Create a credential record for the Amazon Route53 custom application. The Amazon Route53 spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Click New.

The system displays this message: What type of Credentials would you like to create?
3. Select **AWS Credentials**.
4. On the form, fill these values.

**AWS Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Amazon Route53 Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>Amazon Route53</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td>Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke. <strong>sn_amzn_rout53_spk.AmazonRoute53</strong></td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

**Amazon S3 spoke v1.0.1**

Integrate ServiceNow with Amazon S3. Manage buckets, objects, tags, and related ACLs in Amazon S3 from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke was built for API version 2010-03-31, but may be compatible with later versions.
**Spoke requirements**

- User with full access to Amazon S3.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

**Spoke actions**
The Amazon S3 spoke provides actions to automate Amazon S3 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket Management</td>
<td>Create Bucket</td>
<td>Creates a bucket in Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Create ACL</td>
<td>Create new ACL for a bucket and delete the existing one.</td>
</tr>
<tr>
<td></td>
<td>Get Bucket ACLs</td>
<td>Retrieve the ACLs present on a bucket.</td>
</tr>
<tr>
<td></td>
<td>List Buckets</td>
<td>List Amazon S3 buckets.</td>
</tr>
<tr>
<td>Object Management</td>
<td>Copy Object</td>
<td>Copies object from source to destination.</td>
</tr>
<tr>
<td></td>
<td>Delete Object</td>
<td>Deletes specified object from a bucket.</td>
</tr>
<tr>
<td></td>
<td>Get ACL</td>
<td>Retrieves the ACL details for the requested resource.</td>
</tr>
<tr>
<td></td>
<td>List Objects By Bucket</td>
<td>Lists the objects in the specified Amazon S3 bucket.</td>
</tr>
<tr>
<td></td>
<td>List Tags</td>
<td>Lists tags of the specified Amazon S3 resource.</td>
</tr>
<tr>
<td></td>
<td>Update Tags</td>
<td>Updates the tags of the specified Amazon S3 resource.</td>
</tr>
<tr>
<td></td>
<td>Download S3 Object to ServiceNow Record</td>
<td>Downloads the requested object from Amazon S3 and attaches it to a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Upload ServiceNow Attachment to S3</td>
<td>Uploads file from the System Attachment Table (sys_attachment) to a specified Amazon S3 bucket.</td>
</tr>
</tbody>
</table>
Note: Spoke actions can be used independently without subscribing to notifications from Amazon S3.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon S3 spoke
Use Amazon S3 as file storage in place of attachments in ServiceNow. Adds Amazon S3 storage to your ServiceNow instance and enables users to reference Amazon S3 files in ServiceNow records.

Before you begin
• Request an IntegrationHub subscription
• Activate the Amazon S3 spoke
• Role required: admin

Create Credential record for the Amazon S3 spoke
Create Credential record for your AWS account. The Amazon S3 spoke uses this credential to perform actions on Amazon S3.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon S3.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter S3 Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Select Active to use the credential record.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>sn_amazon_s3_spoke Amazon S3</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon S3.</td>
</tr>
</tbody>
</table>

*i Note:* Users are cautioned against directly modifying the default authentication algorithm.

*i Note:* To create the Access key ID and secret access key, log into the AWS console. From your account menu, select *My Security Credentials.*

6. Click **Submit**.

**Results**
The credential record for the Amazon S3 spoke is created.

**Amazon SNS spoke**
Integrate ServiceNow with Amazon SNS. Manage topics and subscriptions, and delegate roles in Amazon SNS from your ServiceNow instance.

**Request apps on the Store**
Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the *ServiceNow Store version history release notes.*

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub.*

**Supported version**
This spoke was built for API version 2010-03-31, but may be compatible with later versions.
**Spoke requirements**

- User with full access to Amazon SNS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

**Spoke subflows**

The Amazon SNS spoke provides a sample subflow to demonstrate automating Amazon SNS tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Amazon SNS Subscription. The subflow receives three types of messages; Notification, Subscription Confirmation, and Unsubscribe Confirmation. This subflow is triggered when you configure your ServiceNow instance to receive events from Amazon SNS. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

⚠️ Note: Spoke subflow can be used independently to subscribe for notifications from Amazon SNS. For more information about the configurations, see Receive events at your ServiceNow instance from Amazon SNS.

**Spoke actions**

The Amazon SNS spoke provides actions to automate Amazon SNS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permission Management</td>
<td>Add Permission</td>
<td>Adds a statement to a topic's access control policy and grants access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td></td>
<td>Remove Permission</td>
<td>Removes a statement from a topic's access control policy and revokes access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td>Subscription Management</td>
<td>Confirm Subscription</td>
<td>Verifies intent of endpoint owner to receive messages by validating the token sent to the endpoint through an earlier Subscribe action.</td>
</tr>
<tr>
<td></td>
<td>Create Subscription</td>
<td>Creates a subscription on a topic.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Subscription</td>
<td>Deletes a subscription on a topic.</td>
</tr>
<tr>
<td></td>
<td>Get Subscription Attributes</td>
<td>Retrieves all properties of a subscription.</td>
</tr>
<tr>
<td></td>
<td>List Subscriptions</td>
<td>Retrieves a list of all subscriptions to a specific region.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td></td>
<td>In your flow, use the Get Subscription Attributes action before this action to populate the required records.</td>
</tr>
<tr>
<td></td>
<td>List Subscriptions By Topic</td>
<td>Retrieves a list of the subscriptions to a specific topic.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td></td>
<td>In your flow, use the Get Subscription Attributes action before this action to populate the required records.</td>
</tr>
<tr>
<td></td>
<td>Set Subscription Attributes</td>
<td>Enables a subscription owner to set an attribute of the subscription to a new value.</td>
</tr>
<tr>
<td><strong>Topics Management</strong></td>
<td>Create Topic</td>
<td>Creates a topic for which notifications can be published.</td>
</tr>
<tr>
<td></td>
<td>Delete Topic</td>
<td>Deletes a topic and all its subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Topic Attributes</td>
<td>Retrieves all properties of a topic. Topic properties retrieved may differ based on the authorization of the user.</td>
</tr>
<tr>
<td></td>
<td>List Topics</td>
<td>Retrieves a list of the requester's topics.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td></td>
<td>In your flow, use the Get Topic Attributes action before this action to populate the required records.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Delivery Policy</td>
<td>Enables a topic owner to set a delivery policy of the topic to a new value.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Display Name</td>
<td>Enables a topic owner to set a display name of the topic to a new value.</td>
</tr>
</tbody>
</table>
Note: Spoke actions can be used independently without subscribing to notifications from Amazon SNS.

Spoke module
The Amazon SNS spoke adds an AWS Configurations module to your ServiceNow instance. If you want receive events at your ServiceNow instance from Amazon SNS, you must specify the subflow internal name here. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon SNS spoke
Integrate the ServiceNow instance and Amazon SNS using AWS credential to authenticate ServiceNow requests.

Before you begin
- Request anIntegrationHub subscription
- Activate the Amazon SNS spoke
- Role required: admin

About this task
To receive events at your ServiceNow instance from Amazon SNS, see Receive events at your ServiceNow instance from Amazon SNS. Spoke set up described here enables you to use spoke subflow and actions.

Create Credential record for the Amazon SNS spoke
Create Credential record for your AWS account. The Amazon SNS spoke uses this credential to perform actions on Amazon SNS.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon SNS.
3. From the Credentials tab, click New.
The system displays the message What type of Credentials would you like to create?

4. Select AWS Credentials.

5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter SNS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select SNS Algorithm.</td>
</tr>
</tbody>
</table>

† Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.

Results
The credential record for the Amazon SNS spoke is created.

Receive events at your ServiceNow instance from Amazon SNS
Receive events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) from Amazon SNS at your ServiceNow instance.

Before you begin
• Request an IntegrationHub subscription
• Activate the Amazon SNS spoke
• Role required: admin

About this task
You can receive events at your ServiceNow instance from Amazon SNS even without setting up the Amazon SNS spoke. To set up the Amazon SNS spoke and use the spoke actions, see Set up the Amazon SNS spoke.
Create secret for the Amazon SNS spoke
Create a client secret to authorize requests from Amazon SNS.

Procedure
1. Navigate to System Definition > Scripts - Background.
2. Enter this command in the Run script (JavaScript executed on server) text field:
   \[\text{gs.info(GlideSecureRandomUtil.getSecureRandomString(32));}\]
3. Click Run Script.
4. Copy and record the generated value for later use.

Create a record in AWS Configurations
Create a record in AWS Configurations to authorise requests from Amazon SNS spoke.

Procedure
1. Navigate to AWS Configuration > All Configurations.
2. Click New.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property Value</td>
<td>Internal name of the Amazon SNS Subscription subflow. For example,</td>
</tr>
<tr>
<td></td>
<td>\text{amazon_sns_subscription.}</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note:</td>
<td>The Amazon SNS Subscription subflow is a sample subflow. You must create a copy of this subflow and use it to customize event management as per your requirement. In this case, specify the internal name of the customized subflow.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret generated by the script. For information about generating Client Secret see, Create secret for the Amazon SNS spoke.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

5. Right-click the form header and click **Copy sys_id**. Record this value for later use.

**Record the Base API path of the Amazon SNS spoke**

Record the Base API path of the Amazon SNS spoke to authorise requests from Amazon SNS.

**Procedure**

1. Navigate to **System Web Services > Scripted Web Services > Scripted REST APIs**.

2. Open the record for **Amazon SNS**.

3. Copy and record the value of **Base API path** for later use.

**Create topic**

Use the Create Topic spoke action to create a topic in Amazon SNS for your ServiceNow instance.
Procedure

1. In Flow Designer, create a flow and include the Create Topic spoke action. For information about creating flows in Flow Designer, see Flows.

2. Customize flow to provide these values as inputs to the Create Topic spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic Name</td>
<td>Name to identify the topic.</td>
</tr>
</tbody>
</table>

3. Test the flow and check the **Executions** tab to ensure that flow is executed as expected.

Create subscription

Use the Create Subscription spoke action to create subscription in Amazon SNS for your ServiceNow instance.

Procedure

1. In Flow Designer, create a flow and include the Create Subscription spoke action. For information about creating flows in Flow Designer, see Flows.

2. Customize flow to provide these values as inputs to the Create Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Protocol</td>
<td>HTTPS</td>
</tr>
</tbody>
</table>

**Note:** For information about obtaining the required values, see Record the Base API path of the Amazon SNS spoke, Create a record in AWS Configurations, and Create secret for the Amazon SNS spoke.
3. Test the flow.
   The flow internally triggers the default Amazon SNS Subscription subflow.

4. In the Executions tab, open the record associated with the subflow execution.
   
   **Note:** Ensure that you check the execution details of the default Amazon SNS Subscription subflow, not the flow you had created.

5. In the Execution Details page, click **RUNTIME VALUE**.

6. Copy and record the value of Token for later use. This confirmation token is needed to Confirm subscription.

   ![RUNTIME VALUE](image)

   **Note:** Ensure that you use the confirmation token to Confirm subscription within its validity period.

**Results**

Subscription for the required topic in Amazon SNS for your ServiceNow instance is created.

**Confirm subscription**

Use the Confirm Subscription spoke action to confirm subscription in Amazon SNS for your ServiceNow instance.

**Procedure**

1. In Flow Designer, create a copy of the default Amazon SNS Subscription subflow. For information about using subflows in Flow Designer, see **Subflows**.

2. In Flow Designer, create a flow that includes the copy of the default subflow. For information about creating flows in Flow Designer, see **Flows**.

3. Customize the subflow to include the Confirm Subscription spoke action.
4. Customize subflow to provide these values as inputs to the Confirm Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Token</td>
<td>Confirmation token generated after creating subscription. See Create subscription, for more information.</td>
</tr>
</tbody>
</table>

Note: Ensure that you use the confirmation token to confirm subscription within its validity period.

5. Test the flow and check the Executions tab to ensure that flow is executed as expected.

Results
The Amazon SNS subscription for your ServiceNow instance is confirmed.

Customize event management
Customize the management of events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) you receive for your ServiceNow instance from Amazon SNS.

Procedure
1. In Flow Designer, create a copy of the default subflow, Amazon SNS Subscription and customize the subflow as per your requirement. For more information about creating subflows, see Subflows.

2. Copy and record the internal name of the customized subflow.

3. Navigate to AWS Configuration > All Configurations.

4. Open the record you had created to receive events. In this record, the internal name of the default Amazon SNS Subscription subflow is specified in Property Value.

5. Update this record by replacing the internal name of default subflow with the internal name of the customized subflow in Property Value.

Note: Use the same Client Secret.
Results
The event management is customized as per your requirement.

Amazon VPC spoke v1.0.1
Provision a logically isolated section of the AWS cloud using Amazon VPC and launch the required AWS resources in a virtual network, from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version
This spoke was built for API version 2016-11-15, but may be compatible with later versions.

⚠️ Note: If you use different API version, ensure that you change the API version in all spoke actions.
Spoke requirements

- User with full access to Amazon VPC.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke subflows

The Amazon VPC spoke provides sample subflows to demonstrate automating Amazon VPC tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. Before you delete the subnet, you must terminate all the running instances in the subnet.</td>
</tr>
<tr>
<td>Delete VPC</td>
<td>Deletes the specified VPC. Before you delete the VPC, you must terminate all the associated instances.</td>
</tr>
</tbody>
</table>

Spoke actions

The Amazon VPC spoke provides actions to automate Amazon VPC tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network &amp; Security Group Management</td>
<td>Add Egress Rules To A Security Group</td>
<td>Adds the specified egress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Add Ingress Rules To A Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Creates a security group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Egress Rules From Security Group</td>
<td>Removes the specified egress rules from security group. Values must match the existing rule's values exactly.</td>
</tr>
<tr>
<td></td>
<td>Delete Ingress Rules From Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Delete Security Group</td>
<td>Deletes a security group.</td>
</tr>
<tr>
<td></td>
<td>List Security Groups</td>
<td>Lists the specified security groups or all of your security groups.</td>
</tr>
<tr>
<td></td>
<td>Lookup Security Group</td>
<td>Retrieves the specified security group.</td>
</tr>
<tr>
<td>Virtual Private Cloud Management</td>
<td>Create Subnet</td>
<td>Creates a subnet in an existing VPC.</td>
</tr>
<tr>
<td></td>
<td>Create VPC</td>
<td>Creates a VPC with the specified IPv4 CIDR block and can optionally request an IPv6 CIDR block for the VPC.</td>
</tr>
<tr>
<td></td>
<td>Delete NAT Gateway</td>
<td>Deletes the specified NAT gateway. Deleting a NAT gateway disassociates its Elastic IP address, but does not release it.</td>
</tr>
<tr>
<td></td>
<td>Delete Route Table</td>
<td>Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it.</td>
</tr>
<tr>
<td></td>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.</td>
</tr>
<tr>
<td></td>
<td>Delete VPC</td>
<td>Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it or use Delete VPC subflow.</td>
</tr>
</tbody>
</table>
## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

## Set up the Amazon VPC spoke

Integrate the ServiceNow instance and Amazon VPC using AWS credential to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription
- Activate the Amazon VPC spoke
- Role required: admin

Create Credential record for the Amazon VPC spoke

Create Credential record for your Amazon VPC account. The Amazon VPC spoke connection and credential alias uses this credential to perform actions on Amazon VPC.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon VPC.
3. From the Credentials tab, click New. The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter VPC Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonVPCAuthAlgo.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.
Results
The credential record the Amazon VPC spoke is created.

Ansible spoke v1.0.2
Integrate your ServiceNow instance with Ansible Tower. Automate Ansible Tower tasks when events occur in ServiceNow.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Supported version
This spoke was built for Ansible Tower v2, but may be compatible with later versions.

Spoke requirements
• Ansible Tower
• If you are using custom OAuth application:
  ◦ Ansible Tower administrator credentials to create a custom application
  ◦ Application information such as Client ID and Client Secret
• If you are using basic authentication, credentials of the user with System Administrator role to log in to Ansible Tower.

Spoke actions
The Ansible spoke provides actions to automate Ansible Tower tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible Tower</td>
<td>Cancel Job</td>
<td>Cancels the required job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Create Job Template</td>
<td>Creates a job template in Ansible Tower.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the required user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Job</td>
<td>Retrieves details of the required job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Status From Ad-Hoc Command</td>
<td>Retrieves the run status of an ad-hoc command.</td>
</tr>
<tr>
<td></td>
<td>Get User</td>
<td>Retrieves details of the required user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Launch Job Template</td>
<td>Launches a job template in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>List Hosts From Inventory</td>
<td>Retrieves list of hosts from an inventory in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>List Instance Groups From Inventory</td>
<td>Retrieves list of instance groups from an inventory in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>List Job Templates</td>
<td>Retrieves the list of job templates.</td>
</tr>
<tr>
<td></td>
<td>List Jobs</td>
<td>Retrieves the list of jobs.</td>
</tr>
<tr>
<td></td>
<td>List Users</td>
<td>Retrieves the list of users.</td>
</tr>
<tr>
<td></td>
<td>Relaunch Job</td>
<td>Relaunches job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Run An Ad-Hoc Command</td>
<td>Runs an ad hoc command on one or more target devices.</td>
</tr>
<tr>
<td></td>
<td>Schedule Job</td>
<td>Schedules a job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates details of the required user in the Ansible Tower environment.</td>
</tr>
</tbody>
</table>
### Metadata Retrieval

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Credentials</td>
<td>Get Inventories</td>
<td>Retrieves credentials in the Ansible Tower environment.</td>
</tr>
<tr>
<td>Get Inventories</td>
<td></td>
<td>Retrieves inventories in the Ansible Tower environment.</td>
</tr>
<tr>
<td>Get Projects</td>
<td></td>
<td>Retrieves projects in the Ansible Tower environment.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Ansible spoke

Integrate the ServiceNow instance and Ansible Tower by using the basic authentication or creating a custom OAuth application to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription
- Activate the Ansible spoke
- Role required: admin

**About this task**

- If you want to connect to the Ansible Tower through a MID Server, set up the Ansible spoke using basic authentication. For instructions, see Set up the Ansible spoke using basic authentication.
- If you want to directly connect to the Ansible Tower, set up the Ansible spoke using a custom OAuth application. For instructions, see Set up the Ansible spoke.
Note: You can use only one authentication at a time.

If you have configured two connection records using basic authentication and custom OAuth application, you must deactivate one of the connections to use the other connection record.

Set up the Ansible spoke using basic authentication

Integrate the ServiceNow instance and Ansible Tower by using the basic authentication to authenticate ServiceNow requests.

Create Credential record for the Ansible spoke

Create Credential record for the Ansible Tower. The Ansible spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Ansible Basic Auth Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to the Ansible Tower. Ensure that the Ansible user has the System Administrator role.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to the Ansible Tower.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
Create Connection record for the Ansible spoke

Create Connection record for the Ansible Tower. The Ansible spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Ansible.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Ansible Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Ansible Tower. For example, select Ansible Basic Auth Cred.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Ansible Tower instance.</td>
</tr>
</tbody>
</table>

5. In the Advanced MID Server Configuration tab, select the MID Server as per your requirement.

6. Click Submit.

Set up the Ansible spoke

Integrate the instance and Ansible Tower by creating a custom OAuth application to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription
- Activate the Ansible spoke
- Role required: admin
Create a custom application in Ansible Tower

Obtain OAuth 2 token by creating a custom application in Ansible Tower.

**Before you begin**
Role required: admin

**Procedure**

1. Create an application in Ansible Tower. See Ansible documentation for information on creating and configuring an application.
   a. Select **Authorization code** for Authorization Grant Type.
   b. Specify the ServiceNow instance URL in **Redirect URI** in this format, `https://<instance-name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect`. For more information on obtaining the Redirect URI, see Register Ansible Tower as OAuth provider.

2. Upon creating the application, access the application information.

3. Copy and record the Client ID and Client Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

**Results**
The custom OAuth application from your Ansible Tower is created and can be integrated with the ServiceNow instance.

**Register Ansible Tower as OAuth provider**

Use the information generated during Ansible Tower application configuration to register Ansible Tower as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for **Ansible**.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Ansible Tower OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the application in Ansible Tower.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the application in Ansible Tower.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Ansible Tower Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://&lt;Ansible-Tower-Instance&gt;.com/api/o/token/.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>
### Field | Value required
--- | ---
Use mutual authentication | Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

4. Right-click the form header, and click **Save**.

5. Paste the Redirect URL value into the Redirect URI for your custom Ansible Tower application. For example, paste `https://<instance-name>.service-now.com/api/sn_ansible_speak/ansible_oauth_redirect`.

**Results**
The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Create Credential record for the Ansible spoke**
Create Credential records for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Ansible**.
3. From the **Credentials** tab, click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Ansible Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Ansible spoke as an OAuth provider. For example, select <strong>Ansible OAuth profile</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

   **Note:** If you are setting up the spoke for the first time, you will be prompted to provide the ServiceNow instance credentials. Provide the credentials.

**Results**

The credential record the Ansible spoke spoke is created.

**Create Connection record for the Ansible spoke**

Create Connection record for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these connections to perform actions in Ansible Tower.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for **Ansible**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Ansible Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Ansible Tower. For example, select <strong>Ansible Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Ansible Tower instance.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Automation Anywhere spoke v1.0.23**

Manage workflows and robotics processes in Automation Anywhere instance from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Automation Anywhere spoke provides actions to automate Automation Anywhere tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bot Management</td>
<td>Deploy Bot</td>
<td>Deploys a bot in the bot runner devices.</td>
</tr>
<tr>
<td></td>
<td>Get Bot</td>
<td>Retrieves details of the specific bot.</td>
</tr>
<tr>
<td></td>
<td>Look up Bots</td>
<td>Retrieves information about all the bots.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Get Device Details</td>
<td>Retrieves details of the specific device.</td>
</tr>
<tr>
<td></td>
<td>Look up Devices</td>
<td>Retrieves details of all the devices.</td>
</tr>
<tr>
<td></td>
<td>Look up Pool</td>
<td>Retrieves details of the specified pool.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Get Folder</td>
<td>Retrieves details of the requested folder.</td>
</tr>
<tr>
<td></td>
<td>Look up Folders</td>
<td>Retrieves information about all the folders.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>Queue Management</td>
<td>Look up Queues</td>
<td>Retrieves all queues for the Enterprise Control Room.</td>
</tr>
<tr>
<td></td>
<td>Look up Work Items in Queue</td>
<td>Retrieves details of all the work items in a queue.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get User</td>
<td>Retrieves details of the requested user.</td>
</tr>
<tr>
<td></td>
<td>Look up Users</td>
<td>Retrieves details of all the users.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** Only users with bot runner or admin role can execute the spoke actions.

**Spoke module**

The Automation Anywhere spoke adds the Automation Anywhere application to your instance and includes the Authentication module. In this module, you should provide details in the default credential record to authentication the ServiceNow requests. See [Create a Credential record for the Automation Anywhere spoke](#) for more information.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Automation Anywhere spoke**

Integrate ServiceNow and Automation Anywhere instances by using the Automation Anywhere credential record to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Automation Anywhere spoke.
- Role required: admin

**Create a Credential record for the Automation Anywhere spoke**

Create a credential record for the Automation Anywhere instance. The Automation Anywhere spoke connection and credential alias uses these credentials to authorize actions.
Procedure

1. Navigate to Automation Anywhere > Authentications.
2. Open the record, Automation Anywhere Credential.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Default name of the credential record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Users are cautioned against modifying the default credential name.</td>
</tr>
<tr>
<td>User Name</td>
<td>Credentials to log in to your Automation Anywhere instance.</td>
</tr>
<tr>
<td>Password</td>
<td></td>
</tr>
<tr>
<td>Credential alias</td>
<td>Default credential alias available along with the Automation Anywhere spoke. For example, select sn_autoanywher_spk.Automation_Anywhere.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Custom authentication algorithm for outbound signing requests. Select Automation Anywhere.</td>
</tr>
<tr>
<td>Algorithm</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to your Automation Anywhere instance.</td>
</tr>
<tr>
<td>Dedicated</td>
<td>Option to specify if you are using a dedicated user for the purpose of integrating Automation Anywhere and ServiceNow instances.</td>
</tr>
<tr>
<td>Integration User</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>- The dedicated user mentioned here, should be used only for the purpose of integrating Automation Anywhere with ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>- If you aren’t using a dedicate user, the ServiceNow instance makes 2 or 3 API calls to execute an action.</td>
</tr>
<tr>
<td></td>
<td>- If you are using a dedicated user, the ServiceNow instance makes only one API call to execute an action.</td>
</tr>
</tbody>
</table>
4. Right-click the form header and click **Save**.

5. Click **Get Token**.

   **Note:** This step is applicable when you select the **Dedicated Integration User** check box.

   The confirmation message, **Token retrieval successful** is displayed.

**AWS Certificate Manager spoke**

Manage certificates in AWS Certificate Manager account from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history** release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**

This spoke was built for AWS Certificate Manager API version 2015-12-08, but may be compatible with later versions.

**Spoke requirements**

- User with full access to AWS Certificate Manager.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

   For more information about creating user in IAM and providing the required access, see **Understanding and Getting Your Security Credentials** page on the **AWS Documentation** site.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The AWS Certificate Manager spoke provides actions to automate AWS Certificate Manager tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate Management</td>
<td>Delete Certificate</td>
<td>Deletes a certificate and its associated private key.</td>
</tr>
<tr>
<td></td>
<td>Get Certificate</td>
<td>Retrieves an Amazon-issued certificate and its certificate chain.</td>
</tr>
<tr>
<td></td>
<td>Get Certificate Details</td>
<td>Retrieves detailed metadata about the specified ACM certificate.</td>
</tr>
<tr>
<td></td>
<td>Import Certificate</td>
<td>Imports a certificate to AWS Certificate Manager (ACM) to use with services that are integrated with ACM.</td>
</tr>
<tr>
<td></td>
<td>Look up Certificates</td>
<td>Retrieves a list of certificate ARNs and domain names.</td>
</tr>
<tr>
<td></td>
<td>Request Certificate</td>
<td>Requests an ACM certificate for use with other AWS services.</td>
</tr>
<tr>
<td></td>
<td>Resend Validation Email</td>
<td>Resends the email that requests domain ownership validation.</td>
</tr>
</tbody>
</table>
### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the AWS Certificate Manager spoke

Integrate the ServiceNow instance and AWS Certificate Manager by using the AWS credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate AWS Certificate Manager spoke.
- Role required: admin

**Create a credential record for the AWS Certificate Manager spoke**

Create a credential record for the AWS Certificate Manager account. The AWS Certificate Manager spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays this message: What type of Credentials would you like to create?

3. Select **AWS Credentials**.

4. On the form, fill these values.

**AWS Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Certificate Manager.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Certificate Manager.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AWS Certificate Manager</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

| Credential alias | Credential alias associated with the spoke.                               |

5. Click **Save**.

**AWS CloudFormation spoke**

Model and provision AWS resources in your cloud environment using AWS CloudFormation from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.
Supported versions
This spoke was built for AWS CloudFormation API version 2010-05-15, but may be compatible with later versions.

Spoke requirements
• User with full access to AWS CloudFormation.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The AWS CloudFormation spoke provides actions to automate AWS CloudFormation tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Set Management</td>
<td>Create Change Set</td>
<td>Creates a list of changes that will be applied to a stack so that you can review the changes before executing them.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Change Set</td>
<td>Deletes the specified change set.</td>
</tr>
<tr>
<td></td>
<td>Execute Change Set</td>
<td>Updates the stack using the input information that was provided when the specified change set was created.</td>
</tr>
<tr>
<td></td>
<td>Get Change Set</td>
<td>Returns the details of the specified change set.</td>
</tr>
<tr>
<td></td>
<td>Look up Change Sets</td>
<td>Returns basic information of each active change set for a stack.</td>
</tr>
<tr>
<td>Stack Management</td>
<td>Cancel Update Stack</td>
<td>Cancels an update on the specified stack.</td>
</tr>
<tr>
<td></td>
<td>Continue Update Rollback</td>
<td>For the specified stack that is in the UPDATE_ROLLBACK_FAILED state, continues rolling the state back to the UPDATE_ROLLBACK_COMPLETE state.</td>
</tr>
<tr>
<td></td>
<td>Create Stack</td>
<td>Creates a stack as specified in the template.</td>
</tr>
<tr>
<td></td>
<td>Delete Stack</td>
<td>Deletes the specified stack.</td>
</tr>
<tr>
<td></td>
<td>Get Stack Policy</td>
<td>Returns the stack policy for a specified stack.</td>
</tr>
<tr>
<td></td>
<td>Get Template</td>
<td>Returns the template body for a specified stack.</td>
</tr>
<tr>
<td></td>
<td>Look up Stack Events</td>
<td>Returns all stack related events for a specified stack in reverse chronological order.</td>
</tr>
<tr>
<td></td>
<td>Look up Stack Resources</td>
<td>Returns details of all resources of the specified stack.</td>
</tr>
<tr>
<td></td>
<td>Look up Stacks</td>
<td>Returns the details for the specified stack.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Set Stack Policy</td>
<td>Sets policy for the specified stack.</td>
<td></td>
</tr>
<tr>
<td>Update Stack</td>
<td>Updates the specified stack.</td>
<td></td>
</tr>
</tbody>
</table>

**Stack Set Management**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Stack Instance</td>
<td>Creates stack instances for the specified accounts, within the specified regions.</td>
</tr>
<tr>
<td>Create Stack Set</td>
<td>Creates Stack set in the specified region.</td>
</tr>
<tr>
<td>Delete Stack Instance</td>
<td>Deletes stack instances for the specified accounts, in the specified regions.</td>
</tr>
<tr>
<td>Delete Stack Set</td>
<td>Deletes the specified Stack set.</td>
</tr>
<tr>
<td>Get Stack Set</td>
<td>Returns the details of the specified stack set.</td>
</tr>
<tr>
<td>Look up Stack Instances</td>
<td>Returns information about stack instances that are associated with the specified stack set.</td>
</tr>
<tr>
<td>Look up Stack Sets</td>
<td>Returns summary information about all the stack sets or the stack sets with the specified Status.</td>
</tr>
<tr>
<td>Update Stack Set</td>
<td>Updates the specified stack set and associated stack instances in the specified accounts and Regions.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the AWS CloudFormation spoke**

Integrate the ServiceNow instance and AWS CloudFormation using AWS credential to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription
- Activate the AWS CloudFormation spoke
- Role required: admin

Create Credential record for the AWS CloudFormation spoke

Create Credential record for your AWS CloudFormation account. The AWS CloudFormation spoke connection and credential alias uses this credential to perform actions in AWS CloudFormation.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Amazon VPC.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter CloudFormation Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS CloudFormation.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS CloudFormation.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AWS_CloudFormation.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.
Results
The credential record the AWS CloudFormation spoke is created.

AWS Elastic Beanstalk spoke
AWS Elastic Beanstalk enables you to quickly deploy and manage applications in the Amazon AWS Cloud. Elastic Beanstalk reduces management complexity without restricting choice or control. When you upload your application, Elastic Beanstalk automatically handles capacity provisioning, load balancing, scaling, and application health monitoring.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**AWS Elastic Beanstalk account requirements**

The AWS Elastic Beanstalk spoke requires a credential that you create in the Amazon Web Services Management Console.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Create Credential record for the AWS Elastic Beanstalk spoke

Create Credential records to integrate AWS Elastic Beanstalk with ServiceNow. The AWS Elastic Beanstalk connection and credential aliases use these credentials to authorize actions. Once connected, Elastic Beanstalk uses basic authentication to authenticate ServiceNow requests.

Before you begin
To set up the AWS Elastic Beanstalk spoke, you must be able to configure security credentials in Amazon Web Services and have a ServiceNow admin role.

- Role required: admin
- Request IntegrationHub subscription
- Activate AWS Elastic Beanstalk spoke

Procedure
2. From the menu under your user name, select My Security Credentials.
3. Click Create access key.
4. Copy the access key ID and the secret access key to a text file. You can only show the secret access key once, but you can delete and create keys if necessary.
5. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and click New.
7. Enter a unique name for the credential, for example, Elastic Beanstalk 01.
8. Enter the Access Key ID and Secret Access Key of the access key you created in the AWS console.
9. In the box labeled Credential alias, enter sn_aws_beanstk_spk.AWS_Elastic_Beanstalk.
10. In the box labeled Authentication Algorithm, enter AmazonElasticBeanstalkAuthAlgo.
11. Click Submit.

Results
The AWS Elastic Beanstalk spoke is set up and integrated with the ServiceNow instance.
AWS Elastic Load Balancing spoke
Manage load balancers, tags, and target groups in AWS account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for AWS Elastic Load Balancing API version 2012-06-01.

Spoke requirements
• User with full access to AWS Elastic Load Balancing.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
**Spoke actions**

The AWS Elastic Load Balancing spoke provides actions to automate AWS Elastic Load Balancing tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Load Balancer Management</td>
<td>Create Load Balancer</td>
<td>Creates an application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Create Load Balancer Listener</td>
<td>Creates a listener for the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Delete Load Balancer</td>
<td>Deletes the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Delete Load Balancer Listener</td>
<td>Deletes the specified listener.</td>
</tr>
<tr>
<td></td>
<td>Get Account Limits</td>
<td>Lists the Elastic Load Balancing resource limits for the AWS account.</td>
</tr>
<tr>
<td></td>
<td>Get Load Balancer Attributes</td>
<td>Lists the attributes for the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Listeners</td>
<td>Retrieves list of the specified listeners for the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Load Balancers</td>
<td>Retrieves list of the specified load balancers or all the load balancers.</td>
</tr>
<tr>
<td></td>
<td>Look up SSL Policies</td>
<td>Lists all policies used for SSL negotiation.</td>
</tr>
<tr>
<td></td>
<td>Update Load Balancer Attributes</td>
<td>Updates the specified attributes of the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td>Tag Management</td>
<td>Add Tags</td>
<td>Adds the specified tags to the specified Elastic Load Balancing resource.</td>
</tr>
<tr>
<td></td>
<td>Delete Tags</td>
<td>Removes the specified tags from the specified Elastic Load Balancing resource.</td>
</tr>

<tr>
<td><strong>Update Target Group</strong></td>
<td></td>
<td>Updates the health checks used for evaluating the health state of the targets in the specified target group.</td>
</tr>
<tr>
<td><strong>Update Target Group Attribute</strong></td>
<td></td>
<td>Updates the specified attributes of the specified target group.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the AWS Elastic Load Balancing spoke**

Integrate the ServiceNow instance and AWS Elastic Load Balancing account using AWS credential to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription
- Activate the AWS Elastic Load Balancing spoke
- Role required: admin

Create Credential record for the AWS Elastic Load Balancing spoke

Create credential record for the AWS Elastic Load Balancing account. The AWS Elastic Load Balancing spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record, AWS_Elastic_Load_Balancing.
3. In the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Elastic Load Balancing Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Elastic Load Balancing.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Elastic Load Balancing.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonElasticLoadBalancingAuthAlgo.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Right-click the form header and click Submit.
AWS IAM spoke v1.0.2
Integrate ServiceNow instance with AWS IAM to manage access to AWS services and resources securely. Manage groups, policies, and roles in AWS IAM from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version
This spoke was built for API version 2010-05-08, but may be compatible with later versions.

ℹ️ Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements
• User with full access to IAM.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke subflows
The Jenkins spoke provides sample subflows to demonstrate automating AWS IAM tasks. Available subflows are:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Group</td>
<td>Deletes the specified AWS IAM group.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the specified AWS IAM user.</td>
</tr>
</tbody>
</table>
Subflow | Description
--- | ---
Delete Policy | Deletes the specified policy from the AWS IAM account.

