If the search source is advanced, modify the data fetch script to handle multiple search result pages.
   Update the data fetch script using one of the following GlideRecord APIs, depending on the scope of the search source.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>setLocation() in GlideRecord - Global</td>
</tr>
<tr>
<td>Scoped application</td>
<td>chooseWindow() in GlideRecord - Scoped</td>
</tr>
</tbody>
</table>

The following is an example data fetch script for a global search source that queries the incident table and paginates results.

```javascript
// queryLocation is a special value injected into the script, // which holds the query_location property of the last item // in the previously fetched result set (function(query, queryLocation, count) {
var results = []; var now_GR = new GlideRecord("incident");
gr.addQuery("123TEXTQUERY321", query);
gr.query();
// Here, we are utilizing queryLocation to implement pagination. // In practice, there are many other ways to use the
```
// query_location value of the last item in the previous
// result set to implement pagination. Your implementation
// will vary by use case.
gr.setLocation(queryLocation - 1);

var resultCount = 0;
while(gr.next() && resultCount < count + 1) {
  results.push({
    label: gr.getDisplayValue(),
    short_description: gr.getValue("short_description"),
    // Here, we are populating the query_location
    // property of each result item. This is how the
    // framework knows what value to pass into the
    // next fetched search result script execution
    query_location: gr.getLocation(),
    primary: gr.getDisplayValue(),
    state: gr.getDisplayValue("state")
  });
  resultCount++;
}

if (results.length == 0)
  return results;

if(results.length > count) {
  results.pop();
} else {
  // In order to indicate that a result in the result
  // set is the final result (that there are
  // no more results to be fetched), add this property
  // to the final element in your result set.
  results[results.length - 1].isLastResult = true;
}
return results;
}) (query, queryLocation, count, facets);

For an additional example, see the Knowledge Base search source.

5. Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options.

Results
The search page only returns the defined number of results at one time. When a user selects Load more results, the search source re-executes the query or data fetch script.
Create an advanced typeahead template

Configure the way typeahead results display with an advanced template.

Procedure

1. Complete the required fields in Define a search source.
2. In the Typeahead tab of the Search Source record, select the Advanced typeahead config check box.
3. In the Typeahead template field, add an HTML template.

Example

This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'"
  style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-img" ng-if="match.model.type=='sc_guide'"
  style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-icon fa fa-file-text-o" ng-if="match.model.type=='sc_content' &&
  match.model.content_type == 'kb'"></i>
```
4. Click **Update**.

Typeahead results display beside the image defined in the service catalog record.

![Typeahead results for Apple](image)

**Tutorial: set up an external knowledge base search source**

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

**Before you begin**

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

**About this task**

In this integration, you will:
• Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
• Decode the JSON response and define the fields that the search widget expects.
• Update the search sources HTML template to open the search result in the external site.

Procedure

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add the search source to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

   a. Define the search function to be executed by the instance.

   Example

   This example uses a recordless RESTMessage, but you can modify this example to use a pre-configured if needed, or create a more secure authentication profile.

   ```javascript
   (function(query) {
   var results = [];
   /* Calculate your results here. */
   var url = "https://myInstance.service-now.com/api/now/table/kb_knowledge?sysparm_query=GO123T Exiting%3D" + encodeURI(query) + 
   "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
   var ws = new sn_ws.RESTMessageV2();
   ws.setBasicAuth("search_user", "search");
   ws.setHttpMethod("get");
   ws.setEndpoint(url);
   
   var jsonOutput = ws.execute();
   
   return results;
   })(query);
   ```
Note: In the preceding example, `ws.setBasicAuth` requires a user and password for the remote instance. For more detail, see `RESTMessageV2 - Scoped, Global`.

b. Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

Example

The final data fetch script:

```javascript
(function(query) {
    var results = [];
    /* Calculate your results here. */
    var url = "https://<my-instance>.service-now.com/api/now/table/kb_knowledge?sysparm_query=GOTO1 23TEXTQUERY321%3D" + encodeURI(query) + "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
    var ws = new sn_ws.RESTMessageV2();
    ws.setBasicAuth("search_user", "search");
    ws.setHttpMethod("get");
    ws.setEndpoint(url);

    var jsonOutput = ws.execute();
    if (jsonOutput) {
        var response = new JSON().decode(jsonOutput.getBody());
        results = response.result;
        results.forEach(function(result) {
            result.url = "https://myInstance.service-now.com/kb_view.do?sysparm_article=\" + result.number;
            result.target = "_blank";
            result.primary = result.short_description;
        });
    }

    if (jsonOutput.haveError()){
        gs.addErrorMessage(jsonOutput.getErrorMessage());
    }

    return results;
})(query);
```
In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to _blank to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. Update the search page template to open the search results in the external site.

**Example**

```html
<div>
  <a href="https://myInstance.service-now.com/kb_view.do?sysparm_article={{item.number}}" target="_blank" class="h4 text-primary m-b-sm block">
    <span ng-bind-html="highlight(item.primary, data.q)"></span>
  </a>
  <span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
    <span class="m-l-xs m-r-xs" ng-if="!$first"> &middot; </span>
    {{f.label}}: <span ng-bind-html="highlight(f.display_value, data.q)"></span>
  </span>
</div>
```

7. Click **Update**.

**Results**

Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.

**Importing Address Book From CSV File**

*KB0000027*

2 views

**Outlook 2010 - Importing Address Book From CSV File**

This article explains how to import your address book from a CSV file into Outlook 2010.

2. Select the File menu.
3. Choose Open.
4. Click Import.
5. Select Import from another program or file, then Next from the Import/Export Wizard.
6. Select Comma Separated Values (Windows), then Next.
7. Choose Browse to navigate to the .csv file that you want to import, and then click Open to return to the Import a File window.
8. Select Next and choose Contacts as the destination folder, and click Next again.
9. Click Finish to import the Address Book.

Authored by Ron Kettering

Helpful? Yes  No
Example: set up a GitHub search source

Set up an advanced search source that queries data from an external site.

Before you begin

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

Procedure

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add search sources to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

Example

To set up a GitHub integration:

```
(function(query) {
    var results = [];
    /* Calculate your results here. */
    var url = "https://api.github.com/search/repositories?q=" + encodeURI(query);
    var ws = new GlideHTTPRequest(url);
    ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
    var jsonOutput = ws.get();
    if (jsonOutput) {
        var response = new JSON().decode(jsonOutput.getBody());
        results = response.items;
        results.forEach(function(result) {
            result.url = result.svn_url;
            result.target = "_blank";
            result.primary = result.full_name;
        });
    }

    return results;
})(query);
```

6. Use the Search page template to customize the way the search results display.
Enable search facets

In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table.

Before you begin
Role required: admin or sp_admin

About this task
Search facets render in the Faceted Search widget on the sp_search page. To enable search facets after upgrade, activate the page route map record to route your search results to render in the sp_search page.

Procedure
1. Navigate to Service Portal > Page Route Maps.
2. Locate the Search record in the list.
   This record redirects users from the search page to the sp_search page when viewing search results in Service Portal. The sp_search page includes the Faceted Search widget, which supports search facets in both desktop and mobile environments.
3. Set the Active field to true.
Results
When using search in Service Portal, results render in the sp_search page. Add facets to the search source to enable end users to filter search results. To learn more about facets, see Add facets to a simple search source.

Add facets to a simple search source
Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions.

Before you begin
Role required: admin or sp_admin
In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps [sp_page_route_map] table. See Enable search facets. Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

Note: Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: Enable text indexing for a table.

Procedure
1. Navigate to Service Portal > Search Sources.
2. Open or create a simple search source.
   Simple search sources do not use a data fetch script. Rather, they define a table as the source of searchable data. To learn more about search sources, see Service Portal search.
3. Select the Facets related list.
4. Click New.
   The Facet form displays.
5. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet header.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Selection type</td>
<td>Type of user selection allowed:</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
|                            | • **Single**: Only one filter value can be selected at a time. For example, if a facet is created for the **Assigned to** field, the end user can select **Fred Luddy** or **Beth Anglin**, but not both at the same time. Before filtering for a new value, the user must first clear the current value.  
|                            | • **Multiple**: Multiple filter values can be selected at the same time. For example, if a facet is created for the **Assigned to** field, the end user can select both **Fred Luddy** and **Beth Anglin**. Because multiple choice results in an OR query, records assigned to either Fred Luddy or Beth Anglin display. |
| Active                     | Whether the filter option displays in search results.                                                                                       |
| Use mapped facet filters   | Maps a facet to a query condition, such as `[Updated][After][Last week]`. When selected, the **Fields** and **Sort** fields are removed from the form. After saving, define filters in the Facet Filters related list. |
| Order                      | Defines the display order when multiple facets are defined. If some facets do not have an order value defined, facets with an order defined display first. Facets without an order defined are displayed alphabetically. |
| Table                      | Table that the query is created for. This value is read-only and defined by the table used in the search source.                             |
| Field                      | Field that end users can filter search results by. For example, if **Active** is selected, the user can filter search results by true or false.  
|                            | Only fields of the following types are supported: True/False, Choice, Decimal, Floating Point Number, Integer, IP Address, Long, Reference, String, String (Full UTF-8), and URL. |
| Sort                       | Determines the order in which filter options display.                                                                                  |
6. Save the record.
   If **Use mapped facet filters** is selected, the **Facet Filters** related list appears in the facet form.

7. **Optional:** If **Use mapped facet filters** is selected, define facet filters. Map facet filters map a query condition to a facet label. When the end user selects the label from the facet list, the defined query executes.

   a. In the **Facet Filters** related list, click **New**.
      The Mapped Facet Form appears.

   b. Define the facet filter fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet filter option.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the display order when multiple facet filters are defined.</td>
</tr>
<tr>
<td></td>
<td>(Optional) If some facet filters do not have an order value defined, facets filters with an order defined display first. Facet filters without an order defined are displayed alphabetically.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Facet</td>
<td>The search facet that uses the mapped query. This value is read-only.</td>
</tr>
<tr>
<td>Table</td>
<td>The table defined in the search facet. This value is read-only.</td>
</tr>
<tr>
<td>Mapped query</td>
<td>A query condition that users can set to filter search results. For example, <code>[Updated][On][Today]</code>.</td>
</tr>
</tbody>
</table>
c. Click Submit.
   Users can filter search results based on the query defined.

**Disable facets for a search source**

Disable facets for one or more search sources by adding a system property. Once disabled, the search source does not display search facets in the Faceted Search widget on the sp_search page. You can disable facets for simple or advanced search sources.

**Before you begin**
Role required: admin or sp_admin

**Procedure**

1. Enter `sys_properties.list` in the Application Navigator to navigate to the System Properties table.
2. Click New.
   The System Property form opens.
3. In the Name field, enter `glide.service_portal.disable_facets_for_search_sources`.
4. In the Value field, enter a comma-separated list of search source Sys IDs to disable facets for. Do not include spaces. For example, `c6170ae86721220023c82e08f585efe6,c96eb1686721220023c82e08f585efff`.
5. Click Submit.

**Results**
Facets do not display when the defined search source is selected in the sp_search page.

**Populate search suggestions in Service Portal**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. Alternatively, you can wait until users search for keywords instead of running this script.

**Before you begin**
Role required: admin
In new instances, the search suggestions are enabled by default. In upgraded instances, you must enable the search suggestions. For more information, see Enable search suggestions.
About this task
The Now Platform collects search data and analytics that generate search suggestions. If you are upgrading from a previous release, the search analytics do not contain any data yet. To immediately provide suggestions to your users, you can populate the search suggestions using data from either the Text Searches [text_search] table or the Service Portal Log Entries [sp_log] table. The Service Portal Log Entries table includes search data from Service Portal only and may take less time to populate search suggestions. The Text Search table includes search data from the entire platform.

Search suggestions improve over time as more people use Service Portal. Search Suggestions is a Now Platform feature. For more information, see Search Suggestions.

⚠️ CAUTION: Populating search suggestions can be a resource-intensive task that may take a while to complete. Do not run this script during peak hours. Populating search suggestions is not supported on domain-separated instances.

Procedure
1. Navigate to System Definition > Scheduled Jobs.
2. Open the Populate Suggestions to avoid Cold Start - Portals scheduled job.
3. Modify the script for your search implementation.
   a. Define which portals the suggestions apply to. By default, the script populates suggestions in the base system service portal, but you can add as many as you want to the array.

```javascript
var portals = ["Service Portal"];```

   b. Change where the data comes from. By default, the script imports data from the Text Searches [text_search] table, but you can change the source table to the Service Portal Log Entries [sp_log] table. The Service Portal Log Entries only saves records from the last 90 days.

```javascript
var searchLogTable = "text_search";
```

   c. Push data to any custom search sources in your instance. Suggestions are not enabled for external search sources. You must push data to both the search source name and the Sys ID.

For example, push text searches from the Incident table to your custom Incident search source. For more information about custom search sources,
see Define a search source. By default, the system pushes text searches from the Catalog and Knowledge tables to the respective search sources.

Add the following code after line 11 in the script for each of your custom search sources.

```javascript
searchSources.push("<search-source-table-name>*");
searchSourceIds.push("<search-source-sys-id>*");
```

If the search source table does not exist, the system does not push suggestions to that search source.

d. Save the record.
   Make sure that the script includes the configuration you need. You can only run the script once.

4. Activate the record and select Execute Now.
   Running this scheduled job populates the Search Events [sys_search_event], Search Source Events [sys_search_source_event], and Search Suggestions [sys_search_suggestion] tables.

Results
Users see suggestions when they start typing in a Service Portal search widget.

Add a text index group to a portal
Define how users see search results. For example, combine search results from several sources, or set the weight of certain fields.

Before you begin
Role required: admin
If you have a custom search source or portal, consider whether you want to use the base system **portal_index_group** text index group, or create your own text index group. The base system text index group includes the Catalog items and Knowledge tables. When a user searches for an item in Service Portal, they see combined results from these tables.

ℹ️ **Note:** Index tables before adding them to a text index group. To learn more about text indexing, see Enable text indexing for a table.

Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.

About this task
ℹ️ **Note:** Text index groups do not support external search sources.
Procedure
1. Navigate to Service Portal > Portals.
2. Open the portal that you would like to add a text index group to.
3. Configure the form to add the Text Index Group field.
4. Add the text index group you want to the Text Index Group field.

Results
Search results display according to the text index group's rules.

Set the default portal search source
Use the glide.service_portal.default_search_sources system property to define default search sources.

Before you begin
Role required: admin

About this task
If you don’t define specific search sources for your portal, the system uses default search sources instead.

Default search source flow chart

Procedure
1. In the Navigation filter, enter sys_properties.list. The entire list of properties in the System Properties [sys_properties] table appears.
2. On the list, find the system property `glide.service_portal.default_search_sources`, and then open the property record.

3. Copy the sys_ID of any search source you want to add into the **Value** field of the system property using a comma-separated list.

   To change the order in which the default search sources show in the Search List, change the order of the IDs in the property.

   You can remove the default search source behavior by deleting the property value or deleting the property altogether.

4. Click **Update**.

**Configure Search Sources available on a page**

Use contextual search to limit search results for an instance of the type-ahead search widget.

With contextual search enabled, users only see type-ahead results for specific search sources. For example, searching on the Service Catalog page only shows results from the Service Catalog search source when contextual search is enabled.

1. In the Service Portal Designer (**Service Portal > Service Portal Configuration > Service Portal Designer**), find an instance of the type-ahead search widget.

2. Point to the widget and click the edit icon (-pencil).

   Alternatively, in any preview page containing the type-ahead search widget, for example the Service Catalog homepage, control + right-click to open the widget context menu. Then click **Instance Options**.

3. In the Contextual Search Sources field, select search sources from the list.

   Search sources listed for contextual search can be limited to just one, several, or all search sources.

Default search sources are defined in the `glide.service_portal.default_search_sources` property, so even if you do not have search sources configured, type-ahead search widget still shows type-ahead suggestions. For more information on default search sources, see **Set the default portal search source**.
AI Search in Service Portal

Configure the ServiceNow AI Search application for Service Portal so that portal users can take advantage of intelligent query features and quickly find the answers they need.

AI Search features

**Powerful and flexible search**

Unlike the legacy Zing search that was used in previous releases, AI Search is faster and more assistive. Portal users can find answers more quickly and easily with features like auto-complete search queries, natural language support, and typo handling.

### Search suggestions

![Search suggestions example](image)

### Typo handling

Showing results for *iphone*  
Search instead for *ipone*

### Relevant and actionable search results

With AI Search enabled in Service Portal, the portal search engine captures information about the user — such as their role, location, department, assets, and search history — and returns search results that are relevant and personalized.

AI Search also includes genius results that enable users to take action directly from the search results list.
Intelligent search refinement

Portal users can refine their search results using dynamic and static filters. For example, if a user searches Mac, they can use facets to filter search results by hardware or user profiles.

Search facets

For more information on using facets and tabs, see Faceted Search widget.
For more information on AI Search features, see Exploring AI Search.

**Activation information**

AI Search is a Now Platform feature that is active by default.

AI Search is enabled in Service Portal for all new and zBoot customers by default.

If you are upgrading to Rome as an existing customer, AI Search is disabled in Service Portal by default. You can enable it by updating the portal record. For more information, see Enable and configure AI Search in Service Portal.

⚠️ **Note:** Search widgets that you cloned or customized before a system upgrade may not be compatible with AI Search. You can resolve this issue by running a fix script that reclassifies search widget instances. For more information, see Reclassify cloned or customized search widgets.

**Configuring AI Search for Service Portal**

Configure AI Search in Service Portal by defining the following:

- **Search application configuration**
  
  Defines search experience settings, such as the search engine, search results limit, and suggestions limit. For more information on defining a search application configuration, see Defining search application configurations.

- **Search results configuration**
  
  Defines how search results are displayed. For more information on defining a search results configuration, see Define a composite dataset.

You can change the search application configuration or search results configuration that your portal uses by updating the portal record. For more information, see Enable and configure AI Search in Service Portal.

To use a different search application or search results configuration for a specific search widget, update the widget instance options. AI Search is used in the following widgets:

- Homepage Search widget
- Typeahead Search widget
- Faceted Search widget
- Catalog Homepage Search widget
- Knowledge Breadcrumbs widget
To configure the search results payload to navigate to and display the appropriate portal page for a selected data source, define an AI Search results action. For more information, see Define an AI Search Results Action.

You can configure the action buttons in genius results by defining an Entity View Action Mapping (EVAM) action. For more information, see Define an EVAM action.

You can customize the look and feel of the AI Search experience in Service Portal by updating the relevant CSS variables. For more information on these variables, see Theming for AI Search in Service Portal.

**Browser support**

With AI Search enabled in Service Portal, users must log in with a modern browser such as Google Chrome, Mozilla Firefox, Microsoft Edge (Chromium), or Apple Safari.

**Enable and configure AI Search in Service Portal**

Enable and define the AI Search experience in your portal.

**Before you begin**

AI Search is only supported in Service Portal, Employee Center (ESC), Consumer Service Portal, and Customer Service Portal. Custom portals must be built off a baseline of one of these portals to have the AI Search capability. The `glide.service_portal.enable_ais_portal.allow_list` property contains a list of supported baseline portals.

To use AI Search for knowledge articles, define a knowledge search source in the Search Sources related list of the portal record. You can keep the default Knowledge Bases search source or select a custom one.
Role required: sp_admin or admin

About this task
AI Search is enabled in Service Portal for all new and zBoot customers by default. If you are upgrading to Rome as an existing customer, AI Search is disabled in Service Portal by default. You can enable it by updating the portal record. If you leave AI Search disabled, the portal uses the legacy search experience.

Procedure
1. Navigate to Service Portal > Portals and open a portal record.
2. On the form, select Enable AI Search.
3. In the Search Application field, select the search application configuration to use for the portal.
   A search application configuration defines search experience settings, such as the search engine, search results limit, and suggestions limit. A search application configuration is selected by default, but you can select a different configuration if needed.
   For more information on defining a search application configuration, see Defining search application configurations.
4. In the Search Results Configuration field, select the search results configuration to enable for the portal.
   A search results configuration defines how search results are displayed. A search results configuration is selected by default, but you can select a different configuration if needed.
For more information on defining a search results configuration, see Create an EVAM definition.

5. Select Update.

Results
Al Search is enabled throughout the portal. Employees or customers can use AI Search the next time they log in.

The Search Sources related list is hidden from the portal record. You now define search sources in the AI Search application. For more information, see Defining search sources.

Note: If you’re experiencing issues using AI Search for knowledge articles, check that the associated search profile is linked to a knowledge bases search source. For more information, see Link a search source to a search profile.

What to do next
Search widgets that you cloned or customized before a system upgrade may not be compatible with AI Search. You can resolve this issue by running a fix script that reclassifies search widget instances. For more information, see Reclassify cloned or customized search widgets.

Reclassify cloned or customized search widgets
Search widgets that you cloned or customized before a system upgrade may not be compatible with AI Search. You can resolve this issue by running a fix script that reclassifies search widget instances.

Before you begin
1. Enable and configure AI Search in Service Portal
2. Run the Portal Analyzer to identify all cloned or customized search widgets. For more information, see Portal Analyzer.
3. For each cloned or customized search widget, copy the sys_id value of each widget instance that is associated with the widget.
4. For each cloned or customized search widget, ensure that the widget and its corresponding widget instances have the latest AI Search code from the base system search widget.

Warning: Run the fix script only after you’ve updated all cloned or customized search widgets. If you run the fix script without first updating the widget code, the widgets won’t be able to uptake the AI Search code later.
Role required: admin

About this task
If you’re unable to use AI Search in Service Portal, you may need to reclassify your cloned or customized search widgets. You can run the **Reclassifying Search widgets** fix script, which reclassifies widget instances to the sp_instance_ais class.

Procedure
1. Navigate to **System Definition > Fix Scripts**.
2. On the list, find and open the record named **Reclassifying Search widgets**.
3. On the form, update the script to define which widget instances to reclassify. Paste the sys_id value of each search widget instance in the array. For example, you would enter the sys_id values as follows:

   ```javascript
   var instances = ["sys_id_1", "sys_id_2"];
   ```
4. Save the form.
5. Select **Run Fix Script**.

Define an AI Search Results Action
Configure the search results payload to navigate to and display the appropriate portal page for the selected data source.

Before you begin
Role required: sp_admin or admin

About this task
This configuration is required for UXF Client Action buttons in genius results or search results cards.

⚠️ Note: If the action is being implemented as a server script, the script is executed by the search widget. Notification messages defined in the server script are displayed.

Procedure
1. Navigate to **Service Portal > AI Search > Search Results Action** and select **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Description of the search results action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Service Portal(s)</td>
<td>Portals in which the search results action appears. If left blank, the search results action appears in all active portals.</td>
</tr>
<tr>
<td>AI Search Source</td>
<td>Content that portal users can search on, including tables in your instance or external data sources. For more information, see <a href="#">Defining search sources</a>.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name of the action assignment. Only <strong>navigation</strong> is supported.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search results action.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the search results action.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority that the search results action takes over other actions with the same configuration. To give higher priority to an action, enter a lower number.</td>
</tr>
<tr>
<td></td>
<td>If two actions have the same order, then the oldest action takes priority.</td>
</tr>
<tr>
<td>Portal page</td>
<td>Page on which the search results action appears.</td>
</tr>
<tr>
<td>Payload query</td>
<td>Query parameters to apply to the URL. In the first drop-down, select the payload fields that correspond to the selected action name. In the next field, enter the query parameter to apply to the URL.</td>
</tr>
<tr>
<td>parameters</td>
<td></td>
</tr>
<tr>
<td>Additional query</td>
<td>Custom query parameters to use in addition to the payload query parameters. For example, to add <code>view=sp</code> as a query parameter, you would enter <code>view</code> and <code>sp</code> in the <strong>Name</strong> and <strong>Value</strong> fields, respectively.</td>
</tr>
<tr>
<td>parameters</td>
<td></td>
</tr>
</tbody>
</table>

3. Select **Submit**.

### Theming for AI Search in Service Portal

You can customize the look and feel of the AI Search experience in Service Portal by updating the relevant CSS variables.

The following CSS variables control the look and feel of the AI Search experience in Service Portal. You can edit these variables in a Theme [sp_theme] record by navigating to **Service Portal > Themes**.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>

<td>darken($btn-primary-bg, 10%)</td>
</tr>
</tbody>
</table>
Service Portal announcements

Use announcements to broadcast messages to Service Portal users. Announcements can display in an announcement banner or an announcement widget instance.

Announcements are active on new instances. To activate announcements after upgrade, you can activate the Service Portal Announcements plugin (com.glide.service-portal.announcements).

When creating announcements, you can define the way an announcement displays.

**Sort order**

Announcements are displayed depending on the order defined in:

- The `glide.service_portal.announcement.default.sort_order` system property. See Service Portal properties.
- The **Display First** field in the announcement record.

If there is a tie between two records set to **Display first**, the sort order defined in the system property is honored.

**Display location**

Announcements can display in the following locations:

- Announcement banner
- Announcements widget instance

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$now-sp-button--primary--border-color--hover</td>
<td>darken($btn-primary-border, 12%)</td>
</tr>
<tr>
<td>$now-sp-button--primary--background-color--active</td>
<td>darken($btn-primary-bg, 10%)</td>
</tr>
<tr>
<td>$now-sp-button--primary--border-color--active</td>
<td>darken($btn-primary-border, 12%)</td>
</tr>
</tbody>
</table>
To define the announcement display location, define the announcement type in the announcement record.

**Display Style**

Using display styles, you can:

- Create a custom color scheme.
- Change the text alignment.

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.

**User criteria**

If user criteria is set up for the Service Portal, you can define who can and who cannot view an announcement. Through user criteria,
you can create announcements only visible to specific users, groups, roles, organizations, and more.

Create an announcement

An announcement appears as a banner in Service Portal or within the announcements widget.

Before you begin
Role required: admin, sp_admin, or announcement_admin

Procedure
1. Navigate to Service Portal > Announcements.
   The Announcements [announcement] table displays all announcements.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal title that doesn't display in the announcement.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the announcement. To hide an announcement, clear the Active check box.</td>
</tr>
<tr>
<td>Title</td>
<td>Title to appear in the announcement.</td>
</tr>
<tr>
<td>From</td>
<td>Date and time that the announcement begins to appear.</td>
</tr>
<tr>
<td>To</td>
<td>Date and time that the announcement ends. If left empty, the announcement continues to appear until it's deactivated.</td>
</tr>
<tr>
<td>Summary</td>
<td>Text to appear in the announcement.</td>
</tr>
<tr>
<td>Display style</td>
<td>Defines the background color, text color, and text alignment of banner announcements. Base system styles include:</td>
</tr>
<tr>
<td></td>
<td>• Normal: Blue background and left-aligned, white text.</td>
</tr>
<tr>
<td></td>
<td>• Urgent: Red background and left-aligned, white text.</td>
</tr>
</tbody>
</table>

Announcements that appear in a banner use the display style defined in the Announcement record, by default. To use the display style in an instance of the Announcements widget, you can select the Use Display Style instance option.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Defines where an announcement displays. By default, announcements appear in the following locations:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Banner</strong>: Announcement banner above the banner frame in the Service Portal.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Widget</strong>: Instance of the announcements widget.</td>
</tr>
<tr>
<td></td>
<td>You can create an announcement type to define other widget instances to display an announcement.</td>
</tr>
<tr>
<td><strong>Glyph</strong></td>
<td>Glyph to display to the left of the title in banner announcements.</td>
</tr>
<tr>
<td><strong>Glyph alt text</strong></td>
<td>Alternative text for the glyph icon used with screen readers.</td>
</tr>
<tr>
<td><strong>Public</strong></td>
<td>Option to display the announcement to users before and after they've logged in.</td>
</tr>
<tr>
<td><strong>Display first</strong></td>
<td>If selected, the announcement displays before all other announcements.</td>
</tr>
<tr>
<td></td>
<td>If there is a tie between two records set to <strong>Display first</strong>, the sort order defined in the glide.service_portal.announcement.default.sort_order system property is honored. See Service Portal properties.</td>
</tr>
<tr>
<td><strong>Roles</strong></td>
<td>If <strong>Public</strong> is not selected, you can define the roles that the announcement is visible to. If left empty, the announcement is visible to all roles.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Alternatively, you can define user criteria for the announcement instead. To do so, set up User criteria for Service Portal and clear the <strong>Public</strong> check box. Announcements display to only the users who pass the access criteria.</td>
</tr>
<tr>
<td><strong>Unauthenticated only</strong></td>
<td>Option to display the announcement only to users who haven't logged in.</td>
</tr>
<tr>
<td></td>
<td>This option appears only if <strong>Public</strong> is selected.</td>
</tr>
<tr>
<td><strong>Click target</strong></td>
<td>Creates a link below the announcement body that opens to a target page or URL.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: Announcement doesn't include a link.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Page</strong>: Opens a Service Portal page in the current browser tab.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>URL in current browser tab</td>
<td>Opens a URL in the current browser tab.</td>
</tr>
<tr>
<td>URL in new browser tab</td>
<td>Opens a URL in a new browser tab.</td>
</tr>
</tbody>
</table>

If the Details link text field is empty and a click target is defined, the title of the announcement is the link.

- **Details page**: The page that opens in the current browser tab. Available if the Click target is **Page**.
- **Details URL**: The URL that opens in the current or new browser tab. Available if the Click target is **URL in current browser tab** or **URL in new browser tab**.
- **Details link text**: Link text for the page or URL click target. If you leave this field empty and define a click target, the title of the announcement is the link.
- **Dismiss options**: Determines whether the user can dismiss the announcement. Options include:
  - User can dismiss - no redisplay
  - User can dismiss for current session only
  - User cannot dismiss
- **Portals**: Portals that display the announcement. If this field is empty, the announcement displays in all portals.

4. Save or submit the record.

**What to do next**
If the Type is Banner, test your announcement by navigating to the portal defined in the Portals field. If the Type is Widget or a custom type, test your announcement by navigating to the page with the associated widget instance.

**Create an announcement display style**
Define the background color, foreground color, and text alignment of an announcement.

**Before you begin**
Role required: admin, sp_admin, or announcement_admin
Procedure

1. Navigate to Service Portal > Announcements.
2. Open an existing announcement or create a new announcement.
3. In the Display style field, click the reference lookup icon to open the referenced table. The Announcement Styles [announcement_style] list view opens.
4. Click New to create a new display style.
5. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the display style.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the announcement. This value is read-only.</td>
</tr>
<tr>
<td>Background color</td>
<td>Color name or HEX value in the format #000000 for the announcement background.</td>
</tr>
<tr>
<td>Foreground color</td>
<td>Color name or HEX value in the format #000000 for the announcement text.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Text alignment. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Left align</td>
</tr>
<tr>
<td></td>
<td>• Center align</td>
</tr>
</tbody>
</table>

6. Click Submit.

Results
By default, the announcement appears in both the portal banner and the Announcements widget, but only the banner uses your new display style. You can configure the widget to use the display style also. For more information, see the instance options in Announcements widget.

Create an announcement type
Announcement types determine where an announcement displays. Announcements include two base system types: banner and widget.

Before you begin
Role required: admin, sp_admin, or announcement_admin
About this task
Similar to creating a category tag, you can create alternative types to define custom locations. For example, to display an announcement only in a specific widget instance, you can create an announcement type for that widget instance. Any announcements tagged with that type will only display in the desired widget instance.

Procedure
1. Navigate to System Definition > Tables > Announcement Consumer Type. The Announcement Consumer Type table [announcement_consumer_type] opens.
2. In the Columns section of the form, Click New.
3. Define a Name. The name is used to associate an announcement with a widget instance.
4. Click Save.
5. Add the custom type to an announcement.
   a. Navigate to Service Portal > Announcements.
   b. Open an existing announcement or create a new announcement.
   c. In the Type field, select the custom type.
   d. Click Save.
6. If using the type in a widget, define the type as a widget instance option. The announcement banner only displays announcements tagged with the Banner type.
   a. Navigate to an instance of the Announcement widget.
   b. Control + right-click the widget instance and select Instance Options.
   c. In the Type field, select the custom announcement type.

Results
The widget instance associated with the type displays any announcements tagged with the same type.

Service Portal security
Control user access to a portal.
Control who accesses your portal and what they can see in the following ways:
• Authentication: Configure login and single sign on for users
• Limit page access by role: Use roles to limit the users who can see a page.
• Public pages: Use the public check box on a page record to make the page publicly accessible.

⚠ Note: A number of portal pages that are installed by default are marked public. Filter your list of Service Portal pages for Public [is] true to identify these pages. Setting the Public value to false will prevent these pages from being publicly available.

• User criteria: For a more advanced way of limiting user access, create and apply user criteria to pages, widgets, widgets instances, and search sources.

• Multifactor authentication: If an instance is configured to require multifactor authentication, users are automatically directed to set up multifactor authentication upon initial login. For setup instructions, see . If multifactor authentication is optional, users can still enable or disable authentication from their user profile. For setup instructions, see .

Single sign-on, logins, and URL redirects

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the ServiceNow platform should make any changes.

Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to Use external login. For more information on SSO and authentication in the platform, see Multiple-Provider single sign-on (SSO).

Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the Public flag on the page record is not selected. For more information, see Create and edit a page using the Service Portal Designer. If a user navigates to a non-public page, they are redirected to the login page for the requested portal.
Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

- **Page**: $sp
- **Active**: true

**Configure the Service Portal login page**

Administrators can configure a login page URL redirect for a portal.

**Procedure**

1. **Add a system property** with the following settings:
   - Name: glide.entry.page.script
   - Type: string
   - Value: 
     ```java
     new SPEntryPage().getLoginURL()
     ```

2. To customize the actual entry page, from the Script Includes table, search for SPEntryPage.

   **Note**: If you make changes to the script include, it won't be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses /sp/ as the portal path to redirect to. Enter your own portal_suffix in place of sp.

   ```javascript
   SPEntryPage.prototype = {
     initialize: function() {
       this.logVariables = false; // for debugging
       this.portal = "/sp"; // The URL suffix specified in the sp_portal record
     },
   }
   ```

   **Note**: The slash character (/) after /sp may cause issues when configuring single sign-on. If you’re experiencing issues, try removing the character from the script.

**Redirect to Service Portal after login**

Use system properties and script includes to conditionally redirect users to a page after logging in.

Follow these steps to redirect a user to Service Portal after they log in.
1. In the `sys_properties` table, add the following property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

getFirstPageURL primarily does the following:

- Redirects to `login_redirect.do` in order to break out of the frameset (if there is one).
- Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the `SPEntryPage` script include.

⚠️ **Note:** If you make changes to the script include, it won't be upgraded with future updates.

⚠️ **Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

### Debug Service Portal URL redirects

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from SPEntryPage and see the session variables it redirects based on:

1. Make sure the system property `glide.entry.first.page.script` has the value: `new SPEntryPage().getFirstPageURL()`.
2. From the SPEntryPage script include, set `this.logVariables = true`.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to **System Logs > System Log > All**.

### Configure page security by role

Set up pages to be public or filter them by role.
Before you begin
Role required: admin or sp_admin

About this task
Public pages won't require a user login; anyone can access them. All other options require user authentication.

Procedure
1. In the Service Portal configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. In the Select Page list, search for the page to apply page security to.
3. Select the highest level node in the tree view.
4. Configure page security.
   • To make a page public, select the Public check box. All users can access pages marked as Public.
   • To limit access to a certain role, add roles in a comma separated list. Users without the role listed can see links to the page if they appear in the portal. Trying to open the page results in a "page not found" error.

   Note: If you select Public and add a list of roles, the page is still accessible by any user.

   • To create a draft page that only administrators can see while the page is still in development, select Draft. Users must have the admin role to see any pages in draft. Everyone else sees a "page not found" error.
5. Click Save.
Example:

Page with limited access by role

What to do next
Follow the steps in Configure widget security to configure security for the widgets on your page.

Configure widget security
Configure widget security to ensure that your widget is being accessed only by the intended audience.

Before you begin
Role required: admin or sp_admin

About this task
There are several ways to configure widget security:

• Make the widget public to unauthenticated users
• Make the widget accessible to any user with a login
• Make the widget accessible to certain roles only

When you configure widget security, configure the page security accordingly so that users can access the widget via the page on which it appears. For more information, see Configure page security by role.

Procedure
1. Navigate to Service Portal > Widgets.
2. Open the record of the widget to configure.
3. On the form, configure the widget security.
<table>
<thead>
<tr>
<th>Option</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make the widget public to unauthenticated users</td>
<td>Select the <strong>Public</strong> check box.</td>
</tr>
<tr>
<td>Make the widget accessible to any user with a login</td>
<td>Note: If you select <strong>Public</strong> and add a list of roles, the widget is still accessible by any user.</td>
</tr>
<tr>
<td>Make the widget accessible to certain roles only</td>
<td>Clear the <strong>Public</strong> check box and leave the <strong>Roles</strong> field blank.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>a. Clear the <strong>Public</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>b. Next to <strong>Roles</strong>, click the edit icon (<strong>Roles</strong>)</td>
</tr>
<tr>
<td></td>
<td>c. On the Roles window, select a role by moving it from the <strong>Available</strong> list to the <strong>Selected</strong> list.</td>
</tr>
<tr>
<td></td>
<td>d. Click <strong>Done</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**User criteria for Service Portal**

User criteria enables you to allow access to users based on role, department, group, location, or company. Administrators can control access to pages, widgets, widget instances, announcements, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal. Learn more about user criteria in the Now Platform:

- **Service Catalog**: Set security for items and categories.
- **Knowledge management**: Control access at the knowledge base level through user criteria.

**Important**: After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.
Converting role-based permissions to user criteria records

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must set the user criteria for Service Portal system property to \textbf{true}. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to \textbf{false}.

User criteria checks

User criteria uses the following checks in Service Portal to verify user access.

Page access user criteria

The following diagram shows how the system decides whether a user can access a page based on user criteria.
Widget access user criteria
The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.

Activate the user criteria for Service Portal plugin
You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.
Set the user criteria for Service Portal system property

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

Before you begin
Role required: admin

About this task
Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

Procedure
1. Navigate to Service Portal > Properties.
2. Click the check box to set the following property to true.
   
   Enable use of User Criteria records instead of Roles fields for Service Portal entitlements
   Defines permissions for Service Portal widgets, widget instances, search sources and pages
   
   Yes | No

   3. Click Save.

Create a user criteria record for Service Portal

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.

About this task
You can apply existing user criteria to records in Service Portal through Service Portal configuration (Service Portal > Service Portal configuration). You can only create user criteria within the platform UI.

Procedure
1. In the navigation filter, type Service Portal.
2. Select a page, widget, or widget instance record.
3. In the related list at the bottom of the record, select the **Can View** or **Cannot View** tab, then click **New**. If a user criteria record is already created, you can click **Edit** to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the user_criteria table.

![User Criteria Form](image)

4. Complete the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Displays or hides the <strong>Script</strong> field.</td>
</tr>
<tr>
<td>Script</td>
<td>Defines any additional criteria, and returns true or false. This field is available only if <strong>Advanced</strong> is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Note:**    | • Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.  
• Do not use a function with its name as answer, that is, answer(). |
| Application  | Application scope for the user criteria record.                                                        |
| Active       | Activate or deactivates this criteria record.                                                          |
| Companies    | Companies to match access criteria.                                                                    |
| Locations    | Locations to match access criteria.                                                                    |
| Departments  | Departments to match access criteria.                                                                   |
| Match All    | Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access.  
By default, this check box is cleared so that any condition met provides a match.  
For example, consider a user criteria record for the following:  
• Locations A or B  
• Company C or D  
With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.  
With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B.  
**Note:** If you select **Match All**, ensure that you do not create contradictory conditions that can never be met.  
For example, if all users in location A work for company G, then the conditions in this example can never be met. |

5. Click **Submit**.
Apply user criteria to a page, widget, or widget instance
Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal.

Before you begin
Activate the Service Portal User Criteria Support (com.glide.service-portal.user-criteria) plugin and set the glide.service_portal.user_criteria_enabled system property to true.

Role required: admin or sp_admin

About this task
You can apply several user criteria records to a single portal item.

Procedure
1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click Who Can View or Who Cannot View.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.
   Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected page, widget, or widget instance.

7. Click Save.
Apply user criteria to a search source

Assign user criteria to search sources to limit user access to content in a portal.

Before you begin

Role required: admin

About this task

You can add user criteria to custom or default Service Portal search.

Procedure

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Search Source in the header menu.

2. Open the search source record that you would like to modify.

3. Under related lists, click Who Can View Search Sources or Who Cannot View Search Sources.

4. Click New.

5. Select a criteria from the Can View or Cannot View list.
   Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected search source.
6. Click **Save**.

**Enable e-signature for Service Portal**

You can configure e-signature in Service Portal to require re-authentication from approving users.

**Before you begin**

The `com.snc.integration.esig.window` system property is supported to enable SSO login in a new window.

Role required: admin

**Procedure**

1. Activate the Approvals with e-Signature `com.glide.e_signature_approvals` plugin.

2. Navigate to **System Definition > e-Signature Registry**.

3. Add any tables you want to require an e-signature for to the list.

**Results**

With e-signature enabled, approvers are required to provide a password to approve or reject any requests. Authentication with touch ID works in the mobile app. On the mobile web, approvers are still required to enter a password. For more information on configuring e-signature, see **Approval with e-signature**.

**Enable SSO login in a new window**

Open a new window for SSO authentication when using e-Signature for approvals.
Before you begin
Security Assertion Markup Language (SAML) login is only supported on the desktop Service Portal.
For additional information, see the e-signature SSO login KB article.
Role required: admin

Procedure
1. Enter the spEsignatureCustom script.
   a. Enter `sys_ui_script.list` in the Filter navigator.
   b. Select New, and create a new UI script.
   c. On the UI Script form, enter `spEsignatureCustom` in the API Name field.
   d. In the UI Type field, select Mobile/Service Portal.
   e. Paste the `spEsignatureCustom script` in the Script field.
   f. Select Submit.
2. Enter the spAuthCustom script.
   a. In the same `sys_ui_script.list` table, create another new UI script by selecting New.
   b. On the UI Script form, enter `spAuthCustom` in the API Name field.
   c. In the UI Type field, select Mobile/Service Portal.
   d. Paste the `spAuthCustom script` in the Script field.
   e. Select Submit.
3. Associate the UI scripts to the JS Include record.
   a. Navigate to Service Portal > Portals.
   b. Identify the Service Portal you want to apply the esignature support to and select the Theme.
   c. In the related lists, select JS Includes.
   d. Select New.
   e. On the form, fill in the fields.
### JS Include form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name for your JS Include. Enter spEsignatureCustom and associate the record with the spEsignatureCustom UI script you created, or enter spAuthCustom and associate the record with spAuthCustom you created.</td>
</tr>
<tr>
<td>Source</td>
<td>Source for your JS Include record. Select <strong>UI Script</strong>.</td>
</tr>
<tr>
<td>UI script</td>
<td>UI script source for your JS Include record. Select either spEsignatureCustom or spAuthCustom depending on the record you’re creating.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for your JS Include record. The default application is <strong>Global</strong>.</td>
</tr>
<tr>
<td>Updated</td>
<td>Field displaying when the record was last updated.</td>
</tr>
<tr>
<td>Package</td>
<td>Field that establishes the JS Include package.</td>
</tr>
</tbody>
</table>

**f.** Select **Submit**.

**Results**

A new window opens when you use E-Signature for approvals.

**spEsignatureCustom script**

Paste the spEsignatureCustom script in the sys_ui_script.list script field.

```javascript
angular.module('sn.$sp').provider('spEsignature', function()

    'use strict';

    this.$get = function spEsignature($q, $http, $window, urlTools, xmlUtil) {
        var w = window;
        var esignOW;
```
var windowWidth;
var windowHeight;
var redirectURL;

function isWindowChosen() {
    var postParams = {
        sysparm_scope: 'global',
        sysparm_processor: 'ESignatureAuthUtils',
        sysparm_name: 'isWindowChosen'
    };
    return $http({
        method: 'POST',
        url: '/xmlhttp.do',
        data: urlTools.encodeURIParameters(postParams),
        headers: {
            'Content-Type': 'application/x-www-form-urlencoded'
        },
        transformResponse: function(response) {

Enable external user self-registration for Service Portal

Enable external users to register to a ServiceNow app through Service Portal.

Before you begin
Complete the previous tasks:

1. Activate External User Registration
2. Configure the registration form for an external user configuration

Role required: admin

About this task
External user self-registration enables a large group of users to register to a ServiceNow app without the help of an administrator. For more information, see Enable external users to self-register to your ServiceNow instance.