**Spoke actions**
The AWS IAM spoke provides actions to automate AWS IAM tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds user to a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group</td>
<td>Searches for the required group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group Users</td>
<td>Lists all the users in the required group.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in AWS IAM.</td>
</tr>
<tr>
<td>Group Policy Management</td>
<td>Attach Inline Policy In Group</td>
<td>Adds or updates an inline policy document embedded in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Attach Policy To Group</td>
<td>Attaches the specified managed policy to the required IAM group.</td>
</tr>
<tr>
<td></td>
<td>Detach Inline Policy From Group</td>
<td>Deletes the specified inline policy from the specified AWS IAM group</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Group</td>
<td>Detaches the specified managed policy from the required IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Attached Group Policies</td>
<td>Retrieves the list of all policies attached to the IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Group Policies</td>
<td>Retrieves all the inline policies of the specified group. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td>Policy Management</td>
<td>Create Policy</td>
<td>Creates managed policy in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Delete Policy</td>
<td>Deletes specified Policy from AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Roles</td>
<td>Detaches the specified managed policy from the specified IAM Role.</td>
</tr>
<tr>
<td></td>
<td>List Entities For Policy</td>
<td>Lists all entities (Users, Group, and Roles) attached to this policy.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Deactivate MFA Device</td>
<td>Deactivates the required MFA device attached to a user.</td>
</tr>
<tr>
<td></td>
<td>Delete Access Key For User</td>
<td>Deletes the access key of the AWS IAM user.</td>
</tr>
<tr>
<td></td>
<td>Delete Login Profile</td>
<td>Deletes the password for the specified IAM user, which terminates the user's ability to access AWS services through the AWS Management Console.</td>
</tr>
<tr>
<td></td>
<td>Delete Service Specific Credential</td>
<td>Deletes the required service-specific credential.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Delete Signing Certificate</td>
<td>Deletes a signing certificate associated with the specified IAM user.</td>
<td></td>
</tr>
<tr>
<td>Delete SSH Public Key</td>
<td>Deletes the specified SSH public key.</td>
<td></td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the required IAM User.</td>
<td></td>
</tr>
<tr>
<td>Delete Virtual MFA Device By User</td>
<td>Deletes the specified Virtual MFA device.</td>
<td></td>
</tr>
<tr>
<td>Detach Policy From User</td>
<td>Detaches the specified managed policy from the specified IAM role.</td>
<td></td>
</tr>
<tr>
<td>Get User</td>
<td>Searches for the required user in the AWS IAM.</td>
<td></td>
</tr>
<tr>
<td>List Access Keys By User</td>
<td>Lists the access key of the AWS IAM user.</td>
<td></td>
</tr>
<tr>
<td>List Groups For User</td>
<td>Retrieves the list of all the groups, a particular user belongs to.</td>
<td></td>
</tr>
<tr>
<td>List Inline User Policies</td>
<td>Retrieves all the inline policies of the specified IAM user. If none exists, the operation returns an empty list.</td>
<td></td>
</tr>
<tr>
<td>List MFA Devices By User</td>
<td>Retrieves information about the MFA services associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
<td></td>
</tr>
<tr>
<td>List Service Specific Credentials</td>
<td>Retrieves information about the service-specific credentials associated with the specified IAM user.</td>
<td></td>
</tr>
<tr>
<td>List Signing Certificates By User</td>
<td>Retrieves information about the signing certificates associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
<td></td>
</tr>
<tr>
<td>List SSH Public Keys By User</td>
<td>Retrieves information about the SSH public keys associated with the specified IAM user. If none exists, the operation returns an empty list.</td>

</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Policy Management</td>
<td>Attach Policy To User</td>
<td>Attaches the specified managed policy to the specified user.</td>
</tr>
<tr>
<td></td>
<td>Delete Inline User Policy</td>
<td>Deletes an inline policy attached to the user.</td>
</tr>
<tr>
<td></td>
<td>List Attached User Policies</td>
<td>Retrieves all the attached policies of the user.</td>
</tr>
<tr>
<td>Role Management</td>
<td>List Roles</td>
<td>Retrieves list of all roles.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the AWS IAM spoke**

Integrate the ServiceNow instance and AWS IAM using AWS credential to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription
- Activate the AWS IAM spoke
- Role required: admin

**Create Credential record for the AWS IAM spoke**

Create Credential record for your AWS IAM account. The AWS IAM spoke connection and credential alias uses this credential to perform actions on AWS IAM.
Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for AWS IAM.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AWS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to IAM.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to IAM.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AWS IAM Auth Algo.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.

Results
The credential record the AWS IAM spoke is created.

AWS Lambda spoke v1.1.0
Manage alias and function in AWS Lambda from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- AWS IAM Spoke (sn_aws_iam_spoke)

⚠ **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported version**

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

⚠ **Note:** If you use different API version, ensure that you change the API version in all spoke actions.

**Spoke requirements**

- User with full access to Lambda.

⚠ **Note:** The AWSLambdaFullAccess IAM policy must be assigned to the user. See Identity-based IAM policies for AWS Lambda for more information about the IAM policy.

- Access Key ID and Secret Access Key of the user as obtained in the IAM Console. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.
### Spoke actions

The AWS Lambda spoke provides actions to automate AWS Lambda tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias Management</td>
<td>Create Function Alias</td>
<td>Creates an alias for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Delete Function Alias</td>
<td>Deletes the specified alias of the function.</td>
</tr>
<tr>
<td></td>
<td>Get Function Alias Details</td>
<td>Retrieves the details of the specified function alias.</td>
</tr>
<tr>
<td></td>
<td>List Function Aliases</td>
<td>Retrieves the list of all aliases for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Update Function Alias</td>
<td>Updates settings of the specified alias.</td>
</tr>
<tr>
<td>Function Management</td>
<td>Add Permission</td>
<td>Grants an AWS service or another account permission to use the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>Create Function</td>
<td>Creates a function in AWS Lambda.</td>
</tr>
<tr>
<td></td>
<td>Delete Function</td>
<td>Deletes the specified AWS Lambda function or function version.</td>
</tr>
<tr>
<td></td>
<td>Get Function Details</td>
<td>Retrieves details of the specified AWS Lambda function or function version.</td>
</tr>
<tr>
<td></td>
<td>Invoke Function</td>
<td>Invokes the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>List Functions</td>
<td>Retrieves list of all AWS Lambda functions in a region.</td>
</tr>
<tr>
<td></td>
<td>Update Function Code</td>
<td>Updates code of the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>Update Function Configuration</td>
<td>Updates configuration of the specified AWS Lambda function.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the AWS Lambda spoke

Integrate the ServiceNow instance and AWS Lambda account using AWS credential to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription
- Activate the AWS IAM spoke v1.0.2
- Activate the AWS Lambda spoke
- Role required: admin

Create Credential record for the AWS Lambda spoke

Create Credential record for your AWS Lambda account. The AWS Lambda spoke connection and credential alias uses this credential to perform actions on AWS Lambda.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon Lambda.
3. From the Credentials tab, click New.
   The system displays the message: What type of Credentials would you like to create?
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Lambda.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Lambda.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Lambda.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential records of the AWS IAM spoke and AWS Lambda spoke.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AWS IAM Auth Algo.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

**Results**
The credential record the AWS Lambda spoke is created.

**AWS OpsWorks spoke**
Manage elastic load balancers, instances, relational database services, and others in AWS OpsWorks account from the ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Supported versions
This spoke was built for AWS OpsWorks API version 2013-02-18, but may be compatible with later versions.

Spoke requirements
• User with full access to AWS OpsWorks
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Azure Automation spoke**

Integrate the ServiceNow instance and Azure Automation by creating a custom OAuth application in Azure portal to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription.
- Activate Azure Automation spoke.
- Role required: admin

Register Azure Automation as an OAuth provider

Register Azure Automation as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Procedure

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for Azure Resource Management.
3. On the form, fill these values.

Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Azure Automation OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Azure Automation application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Secret ID created during the Azure Automation application configuration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;directory-id&gt;/oauth2/v2.0/token and replace &lt;directory-id&gt; with the Directory ID of your Azure Automation account.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>
Create a credential record for the Azure Automation spoke

Create a credential record for the Azure Automation account. The Azure Automation spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Open the Azure_Automation_Spoke record.
3. In the Credentials tab, click New.
   
   The system displays this message: What type of Credentials would you like to create?

4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.

   OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Azure Automation Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Automation application as an OAuth provider. Enter Azure Resource Management default_profile OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use this credential in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke. Click the lock icon and enter sn_azure_rm_spoke.Azure_Resource_Management</td>
</tr>
</tbody>
</table>

Note: Make sure that

sn_azure_auto_spke.Azure_Automation_Spoke
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>alias is already added.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Submit**.

7. To generate the OAuth token, click the **Get OAuth Token** related link.

**Azure DevOps Boards spoke v1.6.3**

Automate the process of managing work items in Azure DevOps Boards from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see **Request IntegrationHub**.

> Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

**Supported versions**

This spoke was built for Azure DevOps Boards REST API version 4.1 and TFS 2018 Update 3, but may be compatible with later versions.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

> Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
**Spoke requirements**

- Azure DevOps instance
- Personal access tokens (PATs) to authenticate Azure DevOps

See Azure DevOps documentation for information about creating personal access token.

**Spoke actions**

The Azure DevOps Boards spoke provides actions to manage work items when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Core Process Management</td>
<td>Create Iteration</td>
<td>Creates an Azure DevOps iteration.</td>
</tr>
<tr>
<td></td>
<td>Delete Iteration</td>
<td>Deletes an Azure DevOps iteration by path.</td>
</tr>
<tr>
<td></td>
<td>Post Iteration to Team</td>
<td>Adds an Azure DevOps iteration to an Azure DevOps team.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Revisions</td>
<td>Adds reporting work-item revisions for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Links</td>
<td>Adds reporting work-item links for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Update Iteration</td>
<td>Updates the name, start date, and end date for an Azure DevOps iteration.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Delink Iterations From A Team</td>
<td>Delinks Azure DevOps iterations from a team.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of all fields in a required Azure DevOps project.</td>
</tr>
<tr>
<td></td>
<td>Get Area Paths of a Team</td>
<td>Retrieves the details of all area paths related to a team.</td>
</tr>
</tbody>
</table>

<td>Add Attachment</td>
<td>Adds an attachment associated with a ServiceNow record to the required work item on the Azure DevOps instance.</td>
</tr>
<tr>
<td></td>
<td>Move To Project</td>
<td>Moves between projects in the same organization.</td>
</tr>
<tr>
<td></td>
<td>Register Service Hook</td>
<td>Registers webhooks for the required project.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

If you want to use different connections in your flow, subflows, and actions, create the child alias and select the default alias record as its parent. To configure the child alias, perform the same steps that are needed to configure the parent alias. Depending on your requirement and set up, you can choose either the parent alias or child alias in your flow, subflows, and actions.

You can also use multiple Azure DevOps accounts. In this case, you should provide the respective **Password** while configuring the credential record and specify the relevant **Connection URL** while configuring the connection record. For more information, see [Set up Azure DevOps Boards spoke](#).
Set up Azure DevOps Boards spoke

Integrate the ServiceNow instance and Azure DevOps Boards using basic authentication to authenticate ServiceNow requests.

Before you begin

• Request IntegrationHub subscription
• Activate Azure DevOps Boards spoke
• Role required: admin

About this task

If you want to use different connections in your flow, subflows, and actions, create the child alias and select the default alias record as its parent. To configure the child alias, perform the same steps that are needed to configure the parent alias. Depending on your requirement and set up, you can choose either the parent alias or child alias in your flow, subflows, and actions.

You can also use multiple Azure DevOps accounts. In this case, you should provide the respective Password while configuring the credential record and specify the relevant Connection URL while configuring the connection record.

Obtain the personal access token

Authenticate Azure DevOps Boards by using the personal access tokens.

Before you begin

Role required: admin

Procedure

1. Log in to your Azure DevOps portal as an admin.
2. Navigate to User Settings > Personal access tokens.
3. Click **New Token**.

4. On the form, fill the required fields.

5. Click **Create**.
The token is displayed.

6. Copy and record the value of token for later use.

Create Credential records for the Azure DevOps Boards spoke

Create Credential records for the Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.

   The system displays the message What type of Credentials would you like to create?.

3. Select Basic Auth Credentials.

4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Azure DevOps Boards Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your Azure DevOps instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Personal access token to authenticate Azure DevOps.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

### Create Connection records for the Azure DevOps Boards spoke

Create Connection records to your Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these connections to perform actions in the Azure DevOps instance.

#### Procedure

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Azure DevOps Boards**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Azure DevOps Boards Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Azure DevOps Boards. For example, select <strong>Azure DevOps Boards Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Azure DevOps instance. For example, <strong><a href="https://dev.azure.com/">https://dev.azure.com/</a>&lt;instance-name&gt;</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

### Azure Traffic Manager spoke v1.0.1

Integrate ServiceNow instance with Azure Traffic Manager. Manage DNS-based traffic distribution and load balancing from your ServiceNow instance.

### Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Azure Traffic Manager 2018-04-01, but may be compatible with later versions.

Spoke requirements
• Client ID and Client Secret of the Azure Traffic Manager registered in the Azure portal.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• Microsoft Azure Resource Management Spoke 1.0.3 (sn_azure_rm_spoke)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Azure Traffic Manager Spoke provides actions to automate DNS-based traffic load balancing tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoint</td>
<td>Creates a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoint</td>
<td>Deletes a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Get Endpoint</td>
<td>Retrieves the details of a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Update Endpoint</td>
<td>Updates the details of a traffic manager endpoint.</td>
</tr>
<tr>
<td>Profile Management</td>
<td>Check DNS Availability</td>
<td>Checks the availability of a traffic manager relative Domain Name System (DNS) name.</td>
</tr>
<tr>
<td></td>
<td>Create Profile</td>
<td>Creates a traffic manager profile.</td>
</tr>
<tr>
<td></td>
<td>Delete Profile</td>
<td>Deletes a traffic manager profile.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Profile</td>
<td>Retrieves the details of a traffic manager profile.</td>
</tr>
<tr>
<td></td>
<td>Look up Profiles By Resource Group</td>
<td>Retrieves all traffic manager profiles within a resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Profiles By Subscription</td>
<td>Retrieves a list of traffic manager profiles within a subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Profile</td>
<td>Updates the details of a traffic manager profile.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Azure Traffic Manager spoke

Integrate the ServiceNow instance and Azure Traffic Manager by creating a custom OAuth application in Azure Traffic Manager to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Azure Traffic Manager Spoke.
- Role required: admin

**Register Azure Traffic Manager as an OAuth provider**

Register Azure Traffic Manager as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

**Procedure**

1. Navigate to System OAuth > Application Registry.
3. On the form, fill these values.
## Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during the Azure Traffic Manager application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key Value created during the Azure Traffic Manager application configuration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;directory-id&gt;/oauth2/v2.0/token and replace &lt;directory-id&gt; with the Directory ID of your Azure Traffic Manager account.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do and replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

### Create a credential record for the Azure Traffic Manager spoke

Create a credential record for the Azure Traffic Manager account. The Azure Traffic Manager connection and credential alias uses these credentials to authorize actions.

#### Procedure

1. Navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases**.
2. Open the **Azure_Traffic_Manager** record.
3. In the Credentials tab, click **New**.

   The system displays this message: What type of Credentials would you like to create?

4. Select **OAuth 2.0 Credentials**.
5. On the form, fill in these fields.
### OAuth 2.0 Credentials fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Traffic Manager.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the credential active.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Traffic Manager application as an OAuth provider. Enter Azure Resource Management default_profile</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to assign the credential to all MID servers, or only specified MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>The order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias of the dependant Azure Resource Management spoke. Click the lock icon and enter sn_azure_rm_spoke.Azure_Resource_Management</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

### BigFix Inventory spoke v1.0.1

Manage hardware, software, and licenses in BigFix Inventory from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Streaming (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions
This spoke was built for BigFix Inventory version 9.2.16.0, but may be compatible with later versions.

Spoke requirements
• BigFix Inventory Management account

Spoke flows and subflows
This spoke has no flows and subflows.

Spoke actions
The BigFix Inventory spoke provides actions to automate BigFix Inventory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
<td>List Hardware Inventory</td>
<td>Retrieves the list of hardware records from the BigFix Inventory.</td>
</tr>
</tbody>
</table>
### Spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>List Shared Disks</td>
<td>Retrieves the list of shared disks from the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>Look Up BIOS Details By Computer ID</td>
<td>Retrieves the Basic Input-Output System (BIOS) details of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Computer Hardware Fields By Computer ID</td>
<td>Retrieves the list of logical partitions of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up IP Addresses By Computer ID</td>
<td>Retrieves the list of Internet Protocol addresses (IP addresses) of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Logical Partitions By Computer ID</td>
<td>Retrieves the list of logical partitions of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Memory Details By Computer ID</td>
<td>Retrieves the memory details of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Network Adapters By Computer ID</td>
<td>Retrieves the list of network adapters of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Operating System Details By Computer ID</td>
<td>Retrieves the operating system details of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Physical Partition Details By Computer ID</td>
<td>Retrieves the physical partitions of the specified computer ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Processor Details By Computer ID</td>
<td>Retrieves the processor details of the specified computer ID.</td>
</tr>
</tbody>
</table>
Spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>

<tr>
<td></td>
<td>List VM Managers</td>
<td>Retrieves the list of Virtual Machine (VM) managers.</td>
</tr>
<tr>
<td></td>
<td>Look Up IBM Product Release By Product ID</td>
<td>Retrieves the list of releases associated with an IBM software.</td>
</tr>
<tr>
<td></td>
<td>Look Up IBM Product Release Instances By Release ID</td>
<td>Retrieves the list of instances associated with an IBM software release.</td>
</tr>
</tbody>
</table>

Set up the BigFix Inventory spoke

Integrate the ServiceNow instance and BigFix Inventory using an API key for authenticating ServiceNow requests.
Before you begin
- Request IntegrationHub subscription
- Activate the BigFix Inventory spoke
- Role required: admin

Configure BigFix Inventory
Create a BigFix Inventory instance to generate an access token for API key authentication.

Before you begin
BigFix Inventory Requirements:
- BigFix Inventory account
- BigFix Inventory administrator credentials

Complete these steps from your BigFix Inventory environment. For more information on installation and configuration, see BigFix V9.5 Inventory Documentation.

Procedure
1. Generate an access token to interact with BigFix Inventory APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the BigFix Inventory spoke
Create Credential records for the BigFix Inventory spoke. The BigFix Inventory spoke connection and credential aliases use these credentials to authorize ServiceNow actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. On the form, fill these fields:
### Create Connection records for the BigFix Inventory spoke

Create Connection records to your BigFix Inventory account. The BigFix Inventory spoke connection and credential aliases use these connections to perform actions in the BigFix Inventory.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for BigFix_Inventory.
3. From the **Connections** tab, click New.
   
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, BigFix Inventory Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record of BigFix Inventory. For example, BigFix Inventory Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Default value is sn_bigfix_in_spoke.BigFix_Inventory.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Do not change the default value for this field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the connection as active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Application scope of the connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to auto-generate the URL based on the inputs. Default is unchecked. When this option is selected, the <strong>Connection URL</strong> is disabled. If selected, define the associated fields.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL for creating the connection. For example, <a href="https://bigfixtestsserver.eastus.cloudapp.server.com:9081/api">https://bigfixtestsserver.eastus.cloudapp.server.com:9081/api</a></td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. If selected, define fields in the <strong>Advance MID Server Configuration</strong> section.</td>
</tr>
<tr>
<td>u_version</td>
<td>Version of the API. Default value is 2.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Blue Prism spokev1.0.1**

Manage jobs and processes in Blue Prism environment from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

ℹ️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported Versions**
This spoke was built for Blue Prism Process Dispatch Framework version 2.6, but may be compatible with later versions.

**Spoke Requirements**
- Blue Prism account

**Spoke flows and subflows**
This spoke has no flows and subflows.

**Spoke actions**
The Blue Prism spoke provides actions to automate Blue Prism tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Management</td>
<td>Get Job Status</td>
<td>Retrieves the status of the specified job.</td>
</tr>
<tr>
<td></td>
<td>List Job Outputs</td>
<td>Retrieves the list of outputs of a job associated with the specified session ID.</td>
</tr>
</tbody>
</table>
Spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Start Job</td>
<td>Executes a job with the specified inputs on the Blue Prism environment.</td>
</tr>
<tr>
<td>Process Management</td>
<td>Get Process Parameters</td>
<td>Retrieves the list of parameters for the specified process on the Blue Prism environment.</td>
</tr>
<tr>
<td></td>
<td>List Processes</td>
<td>Retrieves the list of processes on the Blue Prism environment.</td>
</tr>
<tr>
<td>Utilities</td>
<td>Generate Collection Inputs</td>
<td>Creates a formatted string of the collection type. This formatted string is used as input for the Start Job action.</td>
</tr>
</tbody>
</table>

**MID Server requirements**

These actions use REST calls, which run on MID Server. Use the connection record that is associated with the Blue Prism Inventory alias to configure where actions run as well as to set MID Server selection attributes. For more information, see [MID server](#).

**Set up the Blue Prism spoke**

Integrate the ServiceNow instance and Blue Prism environment to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Role required: admin

**Configure Blue Prism application**

Configure the Dispatch Framework and Process info utilities in your Blue Prism environment to enable integration with ServiceNow.

**Before you begin**

Blue Prism Digital Exchange account
Procedure
1. Log in to Blue Prism Digital Exchange.
2. Click **Link to Asset** of **Dispatch Framework** utility.
   You are redirected to Dispatch Framework repository on GitHub.
4. Click **Link to Asset** of **Process Info** utility.
   You are redirected to Process Info repository on GitHub.
5. Complete the steps mentioned in the Blue Prism Process Info VBO User Guide.
   Your Blue Prism environment is ready for integration with your ServiceNow instance.

**Create Connection and Credential Alias for Blue Prism ProcessInfo**
Connection to Blue Prism ProcessInfo utility is required for integration.

Procedure
1. Navigate to **Connections & Credentials > Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessInfo**.
3. From **Related Links** section, Click **Create New Connection & Credential**.
   The Create Connection and Credential modal appears.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. Default value is Blue Prism Process Info Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL used for creating connection to Blue Prism environment.</td>
</tr>
<tr>
<td>Database Credential Name</td>
<td>Credential name of the database. Default value is DB Read User.</td>
</tr>
<tr>
<td>Database Server Address</td>
<td>Database server address in Blue Prism environment.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Name of the database. Default value is BluePrism.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Blue Prism Process Info Credentials.</td>
</tr>
</tbody>
</table>
Create Connection and Credential Alias for Blue Prism Process Dispatcher

Connection to Blue Prism Process Dispatcher utility is required for integration.

Procedure

1. Navigate to Connections & Credentials > Connection and Credential Aliases.
2. Open the record for BluePrismProcessDispatcher.
3. From Related Links section, Click Create New Connection & Credential. The Create Connection and Credential modal appears.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>User name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. Default value is Blue Prism Process Dispatcher Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL used for creating connection to Blue Prism environment.</td>
</tr>
<tr>
<td>Runtime Credential Name</td>
<td>Credential with runtime access configured in Blue Prism environment.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Blue Prism Process Dispatcher Credentials.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password.</td>
</tr>
</tbody>
</table>

5. Click Create.

A new record is added in the Connections tab.
6. Open the new record and enable **Use MID server**.

   **Note:** **Use MID server** value is disabled by default for a new record.

**BMC Remedy spoke v1.1.3**

Manage change requests, incidents, problems, and other records in BMC Remedy from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

   **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported versions**

This spoke was built for BMC Remedy AR server version 19.08, but may be compatible with later versions.

**Spoke flows**

The BMC Remedy spoke provides the Look up Record sample flow to demonstrate retrieving the details of records based on last modified date. To customize the sample flow, copy it to the required application scope.
**Spoke subflows**

The BMC Remedy spoke provides the Get Incident Request ID sample subflow to demonstrate retrieving the Request IDs of the specified incident numbers. To customize the sample subflow, copy it to the required application scope.

**Spoke actions**

The BMC Remedy spoke provides actions to perform BMC Remedy tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Management</td>
<td>Create Change</td>
<td>Creates a change request in BMC Remedy.</td>
</tr>
<tr>
<td>CMDB Management</td>
<td>Get Class Attributes</td>
<td>Retrieves class attributes schema from BMC Remedy.</td>
</tr>
<tr>
<td>CMDB Management</td>
<td>Get Classes</td>
<td>Retrieves the list of all non-abstract classes in the BMC Remedy CMDB.</td>
</tr>
<tr>
<td>CMDB Management</td>
<td>Get Datasets</td>
<td>Retrieves the list of all datasets in BMC Remedy CMDB.</td>
</tr>
<tr>
<td>CMDB Management</td>
<td>Get Namespace</td>
<td>Retrieves the list of all namespaces in BMC Remedy CMDB.</td>
</tr>
<tr>
<td>Look up CMDB Data</td>
<td></td>
<td>Get All Incidents all CMDB data for specified dataset, namespace, and class from BMC Remedy.</td>
</tr>
<tr>
<td>Incident Management</td>
<td>Create Incident</td>
<td>Creates an incident in BMC Remedy.</td>
</tr>
<tr>
<td>Incident Management</td>
<td>Get All Incidents</td>
<td>Retrieves details of all incidents from BMC Remedy.</td>
</tr>
<tr>
<td>Incident Management</td>
<td>Update Attachment</td>
<td>Updates the attachment of the required incident in BMC Remedy.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get All Objects</td>
<td>Retrieves name and label of all objects in BMC Remedy.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Alias Selector</td>
<td>Get Change Form Fields</td>
<td>Validates the given alias specific to the BMC Remedy spoke and retrieves the alias if it is valid.</td>
</tr>
<tr>
<td></td>
<td>Get Change Status</td>
<td>Retrieves the list of all statuses in the BMC Remedy Change Management.</td>
</tr>
<tr>
<td></td>
<td>Get Change Timing</td>
<td>Retrieves the list of all change timings in BMC Remedy Change Management.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of creatable fields in a required standard or custom BMC Remedy table.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Objects</td>
<td>Retrieves the list of creatable objects in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Impact</td>
<td>Retrieves the list of all impacts in the BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Incident Form Fields</td>
<td>Retrieves the list of fields in the Incident Interface form table.</td>
</tr>
<tr>
<td></td>
<td>Get Incident Status</td>
<td>Retrieves the list of all statuses in BMC Remedy Incident Management.</td>
</tr>
<tr>
<td></td>
<td>Get Investigation Driver</td>
<td>Retrieves the list of all investigation drivers in BMC Remedy Problem Management.</td>
</tr>
<tr>
<td></td>
<td>Get Object Schema</td>
<td>Retrieves schema of the specified object in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Problem Form Fields</td>
<td>Retrieves the list of fields in the Problem Interface form table.</td>
</tr>
<tr>
<td></td>
<td>Get Problem Status</td>
<td>Retrieves the list of all statuses in BMC Remedy Problem Management.</td>
</tr>
<tr>
<td></td>
<td>Get Queryable Fields</td>
<td>Retrieves the list of updatable fields in a required standard or custom BMC Remedy table.</td>
</tr>
<tr>
<td></td>
<td>Get Reported Source</td>
<td>Retrieves the list of all reported sources in BMC Remedy Incident Management.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Risk Level</td>
<td>Retrieves the list of all risk levels in BMC Remedy Change Management.</td>
</tr>
<tr>
<td></td>
<td>Get Service Type</td>
<td>Retrieves the list of all service types in BMC Remedy Incident object.</td>
</tr>
<tr>
<td></td>
<td>Get Token</td>
<td>Generates access token for BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Updatable Fields</td>
<td>Retrieves the list of updatable fields in the required standard or custom BMC Remedy table.</td>
</tr>
<tr>
<td></td>
<td>Get Urgency</td>
<td>Retrieves the list of all urgencies in BMC Remedy.</td>
</tr>
<tr>
<td>Problem Management</td>
<td>Create Problem</td>
<td>Creates a problem in BMC Remedy.</td>
</tr>
<tr>
<td>Record Management</td>
<td>Create Record</td>
<td>Creates record of the required type in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Record Details By ID</td>
<td>Retrieves details of the specified record.</td>
</tr>
<tr>
<td></td>
<td>Look up Record</td>
<td>Looks up a record in BMC Remedy based on the query fields.</td>
</tr>
<tr>
<td></td>
<td>Update Record</td>
<td>Updates details of the specified record in BMC Remedy.</td>
</tr>
<tr>
<td>Service Request Management</td>
<td>Create Service Request</td>
<td>Creates a service request in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Service Request Form Fields</td>
<td>Retrieves the list of fields in the Service Request Interface form table.</td>
</tr>
<tr>
<td></td>
<td>Get Service Request Status</td>
<td>Retrieves the list of all status in the BMC Remedy Service Request management.</td>
</tr>
</tbody>
</table>

**Spoke modules**

The BMC Remedy spoke adds a BMC Remedy application to your instance and includes these modules:
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credentials</td>
<td>Credential records for the BMC Remedy spoke can be accessed here.</td>
</tr>
<tr>
<td>Objects</td>
<td>Information about the objects in BMC Remedy can be accessed here. You can also create an object that can be used in your flows. See <a href="#">Create a BMC Remedy object in your ServiceNow instance</a> for information about creating an object.</td>
</tr>
</tbody>
</table>

**Spoke user roles**

The Remedy_Admin (sn_bmcremedy_spoke.Remedy_Admin) is available when the BMC Remedy spoke is installed. Users with role can view and create objects in the Objects module.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two aliases are available when you install the BMC Remedy spoke; one alias is of the Connection and Credential type and the other alias is of the Credential type.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the BMC Remedy alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up the BMC Remedy spoke**

Integrate the ServiceNow instance and BMC Remedy by using Remedy credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the BMC Remedy spoke.
- Role required: admin.
Note: Ensure that you perform these steps in the BMC Remedy Spoke application scope only.

Create Credential record for the BMC Remedy spoke

Create Credential records for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for the BMC Remedy spoke whose Type is Credential. For example, BMCRemedy_Credential.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?
4. Select Remedy Credential.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Remedy Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name of the BMC Remedy user.</td>
</tr>
<tr>
<td>Note: Administrator user isn’t necessary. However, ensure that the BMC Remedy user has permissions to perform the required change, incident, and problem management actions.</td>
<td></td>
</tr>
<tr>
<td>Password</td>
<td>Password of the BMC Remedy user’s account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias record associated with this record.</td>
</tr>
<tr>
<td>Token Status</td>
<td>Status of the BMC Remedy token. Select Active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential record.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Specific MID Servers that can use this credential record.</td>
</tr>
</tbody>
</table>
6. Right-click the form header and click **Save**.

**Results**
The credential record the BMC Remedy spoke is created.

**Create Connection record for the BMC Remedy spoke**
Create Connection record for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses this connection to perform actions in BMC Remedy.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record of **BMC Remedy spoke** whose **Type** is **Connection and Credential**. For example, **BMCRemedy**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>BMC Remedy Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for BMC Remedy. For example, select <strong>Remedy Cred</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Connection alias associated with this record.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to manually enter the connection URL or use system to build the URL based on the inputs.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to launch the BMC Remedy application. For example, <strong>http://&lt;bmc-remedy-localhost&gt;:8008/api</strong></td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capability of the MID Server. This field appears only when the <strong>Use MID server</strong> option is selected.</td>
</tr>
</tbody>
</table>
Field | Value required
--- | ---
MID Application | Option to use a MID Server. This field appears only when the **Use MID server** option is selected.
Active | Option to actively use the connection record.
Domain | Domain that the action runs in.

5. Click **Submit**.

**Results**
The connection record the BMC Remedy spoke is created.

**Create a BMC Remedy object in your ServiceNow instance**
Manage other objects in BMC Remedy from your ServiceNow instance by creating the required object.

**Before you begin**
Role required: admin or Remedy_Admin

**About this task**
By default, the BMC Remedy spoke supports the change request, incident, and problem objects. To manage other objects, such as Product Catalog, create an object in your ServiceNow instance.

**Procedure**
1. Navigate to **BMC Remedy Spoke > Objects**.
2. Click **New**.
3. On the form, fill these fields.

**BMC Remedy Objects form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the required form. This value is unique to each object. For example, the form value for Product Catalog is <strong>PCT:Product Catalog</strong>.</td>
</tr>
<tr>
<td>Label</td>
<td>Label name to identify the record.</td>
</tr>
<tr>
<td>Creatable</td>
<td>Option to create records in the object. Select the option to create records and use the object in your flows.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
**Box spoke v3.0.1**
Move attachments to Box where they can be managed as shared documents.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
API version v2.

**Spoke flows**
The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Attachment when created to Box</td>
<td>Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.</td>
</tr>
<tr>
<td>On-boarding user</td>
<td>Creates a user in Box when you create a ServiceNow user in the Box User group.</td>
</tr>
</tbody>
</table>

**Spoke actions**
The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Add Metadata to File</td>
<td>Specifies custom data for a particular file or folder.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Attach Box File to Record</td>
<td>Copies a file from Box and attaches it to the specified ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Lookup File ID</td>
<td>Retrieves the ID of the specified file in Box.</td>
</tr>
<tr>
<td></td>
<td>Move Owned Item</td>
<td>Moves all items owned by the specified user in Box to the specified folder.</td>
</tr>
<tr>
<td></td>
<td>Remove File</td>
<td>Removes the specified file from Box.</td>
</tr>
<tr>
<td></td>
<td>Search Content Stream</td>
<td>Searches for files, folders, web links, and shared files across the user's</td>
</tr>
<tr>
<td></td>
<td></td>
<td>content or across the entire enterprise.</td>
</tr>
<tr>
<td></td>
<td>Upload File</td>
<td>Uploads the specified file to Box.</td>
</tr>
<tr>
<td>Document Sharing</td>
<td>Add Collaborator</td>
<td>Grants a user or group a specified level of access to a particular file or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>folder. Collaborators have one of these access levels.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Co-Owner</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Editor</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Previewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Preview Uploader</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Uploader</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Viewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Viewer Uploader</td>
</tr>
<tr>
<td></td>
<td>Create Shared Link</td>
<td>Create a direct and read-only link to a file or folder in Box.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Folder Collaborators By ID</td>
<td>Retrieves all the collaborators associated to the specified folder ID.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Remove Collaborator</td>
<td>Removes the specified collaboration from a file or folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Box on behalf of the specified Box user account.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Lookup Folder ID</td>
<td>Retrieves the ID of the specified folder in Box.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group in Box with the specified invitation preferences.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group in Box.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the specified group in Box with the specified preferences.</td>
</tr>
</tbody>
</table>

**Note:** Items added to Box require ten minutes to become accessible. For example, if one action creates a folder, a Lookup Folder ID action will not return results until after ten minutes have passed.
<table>
<thead>
<tr>
<th>Category</th>

</tbody>
</table>

**Box spoke module**

Bi-directional webhooks can be set up to be notified about the required events. Webhook registry defines the conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Box that you want to be notified about. When the conditions are met, the specified trigger name triggers the associated subflow, which in turn automates the Box tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Box spoke adds the Box Spoke application to your instance and includes the following modules.
Box module

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Box Webhook Registry</td>
<td>Create and view the Plivo webhooks in ServiceNow.</td>
</tr>
<tr>
<td>Legal Hold Policies</td>
<td>View the list of available Box legal policies.</td>
</tr>
<tr>
<td>Retention Policies</td>
<td>View the list of available Box retention policies.</td>
</tr>
</tbody>
</table>

**Box account requirements**

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See [Configure Box account](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses these alias records to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Box</td>
<td>Connection to the Box Collaboration and File Management APIs.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: <a href="https://api.box.com">https://api.box.com</a></td>
</tr>
<tr>
<td>Box Upload</td>
<td>Connection to the Box upload service.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: <a href="https://upload.box.com">https://upload.box.com</a></td>
</tr>
</tbody>
</table>

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias.
Set up Box spoke
Integrate the ServiceNow instance and Box by creating a custom OAuth application in Box to authenticate ServiceNow requests.

Before you begin
- Request IntegrationHub subscription
- Activate the Box spoke
- Role required: admin

Configure Box account
Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Before you begin
Box requirements:
- Box account
- Box administrator credentials

About this task
Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

Procedure
1. From your Box account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Box application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Box application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write all files and folders stored in Box</td>
<td>Document management, document sharing, and folder management actions</td>
</tr>
<tr>
<td>Manage users</td>
<td>User management actions</td>
</tr>
</tbody>
</table>
Box application scope permission | Required for
---|---
Manage groups | Group management actions
Manage enterprise properties | Document sharing, group management, and user management actions

Register Box as OAuth provider
Use the information generated during Box account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure
1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Box OAuth</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Box account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Box account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <strong><a href="https://account.box.com/api/oauth2/authorize">https://account.box.com/api/oauth2/authorize</a></strong>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <strong><a href="https://api.box.com/oauth2/token">https://api.box.com/oauth2/token</a></strong>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.
6. Copy the value from **Redirect URL**.
7. Login to your Box account to edit the configuration of your custom Box application.
See the Box Developer Documentation for instructions.

8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Box application.

   **Example**
   For example, paste https://instance.service-now.com/oauth_redirect.do.

**Results**
The instance can request OAuth 2.0 tokens for the spoke.

⚠️ **Note:** The spoke generates OAuth tokens that expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.

**Create Credential records for the Box spoke**
Create Credential records to the Box custom OAuth application you created during Box account configuration. The Box spoke connection and credential aliases use these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box API Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select <strong>Box OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. Click **New**.
   The system displays the message *What type of Credentials would you like to create?*.

7. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box Upload Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select <strong>Box OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

9. Click **Submit**.

**Create Connection records for the Box spoke**

Create Connection records to your Box account and the Box APIs. The Box spoke connection and credential aliases use these connections to perform actions on Box.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Box**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box API Connection.</td>
</tr>
</tbody>
</table>
**Field** | **Value required**
---|---
Credential | Select the Credential record you created for the Box API. For example, select **Box API Credentials**.

5. Click **Submit**.

6. Open for the record for **Box Upload**.

7. From the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.

8. Enter these values.

**Field** | **Value required**
---|---
Name | Enter any name to uniquely identify the connection record. For example, enter **Box Upload Connection**.
Credential | Select the Credential record you created for Box upload. For example, select **Box Upload Credentials**.

9. Click **Submit**.

**Regenerate Box OAuth token**

Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Box spoke OAuth Credential record.

   **Example**
   For example, select **Box API Credentials**.

3. From Related Links, click **Get OAuth Token**.

   **Results**
   The Box spoke receives a new OAuth access token good for 30 days.
Set up a bi-directional webhook for Box spoke
Configure a webhook to subscribe to Box with a ServiceNow callback URL.

Before you begin
Role required: admin

- Request an IntegrationHub Professional subscription
- Activate the Box spoke
- Role required: admin

Add an endpoint URL in Box account
Specify an endpoint URL in your Box account to create a webhook for Box spoke.

Before you begin
Role required: admin

Procedure
1. Log in to Box developer console.
2. Create an app according to your requirements.
   For more information about app creation, see Box Applications.
3. Generate a Primary Key and Secondary Key for your app and a record the key values.
4. Specify the Endpoint URL of the ServiceNow instance in the following format.
   https://<instance-name>.service-now.com/api/sn_box_spoke/
   box_spoke_webhook_endpoints/webhook_endpoint
5. Specify the callback parameters according to your requirement.

Results
The endpoint URL is added in your Box account. You can create webhook registries and subflows according to your requirements.

Register a Box webhook in ServiceNow
Create a Box webhook registry in ServiceNow to notify the ServiceNow app when certain events occur in your Box account.

Before you begin
Role required: admin
Procedure
1. Navigate to Box > Box Webhook Registry.
2. Click New.
3. On the form, fill in these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the webhook registry. For example, Box spoke webhook registry.</td>
</tr>
<tr>
<td>Secondary Key</td>
<td>Secondary key of your app in Box account.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the spoke.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Box event that triggers the webhook.</td>
</tr>
<tr>
<td>Primary Key</td>
<td>Primary key of your app in Box account.</td>
</tr>
<tr>
<td>Flow Name</td>
<td>Flow to be triggered when the specified event occurs.</td>
</tr>
</tbody>
</table>

Results
The Box webhook is registered in your ServiceNow instance.

Calendly spoke
The Calendly spoke provides actions to view and analyze meaningful usage data for Calendly software subscriptions. Analyze usage for a Calendly account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
Spoke requirements

- Organization owner or admin role in Calendly
- LastPass Enterprise admin account

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Calendly spoke provides actions to automate Calendly tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Management</td>
<td>Look up Scheduled Events Stream</td>
<td>Retrieves details about all scheduled events within an organization.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look up Organization</td>
<td>Retrieves the URI of the organization that the authenticated user currently belongs to.</td>
</tr>
<tr>
<td></td>
<td>Look up Organization Members Stream</td>
<td>Retrieves details about all members within an organization.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Organization</td>
<td>Deletes a user's organization membership.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any
actions that use the connection. For more information, see Connections and Credentials.

Set up the Calendly spoke
Integrate the ServiceNow instance and Calendly by registering a custom OAuth application in Calendly to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate Calendly spoke.
• Calendly role required: organization owner or admin
• LastPass role required: admin
• ServiceNow role required: admin

Register a public application with Calendly
Register a public application with the Calendly service so that you can access the Calendly API using OAuth 2.0.

Before you begin
The Calendly service uses the LastPass password manager and Vault to securely generate and store sensitive information, such as usernames, passwords, client IDs, and client secrets. To successfully authenticate to and access the Calendly API, you must use the LastPass Enterprise plan.

Calendly role required: organization owner or admin
LastPass role required: admin

Procedure
1. Generate Sharing Keys for your LastPass Vault.
   By generating Sharing Keys, you can safely share the sensitive information in your LastPass Vault with other users in your organization.

   You can generate and activate Sharing Keys through either the LastPass web browser extension or your LastPass Vault.

   • Generate Sharing Keys through the LastPass web browser extension:
     a. From a web browser, go to the LastPass downloads page.
     b. Under More ways to get LastPass, select the operating system of the device on which you want to use the LastPass web browser extension.
c. From the list of available extensions, click **Download** for the LastPass web browser extension that you want to use.

d. Follow the instructions to download and add the extension to your web browser.

e. After the extension is added, click the LastPass icon (●) on your web browser toolbar.

f. When prompted, log in to your LastPass admin account.

   Upon successful login, both the LastPass web browser extension and Sharing Keys are activated.

• Generate Sharing Keys through your LastPass Vault:

   a. From a web browser, open **LastPass**.

   b. Log in to your LastPass admin account.

       Your LastPass Vault opens.

   c. On the left navigation menu of your LastPass Vault, select **Advanced Options**.

   d. When prompted, select **Generate sharing keys**.

       The Generate Sharing Key dialog box opens.

   e. In the dialog box, click **Generate**.

       The dialog box closes and your Sharing Keys are generated.

   f. Log out of your LastPass admin account.

   g. Log back in to your LastPass admin account.

       Your Sharing Keys are activated.

2. Register a public application with the Calendly service.

   a. From a web browser, open the **Calendly application registration form**.

   b. Click **Get started**.

   c. Answer each question within the application registration form.

       After you complete the form, your application registers with the Calendly service. Calendly then assigns a Client ID and Client Secret to the application and automatically sends this information to your LastPass admin account.

3. Retrieve your Client ID and Client Secret from the LastPass Admin Console.

   a. From a web browser, open the **LastPass Admin Console**.

   b. Log in to your LastPass admin account.
The LastPass Admin Console opens.

d. On the left navigation menu of the advanced settings, select Keys. The Keys Management page opens.

e. In the OAuth section of the Keys Management page, click ENABLE.

f. Copy the values in the CLIENT ID and CLIENT SECRET fields. Save these in a secure location for later use.

Create a Calendly connection
Create a connection between your Calendly applications and your ServiceNow instance.

Before you begin
ServiceNow role required: admin

Procedure

2. Select the Connections tab.

3. Locate your Calendly connection and then click Add Connection. The Create Connection and Credential dialog box opens.

4. In the dialog box, fill in the fields.

<table>
<thead>
<tr>
<th>Create Connection and Credential dialog box</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>Connection Name</td>
</tr>
<tr>
<td>Connection URL</td>
</tr>
<tr>
<td>OAuth Client ID</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.

The Authorize App dialog box opens.

6. In the dialog box, log in to your Calendly account.

The OAuth access token becomes available for authorizing your Calendly connection.

**Cisco Webex Meetings spoke**

Manage users of the Cisco Webex Meetings application. Get a list of all users, view user activity, and deactivate user accounts.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Supported versions**

Webex Meetings XML API

**Spoke actions**

The Cisco Webex Meetings spoke provides actions to automate Webex tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Get Users</td>
<td>Gets a list of all Webex user subscriptions.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get User Activity</td>
<td>Gets the date of the most recent meeting hosted by each Webex user.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Deactivates a Webex user account.</td>
</tr>
</tbody>
</table>

**Webex Meetings account requirements**

The Cisco Webex Meetings spoke requires creating a custom app in Cisco DevNet to generate OAuth 2.0 tokens. See [Create Webex OAuth app](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the Webex alias record to authorize actions.

**Set up Cisco Webex Meetings spoke**

Integrate your ServiceNow instance and the Cisco Webex Meetings application by creating a custom OAuth application in Cisco DevNet to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Cisco Webex Meetings spoke
- Role required: admin

**Create Webex OAuth app**

Create a custom OAuth application in Cisco DevNet to enable OAuth 2.0 authentication with the Cisco Webex Meetings spoke.

**Before you begin**

Webex Meetings requirements:

- Webex Meetings account
- Webex Meetings administrator credentials
Procedure

1. Navigate to Cisco DevNet WebEx Integration. Log in using the Login with Webex Meetings option.
2. On the My App Information page, click Add App Information.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integration name</td>
<td>Name of your choice. For example, ServiceNow integration.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td><a href="https://instance.service-now.com/oauth_redirect.do">https://instance.service-now.com/oauth_redirect.do</a>, where instance is the name of your ServiceNow instance</td>
</tr>
<tr>
<td>Scope</td>
<td>Webex Meetings application scope permissions you want the app to support.</td>
</tr>
</tbody>
</table>

Note: The read_all and modify_users scopes are required to use the actions provided with the spoke. The Get Users and Get User Activity actions require the read_all scope. The Remove User action requires the modify_users scope.

4. Record the client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

Register Webex Meetings as OAuth provider

Use the information generated during OAuth app creation to register the Webex Meetings application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Click New.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings OAuth.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Authorization Code.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
   The system validates the OAuth credentials and populates the **Redirect URL** field and the OAuth Entity Profiles related list.

### Create Credential record for the Webex Meetings spoke

Create a Credential record for the Webex custom OAuth application you created in Cisco DevNet. The Cisco Webex Meetings spoke connection and credential alias uses the credential to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Selected.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the custom Webex application as an OAuth provider. For example, Webex Meetings OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, All MID Servers.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Create Connection record for the Webex Meetings spoke

Create a Connection record for your Webex account. The Cisco Webex Meetings spoke connection and credential alias uses the connection to perform actions in Webex.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Webex.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, Webex Meetings Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Webex Meetings. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td><a href="https://site.webex.com/WBXService/XMLService">https://site.webex.com/WBXService/XMLService</a>, where site is the name of your Webex site.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Cisco Webex Teams Spoke

Manage Cisco Webex Teams from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Cisco Webex Teams v1, but may be compatible with later versions.

Spoke requirements
• Cisco Webex Teams account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Cisco Webex Teams Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Membership Management</td>
<td>Create Membership</td>
<td>Creates membership and adds a member to a space using the specified email address. You can choose to make the member as the moderator of the space.</td>
</tr>
<tr>
<td></td>
<td>Delete Membership</td>
<td>Removes membership from a space for the specified member.</td>
</tr>
<tr>
<td></td>
<td>Get Membership</td>
<td>Retrieves details for a space membership.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look up Membership</td>
<td></td>
<td>Retrieves a list of all space memberships.</td>
</tr>
<tr>
<td>Update Membership</td>
<td></td>
<td>Updates details of a space membership.</td>
</tr>
<tr>
<td>Message Management</td>
<td>Delete Message</td>
<td>Deletes the specified message.</td>
</tr>
<tr>
<td>Get Message Details</td>
<td></td>
<td>Retrieves details of the specified message.</td>
</tr>
<tr>
<td>Look up Direct Messages</td>
<td></td>
<td>Retrieves a list of messages in a direct space.</td>
</tr>
<tr>
<td>Look up Messages</td>
<td></td>
<td>Retrieves all messages in a space.</td>
</tr>
<tr>
<td>Post Direct Message</td>
<td>Posts Direct Message</td>
<td>Posts a plain text or rich text message to a the specified email address. A file can be specified as an attachment to the message optionally.</td>
</tr>
<tr>
<td>Post Message to Space</td>
<td>Post Message to Space</td>
<td>Posts a plain text or rich text message to the specified space. A file can be specified as an attachment to the message optionally.</td>
</tr>
<tr>
<td>Space Management</td>
<td>Create Space</td>
<td>Creates a space.</td>
</tr>
<tr>
<td>Delete Space</td>
<td></td>
<td>Deletes the specified space.</td>
</tr>
<tr>
<td>Get Space Details</td>
<td></td>
<td>Retrieves details of the specified space.</td>
</tr>
<tr>
<td>Look up Spaces</td>
<td></td>
<td>Retrieves details of the spaces to which the authenticated user belongs.</td>
</tr>
<tr>
<td>Update Space</td>
<td></td>
<td>Updates details of the specified space.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the...
connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

You can use OAuth 2.0 or the custom Cisco Webex Credentials to authenticate requests.

Set up the Cisco Webex Teams Spoke
Integrate the ServiceNow instance and Cisco Webex Teams by creating a custom OAuth application in Cisco Webex Teams or using the custom Cisco Webex Credentials to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate Cisco Webex Teams Spoke.
• Role required: admin

You can choose to use either OAuth 2.0 or the custom credentials, Cisco Webex Credentials, for authentication.

Register Cisco Webex Teams as an OAuth provider
Use the information generated during the Cisco Webex Teams application configuration to register Cisco Webex Teams as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure
1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

   Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Cisco Webex Teams OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Cisco Webex Teams application configuration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Cisco Webex Teams application configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://webexapis.com/v1/authorize">https://webexapis.com/v1/authorize</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://webexapis.com/v1/access_token">https://webexapis.com/v1/access_token</a></td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OauthCiscoWebexTeamsUtils.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
Create a OAuth credential record for the Cisco Webex Teams Spoke

Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Click New.

The system displays this message: What type of Credentials would you like to create?

3. Select OAuth 2.0 Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Cisco Webex Teams Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Cisco Webex Teams as an OAuth provider. For example, Cisco Webex Teams OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use this credential in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.
6. To generate the OAuth token, click the Get OAuth Token related link.

Create a connection and credential alias record for the Cisco Webex Teams Spoke

Create a credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.
Procedure
1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the CiscoWebexTeams record.
3. TBD
4. Right-click the form header and click Submit.

Create a custom credential record for the Cisco Webex Teams Spoke
Create a custom credential record for the Cisco Webex Teams account. The Cisco Webex Teams Spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays this message: What type of Credentials would you like to create?
4. On the form, fill these values.

Cisco Webex Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Cisco Webex Teams Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID generated in your Cisco Webex Teams account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Bot's Access Token generated when you add a bot in your CiscoWebex account.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Cisco Webex Teams.</td>
</tr>
</tbody>
</table>

ℹ️ Note: Do not directly modify the default authentication algorithm.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential alias</td>
<td>Associated Cisco Webex Teams credential record.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

**Confluence Cloud spoke v1.0.2**

The Confluence Cloud spoke provides actions to manage groups, group members, and search content in your Confluence Atlassian account.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for the Confluence Cloud REST API.

**Spoke requirements**

- Atlassian site admin account
- OAuth 2.0 application and OAuth 2.0 token

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
Spoke actions
The Confluence Cloud spoke provides actions to automate Confluence Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Management</td>
<td>Search Content</td>
<td>Retrieves the list of content based on the provided query.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Look up Groups</td>
<td>Retrieves all groups in the Atlassian account, including default groups.</td>
</tr>
<tr>
<td></td>
<td>Look up Members By Group ID</td>
<td>Retrieves all active users within the specified group.</td>
</tr>
<tr>
<td></td>
<td>Remove Member From Group By Group ID</td>
<td>Removes a user from the specified group.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look up Group Memberships For User</td>
<td>Retrieves information about the groups that the user is a member of.</td>
</tr>
</tbody>
</table>

Spoke module
The Confluence Cloud spoke adds the Confluence Cloud application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Confluence Groups</td>
<td>Enables you to specify the groups that have access to Confluence products. By specifying these groups, you can manage the users within only these groups using the Confluence Cloud spoke.</td>
</tr>
</tbody>
</table>

Data accessed through these spoke modules is stored in these tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Confluence Groups</td>
<td>Displays the list of groups that have access to Confluence products.</td>
<td>• Group Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Group ID</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Confluence Cloud spoke

Integrate the ServiceNow instance and Confluence Cloud by creating a custom OAuth 2.0 application in Confluence Cloud to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription.
- Activate Confluence Cloud spoke.
- Atlassian role required: site admin
- ServiceNow role required: admin

Create a Confluence Cloud OAuth 2.0 (3LO) application

Create a Confluence Cloud OAuth 2.0 (3LO) application to enable access to the Confluence Cloud API.

Before you begin

Atlassian role required: site admin

Procedure

1. From a web browser, open the Atlassian Developer portal.
2. Log in to your site admin account.
3. On the page header of the portal, click your profile icon and then select Developer console.
   The My apps page of the Atlassian Developer Console opens.
4. Click the Create app menu and then select OAuth 2.0 (3LO) integration.
   The Create a new OAuth 2.0 (3LO) integration page opens.
5. Enter a name for the OAuth 2.0 (3LO) application in the Name field.
6. Select the I agree to be bound by Atlassian's developer terms check box and then click Create.
   The overview and settings for your newly created app open.
7. Configure authorization settings for your application.

   a. From the left navigation pane, select Authorization.

   b. Click Configure for the OAuth 2.0 (3LO) authorization type.
      The OAuth 2.0 authorization code grants (3LO) for apps page opens.

   c. In the Callback URL field, enter the URL of the OAuth provider that users are
      redirected to after authentication.
      Enter https://instance.service-now.com/oauth_redirect.do, where <instance>
      is the name of your ServiceNow instance.

   d. Click Save changes.

8. Configure API scopes for your application.
   API scopes specify the level of access that the application has to the Atlassian
   APIs.

   a. From the left navigation pane, select Permissions.

   b. From the list of available APIs, locate the Confluence API and then click Add.
      The Add action button automatically changes to the Configure action button.

   c. Click Configure.
      The Confluence API page opens.

   d. Add the following scopes for the Confluence API:
      • Search Confluence content and space summaries
      • Read user groups
      • Create, remove and update user groups
      • Read user

9. Retrieve the client ID and client secret that are assigned to your application.

   a. From the left navigation pane, select Settings.

   b. In the Authentication details section, copy the values in the Client ID and
      Secret fields.
      Save them in a secure location for later use.
Create a Confluence Cloud connection

Create a connection between your Confluence Cloud applications and your ServiceNow instance.

**Before you begin**

ServiceNow role required: admin

**Procedure**

1. From your ServiceNow instance, navigate to **Process Automation > Flow Designer**.
   The Flow Designer launches in a new tab.

2. Select the **Connections** tab.

3. Click **View Details** for your Confluence Cloud connection.

4. From the list of available connections, locate Confluence Cloud and then click **Configure**.
   The Configure Connection dialog box opens.

5. In the dialog box, fill in the fields.

**Configure Connection dialog box**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection Information</strong></td>
<td></td>
</tr>
<tr>
<td>Connection Name</td>
<td>Name of the Confluence Cloud connection. This field populates automatically.</td>
</tr>
<tr>
<td><strong>Credential Information</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Name of your Confluence Cloud credentials. This field populates automatically.</td>
</tr>
<tr>
<td>Site URL</td>
<td>URL of your Confluence Cloud site.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID that is assigned to your Confluence Cloud OAuth 2.0 (3LO) application.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client secret that is assigned to your Confluence Cloud OAuth 2.0 (3LO) application.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the callback URL that you specified in Create a Confluence Cloud OAuth 2.0 (3LO) application.</td>
</tr>
</tbody>
</table>
6. Click **Configure and Get OAuth Token**.
   The Authorize App dialog box opens.

7. In the dialog box, click **Allow**.
   The OAuth token becomes available for authorizing your Confluence Cloud connection.

**Add Confluence groups**

Specify the groups that have access to Confluence products so that you can manage the users within only these groups using the Confluence Cloud spoke.

**Before you begin**

Atlassian role required: site admin  
ServiceNow role required: admin

**Procedure**

1. From a web browser, open the Atlassian Administration portal.
2. Log in to your site admin account.
3. Navigate to **SITE SETTINGS > Product access**.
4. In the Confluence section, view the list of groups that have access to Confluence products.
   Take note of this information for later use.
5. Return to your ServiceNow instance and navigate to **Confluence Cloud > Confluence Groups**.
6. On the Confluence Groups form, click the **Add Groups** related link.
   The Add Confluence Groups dialog box opens.
7. In the Available list, select the groups that have access to Confluence products.

   **Tip:** The Available list includes all groups that are associated with your Atlassian account. Select only the groups that have access to Confluence products.
8. Click the right arrow button to move the groups from the Available list to the Selected list.
9. Click **OK**.

**Continuous Integration and Continuous Delivery (CICD) Spoke**

Build a Continuous Integration and Continuation Delivery (CICD) pipeline for your ServiceNow instances. You can automate publishing and installing...
applications from an application repository, activating plugins, running ATF test suites, and running an instance HealthScan.

**CICD spoke application**
The CICD spoke application is installed by default from the Orlando upgrade onward.

**Supported versions**
Continuous Integration and Continuous Delivery (CICD) REST API version 1.0.0, which is a Now Platform feature active by default.

**Spoke flows**
This spoke has no sample flows.

**Spoke subflows**
The Continuous Integration and Continuous Delivery (CICD) Spoke provides sample subflows in the draft state to demonstrate automating CICD tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activate Plugin</td>
<td>Activate a plugin by ID on the specified instance URL.</td>
</tr>
<tr>
<td>Apply Changes From Source Control</td>
<td>Apply remote changes from source control to an application by its Sys ID.</td>
</tr>
<tr>
<td>With ID</td>
<td></td>
</tr>
<tr>
<td>Apply Changes From Source Control</td>
<td>Apply remote changes from source control to an application by its scope name.</td>
</tr>
<tr>
<td>With Scope</td>
<td></td>
</tr>
<tr>
<td>ATF Suite Start With ID</td>
<td>Start a test suite by its Sys ID on the specified instance URL. Return the test suite execution results.</td>
</tr>
<tr>
<td>ATF Suite Start With Name</td>
<td>Start a test suite by its name on the specified instance URL. Return the test suite execution results.</td>
</tr>
<tr>
<td>Batch Install</td>
<td>Given a Batch Plan in JSON format, install multiple packages (applications, customizations to store applications, and plugins) together in a single batch operation.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Batch Results</td>
<td>Given the sys_id of a result object, view the installation status of each package along with entire batch plan.</td>
</tr>
<tr>
<td>Batch Rollback</td>
<td>With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.</td>
</tr>
<tr>
<td>Get Instance Scan Results</td>
<td>Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.</td>
</tr>
<tr>
<td>Instance Scan Execute Full Scan</td>
<td>Start full Instance Scan on specified instance URL. Scan runs with all active checks.</td>
</tr>
<tr>
<td>Instance Scan Execute Point Scan</td>
<td>Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.</td>
</tr>
<tr>
<td>Instance Scan Execute Suite Scan</td>
<td>Start full Instance Scan on specified instance URL using a specific suite of checks.</td>
</tr>
<tr>
<td>Instance Scan Execute Suite Scan on one or more scoped apps</td>
<td>Start Instance Scan on specified scoped apps using checks from a specified suite ID.</td>
</tr>
<tr>
<td>Instance Scan Execute Suite Scan on one or more update sets</td>
<td>Start Instance Scan on the specified update sets using checks from a specified suite ID.</td>
</tr>
<tr>
<td>Install Application With ID</td>
<td>Install an application by its Sys ID from the application repository.</td>
</tr>
<tr>
<td>Install Application With Scope</td>
<td>Install an application by its scope name from the application repository.</td>
</tr>
<tr>
<td>Publish Application With ID</td>
<td>Publish an application by its Sys ID to the application repository.</td>
</tr>
<tr>
<td>Publish Application With Scope</td>
<td>Publish an application by its scope name to the application repository.</td>
</tr>
<tr>
<td>Rollback Application With ID</td>
<td>Roll back an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rollback Application With Scope</td>
<td>Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td>Rollback Plugin</td>
<td>Roll back a plugin by ID on the specified instance URL to the last installed version.</td>
</tr>
<tr>
<td>Wait Until Tracker Completes</td>
<td>Wait for a tracker to complete its progress on the specified instance URL and return the results.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Continuous Integration and Continuous Delivery (CICD) Spoke provides actions to automate CICD tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Repo</td>
<td>Install Application With ID</td>
<td>Install an application by its Sys ID from the application repository.</td>
</tr>
<tr>
<td></td>
<td>Install Application With Scope</td>
<td>Install an application by its scope name from the application repository.</td>
</tr>
<tr>
<td></td>
<td>Publish Application With ID</td>
<td>Publish an application by its Sys ID to the application repository.</td>
</tr>
<tr>
<td></td>
<td>Publish Application With Scope</td>
<td>Publish an application by its scope name to the application repository.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With ID</td>
<td>Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With Scope</td>
<td>Roll back an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td>ATF</td>
<td>ATF Get Suite Results</td>
<td>Return the test suite execution results by Sys ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Execution Tracker Progress</td>
<td>Return tracker progress information by Sys ID.</td>
</tr>
<tr>
<td></td>
<td>Start ATF Suite With ID</td>
<td>Start a test suite by its Sys ID on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>Start ATF Suite With Name</td>
<td>Start a test suite by its name on the specified instance URL.</td>
</tr>
<tr>
<td>Batch Install</td>
<td>Batch Install</td>
<td>Install multiple applications at once</td>
</tr>
<tr>
<td></td>
<td>Batch Results</td>
<td>View installation status of each package along with entire batch plan.</td>
</tr>
<tr>
<td></td>
<td>Batch Rollback</td>
<td>With a rollback ID, roll back the installation(s) of package(s) installed as a single batch.</td>
</tr>
<tr>
<td>Instance Scan</td>
<td>Get Instance Scan Results</td>
<td>Return Instance Scan execution results by progress ID. Scan_results always display but scan_finding results display only if present.</td>
</tr>
<tr>
<td></td>
<td>Instance Scan Execute Full Scan</td>
<td>Return Instance Scan execution results by progress ID. Scan_results always return but scan_finding results display only if present.</td>
</tr>
<tr>
<td></td>
<td>Instance Scan Execute Point Scan</td>
<td>Start full Instance Scan on specified instance URL. Scan runs with all active checks.</td>
</tr>
<tr>
<td></td>
<td>Instance Scan Execute Suite Scan</td>
<td>Start Instance Scan on specified instance starting from a particular table and record (the table and sys_ID). Target is scanned using all relevant and applicable checks.</td>
</tr>
<tr>
<td></td>
<td>Instance Scan Execute Suite Scan on one or more scoped apps</td>
<td>Start full Instance Scan on specified instance URL using a specific suite of checks.</td>
</tr>
<tr>
<td></td>
<td>Instance Scan Execute Suite Scan on one or more update sets</td>
<td>Start Instance Scan on specified scoped apps using checks from a specified suite ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plugin</td>
<td>Activate Plugin</td>
<td>Activate a plugin by ID on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>Rollback Plugin</td>
<td>Rollback a plugin by ID on the specified instance URL to the last installed version.</td>
</tr>
<tr>
<td>Source Control</td>
<td>Apply Changes From Source Control With ID</td>
<td>Apply remote changes from source control to an application by its Sys ID.</td>
</tr>
<tr>
<td></td>
<td>Apply Changes From Source Control With Scope</td>
<td>Apply remote changes from source control to an application by its scope name.</td>
</tr>
</tbody>
</table>

**CICD account requirements**

The Continuous Integration and Continuous Delivery (CICD) Spoke requires creating basic authorization credentials. The user credentials must have either the admin or sn_cicd.sys_ci_automation roles to authorize CICD actions and flows.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the CICD alias record to authorize actions on local and remote instances.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the CICD alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Continuous Integration and Continuous Delivery (CICD) Spoke**

Use basic authentication to authenticate CICD REST API calls on a ServiceNow instance.
Before you begin

• Request IntegrationHub subscription
• Activate Continuous Integration and Continuous Delivery (CICD) Spoke
• Role required: admin or sn_cicd.sys_ci_automation

Create Credential records for the Continuous Integration and Continuous Delivery (CICD) Spoke

Create Credential records to the ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter CICD Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>The ServiceNow instance user name that authorizes and runs spoke actions and flows. This user must have either the admin or sn_cicd.sys_ci_automation roles.</td>
</tr>
<tr>
<td>Password</td>
<td>The password for the ServiceNow instance user.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Create Connection records for the Continuous Integration and Continuous Delivery (CICD) Spoke

Create Connection records to your ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these connections to perform actions on your ServiceNow instance.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for CICD.
3. From the Connections tab, click New. The system displays a blank HTTP or HTTPS Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter CICD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for CICD. For example, select CICD Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the ServiceNow instance on which the spoke runs actions and flows.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Confluent Kafka REST Proxy spoke
Integrates your ServiceNow instances with the Kafka cluster through Confluent Kafka REST Proxy API.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Supported versions
This spoke was built for Confluent REST Proxy API v2.

Spoke dependencies
If you’re having trouble installing the app, ensure that the dependent plugin, ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime) is installed.

⚠️ Note: The plugin is a licensable feature and requires appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Confluent Kafka REST Proxy spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign Consumer Instance to Topic Partition</td>
<td>Assigns a list of partitions to this consumer manually.</td>
</tr>
<tr>
<td>Commit Consumer Offsets</td>
<td>Commits a list of offsets for the consumer. When the post body is empty, all the records that have been fetched by the consumer instance are committed.</td>
</tr>
<tr>
<td>Create a Consumer Instance within a Consumer Group</td>
<td>Creates a consumer instance within Kafka consumer group.</td>
</tr>
<tr>
<td>Delete Consumer Instance</td>
<td>Destroys the consumer instance.</td>
</tr>
<tr>
<td>Get Kafka Partition Details For A Topic</td>
<td>Retrieves partition details for a Kafka topic.</td>
</tr>
<tr>
<td>Get Messages</td>
<td>Retrieves messages from a Kafka topic.</td>
</tr>
<tr>
<td>Publish Message</td>
<td>Produces messages to a Kafka topic.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any
actions that use the connection. For more information, see Connections and Credentials.

Set up the Confluent Kafka REST Proxy spoke
Integrate Confluent Kafka REST proxy with your ServiceNow instance using basic authentication.

Before you begin
• Request IntegrationHub subscription.
• Activate Confluent Kafka REST Proxy spoke.
• Role required: admin

⚠️ Note: This procedure outlines steps to set up Confluent Kafka REST Proxy spoke using basic authentication. However, based on your customisations, you can also set up the spoke using any other HTTP authentication mechanism that is currently supported by the ServiceNow Platform.

Procedure
1. Create a credential record for the Confluent Kafka REST Proxy spoke.
   a. Navigate to Connections & Credentials > Credentials.
   b. Click New.
      The system displays the message What type of Credentials would you like to create?.
   c. Select Basic Auth Credentials.
      A blank Basic Auth Credentials form displays.
   d. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Kafka spoke Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to connect to the Confluent Kafka REST Proxy API endpoint.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to connect to the Confluent Kafka REST Proxy API endpoint.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

2. Create a connection record for the Confluent Kafka REST Proxy spoke.

**a. Navigate to Connections & Credentials > Connection & Credential Aliases.**

**b. Open for the record, Kafka REST.**

**c. From the Connections tab, click New.**

The system displays a blank HTTP(s) Connection form.

**d. Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Kafka spoke Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the Confluent Kafka REST Proxy spoke. For example, select Kafka spoke Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to the Confluent Kafka REST Proxy API.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

**Cornerstone spoke v1.2.1**

Manage employee records, approvals, and employee learning in your Cornerstone instance from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Cornerstone version v1, but may be compatible with later versions.

Spoke dependencies
If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke flows
The Cornerstone spoke provides a sample flow in the draft state to demonstrate automating the Cornerstone tasks. The sample flow, Cornerstone - Pull Todos Details, retrieves the list of Todos for the required user. Ensure that this user is added to your ServiceNow instance. The retrieved records can be accessed by navigating to the TO DO Lists module in the Cornerstone application of your instance.

To customize the sample flow, copy it to a new application scope.

Spoke subflows
The Cornerstone spoke provides sample subflows in the draft state to demonstrate automating Cornerstone tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cornerstone - Get Certificate</td>
<td>Retrieves the certificate information of the required employee.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Transcript Details</td>
<td>Cornersstone - Get Transcripts Retrieves the transcript information of the required employee.</td>
</tr>
<tr>
<td>Cornerstone - Remove Dangling To Do</td>
<td>Deletes the dangling Todo records. Some of the retrieved Certificate records may not have values set for the Status and Launch URL fields. The Cornerstone - Remove Dangling To Do action deletes such todo records.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Cornerstone spoke provides actions to automate Cornerstone tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Core Management</td>
<td>Look up Approval Details</td>
<td>Retrieves information about the pending approvals.</td>
</tr>
<tr>
<td></td>
<td>Look up Organizational Unit</td>
<td>Retrieves the list of organization units based on organization unit type.</td>
</tr>
<tr>
<td></td>
<td>Global Search</td>
<td>Searches for the required people, training, certification, and so on.</td>
</tr>
<tr>
<td>Employee Management</td>
<td>Create Employee</td>
<td>Creates an employee record and retrieves core employee data from Cornerstone.</td>
</tr>
<tr>
<td></td>
<td>Get Custom Fields For Employee</td>
<td>Retrieves custom fields for an employee from Cornerstone.</td>
</tr>
<tr>
<td></td>
<td>Look up Employees</td>
<td>Retrieves core data of the required employees in Cornerstone.</td>
</tr>
<tr>
<td></td>
<td>Update Employee</td>
<td>Updates details of the required employee in Cornerstone.</td>
</tr>
<tr>
<td>Learning Management</td>
<td>Look up Approvals</td>
<td>Retrieves the pending approvals of the manager or approver.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look up</td>
<td>Assigned Trainings</td>
<td>Retrieves details of the trainings assigned to a user.</td>
</tr>
<tr>
<td>Look up Catalog Search</td>
<td></td>
<td>Retrieves details of the required training.</td>
</tr>
<tr>
<td>Look up Certification Transcripts</td>
<td></td>
<td>Retrieves certification transcript information of the required user.</td>
</tr>
<tr>
<td>Look up Certification From Reporting Data Stream</td>
<td></td>
<td>Retrieves the main view to get the certification data.</td>
</tr>
<tr>
<td>Look up Inbox Items</td>
<td></td>
<td>Retrieves all items in the required user’s inbox as shown on the welcome page.</td>
</tr>
<tr>
<td>Look up Learning Object</td>
<td></td>
<td>Retrieves the learning objects from Cornerstone. The supported learning object types are, Curriculum, Event, Session, Material, Test, Video, and Online Course.</td>
</tr>
<tr>
<td>Look up Sessions</td>
<td></td>
<td>Retrieves details of the upcoming sessions.</td>
</tr>
<tr>
<td>Look up Suggested Training</td>
<td></td>
<td>Retrieves details of the required and suggested learning objects that have been added to user’s transcripts.</td>
</tr>
<tr>
<td>Look up Tasks</td>
<td></td>
<td>Retrieves all the incomplete tasks assigned to the user.</td>
</tr>
<tr>
<td>Look up Transcripts</td>
<td></td>
<td>Retrieves the transcript records of the required user.</td>
</tr>
<tr>
<td>Create Assignment</td>
<td></td>
<td>Creates a standard assignment.</td>
</tr>
<tr>
<td>Look up Assignment Details</td>
<td></td>
<td>Looks up assignment details based on Assignment ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Reporting on Learning Module Management</td>
<td>Look up Tasks From Reporting Data Stream</td>
<td>Retrieves the main view to get training form user tasks.</td>
</tr>
<tr>
<td></td>
<td>Look up Trainings From Reporting</td>
<td>Retrieves the main view to get training data.</td>
</tr>
<tr>
<td></td>
<td>Look up Transcripts From Reporting Data Stream</td>
<td>Retrieves the main view to get all user transcript related data.</td>
</tr>
<tr>
<td></td>
<td>Look up Training Local From Reporting Data Stream</td>
<td>Retrieves the main view to get the training's local data.</td>
</tr>
<tr>
<td></td>
<td>Look up Certifications From Reporting Data Stream</td>
<td>Retrieves the main view to get all user certifications related data.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Cornerstone spoke adds a Cornerstone application to your ServiceNow instance. The Cornerstone application has the TO DO Lists module. List of Todos that the sample flow, Cornerstone - Pull Todos Details, retrieves for the specified user, can be accessed here.