Procedure

1. Navigate to Service Portal > Portals.
2. Open a portal record.
3. On the form, fill in the External user registration configuration field.
   Select a user registration configuration.
4. Click Update.
Results
The login widget includes a link to the registration form that you previously configured.

Register your PIV/CAC card for Service Portal login

Register your Personal Identity Verification (PIV) or Common Access Card (CAC) card so that you can log in to your organization's portal without entering a password.

Before you begin
To register your PIV/CAC card, an administrator must activate certificate-based authentication and then set up PIV/CAC authentication. For more information on this setup process, see Personal Identity Verification (PIV) card or Common Access Card (CAC) based authentication.

The following task assumes that you have a card reader connected to your system.
Role required: none

**Procedure**

1. Log in to a portal using your user name and password.
2. In the portal, open your user profile.
3. Insert your PIV/CAC card into a card reader and then select **Register your client certificate**.

4. In the dialog box that appears, review the PIV/CAC certificate and then select **Register**.
If the registration is successful, the system provides the following alert message:

The PIV/CAC certificate has been successfully registered and linked to the user account.

Close the dialog box to finish.

Results
The next time you log in to your portal, you can log in using your PIV/CAC card. To log in, insert your PIV/CAC card into a card reader and then select **Login with PIV/CAC card**.
To log out of the portal, select your avatar and then select **Logout**. Then, close the browser window.

**Service Portal SCSS Primer**

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.
**SCSS variables**

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the follow data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```plaintext
$font-stack:    Helvetica, sans-serif;
$primary-color: #333;

body {
    font: 100%$font-stack;
    color: $primary-color;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS functions**

List of functions for Service Portal SCSS compiler.

**RGB functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
</tbody>
</table>
### Function Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>mix($color1, $color2, [$weight])</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>

### HSL functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjust-color()</td>
<td>Increases or decreases one or more components of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>scale-color()</td>
<td>Fluidly scales one or more properties of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>change-color()</td>
<td>Changes one or more properties of a color.</td>
<td>No</td>
</tr>
<tr>
<td>ie-hex-str()</td>
<td>Converts a color into the format understood by IE filters.</td>
<td>No</td>
</tr>
</tbody>
</table>
## String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, [$end-at])</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>

## Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>abs($number)</td>
<td>Returns the absolute value of a number.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
A function is a block of code that performs a specific task. Common functions include min(), max(), and random() for numerical operations, and length(), nth(), and set-nth() for list manipulations.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>min($numbers…)</td>
<td>Finds the minimum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>max($numbers…)</td>
<td>Finds the maximum of several numbers.</td>
<td>Yes</td>
</tr>
<tr>
<td>random([[$limit]])</td>
<td>Returns a random number.</td>
<td>No</td>
</tr>
</tbody>
</table>

**List functions**

Lists in SCSS are immutable. All list functions return a new list rather than updating the existing list in-place.

All list functions work for maps as well, treating them as lists of pairs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins two lists into one.</td>
</tr>
<tr>
<td>append($list1, $val)</td>
<td>Appends a single value onto the end of a list.</td>
</tr>
<tr>
<td>zip($lists…)</td>
<td>Combines several lists into a single multidimensional list.</td>
</tr>
<tr>
<td>index($list, $value)</td>
<td>Returns the position of a value within a list.</td>
</tr>
<tr>
<td>list-separator($list)</td>
<td>Returns the separator of a list.</td>
</tr>
</tbody>
</table>

**Adding custom functions**

```scss
@function my-calculation-function($some-number, $another-number)
{ @return $some-number + $another-number }
```

**SCSS nesting**

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:
The `ul`, `li`, and `a` selectors are nested inside the `nav` selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```css
nav { 
  ul { 
    margin: 0;
    padding: 0;
    list-style: none;
  }

  li { display: inline-block; }

  a { 
    display: block;
    padding: 6px 12px;
    text-decoration: none;
  }
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS operators**

SCSS has a handful of standard math operators like `+`, `−`, `∗`, `÷`, and `%.

Use simple math to calculate widths for an aside & article. For example:

```css
.container { width: 100%; }

article[role="main"] { 
```

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The generated CSS looks like:

```css
.container {
  width: 100%;
}

article[role="main"] {
  float: left;
  width: 62.5%;
}

aside[role="complementary"] {
  float: right;
  width: 31.25%;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS mixins**

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```scss
@mixin border-radius($radius) {
  -webkit-border-radius: $radius;
  -moz-border-radius: $radius;
  -ms-border-radius: $radius;
  border-radius: $radius;
}

.box { @include border-radius(10px); }
```

The generated CSS looks like:

```css
.box {
  -webkit-border-radius: 10px;
  -moz-border-radius: 10px;
```
For more information on Sass, see the Sass/SCSS reference.

**Performance Analytics Content Pack for Service Portal**

The Performance Analytics Content Pack for Service Portal enables service delivery executives to improve user engagement with your organization’s portals by tracking the usage of portals in preconfigured indicators and data visualizations.

To enable the Performance Analytics Content Pack for Service Portal, install the content pack from the ServiceNow Store. Purchasing a subscription to the licensed Performance Analytics is required to install the content pack.

After you enable the content pack, you can access the Service Portal dashboard by navigating to **Performance Analytics > Dashboards**. From the dashboard picker, open the Service Portal Usage dashboard.

Assign the pa_viewer role to users who need to view the dashboard. You must have the sp_admin or admin role to edit the dashboard.

The Service Portal Usage dashboard includes the following tabs:

- Overview
- Visitors
- Views
- Searches

You can view reports by selecting options in the interactive filter based on the Service Portal and the Service Portal User Country. The statistics provided in each tab change based on the options selected in the interactive filter.

**Overview tab**

The Overview tab displays the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Searches</td>
<td>Total number of user searches today.</td>
</tr>
<tr>
<td>Average Click-Through Rate</td>
<td>Average number of searches that have resulted in a click today.</td>
</tr>
<tr>
<td>Widget</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Average Click Rank</td>
<td>Average position of clicked items in a search result list today. A lower value means a higher position on the search result list.</td>
</tr>
<tr>
<td>Visitors vs Views</td>
<td>Comparison of three metrics:</td>
</tr>
<tr>
<td></td>
<td><strong>Visitors</strong></td>
</tr>
<tr>
<td></td>
<td>Total number of unique visitors per week.</td>
</tr>
<tr>
<td></td>
<td><strong>Pages per Visitor</strong></td>
</tr>
<tr>
<td></td>
<td>Number of unique views by a unique visitor per week.</td>
</tr>
<tr>
<td></td>
<td><strong>Page views</strong></td>
</tr>
<tr>
<td></td>
<td>Total number of unique views per week.</td>
</tr>
<tr>
<td>Top Portals by Page Views</td>
<td>Weekly ranking of portals by the number of unique views.</td>
</tr>
<tr>
<td></td>
<td><strong>Name</strong></td>
</tr>
<tr>
<td></td>
<td>Name of the portal.</td>
</tr>
<tr>
<td></td>
<td><strong>Week</strong></td>
</tr>
<tr>
<td></td>
<td>Number of unique views each week.</td>
</tr>
<tr>
<td></td>
<td><strong>Change %</strong></td>
</tr>
<tr>
<td></td>
<td>Percentage of change in the number of unique views since last week.</td>
</tr>
<tr>
<td></td>
<td><strong>Trend</strong></td>
</tr>
<tr>
<td></td>
<td>Visualization of how the number of unique views has changed over the course of the last month.</td>
</tr>
<tr>
<td></td>
<td><strong>Distribution</strong></td>
</tr>
<tr>
<td></td>
<td>Visualization of the number of unique views in relation to other portals in your instance. A full bar means that the portal has the highest number of unique views.</td>
</tr>
</tbody>
</table>
Visitors tab

The Visitors tab displays the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visitors - Last 7 Days</td>
<td>Total number of unique visitors in the last week.</td>
</tr>
<tr>
<td>Visitors</td>
<td>Number of unique visitors each day, over the course of the last week.</td>
</tr>
<tr>
<td>Top Pages by Unique Visitor</td>
<td>Daily ranking of pages by number of unique visitors.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the page.</td>
</tr>
<tr>
<td>Day</td>
<td>Number of unique visitors each day.</td>
</tr>
<tr>
<td>Change %</td>
<td></td>
</tr>
<tr>
<td>Widget</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| **Percentage of change in number of unique visitors since yesterday.** | **Trend**  
Visualization of how the number of unique visitors has changed over the course of the last week. | **Distribution**  
Visualization of the number of unique visitors in relation to other pages. A full bar means that the page has the highest number of unique visitors. |

### Views tab

The Views tab displays the following widgets:
<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Views - Last 7 Days</td>
<td>Total number of portal views in the last week.</td>
</tr>
<tr>
<td>Views</td>
<td>Number of portal views each day, over the course of the last week.</td>
</tr>
<tr>
<td>Top Pages by Views</td>
<td>Daily ranking of pages by the number of unique views.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the page.</td>
</tr>
<tr>
<td>Day</td>
<td>Number of unique views each day.</td>
</tr>
<tr>
<td>Change %</td>
<td>Percentage of change in number of unique views since yesterday.</td>
</tr>
<tr>
<td>Trend</td>
<td>Visualization of how the number of unique views has changed over the course of the last week.</td>
</tr>
<tr>
<td>Distribution</td>
<td>Visualization of the number of unique views in relation to other pages. A full bar means that the page has the highest number of unique views.</td>
</tr>
</tbody>
</table>
The Searches tab displays the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average Click Rank</td>
<td>Average position of clicked items in a search result list today. A lower value means a higher position on the search result list.</td>
</tr>
<tr>
<td>Average Click-Through Rate</td>
<td>Average number of searches that have resulted in a click today.</td>
</tr>
<tr>
<td>User who Searched</td>
<td>Number of users who searched the portal today.</td>
</tr>
<tr>
<td>Click Rank Distribution</td>
<td>Number of clicks within each click rank today.</td>
</tr>
<tr>
<td>Searches</td>
<td>Total number of user searches today.</td>
</tr>
</tbody>
</table>
Breakdowns
To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Portal
- Service Portal Page
- Service Portal User Country
- Click Rank Distribution

For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

User Experience Analytics for Service Portal
Visualize metrics and interactions to better understand the Service Portal user experience and identify how to improve it.
User Experience Analytics for Service Portal provides dashboard views for monitoring the key performance indicators (KPIs) of web applications built on Service Portal. You can use these insights to optimize your portal.

For example, User Experience Analytics tracks when a user orders a catalog item or views a knowledge article. You can use this data to infer which items or articles are the most popular among users.

For more information on user-triggered events that are tracked automatically, see Service Portal events.

**Getting started**

1. **Request User Experience Analytics for Service Portal**

   To activate User Experience Analytics for Service Portal, request the Service Portal Analytics plugin (com.glide.service-portal.analytics) through the Now Support Customer Service system.

2. **Create User Experience Analytics settings**

   Turn on user analytics tracking for Service Portal so that you can monitor key performance indicators in the Analytics Dashboard.

**User consent**

ServiceNow has provided template notices that are presented to users depending on their geographic region. Customers should review these notices and confirm they are in accordance with applicable law before they are presented to users (as per our Data Processing Addendum). Customers may tailor the specific options for how these notices are presented to users (including the specific wording). For more information on changing the wording, see Modify user consent text.
When launching the application for the first time, European users are prompted to select whether to consent to analytics tracking. US users are automatically opted-in for tracking, by default. Non-EU/non-US users see a notice of enabled analytics tracking.

Pop-up for EU users

Enable Analytics

Help Optimize this ServiceNow App. We are working to improve our user experience by tracking your in-app activity, including your interaction with our app, to improve performance and user experience.

For more details of how we use your information see: Privacy Statement

No Yes

Pop-up for non-EU/non-US users

Enable Analytics

We are working to improve our user experience by tracking your in-app activity, including your interaction with our app, to improve performance and user experience.

For more details of how we use your information see: Privacy Statement

Agree

To disable this pop-up, set the glide.analytics.user.consent.popup.disabled system property to true.

Next steps

After you set up User Experience Analytics for Service Portal, you are ready to start tracking portal usage in the analytics dashboard.

You can view user analytics tracking for the portal by navigating to User Experience Analytics > Dashboard.

For more information on using the dashboard, see Overview of the Dashboard.

Related information

User Experience Analytics
Request User Experience Analytics for Service Portal

To activate User Experience Analytics for Service Portal, request the Service Portal Analytics plugin (com.glide.service-portal.analytics) through the Now Support Customer Service system.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.

3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

4. On the form, fill in the fields.
Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click **Submit**.

Create User Experience Analytics settings

Turn on user analytics tracking for Service Portal so that you can monitor key performance indicators in the Analytics Dashboard.

**Before you begin**
Get the Service Portal Analytics plugin (com.glide.service-portal.analytics) by submitting a request in Now Support. For more information, see Request User Experience Analytics for Service Portal.

Role required: portal_analytics_admin
Procedure

1. Navigate to **Service Portal > Portals**.
2. Open the record for the base system Service Portal.
3. On the portal form, click **Create Analytics Settings**.

![Portal Form](image)

4. Review the User Experience Analytics Settings form. Optionally, to track users who use your portal without logging in, select the **Enable Unauthenticated User Tracking** field.

![Analytics Settings Form](image)

5. Click **Update**.

Results

An entry for your portal is added to the User Experience Analytics Settings [sys_analytics_bucket] table. You can review this entry by clicking **View SP Analytics Settings** on the portal record. You can review the table by navigating to **User Experience Analytics > Settings**.

You can view user analytics tracking for the portal by navigating to **User Experience Analytics > Dashboard**.
For more information on using the dashboard, see *Overview of the Dashboard.*

**What to do next**
If you selected to enable unauthenticated user tracking, you may be required by law to notify unauthenticated users that you are tracking their usage for analysis. You can display a legal notice by activating the Privacy Notice announcement, which is inactive by default. For more information, see *Activate the privacy notice for unauthenticated users.*

**Activate the privacy notice for unauthenticated users**
If you enabled unauthenticated user tracking in your portal, you may be required by law to notify unauthenticated users that you are tracking their usage for analysis. You can display a legal notice by activating the Privacy Notice announcement.

**Before you begin**
Complete the previous tasks:

1. Request User Experience Analytics for Service Portal
2. Create User Experience Analytics settings

Role required: sp_admin

**Procedure**
1. Navigate to *Service Portal > Announcements* and open the inactive record named *Privacy Notice.*
2. Review the form.
Privacy Notice announcement form

You can modify the default text of the Summary field or leave it as-is.

By default, the Unauthenticated only option is selected to display the announcement only to users who haven't logged in to the portal. The announcement disappears after the user logs in.

3. In the Portals section, select a portal in which to display the announcement.

Note: The Privacy Notice announcement appears only in portals for which you’ve created User Experience Analytics settings.

4. Activate the announcement by selecting the Active option.

5. Click Update.

Results
The Privacy Notice announcement is displayed to unauthenticated portal users.
Privacy Notice example

Notice
We use cookies and related technologies to improve your browsing experience, analyze individualized usage and website traffic, tailor content to your preferences, and make your interactions with this website more meaningful. More information can be found in our privacy policy.

Related information

Create an announcement

Modify user consent text

Modify the text that appears in the pop-up requesting user consent.

Before you begin
Role required: admin

Procedure

Modify the relevant user consent text.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Modify the consent text for EU users | a. Navigate to System UI > Messages.  
b. Find and open the glide.analytics.consent.eu.text record.  
c. Update the Message field.  
d. Click Update. |
**Modify the consent text for non-EU/non-US users**

- Navigate to **System UI > Messages**.
- Find and open the `glide.analytics.consent.other.text` record.
- Update the **Message** field.
- Click **Update**.

**Service Portal events**

View Service Portal events to get insight into how a portal is being used in your organization.

User Experience Analytics automatically detects the gestures and actions of portal users. You can view each occurrence of these events on the Analytics Dashboard.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submit Catalog Request</td>
<td>Tracks when a user submits a request through the SC Catalog Item widget. You can view the request ID and the number of items in each request. Use these analytics to optimize the Service Catalog.</td>
</tr>
<tr>
<td>Order Catalog Item</td>
<td>Tracks when a user orders a catalog item through the SC Catalog Item widget. You can view the name and ID of each ordered item. You can also view the associated request ID. Use these analytics to optimize the Service Catalog.</td>
</tr>
<tr>
<td>Submit Record Producer Request</td>
<td>Tracks when a user submits a request through any record producer. Use these analytics to optimize the Service Catalog.</td>
</tr>
<tr>
<td>View Knowledge Article</td>
<td>Tracks when a user views a knowledge article. You can view the name, ID, and language of each viewed article. Use these analytics to optimize the knowledge base.</td>
</tr>
<tr>
<td>Initiate Search</td>
<td>Tracks when a user searches the portal using the Faceted Search and Typeahead Search widgets. You can view the search keywords that users enter. You can also compare usage of the two search widgets.</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Search Result Selected</td>
<td>Tracks when a user selects a search result when using the Faceted Search widget. You can view the click rank and sys_id of the selected search item. Use these analytics to improve search in Service Portal.</td>
</tr>
<tr>
<td>Successful Login</td>
<td>Tracks when a user logs in to Service Portal. Use these analytics to monitor login activity within a given time period.</td>
</tr>
</tbody>
</table>

You can create custom events to be triggered. For more information, see SNAnalytics - Client

### Role title [name]

### Description

- can create User Experience Analytics settings for Service Portal.

### Contains roles

• None

| Portal Analytics Viewer [portal_analytics_viewer] | Users with this role can view the Analytics Dashboard link and settings within Service Portal > Analytics in the application navigator, and have viewer role permissions for portal metrics in the User Experience Analytics Dashboard. |

## Related properties

Use system properties to configure User Experience Analytics for Service Portal.

**glide.analytics.tracking.force_allowed.portals**

Disables the user consent pop-up for specified portals. This property overrides the `glide.analytics.user.consent.popup.disabled` property. You specify a portal by pasting its sys_id in the Value field. To specify multiple portals, enter a comma-separated list with no spaces. To disable the pop-up in all portals, configure the `glide.analytics.user.consent.popup.disabled` property.

- Type: string
- Default value: none

**glide.analytics.tracking.restricted.portals**

Disables user analytics tracking for specified portals. This property overrides the `glide.sp.analytics.enabled.portals` property. You specify a portal by pasting its sys_id in the Value field. To specify multiple portals, enter a comma-separated list with no spaces.

- Type: string
- Default value: none

**glide.analytics.user.auto.consent**
Allows user analytics tracking for all users when the user consent pop-up is disabled.

- Type: true | false
- Default value: true

**glide.analytics.user.consent.popup.disabled**

Disables pop-up for getting user consent.

- Type: true | false
- Default value: false

**glide.sp.analytics.enabled.portals**

Enables user analytics tracking for specified portals. By default, tracking is enabled for the base system Service Portal.

- Type: string
- Default value: 81b75d3147032100ba13a5554ee4902b

Related information

- Add a system property
- Unique record identifier (sys_id)

**Skills Management**

Use Skills Management to associate skills with individual users or groups and assign them to tasks or projects. You can also assess the skills needed for your organization, identify gaps, and implement effective plans for hiring or training of your teams.

Skills can contain other skills. For example, if you define network as a skill, you can add router as the skill it contains. A user assigned to a parent skill grants access to a child skill. Once a skill is assigned to a group, all members of the group inherit that skill and any others contained within it. Skills management works similar to ServiceNow platform role management.

Using this application, you can:

- Manage skills for agents and your employees from a central location.
- Use a standard way to identify skills for your organization and keep them up to date.
- Group skills into categories and define skill levels to track the expertise of your resources at a granular level.
• Reduce task or project reassignments by assigning tasks to agents and projects to teams that have the right skills to work on those items.
• Identify skill gaps and resolve them by implementing effective plans for coaching and training of resources.
• Manage the effectiveness of your team by evaluating the skills your team has and determining the skills you need for on your projects.

Integration with ServiceNow® applications

A skill is an ability to do something that comes from training, experience, and practice. As a system administrator, you can define skills for your organization and assign it to users and groups from a central location. As an application manager, you can assign users to tasks based on these skills. For example, if you are an IT manager, you can use the Skills Management application to define skills for your agents and assign those agents to resolve incidents using the ITSM application.

Group skills into categories and define skill levels to standardize skill implementation across your organization.

Use skills from the centralized location in the following applications:

• IT service management As an IT manager, reduce your time and costs while resolving incidents by assigning work items to the right agent. Assess the skill gaps that agents have in your team and coach or train agents based on those needs. Identify and define a standard way to keep skill categories and levels consistent within your team.
• **Customer service management** As a customer service manager, identify agent skills and automatically route tasks to agents who have the required skill to work on those tasks. Manage your team's effectiveness by understanding what type of skills your employees need to get hired or get trained to take on other roles.

• **Field service management** As a field service or customer service manager, use rules to identify skills and skill levels that agents require to resolve work items such as cases, work order tasks, and agent interactions. Automate skill assignment to reduce a manager's work load. Automatically assign tasks to agents using Field Service dynamic scheduling.

• **Human resources management** As an HR manager, identify the types of skills your organization needs and make hiring decisions based on those needs. Manage your team's effectiveness by understanding what type of skills your employees need to get hired or get trained to take on other roles.

• **Project portfolio management** As a project and portfolio manager, standardize how you categorize skills, define skill level types, and add skill levels for your team. Set up skills for your team in a central location and make them available within your team. Prevent project reassignments by assigning projects to the team members who have the right skills to work on them.

### Roles used in Skills Management

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| Skill administrator [skill_admin] | - Inherits the skill manager [skill_manager] and skill user [skill_user] roles.  
                        - Can perform create, read, update, and delete (CRUD) operations on skills, skill levels, skill level types, skill categories, and sub categories. |
| Skill manager [skill_manager] | - Inherits the skill user [skill_user] role.  
                          - Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories.  
                          - Can assign skills to users and groups. |
| Skill user [skill_user] | Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories. |
Activating Skills Management
The Skills Management application is activated when you enable the Skills Management (com.snc.skills_management) plugin.

Configuring skills
Create skills, identify the type of skill level it belongs to and associate skill levels for each type to define skills for your users consistently across your organization and be able to assign resources accordingly. For example, you can add French as a skill, language as the skill level type, and familiar, proficient, and expert as the skill levels.

Identify all skills you currently have and would need across your organization to begin implementing skills. For example, if you are in Customer Service, you might have agents who have Java as a technical skill and you might need agents who have experience in network administration. If you are in Human Resources, you may have employees who have coaching as a skill and you might need employees who can get new hires on board.

Associate each skill you have identified with a skill level type. For example, you could associate Java with programming as the skill level type and coaching with leadership as the skill level type.

Define skill levels for each type you have identified. As an example, you could use familiar, proficient, and expert as skill levels for the Java skill level type and beginner, intermediate, and advanced as the skill levels for the coaching skill level type.

Define the skill taxonomy
Organize related skills into categories and subcategories so that you can manage skills and create reports quickly and efficiently.

Before you begin
Role required: skill_admin

About this task
A skill category can contain parent and child categories that together create a category hierarchy. You can add skills to the lowest category in the hierarchy. You can build your skill taxonomy from scratch or use the sample data provided with your application.
**Procedure**

1. Navigate to **Skills > Skill Taxonomy**.
2. In the **Skills Categories** list, click **New**.
3. In the **Name** field, enter a unique name for the category.
4. **Optional:** In the **Parent** field, select a parent category.
5. Right-click the form header and click **Save**. The category is added to the **Category Hierarchy**.
6. Do one of the following:

<table>
<thead>
<tr>
<th>To add</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Subcategories** | • In the **Child Categories** related list, click **New**.  
• In the **Name** field, enter a unique name for the category. |
| **Skills** | • Select the **Add Skills** check box.  
• Right-click the form header and click **Save**. |
To add | Do this
--- | ---
- In the **Skills** related list, click **New**.
- In the **Name** field, enter the name of the skill.

7. Click **Submit**.

**Create skill categories using sample data**

Onboard your team quickly using the skill taxonomy framework provided with your application.

**Before you begin**

Role required: skill_admin

**About this task**

The sample data provides 150 records that you can use to get started building your skill taxonomy.

**Procedure**

1. **Activate** the Skills Library Data for Skills Management (com.snc.skills_management.seed_data) plugin.

2. Navigate to **Skills > Skill Taxonomy**.

3. In the **Skill Categories** list, review each category and set the **Add skills** field to **true** for all skill categories you want to add to your application.

**Define a skill level type**

Define skill levels (for example, beginner, intermediate, advanced) for different skill level types (for example, a language or an IT certification) so you can associate skill levels to users and define skill levels and types required for tasks.

**Before you begin**

Role required: skill_admin or admin

**Procedure**

1. Identify skill level types.

   You can group skills that belong to the same category into a skill level type. For example, you could use language as the skill level type if Japanese and French are defined as skills. Take an inventory of every type of skill your organization needs.

2. Add skill level types, define skill levels, and associate them with a skill level type.
After you add a skill level type, you can define different levels for that type of skill. For example, if you add language as a type of skill, you can associate familiar, proficient, and expert as skill levels. When you select French, for example, as a skill for a user, you will be able to define the user’s skill level for French as either familiar, proficient, or expert.

**a.** Navigate to **Skills > Skill Level Types**.

**b.** Click **New**.

c. Enter a name and description for the skill level type, and then right-click the form and click **Save**.

d. Associate skill levels with this skill type.

By default, skill level types are associated with the **Default** skill level and have a value of 1. You can change the name and value for this default skill level. The value is used to measure skill gaps. For example, if you give a value of 10 for a skill level defined as proficient and a value of 25 for a skill level defined as expert, when you create a skill report to measure gaps, you will see a value of 15 as a measure for the skill gap.

3. Click **Submit**.

**Example:**

This example shows a system administrator creating the skill level type Language, adding the skill level Proficient to that type, and associating a value for the level.
Add a skill
Create skills to specify the competencies of your users and associate them with users, and configuration items so you can.

Before you begin
Role required: skill_admin or admin

Procedure
1. Identify skills.
   Take an inventory of all skills you currently have and would need across your organization. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

2. Add skills.
   You can associate each skill with other skills, users, or configuration items. You can assign users to tasks or projects, or identify employees with specific skills using these associations.
   
   a. Navigate to Skills > All Skills.
   
   b. Click New.
   
   c. Enter a name and description for the skill and then right-click the form and click Save.
   
   d. If you want to associate subskills with the skill, click the Contains Skills tab and create a new skill or add an existing skill as a subskill. The subskill is automatically inherited by the user or group that contains the associated skill.
   
   e. Specify skills for users by clicking the Users tab and creating a new user for the skill or adding existing users.
   
   f. Associate the skill with configuration items by clicking the Model tab and adding one or more configuration items.

3. Click Update.
Managing skills

Manage skill assignment efficiently by simultaneously assigning a skill to multiple users or multiple skills to multiple users. Assign your agents to tasks and teams to projects based on skills.

Assign IT skills to users

Assign IT skills and skill levels to users to facilitate the automatic assignment of skill-based tasks to agents.

Before you begin
Role required: skill_manager or skill_admin

About this task
Only skill administrators can create or edit skills. Skill managers can assign skills to users.

Procedure
1. Navigate to Skills > Manage IT Skills.
2. Do one of the following:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| Add a skill to a user | a. Click New Skill.  
b. In the Skill field, enter a name for the skill.  
c. In the Level Type field, select the type to which the skill belongs. |
| Assign a skill to multiple users | a. From the All Skills list, select a skill.  
b. Click Assign/Remove Users.  
c. Select the name of each user you want to assign this skill.  
d. From the list, select the level for this skill for each user.  
e. Click Assign/Remove Users again to assign the skill and skill level to the users. To remove the assigned skill, select the name of the user and clear the check box for the skill. |
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Assign multiple skills to multiple users** | **a.** From the All Users list, select a user.  
**b.** From the Skill list, select each skill and the skill level to assign for this user.  
**c.** Repeat the steps above for all users you would like assign multiple skills and associated skill levels. |

**Example:**  
In this example, a system administrator assigns the skill **iPhone** to multiple users and adds a skill level for each user.
In this example, a system administrator assigns multiple skills and associated skill levels to multiple users.

**Associate skills with users and groups**

Add skills to users and groups and effectively assign users to tasks and teams to projects.

**Before you begin**

Role required: skill_manager

**About this task**

Users automatically inherit a skill contained within a skill. Members of a group inherit all skills assigned to the group.

**Procedure**

1. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Assign a skill to a user** | a. Navigate to **Skills > User Skills**.  
  b. Click **New**.  
  c. In the **Skill** field, click the lookup icon and select a skill.  
  d. In the **User** field, click the lookup icon and select a user. |
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| Assign a skill to a group | a. Navigate to Skills > Group Skills.  
b. Click New.  
c. In the Skill field, click the lookup icon and select a skill.  
d. In the Group field, click the lookup icon and select a group. |

2. Optional: In the **Skill level** field, click the lookup icon and select a level for the selected skill.

3. Optional: If the skill level is inherited, enable the **Skill level inherited** check box. You must configure the form to display the **Skill level** field and **Skill level inherited** check box.

4. Click **Submit**.

**Associating skills with work items**

Assign skills to tasks manually or use rules to associate them automatically to work items such as cases, tasks, or chat interactions.

The video below shows an overview of how skills are automatically added to work items.

**Skill-based routing**

**Assign skills to tasks**

Add skills and the level required for each skill to tasks. Identify whether the skill is mandatory to perform the task.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to incident, problem, change request or any task record to which you want to associate skills.

2. In the related list, select the **Tasks Skills** tab. You must configure the related list and add **Task Skill->Task** to the **Selected** column to display this tab.

3. In the Task Skills table, do the following:
a. In the **Skill** field, click the lookup icon and select a skill.

b. In the **Skill level** field, select a level for the selected skill.

c. In the **Mandatory** field, select **true** if the skill is mandatory for the selected task.

4. Click **Submit**.

**Example:**
The image below shows an administrator configuring skills for an incident task where the user is unable to access the shared folder. It is mandatory for agents working on this task to have familiarity with IT skills.

Using rules to identify skills for work items

Automate the identification of skills required for work items using rules, which eliminates the need to assign them manually.

When you automate skill identification, you prevent task reassignments by assigning agents with the right skills to work on tasks and make time available for agents and managers to work on more important tasks.

You can identify skills using rules for tasks such as cases, work order tasks, incidents, problems, and change requests and also for interactions such as chat, phone, or walk-up experience.

The video below gives you an overview of how skills are added to work items using rules. Skill-based routing
Related information

AWA for CSM overview
Create rules to route and assign customer service cases
Dynamic scheduling

Create rules to assign skills to work items
Create rules to identify skills and automatically associate them to work items.

Before you begin
Role required: skill_admin or admin

About this task
You can automatically add a skill to a case based on the product associated with the case if you enable the Product to Skill mapping table (Skill Required for Model Maintenance [cmn_m2m_skill_model]).

A skill determination rule is created for every new skill required for a work item.

- If a skill is no longer required for a work item, deactivate or remove the rule applied for the work item.
- If two rules have the same skill associated with one work item and one rule evaluates the skill as mandatory and the other rule evaluates it as optional, then the rule that evaluates the skill as mandatory is always used.

Note: If you create a new skill determination rule, you also need to create a corresponding business rule.

Procedure

1. Navigate to Skills > Skill Determination Rules.
2. Click New.
3. In the Name field, enter a name for the rule.
4. Select the Active check box to enable the rule to assign skills to work items.
5. From the Source table drop-down menu, select the work item source table for this rule.
6. Using the condition builder, select the conditions to evaluate the work item.
7. Create the rule.
<table>
<thead>
<tr>
<th>Rule type</th>
<th>Steps</th>
</tr>
</thead>
</table>
| Create a simple rule   | a. From the **Type** drop-down menu, select **Simple**.  
    b. In the **Skills** table, add each skill required for the selected work item.  
    c. If a skill is optional for selected work item, in the **Mandatory** field, select **False**.  
    d. In the **Skill Level** field, add a level for the skill. You must configure the form to display this field.  
    For information about defining skill levels, see                                                                 |
| Create a lookup rule   | a. From the **Type** drop-down menu, select **Lookup**.  
    b. From the **Lookup table** drop-down menu, select the reference table to connect to the source table.  
    The **Skills Field** that connects the source and reference tables is automatically populated.  
    c. If this skill is mandatory, select the **Mandatory** check box.  
    d. From the **Skill Level Field** drop-down menu, select a level for this skill.  
    e. Click **Save**.  
    f. In the **Field Mappings** related list, click **New**.  
    g. From the **Source table field** drop-down menu, select an attribute to map to the reference table.  
    h. From the **Lookup table field** drop-down menu, select an attribute to map to the source table. |
| Create an advanced rule| a. From the **Type** drop-down menu, select **Advanced**.  
    b. In the **Script** window, enter a script.  |

8. Click **Submit**.

**Activate business rules for skill determination**

Enable the business rules to determine skills for cases, work order tasks, and chat interactions that are available in your application.

**Before you begin**

**Role required:** admin
About this task
You can also Create a business rule for tasks such as incidents, problems and change requests to associate skills to those tasks.

Create skill determination rules based on any of the following rule types:

• **Simple**
  Adds skills to work items based on a set of conditions used to evaluate the source table.

• **Lookup**
  Adds skills to work items based on selections from two different tables connected using one or more reference fields.

• **Advanced**
  Adds skills to work items using a script.

Procedure
2. Do one of the following:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Enable the business rules for cases, work order tasks, or chat interactions** | • To create rules for cases, select the **Active** check box in the **Skill determination for case** business rule record.  
  • To create business rules for work order tasks, select the **Active** check box in the **Skill determination for work order task** business rule record.  
  • To create rules for chat interactions, select the **Active** check box in the **Skill determination for interaction** business rule record. |
| **Create business rules for tasks such as incidents, problems, and change requests** |  
  a. Open a case, work order, or chat interaction business rule record.  
  b. Right-click the record and select **Insert and Stay**. |
Routing work items to agents based on skills

Use rules to automatically route work items to agents.
For more information on routing agents to work items, see Advanced work assignments

Qualify and rank users based on skills and skill levels

Rank users so that you can select the right users based on skills needed to complete tasks. Qualify users to work on tasks such as case, work order task, or chat interaction based on the number of skills and skill levels required to work on those tasks.

Before you begin
Role required: skill_admin

About this task
Use the UserSkillAnalyzer API to analyze the skills and skill levels of users and the UserSkillRanking API to rank and assign them to tasks. For example, when you use the Field Service Management application to assign agents to tasks, you can analyze and rank them based on their skills and skill levels using these APIs and use dynamic scheduling to assign them to tasks.

Note: You must add the Matching Skill Level Gap for Dynamic Scheduling criterion to the task filter to rank agents assessed based on skill gaps. For more information on adding this criterion, see Create a task filter

Procedure
1. Analyze the skills and skill levels users have to complete work items using the UserSkillAnalyzer API.
The API performs the following verification to check if users are qualified to be assigned to the work items:
a. If the user has all mandatory skills required to complete the work item, but
does not have the skill level, the agent is not qualified to work on the task if
the skill level is mandatory to work on the task.

b. If the user does not have all mandatory skills required to complete the task,
the agent is not qualified to work on the task.

c. If the user has all skills and the skill levels required to complete the task, the
agent is qualified to work on the task.

d. If the user has all skills required, but not mandatory to complete the task, the
agent is qualified to work on the task.

If the user is qualified to work on the task, the API performs the following
verification to analyze gaps in skill level and the total number of skills the users
have to execute tasks based on the skill requirements for the work item:

a. Verifies if a work item requires a skill that does not have a level type defined.

b. Verifies if a work item requires a skill that has a level type defined but does
not have the skill level defined.

c. Verifies if a work item requires a skill that has the skill level defined, but the
agent does not have the skill level defined. If the skill level is mandatory to
complete the task, the user who does not have those skill levels will not be
assigned to those tasks.

d. Verifies whether a user has all skill levels that are mandatory, but not
optional, to perform a task.

2. Rank users qualified to complete work items using UserSkillRanking API.
The API retrieves a list of qualified users based on matching and mandatory
skills and skill levels.

Skills Management dashboard and reporting

Use the Skills Management dashboard to analyze trends in assessing skill gaps in
your organization and plan for coaching or training of your employees based
on needs. Identify users and teams who have the right skills to work on tasks and
projects. The Skills Management dashboard provides comprehensive reports on
skill competencies of users, the tasks that require those skills, and skill gaps you
can address to fulfill your organizational needs.

You can access the dashboard by navigating to Skills > Dashboard.
Overview and Skill Matrix tab

Skill Taxonomy
You can filter these reports based on the skill category and view reports for each category.

### Domain separation and Skills Management

Domain separation is supported in the Skills Management app, and configured to apply to all features of the application. Separation of data is configured along with separation of logic and process. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- **Business logic:** Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see [Application support for domain separation](#).

### How domain separation works in Skills Management

Domain separation is supported in Skill Management with no explicit setup or configuration requirements. Skills, skill categories, skills levels can be created in separate domains, including the global domain. When domain separation is implemented, people with skill app roles can view skill information only in the domain assigned. **Domain** and **Domain Path** columns are available for all Skill tables provided with the base system. The **Domain** column contains the name of the domain to which the event or alert belongs, and the **Domain Path** column contains the unique domain identifier.

</tr>
</tbody>
</table>

Note: If the domain column is not shown, click the **Update Personalized List** icon and add the required column. You can also add the domain path column, if desired.

Use cases:

- A Skill Manager that belongs to the Acme domain creates a skill and wants to view and associate it to user in the Acme domain. A user must belong to the Acme domain, its parent domain, or the global domain to view the skill record.

- A Skill Manager that belongs to a parent domain tries to view a skill in a child domain. The user of a parent domain can view a skill record of the parent as well as all child domains of that parent.

- A Skill Manager that belongs to a parent domain wants to create/associate a skill on behalf of another user in the Acme domain. A user must belong to the same domain as the user for which the skill record is created.

- A Skill Manager wants to associate a record for an integrated application in the Acme domain. A user must belong to the domain of the integrated application from which a record is associated.

- A Skill Manager has access to multiple domains but wants to update a record with content within a specific domain. The domain specified for the current record drives the functionality of that record and reference fields.

Quick start tests for Skills Management

Validate that Skills Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.
Skills Management quick start tests require activating the Skills Management plugin (com.snc.skills_management).

• Configure the color-code threshold
• Configure the enforcement properties

Subscription Management overview
The ServiceNow® Subscription Management application gives you visibility and control of your ServiceNow subscriptions and applications. Get a real-time view of allocation and entitlement usage and reports showing your usage over time. Use Subscription Management to stay within compliance and make informed decisions about your subscription usage and purchases.

Subscriptions
ServiceNow sells subscription services. To use products from the ServiceNow Store, the members of your organization must have valid subscription licenses. Subscription licenses give your users access to ServiceNow and third-party applications available on the ServiceNow Store.

• The subscriptions that your organization purchases entitle an agreed-upon number of users to use applications included in various subscription plans.

• Subscriptions come in different types, such as per-user and capacity. The type of subscription determines the properties and attributes of the licenses that your company receives. For example, per-user subscriptions give a certain amount of fulfiller users access to applications. To learn more, see types of subscriptions.

Setting up Subscription Management
Subscription Management is active for all production instances by default. Assign a usage_admin and configure your properties to get started. For more information, see Setting up Subscription Management.
Using Subscription Management
The admin or usage_admin can use Subscription Management to manage your subscriptions, users, custom resources, and compliance. Use Subscription Management to manage and monitor your subscriptions to help you make informed decisions about subscription purchases. For more information, see Using Subscription Management.

Setting up Subscription Management
Set up Subscription Management to help you with using the application.

What to do

Assign the usage admins
Assign the usage_admin role to users that manage subscriptions for your organization. Assign the usage_admin role to at least one person in your organization. Only admins and usage_admins can use Subscription Management.

Configure the color-code threshold
The Subscription Management module uses color-coded dots to represent your allocation numbers. You can change the threshold for your instance.

Configure the enforcement properties
If you have non-production instances, you can configure how licensing behaves in those instances.

Map your custom applications
If your organization has custom applications, you must map your applications to a subscription.

Map your custom tables
If your organization purchased subscriptions that include custom table entitlements, you must map your custom tables to a subscription.

What to do next

Monitor and manage your subscriptions
Use Subscription Management to manage your subscriptions, users, custom resources, and compliance. See Using Subscription Management.
Subscription Management Properties

The **Properties** module gives you control over certain settings within Subscription Management.

![Subscription Management](image)

### Color-code threshold

Subscription Management uses a color-code within the interface to represent subscription allocation values. See **Configure the color-code threshold**.

### Enforcement Overrides

Non-production instances associated with a production instance receive the same licenses. You can set up your non-production instances to behave like your production instance. Alternately, you can override the enforcement and have your non-production instance behave differently. Licensing in your non-production instances gives you visibility of your entitlements prior to deploying to production instances.

With Subscription Management, you can set the **enforcement properties** of your non-production instances. Enforcement properties determine the behavior of application and plugin installation and user entitlement on your non-production instance.

For entitlement checks on the non-production instances, the **DEFAULT** is **OFF**. The system performs no licensing checks and displays no warning messages. For license checks on applications and plugins, the **DEFAULT** is **WARN**. The system allows installation and activation of plugins and store apps without a valid license, but displays a warning message.

**Note:** The licensing server controls the enforcement properties for some instances. For those instances, you must contact customer support to change the enforcement overrides.
To learn more about enforcement properties and to change the behavior of your non-production instances, see Configure the enforcement properties.

Configure the color-code threshold

Configure the color-code threshold to be used on your lists, forms, and charts within Subscription Management. The color code indicates the percentage of the subscription that has been allocated. Use the color codes to help you stay in compliance.

Before you begin
Role required: usage_admin or admin

About this task
The color code indicates the percentage of the subscription that has been allocated. The threshold you set dictates the colors.

- Green indicates that usage is below the threshold that you set.
- Yellow indicates that usage is between the threshold and 100%.
- Red indicates that usage is greater than 100%.

Procedure
1. Navigate to Subscription Management > Properties.
2. Update the Color-code threshold (subscription.used.thresh) property setting and then click Save. Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription limit.
Related information

View your subscriptions

Configure the enforcement properties

Configure the enforcement properties to change the behavior of plugin activation and user entitlement on your non-production instance.

Before you begin
Role required: usage_admin or admin

About this task
The enforcement properties apply only to your non-production instance.

Note: The licensing server controls the enforcement properties for some instances. For those instances, you must contact customer support to change the enforcement overrides.

Procedure

1. Navigate to Subscription Management > Properties.
2. Under Enforcement Overrides (Non-Production), select your options from the lists.

   Enforcement Overrides (Non-Production)

   Entitlement checks on entitlement-driven actions.

3. Select **Save**.

**Domain separation and Subscription Management**

Domain separation is supported in Subscription Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data. Subscription Management tracks subscription data across your domains.

**Support level: Basic**

- Business logic: Ensure that data goes into the proper domain for the application’s service provider (SP) use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all use domain at production run time.
- The owner of the instance needs to be able to set up the application to function across multiple tenants.

Use case: When an SP uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

**Overview**

Subscription Management tracks user allocation of your subscriptions and user actions counts across domains.
Note: This feature is available only in domain-separated instances only. Non-domain separated instances do not see this feature.

Your organization has a single instance containing your own domain (A1) and three customer domains (C1, C2, C3). Your organization has purchased an ISTM Fulfiller subscription. You allocate five of your own employees and five customers from each domain to the ISTM Fulfiller subscription.

The Subscription form shows that 20 users are allocated to the subscription. However, when you view the Allocated Users by Domain tab, the page lists a breakdown by domain:

- A1: 5
- C1: 5
- C2: 5
- C3: 5

**Domain Compliance Overview dashboard**

The Domain Compliance Overview dashboard shows all of your domain-separated subscription information. The dashboard contains the list of users by domain and reports generated for certain types of user actions.

<table>
<thead>
<tr>
<th>Tab</th>
<th>Description</th>

| Capacity Based               | For Capacity Based License Types  
Tracks action counts for capacity-based licenses. Each subscription ties to a definition ID which is used for the data. The dashboard shows the domain, number of actions, and accrual period.  
The dashboard also shows visual representations of the total capacity count, count by definition ID, and count by definition ID and domain. |
| Allocated Users by Domain    | Lists users and their subscriptions separated by domain.                                                                                                                                                     |

To view and to learn more about the dashboard, see [View your domain compliance overview](#).