**Cornerstone spoke account requirements**

If you want to use the default settings and permissions provided along with the spoke, you can install the ServiceNow tile on the Cornerstone Marketplace. For more information about registering an application, see [Getting started with an Integration](#) in Cornerstone OnDemand Help. Record the generated Client ID and Client Secret for later use.

If you want to configure and customise the spoke as per your requirement and provide additional permissions, register an OAuth 2.0 application in your Cornerstone account to generate OAuth 2.0 tokens for the Cornerstone spoke.
For more information about registering an application, see API Management in Cornerstone OnDemand Help. Record the generated Client ID and Client Secret for later use.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Cornerstone spoke**

Integrate your Cornerstone application with your ServiceNow instance. Register an OAuth application in Cornerstone and authenticate requests from ServiceNow.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Cornerstone spoke
- Role required: admin

**Register Cornerstone as an OAuth provider**

Use the information generated during the Cornerstone application creation and configuration to register Cornerstone as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Open the record for the Cornerstonespoke.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Cornerstone OAuth profile.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in Cornerstone.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in Cornerstone.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Client Credentials.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Cornerstone Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry. Select the option.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://&lt;Cornerstone-Instance&gt;.com/services/api/oauth2/token.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

5. In the **OAuth Entity Profiles** tab, click the default profile, **Cornerstone default_profile**.

6. Insert a record in the OAuth Entity Scope related list and select the default entity scope for the Cornerstone spoke. For example, **all**.

7. Click **Update**.

**Note:** Ensure that the value of **OAuth Provider** is **Cornerstone**.
Create Credential record for the Cornerstone spoke

Authorize the Cornerstone spoke actions by creating credential records for the application registered in Cornerstone. The Cornerstone spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Cornerstone Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record. Select the option.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Default OAuth entity profile of the Cornerstone spoke. For example, select Cornerstone default_profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

Create Connection record for the Cornerstone spoke

Create Connection records to your Cornerstone application. The Cornerstone spoke connection and credential alias uses these connections to perform actions in Cornerstone.

Before you begin
Role required: admin
Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for the Cornerstone spoke.
3. From the Connections tab, click New.
4. On the form, fill these values.

HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Cornerstone Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Cornerstone. For example, select Cornerstone Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Cornerstone instance.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn’t applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection. Select the option.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_base_url</td>
<td>URL of the Cornerstone instance.</td>
</tr>
<tr>
<td>u_version</td>
<td>Cornerstone version of your instance. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Coupa spoke v3.0.1

Manage business spend and automate approval, contract, inventory, purchase order, requisition, supplier, and user management in Coupa from your ServiceNow instance.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Coupa version stable_029.0.1, but may be compatible with later versions.

Spoke requirements
Create an API key in your Coupa instance and record the API key for later use. See Coupa documentation for information about creating API key.

Spoke user roles
The following user roles are available with the spoke:

• Coupa Admin (sn_coupa_spoke.Coupa Admin): Users with this role have access to both, My Current Approvals and Contracts modules.

• Coupa Approval User (sn_coupa_spoke.Coupa Approval User): Users with this role have access only to the My Current Approvals module

• Coupa Contract User (sn_coupa_spoke.Coupa Contract User): Users with this role have access only to the Contracts module.

Spoke module
The Coupa spoke adds a Coupa application to your ServiceNow instance. The Coupa application supports Coupa Approval User and Coupa Contract User roles. You can access the Coupa application from the ServiceNow instance on your Now Mobile app.

Note: Make sure that Coupa Login attribute and the user ID of ServiceNow instance match before using the My Current Approvals module.

The Coupa application has the following modules.
### My Current Approvals
Displays the list of approvals in Coupa for a user.

### Contracts
Displays a list of contracts in Coupa.

### Spoke actions
The Coupa spoke provides actions to automate approval, contract, inventory, invoice, catalog item, purchase order, requisition, supplier, and user management when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Management</td>
<td>Approve Approval Request</td>
<td>Approves an approval request in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Approval Details</td>
<td>Retrieves the details of the required approval in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval</td>
<td>Looks up an approval record in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval By Requisition ID</td>
<td>Looks up the required approval record in Coupa using its Requisition ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approvals</td>
<td>Looks up the required approval records in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Reject Approval Request</td>
<td>Rejects a request for approval in Coupa.</td>
</tr>
<tr>
<td>Contract Management</td>
<td>Look Up Contracts</td>
<td>Looks up the required contract records in Coupa using the Coupa query.</td>
</tr>
<tr>
<td>Inventory Management</td>
<td>Create Receipt</td>
<td>Creates a receipt in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Receipt Details</td>
<td>Retrieves the details of the required receipt in Coupa.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that description has the exact item name. When you want to access the item name in a flow, use the description data pill.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Get Receipt Fields</td>
<td>Retrieves the list of fields in the Coupa Receipts table.</td>
</tr>
<tr>
<td></td>
<td>Get Advance Shipment Notices After Updated Date</td>
<td>Retrieves the details of the advance shipment notices after the updated date in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Advance Shipment Notice By Purchase Order Line ID</td>
<td>Retrieves details of the required advance shipment notice using its Purchase Order Line ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Receipt</td>
<td>Looks up the required receipt in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Receipts</td>
<td>Looks up the required receipts in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Void Receipt</td>
<td>Makes the required receipt void.</td>
</tr>
<tr>
<td>Invoice Management</td>
<td>Look Up Invoice</td>
<td>Looks up an invoice in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Void Invoice</td>
<td>Makes the required invoice void.</td>
</tr>
<tr>
<td>Item Management</td>
<td>Look Up Items</td>
<td>Looks up the required items in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look up Item</td>
<td>Looks up the required item in Coupa using the Coupa query.</td>
</tr>
<tr>
<td>Purchase Order Management</td>
<td>Cancel Purchase Order</td>
<td>Cancels the required purchase order in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Close Purchase Order</td>
<td>Closes the required purchase order in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get PO Line</td>
<td>Retrieves details of the required purchase order line in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Purchase Order</td>
<td>Looks up the required purchase order in Coupa using the Coupa query.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Requisition Management</td>
<td>Look Up Purchase Orders</td>
<td>Looks up the required purchase orders in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Requisition</td>
<td>Creates a requisition in Coupa with its status as Draft.</td>
</tr>
<tr>
<td></td>
<td>Create Requisition</td>
<td>Creates a requisition in Coupa with its status as Pending Approval or Pending Buyer Action.</td>
</tr>
<tr>
<td></td>
<td>Get Requisition Fields</td>
<td>Retrieves the list of fields in the Coupa Requisitions table.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
<td>This is a metadata action and doesn't make an API call to Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Requisition</td>
<td>Looks up the required requisition in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Requisitions</td>
<td>Looks up the required requisitions in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Update Requisition</td>
<td>Updates the details of the required requisition in Coupa.</td>
</tr>
<tr>
<td>Supplier Management</td>
<td>Look Up Supplier</td>
<td>Looks up the required supplier in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Supplier Items By Item ID</td>
<td>Looks up the required supplier in Coupa using the item ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Suppliers</td>
<td>Looks up for a list of suppliers in Coupa using the query.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up User</td>
<td>Looks up the required user in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users</td>
<td>Looks up the required users in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Reset User Password</td>
<td>Resets password of the required user in Coupa.</td>
</tr>
</tbody>
</table>
tight Note: Remote tables are created when the Coupa spoke is activated. Users are cautioned against directly modifying schema or inserting data in these tables.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up Coupa spoke
Integrate the ServiceNow instance and your Coupa account using an API key to authenticate ServiceNow requests.

Before you begin
• Request IntegrationHub subscription
• Activate the Coupa spoke
• Configure the system properties:
  ◦ com.glide.transform.json.max-partial-length: Type as integer and Value as 16384000
  ◦ glide.pf.rest.response_payload_max_size: Type as integer and Value as 100000000
• Role required: admin

Create Credential records for the Coupa spoke
Create Credential records to the Coupa application you created. The Coupa spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.
### Create Connection records for the Coupa spoke

Create a Connection record to the Coupa API. The Coupa spoke connection and credential alias uses these connections to perform actions in Coupa.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Coupa**.
3. From the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Coupa Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Coupa. For example, select <strong>Coupa Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Coupa organization URL. For example, <strong>https://&lt;instance-name&gt;.coupacloud.com</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

---

**Docker spoke v1.0.3**

Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

⚠️ Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

Community Edition version 18.09.0.

Spoke actions

The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Images Management</td>
<td>Create An Image</td>
<td>Creates an image in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Lists images from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove An Image</td>
<td>Removes an image from the Docker instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Search Images</td>
<td></td>
<td>Searches for images on Docker Hub.</td>
</tr>
<tr>
<td>Services Management</td>
<td>Create A Service</td>
<td>Creates a service in the Docker instance. Services are tasks run on a swarm.</td>
</tr>
<tr>
<td></td>
<td>Delete A Service</td>
<td>Deletes a service from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Service</td>
<td>Returns detailed information about a service in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Update A Service</td>
<td>Updates a service to the swarm on the docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Services</td>
<td>Returns a list of services from the Docker instance.</td>
</tr>
<tr>
<td>Containers Management</td>
<td>Create A Container</td>
<td>Creates a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Container</td>
<td>Inspects a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Kill A Container</td>
<td>Kills a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Containers</td>
<td>Lists containers in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Pause A Container</td>
<td>Suspends all processes in a container on the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove A Container</td>
<td>Removes a container from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Rename A Container</td>
<td>Renames a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Restart A Container</td>
<td>Restarts a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Start A Container</td>
<td>Starts a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Stop A Container</td>
<td>Stop a container in the Docker instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Unpause A Container</td>
<td>Unpauses a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Update A Container</td>
<td>Updates a container in the Docker instance with the provided values.</td>
</tr>
<tr>
<td></td>
<td>Wait for A Container</td>
<td>Blocks all processes until a container stops, then returns the exit code for the container on the Docker instance.</td>
</tr>
<tr>
<td>Executions Management</td>
<td>Create An Exec Instance</td>
<td>Creates an exec instance in Docker, through which you can run a new command in a running container. To execute a command in a container, create and start an exec instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect An Exec Instance</td>
<td>Inspects an exec instance in Docker.</td>
</tr>
<tr>
<td></td>
<td>Start An Exec Instance</td>
<td>Starts an exec instance in Docker, through which you can run a new command in a running container.</td>
</tr>
<tr>
<td>Networks Management</td>
<td>Create A Network</td>
<td>Creates a network on the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Network</td>
<td>Returns detailed information about a network in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Networks</td>
<td>Returns a list of networks from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove A Network</td>
<td>Removes a network from the Docker instance.</td>
</tr>
<tr>
<td>Volumes Management</td>
<td>Create A Volume</td>
<td>Creates a volume in Docker.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Volume</td>
<td>Returns detailed information about a volume in Docker.</td>
</tr>
<tr>
<td></td>
<td>List Volumes</td>
<td>Returns a list of volumes from Docker.</td>
</tr>
<tr>
<td></td>
<td>Remove A Volume</td>
<td>Removes a volume from the Docker instance.</td>
</tr>
</tbody>
</table>
### Swarm Management

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete A Node</td>
<td>Deletes a node from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Initialize A New Swarm</td>
<td>Initializes a new Docker swarm. A swarm is a group of machines running Docker joined into a cluster.</td>
</tr>
<tr>
<td></td>
<td>Inspect Swarm</td>
<td>Returns detailed information about a Docker swarm.</td>
</tr>
<tr>
<td></td>
<td>Join An Existing Swarm</td>
<td>Joins a node to a swarm as a manager or worker node based on the Docker token.</td>
</tr>
<tr>
<td></td>
<td>Leave A Swarm</td>
<td>Removes a Docker instance from a swarm.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Docker alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

### Create Connection records for the Docker spoke

Create Connection records to the Docker engine. The Docker spoke connection and credential alias uses these connections to perform actions on Docker.
Before you begin

- Request IntegrationHub subscription
- Activate Docker spoke
- Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Docker.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Docker Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Docker is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

DocuSign spoke v2.0.3

Automate the process of sending a document to an individual or list of recipients for digital signature using DocuSign. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Compatible versions**
This spoke was built for DocuSign API version v2 or v2.1, but may be compatible with later versions.

**Key features**
DocuSign spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or DocuSign template to an individual or recipient list for digital signature.

- Discover and synchronize DocuSign accounts and templates in ServiceNow.
  - Retrieve a list of accounts and associated templates from DocuSign and then insert or update them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables using the Get Accounts subflow.
  - Retrieve templates associated with a specified DocuSign account and then insert or update them as records in the Templates [sn_docusign_spoke_docusign_templates] table using the Get Templates Per Account subflow.

- Copy and customize sample flows for sending templates and on-demand document requests.

- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.

- Use values from a signed document in a flow.
• Attach a completed DocuSign document to a ServiceNow record for auditing purposes.
• Manage envelopes and users.

**Spoke requirements**

• DocuSign account
• DocuSign administrator credentials
• DocuSign application configured to integrate with ServiceNow
• DocuSign application details such as client ID, integrator key, secret keys, and RSA keypairs
• ServiceNow IntegrationHub subscription

>i Note: Ensure that you have activated the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin.

See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications.

**Spoke flows**

The DocuSign spoke provides sample flows to demonstrate automating DocuSign tasks. Use DocuSign spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document to DocuSign for a digital signature when a Service Catalog request is created by the Send a Document for Digital Signature item. Before using this flow, activate the Send a Document for Digital Signature catalog item.</td>
</tr>
<tr>
<td>Send employment offer to candidate using DocuSign template</td>
<td>Sends a DocuSign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the Demonstrate Template - Send Job Offer to Candidate catalog item.</td>
</tr>
</tbody>
</table>

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.
**Catalog item** | **Description**
--- | ---
Send a Document for Digital Signature | Sends a document for digital signature in DocuSign.
Demonstrate Template - Send Job Offer to Candidate | Sends a job offer using a DocuSign template.

**Spoke subflows**
The DocuSign spoke provides sample subflows to demonstrate automating DocuSign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach DocuSign Envelope To ServiceNow Record</td>
<td>Attaches all the documents in an envelope to a ServiceNow record.</td>
</tr>
<tr>
<td>Get &amp; Set DocuSign Field Data</td>
<td>Processes a list of catalog item variables and updates a draft envelope with each variable value.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user including the permission profile and group memberships.</td>
</tr>
<tr>
<td>Update User</td>
<td>Updates a user including the permission profile and group memberships.</td>
</tr>
</tbody>
</table>

**Spoke actions**
The DocuSign spoke provides actions to automate DocuSign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Accounts</td>
<td>Retrieves accounts associated with the spoke Connection and Credential alias record.</td>
</tr>
<tr>
<td></td>
<td>Get Role ID</td>
<td>Retrieves the roles ID for the specified role name.</td>
</tr>
<tr>
<td>Document Signature</td>
<td>Get Embedded Signing URL</td>
<td>Creates a signing URL that is embedded into an application. User can sign the document without leaving the application.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Note: Signing URL is active for 300 seconds and can be sent to one recipient at a time.</td>
<td></td>
</tr>
<tr>
<td>Document Management</td>
<td>Get Embedded Signing URL Inline</td>
<td>Retrieves a URL which enables you to embed the recipient view of the on DocuSign.</td>
</tr>
<tr>
<td>Add Document to Envelope</td>
<td>Add Document to Envelope</td>
<td>Adds documents to envelope.</td>
</tr>
<tr>
<td>Attach Combined Document To ServiceNow Record</td>
<td>Attach DocuSign Document to Record</td>
<td>Attaches DocuSign documents to a ServiceNow record.</td>
</tr>
<tr>
<td>Get Document ID by Name</td>
<td>Get Document ID by Name</td>
<td>Retrieves the document ID from an envelope using the specified document name.</td>
</tr>
<tr>
<td>Get Documents In An Envelope</td>
<td>Get Documents In An Envelope</td>
<td>Returns a list of documents with an ID and name in the given DocuSign envelope.</td>
</tr>
<tr>
<td>Replace Document In Envelope</td>
<td>Replace Document In Envelope</td>
<td>Replaces documents to envelope.</td>
</tr>
<tr>
<td>Envelope Management</td>
<td>Attach DocuSign Certificate To ServiceNow Record</td>
<td>Attaches a DocuSign certificate to a ServiceNow record.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Add Recipient to Envelope</td>
<td>Adds the specified recipient to the specified envelope.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Administrator enters a numeric value for this Recipient ID.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Envelope from Template</td>
<td>Creates a draft envelope from an existing DocuSign template.</td>
</tr>
<tr>
<td></td>
<td>Get Field ID</td>
<td>Retrieves the ID of the specified field from the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Field Value</td>
<td>Retrieves the value of the specified field from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipient ID by Role Name</td>
<td>Retrieves the recipient ID of the specified role name from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipients In An Envelope</td>
<td>Returns a list of recipients with a Recipient ID and Role Name in the given DocuSign envelope.</td>
</tr>
<tr>
<td></td>
<td>Remove Recipient From Envelope</td>
<td>Deletes a recipient from a DocuSign envelope.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to User</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified recipient for signature.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to Users</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified multiple recipients for signatures at a time. <strong>Note:</strong> When the Use Sequential Signing option is enabled, the DocuSign document is sent to multiple recipients in a sequential order. The Use Sequential Signing option controls the order in which the recipients receive and sign the documents.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request To Users - Inline</td>
<td>Sends the uploaded document from a ServiceNow record to multiple recipients.</td>
</tr>
<tr>
<td></td>
<td>Send Envelope</td>
<td>Sends an envelope to the specified recipients. <strong>Note:</strong> All recipient details must be provided before sending an envelope.</td>
</tr>
<tr>
<td></td>
<td>Set Field Value</td>
<td>Sets the value of the specified field in the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Set Field Values</td>
<td>Assigns the values of multiple fields associated to a document in a draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Wait for Signature from DocuSign</td>
<td>Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get List Of Documents</td>
<td>Gets the list of all DocuSign documents in an envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Group List (Metadata)</td>
<td>Retrieves metadata for a group list.</td>
</tr>
<tr>
<td></td>
<td>Get Roles</td>
<td>Retrieves a list of roles.</td>
</tr>
<tr>
<td></td>
<td>Get Roles (Metadata)</td>
<td>Retrieves metadata for a list of roles.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds user from a group.</td>
</tr>
<tr>
<td></td>
<td>Get Group ID</td>
<td>Retrieves a group ID for the specified role name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes the specified user from a group.</td>
</tr>
<tr>
<td>Template Management</td>
<td>Get Templates Per Account</td>
<td>Retrieves the templates associated with the specified DocuSign account.</td>
</tr>
<tr>
<td></td>
<td>Get Template Fields</td>
<td>Retrieves all fields in a template that is defined for a recipient.</td>
</tr>
<tr>
<td></td>
<td>Get Template Recipients</td>
<td>Retrieves all recipients defined for a template.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a DocuSign user with the specified user details.</td>
</tr>
<tr>
<td></td>
<td>Get User Detail</td>
<td>Retrieves details for a user.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates the specified user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified DocuSign user.</td>
</tr>
</tbody>
</table>

**Note:**
- Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action.
- Value of the Recipient ID is a unique system-generated number.

**Spoke module**

The DocuSign spoke adds a DocuSign module to your ServiceNow instance. The DocuSign spoke synchronizes and stores templates and envelopes in ServiceNow. The DocuSign spoke includes these tables and records.
<table>
<thead>
<tr>
<th>Table/Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Aliases</td>
<td>The DocuSign connection alias.</td>
</tr>
<tr>
<td>Scheduled Job</td>
<td>The Get Accounts &amp; Templates scheduled job that synchronizes templates and envelopes with your DocuSign account.</td>
</tr>
<tr>
<td>Accounts</td>
<td>DocuSign accounts synchronized with your ServiceNow instance. To synchronize accounts, see <a href="#">Synchronize DocuSign with ServiceNow</a>. The Get Accounts subflow retrieves a list of accounts and associated templates from DocuSign and then inserts or updates them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables.</td>
</tr>
<tr>
<td>Templates</td>
<td>DocuSign templates from synchronized DocuSign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified DocuSign account and then inserts or updates them as records in the Templates [sn_docusign_spoke_docusign_templates] table.</td>
</tr>
<tr>
<td>Envelopes</td>
<td>DocuSign envelopes from synchronized DocuSign accounts. Records in the Envelopes table are updated only when webhook is configured for the DocuSign account.</td>
</tr>
</tbody>
</table>

The DocuSign spoke tables include these fields.

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| Accounts [sn_docusign_spoke_accounts] | • Account ID  
• Account Name  
• Description  
• Email  
• Alias  
• Display Name |
### Table

<table>
<thead>
<tr>
<th>Templates [sn_docsign_spoke_docsign_templates]</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Account</td>
<td></td>
</tr>
<tr>
<td>• Template ID</td>
<td></td>
</tr>
<tr>
<td>• Name</td>
<td></td>
</tr>
<tr>
<td>• Description</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>• Template</td>
<td></td>
</tr>
</tbody>
</table>

**DocuSign account requirements**

The DocuSign spoke requires configuring your DocuSign account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the DocuSign Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the DocuSign alias to configure where...
actions run as well as set MID Server selection attributes. For more information, see MID server.

Create connection aliases for additional DocuSign accounts

If your DocuSign implementation includes multiple DocuSign accounts, create a connection alias for each account.

Before you begin
Role required: admin

About this task
Your company may have a DocuSign account for each department that uses DocuSign. To use multiple accounts with this spoke, create an alias for each account. At runtime, the system identifies the alias associated with the account and sends the correct connection and credential information in the request. If your company only has one account, you can use the default DocuSign alias provided with the spoke and proceed to Set up DocuSign spoke.

Procedure
1. Navigate to DocuSign > Connection Aliases.
2. Select New.
3. In the Name field, add a descriptive name for the account. For example, DocuSign HR account.
4. Save the record.

What to do next
Set up DocuSign spoke for each connection alias in your DocuSign implementation.

Set up DocuSign spoke
Integrate your DocuSign account with your ServiceNow instance. Create a custom OAuth application in DocuSign and authenticate requests from ServiceNow.

Before you begin
Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
Configure DocuSign account
Create a custom OAuth application from your DocuSign account to enable OAuth 2.0 authentication with the DocuSign spoke.

Before you begin
DocuSign requirements:
• DocuSign account
• DocuSign administrator credentials
• DocuSign app configured to integrate with ServiceNow

About this task
Complete these steps from your DocuSign account. See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications. DocuSign uses a scripted webhook to send signed document data to x. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

Procedure
1. From your DocuSign account, register your application.
   
   Note: Ensure that you select the Authorization Code Grant option for User Application.

2. Generate an integrator key.

3. Generate a secret key.

4. Record the integrator key and secret key to register the app as a third-party OAuth provider on your x instance.

5. Click ADD RSA KEYPAIR and record the Keypair ID, Public Key, and Private Key.

6. In Redirect URIs, add your xs instance URL in this format: https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook.

Generate the JKS certificate
Generate a JKS certificate for the JWT authentication of the DocuSign spoke.

Before you begin
Role required: admin
**Procedure**

1. Open the text editor for code such as, Sublime Text.
2. Create a new file.
3. Paste the Private Key you had earlier generated from your DocuSign integrator app. For more information, see [Configure DocuSign account](#).
   
   **Note:** Ensure that you include both beginning and ending of the private key.
4. Save the file with the .key extension. For example, `privatekey.key`.
5. Open terminal and navigate to the directory where you saved the file with the .key extension.
6. Create a CA signed certificate using your private key by executing the command:
   ```bash
   openssl req -new -x509 -key <file-name>.key -out <certificate-name>.pem -days 1095
   ```
   System prompts you to provide required details such as Country Name, Province Name and so on.
7. Enter the required details.
8. Create PKCS 12 file using your private key and CA signed certificate by executing the command:
   ```bash
   openssl pkcs12 -export -in <certificate-name>.pem -inkey <file-name>.key -certfile <certificate-name>.pem -out <PKCS-12-file-name>.p12
   ```
   System prompts you to provide a password.
9. Provide the export password.
10. Create the JKS file by executing this command:
    ```bash
        keytool -importkeystore -srckeystore <PKCS-12-file-name>.p12 -srcstoretype pkcs12
        -destkeystore <JKS-certificate-filename>.jks -deststoretype JKS
    ```
    System prompts you to provide a password.
11. Provide the destination and source keystore passwords.

**Attach a Java Key Store certificate to the DocuSign spoke**

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the DocuSign spoke.
Before you begin

- Ensure the availability of a valid Java KeyStore certificate
- Role required: admin

Procedure

1. Navigate to **System Definition > Certificates**.
2. Click **New**.
3. Complete the form.

### X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the record. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Define users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Enter the number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Enter the number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter a password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon ( ![ ] ) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

Create a JWT signing key for the DocuSign spoke

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.
Procedure

1. Navigate to System OAuth > JWT Keys.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Select the valid JKS certificate attached in the previous task. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Enter a key Id to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Select an algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter a password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a JWT provider for the DocuSign spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Procedure

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the JWT Provider form, fill the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT provider. For example, DocuSign JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Enter a number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
</tbody>
</table>
Select a JWT signing key. For example, DocuSign JWT Keys.

4. Right-click the form header, and click Save. The Standard Claims and Custom Claims related lists display.

5. Select the JWT provider created for the DocuSign spoke.

6. Enter values for iss, sub, and aud in the Standard Claims related list. See the DocuSign Developer Center for instructions.

7. Insert a record in the Custom Claims related list and complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

8. Click Update.

Register DocuSign as OAuth Provider

Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.

2. Click New.
   The system displays the message What kind of OAuth application?

3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.

4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>JWT Bearer</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>• For developer sandbox environment, enter <a href="https://account-d.docusign.com/oauth/auth">https://account-d.docusign.com/oauth/auth</a>.</td>
</tr>
<tr>
<td></td>
<td>• For live production system, enter <a href="https://account.docusign.com/oauth/auth">https://account.docusign.com/oauth/auth</a>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>• For developer sandbox environment, enter <a href="https://account-d.docusign.com/oauth/token">https://account-d.docusign.com/oauth/token</a>.</td>
</tr>
<tr>
<td></td>
<td>• For live production system, enter <a href="https://account.docusign.com/oauth/token">https://account.docusign.com/oauth/token</a>. For more information see, Post Go-Live and User Info Endpoint Reference in the DocuSign Developer Center documentation.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, DocuSign OAuth default_profile.

6. Insert a record in the **OAuth Entity Scopes** related list and fill the values.

   **OAuth Entity Scopes related list fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from **Redirect URL**.
8. Click **Update**.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the DocuSign Developer Center for instructions.

Results
The instance can request OAuth 2.0 tokens for the spoke.

Note: When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Obtain consent
Obtain explicit consent for the ServiceNow application from DocuSign.

Role required: admin

Obtain consent for individuals

1. Navigate to System OAuth > Application Registry.
2. Open the record you had created for the DocuSign spoke.
3. Insert a record in the OAuth Entity Profiles related list and fill the values.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles related list fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Is default</td>
</tr>
<tr>
<td>Grant type</td>
</tr>
</tbody>
</table>

4. Click the created OAuth Entity Profile.
5. Insert a record in the OAuth Entity Scopes related list and fill the values.

<table>
<thead>
<tr>
<th>OAuth Entity Scopes related list fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>OAuth Scope</td>
</tr>
</tbody>
</table>
6. Create credential record associated with the OAuth Entity profile whose **Grant type** is **Authorization Code**.

   a. Navigate to **Connections & Credentials > Credentials**.

   b. Click **New**. The system displays the message **What type of Credentials would you like to create?**.

   c. Select **OAuth 2.0 Credentials**.

   d. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>DocuSign Credentials Auth Code</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth Entity profile you created with <strong>Grant type</strong> as <strong>Authorization Code</strong>. For example, select <strong>DocuSign OAuth default_profile_Auth_Code</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

   e. Save the record.

   f. Click the **Get OAuth Token** related link to generate the OAuth token.

   g. Enter your DocuSign user name and password to provide the consent.

7. Create another credential record associated with the OAuth Entity profile whose **Grant type** is **JWT Bearer**. See **Create Credential records for the DocuSign spoke** for the required information. After the credential record, click the **Get OAuth Token** related link to generate the OAuth token.

**Obtain consent for an organization administrator**

See **DocuSign Developer documentation (Admin consent for internal applications)** for instructions to obtain consent for an organization administrator.

**Create Credential records for the DocuSign spoke**

Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.
Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.
   The system displays the message What type of Credentials would you like to create?

3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom DocuSign application as an OAuth provider. For example, select DocuSign OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. Click the Get OAuth Token related link to generate the OAuth token.

Create Connection records for the DocuSign spoke

Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.

2. Open for the record for DocuSign.

3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.

4. Enter these values.
### Field | Value required
--- | ---
Name | Enter any name to uniquely identify the connection record. For example, enter **DocuSign Connection**.
Credential | Select the Credential record you created for DocuSign. For example, select **DocuSign Credentials**.
Connection URL | • For demo environment, enter [https://demo.docusign.net](https://demo.docusign.net).
• For live production system, enter the Base URI such as na2.docusign.net or eu.docusign.net. For instructions on obtaining the base URI, see [Post Go-Live and User Info Endpoint Reference](https://developer.docusign.com/docs/EnvelopeMonitoring/PostGoLive) in the DocuSign Developer Center documentation.

5. Click **Submit**.

### What to do next
Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See [Synchronize DocuSign with ServiceNow](https://developer.docusign.com/docs/EnvelopeMonitoring/PostGoLive).

**Configure DocuSign webhook**

Configure the webhook in your DocuSign account to enable DocuSign to send data to ServiceNow when a recipient signs a document.

**Before you begin**
Role required: admin

**Procedure**

1. Connect a custom configuration to enable your DocuSign application to share events and data with your ServiceNow instance.

2. Add your ServiceNow instance URL in this format: [https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook](https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook).

3. Include basic authorization in the header and add your x credentials.

4. Enable DocuSign to share envelope events with ServiceNow.
   - Envelope Sent
   - Envelope Delivered
   - Envelope Signed/Completed
Synchronize DocuSign with ServiceNow

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

Before you begin
Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- Set up DocuSign spoke

About this task
Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

Procedure

1. **Required**: Schedule a job to synchronize DocuSign data with your ServiceNow instance.
   
   a. Navigate to DocuSign > Scheduled Job. The Get Accounts & Templates scheduled job opens.
   
   b. Select Active.

      The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. **Required**: Synchronize DocuSign data as needed with a UI action.

   b. Click the Get Accounts related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.
Activate DocuSign spoke catalog items

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, the Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

Before you begin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- Activate the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin
- Role required: admin

About this task

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

Procedure

1. Navigate to Service Catalog > Maintain Items.
2. Search for and select Send a Document for Digital Signature.
3. Click Activate.
4. Open the record, Send a Document for Digital Signature.
5. In the Process Engine tab, select Send a Document for Digital Signature for Flow.
6. Search for and select Demonstrate Template - Send Job Offer to Candidate.
7. Click Activate.
8. Open the record, Demonstrate Template - Send Job Offer to Candidate.
Results
When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

Change the DocuSign API version
By default, the DocuSign spoke sends REST API requests to DocuSign API v2. For forward compatibility and to take advantage of DocuSign's newer API, you can update a connection attribute to send API requests to DocuSign API v2.1.

Before you begin
Role required: admin

About this task
To understand the difference between the two APIs, see the DocuSign Developer site.

Procedure
1. Navigate to DocuSign > Connection Aliases.
2. Open the connection alias that you want to update the version for. Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the Connection Attributes related list, add or edit the API Version record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Label</td>
<td>API Version</td>
</tr>
<tr>
<td>Column name</td>
<td>api_version</td>
</tr>
<tr>
<td>Default value</td>
<td>v2.1</td>
</tr>
</tbody>
</table>

4. Save or submit the record.

Results
When the DocuSign spoke makes an API request, it uses the API version designated in the connection attribute Default value field.

How to automate on-demand signing requests
Send DocuSign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.
Before you begin
Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- Set up DocuSign spoke

About this task
cci Note: Customize flows in Flow Designer based on your requirements.

Procedure
1. In Flow Designer, create a flow.
2. Specify TRIGGER to initiate the flow.
3. Specify the ACTIONS to be performed during the flow. The actions include one of the following:
   - Send Adhoc Signature Request To User
   - Send Adhoc Signature Request To Users
4. Optional: To pause the flow until the specified document is signed or rejected, select the Wait for Signature from DocuSign action.
5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient [User]**.
   - To send a document for signing, provide details regarding DocuSign account, PDF document, recipient, email, and envelope expiry.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

How to automate signing requests using templates
Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, Send employee offer.

Before you begin
Role required: admin
• Request IntegrationHub subscription
• Activate DocuSign spoke
• Set up DocuSign spoke

About this task

Note: Customize flows based on your requirements.

Procedure

1. In DocuSign, create document templates and specify recipient roles. For example, Candidate and Manager. The system retrieves other recipient details such as name and email, when the flow is triggered.

2. In Flow Designer, create a new flow.

3. Specify TRIGGER to initiate the flow.

4. Specify the ACTIONS to be performed during the flow and provide recipient details. The actions include:
   • Create Draft Envelope from Template
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Recipient ID by Role Name
   • Add Recipient to Envelope
   • Get Field ID
   • Set Field Value
   • Send Envelope
   • Get Field Value

5. Optional: To pause the flow until the specified document is signed or rejected, select the Wait for Signature from DocuSign action.
   • The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   • An envelope record is created in the Envelopes table. The Envelope status and other details are updated.

How to separate DocuSign account data

Restrict access to DocuSign data based on a user's role. For example, your company may have one DocuSign account used by the HR team and another used by the Legal team. To keep the data separate between these two
accounts, you can create a role for each account and add it to the accounts record.

Before you begin
• Request IntegrationHub subscription
• Activate DocuSign spoke
• Create connection aliases for additional DocuSign accounts
• Set up DocuSign spoke

Procedure
1. Create a role for each DocuSign account that you want to restrict access to.
   b. In the Roles [sys_user_role] table, select New.
   c. Check that the value of the Application field is DocuSign Spoke. If a different scope is listed, change the scope to DocuSign Spoke.
   d. In the Suffix field, add a name to indicate the account that the role is for. For example, Legal.
   e. Save the record.
   f. Note the name of the role you just created. For example, sn_docusign_spoke.legal.
2. Add the role to the associated account in the accounts table.
   a. Navigate to DocuSign > Accounts.
   b. Open the account record that you want to restrict access to.
   c. In the Role field, add the associated role.
   d. Click Update.
3. Grant the role to the desired users.
   b. Open the record for the user you want to provide access.
   c. Add the role you created to the Roles related list.

Results
Only users with the designated role have access to DocuSign data associated with the account.
Dropbox Business spoke v1.0.2

Use Dropbox Business as file storage in place of attachments in ServiceNow. This spoke adds Dropbox storage to your ServiceNow instance and enables users to reference Dropbox files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v2.