### Analytics and Reporting Solutions for Subscription Management

Analytics and Reporting Solutions contain prepackaged Performance Analytics and Reporting content for use with other Now Platform products. This Analytics and Reporting Solution helps you track parts of your subscriptions so you can stay within compliance and plan your future subscription purchases.

**Required roles**
The following roles and tasks are associated with this Solution:

- Now Platform administrator (admin): Install and activate this Analytics and Reporting Solution and make any necessary changes to system properties.
- Performance Analytics administrator (pa_admin): Review the indicators, breakdowns, widgets, and dashboards. Set up and start data collection. Share the dashboards with appropriate stakeholders.

**Using Subscription Management**

Use the ServiceNow® Subscription Management application to manage how purchased subscriptions are used on your instances. You can manage subscriptions, users, and custom resources to stay within compliance and make informed decisions about subscription purchases.

**Subscription life cycle**

A typical subscription life cycle is as follows:

1. Purchase new subscriptions from the ServiceNow Store.
2. After your subscriptions are delivered to your production instance, view them in Subscription Management. See View your subscriptions.
3. Make sure that your users have access to the subscriptions they need. See Managing your users.
4. If your subscriptions come with custom table entitlements, map your custom tables to a subscription. If you create custom applications, map them to a subscription as well. To learn more about custom applications and tables, see Managing your custom applications and tables.
5. Monitor and adjust the resources of your subscriptions to ensure you are within compliance. Watch for:
   - overallocation of users on a subscription
   - out-of-policy users
   - unmapped custom applications and tables
   To learn more about monitoring your compliance, see Managing your subscription compliance.
6. Review the activity of your subscriptions. Look for:
   - usage patterns over time
   - application popularity
   - custom table usage
   To learn about reviewing subscription activity, see View subscription history reports and View user subscription history.
7. Consider your subscription usage to help you make informed decisions on future purchases.
Managing your subscriptions

Subscription Management gives you the information and tools to help you manage your subscriptions.

Subscriptions

Subscription Management shows your purchased subscriptions associated with your current instance. Each subscription contains licenses for the included applications. The subscriptions you purchase allow an agreed-upon number of users to access and use those applications.

Your purchased subscriptions come with applications, plugins, and roles. Some subscriptions come with entitlements for custom applications and tables. Subscription Management tracks and displays metrics and information for your subscriptions.

Types of subscriptions

Subscriptions to ServiceNow applications come in different types. The type of subscription determines the licenses to applications and custom resources that your users are permitted.

For a full breakdown of the subscription types, see Types of subscriptions.

Types of subscriptions

Subscriptions to ServiceNow applications come in different types. The type of subscription determines the allocation of users, access to applications, and custom application and table entitlements.

<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>Unrestricted User (UU)</td>
<td>Previously Max User. Your organization purchases an anticipated maximum number of unrestricted-user licenses. Unrestricted user licenses have no restrictions on role assignment. Your ServiceNow instance auto-allocates active users from the sys_user table to the unrestricted-user licenses. An active user is any user in the sys_user table that has a user id and has the Active field set to true.</td>
</tr>
</tbody>
</table>
### Subscription type | Description
--- | ---
**Note:** Editing the Unrestricted Users list affects your sys_user table and other UU subscriptions.

| PA Indicator | Your organization purchased a subscription for an application family that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications. |
| Per-User | Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. Your instance can monitor and report usage by both subscribed users and users who are not subscribed. Users are automatically allocated to subscriptions based on their roles. |
| Unlimited | ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the **Active** field set to true. |

### Pooled subscriptions
When you purchase multiple qualifying subscriptions for certain types of products, such as IntegrationHub, those individual subscriptions combine into a single subscription pool. Any usage against that subscription deducts from the common pool.

For example, if you buy an IntegrationHub spoke with 1,000 entitlements, and another type of spoke with 500 entitlements, they combine into a common pool of 1,500 entitlements. This total entitlement pool appears in the all allocation counts for the subscription pool. Qualifying entitlement usage for either type of spoke automatically deducts from this common pool.

### View your subscriptions
Use the **Subscriptions** page to view the subscriptions that your organization has purchased.

### Before you begin
**Role required:** usage_admin or admin

### About this task
By default, the page lists active subscriptions only. To view expired subscriptions as well, set the list filter to **All**.
Procedure

1. Navigate to Subscription Management > Subscriptions.

   • The page attempts to list all subscriptions that your organization has purchased. Some subscriptions do not appear. See Why a subscription might not appear in the list.

   Note: In a non-production environment, your subscription allocation counts will not match with production.

   • A color-coded dot next to a subscription’s Allocated number indicates how close that subscription allocation is to the purchased number of subscribers. See Configure the color-code threshold.

2. Click a subscription Name to open the Subscription Form, where you can:

   • View the subscription allocation metrics and history reports.
   • View applications, plugins, and roles associated with a subscription.
   • Manage groups and custom tables.

</tr>
<tr>
<td>Associated Roles</td>
<td>Roles included in the subscription and what application the role belongs to. The Requires Subscription column indicates if users with this role must be allocated to the subscription to stay in compliance.</td>
</tr>
<tr>
<td>Entitlement Purchase History</td>
<td>Purchase information for your subscription. Includes product codes, dates, and number of licenses and tables purchased.</td>
</tr>
</tbody>
</table>

Why a subscription might not appear in the list

The Subscriptions list displays the subscriptions that your organization has purchased. Some missing subscriptions might not appear on the list.

Why does my subscription not appear in the Subscriptions list?

• You might not see all subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
• The subscription may have expired. The page lists only subscriptions that are currently active. To view expired subscriptions as well, set the list filter to All.
• Subscription data arrives on production instances only.
• Self-hosted instances do not receive subscription information.
• Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

Why is the Subscriptions list empty?

• The subscription information might not yet have arrived. The data is downloaded daily.
View subscription enforcement logs

View subscription enforcement logs to see attempted actions by unlicensed users.

Before you begin
Role required: usage_admin or admin

About this task
Enforcement logs track users with the proper roles but have not been granted the proper entitlement.

Procedure

1. Navigate to Subscription Management > Subscription Overview.
2. Select Unpermitted Users This Month.
3. Click a user’s ID to open the log.
The **Subscription Enforcement Log** form lists information regarding the user's attempts to perform licensable actions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Name of the table that the user attempted to access without proper permissions.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user</td>
</tr>
<tr>
<td>Application Type</td>
<td>Origin of the application.</td>
</tr>
<tr>
<td>Application Name</td>
<td>Name of the application</td>
</tr>
<tr>
<td>Application ID</td>
<td>ID of the application that the user attempted to access without proper permissions. This ID can be any of the following examples:</td>
</tr>
<tr>
<td></td>
<td>• Plugin ID (com.snc.incident)</td>
</tr>
<tr>
<td></td>
<td>• Package ID of a custom application (x_snc_custom_app1)</td>
</tr>
<tr>
<td></td>
<td>• Scope of the application (global)</td>
</tr>
<tr>
<td></td>
<td>• Sys ID of a custom application (3b72c0ec346b2010f8774b046215bd6a)</td>
</tr>
<tr>
<td>Product ID</td>
<td>ID of the product that the application belongs to. This ID can be any of the following examples:</td>
</tr>
<tr>
<td></td>
<td>• Product Family ID (incident_management)</td>
</tr>
<tr>
<td></td>
<td>• Package ID of a custom application (x_snc_custom_app1)</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Scope of the product (global)</td>
<td></td>
</tr>
<tr>
<td>• Sys ID of a custom application (3b72c0ec346b2010f8774b046215bd6a).</td>
<td></td>
</tr>
<tr>
<td>Reason Code</td>
<td>Reason for the system rejecting the user.</td>
</tr>
<tr>
<td>Accrual Period</td>
<td>Month and year that the log collected data.</td>
</tr>
<tr>
<td>Requested Entitlement</td>
<td>Type of entitlement the user attempted to use to access the table.</td>
</tr>
<tr>
<td>Entitlement Checks</td>
<td>Number of times the system rejected a check for the requested entitlement.</td>
</tr>
<tr>
<td>Last Attempted</td>
<td>Date and time the user last attempted to access the table without proper permissions.</td>
</tr>
</tbody>
</table>

### View subscription history reports

View a subscription's history report to see subscription status, dates, and trend information.

**Before you begin**

Role required: usage_admin or admin

**Procedure**

1. Follow the **How to** instructions in the table.
2. Navigate to **Subscription Management > Subscription Overview**.
3. Select a subscription.
4. Under related links, select **View Subscription History**.
   - The Subscription History pop-up lists the operations on subscriptions for your current instance. Select an operation to view details.

### View subscription roles

The **Associated Roles** related list shows the roles included with a subscription.

**Before you begin**

Role required: usage_admin or admin
About this task
Subscriptions auto-allocate users based on their roles. To see which roles are associated with a subscription and what applications they have access to, use the Associated Roles related list. Select a role to see more details.

<table>
<thead>
<tr>
<th>Associated Roles</th>
<th>Search</th>
<th>Application</th>
<th>Requires Subscription</th>
</tr>
</thead>
<tbody>
<tr>
<td>asset</td>
<td>Asset Management</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>category_manager</td>
<td>Asset Management</td>
<td>false</td>
<td></td>
</tr>
<tr>
<td>inventory_admin</td>
<td>Asset Management</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>inventory_user</td>
<td>Asset Management</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>model_manager</td>
<td>Asset Management</td>
<td>false</td>
<td></td>
</tr>
<tr>
<td>sam</td>
<td>Asset Management</td>
<td>true</td>
<td></td>

Managing your users
Use Subscription Management to monitor and manage your users and their licenses. Ensure that users have access to the correct applications and monitor over-allocation to stay within compliance.

Overview
System entitlement allocates subscriptions to users based on their roles.
You can over-allocate users to subscriptions, meaning more users possess an entitlement than the number of purchased entitlements. Subscription Management flags over-allocated subscriptions. Remove users or groups from the subscription or purchase more entitlements to stay within compliance.

Managing users
You can manage aspects of user allocation. Based on your role, you can perform different actions regarding user allocation.
• If you have the admin or user_admin role:
  ◦ Change a user’s role
  ◦ Create a group
  ◦ Add a user to a group
• If you have the admin or usage_admin role:
  ◦ Assign a group to a subscription
  ◦ Edit the unrestricted-user population

**Monitoring users**

Use the following methods to monitor your user's allocations. Monitoring your users can help you stay within compliance.

• View a subscription’s users.
• View user subscription history.
• View subscription enforcement logs.
• View subscription roles.

**Related information**

User administration
Roles
Groups

**View a subscription’s users**

View the list of users allocated to a subscription.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to Subscription Management > Subscription Overview.
2. Select a subscription.
3. Select the Subscribed Users related list.
   The Subscribed Users related list shows the currently subscribed users. The list also shows how each user was allocated and their roles.
View user subscription history

View a history of the users allocated to a subscription.

Before you begin
Role required: usage_admin or admin

Procedure
1. Navigate to Subscription Management > Subscription Overview.
2. Select a subscription.
3. Under related links, select View User Subscription History.
   The Subscription User History pop-up lists the user allocation history for the
   subscription. The list shows the user's current subscription status and how they
   were allocated.

User sets and groups
Subscription Management uses groups (previously user sets) to provide licenses
to sets of users.

User set and groups overview
Prior to Rome, Subscription Management used user sets to group users together.
Usage_admins grouped users by conditions, such as what city or department they are in. User sets could then be assigned to subscriptions to give every user in
the user set a license to the subscription.

In Rome, all user sets converted to groups. A group is a set of users who share a
common purpose. Similar to user sets, groups can be allocated to subscriptions.
Allocating a group to a subscription gives every user in the group a license to
that subscription.

User set conversion
On upgrade to Rome, all current user sets convert to groups. The new groups
contain the same users and properties as your user sets.

Group management
Admins and user_admins create groups and add users in the User Administration
application.
To learn more about creating and editing groups, see Groups.
Groups in Subscription Management

Admins and usage_admins allocate groups to subscriptions. Allocating a group to a subscription gives every user in the group a license. Users added via a group show Group as their source when looking at subscribed users.

Allocate a group to a subscription

Allocate a group to a subscription to give every member of the group entitlement.

Before you begin

Role required: usage_admin or admin

Procedure

1. Navigate to Subscription Management > Subscription Overview.
2. Select a subscription.
3. Under the Groups related list, click Edit Groups.
4. Move the group you want to allocate to the Groups List.
5. Click Save.

The group allocates all users within it to the subscription. Your allocation totals update with the next system refresh. Or you can select Update Allocation Totals in the Subscription Overview dashboard to apply your changes immediately.
Remove a group from a subscription

Remove a group allocated to a subscription to remove entitlement for all the users in the group. Remove groups to free up entitlements.

Before you begin
Role required: usage_admin or admin

Procedure
1. Navigate to Subscription Management > Subscription Overview.
2. Select a subscription.
3. Under the Groups related list, click Edit Groups.
4. Move the group you want to remove to the Collection list.
5. Click Save.
   The group allocates all users within it to the subscription. Your allocation totals update with the next system refresh. Or you can select Update Allocation Totals in the Subscription Overview dashboard to apply your changes immediately.

Edit the unrestricted-user population

Add or remove users from the groups of users that are part of the unrestricted-user population. Editing the population affects all unrestricted-user subscriptions.

Before you begin
Role required: admin or usage_admin
Procedure

1. Navigate to Subscription Management > Subscription Overview.
2. Select an unrestricted-user subscription.
3. In the Groups related list, select Edit Groups.

A warning message appears.

4. Select OK.

5. Move groups to the Groups List to add them to the population. Move groups to the Collection List to remove them.

6. Select Save.

Managing your custom applications and tables

Subscription Management helps you manage and track custom applications and custom tables on your instances.
Custom applications

A custom application is defined as any non-ServiceNow-provided application that you create on the Now Platform. If your organization purchased App Engine, you can use Subscription Management to manage your custom application subscriptions.

Custom tables

A custom table is defined as any non-ServiceNow-provided table that you create on the Now Platform. Some tables are exempted from being classified as a custom table.

Note: For more information on custom tables on the Now Platform, see Table administration. For a detailed description of custom table use rights and exempt tables, see the Custom Table Guide on http://www.servicenow.com/upgrade-schedules.html

Subscriptions come with custom table entitlements that dictate the number of custom tables that you can map to a subscription. The number of custom table entitlements depends on the subscription.

Mapping custom applications and tables

Installation of custom applications and custom tables on a production instance requires you to map your application and tables to a valid subscription. On non-production instances, your enforcement properties determine the installation of applications and tables without proper entitlement. For more information on your enforcement properties, see Subscription Management Properties.

When you purchase a subscription with custom table entitlements, the entitlement data appears in Subscription Management. On the Subscription Overview dashboard or Subscription form, your remaining entitlements appear as Available.

As your developers create and deploy new custom applications and tables on your instances, use Subscription Management to map and monitor them. Map all of your custom applications and tables to valid subscriptions for accurate entitlement and to help you stay within compliance.

Related information
Now Platform App Engine

View your custom application and table inventory

Use the Custom Application Inventory to view your applications and tables. From the dashboard, you can track the allocation of your custom applications tables and map any unallocated applications or tables.
Before you begin
Role required: admin or usage_admin

Procedure

Navigate to Subscription Management > Custom Application

Inventory

What to do next
With the Custom Application Inventory, you can view and manage your custom applications and tables.

• View your Grandfathered and exempted tables.
• Map your custom applications.
• Map your custom tables.

Grandfathered and exempted tables
Grandfathered and exempted custom tables are treated differently than other custom tables on your instance. Please refer to your organization’s ServiceNow® contract for additional information.

Grandfathered tables
Depending on your organization’s legacy subscription entitlements and contractual migration, grandfathered tables may be allotted to your production instance. To preserve an organization’s previous custom table entitlements...
through the license migration, a grandfathered table entitlement may be provided to the production instance. This one-time process ensures that custom tables that currently exist in a production instance do not count against your new custom table entitlements.

To view your grandfathered tables, navigate to **Subscription Management > Custom Application Inventory**, and select **Grandfathered Tables**.

**Example: Grandfathered tables on an instance**

Scenario: Your organization purchases three new subscriptions with entitlements for a total of 55 App Engine Starter custom tables (formerly Bundled Custom Tables). To ensure your organization doesn't lose the previous custom table entitlements, a grandfather subscription with an entitlement for 25 grandfathered tables is allotted to your instance. This subscription requires the admin to identify and map the existing 25 tables. These subscriptions result in a total custom table entitlement of 80. Once a custom table has been assigned to the grandfather subscription there is no option to revert this.

<table>
<thead>
<tr>
<th>Multiple subscriptions with grandfathered and custom table entitlements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subscription</strong></td>
</tr>
<tr>
<td>Grandfathered subscription</td>
</tr>
<tr>
<td>New Subscription 1</td>
</tr>
<tr>
<td>New Subscription 2</td>
</tr>
<tr>
<td>New Subscription 3</td>
</tr>
</tbody>
</table>

**Exempted tables**

Exempted tables are custom tables that do not count towards your subscription entitlements. These tables consist mostly of custom extensions of certain system-related tables, such as sys_portal_page and sys_user_preference, that you extend for operational improvements in your production instance.

To view a list of exempted tables:

- In the instance, navigate to **Subscription Management > Custom Table Inventory** and select **Exempt Tables**.

The **Custom Table Guide legal schedule** provides the complete definition of which tables are considered exempt.
Note: Legal schedules are enforced based on when the contract is executed.

To find past versions of the Custom Table Guide, see the Legal Schedules Custom Table Guide.

Map your custom applications

Map your custom applications to a subscription to properly track your applications and monitor your compliance.

Before you begin
Role required: admin or usage_admin

About this task
Custom applications must be mapped to a valid subscription on installation. Existing custom applications must be mapped to a valid subscription to maintain accurate entitlement and stay within compliance.

Note: On non-production instances, custom-application mapping is suggested, but not required.

Procedure

1. Navigate to Subscription Management > Subscription Overview.
2. Select the Unmapped applications with custom tables tile.
   The page lists all applications without a subscription.
3. Select an application to bring up the custom application form.
4. Under Subscription Management, select the Subscription field and select a valid subscription from the list.
5. Select Update.

Results
The selected custom application maps to the subscription. Select the Update Allocation Totals button in the Subscription Overview dashboard for the allocation numbers to update. Otherwise, wait for the nightly system update.
Map your custom tables

Map your custom tables to your subscriptions to maintain and track custom table compliance over time. Mapping and tracking your tables ensures that your organization does not run out of custom table entitlements.

**Before you begin**
Role required: admin or usage_admin

**About this task**
Administrators and application developers can create custom tables to store application data. Map your custom tables to a subscription with available custom-table entitlements to stay within compliance. The system flags unmapped tables as out of compliance.

**Procedure**

1. Navigate to **Subscription Management > Custom Application Inventory**.
2. Click the **Global Tables Without Applications** tile on the dashboard. The page lists all tables not mapped to a subscription.
3. Select a table.
4. In the **Subscription** field, select a subscription.
5. Click **Update**.

**Results**
The selected custom tables map to the subscription. Select the **Update Allocation Totals** button in the **Subscription Overview** dashboard to update the allocation numbers immediately. Otherwise, wait for the nightly system update.

**Example:**
Your developers create a custom table to store the data...

**App Engine subscriptions**
Use Subscription Management to monitor subscription usage of your organization's custom applications.
With the Now Platform® App Engine, you can create custom applications and monitor the usage with Subscription Management. For more information on creating applications, see Now Platform App Engine.

ℹ️ **Note:** App Engine requires a separate purchase.

App Engine subscriptions entitle you to develop applications and deploy custom tables in production instances. Based on your App Engine version, you monitor the subscription usage of your App Engine applications differently.

### App Engine V1

Use the **App Engine Usage** dashboard to see App Engine subscriptions present on your instance. The dashboard lists:

- The total number of users that are currently allocated to each subscription.
- The number of custom tables that each user in the subscription is entitled to access.
- The list of specific users that are counted against each subscription.
- The number of unlicensed users if the subscription is over-allocated.
- Individual users with access to more custom tables than permitted by available entitlements.

ℹ️ **Note:** If you do not own App Engine V1, the **App Engine Usage** module is hidden.

### App Engine V2

View your App Engine subscriptions in the **Subscriptions** list. In the Subscription form, select the **Usage Details** related link. The **App Engine Subscription Management** page lists:

- The total number of users that are currently allocated to that subscription.
- The number of entitled custom tables each user is permitted.
- The roles that have access to the subscription.
- The number of unlicensed users if the subscription is over-allocated.
Custom-table mapping with App Engine subscriptions

Similarly to your other subscriptions, you can map custom tables to your App Engine subscriptions. Custom-table mapping helps track subscription usage, entitle roles, and help you stay in compliance. For more information, see Managing your custom applications and tables.

Custom table entitlements for App Engine subscriptions depend on your App Engine version.

**App Engine V1**

Your purchased App Engine subscriptions contain a *limited* number of custom table entitlements. Keep your mapped custom tables under the defined amount to stay within compliance.

**App Engine V2**

Your purchased App Engine subscriptions contain an *unlimited* number of custom table entitlements.

Unmapped custom tables are considered unsubscribed and unlicensed. Map your custom tables to track usage and maintain compliance over time.

**View App Engine V1 subscription compliance**

View your usage metrics for App Engine subscriptions. Use the information to help stay within compliance and help with subscription purchases.

**Before you begin**

Role required: usage_admin or admin

**About this task**

For App Engine V1 customers, use the **App Engine Usage** module to view metrics for custom application subscriptions. Monitor users, roles, and custom-table mapping. Use the information to determine if you need to make changes or purchase additional licenses and subscriptions.

**Procedure**

1. Navigate to **Subscription Management > App Engine Usage**.
2. Select the App Engine subscription you want to see metrics for.

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>

</tr>
<tr>
<td>Entitled Custom Applications</td>
<td>Names of the custom applications that are granted access by the role.</td>
</tr>
<tr>
<td>Users in Subscription</td>
<td>Names of the users in the associated roles.</td>
</tr>
</tbody>
</table>

**Note:** To learn more about how to manage role compliance, see Remove access to a custom table for large numbers of users.

**Remove individual user access to a custom table by role or group**
Remove an individual user’s access to a role or group to fix situations where too many users have access to custom tables for the subscription.

**Before you begin**
Role required: usage_admin or admin

**About this task**
The Users related list in the App Engine Usage dashboard lets you view all users who currently use App Engine subscriptions. You can select any user and view their user profile. The user profile lists each custom table and related custom application that the user can access.

**Procedure**
1. Navigate to **Subscription Management > App Engine Usage**.
2. To view the users or roles that are assigned to a specific App Engine subscription, click a subscription tile.
3. In the Users related list, click an individual user to view their standard user profile.
4. Click the Entitled Custom Tables related list to view information about the custom tables that the user can access for the subscription.
Entitled custom tables related list

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the custom table that the user is entitled to access.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the custom application that the custom table belongs to. <strong>Global</strong> appears if the custom table is for global use.</td>
</tr>
<tr>
<td>Role</td>
<td>Role(s) that grant the user access to the table.</td>
</tr>
</tbody>
</table>

5. To remove the selected user from the subscription, select a line in the Entitled Custom Tables listing.

6. From **Actions on selected rows**, click **Remove user's access to table**.

7. When the **Remove User from Role** confirmation dialog appears, click **OK**.
   If you receive a message stating that access to the table was granted via an inherited role or group, you must instead remove the user from the group:
   • Click the Groups related list.
   • Select the user that you want to remove.
   • From **Actions on selected rows**, click **Delete**.
   • When the confirmation dialog appears, click **Delete**.

8. To formally remove the user's access to the custom table, click **Confirm** when the final **Remove User from Role** confirmation dialog appears.

Remove access to a custom table for large numbers of users

Adjust roles or remove multiple users from those roles by granting custom table access in the subscription as needed. Use the Roles related list in the App Engine Usage dashboard to view the roles that grant user access to custom tables in a selected App Engine subscription.

**Before you begin**
Role required: usage_admin or admin

**About this task**
This procedure is similar to the procedure for removing custom table access for an individual user or smaller number of users. However, you may need to remove custom table access for several hundred, or several thousand users. Rather than doing this one by one, you can either:
• Remove the role or roles that grant access to the custom tables for these groups of users, depending on permissions
• Remove large groups of users from these roles.

For example, you would use this procedure if you are developing an application for use in North America and need to remove access for all European users.

Procedure

1. Navigate to Subscription Management > App Engine Usage.

2. To view the users or roles assigned to that specific App Engine subscription, click a subscription tile.

3. In the Roles related list, click a role to view the Role record.
   To learn more about roles and how they relate to users and groups, see . The Custom Tables related list contains information about the custom tables that the role can access for the subscription:

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Name of the custom application that the custom table belongs to. Global appears if the custom table is for global use.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the custom table that belongs to the application.</td>
</tr>
</tbody>
</table>

4. To view the users assigned to the role, click the Subscribed Users related list.

<table>
<thead>
<tr>
<th>Subscribed users related list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fields</td>
</tr>
<tr>
<td>User</td>
</tr>
<tr>
<td>State</td>
</tr>
<tr>
<td>Inherited</td>
</tr>
</tbody>
</table>

5. To remove users from the role, select the users in the Subscribed Users listing, and from Actions on selected rows, click Remove user's access to table.
6. When the **Remove User from Role** confirmation dialog appears, click **OK**.
7. To formally remove the user's access to the custom table, click **Confirm** when the final **Remove User from Role** confirmation dialog appears.

**Results**
The selected user's access is removed from the custom table for the selected subscription. After either remediation action is complete, the subscription compliance automatically updates to reflect the change.

**View App Engine V2 subscription compliance**
View your usage metrics for App Engine subscriptions. Use the information to help stay within compliance and help with subscription purchases.

**Before you begin**
Role required: admin or usage_admin

**About this task**
For App Engine V2 customers, use the **App Engine Subscription Management** page to view metrics for custom application subscriptions. Monitor users, roles, and custom-table mapping. Use the information to determine if you need to make changes or purchase additional licenses and subscriptions.

**Procedure**
1. Navigate to **Subscription Management > Subscription Overview**.
   The **Subscriptions** page lists your active subscriptions, including installed App Engine V2 subscriptions. Some subscriptions might not appear. See **Why a subscription might not appear in the list**.
2. Select the App Engine subscription you want to view.
3. In the Subscription form, select the **Usage Details** related link.
   The **App Engine Subscription Management** page lists the users, roles, and metrics associated with the custom application subscription.
Managing your subscription compliance

With Subscription Management, you can review and monitor your subscription compliance. By monitoring the allocation of users, applications, and tables, you can make better decisions about your subscription purchases and stay within compliance.

Subscription Management monitoring

Subscription Management tracks metrics on the usage of your subscriptions. Use the data to:

• Track over-allocation of users
• Determine whether users who are not subscribed are accessing a subscription application.
• Ensure that your custom applications and custom tables are mapped to subscriptions.
• Monitor your custom application and custom table entitlements.
• Plan and budget for upcoming or future subscription needs.
  ◦ Assess whether you have allocated too many fulfiller users to a per-user subscription. Consider purchasing more subscription entitlements.
  ◦ Assess your custom application and table entitlements. Consider purchasing more entitlements to map all of your custom applications and tables to subscriptions.
Compliance dashboards

The **Subscription Overview** dashboard shows a breakdown of your active and expired subscriptions, allocation numbers, and other important information about your subscriptions. See View your subscription overview.

The **Domain Compliance Overview** dashboard shows a breakdown of units per domain for instances that support domain separation. See View your domain compliance overview.

Related reference
- Types of subscriptions

</tr>
<tr>
<td>Unsubscribed application usage</td>
<td>Number of users using an application without the proper entitlement.</td>
</tr>
</tbody>
</table>

**What to do next**

After editing your subscriptions, select the **Update Allocation Totals** button for Subscription Management to show the changes. Otherwise, the changes show after the nightly system update.

**View your domain compliance overview**

View the Domain Compliance Overview dashboard to see a breakdown of units per domain for instances that support domain separation.

**Before you begin**

Role required: usage_admin or admin

**About this task**

The Domain Compliance Overview dashboard appears only for instances that support domain separation. For more information, see Domain separation and Subscription Management.

**Procedure**

Navigate to **Subscription Management > Domain Compliance Overview**.

The **Access Count**, **Fulfiller Count**, and **Producer Count** tabs display action counts in lists and charts.
The **Capacity Based** tab displays counts for capacity-based licenses and charts.

The **Allocated Users by Domain** tab displays a list of users separated by domain. Selecting a domain shows more information on the allocated users in each domain.
Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

The differences between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.
Configuring surveys
There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

⚠️ **Tip:** The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

⚠️ **Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys
Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

⚠️ **Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

Survey Management roles

The Survey Management application uses the following roles.

No role is required to take assigned survey questionnaires.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Survey administrator      | Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu. | • survey_reader  
                           |                                                                             | • assessment_admin |
| survey_reader             | View surveys and related information, such as survey responses, survey groups, scorecards, and reports. | none                            |

Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
</tbody>
</table>
Key survey terms (continued)

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the <strong>Assigned to</strong> field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

### Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue.

No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

### Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.
Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Before you begin
Role required: none

About this task
Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

Procedure

1. Navigate to **Self-Service > My Assessments & Surveys**.
   Users with the assessment_admin role, including survey administrators, can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save your responses without submitting them</td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue.</td>
</tr>
</tbody>
</table>
### Domain separation and Survey Management

Domain separation is supported in Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see Application support for domain separation.

---

**Option** | **Description**
--- | ---
Submit the survey after answering all questions

- **Note:** The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.

Click **Submit**. You cannot return to the questionnaire after submitting.

- **Note:** If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.
Overview
As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management
There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances
The following domains are available by default after activating the Domain Support-Domain Extensions Installer [com.glide.domain.msp_extensionsinstaller] plugin. Only ServiceNow employees can activate this plugin.

• Global
• Acme
• Cisco

Access to surveys in domain-separated instances
Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td></td>
<td>Acme</td>
</tr>
<tr>
<td></td>
<td>Cisco</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>Yes</td>
</tr>
</tbody>
</table>
Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

⚠️ Note: When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

**Trigger conditions in domain-separated instances**

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the **User field** under **Caller**. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the **asmt_condition** table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

**Related information**

- Domain separation for service providers

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the **positive indicator** field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.
Survey responses

Survey responses are stored in the Metric Result [asmt_metric_result] table and display the recipients’ answers to each question in a category. To view general results, navigate to **Survey > Survey Responses**. To view results for a particular criterion, use a filter on the Metric Result [asmt_metric_result] table. For example, to view results based on the assignment group, apply a filter condition for assignment group.

**Survey metric results**

![Survey metric results table](image)

**Category results**

Category results are stored in the Assessment Category Result [asmt_category_result] table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to **Assessments > Results > Category results** and filter the results using the `[Type.Evaluation method] [is] [Survey]` condition.
Assessment category results

Survey scorecards
A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

Related information
- View a survey scorecard
- Survey designer elements
- Configure category weights for a survey

View results for all surveys
You can view the survey responses that are stored on the Metric Result [asmt_metric_result] table.

Before you begin
Role required: survey_admin or survey_reader

Procedure
1. Navigate to Survey > Survey Responses.
   Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

   The Type column displays the survey definition each response is associated with.

2. Select a response to view its details.
View the results for a survey

You can view the responses for one survey definition. Survey results are stored on the Metric Result [asmt_metric_result] table.

Before you begin
Role required: survey_admin or survey_reader

Procedure
1. Navigate to Survey > View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Example

Metric result fields
List of field descriptions for the Metric Result form.
# Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Checkbox</strong>: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Date, Date/Time, or String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Yes/No</strong>: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
</tbody>
</table>
### Metric Result form (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in <strong>Normalized value for an assessment</strong>.</td>
</tr>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the <strong>Actual value</strong>, such as when the question data type is <strong>Percentage</strong>. The string value is <strong>N/A</strong> for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

### Normalized value for an assessment

The normalized value is calculated based on a linear equation and the scale definition of the metric. This value can be used for risk assessment.

### Normalized value for any metric

The normalized value is directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then

\[
\text{Normalized value} = 1.0 - \text{Normalized value}
\]

For reporting purpose, use the Metric Result [asmt_metric_result] table.

\[
\text{Normalized value} = \frac{(\text{Input Value} - \text{Min value defined in metric})}{(\text{Max value defined in metric} - \text{Min value defined in metric})} * \text{(current metric weight / (sum of valid metric weight in the metric category))} * \text{scale_factor}
\]

**Note:**

- If a metric is skipped when taking the assessment, its weight is excluded when calculating `sum of valid metric weight in the metric category`.
- The following metric types are excluded in the normalized value calculation:
  - String
  - Date
  - Date/Time
  - Reference
  - Attachment
  - Ranking

For example, consider the following scenario.

Calculate the normalized value for the **Please rate the competency of the technician** metric.
### Values of the metric

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>6</td>
</tr>
<tr>
<td>• of type=number</td>
<td></td>
</tr>
<tr>
<td>• of type=yes/no</td>
<td></td>
</tr>
<tr>
<td>• of type=string (invalid data type; value cannot be calculated)</td>
<td></td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

Normalized value = \(\frac{(3 - 1)}{(6 - 1)} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8\)

**Normalized value for a multiple selection metric**

The normalized value for a multiple selection metric is calculated by using the weight of the metric and the score for each choice of the metric.

In a multiple selection metric, for each choice that should be used for the normalization calculation, define the normalization input value.

\[
\text{Normalized value} = (\text{Score of all choices}) \times \left(\frac{\text{current metric weight}}{\text{sum of valid metric weight in the metric category}}\right) \times \text{scale_factor}
\]

Here, score of all choices of the metric is the sum of individual scores of each choice.

- Score of each choice in a multiple selection metric = Normalization input of the choice / max value of the metric
- max value of the metric = Sum of the normalization input for all choices of the metric
- min value of the metric is always 0

For example, consider the following scenario.

Calculate the normalized value for the multiple selection metric, **Please rate the competency of the technician**, with three choices, A, B, and C.
Values of the metric

<table>
<thead>
<tr>
<th>Choice</th>
<th>Normalization input is 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice A</td>
<td>Normalization input is 1</td>
</tr>
<tr>
<td>Choice B</td>
<td>Normalization input is 1</td>
</tr>
<tr>
<td>Choice C</td>
<td>Normalization input is 2</td>
</tr>
<tr>
<td>Minimum value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum value</td>
<td>4</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>5</td>
</tr>
<tr>
<td>Valid metric weight of each metric</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

If Choice A and B are selected, Normalized value = \((\frac{1}{4} + \frac{1}{4}) \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 1\)

Weighted value for a risk assessment

For a risk assessment, the weighted value from metric results table is calculated as following.

\(\text{weighted\_value} = \text{metric\_weight} \times \text{result\_actual\_value}\)

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Before you begin
Role required: survey_admin or survey_reader

About this task
A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.
**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, click **View Scorecard**. The interactive scorecard displays the following filters:
   - **Question Results**: Displays the result of all questions or an individual question.
   - **Category Results**: Displays the results of all questions associated with an individual category or all categories.
   - **Average Ratings**: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - **History**: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - **Sentiment Analysis Results**: Displays the results of sentiment analysis for the survey.

   **Note**: The scorecard link is hidden if there are no survey results to report.

**Survey scorecard category results**

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale
**Note:** The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.

Survey category results

Scorecard Customer Satisfaction Survey

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail

Survey scorecard question results

The **Question Results** filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

**Pie chart**

The pie chart shows question results for all data types other than those that are displayed in the list view. See **Survey question data types**.
• Checkbox.
• Boolean.
• Choice.
• Likert Scale.
• Number.
• Percentage.
• Yes/No.
• Image Scale.
• Multiple Selection.
• Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:
- \( \% \text{Promoters} = \frac{\text{Number of promoters}}{\text{Sample size}} \)
- \( \% \text{Detractors} = \frac{\text{Number of detractors}}{\text{Sample size}} \)
- \( \% \text{Passives} = \frac{\text{Number of passives}}{\text{Sample size}} \)
- \( \text{NPS} = \% \text{Promoters} - \% \text{Detractors} \)

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

**Survey scorecard history**

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.
Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.

![Survey scorecard trend chart](chart.png)

**3 years**

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.
Survey scorecard history - 3 years

<table>
<thead>
<tr>
<th>Survey Scorecard</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Overall Rating</strong></td>
<td><strong>Current</strong></td>
<td><strong>Diff</strong></td>
<td><strong>2013</strong></td>
<td><strong>2012</strong></td>
</tr>
<tr>
<td>Service Desk Satisfaction Survey</td>
<td>5.40</td>
<td>0.00</td>
<td>5.40</td>
<td>0.00</td>
</tr>
<tr>
<td>How satisfied were you with the response time to your incident? (1=not at all, 6=excellent)</td>
<td>0.00</td>
<td>-1.02</td>
<td>1.02</td>
<td>0.00</td>
</tr>
<tr>
<td>How courteous and respectful was the technician who responded? (1=poor, 6=excellent)</td>
<td>0.00</td>
<td>-1.21</td>
<td>1.21</td>
<td>0.00</td>
</tr>
<tr>
<td>Please rate the technical competency of the technician serving you (1=poor, 6=excellent)</td>
<td>0.00</td>
<td>-1.02</td>
<td>1.02</td>
<td>0.00</td>
</tr>
<tr>
<td>Was technician able to resolve your issue during the first call?</td>
<td>0.00</td>
<td>-1.00</td>
<td>1.00</td>
<td>0.00</td>
</tr>
<tr>
<td>How satisfied are you with your overall service experience? (1=not at all, 6=excellent)</td>
<td>0.00</td>
<td>-1.14</td>
<td>1.14</td>
<td>0.00</td>
</tr>
</tbody>
</table>

4 quarters
Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd [2015], 1st [2015], 4th [2014], and 3rd [2014]. All four of the previous quarters appear, whether or not there was any data for those quarters.
Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Before you begin
Role required: admin or survey_admin
Procedure

1. Click the menu icon (≡) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

Example

2. Click **Download** and save the scorecard image to a storage location.

Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

• Create, customize, and publish surveys.

• Write and maintain survey questions.

• Define trigger conditions for when surveys are sent to users, such as when an incident closes.

• Maintain surveys and survey questions as the organization's needs change.
To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

**View the overview of all surveys**

Use this homepage to view various survey reports such as results by metric type and state.

**Before you begin**

Role required: admin or survey_admin

**About this task**

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

**Procedure**

1. Navigate to **Survey > Overview**.
   The following reports are available:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group Customer Satisfaction</td>
<td>Metric Result [asmt_metric_result]</td>

</tr>
</tbody>
</table>
2. To view the required information, click elements within the reports.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

**Survey designer**

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

**Related information**

Create a survey designer template question
Select recipients for a survey in the Survey Designer
Publish a survey in the Survey Designer

**Survey designer elements**

The survey designer is accessible from **Survey > Survey Designer**.

The survey designer contains the Controls tab, the Questions tab, the Categories tab, a header bar, and the design canvas.

**Controls tab**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

### Question data types

<table>
<thead>
<tr>
<th>Data type</th>

</tr>
</tbody>
</table>
### Question data types (continued)

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>Yes</td>
<td>Question with a check box or Yes and No choices for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>Yes</td>
<td>List of predefined options. For more information, see the definition of the <strong>Choices</strong> field in Create a question in the survey designer.</td>
</tr>
<tr>
<td>Date</td>
<td>No</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>No</td>
<td>Date and time field.</td>
</tr>
<tr>
<td>Number</td>
<td>No</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>No</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Yes</td>
<td>Predefined Likert scale. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>Numeric Scale</td>
<td>Yes</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>String</td>
<td>No</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Yes</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <strong>Quiz scorecards</strong>.</td>
</tr>
<tr>
<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify sys_user as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
<tr>
<td>Multiple Selection</td>
<td>Yes</td>
<td>Question with multiple check boxes that can be selected.</td>
</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>
Questions tab
This tab displays all metrics added to the question bank for surveys. Use the Filter field to search for questions. Each metric is displayed with its name and type.

Categories tab
This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are grouped under the corresponding metric category. Use the Filter field to search for categories or questions.

Header bar
The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

• **Design**: Add and configure the properties of categories and questions. This is the default view.
• **Configuration**: Create introductions and end notes for surveys and select a signature.
• **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey.

• **Save**: Save the current survey without changing its state.
• **Preview**: Display a preview of the survey as it appears to recipients.
• **Publish**: Distribute the survey to the selected recipients.
• **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.
• **New Survey**: Open a fresh canvas for a new survey.
• **Load Survey**: View the list of existing surveys.
• **Copy Survey**: Copy the current survey.

Design canvas
New surveys open in the canvas of the Design view. The survey Name field appears above first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer

Configuration settings apply to the entire survey.

**Before you begin**
Role required: admin, survey_creator, or survey_admin

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition in Survey Designer.
3. Select the **Configuration** tab and complete the Survey Designer Configuration form.

**Configuration tab fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select the check box to enable the distribution of this survey to recipients.</td>
</tr>
<tr>
<td>Survey Owners</td>
<td>Owners of the survey. You can add a user with the survey_creator, survey_admin, or assessment_admin role.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Select the check box to collect survey responses anonymously. Recipients are not listed with survey results. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>

Survey categories

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks.
• Separate groups of questions into collapsible sections by category on the survey questionnaire.
• Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer
A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Before you begin
Role required: admin or survey_admin

About this task
When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

Procedure
1. Navigate to Survey > Survey Designer.
2. Enter the name of the survey in the Name field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a. Enter a new name and a description for the category.
   b. Enter text in the Details field that introduces or explains the category to recipients.
   c. Click the X icon to close the Properties dialog box and save your settings.
4. To add a new category, click the + icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the X icon in a category header to delete a category that you added in error.

Create a survey category in a survey
You can modify an existing survey to add one or more survey categories.

Before you begin
Role required: admin or survey_admin
About this task

Only one category is required for each survey, but you can add additional categories as needed.

Procedure

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category or click New. Each survey category is stored as a record on the Metric Category [asmt_metric_category] table with a modified view for survey use.
4. Enter the survey category name and description. The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click Save. The Assessment Metrics and Users related lists appear.
6. Click Update.

Create a question in the survey designer

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Before you begin
Role required: admin or survey_admin

About this task
The data type that you select for each question determines how it can be answered by survey recipients.

Procedure
1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar. The Properties dialog box opens.
3. Complete the form.
### Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the <strong>Additional Information Label</strong> field is enabled. The <strong>Additional Information Label</strong> field value is displayed as a field on the survey response page to provide additional information for a question.</td>
</tr>
<tr>
<td>Note:</td>
<td>This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a <strong>Yes/No</strong> list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is <strong>String</strong>. The string options include the following.</td>
</tr>
<tr>
<td>• Single line</td>
<td>Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td>• String line wide</td>
<td>Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td>• Multiline</td>
<td>Full page width multiline text field that allows word wrap and returns</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number, Percentage, or Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number, Percentage, or Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>$(param)</code> placeholder is added at the end of the question label. <strong>Note:</strong> You can move this placeholder anywhere in the question label. When a user takes the survey, the question with dynamic value is included in the survey instance and <code>$(param)</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>${param}</code> placeholder is not replaced by any value and is displayed as is in the question. For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>${param}</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is. <strong>Note:</strong> When survey questions are translated to other languages by a survey admin, the <code>${param}</code> placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey. <strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options. <strong>Note:</strong> Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab.
   The question must have a data type of **Boolean, Choice, Scale, or Template**.

5. Select a question in the **Displayed when** field.
   The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.
   You can select more than one answer. Selected answers are indicated by a check mark.
   The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the **X** icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the **+** icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the **X** icon in its title bar.

**Related information**

- Create a survey designer template question

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:
• View a list of the attached files.
• View an attached file in a separate window.
• Rename an attached file.
• Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type
On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type
On questionnaires, users select a value from a list of choices.

If you select Choice, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.
Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.

Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options **Easy**, **Average**, and **Difficult**.
If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ℹ️ **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

### Number data type
On questionnaires, users enter a number.

If you select **Number**, you must fill in these additional fields:
- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type
On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:
- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.
Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

ℹ️ Note: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.

String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:
• Single line

| Additional comments |

• Single line wide

| Additional comments |

• Multiline

| Additional comments |

**Template data type**

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

• **Template**: Select a template.

• **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

**Yes/No data type**

On questionnaires, users select **Yes** or **No** from a list.
If you select **Yes/No**, you must fill in the **Scale definition** field. Select **High** if **Yes** is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected image</th>
<th>Unselected image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>

<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to "Select all that apply" in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer
You can modify surveys using the survey designer.