Spoke subflows

The Dropbox Business spoke provides sample subflows in the draft state to demonstrate automating Dropbox tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process File Changes</td>
<td>Subflow to process file changes in Dropbox.</td>
</tr>
<tr>
<td>Process Team Member Changes</td>
<td>Subflow to process team member changes in Dropbox.</td>
</tr>
</tbody>
</table>

Spoke actions

The Dropbox Business spoke provides actions to perform Dropbox tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File and Folder</td>
<td>Copy Dropbox File To Attachment</td>
<td>Copies a Dropbox file and attaches it to a ServiceNow record. If a ServiceNow incident record is supplied as input, the specified record is attached to it.</td>
</tr>
<tr>
<td>Management</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Copy File or Folder</td>
<td>Creates a copy of the specified Dropbox file or folder in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder at the specified path in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder</td>
<td>Deletes a file or folder at the specified path in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Get File Changes - Webhook</td>
<td>Retrieves the file changes noticed in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Look up Folder</td>
<td>Looks up the contents of a Dropbox folder and returns an object containing information about the folder</td>
</tr>
<tr>
<td></td>
<td>Update Latest Cursor</td>
<td>Updates the latest cursor value for the corresponding team in the Team Details table.</td>
</tr>
<tr>
<td></td>
<td>Upload Attachment to Dropbox</td>
<td>Copies a ServiceNow attachment to a Dropbox folder. It copies to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>

<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Users in Group</td>
<td>Lists all the members in the specific group. Returns user profile data and role in the group.</td>
</tr>
<tr>
<td></td>
<td>Look up Users in Team</td>
<td>List all the members in the team. Returns user profile data, membership type, and role.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Team</td>
<td>Removes user from a team. Options include user retains files, and access to team shares, keeps email account and unrestricted team shares, and to delete relevant data.</td>
</tr>
<tr>
<td></td>
<td>Remove Users From Group</td>
<td>Removes one or more users from an existing group.</td>
</tr>
</tbody>
</table>

**Dropbox Business account requirements**

The Dropbox Business spoke requires a custom app that you create in Dropbox Business.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Dropbox alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Dropbox Business spoke**

Integrate a ServiceNow instance and Dropbox Business spoke by using Dropbox credentials to authenticate ServiceNow requests.
Before you begin

- Request IntegrationHub subscription.
- Activate the Dropbox Business spoke.
- Role required: admin

Setting up the Dropbox Business spoke includes actions in the Dropbox app console, in the Now Platform® user interface, and in the Flow Designer. Setup is easier if you keep each of these pages open in separate tabs.

Configure Dropbox Business applications

Create two custom OAuth applications from your Dropbox Professional account to enable OAuth 2.0 authentication with the Dropbox Business spoke.

Before you begin

Dropbox Business integration requirements:

- A Dropbox Business account and team admin credentials.

About this task

In this task, you create two apps using the Dropbox Business API (not the normal Dropbox API). The first is for Team member file access and the other is for Team member management. Complete these steps from your Dropbox Business account. See the Dropbox Business product documentation for instructions on creating and configuring custom applications.

Procedure

2. Click Create app.
3. Choose Dropbox Business API.
4. Under Choose the type of access you need, select Team member file access.
5. Name the app and click Create app.
6. On the next screen, you see the App key and App secret. Show the App secret and copy both values. You use these values to connect Dropbox Business to ServiceNow.
7. Enter the redirect URI. The form of the redirect URI is https://<your-instance>.service-now.com/oauth_redirect.do.
8. Go back to the Create app screen and create a **Team member Management** app following the same steps. Make sure to note which App key and App secret belong to each application.

**What to do next**

Create Connection and Credential records for the Dropbox Business Team Management alias

**Create Connection and Credential records for the Dropbox Business Team Management alias**

Create connection records to a Dropbox Business account. A connection alias resolves your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

**Before you begin**

The Dropbox Business spoke comes with three Connection and Credential aliases. Configure them in the following order:

1. DropboxBusinessTeamManagement
2. DropboxBusinessFileAccess
3. DropboxBusinessContent

You configure each alias with an App key and App secret that you generated in the Dropbox app console.

When you configure the DropboxBusinessTeamManagement alias, you navigate to the Flow Designer to get the team_member_id.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the DropboxBusinessTeamManagement alias.
3. Click the **Create New Connection and Credential** related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.

<table>
<thead>
<tr>
<th>Section</th>
<th>Information</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name</td>
<td>A relevant connection name such as <strong>Dropbox Business Team Management Connection</strong>.</td>
</tr>
<tr>
<td>Section</td>
<td>Information</td>
<td>Input</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td></td>
<td><a href="https://api.dropboxapi.com">https://api.dropboxapi.com</a></td>
</tr>
<tr>
<td>API Version</td>
<td></td>
<td>2</td>
</tr>
<tr>
<td>Credential Information</td>
<td>Credential Name</td>
<td>Enter a relevant connection name such as Dropbox Business Team Management Credential.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as Dropbox Business Team Management OAuth.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member Management application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member Management application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Redirect URL</td>
<td>Enter the redirect URI. The form of the redirect URI is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.

6. Once you successfully acquire the OAuth token, get the team member ID for the connection.

   a. Navigate to **Flow Designer > Designer** and select **Actions**.
   
   b. Open the Get Admin Details action for the Dropbox Business spoke.
   
   c. In the Action Outline screen, click **Test**. After the test executes, click the link to view the result.
   
   d. On the **Execution Details** tab, click the link in the **Runtime Value** column to view the output of the action.
   
   e. Copy the value for `team_member_id` from the Viewing admin_details pop-up to a text file. You add this value to all three credential alias configurations.

8. On the Connections tab, select the **Dropbox Business File Access Connection**.

9. On the **Attributes** tab, paste the value of the `team_member_id` in the **Member ID** box and click **Update**.
What to do next
Create Connection and Credential records for the Dropbox Business File Access alias

Create Connection and Credential records for the Dropbox Business File Access alias

Create connection records to a Dropbox Business account for the DropboxBusinessFileAccess alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Before you begin
The Dropbox Business spoke comes with three Connection and Credential aliases. You have already configured the Team Management alias.

You configure each one with an App Key and App Secret that you generated in the Dropbox app console.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
3. Click the Create New Connection and Credential related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.

<table>
<thead>
<tr>
<th>Section</th>
<th>Information</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Information</td>
<td>Connection Name</td>
<td>A relevant connection name such as Dropbox Business File Access Connection.</td>
</tr>
<tr>
<td></td>
<td>Connection URL</td>
<td><a href="https://api.dropboxapi.com">https://api.dropboxapi.com</a></td>
</tr>
<tr>
<td></td>
<td>API Version</td>
<td>2</td>
</tr>
<tr>
<td>Credential Information</td>
<td>Credential Name</td>
<td>Enter a relevant connection name such as Dropbox Business File Access Credential.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as Dropbox Business File Access OAuth.</td>
</tr>
<tr>
<td>Section</td>
<td>Information</td>
<td>Input</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member File Access application in the Dropbox app console.</td>
<td></td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member File Access application in the Dropbox app console.</td>
<td></td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>Enter the <strong>redirect URI</strong>. The form of the redirect URI is <code>https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do</code>.</td>
<td></td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.

7. Paste the value of the `team_member_id` in the **Member ID** box and click **Update**. You generated the `team_member_id` when you configured the DropboxBusinessTeamManagement alias.

**What to do next**

Create Connection and Credential records for the Dropbox Business Content alias

Create Connection and Credential records for the Dropbox Business Content alias

Create connection records to a Dropbox Business account for the DropboxBusinessContent alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

**Before you begin**

The Dropbox Business spoke comes with three Connection and Credential aliases. You have already configured the Team Management and File Access aliases.

You configure each one with an App Key and App Secret that you generated in the Dropbox app console.

When you configure the DropboxBusinessContent alias, you navigate to the Flow Designer to get the `root_namespace_id`. In the Connection configuration, you paste this value into the **Folder ID** field.
Procedure

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the DropboxBusinessContent alias.
3. Click the **Create New Connection and Credential** related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.

<table>
<thead>
<tr>
<th>Section</th>
<th>Information</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Name</td>
<td>A relevant connection name such as Dropbox Business Content Connection.</td>
</tr>
<tr>
<td>Connection</td>
<td>URL</td>
<td><a href="https://content.dropboxapi.com">https://content.dropboxapi.com</a></td>
</tr>
<tr>
<td></td>
<td>API Version</td>
<td>2</td>
</tr>
<tr>
<td>Credential</td>
<td>Name</td>
<td>Enter a relevant connection name such as Dropbox Business Content Credential.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as Dropbox Business Content OAuth.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>Redirect URL</td>
<td>Enter the <strong>redirect URL</strong>. The form of the redirect URI is <code>https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do</code>.</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.
6. Once you successfully acquire the OAuth token, you acquire the root_namespace_id for the connection.
   a. In a different tab, navigate to **Flow Designer > Designer** and select **Actions**.
   b. Open the **Get Current Account** action for the Dropbox Business spoke.
   c. In the Action Outline screen, click **Test**. In the Test Action pop-up, click **Run Test**.
d. On the Execution Details tab, click the link under Runtime Value to view the output of the action.

e. Copy the value for root_namespace_id from the Account Details pop-up to a text file. You add this value to all three credential alias configurations.

7. Return to the Connection & Credential Aliases for the DropboxBusinessContent alias.

8. On the Connections tab, select the Dropbox Business Content Connection.

9. Paste the value of the root_namespace_id in the Folder ID box and click Update.

Results
The Dropbox Business spoke is set up and integrated with the ServiceNow instance.

F5 BIG-IP spoke
Manage servers and pools in the F5 BIG-IP system.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
**Supported version**
BIG-IP 13.1.0.

**Spoke flows**
The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Traffic Management Using F5 Big-IP</td>
<td>Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.</td>
</tr>
</tbody>
</table>

**Spoke subflows**
The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5 Server - Pool Management</td>
<td>Creates a pool in the BIG-IP system and manages it.</td>
</tr>
</tbody>
</table>

**Spoke actions**
The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Management</td>
<td>Create Pool</td>
<td>Creates a pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Add Pool Member</td>
<td>Creates a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Check Pool</td>
<td>Checks pool health in BIG-IP system. Returns whether the pool is available, unavailable, offline, or if the status is unknown.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Pool</td>
<td>Deletes a pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Disable Pool Member</td>
<td>Disables a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Enable Pool Member</td>
<td>Enables a pool member of a specified pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Get Pool Members</td>
<td>Retrieves the list of members of a specified pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Remove Pool Member</td>
<td>Deletes a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td>Server Management</td>
<td>Add Profile to Virtual Server</td>
<td>Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.</td>
</tr>
<tr>
<td></td>
<td>Create Virtual Server</td>
<td>Creates a virtual server in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual Server</td>
<td>Deletes a virtual server from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Update Virtual Server</td>
<td>Updates virtual server attributes in the BIG-IP system.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses this alias record to authorize actions.
<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| F5_BIG_IP                    | Connection to the F5 BIG-IP system. | • Connection type: HTTP  
• Connection URL: URL of the host machine where the F5 server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

**MID Server requirements**

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up F5 BIG-IP spoke**

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate F5 BIG-IP spoke
- Role required: admin

**Create Credential records for the F5 BIG-IP spoke**

Create Credential records to the F5 BIG-IP server. The F5 BIG-IP spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   - A blank Basic Auth Credentials form displays.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter F5 Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your F5 BIG-IP user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your F5 BIG-IP password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Create Connection records for the F5 BIG-IP spoke**

Create Connection records to your F5 BIG-IP account. The F5 BIG-IP spoke connection and credential alias uses these connections to perform actions on the F5 BIG-IP server.

**Procedure**

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **F5_BIG_IP**.
3. From the **Connections** tab, click **New**.
   - The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter F5 Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for F5. For example, select <strong>F5 Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the F5 BIG-IP server is installed.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
First Advantage spoke v1.5.2
Manage and track the background verifications of candidates using First Advantage from your ServiceNow instance. Manage users, accounts, candidates, invites, and orders in First Advantage from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for First Advantage API version v1.1, but may be compatible with later versions.

Spoke requirements
• First Advantage account
• API key

  Note: Contact the First Advantage team to obtain the API key.
• Account ID

  Note: Contact the First Advantage team to obtain the Account ID.

Spoke flows
The First Advantage spoke provides sample flows to demonstrate automating the First Advantage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Advantage -</td>
<td>Initiates background check of the candidate using invite. Sends a request</td>
</tr>
<tr>
<td>Candidate Background</td>
<td>to the candidate to complete an application. For information about creating</td>
</tr>
<tr>
<td></td>
<td>a case, see Create a case in First Advantage from ServiceNow.</td>
</tr>
<tr>
<td>Flow</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Verification using Invite</td>
<td></td>
</tr>
<tr>
<td>First Advantage - Candidate Background Verification using Order</td>
<td>Initiates background check of the candidate using order. An order record is created and request to provide essential details is sent to the candidate. For information about creating a case, see Create a case in First Advantage from ServiceNow.</td>
</tr>
<tr>
<td>First Advantage - (Order As) Candidate Background Verification using Order</td>
<td>Initiates background check of the candidate using order and places order on behalf of the required user.</td>
</tr>
<tr>
<td>First Advantage - (Order As) Candidate Background Verification using Invite</td>
<td>Initiates background check of the candidate using invite and places order on behalf of the required user.</td>
</tr>
</tbody>
</table>

### Spoke subflows

The First Advantage spoke provides a sample subflow to demonstrate automating First Advantage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Packages. The subflow retrieves packages in First Advantage and stores the details in the Packages table.

### Spoke actions

The First Advantage spoke provides actions manage accounts, candidates, invites, orders, and users when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Account Details</td>
<td>Retrieves details of the First Advantage account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Packages</td>
<td>Retrieves the details of all the packages in an account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Account Profiles</td>
<td>Retrieve the details of all profiles in an account.</td>
<td></td>
</tr>
<tr>
<td>Get Account Users</td>
<td>Retrieve the details of all users in an account.</td>
<td></td>
</tr>
<tr>
<td>Candidate Management</td>
<td>Create New Candidate</td>
<td>Creates a candidate profile for background verification.</td>
</tr>
<tr>
<td>Get Candidate By Candidate ID</td>
<td>Retrieve the details of the required candidate.</td>
<td></td>
</tr>
<tr>
<td>Get Documents For A Specific Candidate</td>
<td>Retrieve the documents associated with the required candidate.</td>
<td></td>
</tr>
<tr>
<td>Get Monitoring Product Details For A Specific Candidate</td>
<td>Retrieve the details of the monitoring product for the required candidate.</td>
<td></td>
</tr>
<tr>
<td>Update Candidate Details</td>
<td>Updates the details of a candidate profile.</td>
<td></td>
</tr>
<tr>
<td>Invite Management</td>
<td>Create Invite</td>
<td>Create an invite for the candidate to fill the application.</td>
</tr>
<tr>
<td>Get Invite Status By Applicant ID</td>
<td>Retrieve the latest status of the invite for the required applicant.</td>
<td></td>
</tr>
<tr>
<td>Get Invite View Link By Application ID</td>
<td>Retrieve a secure link to access the profile that the candidate must complete.</td>
<td></td>
</tr>
<tr>
<td>Order Management</td>
<td>Create Order</td>
<td>Creates a First Advantage screening order.</td>
</tr>
<tr>
<td>Get Order Report By Order ID</td>
<td>Retrieve the completed order report for the required order.</td>
<td></td>
</tr>
<tr>
<td>Get Order Status By Order ID</td>
<td>Retrieve the latest order status for the required order.</td>
<td></td>
</tr>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Activates the required user.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user profile.</td>
<td></td>
</tr>
<tr>
<td>Deactivate User</td>
<td>Deactivates the required user.</td>
<td></td>
</tr>
<tr>
<td>Update User Password</td>
<td>Updates the password of the required user.</td>
<td></td>
</tr>
</tbody>
</table>
## Spoke module

The First Advantage spoke adds a First Advantage spoke module to your ServiceNow instance. The First Advantage spoke synchronizes and stores information about First Advantage cases, tasks, employee tasks, order tasks, and packages.

The First Advantage spoke includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounts</td>
<td>Enables you to view the details of all accounts available in First Advantage. To view the account details, you must set up the spoke and synchronise the accounts.</td>
</tr>
<tr>
<td>FADV Webhook Client Details</td>
<td>Enables you to set up First Advantage webhook by providing key for the First Advantage webhook client.</td>
</tr>
<tr>
<td>Create New First Advantage Case</td>
<td>Enables you to initiate the background check of the required candidate using invite or order from ServiceNow.</td>
</tr>
<tr>
<td>First Advantage Cases</td>
<td>Enables you to view list of all First Advantage cases created using invite and order.</td>
</tr>
<tr>
<td>Packages</td>
<td>Enables you to view the details of all packages available in First Advantage. To view the package details, you must set up the spoke and synchronise the packages.</td>
</tr>
<tr>
<td>Order Tasks</td>
<td>Enables you to view list of all First Advantage order records.</td>
</tr>
<tr>
<td>Employee Tasks</td>
<td>Enables you to view list of all First Advantage cases created using invite.</td>
</tr>
</tbody>
</table>

The First Advantage spoke includes the these tables:

- First Advantage Task [sn_fadv_spoke_first_advantage_task]
- First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table]
• Packages [sn_fadv_spoke_packages]
• FADV Webhook Client Details [sn_fadv_spoke_webhook_client_details]

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Advantage Task</td>
<td>Details of all the First Advantage order records.</td>
</tr>
<tr>
<td>First Advantage Employee Task</td>
<td>Details of all the First Advantage invite records.</td>
</tr>
<tr>
<td>Packages</td>
<td>First Advantage packages that are synchronized with ServiceNow®.</td>
</tr>
<tr>
<td>FADV Webhook Client Details</td>
<td>Client details to set up the First Advantage webhook.</td>
</tr>
</tbody>
</table>

**Spoke user roles**
- First Advantage admin
- First Advantage user

Only users with the First Advantage admin role can view the **FADV Webhook Client Details** module.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the First Advantage spoke**

Integrate the ServiceNow instance with your First Advantage account using an API key to authenticate ServiceNow requests.

**Before you begin**
- Request IntegrationHub subscription
- Activate the First Advantage spoke
- Role required: admin
Create Credential record for the First Advantage spoke

Create Credential records to the First Advantage spoke. The First Advantage spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter FADV Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated for your First Advantage instance.</td>
</tr>
<tr>
<td>Note:</td>
<td>Contact the First Advantage team to obtain the API key.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection record for the First Advantage spoke

Create a Connection record to the First Advantage API. The First Advantage spoke connection and credential alias uses these connections to perform actions in First Advantage.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for First Advantage.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter FADV Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for First Advantage. For example, select FADV Credentials.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution Email</td>
<td>Distribution email of your organization.</td>
</tr>
<tr>
<td>u_version</td>
<td>v1.1</td>
</tr>
</tbody>
</table>

**Note:** If you are using any other version of First Advantage, specify the version number.

6. Click **Submit**.

7. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

8. Open for the record for **First Advantage**.

9. Click the **Connection Attributes** tab.

10. Modify the default values of the connection attributes records as per your requirement.

<table>
<thead>
<tr>
<th>Connection Attributes record</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution Email</td>
<td>Distribution email of your organization.</td>
</tr>
<tr>
<td>Version</td>
<td>v1.1</td>
</tr>
</tbody>
</table>

**Note:** If you are using any other version of First Advantage, specify the version number.
Create First Advantage states in your ServiceNow instance

Create First Advantage states to be displayed in the State list in your ServiceNow instance.

Before you begin
Role required: admin

Create the Draft, Ready, and In Progress states
Create the Draft, Ready, and In Progress states in the Task [task] table.

Procedure
1. In the Filter navigator, enter sys_choice.list.
   The records in the Choice [sys_choice] table are displayed.
2. Click New.
3. On the form, fill these values and create three records for the Draft state.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Element</td>
<td>state</td>
</tr>
<tr>
<td>Label</td>
<td>Draft</td>
</tr>
<tr>
<td>Value</td>
<td>137</td>
</tr>
</tbody>
</table>

Note:
- Ensure that you provide the exact numbers in the Value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the Global application.

4. Click Submit.
5. Similarly, create records for the Ready and In Progress states.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Element</td>
<td>state</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Label</td>
<td>Ready</td>
</tr>
<tr>
<td>Value</td>
<td>173</td>
</tr>
</tbody>
</table>

Record 3 - In Progress state

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task [task]</td>
</tr>
<tr>
<td>Element</td>
<td>state</td>
</tr>
<tr>
<td>Label</td>
<td>In Progress</td>
</tr>
<tr>
<td>Value</td>
<td>181</td>
</tr>
</tbody>
</table>

**Note:**
- Ensure that you provide the exact numbers in the Value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the Global application.

**Results**
The Draft, Ready, and In Progress states are created in the Task [task] table.

**Create the Complete and Cancelled states**
Create the Complete and Cancelled states in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

**Procedure**
1. Navigate to First Advantage Spoke > Order Tasks.
2. Click New.
   - **Note:** Ensure that the record is created in the First Advantage application.
3. Right-click State and click Configure Choices.
4. Perform these steps to create the Cancelled state:
   a. Enter Cancelled in New item text.
   b. Enter 149 in Numeric value.
c. Click Add.

d. Click Save.

5. Perform these steps to create the Complete state:

a. Enter **Complete** in **New item text**.

b. Enter 127 in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

c. Click Add.

d. Click Save.

Results

The Complete and Cancelled states are created in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

Create the Complete - Success and Complete - Deal Broken states

Create the Complete - Success and Complete - Deal Broken states in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Procedure

1. Navigate to **First Advantage Spoke > Employee Task**.

2. Click **New**.

   Note: Ensure that the record is created in the **First Advantage** application.

3. Right-click **State** and click **Configure Choices**.

4. Perform these steps to create the Cancelled state:
a. Enter **Complete - Success** in **New item text**.

b. Enter **161** in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

c. Click **Add**.

d. Click **Save**.

5. Perform these steps to create the Complete state:

a. Enter **Complete - Deal Broken** in **New item text**.

b. Enter **117** in **Numeric value**.

   Note: Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

c. Click **Add**.

d. Click **Save**.

Results
The Complete - Success and Complete - Deal Broken states are created in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

Set up First Advantage webhooks
Receive invite and order event updates at your ServiceNow instance by setting up the webhooks.

Before you begin
Role required: admin

Provide key in your ServiceNow instance
Set up the First Advantage webhook by providing key for the First Advantage webhook client.
Before you begin
- Generate a secure key as per your requirement and record the value. For example, a base64 encoded key.
- Role required: admin

Procedure
1. Navigate to First Advantage Spoke > FADV Webhook Client Details.
2. Click New.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Authorization Key</td>
<td>Key you had generated as per your requirement.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Access API endpoints
Access the API endpoint for the invite and order events and share the required details with First Advantage to set up the webhooks.

Before you begin
Role required: admin

Procedure
1. Navigate to System Web Services > Scripted REST APIs.
2. Open the record for the First Advantage spoke. For example, First Advantage Webhook.
3. In the Resources tab:
   a. Open the record for the invite event. For example, Invite Status.
   b. Copy and record the path provided in Resource path. For example, /api/sn_fadv_spoke/fadv/invite_status.
   c. Open the record for the order event. For example, Order Status.
   d. Copy and record the path provided in Resource path. For example, /api/sn_fadv_spoke/fadv/order_status.
What to do next
Contact First Advantage to setup webhooks for your ServiceNow instance. For this, share these details with First Advantage:

• Custom header in this format: `fadvKey <authorization-key>`.

**Note:**

◦ Ensure that the custom header is in this format only. The spoke flows will not be triggered if there is any change.

◦ Provide the same key you had earlier provided in First Advantage Spoke > FADV Webhook Client Details.

◦ Use the same case as mentioned here: `fadvKey`.

• API endpoint for the invite events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/invite_status`

• API endpoint for the order events in this format: `<ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/order_status`

Synchronise First Advantage accounts and packages with ServiceNow
Store the details of the First Advantage accounts and packages by synchronizing First Advantage accounts and packages with ServiceNow.

Before you begin
Role required: First Advantage admin

Procedure
1. Navigate to First Advantage Spoke > Accounts.
2. Click New.
3. On the form, fill in the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Account</td>
<td>Option to specify that the account is a primary account. Select the check box.</td>
</tr>
<tr>
<td>Account ID</td>
<td>ID of the primary account.</td>
</tr>
<tr>
<td>Account Name</td>
<td>Name of the primary account.</td>
</tr>
</tbody>
</table>

4. Click Submit.
   The primary account is created and the record is displayed.
5. Navigate to **First Advantage Spoke > Accounts**.
6. Click the **Get Accounts** related list.
7. Navigate to **First Advantage Spoke > Packages**.
8. Click the **Get Packages** related link.

### Results

The First Advantage account and package details are retrieved.

ℹ️ **Note:** Only users with the FADV admin role can synchronize the account and package details. Users with FADV user role can only view the retrieved details.

### Create a case in First Advantage from ServiceNow

Initiate the background check of the required candidate using invite or order from ServiceNow.

### Before you begin

- Set up the First Advantage spoke
- Synchronise First Advantage accounts and packages with ServiceNow
- Create users in the User [sys_user] table. Background check can be performed only for these users.
- Role required: First Advantage admin or First Advantage user

### Procedure

1. Navigate to **First Advantage Spoke > Create New First Advantage Case**. Form to provide the First Advantage case details is displayed.
2. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Distribution Email for getting invite email from First Advantage</td>
<td>Option to send invitation email to all users in the distribution email.</td>
</tr>
<tr>
<td>Select User</td>
<td>User in the User [sys_user] table.</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the selected user. The value is auto-populated based on the user selected in <strong>Select User</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the selected user. The value is auto-populated based on the user selected in <strong>Select User</strong>.</td>
</tr>
<tr>
<td>Email</td>
<td>Email address of the selected user. The value is auto-populated based on the user selected in <strong>Select User</strong>.</td>
</tr>
<tr>
<td>Select An Account</td>
<td>First Advantage account to perform the background check.</td>
</tr>
<tr>
<td>Select A Package</td>
<td>First Advantage package to perform the background check.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Brief description about the background check.</td>
</tr>
<tr>
<td>Agent Name</td>
<td>Agent to perform the background check.</td>
</tr>
<tr>
<td>Send Invite link</td>
<td>Option to send an invite email. When selected, a request to complete an application is sent to the candidate through an invite email. If this option isn’t selected, an order email is sent to the user. An order record is created and request to provide essential details is sent to the candidate.</td>
</tr>
<tr>
<td>Note:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• When the <strong>Send Invite link</strong> option is selected, an order is created only after the candidate has filled the application form.</td>
</tr>
<tr>
<td></td>
<td>• When the <strong>Send Invite link</strong> option isn’t selected, an order is immediately created.</td>
</tr>
<tr>
<td>Events updates</td>
<td>Can be accessed in your ServiceNow instance.</td>
</tr>
<tr>
<td>Use &quot;Order As&quot;</td>
<td>Option to place order on behalf of the required user.</td>
</tr>
<tr>
<td>Email (Order As)</td>
<td>Email ID of the required user. This field is available only when the <strong>Use &quot;Order As&quot;</strong> check box is selected.</td>
</tr>
<tr>
<td>Account ID (Order As)</td>
<td>Account ID of the required user. This field is available only when the <strong>Use &quot;Order As&quot;</strong> check box is selected.</td>
</tr>
<tr>
<td>User ID (Order As)</td>
<td>User ID of the required user. This field is available only when the <strong>Use &quot;Order As&quot;</strong> check box is selected.</td>
</tr>
</tbody>
</table>
3. Click Submit.
   A First Advantage task is created in your ServiceNow instance with State as Draft. The case can be accessed by navigating to First Advantage Spoke > First Advantage Cases.

Initiate background verification in First Advantage from ServiceNow using invite

Initiate background verification of the required candidate by sending a request to complete an application through an invite email.

Before you begin
• Create a case in First Advantage from ServiceNow
  
  Note: Ensure that the Send Invite link option is selected and the Use "Order As" option isn't selected.
• Role required: First Advantage admin or First Advantage user

Procedure
1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure that the Send Invite link option is selected and the Use "Order As" option isn't selected.
4. Change the State of the task from Draft to Ready.
   • The First Advantage - Candidate Background Verification using Invite flow is triggered.
   • State is changed to In Progress.
   • In the Employee Tasks tab, a record is created and its details such as Number, Invite ID and so on, are populated. Open the record to access details such as Invite URL, Candidate ID, and so on. Also, real-time updates are displayed here.

  Note: The Employee Tasks tab displays all the invite records created for the user.

   • In the Order History tab, a record is created and its details such as Number, Short Description and so on, are populated.

  Note: The Order History tab displays all the order records created for the user.

   • Real-time updates and System Administrator events are displayed in the Order Details tab.
Note: Order ID is populated only after the invite is executed successfully. For example, Order ID isn't populated if the candidate has declined to complete the application form.

- An invite email is sent to the candidate.

Results
After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to First Advantage Spoke > Employee Tasks.
- Guest events are displayed in the respective First Advantage Employee Task record.

Note:
- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order
Initiate background verification of the required candidate by sending an email requesting for the essential information.

Before you begin
- Create a case in First Advantage from ServiceNow

Note: Ensure that the Send Invite link and Use "Order As" options aren't selected.
- Role required: First Advantage admin or First Advantage user

About this task
An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.
Procedure
1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure that the Send Invite link and Use "Order As" options aren't selected.
4. Change the State of the task from Draft to Ready.
   • The First Advantage - Candidate Background Verification using Order flow is triggered.
   • State is changed to In Progress.
   • In the Order History tab, a record is created and its details such as Order ID, Number, Short Description and so on, are populated.
   • Real-time updates and System Administrator events are displayed in the Order Details tab.

   Note: The Order History tab displays all the order records created for the user.
   • An order email is sent to the candidate.

Results
A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the Order Details tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note: You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

Initiate background verification in First Advantage from ServiceNow using invite on behalf of another user
Initiate background verification of the required candidate by sending a request on behalf of another user to complete an application through an invite email.

Before you begin
• Create a case in First Advantage from ServiceNow

   Note: Ensure that the Send Invite link and Use "Order As" options are selected.
   • Role required: First Advantage admin or First Advantage user
Procedure
1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure that the Send Invite link and Use "Order As" options are selected.
4. Change the State of the task from Draft to Ready.
   • The First Advantage - Candidate Background Verification using Invite flow is triggered.
   • State is changed to In Progress.
   • In the Employee Tasks tab, a record is created and its details such as Number, Invite ID and so on, are populated. Open the record to access details such as Invite URL, Candidate ID, and so on. Also, real-time updates are displayed here.

   📌 Note: The Employee Tasks tab displays all the invite records created for the user.
   • In the Order History tab, a record is created and its details such as Number, Short Description and so on, are populated.

   📌 Note: The Order History tab displays all the order records created for the user.
   • Real-time updates and System Administrator events are displayed in the Order Details tab.

   📌 Note: Order ID is populated only after the invite is executed successfully. For example, Order ID isn't populated if the candidate has declined to complete the application form.
   • An invite email is sent to the candidate.

Results
After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

   • The status and all other details can be accessed in real-time by navigating to First Advantage Spoke > Employee Tasks.
   • Guest events are displayed in the respective First Advantage Employee Task record.
Note:
• You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
• If the candidate has declined the request for background verification, the Order record isn't created for the task.

Initiate background verification in First Advantage from ServiceNow using order
Initiate background verification of the required candidate by sending an email requesting for the essential information on behalf of the required user.

Before you begin
• Create a case in First Advantage from ServiceNow

Note: Ensure that the Send Invite link option isn't selected and the Use "Order As" option is selected.
• Role required: First Advantage admin or First Advantage user

About this task
An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

Procedure
1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure the Send Invite link option isn't selected and the Use "Order As" option is selected.
4. Change the State of the task from Draft to Ready.
   • The First Advantage - Candidate Background Verification using Order flow is triggered.
   • State is changed to In Progress.
   • In the Order History tab, a record is created and its details such as Order ID, Number, Short Description and so on, are populated.
   • Real-time updates and System Administrator events are displayed in the Order Details tab.
Note: The Order History tab displays all the order records created for the user.

- An order email is sent to the candidate.

Results
A mail is sent to the candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the Order Details tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

Note: You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

GitHub spoke v2.0.4
Manage distributed version control and source code in GitHub from your ServiceNow instance. Create flows in ServiceNow to manage collaborative features such as tracking bugs, feature requests, tasks and so on, for projects in GitHub. View and analyze meaningful usage data for GitHub Enterprise Cloud and GitHub Enterprise Server software subscriptions so that you can reclaim stale licenses.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Supported versions
This spoke was built for GitHub API version v3, but may be compatible with later versions.
**Spoke requirements**

- GitHub account
- User with admin credentials
- Token to authenticate the ServiceNow instance

See the [GitHub documentation](#) for instructions on creating GitHub account and generating token.

**GitHub Webhooks module**

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitHub for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the GitHub tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the GitHub Webhooks application is available in the GitHub spoke and has the following modules:

- GitHub Webhook Registries
- GitHub WebHook Routing Policies

Use the GitHub Webhook Registries module to assign a token and provide the API path. You must generate Callback URL here and provide this URL in GitHub. A default routing policy is provided in the GitHub WebHook Routing Policies module. The default routing policy supports these GitHub fields:

<table>
<thead>
<tr>
<th>Supported GitHub fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
</tr>
<tr>
<td>Base Ref</td>
</tr>
<tr>
<td>Commit Comment Body</td>
</tr>
<tr>
<td>Commit Comment Created At</td>
</tr>
<tr>
<td>Commit Comment Path</td>
</tr>
<tr>
<td>Supported GitHub fields</td>
</tr>
<tr>
<td>-------------------------------------------------------------</td>
</tr>
<tr>
<td>Commit Comment Updated At</td>
</tr>
<tr>
<td>Commit Comment User</td>
</tr>
<tr>
<td>Force Push</td>
</tr>
<tr>
<td>GitHub Instance URL</td>
</tr>
<tr>
<td>Issue Assigned To</td>
</tr>
<tr>
<td>Issue Assignees</td>
</tr>
<tr>
<td>Issue Body</td>
</tr>
<tr>
<td>Issue Closed At</td>
</tr>
<tr>
<td>Issue Comment</td>
</tr>
<tr>
<td>Issue Comment Count</td>
</tr>
<tr>
<td>Issue Comment Created At</td>
</tr>
<tr>
<td>Issue Comment Updated At</td>
</tr>
<tr>
<td>Issue Created At</td>
</tr>
<tr>
<td>Issue Labeled To</td>
</tr>
<tr>
<td>Issue Labels</td>
</tr>
<tr>
<td>Issue Locked</td>
</tr>
<tr>
<td>Issue Milestone</td>
</tr>
<tr>
<td>Issue Previous Body</td>
</tr>
<tr>
<td>Issue Previous Comment</td>
</tr>
<tr>
<td>Issue Previous Milestone</td>
</tr>
<tr>
<td>Supported GitHub fields</td>
</tr>
<tr>
<td>-------------------------</td>
</tr>
<tr>
<td>Issue Previous Title</td>
</tr>
<tr>
<td>Issue Previously Assigned To</td>
</tr>
<tr>
<td>Issue Previously Labeled To</td>
</tr>
<tr>
<td>Issue State</td>
</tr>
<tr>
<td>Issue Title</td>
</tr>
<tr>
<td>Issue Updated At</td>
</tr>
<tr>
<td>Issue User</td>
</tr>
<tr>
<td>Milestone Closed At</td>
</tr>
<tr>
<td>Milestone Created At</td>
</tr>
<tr>
<td>Milestone Creator</td>
</tr>
<tr>
<td>Milestone Description</td>
</tr>
<tr>
<td>Milestone Due On</td>
</tr>
<tr>
<td>Milestone State</td>
</tr>
<tr>
<td>Milestone Title</td>
</tr>
<tr>
<td>Milestone Updated At</td>
</tr>
<tr>
<td>Organization Description</td>
</tr>
<tr>
<td>Organization Login</td>
</tr>
</tbody>
</table>
To use other conditions in the routing policy, create routing policy in the GitHub WebHook Routing Policies module and specify conditions as per your requirement. See [Set up bi-directional webhook for the GitHub spoke](#) for information regarding setting up and configuring the webhooks.

**Spoke subflows**

The GitHub spoke provides a sample subflow to handle various GitHub webhook events. Available sample subflows are:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
<th>Supported GitHub Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process GitHub Branch and Tag Webhook Events</td>
<td>Handles branch and tag webhook events.</td>
<td>Branch and Tag</td>
</tr>
<tr>
<td>Process GitHub Commit Webhook Events</td>
<td>Handles commit webhook events.</td>
<td>Commit</td>
</tr>
<tr>
<td>Process GitHub Issue Webhook Events</td>
<td>Handles issue webhook events.</td>
<td>Issue</td>
</tr>
<tr>
<td>Process GitHub Milestone Webhook Events</td>
<td>Handles milestone webhook events.</td>
<td>Milestone</td>
</tr>
</tbody>
</table>
Spoke subflows (continued)

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
<th>Supported GitHub Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process GitHub Project Webhook Events</td>
<td>Handles project webhook events.</td>
<td>Project</td>
</tr>
<tr>
<td>Process GitHub Pull Request Webhook Events</td>
<td>Handles pull request webhook events.</td>
<td>Pull Request</td>
</tr>
<tr>
<td>Process GitHub Push Webhook Events</td>
<td>Handles push request webhook events.</td>
<td>Push Request</td>
</tr>
<tr>
<td>Process GitHub Release Webhook Events</td>
<td>Handles release webhook events.</td>
<td>Release</td>
</tr>
<tr>
<td>Process GitHub Repository Webhook Events</td>
<td>Handles repository webhook events.</td>
<td>Repository</td>
</tr>
<tr>
<td>Process GitHub Security Webhook Events</td>
<td>Handles security webhook events.</td>
<td>Security</td>
</tr>
<tr>
<td>Process GitHub Webhook Events</td>
<td>Handles all GitHub webhook events.</td>
<td>Note: This subflow handles all GitHub events. You can customize this subflow to handle other GitHub webhook events that are not supported by default.</td>
</tr>
</tbody>
</table>

To create subflows to handle other GitHub webhook events or handle the supported GitHub webhook events differently, customize the Process GitHub
Webhook Events subflow. For this, you must create a copy of the subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Note:
- You must configure webhooks to use the spoke subflow. See Set up bi-directional webhook for the GitHub spoke for information regarding setting up and configuring the webhook.
- The sample subflows run as a user by default. It can be configured to run as system.
- GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Spoke actions
The GitHub spoke provides actions manage branches, issues, repositories, and source code when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in GitHub based on a specific commit SHA.</td>
</tr>
<tr>
<td></td>
<td>Delete Branch</td>
<td>Deletes a branch from the GitHub repository.</td>
</tr>
<tr>
<td></td>
<td>Get Branch</td>
<td>Retrieves the details of a branch in the GitHub repository.</td>
</tr>
<tr>
<td></td>
<td>Get Branch Protection</td>
<td>Retrieves the restriction details of the required branch.</td>
</tr>
<tr>
<td></td>
<td>List Branches</td>
<td>Retrieves the list of all branches in a repository.</td>
</tr>
<tr>
<td></td>
<td>Remove Branch Protection</td>
<td>Removes protection on the required branch.</td>
</tr>
<tr>
<td></td>
<td>Update Branch Protection</td>
<td>Updates protection on the required branch.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Issue Management</td>
<td>Create Comment on Issue</td>
<td>Creates comment on a required issue.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates issue for the required repository.</td>
</tr>
<tr>
<td></td>
<td>Delete Comment on Issue</td>
<td>Deletes comment on a required issue.</td>
</tr>
<tr>
<td></td>
<td>Lock Issue</td>
<td>Locks the required issue. This limits the conversation to collaborators only.</td>
</tr>
<tr>
<td></td>
<td>Look Up Comments on Issue</td>
<td>Retrieves the list of comments on an issue.</td>
</tr>
<tr>
<td></td>
<td>Look Up Issues</td>
<td>Retrieves the list of issues for a repository.</td>
</tr>
<tr>
<td></td>
<td>Unlock Issue</td>
<td>Unlocks the required issue. This opens conversation to all users.</td>
</tr>
<tr>
<td></td>
<td>Update Comment on Issue</td>
<td>Updates a comment on an issue.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates the details of the required issue.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Fields by Action</td>
<td>Retrieves the list of fields for an action filter in the GitHub Fields table.</td>
</tr>
<tr>
<td>Organization Management</td>
<td>Get Organization Plan</td>
<td>Retrieves the plan name of an organization.</td>
</tr>
<tr>
<td></td>
<td>List Organization Members</td>
<td>Retrieves the list of all members within an organization.</td>
</tr>
<tr>
<td></td>
<td>List Organization Repositories</td>
<td>Retrieves the list of all repositories within an organization.</td>
</tr>
<tr>
<td></td>
<td>Remove Organization Member</td>
<td>Removes a user from an organization.</td>
</tr>
<tr>
<td>Repository Management</td>
<td>Add Collaborator</td>
<td>Adds collaborator to the required repository.</td>
</tr>
<tr>
<td></td>
<td>Create Comment on Pull Request</td>
<td>Create review comments on a pull request.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Milestone</td>
<td>Creates milestone for the required repository.</td>
</tr>
<tr>
<td></td>
<td>Create Pull Request</td>
<td>Creates a pull request for a repository.</td>
</tr>
<tr>
<td></td>
<td>Create Reply on Pull Request Review Comment</td>
<td>Creates reply to a review comment for a pull request.</td>
</tr>
<tr>
<td></td>
<td>Create Repository</td>
<td>Creates a repository in GitHub.</td>
</tr>
<tr>
<td></td>
<td>Delete Comment on Pull Request</td>
<td>Deletes review comment on a pull request.</td>
</tr>
<tr>
<td></td>
<td>Delete Milestone</td>
<td>Deletes milestone from the required repository.</td>
</tr>
<tr>
<td></td>
<td>List Comments on Pull Request</td>
<td>Retrieves the list of all review comments on a pull request.</td>
</tr>
<tr>
<td></td>
<td>List Milestones</td>
<td>Retrieves the list of all milestones in a repository.</td>
</tr>
<tr>
<td></td>
<td>List Repository Events</td>
<td>Retrieves the list of events across a repository.</td>
</tr>
<tr>
<td></td>
<td>Look Up Pull Requests</td>
<td>Retrieves the details of pull requests for a repository.</td>
</tr>
<tr>
<td></td>
<td>Look Up Repositories</td>
<td>Retrieves the details of repositories based on a specific user or organization.</td>
</tr>
<tr>
<td></td>
<td>Merge Pull Request</td>
<td>Merges the pull request to a repository.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborator</td>
<td>Removes collaborator from a repository.</td>
</tr>
<tr>
<td></td>
<td>Update Comment on Pull Request</td>
<td>Updates review comment provided for a pull request.</td>
</tr>
<tr>
<td></td>
<td>Update Milestone</td>
<td>Updates the details of a milestone in a repository.</td>
</tr>
<tr>
<td></td>
<td>Update Pull Request</td>
<td>Updates the details of a pull request in a repository.</td>
</tr>
</tbody>
</table>
### Source Code Management

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Update Repository</td>
<td>Updates the details of a repository in GitHub.</td>
</tr>
<tr>
<td></td>
<td>Create Comment on Commit</td>
<td>Creates comment for the required commit using its SHA.</td>
</tr>
<tr>
<td></td>
<td>Create or update a file</td>
<td>Creates a file or updates an existing file in a repository.</td>
</tr>
<tr>
<td></td>
<td>Get Comments By Commit ID</td>
<td>Retrieves comments provided for a single commit.</td>
</tr>
<tr>
<td></td>
<td>Get Commit Information By ID</td>
<td>Retrieves the contents of the required commit reference.</td>
</tr>
<tr>
<td></td>
<td>Get File Content</td>
<td>Retrieves the contents of a file in a repository.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> This action supports files with file size up to 1 MB.</td>
</tr>
<tr>
<td></td>
<td>List Commits on a Repository</td>
<td>Retrieves the details of all commits made on a repository.</td>
</tr>
</tbody>
</table>

#### User Management

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Get All Users for Enterprise Server</td>
<td>Retrieves the list of all GitHub Enterprise Server users.</td>
</tr>
<tr>
<td></td>
<td>List Organizations for the Authenticated User</td>
<td>Retrieves the list of organizations that the logged in user is a member of.</td>
</tr>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends a GitHub user account.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up GitHub spoke

Integrate the ServiceNow instance and GitHub account using an API key to authenticate ServiceNow requests.
Before you begin

- Request IntegrationHub subscription
- Activate GitHub spoke
- Generate token and record the value
- Role required: admin

Create Credential record for the GitHub spoke

Create Credential records for the GitHub spoke. The GitHub spoke connection and credential aliases use these credentials to authorize actions.

Before you begin
Role required: admin

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter GitHub Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>Token generated in GitHub.</td>
</tr>
<tr>
<td></td>
<td>See the GitHub documentation for instructions on creating GitHub account and generating token.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Note: This option is not applicable to this spoke.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Create Connection records for the GitHub spoke

Create Connection records for your GitHub account. The GitHub spoke connection and credential aliases use these connections to perform actions in GitHub.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for GitHub.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter GitHub Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitHub. For example, select GitHub Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. Enter <a href="https://api.github.com/">https://api.github.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Set up bi-directional webhook for the GitHub spoke

Configure webhook to subscribe to GitHub with a ServiceNow callback URL.

Before you begin

- Request IntegrationHub subscription
- Activate the GitHub spoke
- Role required: admin

Create secret for the GitHub spoke

Create secret to embedded in the GitHub webhook URL.

Before you begin

Role required: admin
Procedure

1. Navigate to System Definition > Scripts - Background.
2. Enter this command in the Run script (JavaScript executed on server) text field:
   gs.info(GlideSecureRandomUtil.getSecureRandomString(16));
3. Click Run Script.
4. Copy and record the generated secret for later use.

Register GitHub webhook in ServiceNow

Register a GitHub in ServiceNow to notify the ServiceNow app when certain events occur in GitHub.

Before you begin
Role required: admin

Procedure

1. Navigate to GitHub Webhooks > GitHub Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, GitHub webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Secret</td>
<td>Secret you had generated using the Scripts - Background module.</td>
</tr>
<tr>
<td>Path</td>
<td>GitHub webhook path. By default, this is set to api/space/gitevent/wh_entry</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the Webhook Callback URL.
6. Copy and record the Webhook Callback URL.

Results

The GitHub webhook is registered in your ServiceNow instance.
Add Callback URL in GitHub
Provide Webhook Callback URL in GitHub account to create webhook.

Before you begin
Role required: admin

Procedure
1. Log in to your GitHub account.
2. Create a webhook in your Atlassian account.
3. Enter Webhook Callback URL in Payload URL and Secret in Secret. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Note: GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

Results
The Callback URL is added in the GitHub account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding creating new routing policies and subflows.

Customize bi-directional webhook in the GitHub spoke
Create webhook routing policy and subflow as per your requirement in the GitHub spoke.

Before you begin
Role required: admin

About this task
The default routing policy in the GitHub WebHook Routing Policies modules triggers the relevant GitHub subflow and notifies the ServiceNow app when certain events occur in GitHub. See GitHub spoke v2.0.4 for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure
1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and GitHub spoke v2.0.4 for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support.

6. Click New.

7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
| Default answer    | Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.  
  a. Click the Lookup icon.  
  b. Select the required subflow from the Document: list.  
  
  **Note:** Ensure that the Table name is `Flow [sys_hub_flow]`. |
| Condition         | Conditions to be met when the required events occur in GitHub.  
  See GitHub spoke v2.0.4 for information about the supported fields. |
| Answer            | Subflow that has to be triggered when the specified conditions are met.     |

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

**Results**
Routing policy and subflow are created.

**GitLab spoke v1.0.4**
Manage the DevOps lifecycle in GitLab from your ServiceNow instance. Create flows in ServiceNow to manage branches, groups, issues, merge requests, projects, and source code in GitLab.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Compatible versions
This spoke was built for GitLab API version v4, but may be compatible with later versions.

Spoke requirements
• GitLab account
• An application in GitLab configured to integrate with ServiceNow
• Application ID and Secret of the GitLab application

See the GitLab documentation for instructions on creating and configuring applications.

Spoke actions
The GitLab spoke provides actions to automate GitLab tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in the required project.</td>
</tr>
<tr>
<td>Delete Branch</td>
<td>Deletes the required branch from a project.</td>
<td></td>
</tr>
<tr>
<td>Delete Merged Branches</td>
<td>Deletes the required merged branch from a project.</td>
<td></td>
</tr>
<tr>
<td>Get Branch</td>
<td>Retrieves the details of the required branch.</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Branches</td>
<td>Retrieves the list of branches in a required project.</td>
</tr>
<tr>
<td></td>
<td>Protect Branch</td>
<td>Protects a branch in a project with access levels.</td>
</tr>
<tr>
<td></td>
<td>Unprotect Branch</td>
<td>Unprotects a branch in a project with access levels.</td>
</tr>
<tr>
<td></td>
<td>Add User To A Group</td>
<td>Adds user to a GitLab group.</td>
</tr>
<tr>
<td></td>
<td>Remove User From A Group</td>
<td>Removes user from a GitLab group.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in the required project.</td>
</tr>
<tr>
<td></td>
<td>Create Issue Note</td>
<td>Creates an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue Note</td>
<td>Deletes an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issue Notes</td>
<td>Retrieves the list of all issue notes for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issues</td>
<td>Retrieves the list of the issues based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates details of the required issue.</td>
</tr>
<tr>
<td></td>
<td>Update Issue Note</td>
<td>Updates an issue note in a project.</td>
</tr>
<tr>
<td></td>
<td>Accept Merge Request</td>
<td>Approves a merge request in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request</td>
<td>Creates a merge request in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request Note</td>
<td>Creates a note for the required merge request.</td>
</tr>
<tr>
<td></td>
<td>Delete Merge Request Note</td>
<td>Deletes a note for the required merge request.</td>
</tr>
</tbody>
</table>

<td>Share Project With Group</td>
<td>Shares a project with a group in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Project</td>
<td>Unarchives a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unshare Project With Group</td>
<td>Unshares a project with a group in GitLab.</td>
</tr>
</tbody>
</table>
Spoke module
The GitLab spoke provides Gitlab Token Management application that includes the Gitlab Token Managements module. You should record here to authenticate requests from your ServiceNow instance.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements
These actions use REST calls, which can run on a MID Server. Use the connection record associated with the GitLab alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up GitLab spoke
Integrate the ServiceNow instance and GitLab by creating a custom OAuth application in GitLab to authenticate ServiceNow requests.

Before you begin
- Request IntegrationHub subscription
- Activate the GitLab spoke
- Role required: admin

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Milestone</td>
<td>Updates details of a milestone in a project.</td>
<td></td>
</tr>
<tr>
<td>Update Project</td>
<td>Updates details of a project.</td>
<td></td>
</tr>
<tr>
<td>Source Code</td>
<td>Add New File To Repository</td>
<td>Adds a file to a repository in GitLab.</td>
</tr>
<tr>
<td>Management</td>
<td>Get Commit</td>
<td>Retrieves a details of a commit in GitLab.</td>
</tr>
</tbody>
</table>
Create OAuth application in GitLab account

Create a custom OAuth application from your GitLab account to enable OAuth 2.0 authentication with the GitLab spoke.

Before you begin

- GitLab account
- GitLab admin credentials

About this task

Complete these steps from your GitLab account. See the GitLab documentation for instructions on creating and configuring applications.

Procedure

1. From your GitLab account, create an application.
2. Enter ServiceNow instance URL in Redirect URI.
3. Copy and record the Application Id and Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

Results

The custom OAuth application from your GitLab account is created and can be integrated with the ServiceNow instance.

Register GitLab as OAuth provider

Use the information generated during GitLab application configuration to register GitLab as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open for the record for GitLab.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter GitLab OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the GitLab application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Secret created during the GitLab application configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td></td>
<td>✨ Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select GitLab Spoke.</td>
</tr>
<tr>
<td></td>
<td>✨ Note: You must ensure that the application scope is GitLab Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td></td>
<td>✨ Note: If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/oauth/authorize</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, <a href="https://gitlab.com/oauth/token">https://gitlab.com/oauth/token</a>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/oauth/token</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry. Replace <code>&lt;Instance-Name&gt;</code> with the name of your ServiceNow instance. The format of the redirect URL is: https://&lt;instance-name&gt;.service-now.com/api/sn_gitlab_spoke/gitlab_oauth_redirect/oauth.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL**.

5. Copy and record the **Redirect URL**.

6. Login to your GitLab application and edit the configuration of your GitLab application. See the GitLab documentation for instructions on creating and configuring applications.

7. Paste the **Redirect URL** value into the **Redirect URI** for your GitLab application.

**Results**
The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Add GitLab token**
Add GitLab token to authenticate requests from your ServiceNow instance.

**Procedure**
1. Navigate to **GitLab Token Management > GitLab Token Managements**.
2. Click **New**.
3. On the form, fill these values.
Gitlab Token Management form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secret</td>
<td>Secret created during the GitLab application configuration.</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of GitLab spoke as an OAuth provider. For example, select <strong>GitLab OAuth profile</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Create Credential records for the GitLab spoke**

Authorize the GitLab spoke actions by creating credential records for the application registered in GitLab. The GitLab spoke connection and credential alias uses these credentials to authorize actions.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>GitLab Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of GitLab spoke as an OAuth provider. For example, select <strong>GitLab OAuth profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
</tbody>
</table>
5. Right-click the form header and click **Save**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

**Results**
The credential record for the GitLab spoke is created.

**Create Connection record for the GitLab spoke**
Create Connection records to your GitLab account. The GitLab spoke connection and credential alias uses these connections to perform actions in GitLab.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **GitLab**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>GitLab Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitLab. For example, select <strong>GitLab Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://gitlab.com/api">https://gitlab.com/api</a>.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/api</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Results**
The connection record is created for GitLab spoke.
Gmail spoke
Manage Gmail actions.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
API version v1.

Spoke subflows
The Gmail spoke provides sample subflows in the draft state to demonstrate automating Gmail tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Gmail</td>
<td>Copies an attachment from ServiceNow to Gmail.</td>
</tr>
</tbody>
</table>

Spoke actions
The Gmail spoke provides actions to automate Gmail tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label Management</td>
<td>Add Label to Email</td>
<td>Add a label to an email.</td>
</tr>
<tr>
<td></td>
<td>Create New Label</td>
<td>Create a label in your Gmail account.</td>
</tr>
<tr>
<td></td>
<td>Lookup Label ID By Name</td>
<td>Retrieve details of a specified Label ID.</td>
</tr>
<tr>
<td></td>
<td>Remove Label From Email</td>
<td>Remove the specified label from an email.</td>
</tr>
</tbody>
</table>
### Email Management

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Add Attachment To ServiceNow Record</td>
<td>Add an attachment from an email in your Gmail account to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Get Email Details</td>
<td>Retrieve details of a specified email.</td>
</tr>
<tr>
<td></td>
<td>Look Up Emails</td>
<td>Retrieve details of specified emails.</td>
</tr>
<tr>
<td></td>
<td>Reply To Email</td>
<td>Send a reply to an email.</td>
</tr>
<tr>
<td></td>
<td>Send Email</td>
<td>Send email from your Gmail account to specified recipients.</td>
</tr>
<tr>
<td></td>
<td>Delete Email</td>
<td>Delete the specified email.</td>
</tr>
<tr>
<td></td>
<td>Undelete Email</td>
<td>Retrieve the specified email from the Bin.</td>
</tr>
</tbody>
</table>

**Gmail spoke account requirements**

The Gmail spoke requires a custom app that you create in the Google Developers Console.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Gmail alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Gmail spoke**

Integrate the ServiceNow instance and Gmail spoke by using Google credentials to authenticate ServiceNow requests.

**Before you begin**

- Install the Gmail spoke.
- Request IntegrationHub subscription.
• Activate the Gmail spoke.
• Role required: admin.

Configure Gmail application

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Gmail spoke.

Before you begin

Google Tasks integration requirements:
• A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
• A Google G Suite or Gmail login created with the domain.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type Web application.

5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create. This redirect URI must match the Redirect URL you provide when you Register Gmail as an OAuth provider.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Gmail as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register Gmail as an OAuth provider

Use the information generated during Gmail application configuration to register the Gmail application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure
1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the Gmail spoke.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Gmail application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Gmail application you created.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon , enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

4. In the OAuth Entity Scopes related list, add the scopes required by your application. The Gmail spoke supports these scopes:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>labels</td>
<td><a href="https://www.googleapis.com/auth/gmail.labels">https://www.googleapis.com/auth/gmail.labels</a></td>
</tr>
<tr>
<td>send</td>
<td><a href="https://www.googleapis.com/auth/gmail.send">https://www.googleapis.com/auth/gmail.send</a></td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/gmail.readonly">https://www.googleapis.com/auth/gmail.readonly</a></td>
</tr>
<tr>
<td>compose</td>
<td><a href="https://www.googleapis.com/auth/gmail.compose">https://www.googleapis.com/auth/gmail.compose</a></td>
</tr>
<tr>
<td>insert</td>
<td><a href="https://www.googleapis.com/auth/gmail.insert">https://www.googleapis.com/auth/gmail.insert</a></td>
</tr>
<tr>
<td>modify</td>
<td><a href="https://www.googleapis.com/auth/gmail.modify">https://www.googleapis.com/auth/gmail.modify</a></td>
</tr>
</tbody>
</table>
### Table: OAuth Scopes for Gmail

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td><a href="https://www.googleapis.com/auth/gmail.metadata">https://www.googleapis.com/auth/gmail.metadata</a></td>
</tr>
<tr>
<td>basic settings</td>
<td><a href="https://www.googleapis.com/auth/gmail.settings.basic">https://www.googleapis.com/auth/gmail.settings.basic</a></td>
</tr>
<tr>
<td>sharing settings</td>
<td><a href="https://www.googleapis.com/auth/gmail.settings.sharing">https://www.googleapis.com/auth/gmail.settings.sharing</a></td>
</tr>
<tr>
<td>mail</td>
<td><a href="https://mail.google.com">https://mail.google.com</a></td>
</tr>
</tbody>
</table>

ℹ️ **Note:** The mail scope provides full access to the account including permanent deletion of threads and messages.

Click **Insert a new row** and enter the name and the OAuth scope URL.

5. On the OAuth Entity Profiles tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update**.

7. On the Application registries form, click **Update** again. The system validates the OAuth credentials.

**What to do next**

Create Credential record for the Gmail spoke.

**Create Credential record for the Gmail spoke**

Create Credential records to Gmail. The Gmail spoke connection and credential alias uses these credentials to authorize actions.
Before you begin

- Role required: admin.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, Gmail Spoke Credential.
4. Click the OAuth Entity Profile search icon (🔍) and select the default Gmail profile.
5. Click Submit and reopen the credential.
7. Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

What to do next
Create Connection record for the Gmail spoke.

Create Connection record for the Gmail spoke

Create Connection records to your Gmail account. The Gmail spoke connection and credential alias uses these connections to perform actions on Gmail.

Before you begin
Role required: admin

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and select Gmail.
2. On the Connections related list, click New.
3. Select HTTP(s) Connection.
4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gmail.</td>
</tr>
</tbody>
</table>
5. Click **Submit**.

**Results**
The Gmail spoke is set up and integrated with the ServiceNow instance.

**Google Calendar spoke v 1.0.3**
Use ServiceNow to create and update events and attendees in Google Calendar.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
API version v1.

**Spoke actions**
The Google Calendar spoke provides actions to perform Google Calendar tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Event</td>
<td>Updates an event by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remove Attendees</td>
<td>Remove Attendees From</td>
<td>Updates an event by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>From Event</td>
<td>Event</td>
<td></td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Event</td>
<td>Creates an event on the specified calendar.</td>
</tr>
<tr>
<td>Update Event</td>
<td>Update Event</td>
<td>Edit event information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Get Event By ID</td>
<td>Get Event By ID</td>
<td>Returns the specified event.</td>
</tr>
<tr>
<td>Delete Event</td>
<td>Delete Event</td>
<td>Removes a specified event from a calendar.</td>
</tr>
<tr>
<td>Look Up Events</td>
<td>Look Up Events Stream</td>
<td>Returns events on a specified calendar based on start time, end time, or search terms.</td>
</tr>
</tbody>
</table>

**Google Calendar Online account requirements**

The Google Calendar spoke requires a custom app that you create in Google G Suite.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Calendar alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Google Calendar spoke**

Integrate a ServiceNow instance and Google Calendar by using G Suite credentials to authenticate ServiceNow requests.
Before you begin

- Request IntegrationHub subscription.
- Activate the Google Calendar spoke.
- Role required: admin

**Configure Google Calendar application**

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Calendar spoke.

**Before you begin**

Google Calendar integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

**About this task**

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

**Procedure**

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. Search for the Google Calendar API and enable it.

4. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

5. Select the application type Web application.

6. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

This redirect URI must match the Redirect URL you provide when you Register Google Calendar as an OAuth provider.
7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Tasks as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Calendar as an OAuth provider

Use the information generated during Google Calendar account configuration to register the Google Calendar application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Calendar.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Calendar application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon (🔍) and select OAuthGoogleRefreshTokenUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon ( secreto), enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon ( secreto), enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon 🗝️, enter https://&lt;instance&gt;.servicenow.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. **Optional:** In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Calendar spoke includes these scopes by default:
   - Calendar
   - Events

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

Create Credential record for the Google Calendar spoke

Create Credential records to connect the Google Calendar custom OAuth application you created during account configuration. The Google Calendar spoke connection and credential aliases use these credentials to authorize actions.

Procedure

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, gCal Cred.
4. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Calendar service as an OAuth provider.
5. Click **Get Oauth Token**.

Create Connection record for the Google Calendar spoke

Create connection records to a Google Calendar account. A connection alias resolves your Google Calendar connection and credential at runtime. Only one connection is active per Connection Alias at a time.

About this task

You should provide a single Credential and Connection Alias for all G Suite service spokes.
Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the Google Calendar connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.
   If there are no connection attributes, click New and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Calendar Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name Google Calendar Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is gCal Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_gcalendar_scope.Google_Calendar.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlecalendar_cred.
6. From Related Links, click Get OAuth Token.
A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

Note: Ensure that you allow pop-up windows in your browser.

Results
The Google Calendar spoke is set up and integrated with the ServiceNow instance.

Google Cloud Datastore spoke v1.0.1
Manage the NoSQL database services in Google Cloud Datastore from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Google Cloud Datastore v1, but may be compatible with later versions.

Spoke requirements
• Google Cloud Datastore account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• IntegrationHub (com.glide.hub.integrations)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
Spoke actions

The Google Cloud Datastore spoke provides actions to automate Google Cloud Datastore tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entity Management</td>
<td>Entity Export</td>
<td>Exports a copy of all or a subset of entities from Google Cloud Datastore to another storage system.</td>
</tr>
<tr>
<td></td>
<td>Entity Import</td>
<td>Imports entities into Google Cloud Datastore.</td>
</tr>
<tr>
<td>Index Management</td>
<td>Create Index</td>
<td>Creates the specified index.</td>
</tr>
<tr>
<td></td>
<td>Delete Index</td>
<td>Deletes an existing index.</td>
</tr>
<tr>
<td></td>
<td>Get Index</td>
<td>Gets an index.</td>
</tr>
<tr>
<td></td>
<td>Look up Index</td>
<td>Retrieves the list of indexes that match the specified filters.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Cancel Operation</td>
<td>Starts asynchronous cancellation on a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Delete Operation</td>
<td>Deletes a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Get Operation</td>
<td>Gets the latest state of a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operation</td>
<td>Retrieves the list of operations that match the specified filter in the request.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
**Set up the Google Cloud Datastore spoke**

Integrate the ServiceNow instance and Google Cloud Datastore spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

**Before you begin**
- Request IntegrationHub subscription.
- Activate Google Cloud Datastore spoke.
- Role required: admin

**Register Google Cloud Datastore as an OAuth provider**

Register G suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

**Procedure**

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

**Applied Registries form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud Datastore.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response to the external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>The OAuth application logo URL.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>The default grant type used to establish the token. Select Authorisation Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Option to make the app accessible from all application scopes or from this scope only.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the app active.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>The OAuth authorization code endpoint.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The OAuth server token endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The OAuth callback endpoint. If left blank, the instance auto-generates the URL.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>The OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>

5. Go to the related list on the record OAuth Entity Profiles to validate a system-generated default profile for the G Suite OAuth provider without any scope.

6. Go to the related list on the record OAuth Entity Scopes to define all available OAuth scopes for this OAuth provider.

7. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Cloud Datastore spoke**

Create credential record for the Google Cloud Datastore application. The Google Cloud Datastore spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, Google Cloud Datastore credential.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to apply the credentials for all MID Servers, or specific MID servers.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make this credential active.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence in which the credential is applied to devices.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Enter Google Cloud Datastore default_profile. This OAuth profile is a combination of a grant type and at least one scope.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you want to map to the OAuth 2.0 credential.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Submit**.

**Google Cloud Functions spoke**

Manage functions that are attached to events, using your Google Cloud Functions account from ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for the Google Cloud Functions API version v1, but may be compatible with later versions.

**Google Cloud Functions spoke requirements**

The Google Cloud Functions spoke requires a custom app that you create in Google Cloud Platform.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• Google Identity and Access spoke
• Google Cloud VPC Access spoke
• Google Cloud Storage spoke
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Google Cloud Functions spoke provides actions to automate Google Cloud Functions tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function Management</td>
<td>Create Function For Event</td>
<td>Creates a function for an event.</td>
</tr>
<tr>
<td></td>
<td>Create Function For HTTP</td>
<td>Create a function to process an HTTP request.</td>
</tr>
<tr>
<td></td>
<td>Delete Function</td>
<td>Deletes the specified function.</td>
</tr>
<tr>
<td>Generate Download URL</td>
<td>Generate Download URL</td>
<td>Retrieves details of a signed URL to download source code of the deployed function.</td>
</tr>
<tr>
<td>Generate Upload URL</td>
<td>Generate Upload URL</td>
<td>Retrieves details of a signed URL for uploading source code of the deployed function.</td>
</tr>
<tr>
<td></td>
<td>Get Function</td>
<td>Retrieves information about the specified function.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get IAM Policy</td>
<td>Retrieves details of IAM access control policy for a function.</td>
</tr>
<tr>
<td></td>
<td>Look up Functions</td>
<td>Retrieves a list of functions available in the specified location.</td>
</tr>
<tr>
<td></td>
<td>Set IAM Policy</td>
<td>Sets the IAM access control policy for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Update Function</td>
<td>Updates details of the specified function.</td>
</tr>
<tr>
<td>Location Management</td>
<td>Look up Locations</td>
<td>Retrieves a list of locations available in the specified project.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Get Operation</td>
<td>Retrieves details of the specified operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operations</td>
<td>Retrieves the list of operations available in the specified project.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Cloud Functions spoke**

Integrate the ServiceNow instance and Google Cloud Functions account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Google Cloud Functions spoke.
- Role required: admin

**Configure the Google Cloud Functions application**

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Functions spoke.
About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type OAuth client ID.

5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud Functions as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Cloud Functions as an OAuth provider

Use the information generated during the Google Cloud Functions application configuration to register Google Cloud Functions as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.

2. Open for the record, Google Cloud Functions.

3. On the form, fill these values.

   Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create a credential record for the Google Cloud Functions spoke**

Create a credential record for the Google Cloud Functions application. The Google Cloud Functions spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credential Aliases**.
2. Open record for the Google Cloud Functions spoke. For example, `GoogleCloudFunctions`.
3. In the **Credentials** tab, click **New**.
4. Select **OAuth 2.0 Credentials**.
5. Enter a unique name for the credential, for example, `GFunctions_Cred`.
6. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you configured when you registered the Google Cloud Functions service as an OAuth provider. See **Register Google Cloud Functions as an OAuth provider** for more information.
7. Right-click the form header and click **Save**.
8. Click **Get OAuth Token**.

**Google Cloud Load Balancer Spoke**

Manage load balancing of your external or internal Virtual Private Cloud (VPC) network from ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Google Cloud Load Balancer v1, but may be compatible with later versions.

Spoke requirements
- Google Cloud Platform (GCP) account with access to Google Compute Engine and Google Virtual Private Network

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- Google Compute Engine spoke (sn_gcompute_spoke)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows
The Google Cloud Load Balancer Spoke provides subflows to automate Google Cloud Load Balancer tasks when events occur in your ServiceNow instance. Available subflows include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTPS Load Balancer Management</td>
<td>Create HTTPS Load Balancer For A New Backend Service</td>
<td>Creates a HTTPS load balancer for a new backend service in the specified project.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Create HTTPS Load Balancer For An Existing Backend Service</td>
<td>Creates a HTTPS load balancer for an existing backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete HTTPS Load Balancer</td>
<td>Deletes the components of the specified load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Components Of HTTPS Load Balancer</td>
<td>Retrieves a list of names of all the components associated with a HTTPS load balancer.</td>
</tr>
<tr>
<td>HTTP Load Balancer Management</td>
<td>Create A HTTP Load Balancer For A New Backend Service</td>
<td>Creates a HTTP load balancer for a new backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Create HTTP Load Balancer For An Existing Backend service</td>
<td>Creates a HTTP load balancer for an existing backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete HTTP Load Balancer</td>
<td>Deletes the components of a HTTP load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Components Of HTTP Load Balancer</td>
<td>Retrieves a list of names of all the components associated with a HTTP load balancer.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Google Cloud Load Balancer Spoke provides actions to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backend Service Management</td>
<td>Create Backend Service</td>
<td>Creates a backend service.</td>
</tr>
<tr>
<td></td>
<td>Delete Backend Service</td>
<td>Deletes the specified backend service</td>
</tr>
<tr>
<td></td>
<td>Get Backend Service</td>
<td>Retrieves the details of the specified backend service.</td>
</tr>
<tr>
<td></td>
<td>Get Health Of Backend Service</td>
<td>Retrieves the health details of the specified backend service.</td>
</tr>
<tr>
<td></td>
<td>Look up Backend Services</td>
<td>Retrieves a list of all backend services.</td>
</tr>
<tr>
<td></td>
<td>Update Backend Service</td>
<td>Updates the details of the specified backend service.</td>
</tr>
<tr>
<td>Global Address Management</td>
<td>Create A Global Address</td>
<td>Creates a global address.</td>
</tr>
<tr>
<td></td>
<td>Delete A Global Address</td>
<td>Deletes the specified global address</td>
</tr>
<tr>
<td></td>
<td>Get Global Address</td>
<td>Retrieves the details of all the global addresses.</td>
</tr>
<tr>
<td></td>
<td>Look up Global Addresses</td>
<td>Retrieves a list of all global addresses.</td>
</tr>
<tr>
<td>Global Forwarding Rule Management</td>
<td>Create Global Forwarding Rule</td>
<td>Creates a global forwarding rule.</td>
</tr>
<tr>
<td></td>
<td>Delete Global Forwarding Rule</td>
<td>Deletes the specified global forwarding rule.</td>
</tr>
<tr>
<td></td>
<td>Get Global Forwarding Rule</td>
<td>Retrieves the details of a global forwarding rule.</td>
</tr>
<tr>
<td></td>
<td>Look up Global Forwarding Rules</td>
<td>Retrieves a list of all global forwarding rules.</td>
</tr>
</tbody>
</table>
### Spoke actions (continued)

<table>
<thead>
<tr>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and
connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Cloud Load Balancer Spoke**

Integrate the ServiceNow instance and Google Cloud Load Balancer by creating a custom OAuth application in Google Cloud Storage to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Google Cloud Load Balancer Spoke.
- Role required: admin

**Register Google Cloud Load Balancer as an OAuth provider**

Use the information generated during the Google Cloud Storage application configuration to register Google Cloud Load Balancer as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for Google Cloud Load Balancer.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Application Registries form</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Google Cloud Storage application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during the Google Cloud Storage or application configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://oauth2.googleapis.com/token">https://oauth2.googleapis.com/token</a></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code></td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select <code>OAuthGoogleCloudLoadBalancerUtil</code>.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create a credential record for the Google Cloud Load Balancer Spoke**

Create a credential record for the Google Cloud Storage custom application. The Google Cloud Load Balancer Spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases**.