Before you begin
Role required: admin or survey_admin

About this task
You can edit a survey even after it has been distributed, with the following results.
• Added questions are available only on surveys that are distributed after this change.
• Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
• Deleted questions are also deleted from the distributed surveys in user queues.

⚠️ **Note:** You can only edit a survey that has the same application scope as that of your current session.

**Procedure**
1. Navigate to **Survey > Survey Designer**.
2. Point to the menu icon in the survey header bar, and select **Load Survey**.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select **Save** or **Save and Publish**.
   - When you publish the edited survey, the system generates survey instances for any associated survey users.

**Configure category weights for a survey**
You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

**Before you begin**
Configure the Survey Category form to display the **Weight** field.
Role required: admin or survey_admin

**About this task**
Weights are set to a value of **10** by default but can be changed.

**Procedure**
1. Navigate to **Survey > View Surveys** and select a survey from the list.
2. In the Survey Definition form, select a category from the **Metric Categories** related list.
3. Edit the default weight value.
4. Click **Update**.
View a survey instance

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to Survey > Survey Instances. The following sub-modules are available based on the state of the instances:

   • **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.

   • **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.

   • **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.

   • **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.

   • **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than **Completed**.

   **Note:**
   - When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.
   - Each survey instance is stored as a record on the Assessment Instance [asmt_assessment_instance] table with a modified view for survey use.

<table>

Schedule periods

Survey users and groups

Survey users and survey user groups help survey administrators control who can take a survey.

Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

Administering survey users

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to Daily, Weekly, Monthly, or Yearly. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

Note: If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

Create a survey user group

Survey user groups are groups that have the Type field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.
Before you begin
Role required: admin or user_admin

About this task
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

Procedure
1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save. The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a. In the Group Members related list, click Edit.
   b. Select users from the list on the left and add them to the Group Members List on the right.
   c. Click Save.

Related information

Select recipients for a survey in the Survey Designer
You can assign survey users while designing or modifying the survey.

Before you begin
Role required: admin or survey_admin

Procedure
1. In the Survey Designer, click the Availability tab.
2. Under Accessible by: select the Specific users option, then select users.
3. If desired, select the **Survey groups only** check box, then select survey user groups or other groups.

4. Click **Save**.

**Designate a survey user**

You can designate one survey user at a time from the Survey Definition form.

**Before you begin**

Role required: admin or survey_admin

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
   There must be at least one category.
3. In the **Survey Users** related list, click **New**.
4. Select a **User**.
5. Click **Submit**.
   The Survey Definition form reopens.
6. **Optional:** To remove survey users, in the **Survey Users** related list, select the check box beside the user, and then select **Delete** from the action list below the list.

**Designate or remove multiple survey users at one time**

Use the Survey Category form to designate or remove multiple survey users at a time.

**Before you begin**

Role required: admin or survey_admin

**Procedure**

1. Open a survey definition.
2. In the **Metric Categories** related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey’s categories automatically.
3. In the **Users** related list, click **Edit**.
4. Use the slushbucket to add or remove survey users.
5. Click **Save** to return to the survey category.
   The changes are also reflected in the **Survey Users** related list on the survey definition.

**Allow recipients to retake a survey**

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey's due date.

**Before you begin**

Configure the Survey Definition form to display the **Allow retake** field. For more information, see

Configure the form .

Role required: admin or survey_admin

**About this task**

Results are not calculated for the survey until the configured duration has elapsed. The card in the user's queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

**Procedure**

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. Select the **Allow retake** check box.
4. Click **Update**.

**Copy a survey**

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

**Before you begin**

Role required: survey_admin or admin

**About this task**

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.
Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>a. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>b. In the Survey Designer title bar, point to the menu icon (≡) on the header bar and click <strong>Copy Survey</strong></td>
</tr>
</tbody>
</table>

Publish a survey
You must publish a survey to enable people to receive and complete survey instances.

Before you begin
Role required: admin or survey_admin

About this task
The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state.

⚠️ Note: You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

Procedure
1. Navigate to Survey > View Surveys and select a survey to publish.
2. Click **Publish**.
   When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.
Publish a survey in the Survey Designer

You must save changes to a survey before you can publish it to the specified recipients or groups.

Before you begin
Role required: admin or survey_admin

Procedure
1. In the Survey Designer, point to the menu and select Load Survey.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click Preview.
4. When you are satisfied with the survey, click either Save and Publish or Publish to distribute it.
   When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient's My Assessments & Surveys portal.

Customize the appearance of a survey

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Before you begin
Role required: admin or survey_admin

About this task
For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the # character is required. Values are not case-sensitive.

For example, all of the following formats are valid: LightGray, lightgray, #D3D3D3. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

Procedure
1. Navigate to either of the following modules.
   - Assessments > Admin > Assessment Properties
   - Survey > Administration > Properties
2. On the properties page, edit the properties as needed.
   Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
   You may need to clear the browser's cache to see updates.

**Assessment and survey properties**

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Related information

Send survey invitations to users

Modify a survey definition

You can configure additional options for a survey definition.

Before you begin

Role required: admin, survey_creator, or survey_admin

Procedure

1. Navigate to Survey > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition.
   The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form.

   Note: You can only edit a survey that has the same application scope as that of your current session.

4. Save the record.

**Related information**

- Survey trigger conditions
- Publish a survey

**Schedule periods**

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.
For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

⚠️ **Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

**Related information**
- Publish a survey

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

**Before you begin**
- Role required: admin or survey_admin
Procedure

1. Navigate to **Survey > Survey Designer** and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.

![Image of Survey Designer interface]

Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.

7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.

9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions
Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.

Before you begin
Role required: admin or survey_admin

About this task
Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category.

4. In the **Assessment Metrics** related list, open an existing question or click **New**. Each survey question is stored as a record on the Assessment Metric [asmt_metric] table with a modified view for survey use.

5. Complete the Survey Question form. The fields that appear depend on the selected **Data type**.

<tr>
<td>Template</td>
<td>Question template to use for the answer options. This field is visible and required only if the data type is Template.</td>
</tr>
<tr>
<td></td>
<td>Note: If another question depends on this question, you cannot change the template.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note: <strong>Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</strong></td>
<td></td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the <strong>Depends on</strong> field is empty and the data type is not <strong>Checkbox</strong>. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this question on survey questionnaires. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Template</strong>, or <strong>Yes/No</strong>.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the <strong>Additional Information Label</strong> field is enabled. The <strong>Additional Information Label</strong> field value is displayed as a field on the survey response page to provide additional information for a question. <strong>Note:</strong> This is not applicable for the String and Template data types.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays <strong>Checkbox</strong>, <strong>Choice</strong>, <strong>Template</strong>, and <strong>Yes/No</strong> questions of the same category as this question. Then, use the <strong>Displayed when</strong> field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected <strong>Depends on</strong> question which, when chosen on surveys, display this question. This field is visible and required only when the <strong>Depends on</strong> field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is <strong>String</strong>.</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>{param}</code> placeholder is added at the end of the question label.</td>
</tr>
</tbody>
</table>

  ❗️ **Note:** You can move this placeholder anywhere in the question label.

  When a user takes the survey, the question with dynamic value is included in the survey instance and `{param}` placeholder is replaced with the source field value.

  If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the `{param}` placeholder is not replaced by any value and is displayed as is in the question.

  For example, if the survey is triggered from a **PRB** record and the survey question is configured with a dynamic value from **Incident**, the `{param}` placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.

  ❗️ **Note:** When survey questions are translated to other languages by a survey admin, the `{param}` placeholder should not be translated.

Trigger condition example

**Related information**

Survey question template

Survey trigger conditions
Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.
If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ⓘ **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.
• **Date/Time:** On questionnaires, users select a date and time.

![Date/Time Image]

**Likert Scale data type**

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options **Easy, Average, and Difficult.**

![Likert Scale Image]

If you select **Likert Scale**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

ℹ️ **Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Number data type**

On questionnaires, users enter a number.

![Number Image]

If you select **Number**, you must fill in these additional fields:
• **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.

• **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

![Approximately what percent of the time are your incidents resolved in a week or less?](image)

If you select **Percentage**, you must fill in these additional fields:

• **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.

• **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

⚠️ **Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table.
String data type
On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**

![Single line](image)

- **Single line wide**

![Single line wide](image)

- **Multiline**

![Multiline](image)

Template data type
On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

Yes/No data type
On questionnaires, users select Yes or No from a list.
If you select Yes/No, you must fill in the **Scale definition** field. Select **High** if Yes is the best answer.

### Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** N/A option is not supported for image scale type question.
**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.

![Multiple Selection Example](image)

**Ranking data type**

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

![Ranking Example](image)

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

**Related information**

Survey question template

**Survey question template**

Question templates define reusable sets of answer options for survey questions.

Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the
following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

**Template definition**

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in [Create a survey question template](#).

**Default question templates**

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

**Before you begin**

Role required: admin or survey_admin

**About this task**

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.
Procedure

1. Navigate to Survey > Templates.
   Each template is stored as a record on the Assessment Metric Template [asmt_template] table.

2. Click **New**.

3. Enter a **Name**.

4. Right-click the form header and click **Save**.

5. In the **Assessment Template Definitions** related list, click **New**.
   Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest <strong>Value</strong>. Each template definition for a given template must have a unique <strong>Value</strong>.</td>
</tr>
</tbody>
</table>

7. Click **Update**.

**Update min and max values to match templates**

If you use survey result calculation data, ensure that the **Min** and **Max** values for a question that uses a template are equal to the smallest and largest template definition **Value**.

**Before you begin**
Role required: admin or survey_admin

**About this task**
When you create a question of the **Template** data type, the system sets the **Min** and **Max** fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the **Value** of an existing template. If the new **Value** is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.
Procedure

1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] [is] [<select the template you updated>].
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.
   If the values do not match, edit the Min and Max values directly from the list.

Note: When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Add a metric category and metric in the question bank for surveys

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Before you begin
Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

Procedure

1. Navigate to Survey > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.

Metric Category fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click Save.
5. In the Assessment Metrics related list, click New.
6. In the Survey Question form, fill the fields. For information on these fields, see Create or modify survey questions.

7. Click Submit.

Configure metric categories or metrics for a survey using the question bank

Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating a survey.

Before you begin
Role required: admin or survey_admin
Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

Procedure
1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Optional: To add metric categories to a survey from the question bank in Platform, perform the following steps.
   a. In the Metric Categories related list, click New Category from Bank. The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b. Select the required categories and click Add Selected. A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. Optional: To add metrics to a survey from the question bank in Platform, perform the following steps.
   a. In the Metric Categories related list, open a metric category definition.
   b. In the Assessment Metrics related list, click New Metric from Bank. The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c. Select the required metrics and click Add Selected. A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from a survey in Platform, perform the following steps.
a. In the Metric Categories related list, open a metric category definition.

b. Click Add to question Bank.
   A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a survey in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.
   b. In the Assessment Metrics related list, open the required metric definition.
   c. Click Add to Question Bank.
      The Add to Question Bank dialog box is displayed.
   d. In the Choose a question bank to add this question/metric field, select a metric category that you want to add this metric to, and click OK.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.

   a. Open the survey in Survey Designer.
   b. Optional: To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.
   c. Optional: To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

Note:
- When you drag and drop a metric category, all dependencies within the category are also added to the survey.
- From the Categories tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.
Create or modify answer options

You must create answer options, called metric definitions, for survey questions that have **Data type** set to **Choice** or **Likert Scale**.

**Before you begin**
Role required: admin or survey_admin

**About this task**
Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

**Procedure**

1. Navigate to **Survey > Questions**.
2. Open a choice or Likert scale survey question.
3. In the **Assessment Metric Definitions** related list, open a metric definition or click **New**.
   Each answer option is stored as a record on the Assessment Metric Definition [asmt_metric_definition] table.
4. Complete the Assessment Metric Definition form.

**Assessment Metric Definition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different <strong>Value</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Example:**
On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Answer option order based on value

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question Scale definition is set appropriately based on the answer options. In the previous example, if you want the answer option Good to earn the highest score, the scale definition should be Low because Good has the smallest value.

### Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

**Before you begin**

Role required: admin or survey_admin

**About this task**

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the Order field for the first question to 101, the second to 102, and so on. After you create a new question outside of the survey creator, the Order is set to 100 by default, which means it appears before all questions generated by the survey creator.

**Procedure**

1. Navigate to Survey > View Surveys and open the appropriate survey definition.

2. In the Metric Categories related list, edit the values in the Order column.

3. To change the order of questions within a category, complete the following steps.
   a. Open the Assessment Metrics related list.
   b. Edit the values in the Order column.

4. Click Update.
Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

⚠️ Note: Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Before you begin
Role required: admin or survey_admin

Procedure

1. Navigate to Survey > Trigger Conditions.
2. Click New.

⚠️ Note: Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

<table>
<thead>
<tr>
<th>Trigger condition fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Assessment</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>--------------------------</td>
</tr>
<tr>
<td>whenever an incident closes, select the Incident [incident] table.</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Repeat interval</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Business rule</td>
</tr>
<tr>
<td>Trigger randomly</td>
</tr>
<tr>
<td>Probability (%)</td>
</tr>
<tr>
<td>Related Field 1- 4</td>
</tr>
</tbody>
</table>

Note: To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field specification</td>
<td>the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance.</td>
</tr>
</tbody>
</table>

**Note:** You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the `trigger_id` column of the table.

<table>
<thead>
<tr>
<th>Description</th>
<th>Summary information to identify the trigger condition.</th>
</tr>
</thead>
</table>

**Note:** For a triggered record, the table title is used for the survey description.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <code>[State] [is] [Closed]</code>.</th>
</tr>
</thead>
</table>

**Note:** When defining conditions like case sensitivity or null values, see API `GlideFilter - Scoped, Global`.

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
Example:

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident [incident]
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: [State] [is] [Closed] [or] [State] [is] [Resolved]

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.
Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- **User** (Related Field 1): Boris Catino
- **Problem** (Related Field 2): PRB010101
- **Task** (automatically created): INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the **Repeat interval** setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).

To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to **ReportsView/Run** and clicking **Create a report**.
Survey distribution

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Before you begin
Role required: admin or survey_admin

About this task
Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
- State is Published.
- Survey is associated with at least one question.
Note: You (or a trigger) can send more than one instance of a survey to a user at any time.

Procedure
1. Navigate to Survey > View Surveys.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click Send invitations.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click Assign Survey and select one or more users, and then click OK.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the Assign Survey button, the selected user is not saved as a survey user.

Define a recipients list for surveys
Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to Survey > Administration > Recipients Lists.
2. Click New.
3. In the Recipients List form, add the field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipients list.</td>
</tr>
</tbody>
</table>
| Type      | Type of users to include in the list. Possible values are:  
<p>|           | • Contacts                                       |
|           | • Internal Users                                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the recipients list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: List has not yet been generated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>In Progress</strong>: List is currently being generated. (You can see this state only when generating a very large list of recipients.)</td>
</tr>
<tr>
<td></td>
<td>• <strong>Complete</strong>: List is generated.</td>
</tr>
<tr>
<td>Setup</td>
<td>Method used to generate the recipients list. Possible values are:</td>
</tr>
<tr>
<td>Method</td>
<td>• <strong>Upload File</strong>: Upload an Excel file with the recipients list using the specified template.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic Condition</strong>: Run a script or condition builder to create the recipients list.</td>
</tr>
<tr>
<td>Choose File</td>
<td>Allows you to download an Excel template, and then upload the Excel file with user information using the specified template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td></td>
<td>• The templates vary based on the entity selected in the <strong>Type</strong> field. For accounts, the template includes columns for sys_id and account number values. For contacts, consumers, and internal users, the template includes columns for sys_id and email values.</td>
</tr>
<tr>
<td>Show Script</td>
<td>If selected, displays the script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong> and the <strong>Show Script</strong> check box is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the user information. The table is selected based on the <strong>Type</strong> field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>User Field</td>
<td>Table field that refers to users.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
</tbody>
</table>

**Note:** When the **Method** is **Dynamic Condition**, you can either use a script or a condition builder to create the recipients list.

4. Click **Submit**.
   For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. **Optional:** To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

### Add a recipients list to a survey
Send the survey invites to targeted sets of users by adding a recipients list to a survey.

**Before you begin**
Role required: admin or survey_admin
Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see [Define a recipients list for surveys](#).

**Procedure**
1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>a. Under the Survey Recipients Lists related list, click New.</td>
</tr>
<tr>
<td></td>
<td>b. In the Survey Recipients Lists form, from the Recipients List list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>c. Click Submit.</td>
</tr>
<tr>
<td>From Survey Designer</td>
<td>a. Under the Availability tab, for the Accessible By field, select Specific users.</td>
</tr>
<tr>
<td></td>
<td>b. In the Add recipients lists list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>c. To send the survey to users, click Save and Publish.</td>
</tr>
</tbody>
</table>

4. To send survey invites to all survey users and recipients lists, click Send Invitations.

**Note:**
- The Send Invitations UI action is available when there is at least one recipients list or survey user for the survey.
- If a user is available in the Survey Users related list and multiple recipients lists, the survey invite is sent only once to the user.

**Embed a survey within the Outlook email client**

Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

**Before you begin**
Role required: admin or survey_admin
The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.
Note:

• The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft website.

• Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the `sn_ms_oam.outlookactionable.originator` property.

• Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may are not rendered as adaptive cards.

• You cannot customize the default actionable message templates.

Procedure

1. Navigate to System Notification > Email > Notifications.

2. For the Survey User Invite notification, in the What it will contain tab, add the following script in the Message field in addition to the existing information.

   ```
   ${mail_script:include_survey_actionable}
   ```

   This script includes the Outlook actionable message in the email notification sent to the user.

3. Navigate to Survey > View Surveys, and open a survey.

4. To send an email notification to the survey user, select the Send notifications check box.

5. Select the Outlook Actionable Message check box and save the survey.
Note:

- The following questions are not supported for an embedded survey:
  - Attachment
  - Date
  - Datetime
  - Template
  - Reference
  - Image Scale
  - Ranking
- Dependent questions are not supported.
- Signature is not supported.
- Mandatory questions are supported.

In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.

6. Click Assign Survey and assign the survey to a user.
   An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

Enable localization for a survey
Enable a survey user to take a survey in multiple languages.

Before you begin
Role required: admin or survey_admin
The plugin for the language that you want the survey to be available in should be installed.

Note: Localization is applicable only for public surveys.

Procedure
1. Navigate to Survey > Administration > Properties.
2. Enable the Enable/Disable whether to show language picker when a public survey is taken property.
3. In the System Settings window, from the Language list, select the language that you want the survey to be available in.
4. Navigate to Survey > View Surveys and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

Note: The localization is also applicable in Service Portal if the Assessment Properties Allow survey link from email to open in service portal view (applies only for surveys) (sn_portal_surveys.sp_survey.email_redirection) property is enabled.

- The survey is available for survey users in the translated language.
- Users can change the language of the survey using the language picker.

Survey URLs
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.
  - The appropriate action occurs, depending on the State of the survey instance (see table).
Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take:</strong></td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td>User has not saved any responses.</td>
<td></td>
</tr>
<tr>
<td><strong>In progress:</strong></td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td>User has saved at least one response.</td>
<td></td>
</tr>
<tr>
<td><strong>Complete:</strong></td>
<td>If the schedule period is <strong>No Limit</strong> or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
<tr>
<td>User has submitted all required responses.</td>
<td></td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

**Before you begin**

Role required: admin or survey_admin

**About this task**

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link. This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the Email button to send via email. The Email button is visible only for a public survey that is published.

What to do next
When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the Ready to take state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to System Notification > Email > Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section. The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box. The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Before you begin
Role required: admin or survey_admin

About this task
The survey instance URL is available on the survey instance record.
Procedure
1. Navigate to Survey > Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link. The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Before you begin
Role required: admin or survey_admin

Procedure
1. Navigate to Survey > View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Before you begin
Role required: admin or survey_admin

About this task
When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.
• Creates a new survey instance
• Opens an existing survey instance
• Displays an error message.

Procedure
1. Perform the appropriate action for your version of the UI:
   • **UI16**: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   • **UI15**: Right-click the application menu you want to add the module to and select **Edit Application Menu**
2. In the **Modules** related list, click **New**.
3. Complete the following fields.
   • **Link type**: Assessment
     Do not select **Survey**, which is used for legacy surveys only.
   • **Assessment**: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import
You can export a survey and then import it to a different ServiceNow instance.

ℹ️ **Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see **System update sets**.

The system exports a single XML file that contains a survey definition [asmt_metric_type] and the associated records, including the following.

• Assessment Metric Template [asmt_template]
• Assessment Template Definition [asmt_template_definition]
• Metric definitions [asmt_metric_definition] (survey question answer options)
• Scheduled Jobs associated with the Survey [sys_trigger]
• Survey categories [asmt_metric_category]
• Survey questions [asmt_metric]
• Survey users [asmt_m2m_category_user]
• Trigger Condition [asmt_condition]
**Export a survey**

You can export a survey and then import it to another instance.

**Before you begin**
Role required: admin, survey_reader, or survey_admin
For information about update sets, see System update sets.

**Procedure**

1. Navigate to **Survey > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

**Import a survey**

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

**Before you begin**
Role required: admin or survey_admin

⚠️ **Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

**About this task**

**Procedure**

1. Verify that the target instance has assessments enabled.
2. Follow the steps to import the assessment.

**Use update sets for surveys and assessments**

Use an update set to capture changes to surveys and assessments.

**Before you begin**
Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.
The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

**Configure a survey in the Connect chat support**

Enable a user to take a survey after chatting with a survey agent.

**Before you begin**

Role required: admin or survey_admin

⚠️ Note: The Connect Support plugin (com.glide.connect.support) should be activated.

**Procedure**

1. Navigate to **Connect Support > Support Administration > Chat Survey**.
2. Click **New**.
3. In the Chat Survey form, fill the fields.

**Chat Survey form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey</td>
<td>Survey whose instance should be available in Connect Support.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of chat where the survey is available.</td>
</tr>
<tr>
<td>Chat queue</td>
<td>Chat queue where the survey is available.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the chat survey configuration is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the chat survey configuration.</td>
</tr>
</tbody>
</table>
4. Click Submit.
When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.

Monitor incoming Connect Support conversations

Outlook Actionable Messages
Outlook actionable messages plugin enables users to respond to the survey from within the Microsoft Outlook application.

Install Outlook Actionable Messages plugin
Install Outlook Actionable Messages(sn_ms_oam) plugin to configure actionable messages.

Before you begin
Role required: oam_admin

Procedure
1. Navigate to System Application > All Available Applications > All.
2. In the search field, enter Outlook Actionable messages.
   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
3. Click Install.

Customize fields for the approval message
Customize the body message for a request, change, and request item approval sent in Microsoft Outlook.

Customize fields in the approval message for request
Customize the body message for a request and request item sent in Microsoft Outlook.

Before you begin
Role required: oam_admin
Procedure

1. Navigate to Actionable Messages > OAM Definition.

2. Choose one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>Click OAM Request Approval</td>
</tr>
<tr>
<td>Request Item</td>
<td>Click OAM RITM Approval</td>
</tr>
</tbody>
</table>

3. In the OAM Container section, customize the following fields as required:
   a. Title: Title of the Outlook approval notification.
   b. Requester info: User who created the request.
   c. Request Details: This field can be customized. You can also add additional fields as per the requirement.

4. Click Update.

   The approval message is displayed in Microsoft Outlook as shown below. Click View Details button to view the request in ServiceNow instance.

Customize fields in the approval message for change request

Customize the body message for a change request approval sent in Microsoft Outlook.

Before you begin
Role required: oam_admin
Procedure
1. Navigate to Actionable Messages > OAM Definition.
2. Click OAM Change Approval.
3. In the OAM Container section, customize the following fields as required:
   a. **Title**: Title of the Outlook approval notification.
   b. **Requester info**: User who created the request.
   c. **Request Details**: This field can be customized. You can also add additional fields as per the requirement.
4. Click Update.
   The approval message is displayed in Microsoft Outlook as shown below. Click View Approval Request to view the request in ServiceNow instance.

Enable Advanced view for Outlook Actionable Message definition
Enable the advanced view to customize the actionable message as per the requirement for Microsoft Outlook.

Before you begin
Role required: oam_admin

Procedure
1. Navigate to Actionable Messages > OAM Definition.
2. Choose one of the following:
### OAM definition

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request</td>
<td>Click OAM Request Approval</td>
</tr>
<tr>
<td>Request Item</td>
<td>Click OAM RITM Approval</td>
</tr>
<tr>
<td>Change</td>
<td>Click OAM Change Approval</td>
</tr>
</tbody>
</table>

3. Click **Advanced OAM** under **Related Links**.

4. In the OAM Definition form, perform the following actions:
   a. Modify the script as required.
   b. Click **Update**.

### Sentiment analysis for surveys

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.

**Note:** You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under **Survey > Question Sentiment Results**. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

### Configure a sentiment connector

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

**Before you begin**

Role required: admin
Procedure

1. Change the scope of the current session to **Sentiment Analysis**.
2. Navigate to **Sentiment Analysis > Sentiment Connector Configurations**.
3. Add or edit the connector configuration for a third party vendor such as Google, IBM Watson, and MS Azure.

   **Note:** By default, placeholders are available for configuring connectors for Google, IBM Watson, and MS Azure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to call the Sentiment Analysis API and the normalize the values.</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials

   **a.** Open the record referred in the **Credential Alias** field.

   **b.** Under the **Connections** tab, select the connection.

   **c.** In the **Connection URL** field, enter the value.

   **d.** Open the record referred in the **Credentials** field.

   **e.** Enter the credential information.
Note:

- You should obtain the connection credentials from the respective third-party vendors.
- If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

f. Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

Sentiment analysis properties

You can use the sentiment analysis properties to customize the Sentiment Analysis module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout)</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it's timeout.</td>
</tr>
</tbody>
</table>

Sentiment analysis results

The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators

Following are the color indicators in the bar chart:

- Green: Positive
- Red: Negative
- Blue: Neutral
Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.

To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the View all link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: My Surveys</td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the Pagination setting for Service Portal view survey designer property is set to one question per page by default.

One Click survey
A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.
Note:
- The **One Click Survey** field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

Note:
- A kiosk survey does not have any **Submit** or **Cancel** buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

**URI parameters for One Click survey**

Pass these URI parameters through the `createAssessment()` API to store their values in the `asmt_assessment_instance` table for both platform view and Service Portal view.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sysparm_refresh_interval</code></td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, <code>sysparm_refresh_interval=5</code>.</td>
</tr>
<tr>
<td><code>sysparm_trigger_table</code></td>
<td>Location that is stored as the <strong>Trigger Table</strong> field in the <code>asmt_assessment_instance</code> table. For example, <code>sysparm_trigger_table=incident</code>.</td>
</tr>
</tbody>
</table>
URI parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the <strong>Trigger ID</strong> field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>

**Surveys in ITSM Virtual Agent**

You can use surveys in ITSM Virtual Agent to collect survey responses from users through conversational questionnaires (pre-chat and post-chat surveys) in the chat client.

A chat survey is available in ITSM Virtual Agent through the Provide Virtual Agent Feedback topic. The logic that renders the survey dynamically is called from the re-usable Survey topic block. It is common to use the Provide Virtual Agent Feedback topic as the survey setup topic in the general definitions of ITSM Virtual Agent, so that users automatically receive a survey at the end of their conversations. For information about the Survey topic block, see [ITSM Virtual Agent](#).

When you select the **Chat Survey** check box for a survey, the following conditions are validated for surveys on ITSM Virtual Agent.

- Survey should contain only one metric category.
- Survey can contain only these metric types.
  - Attachment
  - Boolean
  - Check box
  - Choice
  - Date
For information on configuring a survey, see *Modify a survey definition* and *Configure a survey in the survey designer*.

The following capabilities are supported for the survey:

- Dependent survey fields
- Introduction and end notes

**Association between a survey and Virtual Agent chat**

After a survey is submitted in a Virtual Agent conversation, a survey instance is created. This instance displays the following information:

- Trigger ID, which is the sys_id of the associated interaction ID created in the Virtual Agent chat
- Trigger table, which is the interaction table

**Legacy survey migration**

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.
The following legacy survey components are migrated:

• Survey masters
• Supported survey questions and question choices
• Survey instances
• Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

⚠️ Note:

• The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.

• The following legacy survey plugins are inactive by default, and are available upon request:
  ◦ Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  ◦ Survey Management (ID: com.glideapp.survey)
  ◦ Assessment Components (ID: com.snc.assessment)
  ◦ Survey Wizard (ID: com.glideapp.survey_wizard)

• Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Before you begin
Role required: admin or survey_admin

About this task
To avoid timing out for very large surveys, you can disable the transaction quota. See.
Procedure

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a. Navigate to Survey > Legacy Administration > Survey Conditions.
   b. In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey > Administration > Trigger Conditions to create new trigger conditions for the migrated survey.

Results
The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.
Survey question migration

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question [survey_question_new] table to the Assessment Metric [asmt_metric] table. In legacy surveys, the **Type** field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the **Data type** field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>

<tr>
<td>Yes / No</td>
<td>Yes/No</td>
</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master [survey_master]</td>
<td>• Survey definition [asmt_metric_type]</td>
</tr>
<tr>
<td></td>
<td>• Assessable record [asmt_assessable_record], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category [asmt_metric_category]</td>
</tr>
<tr>
<td>Survey question [survey_question_new]</td>
<td>• Survey question [asmt_metric]</td>
</tr>
<tr>
<td>Question choice [question_choice]</td>
<td>• Assessment metric definition [asmt_metric_definition]</td>
</tr>
<tr>
<td>Survey instance [survey_instance]</td>
<td>• Assessment group [asmt_assessment], for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance [asmt_assessment_instance]</td>
</tr>
<tr>
<td>Survey response [survey_response]</td>
<td>• Survey instance question [asmt_assessment_instance_question]</td>
</tr>
<tr>
<td></td>
<td>• Survey response [asmt_metric_result]</td>
</tr>
<tr>
<td></td>
<td>• Category result [asmt_category_result], for system use only</td>
</tr>
</tbody>
</table>
Migrated question review

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric [asmt_metric] table. For legacy questions of the Multiple Choice and Select Box types, the system also creates a metric definition record, on the Assessment Metric Definition [asmt_metric_definition] table, for each legacy question choice.

### Comparable metric definitions and survey question choices

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value.
Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

### Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

### Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

### Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.
Task Communications Management

Task Communications Management (TCM) provides a framework for defining and managing a communication process for any entity that extends the task table.

<td></td>
</tr>
</tbody>
</table>

Task Communications Management process

Task Communications Management helps you to streamline the process by creating designated communication plans for effective communication during an event. The communication plan, with its defined tasks, helps you to focus on resolving the current issue instead of deciding when to send a communication, what information to share, and whom to inform.
**How Task Communications Management works**

With Task Communications Management, you can predefine a communication plan for an event such as major incident, planned maintenance, and release. Each plan generally involves a series of tasks that define different communication and collaboration activities along with frequency and method of communication. For each task, you must specify the communication channel for contacting the stakeholders. You can also define templates for email and SMS messages.

After defining the task and channel for communication, you can define the contacts or the target audience to be contacted for each task.

After a communication plan is defined, the plan gets associated with the appropriate task table based on the conditions defined. Thereafter, the tasks defined in the plan get executed sequentially and stakeholders are contacted as defined in the plan. The communication plan makes communication and collaboration process smoother and brings a quicker resolution of the issue.

**Example: Task Communications Management flow in major incident management**

Assume that you want an incident communication plan generated for a high-priority major incident.

- As the major incident manager, you can predefine a communication plan and the conditions that drive its attachment. In this case, the conditions are: Priority = High and Major Incident state = Accepted. Consider that the target audience is the technical stakeholders of the incident and the communication plan definition is named Technical Communications.

- The plan definition can have multiple communication task definitions such as:
  - Initiate Technical Communications
  - Technical Status Update
• Each communication task definition also specifies the channel of communication and the communication frequency (one time or recurring).
  ◦ Initiate Technical Communications uses email as a channel of communication and communication frequency is one time.
  ◦ Technical Status Update uses email and SMS as channel of communication and the communication frequency is recurring.
• The target audience for the communications is defined as communication contact definitions on the plan definition. In this case, consider Service owners of the affected configuration items (CIs) related to the incident as technical stakeholders.
• When an incident meets these conditions, an incident communication plan together with its tasks gets attached to the incident record.
• As the major incident manager, you can effectively carry out the communication without any delay in the resolution of the major incident.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Task Communications Management plugins
The Task Communications Management plugins is activated in the base system. The plugin includes demo data.

Activate Task Communications Management
The Task Communications Management plugin (com.snc.task_communication_management) is activated when you activate the Incident Communications Management plugin (com.snc.iam) or the Incident Management - Major Incident Management plugin (com.snc.incident.mim). This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
Task Communications Management activates these related plugins if they are not already active.
Plugins for Task Communications Management

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Management [com.snc.contact_management]</td>
<td>The Contact Management plugin manages the connections between users or groups and other resources in the system.</td>
</tr>
<tr>
<td>Targeted Communications [com.sn_publications]</td>
<td>The Targeted Communications plugin provides a way to publish and send out newsletter like articles to targeted internal or external customers.</td>
</tr>
</tbody>
</table>

Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for `<plugin name>`.

Related information

**Components installed with Task Communications Management**

Several types of components are installed with the Task Communications Management plugin, including tables and user roles.

**Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see **Find components installed with an application**.

Demo data is available for this feature.

Working with Task Communications Management

The section covers topics that help you with a variety of technical concepts related to Task Communications Management such as creating communication plan definition, task definition, channel definition, and contact definition.

Define a communication plan

Define a communication plan for a task record to specify communication task and contact definitions. When specified conditions for the plan definition are met, the communication plan and its associated records are automatically attached to the task record, eliminating manual effort.
Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

Procedure
2. On the form, fill in the fields.

Communication Plan Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the communication plan.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the plan is attached to when the conditions are met.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of communication plan such as Technical, Internal, External, Customer.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the communication plans must be associated to the table.</td>
</tr>
<tr>
<td>Condition based</td>
<td>Option to define whether the plan is attached to a table based on the conditions. For example, if you want to attach a communication plan to an incident of priority = 2, you can mention the condition in the <strong>Condition</strong> field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan definition is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan definition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which a communication plan gets attached to a table.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
The communication plan is submitted. The following related lists appear in the communication plan definition:
- Communication Task Definitions
- Communication Contact Definitions

What to do next
Define a communication task for the plan.
Define a communication task

Define a communication task for a communication plan. When a plan gets attached to a table, the tasks related to the plan need to be executed to resolve the issue. You can associate multiple tasks with a communication plan.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan.

Procedure
1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click the communication plan for which you want to define a communication task.
3. Click the Communication Task Definitions related list and then click **New**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication plan definition</td>
<td>Unique name of the communication plan definition that you are defining the task for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name for the communication task definition.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of task, such as internal communication, that is applicable globally or to a particular table.</td>
</tr>
<tr>
<td>Note: The value in the Type field helps you to filter a task by its type. The value also helps to generate a report of a particular task type or to create SLAs on any communication task.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the task definition. The task definition is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the communication tasks appear in the plan. This field indicates which communication task to execute first.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to define whether the task is active or not.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the task definition.</td>
</tr>
<tr>
<td>Communication frequency</td>
<td>Frequency of the communication task execution. You can send the notification once or the notification can be repeated.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time by which you want to send a notification. For example, if the communication frequency is <strong>One time</strong> and the <strong>Duration</strong> is 15 minutes, then the notification is sent only once in 15 minutes. If the communication frequency is <strong>Recurring</strong>, then the notification is sent every 15 minutes.</td>
</tr>
</tbody>
</table>

5. Click **Update**. The communication task is defined for the communication plan.

**What to do next**
Define communication channel for the task.

**Define a communication channel**
Define a communication channel for each communication task to determine which mode of communication to use for the task when a plan is attached to a table.

**Before you begin**
Role required: sn_comm_management.comm_plan_admin or admin
You have defined a communication plan and its related tasks.

**About this task**
- The modes of communication available are: email, SMS, conference, and Slack.
- For the incident table, the functionality for SMS and conference appears only if you activate the Notify plugin (com.snc.notify) and the `com.snc.iam.notify_number` property value is set to the registered notify number. The notify number is registered while configuring the Twilio account.
- For the incident table, the functionality for Slack appears only if you activate the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook). To activate the Collaboration Services for Task Communications Management plugin, navigate to ServiceNow Store and...
install the Collaboration Services for Task Communications Management application. For more information, refer Collaboration services for Task Communications Management.

**Note:** For information on how to configure Slack, refer to [Configure Slack workspace](#).

- **Add Channel – Conference** is mutually exclusive to **Add Channel – SMS** and **Add Channel – Email**. If you select **Add Channel – Conference**, you cannot select **Add Channel – Email** or **Add Channel – SMS**.

**Procedure**

1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click a communication plan.
3. Click the Communication Task Definitions related list and then click the task for which you want to define the communication channel.
4. On the Communication Task Definition form, click any one of the following related links based on your requirement:
   - **Add Channel – Conference**
   - **Add Channel – Email**
   - **Add Channel – SMS**
   - **Add Channel – Slack**
5. On the form, fill in the fields.

**Communication Channel Definition form**

<table>
<thead>
<tr>
<th>Field</th>

Note: | The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to send SMS.

Add Channel – Slack

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication task definition</td>
<td>Communication task definition this channel definition is associated with.</td>
</tr>
<tr>
<td>Channel Type</td>
<td>Channel type is Slack.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
A communication channel is defined for the communication task.

**What to do next**
After creating communication tasks and communication channels for those tasks, define contacts for the communication plan.

**Define a communication contact**
Define the recipients of a particular plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle. A notification for a task is sent to all individuals specified for that task.

**Before you begin**
Role required: sn_comm_management.communication_plan_admin or admin
You have defined a communication plan.

**About this task**
You can add or remove any particular communication contact manually.

**Procedure**
1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click the communication plan that you want to define the contacts for.
3. Click the **Communication Contact Definitions** related list and then click **New**.
4. On the form, fill in the fields.
Communication Contact Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list that you want to involve in the plan. The contact type is assigned dynamically at the time of the table execution. For information on recipient lists, refer Define a recipient list for communication contact.</td>
</tr>
<tr>
<td>Responsibility</td>
<td>Responsibility that the user, group, or individuals in the recipient list are expected to handle.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user, group, or recipient list to be added to the contact list. Note: You can use the recipient list to specify dynamic criteria for fetching the list of users for a particular communication plan.</td>
</tr>
</tbody>
</table>

5. Click Submit.
A communication contact is defined for the communication plan.

Define a recipient list for communication contact

A recipient list lets you specify a filter to fetch a list of users. Use the recipient list as the contact for a particular communication plan.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

About this task
Sometimes, the contacts that you want to include in a plan can only be known dynamically. For example, you might want the support group associated with a particular business service in an incident to be involved in the communication plan. The support group might change depending on the business service that you select. In such a case, a recipient list provides the flexibility to add recipients dynamically.
Procedure

1. Navigate to Task Communications Management > Administration > Recipients Lists.
2. Click New to create a new recipient list.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipient list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recipient.</td>
</tr>
<tr>
<td>State</td>
<td>[Read only] The state of the recipient list.</td>
</tr>
<tr>
<td>Setup Method</td>
<td>The method used to generate the recipient list.</td>
</tr>
<tr>
<td></td>
<td>• Upload File: Upload an Excel file with the recipient information to create a recipient list. This list is static.</td>
</tr>
<tr>
<td></td>
<td>• Dynamic Condition: Use scripts or conditions to receive recipient information.</td>
</tr>
</tbody>
</table>

4. Click Submit.
   A recipient list is defined for the contact.

What to do next
Define a communication contact for the task.

Create a plan type

Create the communication plan type and specify whether the plan type is applicable globally or to a particular table. When you create the communication plan type, it is referenced in the communication plan definition. The type of the communication plan helps you to filter the plan by its type, generate a report of a particular plan type, or create SLAs for any communication plan.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin
Procedure

1. Navigate to Task Communication Management > Administration > Plan Types, and click New.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication plan type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the plan type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table for which the plan type appears.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the plan type. The plan type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan type is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan type.</td>
</tr>
</tbody>
</table>

3. Click Submit.
   A communication plan type is created.

What to do next
Define a communication plan.

Create a task type
Create the communication task type and specify whether the task is applicable to a particular table or is globally applicable. The communication task type helps you to filter a task by its type, generate a report of a particular task type, or create SLAs for any communication task.

Before you begin
Role required: sn_comm_management.comm_plan_admin
Procedure

1. Navigate to **Task Communication Management > Administration > Task Types**, and click **New**.
2. On the form, fill in the fields.

**Communication Task Type Lookup form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication task type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the task type is available for all tables or for a specific table. If the check box is not selected, the <strong>Table</strong> field appears where you can select the table the task type appears for.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the task type. The task type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the task type is active or not.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description regarding the type of the task.</td>
</tr>
</tbody>
</table>

3. Click **Submit**. 
   A communication task type is created.

**What to do next**
Define a communication task.

**Define contact responsibilities**
Define the different contacts or target audience involved in the communication process and their responsibility to understand the expectations from those contacts throughout the process.

**Before you begin**
Role required: sn_comm_management.comm_plan_admin or admin
Procedure

1. Navigate to Task Communication Management > Administration > Contact Responsibilities, and click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Option to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table that you are defining the contact responsibility for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name of the contact, such as Business Director or Communication Manager, involved in the communication process.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the contact is activated on when a communication plan is attached.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Contact responsibilities are defined.

What to do next
Define a communication contact for the task.

View communication channel configuration

View the configuration of different communication channels that are used to contact the target audience in the communication process. By default, the communication channels available are email, SMS, Slack, and conference.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin

About this task
You only have read access to the Channel Configuration module. If you want to create a new channel configuration, request the channel configuration through the Now Support Customer Service system.
Procedure
1. Navigate to Task Communication Management > Administration > Channel Configuration.
2. Open any communication channel record.
3. On the form, view the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>[Read only] Mode of channel.</td>
</tr>
<tr>
<td>Configuration script</td>
<td>[Read only] Lookup icon (🔍) to select the script that defines the channel configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>[Read only] Option to define whether the communication channel is active or not.</td>
</tr>
<tr>
<td>Classification</td>
<td>[Read only] Internally used to group the channels between conference or major incident management workbench.</td>
</tr>
</tbody>
</table>

Configure Slack for a communication task
Configure Slack as a mode of communication for a communication task to send direct message to the users.

Before you begin
Role required: sn_comm_management.comm_plan_admin or admin
Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from ServiceNow Store.

Procedure
1. Navigate to Incident > Communication Plan Definitions.
2. Open the communication plan where you want to add Slack as a communication channel for a communication task.
3. Open the communication task definition for which you want to add Slack as the mode of communication.
4. Click the Add Channel – Slack related links.
5. Click Submit.
   Slack gets added as a communication channel for the communication task.
Timeline Visualizations

A timeline visualization is a representation of an organization's activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

The CIO Roadmap timeline visualization shows your organization's projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

Note: Activating timeline visualizations does not activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Key terms for timeline visualizations

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.

- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.

- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.

- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.

- **Slider**: A tool used to control the time period seen in a 3D visualization.

- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
An administrator can activate the Timeline Visualization plugin (com.snc.timeline_visualization) to access the functionality.

About this task
To use the CIO roadmap with timeline visualization, you must activate Project Portfolio Management (com.snc.financial_planning_pmo) plugin.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

- **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

### Installed with Timeline Visualizations

Several components are installed with timeline visualizations.

#### Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization [roadmap_-page]</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline [roadmap_user_-page]</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>

#### UI Policies

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>

#### Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
</tbody>
</table>
### Timeline Visualization Utility

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization [roadmap_page] table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

### Business Rules

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization [roadmap_page]</td>
<td>Checks if another visualization is already set as default when user sets a</td>
</tr>
</tbody>
</table>

### Client Scripts

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization</td>
<td>Allows changing the color fields for the item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization</td>
<td>Allows changing the field name for item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>
Timeline visualizations roles

Timeline visualizations provides two roles.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
<tr>
<td>Timeline user</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the project_manager and project_user roles.</td>
</tr>
</tbody>
</table>

Create a Timeline Visualization

Set up timeline visualizations for the organization’s leaders by creating a timeline that provides visual representations of the organization’s operational and strategic activities.

**Before you begin**
Role required: timeline_admin

**About this task**
Additionally, create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

ℹ️ **Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

**Procedure**
Navigate to Timeline Visualization > Create New and create a new record.
Timeline visualization configuration form

Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
</tbody>
</table>
| Panel table         | Table that provides the records displayed as lanes and panels in the timeline.  
                      | **Note:** The list shows only tables and database views that are in the same scope as the visualization.                                 |
| Relationship field  | Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values.  
                      | **Note:** The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field. |
| Show slider         | Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.              |
| Panel name          | Field from the Panel table that contains the values displayed in the panel body.                                                             |
| Panel date          | Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in  |

</tr>
<tr>
<td>Color 4</td>
<td></td>
</tr>
</tbody>
</table>

Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.
About this task
You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

Procedure
1. Navigate to Incident > All.
2. Open an incident.
3. Right-click the form header and select Configure > Form Layout.
4. Under Form view and section, go to the View name field and select New.
5. Enter timeline visualization in the View name field.
6. Click Ok to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the Available and Selected columns.
8. Click Save.

Planning Your Timeline Visualization
Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.
Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application does not install the CIO Roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap. CIO Roadmap is a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

Note: Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

Lanes

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Note: The number of items displayed in a lane depends on the Max items per lane and Max items per lane 2d settings on Timeline Visualization form.

Markers

Markers are horizontal lines that cross all lanes and identify a transition to the next month.

Panels

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

**Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

To view additional information about a panel:

- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Press the Shift key and then click a panel to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

**Personalize Timeline Visualizations**

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.
Personalization
Open the Settings pane and click **Configure**. Complete the form as appropriate (see table).

Visualization personalization

![Visualization personalization form]

<table>

</tr>
</tbody>
</table>

**Note:**

- Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

- If the Max items per lane field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.

**The Settings pane**

Element names in the Settings pane vary based on the table and fields used to create the visualization.
The Settings pane contains the following elements:

### Settings pane elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
</tbody>
</table>
Settings pane elements (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a Show all &lt;records&gt; button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

⚠️ **Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

⚠️ **Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.
Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.

**View timeline visualization**

You can view timeline visualizations from a project.

**Procedure**

1. Navigate to **Project > Projects > All**.

2. Scroll to the bottom of the list and click the **Timeline Visualization** related link. By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

   **Note:** Activating timeline visualizations doesn’t activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

   Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click **All**. If a timeline visualization exists for the application's table, a Timeline Visualization related link appears.

**Work with timeline visualizations**

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

**2D views**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
</tbody>
</table>
### 2D views (continued)

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

#### Navigating stacked panels

<table>

<td>Press the arrow keys to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Shift key</td>
<td>Press the shift key and click the panel for a single record to open the complete record that contains additional information.</td>
</tr>
</tbody>
</table>
Visual Task Boards

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLs) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

Video on Visual task boards

Note: UI16 or UI15 is required to use Visual Task Boards.

Visual task boards have domain separation at the data level only. For more information, see Domain separation and Visual Task Boards.

The following podcast offers additional information on the use of Visual Task Boards.

Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin [com.glide.ui.vtb] if you have the admin role.

Before you begin
Role required: admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the Visual Task Boards plugin (com.glide.ui.vtb) using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Domain separation and Visual Task Boards

Domain separation is supported in the Visual Task Boards application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic
• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.

• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.

• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP’s response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Visual Task Boards

Visual Task Boards that are "data-driven" show the data from tables that are like Task tables. The data that is domain separated is also supported.

Condition-based criteria is used to filter that data. Free-form VTBs’ use Private Tasks (vtb_task), which supports domain separation as an extension of Task and inherits domain separation logic as a result.

</table>

**Related information**

**Connect Chat**

**Notifications installed with Visual Task Boards**

Notifications are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTB member addition notification</td>
<td>Sends an email notification to the member about their addition to the board.</td>
</tr>
<tr>
<td>Notification</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>VTB member deletion notification</td>
<td>Sends an email notification to the member about their removal from the board.</td>
</tr>
<tr>
<td>VTB additional assignee notification</td>
<td>Sends an email notification to users when they are designated as additional assignees for tasks.</td>
</tr>
<tr>
<td>VTB assignee notification</td>
<td>Sends an email notification to users when they are designated as the primary assignees for personal tasks.</td>
</tr>
<tr>
<td>VTB lane change notification</td>
<td>Sends an email notification to a task’s assignees when the task changes lanes.</td>
</tr>
<tr>
<td>VTB lane limit reached</td>
<td>Sends an email notification to the board member that the number of tasks in the lane has reached the set lane limit.</td>
</tr>
<tr>
<td>VTB lane limit exceeded</td>
<td>Sends an email notification to the board member that the number of tasks in the lane has exceeded the set lane limit.</td>
</tr>
<tr>
<td>VTB card movement across vertical lanes and swimlanes</td>
<td>Sends an email notification to the board member with the details of the card moved and the member who moved the card.</td>
</tr>
</tbody>
</table>

**Supported browsers for Visual Task Boards**

The system supports Visual Task Boards on most modern browsers.

**Supported browsers**

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 12
- Internet Explorer version 11
  - Edge mode is supported.
  - Compatibility mode is not supported.
  - Setting Security Mode to High (via the **Internet Options > Security** tab) is not supported.
Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Note:** VTB loading is comparatively slower on Internet Explorer 11 browsers.

The recommended limit to include various elements to the board while working on Internet Explorer and Edge browsers is as follows:

<table>
<thead>
<tr>
<th>Browser</th>
<th>Scenario</th>
<th>Recommended Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Cards</td>
</tr>
<tr>
<td>IE</td>
<td>Without Swimlane</td>
<td>500</td>
</tr>
<tr>
<td></td>
<td>With Swimlane</td>
<td>500</td>
</tr>
<tr>
<td>Edge</td>
<td>Without Swimlane</td>
<td>1000</td>
</tr>
<tr>
<td></td>
<td>With Swimlane</td>
<td>1000</td>
</tr>
</tbody>
</table>

- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See supported devices for more information.

**Scripting support**

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

**Task board structure**

Different types of task boards work for different kinds of task management. However, all board types share the same overall structure.

<table>
<thead>
<tr>
<th>Task board types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board type</td>
</tr>
<tr>
<td>Freeform boards</td>
</tr>
</tbody>
</table>
Task board types (continued)

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match a filter against a particular table. Members of flexible boards can add task cards. Cards are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
<tr>
<td>Guided boards</td>
<td>Similar to flexible boards except that guided board lanes correspond to field values and cannot be edited in most cases.</td>
</tr>
</tbody>
</table>

You can identify the task board type by the icon beside the board name.

- The freeform board icon: ( )
- Flexible board icon: ( )
- Guided boards icon: ( )

Sample Visual Task Board dashboard

All boards have the displayed elements. The color of the left boundary of a card represents the color you choose in the color palette for that board.

Sample Visual Task Board elements

Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.
Create a freeform board

You can create freeform Visual Task Boards (VTBs) for tracking any kind of task or project.

Before you begin
Role required: none

Procedure
2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Freeform.
   A new task board opens with the default freeform lanes, To Do, Doing, and Done.
4. Click the board name and enter a new name.

What to do next
After the board is created, board members can:
- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided data driven Visual Task Board (VTB) for any table that extends Task, such as Incident or Change.

Before you begin
Role required: none

About this task

Procedure
2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Data Driven Board.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.

5. Optional: From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting None.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a guided board. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the State column, the board shows one lane for each incident state, such as New or Closed. If you select a column that is not a reference or choice, the board is a flexible board and the board shows the default lanes, To Do, Doing, and Done, with all cards in the To Do lane.

6. Optional: Create a filter to show only the records you want to work with. For example, you might filter out incidents that are not assigned to you.
   (Optional) Any card that no longer fits the parameters of the filter is automatically removed from the task board.

7. Optional: Click the board name and enter a new name.

   Note: For guided boards created from choice fields, such as State, the system creates a lane for each possible choice value. For guided boards created from reference fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

What to do next
After the board is created, board members can:

• Add and modify lanes
• Create and modify task cards
• Add and remove members
• Configure the look and feel

Delete a task board
You can delete any task board you own.

Before you begin
Role required: none
About this task
Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.

Procedure
2. Under Boards you own, point to a board and click the delete icon (X).
3. In the confirmation dialog, click Delete.

Add or modify task board lanes
Any board member can change the names and add new lanes to accommodate the task workflow you want to track. When you create a freeform or flexible task board, it includes the default lanes To Do, Doing, and Done.

Before you begin
Role required: none

About this task
Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

Note: You cannot remove lanes from guided boards.

Procedure
1. Open a task board.
2. Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new lane</td>
<td>a. Scroll past the last lane and click Add Lane.</td>
</tr>
<tr>
<td></td>
<td>b. Enter a title for the lane, then press the Enter key.</td>
</tr>
<tr>
<td></td>
<td>The Add Lane option is always available for freeform and flexible boards.</td>
</tr>
<tr>
<td></td>
<td>It is available for guided boards only if the lanes are based on a reference</td>
</tr>
<tr>
<td></td>
<td>field, such as Assigned to.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rearrange lanes</td>
<td>Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane. You can also change the lane order from the board configuration menu.</td>
</tr>
<tr>
<td>Hide a lane</td>
<td>a. Click the lane menu (3) in a lane header.</td>
</tr>
<tr>
<td></td>
<td>b. Select Hide Lane. You can restore hidden lanes from the board configuration menu.</td>
</tr>
<tr>
<td>Delete a lane</td>
<td>a. Click the lane menu in a lane header.</td>
</tr>
<tr>
<td></td>
<td>b. Select Delete Lane.</td>
</tr>
<tr>
<td></td>
<td>c. In the confirmation dialog box, click Delete. When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.</td>
</tr>
<tr>
<td></td>
<td>The Delete Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards.</td>
</tr>
<tr>
<td>Exclude Child Table Records</td>
<td>a. Click Info icon (i)</td>
</tr>
<tr>
<td></td>
<td>b. Under Structure menu, select Exclude Child Table Records</td>
</tr>
</tbody>
</table>
### Task cards

Visual Task Board task cards can represent a personal task or a record on a table.

You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each board can display up to 1,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit for task boards.

### Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

#### Add a personal task to a freeform board

You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task [vtb_task] table.

### Before you begin

Role required: none
Procedure

1. In a lane header, click the lane menu (Ξ) and select **Add Task**. Alternatively, click **Add Task** at the bottom of a lane. A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press **Enter**.

**Add a task to a freeform board from a form**

You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

**Before you begin**
Role required: none

**About this task**
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

**Procedure**

1. Open a task record, such as an incident.
2. Click the menu icon (Ξ) or right-click the form header to show the form context menu.
3. Select **Add to Visual Task Board**. A pop-up window appears with a list of freeform task boards.

4. Click the name of the board you want to add the card to. A confirmation message appears.
5. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.
Add a task to a freeform board from a list

You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Before you begin
Role required: none

About this task
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

Procedure
1. Navigate to a list of task records, such as Incident > Open.
2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.

3. Click the name of the board you want to add the card to.
   A confirmation message appears.

4. To view the board, click the board name in the confirmation message.
   The task appears in the first lane by default.

Data driven board tasks
You can add a task to a flexible or guided task board.
Add a task to a flexible or guided board

Cards in a flexible or guided board represent records on whichever table the board is associated with.

Before you begin
Role required: none

Procedure

1. In a lane header, click the lane menu (…) and select Add Task. Alternatively, click Add Task at the bottom of a lane.

   A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.

   Consider the example of a guided board that shows incidents with the Software category, with a lane for each assignee. If you add a card to the ITIL User lane, the new incident record Category and Assigned to fields are automatically set to Software and ITIL User.

2. Complete the form and click Submit.
   A new task card appears in the lane.

Edit task board card details

Edit the details of the card if you need to assign tasks, add comments, change the due date, or change other features of the card.

Before you begin
Role required: none

About this task

You can edit various card details. Updating these values also updates the underlying task record.
Procedure

1. Open the task board from the My Task Boards dashboard.

2. Click a card on the board.
   The details for the card appear in a pop-up window.

3. Modify the card details.
   Possible modification actions include:
   • Rename the card by clicking the card title and providing the new name.
   • Modify the short description.
   • Add comments or work notes in the activity stream.
   • Edit the users assigned to tasks.
   • Add a label to the card by selecting one or more of the available labels.
   • Add or edit the Due Date. If the completion of a task exceeds the due date, the date appears in red.
• Add or remove file attachments.
• Archive the card (freeform boards only). Once archived, the card is not visible in active items.
• Move the card to a different board (freeform boards only).

Add an attachment to a task card
You can add an attachment to a record within a task board.

Before you begin
Role required: none

About this task
Adding an attachment to a task card also adds the attachment to the underlying task record.
Procedure
1. Click a card.

2. Click the attachment tab (_attachment_icon_).

3. Click **Add Attachment** and select a file to add as an attachment.

**Label a task card**
Labels help categorize tasks and visually distinguish them on the task board.

**Before you begin**
**Enable** labels for the board.

**Role required:** none

**About this task**
You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

**Task card labels**

My desk phone does not work

 Labels

INC0000041

a day ago

You can add one or more labels to a task card.

**Procedure**
Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Add a label to a card from the quick panel** | a. Drag a label from the quick panel directly to a task card.  
b. Drop the label in the drop zone. |
| **Add a label to a card from the card details** | a. Open the card details for a task.  
b. Click the details tab (details_icon). |
### Option Description

c. Under **Labels**, select one or more labels. Point to a label to display its name.

d. Close the card detail pop-up window.

---

**What to do next**

You can use configuration options to rename or disable labels or to hide labels altogether.

**Assign a task card to a user**

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

**About this task**

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

---

#### Task card assignees

<table>
<thead>
<tr>
<th>PRIMARY</th>
<th>ITIL User</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDITIONAL</td>
<td>Add Additional Assignee</td>
</tr>
<tr>
<td>David Loo</td>
<td>Assignee</td>
</tr>
<tr>
<td>Bow Ruggeri</td>
<td>Assignee</td>
</tr>
</tbody>
</table>
When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task’s **Assigned to** field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.

**Note:** Assignees are not automatically granted access to the board. Only members can access the board.

**Procedure**

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add an assignee from the quick panel</td>
<td>a. Drag a user’s avatar from the quick panel directly to the task card.</td>
</tr>
<tr>
<td></td>
<td>b. Drop the avatar in the <strong>Primary</strong> or <strong>Additional</strong> drop zone.</td>
</tr>
<tr>
<td>Add an assignee from the card details</td>
<td>a. Open the card details for a task.</td>
</tr>
<tr>
<td></td>
<td>b. Click the assignees tab ( ).</td>
</tr>
<tr>
<td></td>
<td>c. Click <strong>Add Primary Assignee</strong> or <strong>Add Additional Assignee</strong>. The <strong>Add Primary Assignee</strong> option is not available if there is already a primary assignee.</td>
</tr>
<tr>
<td></td>
<td>d. Select a user.</td>
</tr>
<tr>
<td></td>
<td>e. Close the card detail pop-up window.</td>
</tr>
</tbody>
</table>

The system sends an email notification to inform the new assignee of the change.

**Visual Task Board checklists**

Checklists help you track the progress of tasks on your Visual Task Board. Checklists are available as a tab in the card details.
You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see.

Create a checklist for a card
You can create a unique checklist for each Visual Task Board card or create a task from a checklist item.

Before you begin
Role required: none

Procedure
1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Click Add Item.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. To reorder checklist items, click the drag icon (_drag_ ) and drag a checklist item to a different position in the list.
9. To create a task from a checklist item:
   a. Point to a checklist item and click the create task icon (create).
   b. Select the type of task you want to create. An administrator can configure which task types are available. The new task record appears in a pop-up window. The short description is automatically populated with the checklist item text.
   c. Fill in the form with additional detail as necessary.
   d. Click Update.

Create checklist template
A template saves time by creating checklist items automatically. You can add, edit, or remove checklist items without impacting the template.
Before you begin
Role required: none
See Activate Visual Task Boards

Procedure
1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Add items to the checklist that you want to save as part of the template.
4. Click the more icon (ameleon).
   The more icon does not display unless you have added an item to the checklist, or if you have a pre-existing checklist template.
5. Select Save as Template.
6. In the dialog box, enter a descriptive template name to identify the checklist. When a user creates a checklist from a template, all templates are listed in alphabetical order and there is no way to filter which templates appear. To provide a better user experience, consider implementing a naming system for checklist templates. For example, include the name of the table or another identifier to clarify how the checklist should be used.
7. Click Save.

What to do next
Create a checklist from a checklist template by selecting the template from the more icon.

Delete a checklist from a card
You can remove a checklist from a Visual Task Board card.

Before you begin
Role required: none

Procedure
1. Open a task card that contains a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (ameleon).
4. Select Remove Checklist.
   A confirmation dialog box appears.
5. Click Delete.
Configure which types of tasks can be created from checklist items

A system property controls which types of tasks you can create from a Visual Task Board checklist item.

Before you begin
Role required: admin

About this task
You might want to add custom tables or remove tables you do not use.

Procedure
1. Navigate to `sys_properties.list`.
2. Locate the `glide.ui.create_task_type_option_list` property.
3. Edit the Value to add or remove tables.
   You can add any table that extends Task [task]. Use the table name, not the label. For example, you would enter `change_request`, not Change Request. Ensure the tables listed are separated by commas, with no spaces.
   The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

Archive a card

Archiving a card is a non-destructive way to remove a card from a freeform board. You can archive cards you are no longer working on to reduce visual clutter.

Before you begin
Role required: none
About this task

ℹ️ Note: You can only archive cards on a freeform board.

Procedure
Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Archive one card from the lane view | 1. Point to a card and click the X icon that appears in the corner.  
2. In the confirmation dialog, click Archive. |
| Archive one card from the card details | 1. Click a card and view the Details tab.  
2. Under Tools, click Archive.  
3. In the confirmation dialog, click Confirm. |
| Archive all the cards in a lane | 1. In the lane header, click the more options icon (⋮).  
2. Select Archive All Tasks.  
3. In the confirmation dialog, click Archive. |

What to do next

• To see all archived cards for the current board, from the board navigation panel, open the board information menu (⋮) and click View Archived Tasks.

• To restore an archived card, point to it and click Restore.

Access a task record from a VTB card

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

Before you begin

Role required: none
Access a task record using one of the following options.
Procedure

• Access the record from the task card by clicking the record number on the task card.

• Access the record from the card details by doing the following:
  1. Open the card details for a task.
  2. Click the record number in the header.

Move a card to a different lane
You can move a card from one lane to another.

Before you begin
Role required: none

About this task
When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

Procedure

1. Open a Visual Task Board.
2. Select a card and drag it to a different lane.
   To cancel the move, press the Escape key while you drag the card.

   Note: All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident [incident] table, with a lane for each State. The Close code and Close notes fields become mandatory when the State changes to Closed. If you attempt to move an incident card from the New lane to the Closed lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

Move a card to a different board
You can move a card from one freeform board to another.

Procedure

1. Open the card details.
2. In the details tab ( ), click Move Card.
3. In the pop-up window that appears, select the board and lane to move the card to. The board selection list displays freeform boards only.

**Task board tools**

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

**Conversation tool tabs**

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
</table>
| 📘       | Info     | Contains the following information about the task board:  
            • Board Name  
            • Board type  
            • Board Owner  
            • Number of members  
            • Number of assignees  
            • Number of lanes  
            • Number of tasks  
            • Table name  
            • Filter conditions (visible on data driven boards only)  
            • Lane field (visible to the board owner, on data driven boards only)  
            • Swimlane field - To change Swimlane field for the board  
            • Due Date field - To change the Due Date field for the board.  
            • URL |
| 🧑‍💻    | Members  | Lists all members and assignees of the board. You can add or remove board members, promote assignees |

</tr>
</tbody>
</table>

### View board information

You can display key information about any task board.

**Before you begin**

Role required: none
About this task
Procedure
1. Open a task board.

2. Click the board information icon (i).

Add a board as a favorite
Add boards you access frequently to the application navigator using the favorite option.

Before you begin
Role required: none

About this task
Adding a board as a favorite is only available in UI16.

Procedure
1. Navigate to Self Service > Visual Task Boards.

2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

**View a task board in a list**

You can view a task board in the list view using the board information option.

**Before you begin**
Role required: none

**Procedure**
1. Open a task board.
2. From the task board tools, click the board information icon (.setImageResource).
3. Click **View List** at the bottom of the information panel.
   The cards from the board open in the list view.

  **Note:** The freeform board list view only shows cards made by the board and no other tasks that might be added manually.
Add or remove a task board member

You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.

Before you begin
Role required: none

About this task
Only members of a task board can access the board. Any board member can add or remove other members.

Procedure
1. On a Visual Task Board, open the task board tools.
2. Click the members tab.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>a. In the Users section, click Add Members.</td>
</tr>
<tr>
<td></td>
<td>b. Enter a user's name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>a. In the Members section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>b. Click the remove icon (🗑️).</td>
</tr>
<tr>
<td>Promote an assignee to a member</td>
<td>a. In the Assignees section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>b. Click the upward arrow icon.</td>
</tr>
<tr>
<td>Promote all assignees to members</td>
<td>In the Assignees section, click Promote All.</td>
</tr>
</tbody>
</table>
Visual Task Board SLA indicators

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.

Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

Related information
Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Before you begin
Role required: none

Procedure
2. Drag a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it.
   If you share a task board in a record conversation, it appears as a URL in the record activity stream.

   Connect
   Visual Task Boards

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Before you begin
Role required: none

About this task
When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

Procedure
2. Open a task board.
3. In the board header, click the connect with board members icon (🔗).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Visual Task Boards

Visual Task Board accessibility

Several accessibility improvements are included in Visual Task Boards.

Skip links

Skip links allow you to tab directly to the main content on a page. When accessibility mode is enabled, task boards include a skip link to view tasks as a list. The View tasks as a list skip link switches all the task cards to the table view. For more information on viewing task boards in a list view, see View card details in a task board.

View card details

With accessibility mode enabled, visual indicators appear on task cards that users can tab to in order to open card details. For more information, see View card details in a task board.

View card details in a task board

With accessibility mode enabled, tab through cards in a task board. Use the card details button to view task card details.

Before you begin

Enable accessibility from the General tab of the system settings menu.
Role required: none

Procedure

2. Open an existing task board.
3. Press the Tab key to navigate through the board to get to a task card.
4. Press the Tab key to navigate through the card until the Open Card Details button appears.
5. Press **Enter** to open the card.

6. To exit the card, press **Escape**.

**Configure a task board**

You can configure several options in the Visual Task Boards to customize the look and feel of the board.

**Before you begin**

Role required: none

**Procedure**

1. From the task board tools, click the menu icon (.Excel).

2. Click **Advanced Settings**.

3. In the **Theme** section, select a color from the palette.
   The selected theme is applied to the background of the board, lane header, add card button, quick filter, tab header, quick panel, and board header.
   It also appears as the color for the board on the My Task Boards page. This setting applies only to the boards of the user.
4. In the Quick Panel section, toggle the options to customize the quick panel.

**Note:** Unless otherwise noted, these settings apply to the current user only.

### Quick panel options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>Option for making visible on the board.</td>
</tr>
<tr>
<td>User Names</td>
<td>User names that appear next to user avatars in the quick panel.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>Labels that appear on cards and in the quick panel.</td>
</tr>
</tbody>
</table>

**Note:** The setting applies to all users.
### Option Description

<table>
<thead>
<tr>
<th>Label Names</th>
<th>Label name that appears beside the colored icon for that label in the quick panel.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note:</strong> This setting is available only when you enable Show Labels.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like the following illustration.

![Quick Panel Illustration](image)

5. In the Configure Cards section, toggle the options to customize the appearance and information of cards.

Changes to the cards apply to the current user only.

<table>
<thead>
<tr>
<th>View options</th>
<th>Option</th>
<th>Description</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Compact Cards</td>
<td>Decreases the lane width and card information. Thumbnail images do not appear on the card.</td>
<td>This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td></td>
<td>Show Card Info</td>
<td>Displays card information on each card. Card information typically includes details like the task state, date opened, and last user to update it.</td>
<td>This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td></td>
<td>Show Card Attachment</td>
<td>Cards display the first image attached to that card as a thumbnail.</td>
<td>This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td></td>
<td>Show SLAs</td>
<td>SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled.</td>
<td>This setting is available only when SLAs are associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

6. Under Advanced Settings, in the Lane Configuration section, show or hide lanes by selecting or clearing the check box for each lane. This setting is a user preference.
Sort Visual Task Boards

You can sort Visual Task Boards using criteria that you create with a Sort-Filter option, grouping items by properties to help organize your cards.

About this task

Only the owner of the board can create the sorting criteria, and add, edit, or delete the criteria. The criteria appear as “read-only” for other users.

Note: The procedure is slightly different for Data Driven and Freeform boards. The instructions below contain both options.

Procedure

1. For a Data Driven board: In the left pane of your instance, navigate to Visual Task Boards > My Task Boards > New.
2. From the Create New Board window, select Data Driven Board.
3. Fill out the fields with your choices and then select Next.
4. Select Add sort, choose the conditions you want from the fields and then select Create.

5. In the Add Sort window, choose your sorting order and then select Save.

Your criteria displays. You can edit your sort order here, or add new criteria. You can also edit your choices in the navigation pane on the right.
6. For a **Freeform Board**: From the Create New Board window select **Freeform Board**.

7. Make your selections and then select **Save**.

8. The sorting criteria and filtering appear in the right navigation pane.

You can edit your sorting criteria for both Freeform and Data Driven boards by selecting the **Edit Filter and Sort** button.

## Configure Visual Task Boards labels

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

**Before you begin**

Role required: tags_admin and global_tags_creator

**About this task**

Every board has seven labels by default.
Any board member can edit the labels on a board. All the labels are visible on the Quick Panel under Labels.

Procedure

1. From the task board tools, click the Labels tab.

2. Turn on the Show Labels button if it is turned off. You can see seven default labels:
   - Users with global_tags_creator role can add labels to the board and rename the label.
   - To add labels, click Add Labels. Newly added label remains in off state by default. You can assign any color or no color to the label. To rename the label, click the label text and enter new value.
   - To change the color of the label, click the Select color icon beside the label. Select the color of your choice from the color picker and click Save.
To disable or enable a specific label, toggle the button next to the label. To turn on or turn off a specific label, toggle the button next to the label. Only turned on labels show up in the quick filter and can be applied to a card.

- Board owner can delete the label by clicking Delete Label icon next to the label.
- To filter the cards by labels, type the Label name in the Search bar or click Add to Filter icon against the label. Once you filter by the label, you can only see cards with that label.

**Labels on Card Details Page**

When user clicks the card, the card opens with the details of the card. It contains all the applied labels under **Details** tab.
Under the **Labels** tab, the toggle button for applied labels is On and Off for the labels that are not applied.

**Configure visual task board with swimlanes**

Swimlanes enable you to create an environment with horizontal lanes in addition to vertical lanes. Swimlanes use only compact cards in task board.

**Before you begin**
Role required: none

**About this task**
You can add swimlanes in the following types of the visual task boards:
• Freeform Board
• Flexible Board
• Guided Board

You can perform following activities when you select swimlanes in visual task boards.

• Name and rename the swimlanes.
• Move the tasks horizontally and vertically from one user to another.
• Drag the cards across swimlanes.
• Reorder swimlanes by dragging them or from Lane Configuration.

• Collapse and expand swimlanes.

Procedure
1. Navigate to **System Definition > Self-service > Visual Task Boards**.
2. Click **New** and select the board type.
   • Freeform Board
   • Data Driven Board
3. Configure swimlanes in the boards.
• In a freeform board, activate the swimlanes by sliding the swimlanes toggle in the **Info** tab to the right.

The following figure shows a sample freeform board created with swimlanes.

• In a Ddata driven flexible board:
  a. Select **None** in **Vertical Lane Field** from the drop-down.
  b. Click **Next** and slide the toggle under the **Info** tab to the right.
The following figure shows a data driven flexible board created with swimlanes.

• In a data driven guided board, select **Vertical Lane Field** and **Swimlane Field** while creating the board. You must have created a freeform board in order to create a guided board.

You can also add swimlanes to the existing guided board by selecting **Swimlane Field** under **Info** tab in the board.
Modify the query or lane field for an existing board

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.
Before you begin
Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.
Role required: none but you must be the board owner

About this task
The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.
The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

Procedure
1. Open a task board.
2. Click the board information icon (i) by the board name.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit the board query</td>
<td>a. Under Board Filter, click Edit Filter to open the condition builder.</td>
</tr>
<tr>
<td></td>
<td>b. Add and remove conditions as needed to edit the query.</td>
</tr>
<tr>
<td></td>
<td>c. Click Save.</td>
</tr>
<tr>
<td>Change the lane field</td>
<td>a. Click the Lane Field picker and select a field or the None option.</td>
</tr>
<tr>
<td></td>
<td>Guided boards have the Lane Field set to a field, such as State. Flexible</td>
</tr>
<tr>
<td></td>
<td>boards have the Lane Field set to None. You can change the Lane Field value</td>
</tr>
<tr>
<td></td>
<td>accordingly to change the board type.</td>
</tr>
<tr>
<td></td>
<td>b. In the confirmation dialog, click OK.</td>
</tr>
</tbody>
</table>

The board reloads to reflect the changes.
Configure WIP Lane Limit

You can set a limit to the number of cards added to a lane. If the limit is not set, any number of cards can be added to a lane by default.

**Before you begin**
Role required: admin

**Procedure**
1. Open the Visual Task Board.
2. Click on the lane header.
3. Select **Set Lane Limit.** **Set Lane Limit for <name of the lane>** window appears.
4. Enter the number you want to set for the specific lane. Leave blank, if you want set no limit to the lane.
5. Click **Save.**

**Results**
The number appears on the lane header.

```
Hardware 4/10
```

If the number of cards exceeds the set limit, the Red symbol appears on the lane header for all the board members.

```
Hardware ! 9/8
```

If a card is moved to a lane with exceeded WIP lane limit, the error message **To lane limit exceeded!** appears on the top of the page. The member who moves a card to the lane with exceeded limit can view the error message.

Configure the card limit for Visual Task boards

Freeform and Data Driven boards can display up to 1,000 cards by default. You can change the default card limit by adding a property.

**Before you begin**
Role required: admin

**About this task**
You can set card limit for both Freeform board and Flexible and Guided board in Data Driven board.
Procedure

1. Add a new system property with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>

2. Set the Value to the maximum number of cards allowed for each board.

*Note:* Performance degradation may occur if you set the Value to a number greater than 1,000, especially on tablet devices.

Configure the task board card view

Configure the fields that appear in a card on a task board.

*Before you begin*
Role required: admin

Procedure

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select **Configure > Form Layout.**
3. Under the Form View section, select the VTB view.
   You may need to create a VTB view for the form. For more information, see [Create and delete views](#).
4. Select the fields to appear on the card by adding or removing the fields from the Selected column. You can also adjust the order they appear on the form by moving the fields up or down.

Workflow

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of activities, such as generating records, notifying users of pending approvals, or running scripts. The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.
Note: As of the New York release, Workflow is a legacy product. Use Flow Designer for any new process automation. As many organizations have workflows in production, use this Workflow documentation to learn how to work with existing workflows.

Getting started with workflows

The graphical Workflow Editor provides a drag-and-drop interface for automating multi-step processes across the platform.

Parts of a workflow

Workflows consist of these parts.

**Properties**

Specify configuration settings such as the workflow name, the table whose records the workflow acts on, and the conditions under which to run it.

**Activities**
Specify the sequence of operations the workflow performs such as generating records, notifying users of pending approvals, or running scripts.

Transitions
Specify the conditions under which to run an activity.

Exit conditions
Specify the conditions under which to run a transition.

Contexts
Store historical runtime information about a specific workflow run in a Workflow Context record.

Versions
Store historical design information about a specific workflow in a Workflow version record.

Workflow life cycle
A workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog. You can also schedule workflows to run periodically or call them from scripts such as business rules.

When an activity completes, the workflow transitions to the next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item. If the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:
1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.
When the workflow runs out of activities, the workflow is complete. The Workflow Context stores the execution history of the activities and transitions run. The Workflow Version stores the design history of the activities, transitions, and exit conditions available to run.

**Workflow properties**

The workflow properties specify when to run a workflow and what records it acts on. For more information about workflow properties, see [Workflow properties](#).

**Workflow activities**

A workflow activity contains instructions that are processed by the workflow. Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:

![Sample activity](image)

Workflow runs activities as the user session that starts them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

For more information on available activities and their behaviors, see [Workflow activities](#).

**Transitions**

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the **Change Approved** Script to the **Change Task** activity:
Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:

Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow > Workflow Editor. For information about using the editor, see Create a workflow.

Welcome screen

The editor opens with the Welcome page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.

**Core**: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.

**Packs**: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.

**Custom**: Orchestration custom activities available. Only visible if the orchestration plugin is installed.

**Data**: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

⚠️ **Note**: If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to Rome. You can update the workflow welcome page to the latest version by editing the **UI pages**.

Navigate to **System UI > UI Pages > Workflow Editor welcome**. In the UI page record for `workflow_editor_welcome`, scroll to the **Versions** related list. Select the row for the version corresponding to the upgrade to Rome, right-click and select **Revert to this version**.

### Workflow canvas

After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the Workflow Editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see [Create a workflow](#).

- **Canvas tabs**: Contains tabs for accessing workflows being edited or created.
- **Title bar**: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- **Canvas**: Provides the working surface for creating new workflows or editing existing ones.
• **Palette tabs**: Contains tabs for accessing activities being edited or created.

• **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.

**Workflow user interface**

The default workflow palette contains workflow activities and existing workflows you can use as subflows.

The basic workflow palette contains these tabs:

• **Workflows**: Displays existing workflows and provides controls for creating new ones.

• **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

**Workflows tab**

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.
Workflows tab in the palette

The Core tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see Add an activity to a workflow.
When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.

Controls on the right side of the title bar manage the workflow.
• **Workflow Properties**: Opens the current workflow's properties form.

• **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.

• **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see [Workflow Validation](#).

• **Help**: Opens documentation to help you create the workflow.

### Workflow menu

Click the menu icon in the title bar for additional options to configure the workflow.

These menu options are available:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Workflow</td>
<td>Creates a new workflow.</td>
</tr>
<tr>
<td>Open Existing</td>
<td>Opens another existing workflow.</td>
</tr>
<tr>
<td>Copy</td>
<td>Creates a duplicate of the workflow. Give the copy a different name.</td>
</tr>
<tr>
<td>Publish</td>
<td>Makes the personal workflow version public, overwriting the current published workflow version.</td>
</tr>
<tr>
<td>Checkout</td>
<td>Creates a personal version of the workflow for you, which you can edit. This option is only available for published workflows.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the workflow. You cannot delete workflows that have contexts associated with them.</td>
</tr>
<tr>
<td>Set Inactive</td>
<td>Inactivates the workflow so that it cannot be used.</td>
</tr>
<tr>
<td>Expand Transitions</td>
<td>Redraws the transitions so that they do not overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Start Workflow</td>
<td>Starts a test run of the current workflow.</td>
</tr>
<tr>
<td>Validate Workflow</td>
<td>Runs validation tests on your workflow prior to publication. Use this validation to detect potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see Work on workflows.</td>
</tr>
<tr>
<td>Collapse Transitions</td>
<td>Redraws the transitions so they overlap when they leave the activity condition.</td>
</tr>
<tr>
<td>Show Contexts</td>
<td>Displays all the contexts for the current workflow. You can use this option to troubleshoot a workflow.</td>
</tr>
<tr>
<td>Properties</td>
<td>Opens the Workflow Properties form, which defines the workflow's attributes.</td>
</tr>
<tr>
<td>Edit Inputs</td>
<td>Opens the Workflow Inputs list of variables that the workflow can accept when used as a subflow. For more information, see Pass a variable from a workflow to a subflow.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>Edit Stages</td>
<td>Opens the Workflow Stages list. For more information, see Workflow stages. For tables with a column of Type = Workflow.</td>
</tr>
</tbody>
</table>

Workflow editor keyboard navigation

The platform includes accessibility features that support Web Content Accessibility Guidelines (WCAG) 2.0 level A and make the interface accessible to users with disabilities.

These features improve the user experience when accessing platform functions with screen readers and keyboard navigation. In general, you use the following set of standard keyboard navigation functions:

- Press **Tab** to navigate major groupings in a pre-defined sequence. This usually includes moving between standard interface controls (fields and lists) in a module, or between records within a tab.
- Press **Shift Tab** to move backwards in a pre-defined sequence.
- Use arrow keys (left, right, up, down) to navigate between individual elements within a group. This usually includes moving between tabs, or between available selections within a specific control (for example, within a list).
- Press **Enter** to select a control or tab, or enter text within a control.

The Workflow Editor is constructed in a unique manner. It includes a series of main (left) panel tabs, a series of side (right) panel tabs, and a drawing canvas for workflow creation or editing. As such, it has its own unique set of keyboard accessibility functions and commands.

Welcome page keyboard commands

Use keyboard commands to navigate and operate the Workflow Editor Welcome page.
### Task or Action

Navigate to main content (left) panel, and select a workflow

<table>
<thead>
<tr>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. After accessing the Workflow Editor from a menu, press Tab. <strong>Skip to Main Content</strong> appears in the upper left corner.</td>
</tr>
<tr>
<td>2. Press Enter to position the cursor in the first record displayed in the Published tab.</td>
</tr>
<tr>
<td>3. Press Tab to navigate down the listing of workflow records. Press Enter to select and open a workflow record in the Workflow drawing canvas.</td>
</tr>
<tr>
<td>Task or Action</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
</tr>
</tbody>
</table>
| Select a checked out workflow or a help function in main content panel | 1. After accessing the Workflow Editor from a menu, press **Tab** until the **Published** tab is highlighted.  
   **Note:** Do not select **Skip to Main Content** or **Skip to Workflow Side Panel**.  
   2. Press the right or left arrow keys to navigate between the **Published**, **Checked Out**, or **Help** tabs.  
   3. Press **Tab** to navigate across the columns and down the listing of checked out workflow records or help selections.  
   Press **Enter** to select and open a checked out workflow record in the Workflow drawing canvas, or open a help selection (work or orchestration videos, documentation, community discussions, knowledge base, or live feed). |
| Create a workflow                                  | 1. After accessing the Workflow Editor from a menu, press **Tab** until **New Workflow** is highlighted.  
   2. Press **Enter** to open **New Workflow** |
<p>| Jump to Top                                         | After tabbing through the displayed records in a tab in the main panel (for example, within the <strong>Published</strong> tab), <strong>Jump to top</strong> appears at the bottom of the listing. Press <strong>Enter</strong> to return to the Welcome tab at the top of the Workflow Editor. |</p>
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Navigate to page selection controls                                          | 1. After tabbing through the displayed records in a tab in the main panel (for example, within the **Published** tab), including **Jump to top**, press **Tab** to access the page selection controls. Continue to press **Tab** until you access the desired one.  
2. Press **Enter** to operate the selected page control.                       |
| Navigate directly to side (right) panel to open help, create a new workflow, or open an existing one | 1. After accessing the Workflow Editor from a menu, press **Tab** two times. Do not select **Skip to Main Content**.  
2. Press **Enter** to position the cursor in the **Workflows** tab in the side panel.  
3. To open help, press **Tab** to navigate to **Help**. Press **Enter** to open help, or press **Tab** to skip.  
4. To create a new workflow, press **Tab** to navigate to **Create**. Press **Enter** to open **New Workflow**, or press **Tab** to skip.  
5. To open an existing workflow:  
   • As needed, stop at the filter field to filter workflows.  
   • Press **Tab** to navigate down the workflow list.  
   • Press **Enter** to select and open a workflow record in the Workflow drawing canvas. |
<p>| Add a core activity to a checked out workflow in the Workflow drawing canvas  | If a checked out workflow is open in the Workflow drawing canvas, core activity records display in the <strong>Core</strong> tab. To |</p>
<table>
<thead>
<tr>
<th>Task or Action</th>

<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Select Workflow Actions menu command (for example, Validate Workflow or Publish Workflow) | 1. Press **Tab** until the context menu (≡) is highlighted.  
2. Press **Enter** to open the context menu.  
3. Use the down arrow key to move to the command, then press **Enter** to select it. |
| Set general workflow properties                   | 1. Press **Tab** until **i** is highlighted.  
2. Press **Enter** to open **Workflow Properties**.                                                                                           |
| Navigate from activity box to activity box.       | Simply press **Tab** or use the arrow keys (right, left, up and down) to navigate from activity to activity within the workflow.                |

**Note:** Depending on the complexity and number of activity boxes in the workflow, the sequence of navigation is not always predictable. Depending on how you are navigating within the workflow, the navigation sequence is generally (but not always) row-by-row, and focus is usually placed on the nearest activity box.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Modify a selected activity. | 1. Navigate to the activity box, then press **Enter** to select it and place it in Edit mode. When you select an activity box, it appears as highlighted.  
2. Once in Edit mode, use **Tab** to move around within the activity box to change or access elements such as:  
   - Activity Properties (√)  
   - Title  
   - Node context menu  
   - Delete Node (⊗)  
   - Condition Properties (Always)  
   - Node conditional context menu (†)  
   - Node conditional port options (✉)  
   > **Note:** All elements in a selected activity are only accessible when working with a checked out workflow. When working with a published workflow, you can only access its activity properties and title,  
3. Press **Enter** to select an element, or press **Esc** to escape an element without making changes. |
| Add a condition to an activity. | 1. Within an activity box, select **Condition Properties**.  
2. In **Condition Properties**, specify the conditions for the activity. |
| Create a connection from a condition on one activity to the next activity that follows | 1. Within an activity box, select **Node conditional context menu (†)**.  
2. Select **Link to...** to create a connection to the next activity box that follows, or select **Delete** to delete an existing connection. |
| Add a core or custom activity | 1. Within an activity box, select **Node conditional port options (✉)**.  
2. Select **Add Core Activity** to access Workflow Activity Definitions to add a new core activity, or select **Add Custom Activity** to add a custom activity to the workflow. |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Move an activity box         | 1. Press **Tab** to navigate to the activity box, enter press **Enter** to select it.  
                               | 2. Use the arrow keys to move the activity box. To move the activity box one pixel at a time, press **Shift** while using the arrow keys. |
| Validate a workflow          | 1. Press **Tab** until ✅ is highlighted.  
                               | 2. Press **Enter** to validate the workflow.                                                                                              |
|                              | You can also select **Validate** from the Workflow Actions menu.                                                                               |
| Run a workflow               | 1. Press **Tab** until ⏬ is highlighted.  
                               | 2. Press **Enter** to run the workflow.                                                                                                     |
|                              | **Note**: If the workflow is tied to a database table, this function is disabled. The workflow runs when the proper table conditions are activated (for example, insertion of a new record into the table). |
| Close workflow drawing canvas| 1. Press **Tab** until ✗ (on the right side of the tab that contains the name of the workflow) appears.  
                               | 2. Press **Enter** to close the canvas.                                                                                                     |
| Publish a workflow           | 1. Press **Tab** until ⏬ (on the right side of the tab that contains the name of the workflow) appears.  
                               | 2. Press **Enter** to open the context menu.                                                                                               |
|                              | 3. Use the down arrow key to move to the **Publish** command, then press **Enter** to select it.                                               |
| Jump to Top                  | After tabbing through the entire workflow, appears at the bottom of the listing. Press **Enter** to jump to the top of the Workflow drawing canvas. |

**Workflow management**

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to
use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

Create a workflow

Automate a multi-step process by creating a workflow with the Workflow Editor.

Before you begin

- You must have the workflow_admin or workflow_creator role to use the Workflow Editor.
- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

1. Navigate to Workflow > Workflow Editor.
   The Welcome tab of the Workflow Editor opens.
2. On the Workflows tab in the palette, click New Workflow.
   A simplified version of the New Workflow form opens.
3. Fill in the Name and Table fields
4. [Optional] Add a Description.
5. [Optional] Do one of the following:
a. If the **Conditions** UI section is displayed, specify a **Condition** if needed and edit the fields. (The **Conditions** UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the `sc_req_item` table, conditions are not applicable and the **Conditions** UI section is not displayed.)

b. If the **Stages** UI section is displayed, check that the **State rendering** and **Stage order** fields contain the correct information. (The **Stages** UI section shows only if the selected table supports stages. For example, if you select the `sc_req_item` table, the **Stages** UI section is displayed.)

6. Click **Submit**.

   The new workflow is created with the **Begin** and **End** activities connected by a single transition.

![Diagram of a workflow with Begin and End activities connected by a single transition.](image)

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users. For more information, see **Work on workflows**.