2. Open the **Google_Cloud_Storage** record.

3. In the **Credentials** section, click **New**.

   The system displays this message: What type of Credentials would you like to create?

4. Select **OAuth 2.0 Credentials**.

5. On the form, fill these values.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Google Cloud Load Balancer OAuth Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Google Cloud Storage as an OAuth provider. Find and select <code>GCP Cloud Storage default_profile</code>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Submit.
7. To generate the OAuth token, click the Get OAuth Token related link.

**Google Cloud Pub Sub Spoke**
Manage Google Cloud Pub/Sub messaging service from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Google Cloud Pub Sub v1, but may be compatible with later versions.

**Spoke requirements**
- Google Cloud account

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

• Complex Object (com.glide.cobject)
• Google Identity And Access Spoke (sn_gcp_id_acc_spk)

ℹ️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

### Spoke subflows

The Google Cloud Pub Sub Spoke provides sample subflows to demonstrate automating Google Cloud Pub/Sub tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Google PubSub Messages</td>
<td>Receives messages from a sub topic and displays the messages in logs.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Google Cloud Pub Sub Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snapshot management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot from the requested subscription.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Removes the specified existing snapshot.</td>
</tr>
<tr>
<td></td>
<td>Get Snapshot IAM Policy</td>
<td>Retrieves the IAM policy of the snapshot.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshots</td>
<td>Retrieves a list of existing snapshots.</td>
</tr>
<tr>
<td></td>
<td>Set Snapshot IAM Policy</td>
<td>Assigns the access control policy to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Update Snapshot</td>
<td>Updates an existing snapshot.</td>
</tr>
<tr>
<td>subscription management</td>
<td>Acknowledge</td>
<td>Acknowledges the messages associated with the acknowledge IDs in the acknowledge request.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Acknowledge Deadline</td>
<td>Updates the acknowledge deadline in seconds for a specific message.</td>
</tr>
<tr>
<td></td>
<td>Create Pull Subscription</td>
<td>Creates a pull subscription to the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Create Push Subscription</td>
<td>Creates a push subscription to the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Delete Subscription</td>
<td>Deletes an existing subscription for the specified project.</td>
</tr>
<tr>
<td></td>
<td>Get Subscription</td>
<td>Retrieves the configuration details of the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Get Subscription IAM Policy</td>
<td>Retrieves the access control policy for the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Look up Subscriptions</td>
<td>Retrieves a list of subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Pull Messages</td>
<td>Pulls message asynchronously for the specified project.</td>
</tr>
<tr>
<td></td>
<td>Seek Subscription</td>
<td>Seeks an existing subscription to a point in time or to a specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Set Subscription IAM Policy</td>
<td>Assigns the access control policy to the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Push Configuration</td>
<td>Updates the push configuration for the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Subscription</td>
<td>Updates the specified existing subscription.</td>
</tr>

</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

**Set up the Google Cloud Pub Sub Spoke**

Integrate the ServiceNow instance and Google Cloud Pub Sub by creating a custom OAuth application in Google Cloud account to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Google Cloud Pub Sub Spoke.
- Role required: admin

**Register Google Cloud Pub Sub as an OAuth provider**

Use the information generated during the Google Cloud Pub Sub application configuration to register Google Cloud as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
The system displays this message: What kind of OAuth application?

3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Google Cloud Pub Sub OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Google Cloud account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Google Cloud account configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://oauth2.googleapis.com/o/oauth2/auth">https://oauth2.googleapis.com/o/oauth2/auth</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://oauth2.googleapis.com/token">https://oauth2.googleapis.com/token</a></td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** You can use only **Authorization Code** as the **Default Grant type** when PKCE is enabled.

Application scope that contains this record.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Add OAuth Entity Profile.
6. Add OAuth Entity Scope.
7. Right-click the form header, and click **Save**.

**Create a credential record for the Google Cloud Pub Sub Spoke**

Create a credential record for the Google Cloud account. The Google Cloud Pub Sub Spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays this message: **What type of Credentials would you like to create?**
3. **Select OAuth 2.0 Credentials**.
4. On the form, fill these values.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Google Cloud Pub Sub Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Google Cloud Pub Sub as an OAuth provider. For example, Google Cloud Pub Sub OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more <strong>Specific MID servers</strong>. Specify</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Submit.
7. To generate the OAuth token, click the Get OAuth Token related link.

**Create a credential record for the Google Cloud Pub Sub Spoke**

Create a credential record for the Google Cloud account. The Google Cloud Pub Sub Spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the GoogleCloudPubSub record.
3. In the Credentials section, click New.
4. <TBD>.
5. Right-click the form header and click Submit.
6. To generate the OAuth token, click the Get OAuth Token related link.

**Google Cloud SQL spoke**

Manage provisioning of MySQL and PostgreSQL in Google Cloud SQL from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
**Supported versions**
This spoke was built for Google Cloud SQL v1beta4, but may be compatible with later versions.

**Spoke requirements**
- Google Cloud Platform account
- Google Identity and Access spoke (sn_gcpcloudsql_spk)

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Google Cloud SQL provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Required Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Back up Run Management:</td>
<td>Create Backup</td>
<td>Creates a backup.</td>
<td>cloudsql.backupRuns.create</td>
</tr>
<tr>
<td></td>
<td>Delete Backup</td>
<td>Deletes a backup.</td>
<td>cloudsql.backupRuns.delete</td>
</tr>
<tr>
<td></td>
<td>Run</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Get Backup Run</td>
<td>Retrieves details of the backup.</td>
<td>cloudsql.backupRuns.get</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Required Permission</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------</td>
<td>--------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>Look up Backup Runs</td>
<td>Retrieves a list of the backup runs.</td>
<td>cloudsql.backupRuns.list</td>
<td></td>
</tr>
<tr>
<td>Database Management</td>
<td>Create Database</td>
<td>Creates a database.</td>
<td>cloudsql.databases.create</td>
</tr>
<tr>
<td></td>
<td>Delete Database</td>
<td>Deletes a database.</td>
<td>cloudsql.databases.delete</td>
</tr>
<tr>
<td></td>
<td>Get Database</td>
<td>Retrieves details of the instance.</td>
<td>cloudsql.databases.get</td>
</tr>
<tr>
<td></td>
<td>Look up Databases</td>
<td>Retrieves a list of the databases.</td>
<td>cloudsql.databases.list</td>
</tr>
<tr>
<td></td>
<td>Update Database</td>
<td>Updates a database.</td>
<td>cloudsql.databases.update</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Clone Instance</td>
<td>Clones an instance.</td>
<td>cloudsql.instances.clone</td>
</tr>
<tr>
<td></td>
<td>Create Instance</td>
<td>Creates an instance.</td>
<td>cloudsql.instances.create</td>
</tr>
<tr>
<td></td>
<td>Delete Instance</td>
<td>Deletes an instance.</td>
<td>cloudsql.instances.delete</td>
</tr>
<tr>
<td></td>
<td>Get Instance</td>
<td>Retrieves details of the instance.</td>
<td>cloudsql.instances.get</td>
</tr>
<tr>
<td></td>
<td>Look up Instances</td>
<td>Retrieves a list of the instances.</td>
<td>cloudsql.instances.clone</td>
</tr>
<tr>
<td></td>
<td>Restart Instance</td>
<td>Restarts an instance.</td>
<td>cloudsql.instances.restart</td>
</tr>
<tr>
<td></td>
<td>Update Instance</td>
<td>Updates an instance.</td>
<td>cloudsql.instances.update</td>
</tr>
<tr>
<td>Operations</td>
<td>Get Operation</td>
<td>Retrieves details of the operation.</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>Look up Operations</td>
<td>Retrieves a list of the operations.</td>
<td>N/A</td>
</tr>
<tr>
<td>Tiers</td>
<td>Look up Tiers</td>
<td>Retrieves a list of the tiers.</td>
<td>N/A</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Required Permission</td>
</tr>
<tr>

<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user.</td>
<td>cloudsql.users.create</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user.</td>
<td>cloudsql.users.delete</td>
</tr>
<tr>
<td></td>
<td>Look up User</td>
<td>Retrieves a list of the users.</td>
<td>cloudsql.users.list</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates a user.</td>
<td>cloudsql.users.update</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Cloud SQL spoke**

Integrate the ServiceNow instance and Google Cloud SQL spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Google Cloud SQL spoke.
- Role required: admin

**Configure the Google Cloud SQL application**

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud SQL spoke.

**Before you begin**

Google Identity and Access integration requirements:

- Google Cloud SQL account

**About this task**

Complete these steps from the Google Cloud Platform.
Procedure

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your Google Cloud Platform administrator credentials, and open the project.

2. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain service-now.com. Click **Save**.

3. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.

5. Enter the following Authorized redirect URL: https://<instance>.service-now.com/oauth_redirect.do and click **Create**.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider. The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Cloud SQL as an OAuth provider**

Use the information generated during Google Cloud SQL account configuration to register the Google Cloud SQL application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

**Procedure**

1. In ServiceNow instance, navigate to **System OAuth > Application Registry**.

2. Open the record for **Google Cloud SQL**.

3. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud SQL.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud SQL application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you create the application.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGCPSQLUtil.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.servicenow.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Cloud SQL spoke**

Create Credential records to connect the Google Cloud SQL custom OAuth application you created during account configuration. The GoogleCloud SQL spoke connection and credential aliases use these credentials to authorize actions.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **GCSQL Cred**.
4. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Cloud SQL service as an OAuth provider.
5. Click **Get Oauth Token**.
Google Cloud Storage spoke
Manage storage and retrieval of data in Google Cloud from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Google Cloud Storage account requirements
The Google Cloud Storage spoke requires a custom app that you create in Google Cloud Platform.s

Supported versions
This spoke was built for API version v1, but may be compatible with later versions.

Spoke subflows
The Google Cloud Storage spoke provides sample subflows to demonstrate automating Google Cloud Storage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflows include:
<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move An Object</td>
<td>Moves an object from the source bucket to destination bucket.</td>
</tr>
<tr>
<td>Rename An Object</td>
<td>Renames the specified object.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Google Cloud Storage spoke provides actions to automate Google Cloud Storage when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket Access Control Management</td>
<td>Create/Update Bucket Access Control</td>
<td>Creates or updates a bucket access control.</td>
<td>• storage.buckets.get</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.getIamPolicy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.setIamPolicy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.update</td>
</tr>
<tr>
<td></td>
<td>Delete Bucket Access Control</td>
<td>Deletes the specified bucket access control.</td>
<td>• storage.buckets.get</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.getIamPolicy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.setIamPolicy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.update</td>
</tr>
<tr>
<td></td>
<td>List All Bucket Access Controls</td>
<td>Retrieves the list of all bucket access controls.</td>
<td>• storage.buckets.get</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• storage.buckets.getIamPolicy</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Bucket Management</td>
<td>Create Bucket</td>
<td>Creates a bucket in Google Cloud Storage.</td>
<td>storage.buckets.create</td>
</tr>
<tr>
<td></td>
<td>Delete A Bucket</td>
<td>Deletes the specified bucket in Google Cloud Storage.</td>
<td>storage.buckets.delete</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

For more information about the required permissions, see IAM permissions reference.
Before you begin

- Request IntegrationHub subscription.
- Activate the Google Cloud Storage spoke.
- Access to Google Cloud Platform.
- Role required: admin.

Configure the Google Cloud Storage application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Storage spoke.

About this task

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type Web application.

5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud Storage as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Cloud Storage as an OAuth provider

Use the information generated during Google Cloud Storage account configuration to register the Google Cloud Storage application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.
Procedure

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Cloud Storage.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud Storage.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud Storage application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleCloudStorageUtils</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save. The system validates the OAuth credentials.

Create Credential record for the Google Cloud Storage spoke

Create Credential records to connect the Google Cloud Storage custom OAuth application you created during account configuration. The Google Cloud Storage spoke connection and credential aliases use these credentials to authorize actions.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, GStorage_Cred.

4. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Cloud Storage service as an OAuth provider.

5. Click Get Oauth Token.

**Google Cloud Translator Service spoke**

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**Subscription**

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- IntegrationHub Professional subscription package. For more information see, Request IntegrationHub.

**Supported versions**

Google Translate API version v3

**Scope of the spoke in the Dynamic Translation framework**

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see .

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.
### Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Single Language</td>
<td>Translates the input text to a single language.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>

### Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions.

### Set up Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.
Before you begin

• Role required: admin

• Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the Google documentation.

• Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

Before you begin

• Role required: admin

• Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the Google documentation. Following is a sample JSON file:

```json
{
    "type": "service_account",
    "project_id": "primeval-nectar-242610",
    "private_key_id": "0c6c7b1511f1c236c130c5933d528bbf45314e5",
    "private_key": "-----BEGIN PRIVATE KEY-----

```
Procedure

1. In the JSON file, perform the following for the `private_key` value.
   a. Unescape the `\n` characters.
   b. Store the private key in a file with .pem extension.

2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a. Open the link specified for `client_x509_cert_url`.
   b. Unescape the `\n` characters for the certificate associated with the `private_key_id` mentioned in the JSON file.
   c. Store the certificate value in a file with .pem extension.

3. Use the `openssl` command to create a PKCS 12 file using the recently created private key and certificate files.

   ```bash
   ```

   For example, if `certificate.pem` is the certificate and `privatekey.pem` is the private key:

   ```bash
   openssl pkcs12 -export -in certificate.pem -inkey privatekey.pem -certfile certificate.pem -out testkeystore.p12
   ```

   A PKCS 12 file, testkeystore.p12, is created.

4. Specify an export password or source keystore password.

   **Note:** You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the `keytool` command to create a JKS file from the PKCS 12 file.
Note: testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

6. Specify a destination keystore password.

Note: You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

Attach a Java KeyStore certificate to Google Cloud Translator Service spoke
Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

Before you begin
• Role required: admin
• Valid Java KeyStore certificate

Procedure
1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.

X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the certificate.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select Java Key Store.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Key store password | Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see *Create a Java KeyStore certificate*.

#### Short description
Summary about the certificate.

4. Click the manage attachments icon (🔗) and attach a JKS certificate.
5. To validate the JKS certificate, click **Validate Stores/Certificates**.
6. Click **Submit**.

**Create a JWT signing key for Google Cloud Translator Service spoke**
Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

#### JWT Keys form fields

### Field | Description
--- | ---
Name | Identifier of the JWT signing key.
Signing Keystore | Valid JKS certificate for which you want to assign the key.
Key Id | Key ID to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm | Algorithm to sign with the key.
Signing Key Password | Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see *Create a Java KeyStore certificate*. 
Field | Description
--- | ---
Active | Option to activate the key.

4. Click **Submit**.

Create a JWT provider for Google Cloud Translator Service spoke

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

**JWT Provider form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number of seconds that indicate the lifespan of the JWT provider token. Specify 3600.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
5. In the Standard Claims related list, enter the values for these claims.

**Claim**

<table>
<thead>
<tr>
<th>Claim name</th>
<th>Claim value</th>
</tr>
</thead>
<tbody>
<tr>
<td>aud</td>
<td><a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a></td>
</tr>
<tr>
<td>iss</td>
<td>client_email value from the JSON file.</td>
</tr>
</tbody>
</table>

6. In the Custom Claims related list, create the **scope** claim and enter its value as https://www.googleapis.com/auth/cloud-translation.

7. Click **Update**.
Configure the credential for the GoogleTranslation alias

Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the OAuth Entity Profile field.
4. In the JWT Provider field, specify the JWT provider that you want to use.
5. Click Update.
6. To verify if an OAuth Access token is generated to connect to Google’s translation services, click the Get OAuth Token related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias

Connect to the Google’s translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Before you begin
Role required: connection_admin

Procedure
1. Navigate to Connections & Credentials > Connections.
2. Open for the record for Google.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

<table>
<thead>
<tr>
<th>HTTP(S) Connection form fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>location</td>
</tr>
<tr>
<td>project_id</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>---------</td>
</tr>
<tr>
<td>version</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.

**Google Cloud Virtual Network spoke**

Manage firewall, network, subnetwork, and IP address in Google Cloud Virtual Network from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Persistent Disk spoke (sn_gpdisk_spoke)
- Google Compute Engine spoke (sn_gcompute_spoke)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Google Cloud Virtual Network account requirements

The Google Cloud Virtual Network spoke requires a custom app that you create in the Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Cloud Virtual Network spoke provides actions to automate Google Cloud Virtual Network when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Management</td>
<td>Create IP Address For Region</td>
<td>Creates an address resource in the specified project by using the data included in the request.</td>
<td>compute.addresses.create</td>
</tr>
<tr>
<td></td>
<td>Delete IP Address</td>
<td>Deletes the specified address resource.</td>
<td>compute.addresses.delete</td>
</tr>
<tr>
<td></td>
<td>Get IP Address</td>
<td>Retrieves details of the specified address resource.</td>
<td>compute.addresses.get</td>
</tr>
<tr>
<td>Firewall Management</td>
<td>Create Firewall For Egress</td>
<td>Creates a firewall for egress rule in the</td>
<td>compute.firewalls.create</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Firewall For Ingress</td>
<td>Creates a firewall for ingress rule in the specified project.</td>
<td>compute.firewalls.create</td>
</tr>
<tr>
<td></td>
<td>Delete Firewall</td>
<td>Deletes the specified firewall.</td>
<td>compute.firewalls.delete</td>
</tr>
<tr>
<td></td>
<td>Get Firewall</td>
<td>Retrieves details of the specified firewall.</td>
<td>compute.firewalls.get</td>
</tr>
<tr>
<td></td>
<td>Update Firewall For Egress</td>
<td>Updates a firewall for the egress rule in the specified project.</td>
<td>compute.firewalls.update</td>
</tr>
<tr>
<td></td>
<td>Update Firewall For Ingress</td>
<td>Updates a firewall for the ingress rule in the specified project.</td>
<td>compute.firewalls.update</td>
</tr>
<tr>
<td>Metadata Retrieval Management</td>
<td>List Addresses</td>
<td>Retrieves a list of addresses contained within the specified region.</td>
<td>compute.addresses.list</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------</td>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>List Firewalls</td>
<td>Retrieve</td>
<td>Retrieves a list of firewalls available to the specified project.</td>
<td>compute.firewalls.list</td>
</tr>
<tr>
<td>List Networks</td>
<td>Retrieve</td>
<td>Retrieves a list of networks available to the specified project.</td>
<td>compute.networks.list</td>
</tr>
<tr>
<td>List Subnetworks</td>
<td>Retrieve</td>
<td>Retrieves a list of subnetworks available to the specified project.</td>
<td>compute.subnetworks.list</td>
</tr>
<tr>
<td>Network Management</td>
<td>Create</td>
<td>Creates a network in the specified project.</td>
<td>compute.networks.create</td>
</tr>
<tr>
<td></td>
<td>Delete</td>
<td>Deletes the specified network.</td>
<td>compute.networks.delete</td>
</tr>
<tr>
<td></td>
<td>Get</td>
<td>Retrieves details of the specified network.</td>
<td>compute.networks.get</td>
</tr>
<tr>
<td>Subnetwork Management</td>
<td>Create</td>
<td>Creates a subnetwork in the</td>
<td>compute.subnetworks.create</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>specified project.</td>
<td></td>
</tr>
<tr>
<td>Delete Subnetwork</td>
<td>Deletes the specified subnetwork.</td>
<td>compute.subnetworks.delete</td>
<td></td>
</tr>
<tr>
<td>Expand IP CIDR Range</td>
<td>Expands the IP CIDR range of the subnetwork to a specified value.</td>
<td>compute.subnetworks.expandIpCidrRange</td>
<td></td>
</tr>
<tr>
<td>Get IAM Policy</td>
<td>Retrieves details of the access control policy for a resource.</td>
<td>compute.subnetworks.getIAMPolicy</td>
<td></td>
</tr>
<tr>
<td>Get Subnetwork</td>
<td>Retrieves details of the specified subnetwork.</td>
<td>compute.subnetworks.get</td>
<td></td>
</tr>
<tr>
<td>Set IAM Policy</td>
<td>Sets the access control policy on the specified resource.</td>
<td>compute.subnetworks.setIAMPolicy</td>
<td></td>
</tr>
</tbody>
</table>

For more information about the required permissions, see [IAM permissions reference](#).
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Cloud Virtual Network spoke

Integrate the ServiceNow instance and Google Cloud Virtual Network spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

Before you begin

• Request IntegrationHub subscription.
• Activate the Google Cloud Virtual Network spoke.
• Activate and set up the Google Compute Engine spoke.
• Role required: admin.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Open record for the Google Compute Engine spoke. For example, Google Compute Cred.
3. For Credential alias, select the Connection and Credential alias record of the Google Cloud Virtual Network spoke.
4. Right-click the form header and click Save.
5. Click Get Oauth Token.

Google Cloud VPC Access spoke

Manage connector and operations in your Google Cloud VPC Access account from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for the Google Cloud VPC Access API version v1, but may be compatible with later versions.

Google Cloud VPC Access spoke requirements
The Google Cloud VPC Access spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access spoke
- Google Cloud Virtual Network spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Google Cloud VPC Access spoke provides actions to automate Google Cloud VPC Access tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector Management</td>
<td>Create Connector</td>
<td>Creates a connector in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete Connector</td>
<td>Deletes the specified VPC Access connector.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Connector</td>
<td>Retrieves the specified VPC Access connector.</td>
</tr>
<tr>
<td></td>
<td>Look up Connectors</td>
<td>Retrieves the list of VPC Access connectors available in the specified location.</td>
</tr>
<tr>
<td>Location Management</td>
<td>Look up Locations</td>
<td>Retrieves the list of locations available in the specified project.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Get Operation</td>
<td>Retrieves details of the specified operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operations</td>
<td>Retrieves a list of operations available with in the specified location.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Google Cloud VPC Access spoke**

Integrate the ServiceNow instance and Google Cloud VPC Access account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Google Cloud VPC Access spoke.
- Role required: admin

**Configure the Google Cloud VPC Access application**

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud VPC Access spoke.

**About this task**

Complete these steps from the Google Cloud Platform. See the [Google Cloud Platform](#) product documentation for instructions on creating and configuring custom applications.
Procedure

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type OAuth client ID.

5. Enter the following Authorized redirect URL: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud VPC Access as an OAuth provider.

Register Google Cloud VPC Access as an OAuth provider

Use the information generated during the Google Cloud VPC Access application configuration to register Google Cloud VPC Access as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.

2. Open the record, Google Cloud VPC Access.

3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud VPC Access application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
Create a credential record for the Google Cloud VPC Access spoke

Create a credential record for the Google Cloud VPC Access application. The Google Cloud VPC Access spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Connections & Credential Aliases.
2. Open record for the Google Cloud VPC Access spoke. For example, GoogleCloudVPCAccess.
3. In the Credentials tab, click New.
4. Select OAuth 2.0 Credentials.
5. Enter a unique name for the credential, for example, GCloud_VPC_Cred.
6. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you configured when you registered the Google Cloud VPC Access service as an OAuth provider. See Register Google Cloud VPC Access as an OAuth provider for more information.
7. Right-click the form header and click Save.
8. Click Get OAuth Token.

Google Compute Engine spoke

Launch and manage virtual machines in Google Compute Engine from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• Google Persistent Disk spoke (sn_gpdisk_spoke)
• Google Cloud Virtual Network spoke (sn_gcp_vpc_spoke)

⚠ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Google Compute Engine account requirements
The Google Compute Engine spoke requires a custom app that you create in Google Cloud Platform.

Supported versions
This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions
The Google Compute Engine spoke provides actions to automate Google Compute Engine when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Template</td>
<td>Create Instance Template</td>
<td>Creates an instance template.</td>
<td>compute.instanceTemplates.create</td>
</tr>
<tr>
<td>Management</td>
<td>Create Instance Template From Instance</td>
<td>Creates an instance template from instance.</td>
<td>compute.instanceTemplates.create</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

For more information about the required permissions, see IAM permissions reference.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Compute Engine spoke**

Integrate the ServiceNow instance and Google Compute Engine spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Google Compute Engine spoke.
• Access to Google Cloud Platform.
• Role required: admin.

Note: This procedure outlines steps to configure the custom app using OAuth. You can also configure the custom app using Service Account associated with JWT tokens. For more information about setting up the spoke using JWT tokens, see Choosing an Authentication Method - Service accounts and Set up OAuth provider with JWT Bearer grant type.

Configure the Google Compute Engine application
Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Compute Engine spoke.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure
1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Compute Engine as an OAuth provider.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Compute Engine as an OAuth provider
Use the information generated during Google Compute Engine account configuration to register the Google Compute Engine application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.
Procedure

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Open the record for **Google Compute Engine**.
3. Fill these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Compute Engine.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Compute Engine application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleComputeUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Compute Engine spoke**

Create Credential records to connect the Google Compute Engine custom OAuth application you created during account configuration. The Google Compute Engine spoke connection and credential aliases use these credentials to authorize actions.

Procedure

1. Navigate to **IntegrationHub > Connections & Credentials**.
2. Open record for the Google Compute Engine spoke. For example, **Google Compute**.
3. In the **Credentials** tab, click **New**.

4. Select **OAuth 2.0 Credentials**.

5. Enter a unique name for the credential, for example, **Google Compute Cred**.

6. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Compute Engine service as an OAuth provider.

7. Right-click the form header and click **Save**.

8. Click **Get Oauth Token**.

### Google Directory spoke v1.1.0

Manage groups, members, and users in Google Directory from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

### Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

⚠ **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Google Directory account requirements

The Google Directory spoke requires a custom app that you create in the Google Developers Console.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Directory spoke provides actions to automate Google Directory when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group.</td>
</tr>
<tr>
<td></td>
<td>Get Group Details</td>
<td>Retrieves the details of the specified group.</td>
</tr>
<tr>
<td></td>
<td>List All Groups</td>
<td>Retrieves the details of all groups.</td>
</tr>
<tr>
<td></td>
<td>Look Up Groups</td>
<td>Searches for the required groups.</td>
</tr>
<tr>
<td></td>
<td>Update Group Details</td>
<td>Updates details of the specified group.</td>
</tr>
<tr>
<td>Member Management</td>
<td>Add Member To A Group</td>
<td>Adds member to the specified group.</td>
</tr>
<tr>
<td></td>
<td>Delete Member From A Group</td>
<td>Deletes a member from the group.</td>
</tr>
<tr>
<td></td>
<td>Get Member Details From A Group</td>
<td>Retrieves details of a member from the specified group.</td>
</tr>
<tr>
<td></td>
<td>List Members Of A Group</td>
<td>Retrieves list of members in a group.</td>
</tr>
<tr>
<td></td>
<td>Member Of A Group</td>
<td>Checks if a member is part of the specified group.</td>
</tr>
<tr>
<td></td>
<td>Update Member</td>
<td>Updates details of the specified member.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get User Details</td>
<td>Retrieves the details of the specified user.</td>
</tr>
<tr>
<td></td>
<td>Grant Admin To User</td>
<td>Grants admin privileges to the specified user.</td>
</tr>
<tr>
<td></td>
<td>List All Users</td>
<td>Retrieves the list of all users.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users</td>
<td>Searches for the required users.</td>
</tr>
<tr>
<td>Reactivate User</td>
<td></td>
<td>Reactivates the specified user.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
<td>Exercise caution while using this action, as it may affect other user's</td>
</tr>
<tr>
<td></td>
<td></td>
<td>account.</td>
</tr>
<tr>
<td></td>
<td>Reset User Password</td>
<td>Resets the password of the user.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
<td>Exercise caution while using this action, as it may affect other user's</td>
</tr>
<tr>
<td></td>
<td></td>
<td>account.</td>
</tr>
<tr>
<td></td>
<td>Revoke Admin From User</td>
<td>Revokes the admin privileges of the specified user.</td>
</tr>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
<td>Exercise caution while using this action, as it may affect other user's</td>
</tr>
<tr>
<td>Update User Details</td>
<td></td>
<td>account.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Google Directory spoke**

Integrate the ServiceNow instance and Google Directory spoke by using G Suite credentials to authenticate ServiceNow requests.
Before you begin

- Request IntegrationHub subscription.
- Activate the Google Directory spoke.
- Role required: admin.

Configure the Google Directory application

Create a custom OAuth application from your Google G Suit account to enable OAuth 2.0 authentication with the Google Directory spoke.

Before you begin

Google Directory integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Directory as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register Google Directory as an OAuth provider

Use the information generated during Google Directory account configuration to register the Google Directory application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Directory.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Directory.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleDirectoryUtils</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save. The system validates the OAuth credentials.

Create Credential record for the Google Directory spoke

Create Credential records to connect the Google Directory custom OAuth application you created during account configuration. The Google Directory spoke connection and credential aliases use these credentials to authorize actions.
Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, GDirectory Cred.
4. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Directory service as an OAuth provider.
5. Click Get Oauth Token.

Google Cloud DNS spoke

Manage public zones and private managed DNS zones in using Google Cloud DNS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Google Cloud DNS API version v1, but may be compatible with later versions.

Spoke requirements

The Google Cloud DNS spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• Google Cloud Virtual Network spoke
• Google Identity and Access spoke

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Google Cloud DNS spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Management</td>
<td>Create Change</td>
<td>Updates the resource record set collection.</td>
</tr>
<tr>
<td></td>
<td>Get Change</td>
<td>Retrieves the details of an existing change.</td>
</tr>
<tr>
<td></td>
<td>Look up Changes</td>
<td>Retrieves list of changes to a resource record set collection available with in the specified managed zone.</td>
</tr>
<tr>
<td>DNS Key Management</td>
<td>Get DNS Key</td>
<td>Retrieves details about an existing DNS key.</td>
</tr>
<tr>
<td></td>
<td>Look up DNS Keys</td>
<td>Retrieves list of DNS keys to a resource record set collection available with in the specified managed zone.</td>
</tr>
<tr>
<td>Managed Zone Management</td>
<td>Create Managed Zone For Private</td>
<td>Creates a managed private zone with private DNS records.</td>
</tr>
<tr>
<td></td>
<td>Create Managed Zone For Public</td>
<td>Creates a managed public zone.</td>
</tr>
<tr>
<td></td>
<td>Delete Managed Zone</td>
<td>Deletes the specified existing managed zone.</td>
</tr>
</tbody>
</table>

<td>Look up Resource Record Sets</td>
<td>Retrieves list of resource record set collections available within the specified managed zone.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any...
actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Cloud DNS spoke
Integrate the ServiceNow instance and Google Cloud DNS account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin
- Request an IntegrationHub subscription.
- Activate Google Cloud DNS spoke.
- Role required: admin

Configure the Google Cloud Functions application
Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud DNS spoke.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure
1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type OAuth client ID.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud Functions as an OAuth provider. The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register Google Cloud DNS as an OAuth provider

Use the information generated during the Google Cloud DNS application configuration to register Google Cloud Functions as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure
1. Navigate to System OAuth > Application Registry.
2. Open for the record, Google Cloud DNS.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create a credential record for the Google Cloud DNS spoke

Create a credential record for the Google Cloud Functions application. The Google Cloud Functions spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Connections & Credential Aliases.
2. Open record for the Google Cloud DNS spoke. For example, GoogleCloudDNS.
3. In the Credentials tab, click New.
4. Select OAuth 2.0 Credentials.
5. Enter a unique name for the credential, for example, GCloud_DNS_Cred.
6. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you configured when you registered the Google Cloud Functions service as an OAuth provider. See Register Google Cloud Functions as an OAuth provider for more information.
7. Right-click the form header and click Save.
8. Click Get OAuth Token.

**Google Docs spoke**
Manage documents in Google Docs from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Google Docs v1, but may be compatible with later versions.

**Spoke requirements**
Google Cloud account

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Google Docs spoke provides actions to automate Google Docs tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create Footer</td>
<td>Creates a footer in the specified document.</td>
</tr>
<tr>
<td></td>
<td>Create Header</td>
<td>Creates a header in the specified document.</td>
</tr>
<tr>
<td></td>
<td>Get Document Details</td>
<td>Retrieves the structure of the specified document as a JSON object.</td>
</tr>
<tr>
<td></td>
<td>Search Text in Document</td>
<td>Searches for the required document based on the search text or content.</td>
</tr>
<tr>
<td></td>
<td>Update Document</td>
<td>Updates the content of a document with the provided HTML content.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Google Docs**

Integrate the ServiceNow instance and Google Docs by creating a custom OAuth application in G Suite credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Google Docs spoke.
- Role required: admin

**Register Google Docs as an OAuth provider**

Register G Suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.
Procedure

1. Navigate to System OAuth > Application Registry.

2. Click New.
   The system displays the message what kind of OAuth application?.

3. Select Connect to a third party OAuth Provider.

4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Docs.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response to the external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>The OAuth application logo URL.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>The default grant type used to establish the token. Select Authorisation Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Option to make the app accessible from all application scopes or from this scope only.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the app active.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>The OAuth authorization code endpoint.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The OAuth server token endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The OAuth callback endpoint. If left blank, the instance auto-generates the URL.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>The OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>

5. Go to the related list on the record OAuth Entity Profiles to validate a system-generated default profile for the G Suite OAuth provider without any scope.
6. Go to the related list on the record OAuth Entity Scopes to define all available OAuth scopes for this OAuth provider.

7. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Docs**

Create credential record for the Google Docs custom application. The Google Docs connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**

4. Enter a unique name for the credential, for example **Google Docs Credential**.

5. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Docs service as an OAuth provider.

6. Click **Get OAuth Token**.

**Google Drive spoke v1.3.0**

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see **Request IntegrationHub**.
Supported versions
API version v1.

Spoke subflows
The Google Drive spoke provides sample subflows in the draft state to demonstrate automating Google Drive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Google Drive</td>
<td>Copies an attachment from ServiceNow to Google Drive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

Spoke actions
The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File and Folder Management</td>
<td>Copy Attachment to Drive</td>
<td>Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>
<td></td>
<td>Copy Doc File To Attachment</td>
<td>Copies a file Google Drive and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File</td>
<td>Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File To Attachment</td>
<td>Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Google Drive folder that can be nested within other folders.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Drive File Or Folder</td>
<td>Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents</td>
</tr>
<tr>
<td></td>
<td>Look up Files and Folders Stream</td>
<td>Retrieves the list of files and folders.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folders</td>
<td>Returns a list of Google Drive folder IDs based on given search parameters.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment To Drive</td>
<td>Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Metadata</td>
<td>Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.</td>
</tr>
<tr>
<td>Permission</td>
<td>Create File or Folder Permission</td>
<td>Adds a permission to a given user, group, domain, or anyone for a file or folder. If User or Group is selected, the email address is required for those users and groups. If Domain is selected, the domain name is required. If Anyone is selected, then anyone has permissions to the file or folder.</td>
</tr>
<tr>
<td>Management</td>
<td>Delete File Or Folder Permission</td>
<td>Removes a permission to a given user, group, domain, or anyone for a file or folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Or Folder Permissions By ID</td>
<td>Returns the list of permissions associated with a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Look up Permissions Stream</td>
<td>Retrieves the list of files or shared drives permissions.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Transfer Ownership Of All User Data</td>
<td>Transfers the ownership of data from one user to another within a domain. All previous permissions of old owner are removed and new owner permissions are created for new user.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Permission</td>
<td>Updates a given permission by updating the role.</td>
</tr>
</tbody>
</table>

**Google Drive Online account requirements**

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or Google G Suite.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Drive alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Google Drive spoke**

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Google Drive spoke.
- Role required: admin

**Configure Google Drive application**

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.
Before you begin
Google Drive integration requirements:

• A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.

• A Google G Suite or Google Drive login created with the domain.

• A Google Drive account.

About this task
Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

Procedure

2. Enter your business name, the number of employees, and your country, and click Next.

3. Enter the administrator contact name, email address and business phone number, and click Next.

4. Enter the domain associated with this spoke.

5. Provide the user name and password for your domain.

6. Add users to the G Suite account.

7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.