8. To change advanced settings for the workflow, click the **Properties** icon 🔍. If you make changes, click **Update**.

**Workflow properties**

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- **Name**
- **Table**
- **Description**
• If condition matches
• Condition

If you click Diagrammer view, in Related Lists, the following UI sections are available in the dialog box:
• General
• Conditions
• Inputs
• Activities
• Application
• Schedule
• Stages
• Estimated Runtime

General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select Global [global] to run the workflow on all tables.</td>
</tr>
</tbody>
</table>

Note: The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checked out</td>
<td>[Read-only] When the workflow was checked out. Automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>[Read-only] The user who has this workflow checked out. This value is automatically set by the Checkout action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>[Read-only] Check box to indicate whether the workflow has been published. Automatically set by the Publish action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>
Conditions
Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as sc_req_item, that does not require a condition.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| If condition matches   | When the condition evaluates to true, the workflow launches an active context:  
  • **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.  
  • **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the Condition field matches a record that is inserting into the table.  
  • **Run if no other workflows match yet (deprecated)**: The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using.  
  • **Run if no other workflows matched**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as short_desc contains test. A new workflow, which has If condition matches is set to Run if no other workflows match yet, only runs if none of the four workflows have started running on the Incident record. |

| Condition              | A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.                                                                                     |
| Order                  | Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions. |

Inputs
The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>

**Activities**
The Activities section enables you to set activity pinning and maximum activity count.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Activity pinning        | List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning. The possible options are:  
  • **Set by activity**: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.  
  • **Pin all activities**: Pins all activities in the workflow to their current version.  
  • **Unpin all activities**: Allows all activities in the workflow to be updated.                                                                 |
| Max activity count      | The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled. |

**Application**
The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>[Read-only] Scope of this activity. For more information, see Application Scope.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Scope restrictions for this workflow. Possible settings are:</td>
</tr>
</tbody>
</table>
### Field Description

- **All application scopes**: Workflow is accessible to all application scopes.

- **This application scope only**: Workflow access is limited to the scope named in the Application field.

For more information see Workflow scope.

### Schedule

Use the Schedule section to create a schedule for this workflow using the schedule builder.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery based on</td>
<td>The schedule type for this workflow. Possible types are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>User-specified duration</strong>: Duration based on a user-specified value. This is the default schedule type.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Relative duration</strong>: Duration calculated from a preconfigured schedule, such as 8-5 weekdays.</td>
</tr>
<tr>
<td>Expected time</td>
<td>User-defined interval. This field is visible when the schedule type is User-specified duration.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Preconfigured schedule that determines when this workflow runs.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Time zone for this instance.</td>
</tr>
</tbody>
</table>

### Stages

The Stages section appears if you select a table with **Type = Workflow**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Displays the workflow stage progress on the selected table. Optionally, select Stage rendering and Stage order schemes to customize the appearance of the stage field. The default values cover typical scenarios.</td>
</tr>
<tr>
<td>Stage rendering</td>
<td>The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see Workflow stage renderers.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Stage order** | The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.

**Name** | The name of the stage as it appears in workflow fields.

**Duration** | Time allocated for the specific stage.

**Order** | The order of workflow stages when you view a workflow field in a list. Select **Computed** to let the workflow engine compute the stage order from the order of execution in the workflow. Select **User Specified** to use the **Order** field from that Workflow stages.

**Value** | The value of the stage when it is referenced from elsewhere in the system, such as in a script.

---

### Estimated Runtime
The **Estimated Runtime** section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see **Workflow run time metrics**.

### Field | Description
--- | ---
**Requires ERT** | Check box to indicate that this workflow requires an estimated runtime configuration.

You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.

**Estimated Run Time** | The initial estimate for the workflow's run time.

**Number of data points** | [Read only] The number of times the system has compared the estimated run time to an actual run time result.

**Outlier Percentage Threshold for ERT** | [Required] The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see **Outlying workflow run times**.
Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

Before you begin

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.

2. Right-click in the column header and select Configure > Workflows.

   ![Image of column header with Configure and Workflows options selected]

   The Workflow Versions on that table appear in a list.

3. Click New.

   The Workflow Version opens in New Workflow view. The Table field is filled in with the table you selected in step 1 and is read-only.

4. Enter Name.

5. [Optional] Enter Description.
6. [Optional] Edit conditions fields as necessary.

7. Click Submit.
   The new workflow is added to the Workflow Versions list.

8. Click the workflow Name.
   The new workflow is created with the Begin and End activities connected by a single transition.

9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.

10. [Optional] To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow for a new service catalog item

When you create a new service catalog item, you can create a new corresponding workflow at the same time.

Before you begin

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

Procedure

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.

2. At the top of the form, next to Catalog Items, click New.
   The Catalog Item form opens.

3. Add a Name.

4. Next to the Workflow field, click the lookup icon.

5. Next to Workflow at the top, click New.
The Workflow version dialog opens in the New Workflow View. The **Table** field is set to **Requested Item (sc_req_item)** and is read-only.

6. Add a **Name**.

7. [Optional] Add a **Description**.

8. [Optional] Change the stage information as necessary.

9. Click **Submit**.

   The new workflow is created with the **Begin** and **End** activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.

    For more information, see [Work on workflows](#).

11. To change advanced settings for the workflow, click the **Properties** icon.
12. Click **Update**.
   If you close the Workflow Editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the **Workflow** field. Hover over the information icon to view a read-only summary of the workflow.

**Create a workflow for an SLA Definition**

Automate a multi-step process by creating a workflow from an SLA definition.

**Before you begin**
- If you are designing the workflow as part of an update set process, see **Workflow movement with update sets** before creating the workflow.

**Procedure**

1. Open a list of SLA definitions. For example **Facilities > SLA Definitions** or **Service Level Management > SLA Definitions**.

2. At the top of the form, next to **SLA Definitions**, click **New**.

3. Select **Contract SLA** or **Service Offering SLA**.
   The SLA Definition or Service Offering SLA form opens.

4. Next to the **Workflow** field, click the lookup icon.

5. Next to **Workflow** at the top, click **New**.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter **Name**.
7. [Optional] Enter **Description**
8. [Optional] Edit conditions fields as necessary.
9. Click **Submit**.
   The new workflow is created with the **Begin** and **End** activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
For more information, see Work on workflows.

11. [Optional] To change advanced settings for the workflow, click the **Properties** icon 📋. If you make changes, click **Update**.

**Ending workflows with multiple branches**

A workflow is complete when it reaches the **End** activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a **Join** activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

![Workflow with uncompleted branch](image)

For both branches to complete, add a **Join** activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The **Incomplete** condition of the **Join** activity is met only if one of the branches cannot be completed.

![Workflow with completed branches](image)

**Work on workflows**

To complete a workflow, you add workflow activities, validate the workflow, and publish it.

**Add a workflow activity**

Activities determine the functionality of the workflow.
Before you begin
Role required: workflow_admin, workflow_creator, or admin

About this task
When they are created, all workflows contain Start and End activities.
For more information, see Workflow activities.

Procedure
1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow
You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.

Before you begin
Role required: workflow_admin, workflow_creator, or admin

About this task
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.

Procedure
1. Open the workflow to validate in the Workflow Editor.
   When the workflow is loaded, the workflow validator icon appears in the toolbar.
   ![Workflow Editor toolbar with validator icon]

2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.
3. Complete the following steps to generate a workflow validation report from the Workflow Version form

   a. Navigate to Workflow > Administration > Workflow Versions, and select a workflow to validate.

   b. Under Related Links, click Validate Workflow.

Publish a workflow

When a workflow is complete, publish the workflow so that it is available to all users.

Before you begin

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see Workflow validation.

Role required: workflow_admin, workflow_creator, or admin

About this task

To publish a workflow:
Procedure
1. Navigate to Workflow > Workflow Editor.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select Publish.

Results
If you published a new version of workflow, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

Determine whether a workflow can run
A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Before you begin
Role required: workflow_admin, workflow_creator, or admin

Procedure
1. In the navigation filter, enter wf_workflow.list, and then open one of the workflows.
2. In the Versions related list, check for all of the following conditions:
   a. There is only one workflow version in a state of Checked out and Checked out by.
   b. There is only one version and it is not checked out. This version must be both Active and Published.
      You may need to personalize the list and add the Active column.
   c. If there are multiple versions, only one is Published.

These checks determine the only two conditions under which a workflow can run:
• A checked out version of a workflow is available for the user who has it checked out.
• A valid, published version of a workflow is available for all users who have permission to run the workflow.
Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

**Edit a published workflow**

You can edit a published workflow after you check it out.

**Before you begin**

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

**About this task**

⚠️ **Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

**Procedure**

1. Navigate to **Workflow > Workflow Editor**.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select **Checkout**.
   - A new version of the workflow is created and assigned to you.
   - If you are in a different domain than the published workflow, the new workflow version is created in your domain.

**What to do next**

After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

**Copy a workflow between two application scopes**

Application scoping protects applications by identifying and restricting access to application files and data. You can copy a workflow created in one application scope (for example, Test) to another (Production) as needed.

**Before you begin**

Role required: admin
Procedure

1. On the Home page, click  located next to the logged in user name.
2. In the Developer tab, in the Application field, select the application scope (for example, Test) in which you want to operate the ServiceNow platform.
3. Close the System Settings page.
4. Navigate to Workflow > Workflow Editor.
5. Create a workflow in the Workflow Editor. For more details, see Create a workflow.
6. In the Workflow Editor, click  i.
7. In the Application tab, Application is set to the current application scope selected in System Settings.
8. In Accessible from, select All application scopes if the workflow is available to all application scopes, or select This application scope only if it is only available to, and accessible in the current application scope only. Only those workflows that are accessible from all application scopes can be copied to another application scope.
9. Go back to the Homepage, click  .
10. In the Developer tab, in the Application field, select the application scope (for example, Production) to which you want to copy the workflow.
11. Navigate to Workflow > Workflow Editor.
12. Refresh the page, then open the same workflow you created. An Out of scope workflow, workflow belongs to <scope name> scope message appears, where <scope name> is the application scope in which the workflow was originally created.
13. In the Workflow Editor, click  .
14. Select Copy.
The Workflow Name dialog appears:

   Workflow Name
   Workflow Name
   New_Workflow_Name
   Cancel
   OK

   a. In Workflow Name, type the new name for the copied workflow.
   b. Click OK. The system creates a workflow in the current application scope.
15. In the Workflow Editor, click ![i](image).

16. In the Application tab, Application is set to the current application scope.

17. In Accessible from, select This application scope only if to make the newly copied workflow a private one that cannot be accessed from outside current scope.

18. Click Update.

**Results**

A new workflow record is created in the selected application scope and marked as private if designated as one in the Workflow Editor.

**Workflows used as subflows**

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The Workflows tab in the Workflow Editor contains a list of the workflows available for use as subflows.

![Workflows available to use as subflows](image)

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into
a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.

![Workflow with active subflows](image)

**Subflows and the Create Task activity**

If a workflow contains a **Create Task** activity that has executed on the current record, additional task activities in the workflow might not execute as expected. This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the **Create Task** activity again, the system reopen the first task activity instead and does not create an additional task.

ℹ️ **Note:** An alternative to creating duplicate subflows that use the **Create Task** activity is to add a **Run Script** activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a **Create Task** activity more than once. This allows the workflow to create additional tasks.

Running different subflows containing the Create Task activity

Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

**Before you begin**
Role required: workflow_admin, workflow_creator, or admin

**About this task**

**Note:** You can also use the **Return Value** activity in the subflow to return values to the parent workflow. Make sure to have a **Return Value** on every ending transition path.
**Procedure**

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.

2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

   **Note:** You cannot pass variables to a subflow that runs on the Requested Item [sc_req_item] table.

**Define inputs for a subflow**

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

**About this task**

All inputs are stored in the Variables [var_dictionary] table.

**Procedure**

1. In the editor, open and check out the workflow.

2. In the title bar, click the menu icon and select *Edit Inputs*.

3. In the Workflow Inputs window, click *New*.

4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.

5. Click *Submit*.

**Invoke a subflow in a workflow**

Use this procedure to add a subflow to a workflow.

**Procedure**

1. In the Workflow Editor, open and check out the parent workflow.

2. Drag the subflow from the *Workflows* tab to the parent workflow.

3. In the New Activity dialog box, define the variables defined by the subflow's *Inputs*.

   These fields can accept both static values or variables in the following format:

   `${variable_name}`
4. Click **Submit**.

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the **Inputs** definition.

Prepare a subflow

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

**Procedure**

1. In the editor, open and check out the workflow that you want to use as a subflow.

2. In the title bar, click the menu icon and select **Edit Inputs**.

3. In the Workflow Inputs window, click **New** in the **Variables** list.

4. Add a new variable depending on the type of values that it is going to store.

   The following example sets up a string value.
5. Click Submit.

6. Close the Workflows Inputs dialog.

7. Create a Run Script activity on the subflow.
   - Set the value from the parameter to a field on the current form. This is important because the Notification activity can only pull values from the current variable and not from the newly added variable. The following example sets the value in the Description field.

   ```javascript
   current.description = workflow.inputs.bluesubvariable;
   ```
   - Create a new field on the request form but do not display the field. This serves as temporary storage.

8. Create a Notification activity on the subflow. Use `${description}` in the subject to return the value from the field.
This is what the subflow would look like:

![Subflow Diagram]

**Prepare a workflow to use a subflow**

After you create a subflow, use this procedure to prepare the parent workflow.

**Procedure**

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.
   
   In the following example, the variable is named **Blue Main Variable**.
2. Click Submit.

3. Insert a Run Script activity to return the value from a field to the newly created variable.

   In this example, the value of the Short Description field is returned and given to the newly created variable.

   \[
   \text{workflow.scratchpad.bluemainvariable} = \text{current.short_description};
   \]

4. Click Submit.

5. In the subflow activity, set the Blue Sub Variable to pass the bluemainvariable to the bluesubvariable.

   \[
   \text{@{workflow.scratchpad.bluemainvariable}}
   \]
This is what the main workflow looks like:

![Workflow Diagram]

**Using variables in a workflow**

Within workflow there are several different types of variables that are available. Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

**Activity variables**

Activity variables are properties specifically associated with a workflow activity.

**About this task**

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

**Procedure**

1. Navigate to **Workflow > Activity Definitions**.
2. Select a workflow activity, such as **Approval - User**.
3. In the **Activity Variables** section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

**Note:** If defining a new activity variable that is dependent on another activity variable, put the prefix "vars." before the name of the parent activity variable. For example, if the child field is dependent on a field named `parent`, put the value `vars.parent` in the **Dependent** field.
To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table. To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

```
activity.vars.variable_name = new_variable_value
```

**Workflow input variables**

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

**About this task**

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

*Note:* There is a specific kind of input variable for any workflow that is declared against the table Requested Item [sc_request_item]. To understand the use of these variables see Workflow catalog variables.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

**Procedure**

1. Navigate to **Workflow > Workflow Editor**.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select **Edit Inputs**.
4. Select an existing variable or click **New**.

   - Note the **Column name** field. Use this value when accessing the variable from a script.

Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

The input variables are available to use in scripts. To access an input variable from a script:

```
var input  = workflow. variables. variableName //get the workflow variable identified by column name.
```
Assigning values to variables from outside of workflow

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable’s value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow(); //Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of
//workflow
wf.startFlow(wfId, null, "Workflow Name", {input_var_name: input_var_value});
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow(); //Get the workflow id
var wfId = wf.getWorkflowFromName("Workflow Name");
//Start workflow, passing along object containing name/value pairs mapping to inputs
//expected by the workflow
var vars = {};
vars.input_var_name1 = input_var_value1;
vars.input_var_name2 = input_var_value2;
// add as many variables as your workflow is expecting, then pass the object
wf.startFlow(wfId, null, "Workflow Name", vars);
```

Assigning Values for Subflow Inputs from inside of a Main Workflow

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see Workflows used as subflows.

Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:
Workflow scratchpad variables

Store and share string-based variables as name-value pairs between workflow activities.

The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```javascript
workflow.scratchpad.variableName = variableValue;
```

Display

View activity scratchpad values from the Workflow Activity History Scratchpad [wf_history_scratchpad] table. Workflow Activity History Scratchpad is also an embedded list in Workflow Activity History records.

Sample Workflow Activity History Scratchpad records

Access and Assignment

Use standard JavaScript object notation to access or assign scratchpad values. For example, use this format to assign a particular scratchpad variable value.

```javascript
var readValue = workflow.inputs.variable_name;
```
Workflow.scratchpad.variableName = variableValue;

Use this format to assign a JavaScript variable to a scratchpad variable.

var myValue = workflow.scratchpad.variableName;

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

var myVarValue = current.getElement(nameOfTheField);

or

var myVarValue = current.fieldName;

or

current.variableName.setValue( "A Variable Value");

Workflow catalog variables

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.
**Scope**

For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item [sc_request_item], and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

**Declaration**

You can declare requested item catalog variables at the catalog item level or at a global level.

**About this task**

You can declare global catalog variables using the Workflow Editor context menu.

Also see, Global variable declaration option 2.

**Procedure**

1. Navigate to Workflow > Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item [sc_req_item] table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

**Global variable declaration option 2**

You can declare global catalog variables using the Service Catalog.

**Procedure**

1. Navigate to Service Catalog > Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item !=<blank>. Change the filter to Cat Item = <blank> and run the query.
The catalog variables that appear are available to any catalog task that is initiated from within a workflow.

3. Click **New** to create a new variable.
4. Leave the **Cat Item** field blank.
5. Select the **Global** check box.
6. Click **Submit**.
   Also see, [Global variable declaration option 1](#).

**Catalog item specific variable declaration option 1**
You can declare a catalog item-specific variable.

**About this task**
These variables are only available to the catalog item referenced in the **Cat Item** field on the variable record.

**Procedure**
1. Navigate to **Service Catalog > Catalog Variables > Item Variables**.
   Note the list of variables that appears in the workspace has a default filter of **Cat Item != <blank>**.
2. Enter or select a catalog item in the **Cat Item** reference field.
   Selecting a **Cat Item** restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click **Submit**.
   Also see, [Catalog item specific variable declaration option 2](#).

**Catalog item specific variable declaration option 2**
You can declare a catalog item-specific variable directly from a catalog item record.

**About this task**
Creating a catalog variable in this way automatically sets the **Cat Item** reference to the catalog item selected.

**Procedure**
1. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.
2. Select or create an a catalog item.
Note the **Variables** related list. All variables declared using this related list have a **Cat Item** reference value of the current catalog item.

3. From the **Variables** related list, click **New**.

4. Ensure that the **Cat Item** field correctly references the catalog item previously selected or created.

5. Go to or open the **Question** section or tab.

6. Add a **Question**.

7. Add a **Name**.
   Variable names should not include white space and cannot begin with a number.

8. Click **Submit**.
   Also see, *Catalog item specific variable declaration option 1*.

---

**Display**

Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the **Maintain Items** module and in the **Item Variable** modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the **Catalog Task** activity in the form of a slushbucket at the bottom of the **Catalog Task** activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of **Catalog Task** when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the **Catalog Task** activity.

The last place the variables are seen is in the task form that is generated by the **Catalog Task Item**. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

**Access and assignment**

The Catalog Item Variables are available and assigned to a specific **Catalog Task** activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:
var now_GR = current; // or create and query a new GlideRecord
var itemVariable = now_GR. variables[variableName]; //access the service catalog variable identified by the variable name.
var itemVariableValue = itemVariable.getValue();
var itemVariableName = itemVariable.getName();
var itemQuestion = itemVariable.getQuestion(); //All GlideappQuestion API are accessible on itemQuestion

Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration [sysevent_register] table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity [wf_executing] table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing [wf_executing] table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.
Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands [wf_command] table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the onActivityComplete event handler.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for <code>wf_executing.notify_termination</code>, then set the value to <code>true</code> (activity.notify_termination = true) during the onExecute event.</td>
</tr>
<tr>
<td>otherEvent</td>
<td>String value used by the Join activity to respond to an otherEvent.</td>
<td>Informs records in the Workflow Executing Activity [wf_executing] table about an otherEvent that has completed.</td>
<td>The Join activity transitions from n number of preceding activities. These preceding activities create a wf_executing record which causes a check to see if the record already exists; the Join already exists, then the Join created by the execute transition sets the wf_executing record for deletion.</td>
</tr>
<tr>
<td>timer</td>
<td>String value used by workflow activities to respond to a timer.</td>
<td>Allows wf_executing records to be informed about a timer</td>
<td>The Timer activity schedules a job that calls a script. The script fireEvent (wf_executing, timer).</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Timer activity that has expired.</td>
<td>activity that has completed and has fired the timer event.</td>
<td><strong>execute</strong>&lt;br&gt;String value used by workflow activities to respond to a <strong>Timer</strong> activity that has expired.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of <strong>Executing</strong>. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the <code>run()</code> function is called. When the state of a record is <strong>Executing</strong>, this function always calls <code>onExecute</code>.</td>
</tr>
<tr>
<td>execute (specific to <strong>Lock</strong>)&lt;br&gt;String value used by the <strong>Lock</strong> activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a wf_executing record waiting to execute that the specified wait interval has passed and that it should attempt to get the lock again.</td>
<td><strong>Lock</strong> activity schedules a job with a script that uses the workflow script include's <code>fireEvent(wf_executing,'execute')</code> method.</td>
<td></td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs wf_executing records for approval activities about an approval that completed and triggered the timer event.</td>
<td>Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
</tr>
<tr>
<td>cancel (from within activity definitions)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>Informs all wf_executing records in a context that the workflow is being canceled.</td>
<td>The End activity uses the global workflow.broadcastEvent('cancel') to interrupt the currently running wf_executing records. This changes the state of those records to Cancelled.</td>
</tr>
<tr>
<td>cancel (outside current context)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all wf_executing records in a context that the workflow is being canceled. The event is managed via Any script can call cancel on a known executing context via the workflow script include. For example, var w = new Workflow(); w.cancel(context); //where context is a GlideRecord of the context to be canceled.</td>
<td></td>
</tr>
</tbody>
</table>
### Workflow events in the base system

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop (see <strong>End activity</strong>)</td>
<td>The <strong>End</strong> activity checks for this event.</td>
<td>If the stop event is the current event, then the cancel operation of the <strong>End</strong> activity is bypassed.</td>
<td>Only in the <strong>End</strong> activity.</td>
</tr>
</tbody>
</table>

The `onCancel` event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the current mutex.
Workflow events in the base system (continued)

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
</tr>
</thead>
<tbody>
<tr>
<td>listener</td>
<td>String value that the workflow (subflow) activity triggers as an event.</td>
<td>When a main workflow calls a subflow, the workflow keeps the ID of the subflow’s context in the scratchpad. When the subflow is complete, it triggers the listener event via a business rule.</td>
<td>The listener event is passed to the parent context on completion of a subflow and is managed via the \texttt{onListener} action of the workflow activity.</td>
</tr>
<tr>
<td>probe_complete</td>
<td>String value triggered in the workflow by an Orchestration activity indicating that the MID Server has completed a task.</td>
<td>The \texttt{probe_complete} event is triggered from Orchestration sensor processors via the workflow helper function \texttt{handleEventById}.</td>
<td>The \texttt{onProbe_complete} event handler is in the \texttt{WebServiceActivityHandler} and is used by most Orchestration activities.</td>
</tr>
<tr>
<td>pause</td>
<td>String value sent to a workflow from an SLA to pause the \texttt{Timer} activity.</td>
<td>When an SLA is paused, the SLA workflows must be paused if there is a timer running.</td>
<td>Use is exclusive to the SLA activity.</td>
</tr>
<tr>
<td>resume</td>
<td>String value used by the \texttt{Timer} activity to resume a paused timer (see pause).</td>
<td>When an SLA is resumed, the SLA workflows must be resumed as well.</td>
<td>Use is exclusive to the SLA activity.</td>
</tr>
</tbody>
</table>

Glide events relative to workflows

Workflow uses several Glide events.
## Workflow Glide events

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Insert</strong></td>
<td>Global event set upon the insert of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Starts workflows that are associated with the current GlideRecord either by reference, as in request items and SLA timers, or by conditions associated with the GlideRecord's table.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is start. Workflows can also be started manually using a script.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of insert</td>
</tr>
<tr>
<td><strong>Update</strong></td>
<td>Global event set upon the update of a GlideRecord that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Looks to the Workflow Context [wf_context] table to find running workflows that are associated with the current GlideRecord by document ID.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of update of a GlideRecord</td>
</tr>
</tbody>
</table>
### Workflow Glide events (continued)

</table>

Workflow event-specific functions

There are several functions that relate specifically to workflow events.

Workflow event-specific functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent (eventName)</td>
<td>Function in the workflow environment that writes events represented as strings to the \texttt{wf_executing.registered_events} field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma delimited set of events is stored with the Workflow Executing Activity [wf_executing] record. When the event is triggered in the workflow context, the \texttt{wf_executing} table looks for all executing records that contain the string that represents the event in the \texttt{wf_executing.registered_events} field.</td>
<td>The global variable workflow that is available to all Workflow Activity [wf_activity] records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.registerForEvent('myEventName');</code></td>
</tr>
<tr>
<td>unRegisterForEvent (eventName)</td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the \texttt{wf_executing.registered_events} field.</td>
<td>The workflow events are just strings that are written to the \texttt{wf_executing.registered_events} field. When an activity unRegisters for an event, the comma delimited set of events stored with the workflow that is available to all Workflow Activity [wf_activity] records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.unRegisterForEvent('myEventName');</code></td>
<td></td>
</tr>
</tbody>
</table>
## Workflow event-specific functions (continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>fireEvent(eventName)</td>
<td>Function in the workflow environment that examines the contents of the <code>wf_executing.registered_events</code> field, comparing its contents to the <code>eventName</code> passed in.</td>
<td>The workflow events are just strings that are written to the <code>wf_executing.registered_events</code> field. When <code>fireEvent(eventName)</code> is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.</td>
<td>Thread = current thread, current mutex Global variable workflow</td>
</tr>
<tr>
<td>fireEvent(eventRecord,eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The <code>eventRecord</code> is a GlideRecord of the type <code>wf_executing</code>.</td>
<td>This event call expects an <code>onMyEvent</code> event handler in the activity represented in the event record (Workflow Executing Activity [wf_executing] table). When <code>fireEvent(eventRecord, eventName)</code> is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the <code>on&lt;eventName&gt;</code> handler to manage. This event is queued up in its own mutex, so the current queue completes before this event is processed.</td>
<td>Thread = current thread, current mutex Global variable workflow</td>
</tr>
<tr>
<td>fireEvent(eventRecordSysId, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The <code>eventRecordSysId</code> is the <code>sys_id</code></td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.</td>
<td>Thread = current thread, current mutex Global variable workflow</td>
</tr>
</tbody>
</table>
### Workflow event-specific functions (continued)

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>fireEvent (eventRecordSysId, eventName, optionalJSONObject)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity [wf_executing] record. The <code>eventRecordSysId</code> is the sys_id of a GlideRecord of the type <code>wf_executing</code>.</td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.</td>
<td>The <code>Workflow</code> script include contains the call for this. For example, from inside a Run Script activity, a designer can write: <code>var w = new Workflow(); w.fireEvent(executing, eventName, JSONObject);</code></td>
</tr>
<tr>
<td>broadcastEvent (contextId, eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing] records in a specified context, regardless of their state.</td>
<td>This is the same as the <code>fireEvent</code> above, except that it accepts an ID and returns the Workflow Executing Activity [wf_executing] record.</td>
<td>The <code>Workflow</code> script include contains the call for this. For example, from inside a Run Script activity, a designer can write: <code>var w = new Workflow(); w.broadcastEvent(contextId, eventName);</code></td>
</tr>
<tr>
<td>broadcastEvent (eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity [wf_executing] records in the current context, regardless of their state.</td>
<td>This should not be confused with <code>broadcastEvent</code> above. This event is only available to current Workflow Executing Activity [wf_executing] records.</td>
<td>This is available only through the global workflow variable of the current context. The following is an example of its use from within an activity definition's script: <code>workflow.broadcastEvent(eventName)</code></td>
</tr>
</tbody>
</table>

### Event-specific workflow activities

The following workflow activities trigger events.

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event</td>
<td>Requires an event from the event</td>
<td>Fires the notification event specified</td>
<td>1. Navigate to System Policy &gt; Events &gt; Registry</td>
<td>Event Registry</td>
<td>Triggered in the current thread and handled on</td>
<td>On the notification thread of workflow</td>
</tr>
</tbody>
</table>
### Event-specific workflow activities (continued)

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>registry</td>
<td>registry rather than a workflow event. This activity is located in the Notification category of the workflow tree.</td>
<td>in the Workflow Activity [wf_activity] table.</td>
<td>2. Create an event.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>3. Navigate to System Policy &gt; Templates and create an email template.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>4. Navigate to System Policy &gt; Email &gt; Notifications.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>5. Create a new notification that is triggered by the event you created and sends the template you created.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>6. On the workflow canvas, drag the Create Event activity onto the canvas and associate it with the newly registered event.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the workflow executes, the event is created

### Event-specific workflow activities (continued)

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for WF Event</td>
<td>Listens for workflow events, as described in the Workflow Events in the Base System table, and only within the current context. This activity is located in the <strong>Conditions</strong> category of the workflow tree.</td>
<td>Waits for another transition branch of the current context to trigger an event.</td>
<td>Takes an event name as input. When the activity is executed, the specified event name is added to a string array stored in the <strong>registered_events</strong> column. The values in this column are in a list of all events the activity waits for when it is executing.</td>
<td>The <strong>Wait for WF Event</strong> activity has a generic <code>onUnhandledEvent</code> that tests the current event against the value that was passed to the variable. If they match, the <strong>Wait for WF Event</strong> moves the workflow forward.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Workflow stages**

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident [incident] table has an **Incident state** field that indicates progress, but the service catalog uses the **Stage** field.

To indicate the workflow’s progress through the possible stage values, the interface updates the **Stage field** selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow’s progress, as with the Service Catalog’s **Stage** field.
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the **Stage** field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of **In progress**.
- If an activity is in the **Pending** or **Completed** state, the stage reflects this state.
- If an activity is canceled, **Request Cancelled** appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

**How stage values are derived**

Stage values are derived from various sources in the interface.

ℹ️ **Note:** An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see [Workflow stage sets](#).

Stage values are derived from the following sources:

- **Choices for Stage column**: Choices defined for the column selected as the **Stage** column for the workflow.
- **Default stages for table**: Stages defined in the Stage Default [wf_stage_default] table for the table selected.
• **Workflow-specific stages**: Applied only to the workflow for which they were defined in the Workflow Stage [wf_stage] table.

• **Stage values in existing records**: Values from the designated Stage column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named **Stage**, then the progress of the workflow appears in any list view containing the Stage column.

**Stages in a list**

Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of **In progress**. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

**Example**

If the workflow table is Request Item [sc_req_item], then the stage field is automatically set to the **Stage** column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry [sys_dictionary] table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
**Note:** If an activity is cancelled, Request Cancelled appears in the **Stage** field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the **Stage** field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the **Stages** list in workflow activities.

**Note:** If you are creating a workflow with a table other than Request Item [sc_req_item], you must select a **Stage field** in the workflow properties for the workflow to have stages.

**Use workflow stages**

You can add or modify workflow stages.
Before you begin
Role required: workflow_admin, workflow_creator, or admin

Procedure

1. Navigate to **Workflow > Workflow Editor**.

2. Create a new workflow by clicking **New** or open an existing workflow.

3. In the Workflow Properties form, if the table is not the Requested Item [sc_req_item] table, select a field to display stages in the **Stage** field property. Available fields depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box. Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item [sc_req_item] table, the **sc_req_item.stage** field is defined as a workflow type field.

When displaying the stages for a workflow on the Requested Item [sc_req_item] table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an **In progress** state. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.
5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**. Again, these stage values are combined with the choices, defaults, and existing values.

![Workflow editor interface](image)

**Example: Workflow stages**

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:
• Approval
• Order
• Configure
• Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

Examples of stages added to workflow activities

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

About this task

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

Procedure

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a stage Set.
You can create a new set by clicking **New**, typing a name, and clicking **Submit**.

4. Select a corresponding **Table**.

5. Click **Submit**.

The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

### Add a stage to an existing workflow

If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

**Procedure**

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages**.
4. In the Workflow Stages list, click **New**.
5. On the Workflow Stage form, fill in the fields as appropriate.

   Do not use a **Name** or **Value** field value that already exists in the base system.

### Workflow stage fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. Publish the workflow.

### Add a stage to a workflow activity

After stages are added to a workflow, you can assign them to the workflow activities.

**Procedure**

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. Double-click the activity.

4. In the **Stage** field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.

5. Click **Update**.

**Translate workflow stages**

You can provide translations for workflow stage names so the names appear in the language selected for the instance.

**Before you begin**
The instance must already have language internationalization plugins installed. For more information, see **Activate a language**.

**About this task**
Language-specific text appears in workflow fields displayed in a list, **workflow stage sets**, and the Workflow Editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

**Procedure**

1. Set the interface language to **French**.
2. Navigate to **Workflow > Workflow Editor**.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select **Edit Stages**.
5. Edit the **Name** field for each stage and enter the text to display to French users.
   
   Do not change the **Value** field.
6. Confirm that the workflow stages display the French text.

**Results**
Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages [wf_stage] table. For example, to translate workflow stages from multiple workflows into French:
1. Set the interface language to **French**.

2. In the application navigation filter, enter `wf_stage.list`.

3. Edit the **Name** field for each stage and enter the text to display to French users. Do not change the **Value** field.

**Workflow stage sets**

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a **Stage** field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

**Updates to workflow stage values**

During an upgrade, the system makes changes to the **Value** field of records in the Workflow Stage `[wf_stage]` table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support and enable workflows to display translated text in the **Stage** field.

**Create a new stage set**

You can create a new stage set by creating a stage set record and adding stage set entries manually.

**About this task**

Create a stage set record only when you want additional stages that are not available on the table by default.
Procedure
1. Navigate to **Workflow > Stage Sets**.
2. Click **New**.
3. Enter a **Name** that indicates the purpose of the stage set.
   
   **Example**
   For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.
4. Click **Submit**.
5. Open the new stage set record.
6. In the **Stage Set Entries** related list, click **New**.
   Each stage set entry can be used as the **Stage** for an activity in a workflow that uses this stage set.
7. Enter a **Name** that indicates the stage name to appear in workflow fields.
8. Enter a **Value** to use when referencing the entry, such as in a script.
9. Click **Submit**.
10. In the **Stage Set Entries** related list, ensure that each entry has a unique **Order** value.
    Enter a low value for stages that should appear early in the workflow and a higher value for later stages.
What to do next
The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

Use a default stage set
You can assign a stage set as a default set to any number of tables.

About this task
The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

Procedure
1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a Table.
4. Select the Set you want to assign to the selected table.
5. Click Submit.

Import stages from a choice list
You can import the choice list values of a workflow field as stages for a workflow.

Before you begin
Create a choice list as follows:
- Add a custom field of Type Workflow to the table.
- Configure the custom field to use a choice list.
- If you are creating a new field, set the Choice List type to Display without --None-- and create the choices for the newly created field.

For more information, see Create a workflow stage field.

Procedure
1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Stages tab.
5. From the Stage field list, verify that the correct workflow field is selected.
6. In the Related Links section, click **Import Stages from Choice List**.
7. In the dialog box asking you to confirm that you want to import the choice list, click **OK**.
8. Click **Update**.

**What to do next**
The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

---

**Export a stage set from a workflow**
You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

**Procedure**

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Export to Stage Set**.
5. Enter a unique **Name** for the new stage set.
6. Click **OK**.

**What to do next**
The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

---

**Add a stage set to a workflow**
You can add any number of stage sets to an existing workflow.

**About this task**
When multiple stage sets have stage set entries with the same **Value**, the stage appears on the workflow only once.
Procedure

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages to open the Workflow Stages dialog box.
4. In the Related Links section, click Import from Stage Set.
5. Select the stage set.
6. Click Ok.
7. Import additional stage sets as needed for the workflow.

What to do next
After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see Add a stage to a workflow activity.

Create a workflow stage field
Workflows can provide a summary of workflow progress by updating any field of the Workflow type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Before you begin
Role required: admin

About this task
In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see Workflow stages.
To create a workflow stage field:

**Procedure**

1. Navigate to **Workflow > Default Stages (by table)**.
2. Right-click near a column header and select **Configure > List Layout**.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the **Type** set to **Workflow**.
   For detailed steps, see .
5. Click **Save**.
6. Right-click the field label and select **Configure Dictionary**.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select **Dropdown with --None--** from the **Choice** list.
9. Click **Update**.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.
   - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the **Stage field** selected in the workflow properties.
     For detailed steps about importing a choice list, see **Import stages from a choice list**.
   - The **Value** of each choice must match the **Value** of the corresponding workflow stage.
   - Do not use spaces in the **Value** field for either choices or stages. Use underscores in place of spaces.
   - Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.
     For detailed steps on defining choice lists, see .
11. To see workflow stages as icons, add the field to the list layout of the workflow table.
    For detailed steps, see .
What to do next

After you create or update the workflow field:

• Unless the workflow uses the Requested Item [sc_req_item] table, ensure that the workflow field is selected from the Stage field list in the workflow properties. For detailed steps, see Select a stage field. If a workflow uses the Requested Item table, the stage field is automatically set to the Stage field of the table and cannot be changed.

• Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

Select a stage field

A Stage field allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Before you begin

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see Create a workflow stage field.

About this task

Unless the workflow uses the Requested Item [sc_req_item] table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item [sc_req_item] table, the stage field is automatically set to the Stage field of the table and cannot be changed.

To add or edit a workflow stage field:

Procedure

1. Navigate to Workflow > Workflow Editor.
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the General tab.
5. In the Table list, verify that the table containing the workflow field is selected.
6. Click the Stages tab.
7. From the Stage field list, select the workflow field.
8. Click Update.
Display approvers in workflow stage fields

Enable workflow stage fields to display approvers, change the number of approvers to display, or disable displaying approvers.

Before you begin
Role required: admin

About this task
By default, only workflow stage fields that use the Workflow-driven renderer can display a list of approvers. Only these workflow stage renderer types support displaying approvers.

- Linear renderer
- Main flow renderer
- Workflow-driven renderer

Procedure

1. Navigate to Workflow > Administration > Properties.
   The system displays the Workflow Properties page.

2. Set the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of approvers to show if approvers are displayed for workflow stages. Only valid for supported list v2 renderers. glide.workflow.renderer.show_approver_limit | Sets the maximum number of approvers to display within a workflow stage field. The system displays an ellipsis character when there are more approvers than the display limit allows.  
  - Type: integer  
  - Default value: 5 |
| Show approvers when displaying workflow stages with the Linear renderer. glide.workflow.renderer.linear.show_approver | Enables (true) or disables (false) the Linear renderer to display approvers.  
  - Type: true | false  
  - Default value: false |
<p>| Show approvers when displaying workflow stages with the Main flow renderer. | Enables (true) or disables (false) the Main flow renderer to display approvers. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.workflow.renderer.mainflow.show_approver | - Type: true | false  
  - Default value: false |

Show approvers when displaying workflow stages with the Workflow-driven renderer.

| glide.workflow.renderer.workflowdriven.show_approver | Enables (true) or disables (false) the Workflow-driven renderer to display approvers.  
  - Type: true | false  
  - Default value: true |

3. Click **Save**.

4. Add stages to workflows that have associated workflow stage fields.

   **Note:** If you add stages to a subflow, the parent workflow must also have stages.

5. For each approval activity you want to display approvers, select a **Stage** value.

**Example**

For example, the sample workflow **Service Catalog Item Request** has two approval activities. The first **Approval - User** activity has a **Stage** value of **Dept. Head Approval**. The second **Approval - User** activity has a **Stage** value of **CIO Approval**.

**Results**

The workflow stage field renderers you enabled display approvers up to the approver display limit. For example, a Workflow-driven stage field displays up to five approvers when the workflow reaches an approval stage.

**Workflow stage field icons and tooltips**

A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Current active step</td>
</tr>
</tbody>
</table>
### Workflow field icons (continued)

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Approval pending</td>
</tr>
<tr>
<td>✗</td>
<td>Approval rejected</td>
</tr>
<tr>
<td>✔</td>
<td>Complete</td>
</tr>
<tr>
<td>✗</td>
<td>Late (Change/Request) or Canceled (Catalog)</td>
</tr>
<tr>
<td>🔄</td>
<td>Skipped (Catalog only)</td>
</tr>
</tbody>
</table>

#### Stage tooltips

Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.

#### Stage renderers and tooltip behavior

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
<tr>
<td>Other renderers</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>
Stage renderers and tooltip behavior (continued)

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Waiting for Approval by Eric Schroeder</strong></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Waiting for Approval by Eric Schroeder" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Waiting for Approval by Eric Schroeder (In progress)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Dept. Head Approval (Pending - has not started)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="CIO Approval (Pending - has not started)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Order Fulfillment (Pending - has not started)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Backordered (Pending - has not started)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Deployment (Pending - has not started)" /></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Completed (Pending - has not started)" /></td>
<td></td>
</tr>
</tbody>
</table>

If you do not want the approver’s name included in the tooltip, navigate to **System Properties > Service Catalog** and clear the **Show the current pending approver’s name in the stage widget mouseover** check box.

**Property for displaying pending approver’s name**

- **Show the current pending approver’s name in the stage widget mouseover**
  - Yes | No

**Workflow stage renderers**

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

*Note:* Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.

**Workflow-driven**

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are
displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

**Note:** If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

**Main flow**

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The **Stage order** field on the **Stages** tab has two options:

- **Computed** uses the actual workflow path in order
- **User-specified** uses the order specified in the **Order** column on the Workflow Stages record

**Linear**

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more Condition Workflow activities. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer
leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.

The linear renderer displays all these stages in one workflow field. The parent workflow specifies the **Waiting for approval**, **Fulfillment**, and **Completed** stages. The subflow specifies the **Delivery** and **Waiting for Task**, and **Delivery OK** stages.

**Progress bar**

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.

The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:
• Computed uses the actual workflow path in order
• User-specified uses the order specified in the Order column on the Workflow Stages record

**Workflow field progress bar**

<table>
<thead>
<tr>
<th>Stage</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the `WorkflowIconsSCR` script include to define which icons to use, add the attribute `icons=WorkflowIconsSCR` to the Attributes field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute `icons=WorkflowIconsStages`.

The legacy renderer works with all tables except the Requested item `[sc_req_item]` table. In this case, use the requested item renderer instead.

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested Item `[sc_req_item]` table.

Only in Now Mobile, default stage renderer is used.

**Select a stage renderer**

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

**Before you begin**

Consider the following when selecting a stage renderer:
• Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.

• Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.

### Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linear</td>
<td>• The parent workflow and all subflows must modify the same current record.</td>
</tr>
<tr>
<td></td>
<td>• In the properties for all subflows, the <strong>Stage field</strong> value for all subflows must match that of the parent workflow.</td>
</tr>
<tr>
<td></td>
<td>• The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.</td>
</tr>
<tr>
<td></td>
<td>• On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.</td>
</tr>
<tr>
<td>Main flow</td>
<td>• The workflow contains subflows.</td>
</tr>
<tr>
<td></td>
<td>• You do not want or need to reveal the details about the subflows.</td>
</tr>
<tr>
<td>Progress bar</td>
<td>• The workflow properties must have a <strong>Stage ordering</strong> value of <strong>User-defined</strong></td>
</tr>
<tr>
<td></td>
<td>• There must be workflow stages within the workflow.</td>
</tr>
<tr>
<td></td>
<td>• Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the <strong>Value</strong> and <strong>Order</strong> fields.</td>
</tr>
</tbody>
</table>

### About this task

To select a stage renderer:
Procedure

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage rendering** list, select a stage renderer.
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click **Update**.

**Workflow fields with deleted records**

Workflow fields may indicate when a record required by the workflow is deleted. After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see .

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

**Workflow validation**

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.
Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

**Highlighting critical errors**
The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

![Validate missing subflow](image)

**Validations at publishing**
If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

**Validation warning**
A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:
• You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.

• A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.

Validation failure
A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Workflow validation report
Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Workflow validation report

Header summary

The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary**: The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed**: The total number of validations run is also broken down to show the number at each notification level.

Report columns

The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

Workflow termination and external dependencies levels

<tbody>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

### Message

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see [Validate a workflow](#).

### Workflow validator

ServiceNow offers several workflow validators for workflow designers to test their workflows.

This page lists all available workflow validators. See [Workflow validation](#) for information on using workflow validators and the workflow validation report to see the type of information that is returned.

**ValidateTransitionOut**

The **ValidateTransitionOut** validator finds activity conditions with no exit transitions.

**Validation summary**

- **Risk**: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: All conditions have transitions.
- **Invalid Result**: Invalid
- **Invalid Message**: This workflow contains <condition count> activity conditions without an output transition.
• **Suggested Action:** If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.

• **Publishable:** Yes

• **Runnable:** Yes

• **Related Information:** None

**Troubleshooting**

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the **Notification** and **Timer** activities both execute at the start of the workflow. The **Timer** is the entity that decides when the workflow ends. In this situation, executing the **Notification**, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the **Notification** activity as a **Warning** that the designer can ignore.

![Condition with no valid transition](image)

In the second example, the **Notification** activity has no exit transition. The designer missed this because of the layout. The transition from the **Timer** activity passes behind the **Notification** activity and appears to connect the exit from the **Notification** activity to the **End**. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow's designer intended for the **Notification** activity to transition to the **End**.
No condition out

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

ValidateTransitionIn

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

Validation summary

• Risk: Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.

• Purpose: Find activities that do not have inbound transitions.

• Severity Level: Warning.

• Valid Result: Valid.

• Valid Message: All activities in this workflow have at least one inbound transition.

• Invalid Result: Invalid.

• Invalid Message: This workflow contains <activity count> activity conditions without an input transition.

• Suggested Action: Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.

• Publishable: Yes

• Runnable: Yes

• Related Information: None

Troubleshooting

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.
This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.

**ValidateDanglingTransition**

The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

⚠️ **Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

⚠️ **Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- **Risk:** A workflow with dangling transitions will silently hang a workflow with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** Valid
- **Invalid Result:** Invalid
- **Invalid Message:** Invalid
• **Suggested Action:** Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.

• **Publishable:** No

• **Runnable:** No

• **Related Information:** None

**Troubleshooting**

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the `ValidateDanglingTransition` validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record's transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record's workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.

2. Navigate to **Workflow > Administration > Workflow Version**.

3. In the list of workflow versions, select the workflow that has the faulted transition.

4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity--Workflow Version** from the Available list to the Selected list, and click **Save**.

5. In the **Workflow Activities** related list, select the activity cited in the validator.

6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.

7. Delete this transition.

8. Return to the workflow version and re-run the validation check.

The **Critical** warning should disappear. The workflow should execute as expected on the next appropriate transaction.
ValidateSubflows

The ValidateSubflows validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

⚠️ Warning: This is a critical error that prevents a workflow from running.

Validation summary

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains <count> valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains <invalid count> invalid subflow(s) of <total subflow count> total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.

- **Publishable:** No
- **Runnable:** No
- **Related Information:** Workflows used as subflows

Troubleshooting

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the ValidateSubflows validator is when a workflow:
• Is checked out to User A.
• Is a subflow in a parent workflow being run by User B.
• Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record's transaction. Instead, a critical log entry detailing the subflow's state is added to the current workflow's Workflow Context record. To correct the problem, remove the subflow from the main flow, or publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

• Is a subflow in a parent workflow being run by any user.
• Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

Note: You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

Validation summary

• Risk: At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
• Severity Level: Warning
• Valid Result: Valid
- **Valid Message**: The JavaScript in this workflow has no instances of 'current.update()'.
- **Invalid Result**: Invalid
- **Invalid Message**: This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
- **Suggested Action**: Remove `current.update()` from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
- **Publishable**: Yes
- **Runnable**: Yes

**Problems with `current.update()` in workflow scripts**

A workflow initiates execution in one of these ways:

- **Script Engine**: If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.

- **Script**: Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling `startFlow()`.

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the `update()` of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls `current.update()` on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on `update()` on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.
Troubleshooting

This validator detects the use of `current.update()` in any of the editable script fields. Do not call `current.update()` from within a workflow script. In the event of an INSERT or UPDATE of `current`, the changes made to `current` are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of `current` to the engine. Use the scripts only for setting and referencing the current field values.

**ValidateLowestCommonTable**

The **ValidateLowestCommonTable** validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item [sc_req_item] table is the lowest table in a workflow containing a **Catalog Task** activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

⚠️ **Note:** This validator provides information only. It does not indicate an error or warning condition.

**Validation summary**

- **Risk:** This validator informs only and has no risk associated with it.
- **Severity Level:** Data/Information
- **Valid Result:** Valid
- **Valid Message:** The lowest common table in this workflow is <<table_name>>.
- **Invalid Result:** N/A (informational only)
- **Invalid Message:** N/A (informational only)
- **Suggested Action:** None
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

**ValidateTableChange**

The **ValidateTableChange** validator reports any activities in the workflow that are invalid given the table associated with the workflow version.
For example, a workflow version that is associated with the Change Request [change_request] table but has a Catalog Request activity on the canvas is invalid, since the activity is not compatible with the selected table.

Validation summary

- **Risk:** If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- **Severity Level:** Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- **Valid Result:** Valid
- **Valid Message:** All activities are valid for the newly selected table
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- **Suggested Action:** Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

Troubleshooting

Navigate to **Workflow > Administration > Activity Definitions.** Note the **Table** column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.

When a workflow is set to the Global [global] table, it is possible that the process executing the workflow ensures that the current record meets the requirements
of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

**ValidateParentFlow**
The **ValidateParentFlow** validator reports any workflows that use the workflow as a subflow.

**Validation summary**
- **Risk:** There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Currently <workflow version name> is not a subflow.
- **Invalid Result:** None
- **Warning Message:** This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
- **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflows used as subflows

**Troubleshooting**
The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:
• Changing the data types of **input variables**. Verify that all parent workflows cited in this validation report can pass the correct value type.

• Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.

• Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.

• Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

**ValidateSingleEnd**

The **ValidateSingleEnd** validator finds and identifies multiple **End** activities in a single workflow.

Multiple **End** activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

**Validation summary**

- **Risk:** If the execution paths to the **End** activities are not mutually exclusive, then the first **End** encountered completes the workflow and cancels all other executing activities.

- **Severity Level:** Warning

- **Valid Result:** Valid

- **Valid Message:** This workflow contains 1 End activity.

- **Invalid Result:** Invalid Activity

- **Invalid Message:** This workflow contains <count of ends> End activities.

- **Suggested Action:** Remove extraneous **End** activities that are not intended as part of the design.

- **Publishable:** Yes

- **Runnable:** Yes

- **Related Information:** None
Troubleshooting

As soon as an End activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second End activity that is still executing. Those executing activities are canceled as part of the End activity's clean up actions. Therefore, the results of designing workflows with multiple Ends must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple End activities. In the following example, the paths to the two Ends are mutually exclusive execution paths. If this was a large workflow, with many activities between Branch and the second End, the value of the multiple ends becomes apparent. Tracing a No response from User is invalid to a single End behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the End after the Notification activity terminates the workflow.

Mutually exclusive execution paths

The next example has multiple End activities in execution paths that are not mutually exclusive. A Yes response from User is valid causes the Set Values activity to finish immediately. By reaching its End activity first, this execution path cancels the Approval for Apps and the DB Task activities, which might not be the desired outcome. If the paths are all expected to complete before End, the activities should come to a Join (as in the previous example) that transitions to a single End.
Mutually inclusive execution paths

![Diagram of workflow execution paths]

**Note:** To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

**ValidateUpdateSetDependencies**

The ValidateUpdateSetDependencies validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see Create and select an update set.

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.

- **Severity Level:** Warning

- **Valid Result:** Valid

- **Valid Message:** There were no Update Set dependency issues found.

- **Invalid Result:** Invalid
• **Invalid Message**: This workflow has dependent workflows that are in a different update set.

• **Suggested Action**: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  ◦ Ensure that all update sets migrate concurrently.
  ◦ Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

• **Publishable**: Yes
• **Runnable**: Yes
• **Related Information**: Workflow movement with update sets

**Troubleshooting**
A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

• A published subflow is in a different update set than the parent workflow and that update set is In progress.
• A subflow is checked out by another user, who is working in a different update set than the current user.

⚠ **Note**: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

**Example**
Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

**Solution 2**

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to **System Update Sets > Local Update Sets**.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the **Customer Updates** related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the **Update set** field.
• If this field is not on the Customer Update form, configure the form and add the field.

6. Click Update.
   • The base system moves the dependent subflow to the update set selected.

7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

**ValidateUpdateSetParentDependencies**

The ValidateUpdateSetParentDependencies validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

**Validation summary**

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.

- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets
Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

• A published subflow is in a different update set than the parent workflow and that update set is In progress.
• A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:

1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:

1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
Risks

• User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.

• User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   • This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see System update sets.

Solution 2

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   • If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   • The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.
ValidateInputVarUpdateSetDependencies

The **ValidateInputVarUpdateSetDependencies** validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently **in progress**.

**Validation summary**

- **Risk:** Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.

- **Purpose:** Determine whether input variables that belonged to this workflow were deleted in a different update set.

- **Severity Level:** Warning

- **Valid Result:** Valid

- **Valid Message:** There were no Input Variable Update Set dependency issues found.

- **Invalid Result:** Invalid

- **Invalid Message:** There are input variables that have been deleted and logged in a different update set.

- **Suggested Action:** If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.

- **Publishable:** Yes

- **Runnable:** Yes

- **Related Information:** Workflow movement with update sets

**Troubleshooting**

Workflow input variables get individual entries in the **Customer Update** related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for **Input variable removal** when the validator issues this warning.
ValidateWorkflowEndStages

The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- **Risk:** The stage indicator will not show the workflow is completed.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow end stages are valid.
- **Invalid Result:** invalid
- **Invalid Message:** End activity A found with invalid stage "S."
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

Troubleshooting

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

ValidateWorkflowStageColumn

The ValidateWorkflowStageColumn validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

Validation summary

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** Warning
- **Invalid Message:** Workflow stage values are invalid.
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Stage warnings found.
• Invalid Messages:
  ◦ Table T does not have a column named C.
  ◦ Workflow for table T has stages, but no stage column.
  ◦ Table T has a stage column "C," but no stages are set by activities.
  ◦ Workflow on table T has stage column "C" that is not type=workflow.

• Suggested Action: If this is not by design, make the appropriate changes.

• Publishable: Yes

• Runnable: Yes

• Related Information: Workflow activities, Workflow stages

Troubleshooting
To check the stage column:
1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting Properties.
3. View the Stages tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

ValidateWorkflowStateValues
The ValidateWorkflowStateValues validator checks a number of stage aspects in workflow activities for correctness.

This validator has multiple possible error messages.

Validation summary
• Risk: The stage indicators may not display appropriate information.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: Workflow stage values are valid.
• **Invalid Result:** invalid

• **Warning summary:** Stage warnings found.

• **Invalid Messages:**
  ◦ Stage with empty name is not allowed.
  ◦ Stage with empty value is not allowed.
  ◦ Cannot have more than one stage with the same name: x.
  ◦ Cannot have more than one stage with the same value: y

• **Suggested Action:** If this is not by design, make the appropriate changes.

• **Publishable:** Yes

• **Runnable:** Yes

• **Related Information:** Workflow activities

**Troubleshooting**
Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.

2. Open the list of stages for the workflow by clicking the menu icon and selecting **Edit Stages**.

3. Check the names and values.
   
   Ensure that the names and values are unique and are not empty.

4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Validate Workflow State Values

Workflow State Values

| Workflow Stages [Auto-ordered stages view] | New | Go to | Name | Search | L to 3 of 3 |  
|---|---|---|---|---|---|---|
| Request Cancelled | Closed Incomplete | closed_incomplete |  
| Closed Incomplete | complete |  

**Tip:** Make a list of which activities assign which stages.

**Workflow concepts**

You can do many things using the Workflow Editor.

- Modify core activities and exit conditions.
- Create custom activities and reuse the data for other workflows.
  See Orchestration activity designer.
- Download activity packs from the ServiceNow Store and create packs for upload.
- Edit workflows graphically.
- Define transitions between workflow activities.
- For the table that corresponds to the workflow, customize business rules.
- Summarize workflow progress through stages.
- Validate workflows to identify potential problems.
- Publish workflows for other users.
- Edit multiple tables without needing to directly modify them.
Workflow versions

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

Note: Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other’s workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

Workflow scope

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the Workflow Editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

Note: Any script that is created in the Workflow Editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in
any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

⚠️ **Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

### Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.

See Application scope.

For information on how to configure the scope for a workflow, see Workflow properties.
Domain separation and Workflow

Domain separation is supported in the Workflow application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

Overview

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

How domain separation works in the Workflow application

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- Workflow [wf_workflow] and Workflow Version [wf_workflow_version]: used for delegated administration or process separation.
- Workflow Context [wf_context]: used for data separation.

Note: The Workflow Version table [wf_workflow_version] table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The Workflow Editor displays a workflow’s domain in the title bar after the workflow name.
Related information

Domain separation for service providers

Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow records in the Workflow [wf_workflow] and Workflow Version [wf_workflow_version] tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user's domain. This new version is a unique record in the Workflow [wf_workflow] table. After the user publishes this new workflow, other users in the child domain use the new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow.

Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request -
Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

**Workflow permissions**

When a user starts a new workflow, the workflow runs with that user's domain and credentials.

The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

**Workflows and data separation**

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.

Workflow records in the Workflow Contexts [wf_contexts] table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user

in a parent domain can see running workflows in a child domain, a user in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other's service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request's approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The **Run after bus. rules run** workflow property defines if a workflow is **Default** or **Deferred**.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see.
Workflow engine order diagram

Before business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update()

Before business rules (order >=1000)
Do not use current.update()

Database operation (insert, update, delete)
The current record is inserted or updated at the end of the database operation.

After business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()

After business rules (order >=1000)
Always use current.update().
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance.

Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow > Administration > Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables.

Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Column Renderer [column_renderer]</td>
<td>Tracks different versions of element definitions [wf_element_activity].</td>
</tr>
<tr>
<td>Workflow [wf_workflow]</td>
<td>The primary records of workflows.</td>
</tr>
<tr>
<td>Workflow Binding [wf_workflow_binding]</td>
<td>History of workflows run and the triggering record. Workflow Binding records prevent the system from running workflows again when the associated Workflow Context record has been deleted.</td>
</tr>
<tr>
<td>Workflow Context [wf_context]</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow Execution [wf_workflow_execution]</td>
<td>Synthetic &quot;current&quot; records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Instance [wf_workflow_instance]</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Version [wf_workflow_version]</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Activities</td>
<td></td>
</tr>
<tr>
<td>Activity Variables [wf_activity_variable]</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Workflow Activity [wf_activity]</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity Definition [wf_activity_definition]</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Executing Activity [wf_executing]</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
<tr>
<td>Workflow components</td>
<td></td>
</tr>
<tr>
<td>Element Provider [wf_element_provider]</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Variable [item_option_new]</td>
<td></td>
</tr>
<tr>
<td>Workflow Condition [wf-condition]</td>
<td>All of the defined conditions in workflows.</td>
</tr>
</tbody>
</table>
### Workflow tables (continued)

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow Queued Command [wf_command]</td>
<td>Temporary internal storage for workflows that are currently executing.</td>
</tr>
<tr>
<td>Workflow SC Variable [wf_variable]</td>
<td>The Service Catalog variables for a workflow.</td>
</tr>
<tr>
<td>Workflow Schedule [wf_workflow_schedule]</td>
<td>Definitions of the times to run specific workflows.</td>
</tr>
<tr>
<td>Workflow Transition [wf_transition]</td>
<td>All of the defined transitions in workflows.</td>
</tr>
<tr>
<td>History</td>
<td></td>
</tr>
<tr>
<td>Workflow Activity History [wf_history]</td>
<td>The history of executed activities.</td>
</tr>
<tr>
<td>Workflow Log Entry [wf_log]</td>
<td>All of the events and history of the workflow.</td>
</tr>
<tr>
<td>Workflow Transition History [wf_transition_history]</td>
<td>The history of executed transitions.</td>
</tr>
<tr>
<td>Stages</td>
<td></td>
</tr>
<tr>
<td>Stage Default [wf_stage_default]</td>
<td>Definitions of default stage fields for tables to use.</td>
</tr>
<tr>
<td>Stage Set [stage_set]</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry [stage_set_entry]</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table [stage_set_table]</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>
</tr>
<tr>
<td>Workflow Stage [wf_stage]</td>
<td>Definitions of stages used by workflows.</td>
</tr>
</tbody>
</table>
**Workflow administration**
Tailor workflows exactly the way you want them.

**Workflow roles**
Certain roles are required to use workflows.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator [activity_creator]</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>Web service administrator [web_service_admin]</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>Workflow administrator [workflow_admin]</td>
<td>Creates, edits, publishes, and deletes graphical workflows.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.</td>
</tr>
<tr>
<td>Workflow creator [workflow_creator]</td>
<td>Creates new graphical workflows.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Granting this role to a user is equivalent to giving the user the admin role, because workflow Script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.</td>
</tr>
<tr>
<td>Workflow publisher [workflow_publisher]</td>
<td>Publishes graphical workflows.</td>
</tr>
</tbody>
</table>
Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error) is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

Viewing a workflow context

Workflow contexts can be found in two places:

- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow > All Contexts and selecting an active context.

Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.

- Show Timeline displays the workflow context as a timeline.
- Show Workflow displays the workflow context in the graphical Workflow Editor.

Graphical interface

To view the workflow context in the graphical Workflow Editor interface, click the Show Workflow link from either the workflow context record or the current record.
In the top right hand corner are two controls:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="refresh_icon.png" alt="Refresh" /></td>
<td>Refreshes the workflow context.</td>
</tr>
<tr>
<td><img src="help_icon.png" alt="Help" /></td>
<td>Displays a key of the colors used in the workflow to denote the state of activities and transitions:</td>
</tr>
</tbody>
</table>

**Execution order**

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In **Workflow > Live Workflows > Active Contexts** or **All Contexts**, Open the context you want to examine. Click **Show Workflow**, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context **State** to **Canceled**. To cancel an executing workflow, you can use the `cancelContext(context)` script. You can define an `onCancel` script to clean up unresolved workflow activities.

**About this task**

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

**Procedure**

1. Navigate to **Workflow > Active Contexts**.
2. Select a workflow context record.
3. Select the **Cancel** related link.
   A confirmation window appears.
4. Click OK.
   The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

If the workflow does not respond to the cancel command, the Force Cancel window appears.

5. Click Force cancel to interrupt the thread the workflow is actively executing or click Continue waiting to continue waiting for the workflow to cancel gracefully.

⚠️ Warning: Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.
Cancel a workflow with the `cancelContext(context)` script

To cancel an executing workflow, you can use the `cancelContext(context)` script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

**About this task**
For more information, see the API reference.

Define an on-cancel script

Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user's cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The sys_id of the workflow context is available in this script using the `context_sys_id` variable.

**About this task**
On-cancel scripts run asynchronously from the global scope. Your instance workload determines when the system schedules and runs the on-cancel script.

**Important:** Since the system runs on-cancel scripts from the global scope, they cannot call or run scoped script includes.

**Procedure**

1. Navigate to **Workflow > Workflow Versions**.
2. Select a workflow version that you have checked out. Workflow versions that are not checked out are not editable.
3. Edit the **On-cancel script** field. You may need to configure the form to add this field.
4. Click **Update**.

**Example:**
This example script adds a comment to a Requested Item [sc_req_item] record indicating the workflow for that request has been canceled.

```javascript
var grContext = new GlideRecord("wf_context");
grContext.get(context_sys_id);
var grReq = new GlideRecord("sc_req_item");

// The current record may not exist, make sure it exists before modifying it.
if (grReq.get(grContext.id)) {
```

Scheduling a workflow

In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.

Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow > Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Daily</strong>: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Weekly</strong>: On a particular day of the week.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
|               | • **Monthly**: On a particular day of the month  
|               | • **Periodically**: After every set duration.  
|               | • **Once**: At one specific date and time.  
| Time          | For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.  
| Day           | For weekly scheduled workflow, the day of the week to run the workflow.  
|               | For monthly scheduled workflows, the day of the month to run the workflow.  
| Repeat Interval | For periodical workflows, the interval between workflows, beginning from the **Starting** date and time.  
| Starting      | For periodical workflows, the first date and time to run the workflow.  
|               | For scheduled workflows run once, the date and time to run the workflow.  

**Related information**

**Workflow movement with update sets**

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the **workflow is published**, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow [wf_workflow] record and only retain the latest version with the update type of Workflow.

For information about update sets, see [System update sets](#).

**Workflow update set migration use case - simple**

Create a new workflow with no dependencies and then migrate the workflow in an update set.
1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.

   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

**Workflow update set migration use case - subflow dependency (success)**
Successfully edit and migrate an existing workflow and its dependent subflow.

1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.

   Assume that Workflow B was previously published and migrated to the production instance.

4. User A publishes Workflow A.

   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.

**Workflow update set migration use case - subflow dependency (failure)**
Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.
1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published, but has not been migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.
5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:
   Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.
   To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies.

Workflow update set migration use case - subflow dependency (risk)
Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a **User ID**.

   † **Note:** Assume that Workflow B was previously published and migrated to the production instance.

4. User A uses the return value of Workflow B to generate approvals.

5. User B selects Update Set D.

6. User B checks out Workflow B (the subflow in Workflow A).

7. User B modifies the return value of the workflow by changing it from a **User ID** to a **String Message**.

8. User A publishes Workflow A.

   † **Note:** A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.

9. User A cancels publishing and **validates** Workflow A.

10. User A is warned that Workflow B was modified by a user in a different update set.

11. User A ignores this warning and publishes Workflow A.

   † **Note:** A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.

12. User A completes Update Set C and migrates it to the production instance.

13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.

14. User B publishes Workflow B.

   † **Note:** User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See `ValidateUpdateSetDependencies` to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.
1. Note: A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.
17. Update Set D commits without warnings.
18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

**Input variable movement**

You can add input variables to existing workflows and add them to update sets.

When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables [var_dictionary] table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

**Input variable movement use case - two input variables**

An existing workflow already contains two input variables.

1. User A checks out the workflow.
2. User A adds two input variables.
   ServiceNow adds to the current update set one customer update record for each new variable.
   The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.
3. User A publishes the workflow.
   There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.
4. Verify variables included in a specific workflow.
5. User A completes the update set.
6. Adding Input Variables - Success
User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.

- The two existing input variables are already present because of the earlier version.
- The system adds the two new input variables when the user commits the update set.
- The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
- The new published workflow version uses all four variables.
- The user tests the new workflow version and it runs as expected.

Verify variables included in a specific workflow

You can verify the variables that are included in a specific workflow.

Procedure

1. Navigate to System Update Sets > Local Update Sets.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the XML Payload.
5. Search for the name of one of the columns or search for var_dictionary.
   There is one var_dictionary entry for each input variable.

Input variable removal

Deleting workflow input variables, like insert and update actions, creates a customer update record in a user’s current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

Input variable removal risk

An existing workflow already contains two input variables.
1. The workflow was migrated to a production instance with the two variables.

2. On a development instance, User A selects Update Set A and checks out the workflow.

3. User A removes one input variable and all references to it in the workflow.

   The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.

4. User A continues working on other features in Update Set A that need to be moved to production.

5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.

   The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

Input variable removal solution

When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see System update sets.

Note: If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.

Input variable removal prevention

Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See ValidateUpdateSetDependencies for more details.
Avoiding duplicate workflows

Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

Commit a workflow in an update set

Follow the steps in this page to commit a workflow in an update set.

Procedure

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.
   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

Update set migration example

It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.
   A customer update record is added to Update Set B with the Version 2 payload.
   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.
6. Workflow A - Version 3 is published in Update Set C.
A customer update record is added to Update Set C with the Version 3 payload.

A customer update record is added to Update Set C with the Version 2 workflow left unpublished.

7. Update Set C is completed.

8. Update Set C is migrated and committed to the production instance.
   Workflow A - Version 1 is set to unpublished.
   Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
   Workflow A - Version 3 is committed and becomes the only published version of the workflow.

Update set migration risk
Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.
3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

Workflow timelines
The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

Note: Workflow timelines reflect context history only and are not real-time gauges of workflow activity.
Use a timeline

By default, the timeline displays all activities and transitions requested when first opened.

About this task

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

Procedure

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.

The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.

4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max.
5. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.

   a. Move the slider from right to left to view all the spans on a long timeline.

   b. Adjust the end points of the slider to make arbitrary changes to the magnification.

      A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree.

   Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity.

   This action highlights the activity in the activity pane.

9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.
10. Double-click a span to display a history record for that activity. History records shows information such as the State and the starting and ending times.

Timeline for a selected activity
You can display a partial workflow timeline.

Procedure
1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Open a Workflow Context record.
3. On the Workflow Activity History related list, select one or more individual activities.
4. Click Show Timeline from the action menu.
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow's context with the parent workflow context.
   
a. Navigate to Workflow > Live Workflows > History.
   
b. Select individual history items from the list.
   
c. Select the Show Timeline option from the actions menu.

   History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is Multiple Contexts. The timeline draws only the activities and relationships of the history items selected.

**View subflows in a workflow timeline**

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.

**Workflow error handling**

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.
In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification

**Available error information**

This table shows which activities support error exits.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Workflow log</th>

</table>

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

![Image of a red banner with activity details]

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling for the information available to each activity.

![Tool tip image]

Execution order

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to Workflow > Live Workflows > Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click **Show Workflow**.

4. Hover the cursor over a finished or executing activity.

A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.

![Activity execution order](image)

**Workflow log**

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to **Workflow > Administration > Properties** and enable the **Log workflow debug messages** property.

In this example, an SSH activity named File Read specifies an invalid MID Server.
If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the **Workflow Log** related list. The message displays the target IP address and the credential details.

### Credential debugging in the workflow log

![Credential debugging in the workflow log](image)

**Create an error condition exit**

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

**Procedure**

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select **Add condition** from the context menu.
4. Add a condition exit with the following values:
• Name: Error
• Condition: `activity.state=='faulted'`

5. Click Submit.

The Error exit appears on the activity.

6. Connect the Error exit to another activity for handling the error state, such as Notification or Log Message.

Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.

About this task

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as Skipped, which can appear to be an Approved state. To prevent this from happening, reconfigure the Approved exit as follows:

Procedure

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the Approved exit.
3. Add the following script to the Condition field:

   ```javascript
   && activity.state != 'faulted'
   ```

   This prevents the activity from continuing down the normal path in an error state and ensures that Skipped or Approved is the desired state.
4. Click Update.
Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties.

You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.

About this task

For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

Procedure

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Properties.
4. In the Workflow Properties dialog box, click the Estimated Runtime tab.
5. To enable the collection of run time metrics, check that the Requires ERT option is selected.
6. Open a configuration from the Estimated Run Time column.
7. In Estimated Run Time, enter an initial estimate for the workflow’s run time.
   The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the Outlier Percentage Threshold for ERT field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   The system uses a default value of 20.
9. Click Update.
**Outlying workflow run times**

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the *Estimated Run Time* and *Outlier Percentage Threshold for ERT* values in the workflow properties. These values are used in the following formulas.

### Formulas for computing workflow outlier ranges

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100) = 2 seconds</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

### Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated.

The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a GlideDateTime.

For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value (CRA)</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>

<td>11 seconds</td>
</tr>
</tbody>
</table>
Data point | Latest value | Cumulative running average (CRA) | CRA after rounding to the nearest second  
---|---|---|---
3 | 9 seconds | 10.333 seconds | 10 seconds

**Note:** Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

**Workflow pause utility**

Workflow Pause Utility provides functionality you can use to pause or resume all workflow contexts, a subset of qualified workflow contexts, or individual workflow contexts. You designate the data and time of day at which the paused workflows should resume, and can manually resume individual workflows as needed.

Once activated, the Workflow Pause Utility plugin (com.glideapp.workflow.pause) updates several tables when you pause or resume workflows. Each table stores specific data related to each paused or resumed workflow.

**wf_pause_request**

Records every workflow pause request. The system automatically updates and inserts records in this table whenever you pause workflow contexts. It tracks user-specified resume time, whether the pause request is still active, and the total number of workflow activities that paused or resumed.

**wf_pause_status**

Records the status of each workflow context you pause. When you pause workflow contexts, the plugin waits until the current executing activity finishes, and pauses it before the next activity starts. It tracks the specific activity on which the workflow context was paused and whether it has resumed. If the workflow is paused, it tracks the time at which it is scheduled to resume.

**wf_pause_group_request**

Pauses the specific set of workflow contexts you designate using filtering in Group Pause Requests. You can manually pause all currently active workflows by clicking the Pause All check box.

**wf_pause_snapshot**
Before pausing and after resuming a workflow, the table records a snapshot of the current state of the workflow context. The table also records the state of the currently executing activity on the paused workflow context.

**Use examples**

When you take down an instance for maintenance, you can pause all or selected active workflow contexts, and then resume them after you complete the maintenance.

You have an integration workflow context that hits an internal service that is down for maintenance. You can pause all instances of that workflow context from progressing to the next activity, allowing time for the internal service to be restored. Then, the paused workflow contexts can be resumed.

**Activate workflow pause utility**

You can activate the Workflow Pause Utility plugin (com.glideapp.workflow.pause) if you have the admin role. This plugin may include demo data and activates related plugins if they are not already active.

**Before you begin**

Role required: Workflow_admin or workflow_publisher, workflow_creator

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note**: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the *global* domain. Otherwise, the following error appears: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>*.

**Related information**

[List of plugins](#)
Pause and resume individual workflows

To pause individual workflow contexts, specify the date and time of day at which the workflow context should resume. When a workflow context is paused, the system saves basic information about the pause request, such as the resume date and time, in the wf_pause_request table. A workflow context automatically resumes at a specified date and time of day, but paused workflow context can be manually resumed as needed.

Before you begin
Role required: Workflow_admin or workflow_publisher, workflow_creator
Install and activate the Workflow Pause Utility plugin.

Procedure
1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select the individual workflow context you are pausing.
   Workflow Context appears.
3. In Related Links, click Pause.
   A Workflow Pause Inputs dialog appears.
4. In the Workflow Pause Inputs dialog:
   a. Click to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow should resume. You can select the current date or future date, but you must enter a time of day in the future. For example, to pause the workflow context at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.
   b. Click when finished.
   c. The selected date and time of day appear in the Resume At field.
   d. Click OK to return to Workflow Contexts.
      The selected workflow is now paused. Use Workflow pause request to monitor its status.
5. Paused workflows resume on the date and time of day specified in the Resume At field. To manually resume a currently paused workflow context:
a. Navigate to **Workflow > Live Workflows > Active Contexts.**

b. Select the individual workflow context you are pausing. **Workflow Context** appears.

c. In **Related Links**, click **Resume**.

**Pause and resume all or multiple workflows**

Use Workflow Pause Group Requests to pause, or resume, groups of workflows, or all active workflows. If pausing a group of workflows, use filtering functions to select the workflows. If pausing all active workflows, select the Pause All check box to indicate that all currently active workflows should be paused.

**Before you begin**

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

**Procedure**

1. Navigate to **Workflow > Operations > Group Pause Requests.** **Workflow Pause Group Requests** appears and displays existing workflow pause group requests.

2. Click **New**.

   **Workflow Pause Group Request** appears, and assigns a workflow pause group request ID.

3. To pause all active workflows, select **Pause All**, then click **Update**. To pause a filtered group of active workflow contexts, skip this step.

   All currently active workflow contexts in the instance are paused until you resume them. Use **Workflow pause request** to monitor their status.

4. To pause a filtered group of active workflow contexts, use the **Filter** field, specify the conditions for the search, then click **Update**.

   **Workflow Pause Group Requests** appears, and displays the results of the workflow group search. It assigns a workflow pause group request ID and indicates if the group is active (true = paused) or inactive (not yet paused).

5. To update, resume or delete a specific workflow pause group request, select it.

   **Workflow Pause Group Request** appears, and displays the selected workflow pause group request.

6. If the selected workflow pause group request is active (paused), and you do not want to pause it, click **Do Not Pause Incoming Workflows**. If the selected
workflow pause group request is inactive (not yet paused), click **Pause** to pause it.

7. For the paused workflow group request, use the **Resume At** field to specify the date and time of day at which the paused workflow contexts should resume.

   a. Click ![calendar icon] to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow contexts should resume. You can select the current date or future date, but you must enter a time of day in the future.
   
   For example, to pause the workflow context group at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective **Time** fields.

   b. Click ![checkmark icon] when finished.

   c. The selected date and time of day appear in the **Resume At** field.

   d. Click **OK** to return to Workflow Pause Group Request.

8. Click **Submit**.

9. Paused workflow contexts automatically resume on the date and time of day specified in the **Resume At** field. To manually resume currently paused workflow contexts:

   a. Navigate to **Workflow Pause Group Requests**.

   b. Select the workflow pause group request to resume.

   **Workflow Pause Group Request** appears.

   c. Click **Resume**, and then click **Update**.

10. Workflow Group Pause Request also contains the following information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Indicates if workflow group is paused.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of resumed workflow context activities that are completed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Standard filtering fields used to specify the conditions for selection of a group of workflow contexts.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Not Transitioned Workflow Count</td>
<td>Number of workflow contexts that were not transitioned when the group pause request was placed. When a group pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the group pause completed.</td>
</tr>
<tr>
<td>Pause Act Count</td>
<td>Number of paused workflow context activities.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person requesting the workflow context pause.</td>
</tr>
<tr>
<td>Pause percentage</td>
<td>Total percentage of workflow contexts that are paused.</td>
</tr>
<tr>
<td>Resume Percentage</td>
<td>Total percentage of workflow contexts that have resumed.</td>
</tr>
<tr>
<td>Total Workflow Count</td>
<td>Total number of workflows matching the specified filter conditions that are being paused.</td>
</tr>
<tr>
<td>Paused Workflow Count</td>
<td>Number of current paused workflow contexts.</td>
</tr>
</tbody>
</table>

**Monitor workflow pause requests**

You can monitor the status of workflow pause requests using Workflow Pause Request.

**Before you begin**

Role required: Workflow_admin or workflow_publisher, workflow_creator
You must install and activate the Workflow Pause Utility plugin.

**Procedure**

1. Navigate to **Workflow > Operations > Pause Requests**.

   **Workflow Pause Requests** appears and displays existing workflow pause requests.
2. Select the workflow pause request.  

*Workflow Pause Request* appears, and displays the selected workflow pause request.

**Workflow pause request fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Req Number</td>
<td>Unique assigned pause request number.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Pause Active</td>
<td>Selected indicates the workflow context is currently paused. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Transitioned During Pause</td>
<td>Number of workflow contexts that transitioned when the pause request was placed. When a pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Workflow Context</td>
<td>Reference number for the paused workflow context.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Paused Act Count</td>
<td>Date and time of day (h:m:s) at which the paused workflow context is resuming.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person who requested the workflow pause.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Resume At</td>
<td>Date and time of day (h:ms:s) at which the workflow contents are scheduled to resume.</td>
</tr>
<tr>
<td>Table</td>
<td>Related record table name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the workflow context is executing.</td>
</tr>
<tr>
<td>Exec Act Count</td>
<td>Number of activities executing when the workflow context was paused.</td>
</tr>
<tr>
<td>Group Pause Request</td>
<td>Reference number for the associated group pause request, if any. Appears only if pause request was the result of a group pause request.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Is Workflow Complete</td>
<td>Selected indicates the workflow context is complete. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Is Workflow Stuck</td>
<td>Selected indicates the workflow context is stuck. Cleared indicates it is not.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the workflow context - Paused or Resumed.</td>
</tr>
<tr>
<td>Stuck Activities Count</td>
<td>The number of workflow context activities that are stuck.</td>
</tr>
<tr>
<td>Stuck Act Count</td>
<td>Writer to whom the documentation request is assigned.</td>
</tr>
<tr>
<td>To be subtracted for Pause</td>
<td></td>
</tr>
<tr>
<td>Percentage</td>
<td></td>
</tr>
</tbody>
</table>

**Encrypted workflow scratchpad**

The Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) provides encrypted scratchpad support for workflow context and workflow executing activities.

The platform supports encryption on most fields, and workflows can execute on tables with encrypted fields. Encrypted data is typically stored in the workflow scratch pad for workflows that execute using encrypted fields and must access this data after processing an approval, timer, or create task activity.

Data in the workflow scratchpad is not encrypted by default. The Workflow engine supports scratchpad encryption and executing activity records only when the Encrypted Workflow Scratchpad plugin is activated. Once activated, data stored in the wf_context and wf_executing scratchpads is protected by a private workflow engine encryption context, and is prevented from being stored in plain text.

**Activate encrypted workflow scratchpad**

Activate the Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) if you have an admin role.

**Before you begin**

Role required: admin

The Encrypted Workflow Scratchpad plugin must be activated via a Customer Service and Support request. You should activate and thoroughly test the plugin.
in a non-production instance. Only after you satisfied with the results should you activate it in a production instance.

When activating it in a production instance, you should pick a low transactional volume time to do so. Prior to its activation, first activate the Workflow Pause Utility (com.glideapp.workflow.pause), and then pause all active workflows. Refer to Workflow pause utility. After activating the Encrypted Workflow Scratchpad plugin, resume all paused workflows.

About this task
Encrypted Workflow Scratchpad activates these related plugins if they are not already active.

### Plugins for Encrypted Workflow Scratchpad

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Support [com.glide.encryption]</td>
<td>Allows text fields and attached files to be encrypted.</td>
</tr>
</tbody>
</table>

### Procedure

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### What to do next
Once you install and activate the plugin, resume all paused workflows. Refer to Pause and resume all or multiple workflows.

### Related information

Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

Execution path troubleshooting in timelines

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.

Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state.

About this task

Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution
history table to determine which activities in the workflow were left in an unresolved state.

Procedure

1. Run the workflow.
2. Navigate to **Workflow > All Contexts**.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the **Workflow Activity History** related list.
5. Right-click an activity and select **Workflow Debug > Toggle Execution Path Highlighting** from the context menu.

   All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

   ![Workflow Activity History Table](image)

6. Right-click a rollback activity and select **Workflow Debug > Toggle Rollback Highlighting** from the context menu.

   The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

   **Note:** The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

You can clear individual rollback paths or all rollback highlighting.

Use the Workflow Operations Dashboard

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Before you begin
Role required: workflow_admin
The different levels of access are:

- **View**: View the dashboard and refresh report widgets.
- **Customize**: Refresh, add, delete, and rearrange widgets.

About this task
On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

Procedure
1. To view the Workflow Operations Dashboard, navigate to **Workflow > Operations > Workflow Operations Dashboard**.

The default reports on the dashboard include:

- Workflow contexts providing run time metrics
- Active workflows started during a specified time period
- Workflows run between yesterday and today
- Workflows by state for the current month
- Aged workflow contexts for the past month

2. To find and add more widgets, click the **Add Content** icon ( ) in the upper left corner of the dashboard.

**What to do next**
If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

**Workflow gauges**
Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERT Dashboard Controls</strong></td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td><strong>Workflow Dashboard</strong></td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>

<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Contexts</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
<tr>
<td>Workflows Run Between Yesterday and Today (by Table)</td>
<td>Displays workflows that have run in the last day grouped by table name.</td>
</tr>
</tbody>
</table>

### Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing [wf_workflow_timing] table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.
Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

Before you begin

Role required: admin

Procedure

with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see Workflow activities reference.

Core activities provided in the base system

- Approval and rollback workflow activities
- Condition Workflow activities
- Notification workflow activity
- Notify workflow activities
Subflow activities
• Task workflow activities
• Timer workflow activities
• Utility workflow activities

Activities provided with Orchestration
The following activities are included with Orchestration.
• Active Directory activity pack
• Orchestration activities
• PowerShell activities
• Puppet activities

Templates provided for creating custom activities
If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Activity designer components.

Workflow activities reference
Workflow activity reference, organized by category.
Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.
Workflow runs activities as the user session that starts or advances them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

Approval and rollback activities
Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.
## Approval and rollback activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Action</td>
<td>The <strong>Approval Action</strong> activity performs an approval action on the current task.</td>
</tr>
<tr>
<td>Approval Coordinator</td>
<td>The <strong>Approval Coordinator</strong> activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more <strong>Approval - User</strong>, <strong>Approval - Group</strong>, and/or <strong>Manual Approval</strong> activities.</td>
</tr>
<tr>
<td>Approval - Group</td>
<td>The <strong>Approval - Group</strong> activity creates approval records for each member of a specified group.</td>
</tr>
<tr>
<td>Approval - User</td>
<td>The <strong>Approval - User</strong> activity creates one or more individual user approvals.</td>
</tr>
<tr>
<td>Generate</td>
<td>The <strong>Generate</strong> activity immediately creates task or approval records from any task or approval activities placed after the <strong>Generate</strong> activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.</td>
</tr>
<tr>
<td>Manual Approvals</td>
<td>The <strong>Manual Approvals</strong> activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.</td>
</tr>
<tr>
<td>Rollback To</td>
<td>The <strong>Rollback To</strong> activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
</tbody>
</table>

### Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.
**Condition activities**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If workflow activity</td>
<td>The <em>If</em> activity checks a condition or script to determine if a <em>Yes</em> or <em>No</em> transition should be taken.</td>
</tr>
<tr>
<td>Switch workflow activity</td>
<td>The <em>Switch</em> activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td>Wait for condition workflow activity</td>
<td>The <em>Wait for condition</em> activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td>Wait for WF Event workflow activity</td>
<td>The <em>Wait for WF Event</em> activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
</tbody>
</table>

**Notify activities**

Notify workflow activities manage calls and SMS messages in Notify.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call workflow activity</td>
<td>The <em>Forward Call</em> activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>
<tr>
<td>Input workflow activity</td>
<td>The <em>Input</em> activity creates a phone menu by presenting a list of options on a Notify call.</td>
</tr>
<tr>
<td>Hangup workflow activity</td>
<td>The <em>Hangup</em> activity disconnects an active Notify phone call.</td>
</tr>
<tr>
<td>Play workflow activity</td>
<td>The <em>Play</em> activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td>Record workflow activity</td>
<td>The <em>Record</em> workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td>Reject workflow</td>
<td>The <em>Reject</em> workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td>Say workflow activity</td>
<td>The <em>say</em> workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td>Forward to notify client workflow activity</td>
<td>The <em>forward to notify client</em> workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
</tbody>
</table>
Notify activities (continued)

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call workflow activity</td>
<td>The <strong>Call</strong> activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Join conference call workflow activity</td>
<td>The <strong>Join Conference Call</strong> activity connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Send SMS workflow activity</td>
<td>The <strong>send SMS</strong> workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Queue workflow activity</td>
<td>The <strong>Queue</strong> activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

Notification activities

Notification workflow activities notify users of events that occur during the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity</td>
<td>The <strong>Create Event</strong> activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity</td>
<td>The <strong>Notification</strong> activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>

Subflow activities

Subflow activities run and manage workflows from a parent workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher workflow activity</td>
<td>The <strong>Parallel Flow Launcher</strong> activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>
**Task activities**
Task activities create and modify workflow tasks.

ℹ️ **Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity</td>
<td>The <strong>Add Worknote</strong> activity adds text to the Worknotes field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity</td>
<td>The <strong>Attachment Note</strong> activity adds an attachment to the current record.</td>
</tr>
<tr>
<td>Catalog Task workflow activity</td>
<td>The <strong>Catalog Task</strong> activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity</td>
<td>The <strong>Create Task</strong> activity generates a record on any of the tables that extend Task [task].</td>
</tr>
</tbody>
</table>

**Timer activities**
Timer activities pause workflows for set periods of time.

ℹ️ **Note:** Timer activities run as the System user because the system scheduler advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity</td>
<td>The <strong>SLA Percentage Timer</strong> activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity</td>
<td>The <strong>Timer</strong> activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>

**Utility activities**
Utility activities provide controls over the path of the workflow, and other useful tools.
<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity</td>
<td>The <strong>Branch</strong> activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity</td>

**Activities provided with Orchestration**

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
• PowerShell activities
• Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates.

Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

• With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
• Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines.

Approval Action workflow activity

The Approval Action activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

Note: When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field's value.

Results

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the activity.result variable from within a script field of the activity.
**Input variables**

Input variables determine the initial behavior of the activity.

**Approval Action activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Mark task approved</td>
</tr>
<tr>
<td></td>
<td>• Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>• Mark task requested</td>
</tr>
<tr>
<td></td>
<td>• Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition runs after this activity.

⚠️ **Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

**Approval Action activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>

</table>

Approval Coordinator workflow activity

The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.

⚠️ Note: This activity is only available when the workflow runs on a table that extends Task.

To create an Approval Coordinator activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click Submit.

After you click Submit, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the Approval Coordinator activity completes, all pending approvals that were created by any of the Approval Coordinator approval activities are immediately set to No Longer Required. If a single user is called as an approver twice by the same workflow, such as when a single user is both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results

The result value of the Approval Coordinator activity depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
# Input variables

Input variables determine the initial behavior of the activity.

## Approval Coordinator activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Any child activity to be approved: Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• All child activities to be approved: All child activities of the Approval Coordinator activity must complete with a result of approved to cause the Approval Coordinator activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• The first approval or rejection from any child activity: The first child activity that completes with a result of approved or rejected causes the Approval Coordinator activity to complete with the same result.</td>
</tr>
<tr>
<td></td>
<td>• Condition based on script: Call a script to determine how to manage an approval or rejection.</td>
</tr>
</tbody>
</table>

When a rejection occurs

<table>
<thead>
<tr>
<th>Only appears if Wait for is set to All child activities to be approved or Any child activity to be approved.</th>
<th>Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Reject the approval: Immediately complete the Approval Coordinator activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>• Wait for other responses before deciding: Wait until we get other responses from other child activities before making an approval or rejection decision. This allows users to change their minds until a decision is made.</td>
</tr>
<tr>
<td></td>
<td>In addition, if Wait for is set to Any child activity to approve then a single child activity completion with a result of approved will cause the Approval Coordinator activity to complete with a result of approved even if other child activities have completed with a result of rejected.</td>
</tr>

Approval - Group workflow activity

The Approval - Group activity creates approval records for each member of a specified group.

⚠️ Note: This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the Wait For field.

Results

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.
### Approval - Group activity input variables

<tr>
<td></td>
<td>Each member of the group will be assigned an individual approval record.</td>
</tr>
<tr>
<td></td>
<td>If no group is selected, the activity automatically sets the approval to Approved.</td>
</tr>
<tr>
<td>Approval - Group Condition</td>
<td>Specify how the activity decides to approve or reject the group approval, based on the responses from individual members of the group.</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• An approval from each group: Any user from each group can approve and the first approval from each group causes the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• An approval from any group: Any user from any group can approve and the first approval from any group causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>• An approval from everyone from all groups: All users from all groups must approve to cause the activity to complete with a result of approved (see below for how a rejection is handled).</td>
</tr>
</tbody>
</table>
### Approval - Group activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>First response from each group</strong>: The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
<td></td>
</tr>
<tr>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
<td></td>
</tr>
<tr>
<td><strong>Reject the approval</strong>: Immediately complete the activity with a result of rejected.</td>
<td></td>
</tr>
<tr>
<td><strong>First response from any group</strong>: The first approval or rejection from any user in any group causes the activity to complete with a result of approved or rejected.</td>
<td></td>
</tr>
<tr>
<td><strong>Condition based on script</strong>: Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
<td></td>
</tr>
</tbody>
</table>

**Approval script**

If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the overall status for this approval.

This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups.

When called, the following variables are available to the script for all the groups that are part of this approval activity:

- `counts.total` = total number of groups that are part of this approval
- `counts.approved` = # of groups that approved so far
- `counts.rejected` = # of groups that rejected so far
- `counts.requested` = # of groups that are pending approval
- `counts.not_requested` = # of groups that are not pending approval
- `counts.not_required` = # of groups that approval is not required

And for each group:
**Approval - Group activity input variables (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>groups[group_id].total</td>
<td>total number of users that are part of this group's approval</td>
</tr>
<tr>
<td>groups[group_id].approved</td>
<td># of users that approved so far</td>
</tr>
<tr>
<td>groups[group_id].rejected</td>
<td># of users that rejected so far</td>
</tr>
<tr>
<td>groups[group_id].requested</td>
<td># of users that are pending approval</td>
</tr>
<tr>
<td>groups[group_id].not_requested</td>
<td># of users that are not pending approval</td>
</tr>
<tr>
<td>groups[group_id].not_required</td>
<td># of users that approval is not required</td>
</tr>
<tr>
<td>groups[group_id].approvalIDs[state]</td>
<td>array of user ids that are at the specified approval state</td>
</tr>
</tbody>
</table>

**Note: Iterate the groups using:**

```javascript
for (var id in groups) {
    var group = groups[id];
    ... group.total ...
}
```

**Note: Get group object using the following code (to get things like the group name being iterated on):**

```javascript
var objGroup = fncGetGroupObj(id);
    var strGroupName = objGroup.name;

    function fncGetGroupObj(sidGroupApproval) {
        var objGroupApproval = new GlideRecord('sysapproval_group');
        objGroupApproval.get(sidGroupApproval);
        var objGroup = new GlideRecord('sys_user_group');
        objGroup.get(objGroupApproval.assignment_group.sys_id);
        return objGroup;
    }
```
Approval scripts also allow computations. For example, if only half of the approvals are required:

```java
if (counts.approved/counts.total > .49) {
    answer = 'approved';
}
else if (counts.rejected/counts.total > .50) {
    answer = 'rejected';
}
```

When anyone rejects

A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:

- **Reject the approval**: Immediately complete the activity with a result of **rejected**.
- **Wait for other responses before deciding**: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

**Note**: If **Wait for** is set to **Anyone to approve**, then a single approval causes the activity to complete with a result of **approved**, even if one or more users reject.

Approval - Group Schedule

Specify how workflow calculates the approval record's expected start date and due date. Once you've made a selection for 'Due date based on', and 'Schedule based on', the appropriate fields will display.

**Due date based on**

Select how workflow determines the task's duration, due date, and schedule.

- **A user specified duration**: The duration is based on a user specified value.
- **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).
- **A date/time or duration field**: The duration is based on the value of a field on the current record.
- **Script**: The duration is returned by a script.
## Approval - Group activity input variables (continued)

<table>
<thead>
<tr>

</tbody>
</table>

Approval - Advanced
If desired, write a script for determining additional users to request approvals from.

Advanced
Select this check box to write a script for determining additional users to request approvals from. Use the Additional groups script to customize group approvals.

Additional groups script
If the Advanced check box is selected, this script is called to determine any additional group approvals to be created. The script needs to set the variable answer to a comma-separated list of group ids or an array of group ids to add as approver groups. For example:

```javascript
answer = [];  
answer.push('id1');  
answer.push('id2');
```

Conditions
The following conditions determine which transition runs after this activity.

ℹ️ Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.
Approval - Group activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <em>Wait for</em> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <em>Wait for</em> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

**States**
The activity state tells the workflow engine what to do with the activity.

Approval - Group activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Approval - User workflow activity

The *Approval - User* activity creates one or more individual user approvals.

**Results**
The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the *Wait for* or *When Anyone Rejects* fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

**Input variables**

</tr>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
</tbody>
</table>
| Users                                    | The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as ${assigned_to}. If no user is selected, the activity automatically sets the approval to Approved.  

**Note:** Workflow only manages approval records generated by the Approval User activity. After starting the workflow, newly added approvals do not affect the workflow context. |
| Groups                                   | Groups whose members should also receive approvals. Note that this is different than the Approval - Group activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as ${assignment_group}. |
| Approval - User Condition                | Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers. |
| Wait for                                 | A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are: |
Approval - User activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>Anyone to approve:</strong></td>
<td>Any user can approve and the first approval causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td>• <strong>Everyone to approve:</strong></td>
<td>All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td>• <strong>First response from anyone:</strong></td>
<td>The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td>• <strong>Condition based on script:</strong></td>
<td>Each time a user approves or rejects, the <strong>Approval script</strong> is called to determine if the activity should complete.</td>
</tr>
</tbody>
</table>

When anyone rejects

A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:

- **Reject the approval:** Immediately complete the activity with a result of **rejected**.
- **Wait for other responses before deciding:** Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

⚠ **Note:** Note that if **Wait for** is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of **approved** even if one or more users reject.

**Approval Column**

A string field for the name of the approval field on the table the workflow is running on. The default value is **approval**, which is the field on the Task table.

⚠ **Note:** Use the field's name, not its label.

⚠ **Note:** If using any custom approval column fields and approval column journals, use Set Value activities in the workflow to set the custom Approval column fields.
Approval - User activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Script</td>
<td>If the <strong>Wait for</strong> variable is set to <strong>Condition based on script</strong>, this script is called to determine how to handle an approval or rejection. The script needs to set the variable <strong>answer</strong> to approved or rejected to indicate the approval status for this approval. When called, the following information is available:</td>
</tr>

### Approval - User activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears when <strong>Schedule based on</strong> is set to <strong>A specific schedule</strong></td>
<td></td>
</tr>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
</tbody>
</table>
| Time zone based on | The time zone for calculating the duration. The time zone may be based on:  
  - **No time zone**: Default. Workflow uses the GMT time zone.  
  - **A specific time zone**: A specific **Time zone** that you choose from a choice list.  
  - **A time zone field**: A **Time zone field** to track time duration from a field on the form. |
| Time zone | Select the time zone you want from the choice list. |
| Time zone field | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>on is set to</strong></td>
<td>A time zone field.</td>
</tr>
</tbody>
</table>

**Approval - Advanced**

If desired, write a script for determining additional users to request approvals from.

- **Advanced**
  - Select this check box to write a script for determining additional users to request approvals from.

- **Additional approvers script**
  - If the **Advanced** check box is selected, this script is called to determine any additional user approvals to be created. The script needs to set the variable `answer` to a comma-separated list of user ids and group ids or an array of user and group ids to add as approvers. For example:

```javascript
answer = [];
answer.push('id1');
answer.push('id2');
```

### Conditions

The following conditions determine which transition runs after this activity.

**Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.
Approval - User activity states

<table>
<thead>
<tr>

<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Generate workflow activity

The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

Note: This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date

  Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.
• If it is an approval activity, creates the approvals and sets:
  ◦ The approval State to Not Requested
  ◦ The Expected Start Date
  ◦ The Due Date

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Expected start dates and due dates are calculated based on the Expected Duration of all of the tasks and approvals between the Generate activity and the activity being updated. In the case of a branched path (between a Branch and Join activity), the longer duration will be used for any post-branch activities.

The Generate activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the Generate activity, select the Skip during generate check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the Skip during generate check box selected:

• Rejected (for any of the approval activities)
• No condition of If activity
• Continue condition of Turnstile activity
• Incomplete condition of Join activity

Input variables
Input variables determine the initial behavior of the activity.

Generate activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the Generate activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
</tbody>
</table>
Generate activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate</td>
<td>If selected, tasks are created when running the <strong>Generate</strong> activity.</td>
</tr>
<tr>
<td>tasks</td>
<td>If cleared, the tasks are used to compute their estimated duration, but no</td>
</tr>
<tr>
<td></td>
<td>tasks are created.</td>
</tr>
</tbody>
</table>

**States**
The activity state tells the workflow engine what to do with the activity.

**Generate activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the</td>
</tr>
<tr>
<td></td>
<td>activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

**Example**

**Generate workflow**

In this example, the following approvals are generated:
• Approval-2
• Approval-3

Approval-4 is skipped since the **Rejected** condition of Approval-3 has **Skip during generate** selected.

Here is an example of using the **Generate** activity that describes the expected start and due dates:

**Generate workflow start and due date**

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest before the Join</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the **Join** is Task 3/Task 4.
Manual Approvals workflow activity

The **Manual Approvals** activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

⚠ **Note:** This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of **approved**. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
- Error

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
</tbody>
</table>
Manual Approvals activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Any manual user or group approval:</td>
<td>Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td>• All manual user or group approvals:</td>
<td>All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td>• The first response from any manual approval:</td>
<td>The first approval or rejection from any user causes the activity to complete.</td>
</tr>
</tbody>
</table>

When anyone rejects

Indicate what happens when any user rejects their approval request. Options are:

• Reject the approval: Immediately complete the activity with a result of rejected.
• Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

In addition, if Wait for is set to Anyone to approve then a single approval will cause the activity to complete with a result of approved even if one or more users reject.

Conditions

The conditions determine which transition runs after this activity.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Manual Approvals activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.
Manual Approvals activity states

<table>
<thead>
<tr>
<th>State</th>

</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To workflow activity

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

⚠️ Note: This activity is only available when the workflow runs on a table that extends Task.

**Rollback To** determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

Conditions

The conditions determine which transition runs after this activity.

**Rollback To activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>
States
The activity state tells the workflow engine what to do with the activity.

Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the execute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To behavior
The Rollback To activity transitions directly to the activity specified by the transition line arrow.

Use the Rollback To activity for all workflows that use multiple or nested rollbacks. Rollback To resets the targeted task (the direct transition) to Open. All tasks that have executed between the Rollback To activity and the targeted task (rolled back task) are set to Pending.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End

Rollback to workflow

Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

• Approvals are reset to Not Requested.
• Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

Condition Workflow activities

Condition activities provide conditional branching and logical operation functionality for workflows.

If workflow activity

The If activity checks a condition or script to determine if a Yes or No transition should be taken.

If the workflow creator specifies both the Condition and the Advanced script, both must evaluate successfully for activity to take the Yes transition.

Results

The workflow designer can assign a result value using activity.result from within the Script field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

• Yes
• No

Input variables

The following variables determine the behavior of the activity.
**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

### If activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the <strong>Yes</strong> transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the <strong>Advanced</strong> check box. You may then enter a script that is evaluated. If your script sets the variable answer to <strong>yes</strong>, then the <strong>Yes</strong> transition is taken. Otherwise, the <strong>No</strong> transition is taken.</td>
</tr>
</tbody>
</table>

### Conditions

The following conditions determine which transition comes after the activity.

### If activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the <strong>Advanced</strong> script, if specified, returns yes.</td>
</tr>
<tr>
<td>No</td>
<td>Taken when either the condition does not match or the <strong>Advanced</strong> script, if specified, returns no.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

### If activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>
If activity states (continued)

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Switch workflow activity

The **Switch** activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a **Variable** or **Field** to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the **Condition** field of the activity condition, the workflow progresses through that activity condition.

ℹ️ **Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

Results

The variable or field selected in the **Variable** or **Field** activity variable determines the possible result values.

Input variables

The following variables determine the behavior of the activity.

Switch activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select <strong>Variable</strong> or <strong>Field</strong> as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
| Variable or Field | Select the source of the value compared against the switch activity conditions. The field label and available options depend on the **Type** selection.  
  • **Variable**: select any service catalog variable.  
  • **Field**: select any field from the **Table** defined in the workflow properties. |
States
The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Example
You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.

Switch activity example

The **Field** selected is the incident **Assigned to** field.
If the value of the Assigned to field of the workflow-triggering incident is **Service Desk** or **Field Services**, the workflow populates values on the incident record before continuing. If the Assigned to value is **Hardware**, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see [Manage workflow activity conditions](#).
Wait for condition workflow activity

The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see **Timer workflow activities**.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

> **Note:** A **Wait for condition activity** should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

Input variables

The following variables determine the behavior of the activity.

> **Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

### Wait for condition activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.
Wait for condition activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Wait for WF Event workflow activity

The **Wait for WF Event** activity causes the workflow to wait at this activity until the specified event is fired.

Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the `workflow.fireEvent('eventName')` API call.

**Results**

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

**Input variables**

The following variables determine the behavior of the activity.

ℹ️ **Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

**Wait For WF Event activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.
### Wait For WF Event activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the **Table** field value is **Notify Call [notify_call]**.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an *If* workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a *Timer* activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

### Related information

- **Using variables in Notify workflow activities**
- **Forward call workflow activity**

#### Forward call workflow activity

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.
If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

### Input workflow activity

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

### Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of digits</td>
<td>Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the <strong>Finish key</strong> to complete the entry.</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
</tbody>
</table>
## Input Variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
<tr>
<td>Script</td>
<td>Define the script to build the phone menu. The script must specify an <code>answer</code> variable as a JavaScript object with the following format:</td>
</tr>
</tbody>
</table>

```javascript
answer = {
  "1": {
    "play": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "play": "https://some_url.com/options/two.mp3",
    "myCustomData": "some other data here"
  },
  "3": {
    "speak": "type 3 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code using the `speak` attribute or URL of the music to be played using the `play` attribute. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

ℹ️ **Note:** The script object continues to support `say` attribute for backward compatibility.

## Conditions

The conditions determine the transition that comes after this activity.

The `input` activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone
menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**
The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Values written to scratchpad</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Entry</strong></td>
</tr>
<tr>
<td>workflow.scratchpad.digits</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
</tr>
</tbody>
</table>

```javascript
var previousActivity = "choices";
var choicesMenu = workflow.scratchpad.menu[previousActivity];
var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input.
var selectedValue = menuItem.myCustomData; // get the custom data for the selected menu item.
```
**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the <strong>play</strong> activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

**Record workflow activity**

The **Record** workflow activity records audio from a user on a Notify call.

**Note:** The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the **Record** activity variable on the **Join Conference Call** workflow activity.

**Input Variables**

Input variables determine the initial behavior of the activity.
### Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

### Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The `record` activity adds the `recording` variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller's phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

### Reject workflow

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.
Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as busy.</td>
</tr>
</tbody>
</table>

Say workflow activity
The say workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables
Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to define the language and message, instead of using the Text to say and Language values.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.</td>
</tr>
</tbody>
</table>

Forward to notify client workflow activity
The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.

Input variables
Input variables determine the initial behavior of the activity.
Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Select the user to connect the call to.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine which client to</td>
</tr>
<tr>
<td></td>
<td>connect to, instead of using the <strong>User</strong> variable.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which client to connect to. This script</td>
</tr>
<tr>
<td></td>
<td>should return a GlideRecord for a single User [sys_user] record.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be connected</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the call.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Call workflow activity

The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the</td>
</tr>
<tr>
<td></td>
<td>outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>call</td>
<td></td>
</tr>
</tbody>
</table>
**Input variables (continued)**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the <strong>Phone number to call</strong> and <strong>Notify Number</strong> variables.</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Join conference call workflow activity**

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Input variables</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Record</strong></td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
</tr>
<tr>
<td><strong>Script</strong></td>
</tr>
</tbody>
</table>
Input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>

Conditions
The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference.call scratchpad variable is not set.

Scratchpad entries
The activity uses the workflow scratchpad to read persistent values.

Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable different attributes available with Join Conference Call activity
System administrators can enable any or all of the below attributes and use them in the Join Conference Call workflow activity.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hangupOnStar</td>
<td>When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.</td>
</tr>
<tr>
<td>muted</td>
<td>When muted is enabled (set to true), the participant will join the conference in a muted state.</td>
</tr>
<tr>
<td>beepOnEnter</td>
<td>When beepOnEnter is enabled (set to true), a notification beep is played when a user joins the conference.</td>
</tr>
<tr>
<td>beepOnExit</td>
<td>When beepOnExit is enabled (set to true), a notification beep is played when a user leaves the conference.</td>
</tr>
<tr>
<td>enableImmediateInput</td>
<td>When enableImmediateInput is enabled (set to true), it allows input of a single digit immediately after the conference ends for this user and sets that in workflow.scratchpad.confDigits. This option will be ignored if hangupOnStar is false.</td>
</tr>
</tbody>
</table>

To enable any of the above attributes, perform the following steps:

1. Navigate to **Workflow > Administration > Workflow Versions**.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the **Show Workflow** related link.
4. To modify the workflow, click the WorkFlow Actions icon and click **Checkout**.
5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true in the **config** variable in the script. The default setting is false.
8. Click **Update**.
9. Click the WorkFlow Actions icon and click **Publish** to save the changes.

Similarly, you can enable the other attributes.

**Send SMS workflow activity**
The send SMS workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.

**Input variables**
Input variables determine the initial behavior of the activity.

**Input variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From</strong></td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td><strong>Advanced</strong></td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td><strong>To</strong></td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td><strong>To (groups)</strong></td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td><strong>Message</strong></td>
<td>Enter the message to send. You can add field values from the current record by using the <strong>Select variables</strong> box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td><strong>To (script)</strong></td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
</tbody>
</table>
Input variables (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The script should return a JavaScript object with the format <code>{notify_number: &quot;...sys_id...&quot;}, users: [...], groups: [...], numbers: [...]</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if Advanced is selected.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Queue workflow activity

The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Workflow notification activities

Notification workflow activities notify users of events that occur during the workflow.

Create Event workflow activity

The Create Event activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

Results

Finished: the activity added the event to the event queue.
Input variables

Create Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (“ ”).</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this parameter is a string value, it must be within quotes (“ ”).</td>
</tr>
</tbody>
</table>

Notification workflow activity

The Notification activity sends an email or SMS message to specified users or groups.

Input variables

</table>

Timer workflow activity

The Timer activity pauses the workflow for a specified period of time.
This duration can be an absolute time value or a relative value based on a defined schedule. It is best to adjust the **Duration** so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see **wait for condition**.

ℹ️ **Note:** Timer activities run as the System user because the system scheduler advances the workflow.

### Results

**Timer activity results**

<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Example

You can use a **Timer** activity to pause the workflow until the end of the business day.

In this example, the script evaluates the time between the `now` variable and the `eod` variable. The `eod` variable is defined, in 24 hour time, as 4:00 PM. The script then sets the `answer` variable to the difference between these variables, in seconds, and logs a message.
// get now and calc end of day (4:00pm)

var now = new Date();

var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);

answer = (eod.getTime() - now.getTime()) / 1000;

workflow.debug('Timer will fire @: ' + eod + ' ' + (answer / 60) + ' minutes from now');

Task workflow activities
Task activities create and modify workflow tasks.

Task activities are only available when the workflow runs on a table that extends Task.

Add Worknote workflow activity
The Add Worknote activity adds text to the Worknotes field of the current incident record.

A workflow must run on the Incident table to use this activity.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Input variables

Add Worknote activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

Attachment Note workflow activity
The Attachment Note activity adds an attachment to the current record.

Note: This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the [code] tag. Entries in a journal field that use irregular HTML do not
work if the `glide.ui.allow_deep_html_validation` property is true. This property is set to false by default.

⚠️ **Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

### Results
- **Finished:** the activity added the attachment to the record.

### Input variables
The following variables determine the behavior of the activity.

#### Attachment Note activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>When this activity runs, it makes a note on the current record that a file has been attached. Specify the field on the current record in which you want this note to appear. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>none</strong> (defaults to Work Notes)</td>
</tr>
<tr>
<td></td>
<td>• <strong>Additional Comments</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Work notes</strong></td>
</tr>
<tr>
<td>Attachment note information</td>
<td></td>
</tr>
<tr>
<td>Attachment Name</td>
<td>When this activity runs, it creates a .txt file with the name you specify in this field.</td>
</tr>
<tr>
<td>Attachment Data</td>
<td>The content of the .txt file attachment. It can be in plain text or use variables to extract specific data from a table.</td>
</tr>
</tbody>
</table>

### Catalog Task workflow activity

The **Catalog Task** activity creates a service catalog task record.

⚠️ **Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item `[sc_req_item]` table.

⚠️ **Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.
Results

You can assign a result value using `activity.result` from within a script field of the activity. The final State value of the catalog task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input fields

The values you enter in the following fields determine the behavior of the activity.

### Catalog task activity information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Catalog Task Activity Settings</strong></td>
<td>The following fields specify the behavior of the Catalog Task Activity.</td>
</tr>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: <code>[sc_req_item]</code>.</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the Priority field for the new task.</td>
</tr>
<tr>
<td>Wait for completion</td>
<td>If selected, the workflow activity waits for the task to complete before continuing. If cleared, the task is created but the workflow proceeds.</td>
</tr>
<tr>
<td><strong>Catalog Task Record Settings</strong></td>
<td>The following fields specify the field values that this activity sets for the catalog task it creates.</td>
</tr>
<tr>
<td>Task value from</td>
<td>Specify how you want to populate fields on the new task.</td>
</tr>
<tr>
<td>Fields</td>
<td>a predefined set of fields including <strong>Fulfillment group</strong>, <strong>Assigned to</strong>, <strong>Short description</strong> and <strong>Instructions</strong>.</td>
</tr>
<tr>
<td>Template</td>
<td>an existing template for the selected task table.</td>
</tr>
<tr>
<td>Values</td>
<td>values that you specify using a Set Values widget.</td>
</tr>
</tbody>
</table>
### Catalog task activity information (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>After you select a value for Task value from, additional fields specific to that value appear on the form.</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Fulfillment group</strong></td>
<td>The group that is responsible for completing the task. Populates the Assignment group field on the new task.</td>
</tr>
<tr>
<td><strong>Assigned to</strong></td>
<td>The user who is responsible for completing the task. Populates the Assignment to field on the new task.</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>A short description for the task. Populates the Short description field on the new task.</td>
</tr>
<tr>
<td><strong>Instructions</strong></td>
<td>The task instructions for the user to complete prior to closing the task. Populates the Description field on the new task.</td>
</tr>
<tr>
<td><strong>Template</strong></td>
<td>The values in the task will be populated from the values in the template you select.</td>
</tr>
<tr>
<td><strong>SetValues</strong></td>
<td>Select any field on the task record to a value you specify here.</td>
</tr>
</tbody>
</table>
**Catalog task activity information (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>value from is set to Values.</strong></td>
<td></td>
</tr>
<tr>
<td>Advanced</td>
<td>Check <strong>Advanced</strong> if you want to use a script to assign values on the catalog task. When you check <strong>Advanced</strong>, a text box appears where you can enter your script.</td>
</tr>
</tbody>
</table>
| Advanced Script        | Set additional values for the task in this script. This script is run after the task values are set using the **Fields, Template** or **Values** you have specified. Use the variable **task** when setting additional values, for example:  
```
  task.short_description = current.short_description;
```

**Catalog Task Variables**

**Variables on Task Form**

Specify optional catalog variables to include on the Catalog task form. The variables you select here will be displayed in a field called **Variable Editor**. If you select no variables here, the **Variable Editor** field in the Catalog Task form will not be visible.

**Catalog Task Schedule**

Due date based on

Select how workflow determines the task’s duration, due date, and schedule.

- **A user specified duration**: The duration is based on a user specified value.
- **A relative duration**: The duration is calculated from a relative duration (such as End of Next Business Day).
- **A date/time or duration field**: The duration is based on the value of a field on the current record.
- **Script**: The duration is returned by a script.

Duration

The specific number of days and hours.
### Catalog task activity information (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative duration</td>
<td>The general number and length of business days.</td>

</tbody>
</table>
Catalog task activity information (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on is set to A time zone field.</td>
<td></td>
</tr>
</tbody>
</table>

**States**
The activity state tells the workflow engine what to do with the activity.

**Catalog Task activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Create Task workflow activity**
The Create Task activity generates a record on any of the tables that extend Task [task].

⚠️ **Note:** This activity is only available when the workflow runs on a table that extends Task.

If the **Wait for completion** check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

⚠️ **Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.
Results
You can assign a result value using `activity.result` from within a script field of the activity. By default, the final `State` value of the task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input variables
The following variables determine the behavior of the activity.

Create Task activity input variables

<table>
<thead>
<tr>
<th>Field</th>

<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Utility workflow activities
Utility activities provide controls over the path of the workflow, and other useful tools.

Branch workflow activity
The Branch activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the Branch activity onto the canvas. When the Branch activity properties form displays, click Submit to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click Add Condition.

All transitions from this activity execute concurrently. This activity provides a single Always condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.
Branching can affect the behavior of rollback activities. See Rollback To activity for more information.

Join workflow activity

The **Join** activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a **Join** activity, any subsequent activities execute twice.

To add Join to the canvas, click Submit. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a **Join** whenever it is possible for any predecessor activities to follow a transition path that does not lead to the **Join** activity.

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td><strong>Join</strong> exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the <strong>Join</strong>.</td>
</tr>
<tr>
<td>Incomplete</td>
<td><strong>Join</strong> exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the <strong>Join</strong> activity.</td>
</tr>
</tbody>
</table>

Lock workflow activity

The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.
A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.
Note:

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.

**Example of Lock Activity Preceded by Timer Activity**

Since a **Lock** activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a **Lock** and **Unlock** activity block. This may cause the **Unlock** activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:
• Approval activities
• Task activities
• Timer activities
• Wait for condition activity
• Wait for WF Event activity

Results

Lock activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock <strong>Max attempts</strong> times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

Lock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The <strong>Unlock activity</strong> activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Duration</td>
<td></td>
</tr>
<tr>
<td>Max. duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the <strong>Unlock</strong> activity.</td>
</tr>
<tr>
<td>Lock attempts</td>
<td>Specify how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to ‘timeout’ and the activity result will be set to ‘failed’.</td>
</tr>
<tr>
<td>Max. attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
</tbody>
</table>
Lock activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

Log Message workflow activity

The Log Message activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Log Message activity input variables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Message</td>
</tr>
</tbody>
</table>

Log Trace Message workflow activity

The Log Trace Message activity writes a trace message to the workflow log.
The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity activity.

**REST Message legacy workflow activity**

The legacy REST Message activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the Rome release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration REST Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

The REST Message activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

**Note:** If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.

**Input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message</td>
<td>Name of the REST message to run. This is a reference field to the REST Message [sys_rest_message] table (System Web Services &gt; Outbound &gt; REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method [sys_rest_message_fn] table (System Web Services &gt; Outbound &gt; REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Rest Message Variables</td>
<td>Variables Values to use for variables defined in the HTTP Method record.</td>
</tr>
</tbody>
</table>
REST Message activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use the following format for the string:</td>
<td>name1=value1, name2=value2, ...</td>
</tr>
<tr>
<td>For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
<td></td>
</tr>
</tbody>
</table>

Rest Message MID Server

<table>
<thead>
<tr>
<th>Use MID Server</th>
<th>Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
</tbody>
</table>

Rest Message Script

| Sensor Script | The script to execute after the request has been made and a response has been received. You can access the full response body from the activity.output variable. |

Return Value workflow activity

The Return Value activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see Workflows used as subflows.

Use this activity within a subflow to store data that the parent flow can access. The Return Value activity adds the data from the subflow’s value variable to the parent workflow’s scratchpad.

 Scratchpad entries

The activity uses the workflow scratchpad to read and write persistent values.
Return Value activity scratchpad entries

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow value variable to the parent scratchpad. The parent workflow activity that runs the subflow includes a Map return value to variable that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

Related information
- Workflow scratchpad variables
- Using variables in a workflow

Run Script workflow activity
The Run Script activity runs the specified script in the scope of the workflow version.

⚠️ Note: All changes to current are automatically updated. There is no need to call `current.update()`

Input variables
Input variables determine the initial behavior of the activity.

Run Script activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

Set Values workflow activity
The Set Values activity sets values on the current record when the workflow quiesces or ends.

Input Fields
The values you enter in the following fields determine the behavior of the activity.
Set Values Activity Input Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the list on the left, select the field on the current record whose value you want to set when the workflow quiesces or ends. In the user-input field to the right, select or enter the value to which you want that field set.</td>
</tr>
</tbody>
</table>

⚠️ Note: Avoid setting the same fields from different Set Value activities. The workflow only sets the value specified by the last Set Values activity run before quiescing or ending.

⚠️ Note: Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the Approval Action activity instead.

**SOAP Message legacy workflow activity**

The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the Rome release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

**Input variables**

<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
</tbody>
</table>
### SOAP Message activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the <strong>SOAP endpoint</strong> value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
</tbody>
</table>
| Variables           | variables      | Variables to substitute into the SOAP **Envelope** defined in the SOAP Message Function record. Use this format for the string:  
```
name1=value1, name2=value2, ...
```
If either the name or value contains a comma or equal sign, escape these characters with a backslash. |
| Use MID Server      | use_midserver  | Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the **MID Server** field, Workflow automatically attempts to find a MID Server. |
| MID Server          | midserver      | Name of the MID Server to use. This field appears when you select the **Use MID Server** check box. The workflow ignores this parameter if the **use_midserver** parameter is disabled. |
| Sensor Script       | sensor_script  | The script to execute after the request has been made and a response has been received. You can access the full XML response body from the **activity.output** object. |
Turnstile workflow activity

The Turnstile activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the Rollback To workflow activity activity.

Results

You can assign a result value using the activity.result variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The Allowed iterations value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the Allowed iterations value.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>
States
The activity state tells the workflow engine what to do with the activity.

Turnstile activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is triggered.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Unlock workflow activity

The Unlock activity releases a lock that was previously placed by the Lock activity.

To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

Input variables
Input variables determine the initial behavior of the activity.

Unlock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

Subflow activities in workflow
Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launcher subflow activity is available.

Parallel Flow Launcher workflow activity
The Parallel Flow Launcher activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.

Note: The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

Note: Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches.

Activity variables
Activity variables determine the initial behavior of the activity.

Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher configuration</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td>Inputs</td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must</td>
</tr>
</tbody>
</table>
### Parallel Flow Launcher activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td></td>
<td>match those used by the subflow that this activity launches. For a detailed example, see Parallel Flow Launcher Example.</td>
</tr>
</tbody>
</table>

**Parallel Flow Launcher selection**

**Workflow**
The workflow to run.

**Advanced**
Check Advanced, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See WorkflowCoordinator object for more information.

**Parallel Flow Launcher iteration**

Specify parameters to tune the performance of batched workflows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>If not specified by an input set, Count determines the number of subflows executed in parallel from this activity. If the Advanced option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
</tbody>
</table>

**Parallel Flow Launcher Process**

**Process flow complete**
To specify a script that runs after each subflow completes, check Process flow complete. If you check this field, a text box labelled Flow complete appears, where you can enter the script to run.

**Flow complete**
The script that runs each time a subflow finishes. This field is available when the Process flow complete option is selected. The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see Completed subflow values in scripts.
Parallel Flow Launcher activity input variables (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The variable “flow” is available to this script. It is an object that contains the following information about the flow that is finishing:</td>
<td></td>
</tr>
<tr>
<td><strong>flow.output (String)</strong>: The value that the subflow returns to the parent if it executed a Return Value activity before ending.</td>
<td></td>
</tr>
<tr>
<td><strong>flow.index (Number)</strong>: The zero-relative index of the subflow that finished.</td>
<td></td>
</tr>
<tr>
<td><strong>flow.contextId (String)</strong>: The sys_id of the workflow context for the completed subflow.</td>
<td></td>
</tr>
<tr>
<td><strong>flow.inputs (Object)</strong>: The inputs that were passed to the subflow when its context was created and started.</td>
<td></td>
</tr>
<tr>
<td><strong>flow.status (String)</strong>: The final state of the context. This corresponds to the <strong>state</strong> column in the subflow context record, which has possible values of <strong>executing</strong>, <strong>finished</strong>, <strong>cancelled</strong>, or <strong>faulted</strong>. (Since the flow is completed, it cannot be <strong>executing</strong> at this point.)</td>
<td></td>
</tr>
</tbody>
</table>

Parallel Flow Launcher Split

<table>
<thead>
<tr>
<th>Process finished</th>
<th>To specify a script that runs after all subflows have finished, check <strong>Process finished</strong>. If you check this field, a text box labelled <strong>Finished Script</strong> appears where you can enter the script to run. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the <strong>getFlow(index)</strong> method. For example:</th>
</tr>
</thead>
</table>
|                                                      | for (var i = 0; i < coordinator.getNumFlows(); i++)
|                                                      | writeFlowResultsToTable( i, coordinator.getFlow(i) );                                                                                                                                                  |

<table>
<thead>
<tr>
<th>Finished script</th>
<th>The script that runs after all subflows launched by the activity are complete. You can use variables that contain completed flow information in this script. The ‘coordinator’ variable is made available to this script and is an object that allows access to any of the finished subflows using the <strong>getFlow(index)</strong> method. For example:</th>
</tr>
</thead>
</table>
|                                                      | for (var i = 0; i < coordinator.getNumFlows(); i++)
|                                                      | writeFlowResultsToTable( i, coordinator.getFlow(i) );                                                                                                                                                  |
| This field is available when **Process finished** is selected. |------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
States

The activity state tells the workflow engine what to do with the activity. To view an activity’s state, point to the activity. A pop-up window shows the State and Result of the activity. If the activity is in an error state, the pop-up window provides a brief Fault Description.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>

WorkflowCoordinator object

A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the save(variableName) function on the WorkflowCoordinator object. You can reference the object using the value passed in the variableName parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using <object>.save('coord'), and then call this object by entering coord in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.

- Define the WorkflowCoordinator within the Workflow activity variable. Add the javascript: identifier at the beginning of the script. The Parallel Flow Launcher example shows how to use a WorkflowCoordinator object in this way.

- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.
Completed subflow values in scripts

The **Parallel Flow Launcher** activity exposes additional variables you can use in scripts.

### Additional variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the <strong>Finished script</strong> to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the <code>WorkflowCoordinator.load('&lt;Activity&gt;')</code> function. For example, to load the WorkflowCoordinator object from a <strong>Parallel Flow Launcher</strong> activity called <strong>Launch Subflows</strong>, enter <code>var coord = WorkflowCoordinator.load('Launch Subflows');</code> in a later activity.</td>
</tr>
<tr>
<td>flow</td>
<td>The subflow launched by the activity that completed most recently. You can use this variable in the <strong>Flow complete script</strong> to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use <code>var flow = coord.getFlow(I);</code> where <code>I</code> is the numeric index of the subflow based on the order it was launched. These values are available from the completed subflow:</td>
</tr>
<tr>
<td></td>
<td>• <strong>index</strong>: the numerical index of this subflow based on the order it was launched</td>
</tr>
<tr>
<td></td>
<td>• <strong>workflow</strong>: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow</td>
</tr>
<tr>
<td></td>
<td>• <strong>inputs</strong>: any input values provided to the launched subflow</td>
</tr>
<tr>
<td></td>
<td>• <strong>status</strong>: status of the subflow context</td>
</tr>
<tr>
<td></td>
<td>• <strong>output</strong>: the value returned by the subflow</td>
</tr>
<tr>
<td></td>
<td>• <strong>contextId</strong>: the sys_id of the workflow context for the subflow</td>
</tr>
</tbody>
</table>

**Parallel Flow Launcher example**

This example shows how to use the **Parallel Flow Launcher** activity with an array of input values and with a WorkflowCoordinator object.
Sample workflow

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.

Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
Add nodes to the load balancer
The second Parallel Flow Launcher activity uses WorkflowCoordinator objects to specify which subflows to run. The coordinator variable stores the completed flow information from the previous Provision Nodes activity. The script then retrieves the IP address and port for each node that was provisioned. The coord2 WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the coord2 WorkflowCoordinator object runs the SetupDNS subflow once to configure the load balancer.
Specifying which subflows to run

```javascript
var coordinator = WorkflowCoordinator.load("Provision Nodes");
var coord2 = new WorkflowCoordinator(
  workflow: 'Add Node to Load Balancer'
);
for (var i = 0; i < coordinator.getNumFlows(); i++) {
  var ip = coordinator.getInput(i).ip;
  var port = coordinator.getInput(i).port;
  coord2.add({
    ip: ip,
    port: port
  });
}
var loadBalancerIP = '10.0.20.10';
coord2.add({
  ip: loadBalancerIP,
  hostname: 'www.snow1.net',
  'SetupDNS':
  coord2;
}
```

**Workflows used as subflows**

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into
a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.

Subflows and the Create Task activity

If a workflow contains a Create Task activity that has executed on the current record, additional task activities in the workflow might not execute as expected. This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

Note: An alternative to creating duplicate subflows that use the Create Task activity is to add a Run Script activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a **Create Task** activity more than once. This allows the workflow to create additional tasks.

**Running different subflows containing the Create Task activity**

**View workflow activity descriptions**

Tooltips are available for workflow activities to help you understand how to use each activity.
About this task

Procedure

1. To view an activity description in the Workflow Editor, point to the icon for the activity in the palette.

2. To modify activity descriptions, navigate to Workflow > Administration > Activity Definitions and edit the Description field.

   Note: To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

Elements in workflow activity definitions

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.
Not all activities specify all possible elements. See Workflow activities for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.

### Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible <code>activity.results</code> value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See Activity variables for more information.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines which transition the activity follows after completing. See Manage workflow activity conditions for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

### Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

**Procedure**

1. In the Workflow Editor, check out a workflow.

2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

   The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

   If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
3. Create any additional conditions needed for the activity and ensure that all exits are connected.

4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.
Note: All activity descriptions have a **Table** value. If this value is **Global**, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.

### Adding an activity to a workflow

![Workflow Diagram]

Duplicate a workflow activity

You can duplicate an activity used in a workflow, including all the configured properties.

**Procedure**

1. Right-click the activity and select **Copy Activity** from the context menu.
   
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add transitions.

Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity.
About this task
All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

Note:
Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

Procedure
1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
   - Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.

3. To remove a transition, click to highlight it, and then press **Delete**.

**Custom activity transitions**

Controls on the **Approval - User** activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of **Approved** or **Rejected**.

Transitions defined using this method do not become a permanent feature of the **Approval - User** activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

**Manage workflow activity conditions**

Activities contain default conditions that determine which transitions are followed.

**About this task**

For example, the **Approval - User** activity has two conditions, **Approved** and **Rejected**.
Example of activity conditions

You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

**Procedure**

1. Right-click the activity and select **Add Condition** from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>• <strong>current</strong>: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity.result</strong>: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity</strong>: Workflow Executing Activity (wf_executing) record. Used for advanced condition checks.</td>
</tr>
<tr>
<td></td>
<td>• <strong>activity.vars</strong>: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the <strong>Generate activity</strong> does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select **Reorder Conditions**.
A dialog box appears, with a list of the available conditions.

5. Drag the conditions to a new position in the list.

6. Click **OK**.

**Activity result value**

The *result* value specified by an activity controls the condition through which the activity transitions.

Use the *result* value as part of the *Condition* field in the activity. For example, if the *Condition* field of an *Approval - User* activity contains `activity.result == 'rejected'`, the activity transitions through that condition when a rejection is received from the approver. Result values are set in the *Script* field of the activity definition.

**Edit the workflow activity properties form**

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

**Procedure**

1. Navigate to **Workflow > Administration > Activity Definitions**.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the **Edit Variables Layout** related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables. The activity variables appear as separate items that you can rearrange on the form.

For more details on using the form design interface, see .

**Using workflow approval activities and rolling back workflows**

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

**Approval workflow activities and approval engines**

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activites are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals.

**Unavailable approval activities**

## Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.

### About this task

An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a dot-walked field, such as "current.opened_by.department.manager", and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

### To correct a missed approval activity:

1. Identify the approval activity that missed.
2. Determine why the approval activity missed.
3. Adjust the workflow configuration or data to correct the approval.

---

**Turn off approval engines**

Select the Approval Engine to be used for each of the Task tables. The valid options are:

- Approval Rules - Use Approval Rules to create approvals
- Process Guides - Use Process Guides to create approvals
- Turn engines off - Turn the approval engines off for this table (use this when Workflow is being used to manage approvals)

<table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. Navigate to Workflow > Live Workflows > All Contexts.
2. Click the date and time in the Started column for the workflow that is incorrectly processing approval activities.
3. In Related Links, click Show Workflow.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see .
   - Point to each processed approval activity to find activities where the State is Finished and Result is Skipped.
5. Navigate to Workflow > Workflow Editor and open the workflow.
6. Double-click the skipped approval activity.
7. Click Users or Groups.
8. Assign an active user or group for the approval activity. For more information, see Workflow error handling.

Rollback To activity

When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.
**Rollback To behavior**

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin
(1) Log Message
(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End

**Rollback to workflow**
Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested

Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
</tbody>
</table>
(continued)

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call</td>
<td>Supports variable substitution in the <strong>Phone number</strong> field only.</td>
</tr>
</tbody>
</table>

**Scratchpad variables**

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `${variable_name}`. You do not need to include either workflow.scratchpad or activity.scratchpad before the variable name. For example, to use the variable `activity.scratchpad.langCode = ‘en-US’`, call `${langCode}` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `${object.value}`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name:’john.smith’}` by calling `${user.name}`.

**The digit variable**

The **Input** activity exposes the `${digit}` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

**Use multiple timer activities in one workflow**

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

- `workflow.scratchpad.endTime`
- `workflow.scratchpad.realStartTime`
- `workflow.scratchpad.retroactiveSecsLeft`

**Related information**

Timer workflow activities
Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks Publish, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

⚠️ Note: Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.

Locked versions

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the Workflow Editor, selects the checked-out version, and selects Force Checkout, and then Publish.

Workflow activity pinning

Workflow administrators can pin a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

⚠️ Note: Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.