9. Search for the Google Drive API and enable it.

10. Create a Credentials application and save the Client ID and Client secret. The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Register Google Drive as an OAuth provider.
Register Google Drive as an OAuth provider

Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example GoogleDrive.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Drive application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon (🔍) and select OAuthUtilGoogleDrive.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon (🔒), enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon (🔒), enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon (🔒), enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Drive spoke includes these scopes by default:
   - appdata
   - drive
• drivereadonly
• file
• filetransfer
• metadata
• metadatapersonal
• photosreadonly
• scripts
• user

Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

---

<table>
<thead>
<tr>
<th>OAuth Entity Scopes</th>
<th>OAuth scope</th>
</tr>
</thead>
</table>
| ![Icon](
<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendars.ReadWrite</td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td>email</td>
<td>email</td>
</tr>
<tr>
<td>Files.Read</td>
<td>Files.Read</td>
</tr>
<tr>
<td>Files.Read.All</td>
<td>Files.Read.All</td>
</tr>
</tbody>
</table>

---

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

Create Credential record for the Google Drive spoke

Create Credential records to connect the Google Drive custom OAuth application you created during Google Drive account configuration. The Google Drive spoke connection and credential aliases use these credentials to authorize actions.

Procedure

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select **OAuth 2.0 Credentials**.
3. Enter a unique name for the credential, for example, `gDrive Cred`.

4. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Drive service as an OAuth provider.

5. Click Get OAuth Token.

**Create Connection record for the Google Drive spoke**

Create connection records to a Google Drive account. A connection alias resolves your Google Drive connection and credential at runtime. Only one connection is active per Connection Alias at a time.

**Procedure**

1. Navigate to Connections & Credentials > Connection & Credential Aliases.

2. Select the Google Drive connection.

3. On the Connection Attributes related list, set the default value of the API version to `v3`.
   If there are no connection attributes, click **New** and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select **gDrive Connection**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gDrive Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the steps above is gDrive Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_googledrive_spoke.Google_Drive</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a>.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googledrive_cred.

6. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

   Note: Ensure that you allow pop-up windows in your browser.

Results
The Google Drive spoke is set up and integrated with the ServiceNow instance.

Google Hangouts spoke v 1.0.2
Use ServiceNow to create and update events and attendees in Google Hangouts.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
Supported versions
API version v1.

Spoke actions
The Google Hangouts spoke provides actions to perform Google Hangouts tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Hangout</td>
<td>Updates a hangout by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Remove Attendees From Hangout</td>
<td>Updates a hangout by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Hangout</td>
<td>Creates a hangout on the specified calendar.</td>
</tr>
<tr>
<td></td>
<td>Update Hangout</td>
<td>Edit hangout information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Get Hangout By ID</td>
<td>Returns the specified hangout.</td>
</tr>
<tr>
<td></td>
<td>Delete Hangout</td>
<td>Removes a specified hangout from a calendar.</td>
</tr>
</tbody>
</table>

Google Hangouts Online account requirements
The Google Hangouts spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Hangouts alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up Google Hangouts spoke**

Integrate a ServiceNow instance and Google Hangouts by using G Suite credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Google Hangouts spoke.
- Role required: admin

**Configure Google Hangouts application**

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Hangouts spoke.

**Before you begin**

Google Hangouts integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

**About this task**

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

**Procedure**

1. Register a new custom application. Navigate to [https://console.developers.google.com](https://console.developers.google.com), create a project with your G Suite administrator credentials, and open the project.

2. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain service-now.com. Click **Save**.

3. Search for the Google Hangouts API and enable it.
4. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.

5. Select the application type **Web application**.

6. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
   This redirect URI must match the **Redirect URL** you provide when you **Register Google Hangouts as an OAuth provider**.

7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you **Register Google Tasks as an OAuth provider**.
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Hangouts as an OAuth provider**

Use the information generated during Google Hangouts account configuration to register the Google Hangouts application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

**Procedure**

1. In ServiceNow, navigate to **System OAuth > Application Registry**.

2. Click **New**.

3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.

4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Hangouts.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Hangouts application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon (🔍) and select OAuthHangoutsRefreshTokenUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon ☰️, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon ☰️, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon ☰️, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. **Optional:** In the **OAuth Entity Scopes** related list, add any scopes required by your application. The Google Hangouts spoke includes these scopes by default:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar</td>
<td><a href="https://www.googleapis.com/auth/calendar">https://www.googleapis.com/auth/calendar</a></td>
</tr>
<tr>
<td>Events</td>
<td><a href="https://www.googleapis.com/auth/calendar.events">https://www.googleapis.com/auth/calendar.events</a></td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
The system validates the OAuth credentials.

**Create Credential record for the Google Hangouts spoke**

Create Credential records to connect the Google Hangouts custom OAuth application you created during account configuration. The Google Hangouts spoke connection and credential aliases use these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **Hangout Cred**.
4. Click the OAuth Entity Profile search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Hangouts service as an OAuth provider.

5. Click Get OAuth Token.

Create Connection record for the Google Hangouts spoke

Create connection records to a Google Hangouts account. A connection alias resolves your Google Hangouts connection and credential at runtime. Only one connection is active per Connection Alias at a time.

About this task
You should provide a single Credential and Connection Alias for all G Suite service spokes.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the Google Hangouts connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.
   If there are no connection attributes, click New and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Hangouts Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name Google Hangouts Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is Hangouts Cred.</td>
</tr>
<tr>
<td>Connection</td>
<td>alias</td>
</tr>
<tr>
<td>Connection</td>
<td>URL</td>
</tr>
<tr>
<td></td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlehangouts_cred.

6. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

   ⚠️ Note: Ensure that you allow pop-up windows in your browser.

Results
The Google Hangouts spoke is set up and integrated with the ServiceNow instance.

Google Identity and Access spoke
Manage folders, projects, roles, and service accounts in Google Identity and Access Management and Google Resource Manager.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST
  (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version v2 only Folder Management category and v1 for other categories, but may be compatible with later versions.

Spoke requirements
• Google Cloud Platform account

Spoke flows and subflows
This spoke has no flows and subflows.

Spoke actions
The Google Identity and Access spoke provides actions to automate Google Identity and Access Management and Google Resource Manager tasks when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Required Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder.</td>
<td>resourcemanager.folders.create</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder.</td>
<td>resourcemanager.folders.delete</td>
</tr>
<tr>
<td></td>
<td>Get Child Folder</td>
<td>Retrieves the information of a child folder.</td>
<td>resourcemanager.folders.get</td>
</tr>
<tr>
<td></td>
<td>List Folders</td>
<td>Retrieves the list of folders.</td>
<td>resourcemanager.folders.list</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Required Permission</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------</td>
<td>----------------------------------</td>

</tbody>
</table>

For more information about the required permissions, see IAM permissions reference.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Identity and Access Spoke

Integrate the ServiceNow instance and Google Identity and Access spoke by using Google Cloud Platform credentials to authenticate ServiceNow requests.

Before you begin
- Request IntegrationHub subscription
- Activate the Google Identity and Access spoke
- Role required: admin

Configure the Google Identity and Access application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Identity and Access spoke.

Before you begin
- Google Identity and Access integration requirements:
  - Google Cloud Platform account

About this task
Complete these steps from the Google Cloud Platform.

Procedure

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your Google Cloud Platform administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type Web application.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Identity and Access as an OAuth provider

Use the information generated during Google Identity and Access account configuration to register the Google Identity and Access application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. In ServiceNow instance, navigate to System OAuth > Application Registry.
2. Open the record for Google Identity and Access.
3. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Identity and Access.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Identity and Access application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you create the application.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleIAMUtil.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Google Identity and Access spoke**

Create Credential records to connect the Google Identity and Access custom OAuth application you created during account configuration. The Google Identity and Access spoke connection and credential aliases use these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **GCPIAM Cred**.
4. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Identity and Access service as an OAuth provider.
5. Click **Get Oauth Token**.

**Google Persistent Disk spoke**

Manage disks, snapshots, and images in Google Persistent Disk from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Cloud Virtual Network spoke (sn_gcp_vpc_spoke)
- Google Compute Engine spoke (sn_gcompute_spoke)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Google Persistent Disk account requirements
The Google Persistent Disk spoke requires a custom app that you create in the Google Cloud Platform.

Supported versions
This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions
The Google Persistent Disk spoke provides actions to automate Google Persistent Disk when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Management</td>
<td>Create Disk</td>
<td>Creates a persistent disk in the specified project.</td>
<td>compute.disks.create</td>
</tr>
<tr>
<td></td>
<td>Delete Disk</td>
<td>Deletes the specified persistent disk.</td>
<td>compute.disks.delete</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Disk</td>
<td>Retrieves details of the specified persistent disk.</td>
<td>compute.disks.get</td>
</tr>
<tr>
<td></td>
<td>Get Disk Type by Zone</td>
<td>Retrieves the details of the specified disk type by zone.</td>
<td>compute.diskTypes.get</td>
</tr>
<tr>
<td></td>
<td>Resize Disk</td>
<td>Resizes the specified persistent disk.</td>
<td>compute.disks.resize</td>
</tr>
<tr>
<td></td>
<td>Image Management</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Create Image for Disk</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Create Image for Image</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Create Image for Snapshot</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Delete Image</td>
<td>Deletes the specified image.</td>
<td>compute.images.delete</td>
</tr>
<tr>
<td></td>
<td>Get Image</td>
<td>Retrieves details of the specified image.</td>
<td>compute.images.get</td>
</tr>
<tr>
<td></td>
<td>Metadata Retrieval Management</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>List Disk Types by Zone</td>
<td>Retrieves a list of disk types available to the specified project.</td>
<td>compute.diskTypes.list</td>
</tr>
<tr>
<td></td>
<td>List Disks</td>
<td>Retrieves a list of persistent disks contained within the specified zone.</td>
<td>compute.disks.list</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Retrieves the list of images available to the specified project.</td>
<td>compute.images.list</td>
</tr>
<tr>
<td></td>
<td>List Snapshots</td>
<td>Retrieves the list of snapshot resources</td>
<td>compute.snapshots.list</td>

For more information about the required permissions, see IAM permissions reference.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Persistent Disk spoke**

Integrate the ServiceNow instance and Google Persistent Disk spoke by using G Suite credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Google Persistent Disk spoke.
- Activate and set up the Google Compute Engine spoke.
- Role required: admin.

**Procedure**

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Open record for the Google Compute Engine spoke. For example, Google Compute Cred.
3. For **Credential alias**, select the Connection and Credential alias record of the Google Persistent Disk spoke.

4. Right-click the form header and click **Save**.

5. Click **Get Oauth Token**.

**Google Sheets spoke v1.0.3**
Manage spreadsheets in Google Sheets from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported versions**
This spoke was built for Google Sheets v4, but may be compatible with later versions.

**Spoke requirements**
- Google Cloud Platform account
**Spoke actions**

The Google Sheets spoke provides actions to automate Google Sheets tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sheet Management</td>
<td>Add Row</td>
<td>Adds a row with the specified values to a sheet.</td>
</tr>
<tr>
<td></td>
<td>Clear Cells</td>
<td>Clears the values in the sheet for the specified range.</td>
</tr>
<tr>
<td></td>
<td>Copy Sheet</td>
<td>Copies a sheet from a spreadsheet to another spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Create Sheet</td>
<td>Creates a sheet in the specified spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Delete Sheet</td>
<td>Deletes a sheet in the spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Get Cell Values</td>
<td>Retrieves the values in the sheet for the specified range.</td>
</tr>
<tr>
<td></td>
<td>Update Cells</td>
<td>Updates a range of cell values in a sheet.</td>
</tr>
<tr>
<td>Spreadsheet Management</td>
<td>Get Spreadsheet</td>
<td>Retrieves details about the specified spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Details</td>
<td></td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Google Sheets spoke**

Integrate the ServiceNow instance and Google Sheets by creating a custom OAuth application in Google API Console to authenticate ServiceNow requests.
Before you begin
• Request IntegrationHub subscription.
• Activate Google Sheets spoke.
• Role required: admin

Create a Connection and Credential Alias for Google Sheets spoke
Create Connection records to your Google Sheets account. The Google Sheets spoke connection and credential aliases use these connections to perform actions in the Google Sheets.

Before you begin
• Register your application using Google API Console and record the client ID and client secret. For more information, see Google Authorize Requests.
• Role required: admin

Procedure
1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the GoogleSheets record.
3. Under Related Links section, click Create New Connection & Credential record.
4. On the Create Connection and Credential, fill in these fields.

Create Connection and Credential fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. This field is automatically set to Google Sheets Spoke Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL used for connecting to Google Sheets APIs. This field is automatically set to <a href="https://sheets.googleapis.com/v4/spreadsheets">https://sheets.googleapis.com/v4/spreadsheets</a>.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name of the credential. This field is automatically set to Google Sheets Spoke Credential.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth Entity Name</td>
<td>Name of the OAuth entity profile. This field is automatically set to Google Sheets Spoke OAuth.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of the Google Sheets application you registered in G Suite.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret generated when you registered the application in Google API Console.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>The redirect URL. The format of the URL is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.

**Google Tasks spoke**
Manage Google Task actions.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
API version v1.

**Spoke subflows**
The Google Tasks spoke provides sample subflows in the draft state to demonstrate automating Google Tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
### Spoke actions

The Google Tasks spoke provides actions to automate Google Tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Management</td>
<td>Complete Task</td>
<td>Mark a task complete in a task list.</td>
</tr>
<tr>
<td></td>
<td>Create Task</td>
<td>Create a task in a task list.</td>
</tr>
<tr>
<td></td>
<td>Delete Task</td>
<td>Delete a task from a task list.</td>
</tr>
<tr>
<td></td>
<td>Get Task</td>
<td>Retrieve details of a specified task from a task list.</td>
</tr>
<tr>
<td></td>
<td>Look Up Tasks</td>
<td>Retrieve details of specified tasks from a task list.</td>
</tr>
<tr>
<td></td>
<td>Update Task</td>
<td>Update details of the specified task in a task list.</td>
</tr>
<tr>
<td>Task List Management</td>
<td>Create Task List</td>
<td>Create a task list in your Google Tasks account.</td>
</tr>
<tr>
<td></td>
<td>Delete Task List</td>
<td>Delete the specified task list.</td>
</tr>
<tr>
<td></td>
<td>Get All Task Lists</td>
<td>Retrieve the details of all task lists in your Google Tasks account.</td>
</tr>
<tr>
<td></td>
<td>Get Task List</td>
<td>Retrieve details of a specified task list.</td>
</tr>
<tr>
<td></td>
<td>Update Task List</td>
<td>Update details of a specified task list.</td>
</tr>
</tbody>
</table>

### Google Tasks account requirements

The Google Tasks spoke requires a custom app that you create in the Google Developers Console.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Tasks alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Google Tasks spoke

Integrate the ServiceNow instance and Google Tasks spoke by using G Suite credentials to authenticate ServiceNow requests.

Before you begin

- Install the Google Tasks spoke.
- Request IntegrationHub subscription.
- Activate the Google Tasks spoke.
- Role required: admin.

Configure Google Tasks application

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Google Tasks spoke.

Before you begin

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

About this task

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.
Procedure

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type Web application.

5. Enter the following Authorized redirect URL: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Tasks as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Tasks as an OAuth provider

Use the information generated during Google Tasks application configuration to register the Google Tasks application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. In ServiceNow, navigate to System OAuth > Application Registry.

2. Open the Google Tasks spoke.

3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon , enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

4. In the OAuth Entity Scopes related list, add the scopes required by your application. The Google Tasks spoke supports two scopes:
<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>tasks</td>
<td><a href="https://www.googleapis.com/auth/tasks">https://www.googleapis.com/auth/tasks</a></td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/tasks.readonly">https://www.googleapis.com/auth/tasks.readonly</a></td>
</tr>
</tbody>
</table>

Click **Insert a new row** and enter a name for the scope and the OAuth scope URL.

5. On the **OAuth Entity Profiles** tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update**.

7. On the Application registries form, click **Update** again. The system validates the OAuth credentials.

**What to do next**

Create Credential record for the Google Tasks spoke.

**Create Credential record for the Google Tasks spoke**

Create Credential records to Google. The Google Tasks spoke connection and credential alias uses these credentials to authorize actions.

**Before you begin**

Role required: admin.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.

2. Select **OAuth 2.0 Credentials**.
3. Enter a unique name for the credential, for example, Google Tasks Spoke Credential.

4. Click the OAuth Entity Profile search icon (🔍) and select the default Google Task profile.

5. Click Submit and reopen the credential.

   Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

What to do next
Create Connection record for the Google Tasks spoke.

Create Connection record for the Google Tasks spoke
Create Connection records to your Google account. The Google Tasks spoke connection and credential alias uses these connections to perform actions in Google tasks.

Before you begin
Role required: admin

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and select Google Tasks.

2. On the Connections related list, click New.

3. Select HTTP(s) Connection.

4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name GTask.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the name of the credential you created in Create Credential record for the Google Tasks spoke.</td>
</tr>
<tr>
<td></td>
<td>Note: Make sure that you don’t include spaces before or after this URL. If there are spaces, the connection fails.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Results
The Google Tasks spoke is set up and integrated with the ServiceNow instance.

GoTo spoke
The GoTo spoke provides actions to view and analyze meaningful usage data for GoTo software subscriptions. Analyze usage for GoToMeeting and GoToWebinar to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for LogMeIn Admin Center v5.29.0, but may be compatible with later versions.

Spoke requirements
• GoTo admin account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
**Spoke actions**

The GoTo spoke provides actions to automate GoTo tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License Management</td>
<td>Look Up Licenses</td>
<td>Retrieves a list of all product licenses within a GoTo account.</td>
</tr>
<tr>
<td></td>
<td>Remove User License</td>
<td>Removes a user from a specified product license.</td>
</tr>
<tr>
<td>Meeting Management</td>
<td>Get Historical Meeting Report</td>
<td>Reports the meeting history of all organizers within a GoTo account during a given date range.</td>
</tr>
<tr>
<td></td>
<td>Get Upcoming Meeting Report</td>
<td>Reports meetings that are scheduled for all organizers within a GoTo account during a given date range.</td>
</tr>
<tr>
<td>User Management</td>
<td>Delete User</td>
<td>Deletes a user from a GoTo account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Key</td>
<td>Retrieves the account key for the authenticated GoTo account.</td>
</tr>
<tr>
<td></td>
<td>Look up Users</td>
<td>Retrieves a list of all users within a GoTo account.</td>
</tr>
<tr>
<td>Webinar Management</td>
<td>Get Webinars</td>
<td>Retrieves a list of all webinars for a GoTo account.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the GoTo spoke**

Integrate the ServiceNow instance and GoTo by creating a custom OAuth client in GoTo to authenticate ServiceNow requests.
Before you begin

• Request an IntegrationHub subscription.
• Activate GoTo spoke.
• GoTo role required: user with a LogMeIn developer account and admin account
• ServiceNow role required: admin

Create a GoTo OAuth client
Create an OAuth client for authenticating GoTo API requests.

Before you begin
GoTo role required: user with a LogMeIn developer account and admin account

Procedure

1. From a web browser, open the GoTo Developer Center.
2. Sign in using your LogMeIn developer account.
   If you have not already set up a LogMeIn developer account, see How to login or create a developer account for detailed instructions.
3. From the LogMeIn Developers home page, select the OAuth Clients tab.
4. Click Create a client.
   The Create client form opens.
5. On the Details tab, fill in the client details.

   Details tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client name</td>
<td>Name of the OAuth client.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional description for the OAuth client.</td>
</tr>
<tr>
<td>Redirect URLs</td>
<td>Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. Enter https://&lt;instance-url&gt;/oauth_redirect.do, where &lt;instance-url&gt; is the URL of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

6. Click Next.
7. On the Scopes tab, specify the level of access that the OAuth client has to your GoTo users and applications.
### Scopes tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Profile</strong></td>
<td>OAuth scopes for getting and modifying user information for your authenticated users. The <strong>Get user information</strong> scope is enabled automatically. Select the check box to enable the <strong>Modify user details</strong> scope.</td>
</tr>
<tr>
<td><strong>GoToMeeting, GoToWebinar, or GoToTraining</strong></td>
<td>OAuth scope for creating, starting, and modifying sessions for your GoToMeeting, GoToWebinar, and GoToTraining applications. Select the check box to enable this scope.</td>
</tr>
<tr>
<td><strong>GoToAssist Remote Support or Service Desk</strong></td>
<td>OAuth scope for creating, starting, and modifying sessions for the GoToAssist Remote Support and Service Desk applications. Leave this check box unselected.</td>
</tr>
<tr>
<td><strong>SCIM</strong></td>
<td>OAuth scope for automating user management using the System for Cross-domain Identity Management (SCIM) protocol. Leave this check box unselected.</td>
</tr>
<tr>
<td><strong>Admin Center</strong></td>
<td>OAuth scope for managing LogMeIn users through the GoTo Admin Center. Select the check box to enable this scope.</td>
</tr>
<tr>
<td><strong>GoToConnect</strong></td>
<td>OAuth scope for initiating phone calls and other telephone services using GoToConnect. Leave this check box unselected.</td>
</tr>
</tbody>
</table>

8. Click **Save**.

9. On the Credentials tab, copy the values in the **Client ID** and **Client secret** fields.
   Save them in a secure location for later use.

10. Select the check box to verify that you have stored the client secret.

11. Click **Done**.
Create a GoTo connection

Create a connection between your GoTo applications and your ServiceNow instance.

Before you begin
ServiceNow role required: admin

Procedure

1. From your ServiceNow instance, navigate to Process Automation > Flow Designer.
   The Flow Designer launches in a new tab.

2. Select the Connections tab.

3. Click View Details for your GoTo connection.

4. From the list of available connections, locate GoTo and then click Configure.
   The Configure Connection dialog box opens.

5. In the dialog box, fill in the fields.

   **Configure Connection dialog box**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the GoTo connection. This field populates automatically.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of your GoTo credentials. This field populates automatically.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID that is assigned to your GoTo OAuth client.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client secret that is assigned to your GoTo OAuth client.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>Redirect URL of the ServiceNow instance on which you are integrating your GoTo applications. This field populates automatically.</td>
</tr>
</tbody>
</table>

6. Click Configure and Get OAuth Token.
   The Authorize App dialog box opens.

7. On the dialog box, click Allow.
   The OAuth access token becomes available for authorizing your GoTo connection.
Gremlin spoke v1.0.2
Simulate outages and manage attacks using Gremlin instance from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Supported versions
This spoke was built for Gremlin version v1, but may be compatible with later versions.

Spoke requirements
• Set up clients as per your requirement.
• Admin access to the Gremlin dashboard.
• Team in your Gremlin account for integration with ServiceNow instance. For more information about creating teams, see Teams.
• Team ID and API Key of the team. Copy and record these value for later use. For more information about accessing these values, see the Signature-based Authentication section.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Gremlin spoke provides actions to automate Gremlin tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attack Management</td>
<td>Create Attack</td>
<td>Creates an attack on the Gremlin platform.</td>
</tr>
<tr>
<td></td>
<td>Get Attack Details</td>
<td>Retrieves details about an attack.</td>
</tr>
<tr>
<td></td>
<td>Get Attack Executions</td>
<td>Retrieves a list of executions associated with an attack.</td>
</tr>
<tr>
<td></td>
<td>Halt All Attacks</td>
<td>Idempotently halts all active attacks across the Gremlin platform.</td>
</tr>
<tr>
<td>Look up Attacks</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attack Schedule</td>
<td>Create Attack Schedule</td>
<td>Creates an attack schedule on the Gremlin platform.</td>
</tr>
<tr>
<td>Schedule Management</td>
<td>Delete Attack Schedule</td>
<td>Deletes the specified attack schedule.</td>
</tr>
</tbody>
</table>

Note:
- By default, this action can retrieve data up to 5 MB. You can configure the `glide.pf.rest.response_payload_max_size` property to retrieve data up to 10 MB. If the data in the response is more 10 MB, an error is displayed.
- As data up to 10 MB only can be retrieved, you can also specify number of records that should be retrieved in the input field, **Number of records to return**.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get</td>
<td>Attack Schedule Details</td>
<td>Retrieves details about the specified attack schedule.</td>
</tr>
<tr>
<td>Look up</td>
<td>Active Attack Schedules</td>
<td>Lists all the attack schedules on the Gremlin platform.</td>
</tr>
</tbody>
</table>

**Note:**

- Time zone that is considered in the spoke actions, is same as the time zone of your ServiceNow instance.
- Based on your Gremlin license, if you don’t have access to certain Gremlin functionality, you can’t use the associated spoke actions in your ServiceNow instance as well.
- For some arguments that take True or False as input, the actual value that the Gremlin platform considers, might be different from the value you have provided.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Create Connection and Credential record for the Gremlin spoke**

Authorize the Gremlin spoke actions by creating connection and credential record for the application registered in Gremlin. The Gremlin spoke connection and credential alias uses these connections and credentials to authorize actions.

**Before you begin**

Role required: admin
Procedure

1. Navigate to **Connection & Credentials > Connection & Credential Alias**.
2. Open the record, Gremlin.
3. Click the **Create New Connection & Credential** related link.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection Name</strong></td>
<td>Name to identify the connection record. By default, this is Gremlin Connection. You may change it as per your requirement.</td>
</tr>
<tr>
<td><strong>Connection URL</strong></td>
<td>URL to connect to Gremlin. By default, this is <a href="https://api.gremlin.com">https://api.gremlin.com</a>.</td>
</tr>
<tr>
<td><strong>API Version</strong></td>
<td>API version of the Gremlin platform. By default, this is v1.</td>
</tr>
<tr>
<td><strong>Team ID</strong></td>
<td>Team ID of your team.</td>
</tr>
<tr>
<td><strong>API Key</strong></td>
<td>API Key of your team.</td>
</tr>
<tr>
<td><strong>Credential Name</strong></td>
<td>Name to identify the credential record. By default, this is Gremlin Credentials. You may change it as per your requirement.</td>
</tr>
</tbody>
</table>

5. Click **Create**.

Infoblox spoke v2.0

Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.
**Note:** This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

**Supported version**
Infoblox versions 2.7, 2.11 and may be compatible with other future API versions.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Remote Tables plugin (com.glide.script.vtable)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke flows**
The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Register or Reserve IP in IPAM</td>
<td>Registers or reserves an IP address in Infoblox based on a Service Catalog item request.</td>
</tr>
</tbody>
</table>

**Spoke subflows**
The Infoblox spoke provides sample subflows to register and reserve IP addresses.
### Flow

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register AName Record and Get Network Details</td>
<td>Registers an AName record type in the DNS server and retrieves network details such as network options and ID.</td>
</tr>
<tr>
<td>Process Inbound Notifications from Infoblox</td>
<td>Receives the inbound notifications from Infoblox and logs the details.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Infoblox spoke adds the Infoblox application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CName Records</td>
<td>Lists all the CName records.</td>
</tr>
<tr>
<td>Webhook Registry</td>
<td>Lists all the webhook registries for the spoke.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP Management</td>
<td>Delete IP Reservation</td>
<td>Deletes IP address range from an Infoblox server.</td>
</tr>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the Infoblox alias record to authorize actions.
To use the spoke connection alias, create an associated Connection record and an associated Credential record.

### MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

### Set up Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Infoblox spoke.
- Role required: admin

### Create a Connection and Credential Alias for Infoblox spoke

Create Connection records to your Infoblox account. The Infoblox spoke connection and credential aliases use these connections to perform actions in Infoblox.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the Infoblox record.
3. From the Related Links section, click Create New Connection & Credential.
4. On the form, fill in these fields:

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| Infoblox                      | Connection to Infoblox server | • Connection type: HTTP  
• Connection URL: URL of the host machine where the Infoblox server is installed. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Unique name to identify the connection. For example, Infoblox Spoke Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Host URL to connect to your Infoblox account.</td>
</tr>
<tr>
<td>API Version</td>
<td>API version of Infoblox. This field is auto-populated to v2.11</td>
</tr>
<tr>
<td>User Name</td>
<td>User name of your Infoblox account.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of your Infoblox account.</td>
</tr>
</tbody>
</table>
5. Click **Create**.

**Set up bi-directional webhook for Infoblox spoke**

Configure a webhook to subscribe to Infoblox with a ServiceNow callback URL.
Before you begin

- Request an IntegrationHub Standard subscription
- Activate the Infoblox spoke
- Role required: admin

Register a Infoblox webhook

Register a Infoblox webhook in a ServiceNow instance to notify the ServiceNow application when certain events occur in Infoblox.

Before you begin
Role required: admin

Procedure

1. Navigate to **Infoblox spoke > Webhook Registry**.
2. Click **New**.
3. On the form, fill in these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Note: The name must be only Infoblox Webhook Authentication.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the webhook registry.</td>
<td></td>
</tr>
<tr>
<td>Username</td>
<td>Username specified in the Infoblox outbound endpoint configuration.</td>
<td></td>
</tr>
<tr>
<td>Password</td>
<td>Password specified in the Infoblox outbound endpoint configuration.</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Description of the webhook registry.</td>
<td></td>
</tr>
<tr>
<td>Path</td>
<td>Infoblox webhook path. This is field is auto-populated with api/sn_infoblox_spoke/infoblox_webhook.</td>
<td></td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
The system displays the webhook callback URL.

6. Copy and record the webhook callback URL.

**Add callback URL in Infoblox**

Specify a webhook callback URL in Infoblox account to create a webhook.

**Before you begin**

- Register a Infoblox webhook
- Download Infoblox outbound templates from the KB article: KB0966373
- Role required: admin

**Procedure**

1. Log in to your Infoblox account.
2. Create a webhook in your Infoblox account. For more information, see KB0966373.
3. Configure a outbound endpoint for your ServiceNow instance. For more information about configuring Infoblox outbound endpoints, see About Outbound Templates.
4. Configure templates by uploading the templates from the KB0966373 article.

<table>
<thead>
<tr>
<th>Template name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host_Address_IPv4_Insert.txt</td>
<td>Template to configure notifications when a new IPv4 address is added to a host.</td>
</tr>
<tr>
<td>Range_IPv4_Insert.txt</td>
<td>Template to configure notifications when a new IPv4 range is added.</td>
</tr>
<tr>
<td>Network_Insert.txt</td>
<td>Template to configure notifications when a new IPv4 network is added.</td>
</tr>
<tr>
<td>Host_Address_IPv6_Insert.txt</td>
<td>Template to configure notifications when a new IPv6 address is added to a host.</td>
</tr>
</tbody>
</table>

5. Configure notifications rules using the Notification Wizard.
Jenkins v2 spoke v1.0.3
Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Spoke dependencies
If you're having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke requirements
The Jenkins v2 spoke v2 requires generating an API token. See Security Hardening: New API token system in Jenkins 2.129+ for more information about the API tokens.

Supported versions
All versions between 2.176.2 to 2.222.1.

Spoke modules
You can configure the Jenkins v2 spoke v2 to receive updates from Jenkins at your ServiceNow instance. In the routing policies, conditions that must be met to receive updates at your ServiceNow instance are defined. When the conditions
are met, routing policy triggers the associated subflow, which in turn automates the Jenkins tasks. This requires separate setup and can be used independently without using the spoke actions. See Set up a webhook for information regarding setting up and configuring the webhooks. To use other conditions in the routing policy or customize the default subflows, see Customize a webhook.

Routing policies and subflows support these fields:

- Keywords
- Build Number
- Job Name
- Job Path
- Show Related Fields

By default, the Jenkins v2 application is available in the Jenkins v2 spoke and has these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Webhook Answer Subflows</td>
<td>Details of the webhook authorization key to authorise requests from Jenkins.</td>
</tr>
<tr>
<td>Webhook Client Detail</td>
<td>Details about the subflows in Jenkins v2 spoke.</td>
</tr>
</tbody>
</table>

The Jenkins v2 spoke v2 includes these tables:

- Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]
- Jenkins Webhook Client Details [sn_jenkinsv2_spoke_webhook_client_details]

**Spoke subflows**

The Jenkins v2 spoke provides sample subflows to demonstrate automating Jenkins tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Jenkins Job</td>
<td>Receives updates from Jenkins at the ServiceNow instance.</td>
</tr>
</tbody>
</table>
Subflow | Description
---|---
Jenkins Webhook Answer Subflow: Process build information | Builds Jenkins Job and retrieves the information. To customize this subflow, create a copy of the subflow and change it as per your requirement.

**Spoke actions**
The Jenkins v2 spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Management</td>
<td>Delete Build</td>
<td>Deletes a build from a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get Build ID</td>
<td>Retrieves the Build ID of an executed job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Timestamp</td>
<td>Retrieves build timestamp of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Console Output</td>
<td>Retrieves build console output for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>List Builds</td>
<td>Retrieves all the builds for a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Perform Build with Parameters</td>
<td>Executes a job with parameters on the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build History</td>
<td>Retrieves a range of build history for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Information</td>
<td>Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Number</td>
<td>Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.</td>
</tr>
<tr>
<td></td>
<td>Perform Build</td>
<td>Executes a job on the Jenkins server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Configuration</td>
<td>Create Node</td>
<td>Creates a node that you can launch with Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Version</td>
<td>Retrieves the Jenkins server version.</td>
</tr>
<tr>
<td></td>
<td>Restart Jenkins</td>
<td>Restarts the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Test Connection</td>
<td>Tests the connection to the Jenkins server.</td>
</tr>
<tr>
<td>Configuration</td>
<td>Copy Job</td>
<td>Creates a job by copying an existing Jenkins server job.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Create Folder</td>
<td>Creates a Jenkins server folder to organize jobs.</td>
</tr>
<tr>
<td></td>
<td>Create Job</td>
<td>Creates a Jenkins server job from an XML file.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes an existing Jenkins server folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Job</td>
<td>Deletes a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>List Jobs By Folder</td>
<td>Retrieves all the jobs for a given folder from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Job Configuration</td>
<td>Retrieves the XML configuration for a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Reload Job</td>
<td>Reloads a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Rename Job</td>
<td>Renames a Jenkins server job.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes an existing Jenkins server user.</td>
</tr>
<tr>
<td>View Management</td>
<td>Add Job To View</td>
<td>Adds a job to the Jenkins server view. Views are containers to organize jobs. As a Jenkins instance grows, you can create views for appropriate groups and categories. For example, you may...</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create View</td>
<td>Creates a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>Delete View</td>
<td>Deletes a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>List Jobs By View</td>
<td>Retrieves all jobs from a view on the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Remove Job From View</td>
<td>Removes a job from a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>want to create a Build view, which only displays build-specific jobs.</td>
</tr>
</tbody>
</table>

**Connection and credential requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the Jenkins v2 Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

**MID Server requirements**

These actions use REST calls, which run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up the Jenkins spoke**

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate Jenkins spoke
  - Role required: admin

**Create Credential records for the Jenkins spoke**

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias uses these credentials to authorize actions.
Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Jenkins Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Jenkins user name.</td>
</tr>
<tr>
<td>Password</td>
<td>API token.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Jenkins spoke
Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Jenkins v2.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Jenkins Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Jenkins. For example, select Jenkins Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the host machine where Jenkins is installed.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Set up a webhook**

Set up webhook application to receive the required updates from Jenkins at your ServiceNow instance.

**Before you begin**

Role required: admin

**Create authorization key for the Jenkins v2 spoke**

Create a authorization key to authorise requests from Jenkins.

**Procedure**

1. Navigate to **System Definition > Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   
   ```
   gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
   ```

3. Click **Run Script**.

4. Copy and record the generated value for later use.

   ![Script output]

   [0:00:00.241] Script completed in scope x_snc_sap_ecc_rfc: script

   **Script execution history and recovery available here**

   **x_snc_sap_ecc_rfc**: r2983icyHMMZAs06veZvyxBF48K06s14

**Provide authorization key for webhook**

Authorise requests from Jenkins by providing authorization key for webhook in your ServiceNow instance.

**Procedure**

1. Navigate to **Jenkins v2 > Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values:
Jenkins Webhook Client Details form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization Key</td>
<td>Authorization key you had generated. See Create authorization key for the Jenkins v2 spoke for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the webhook client record.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Provide authorization key in Jenkins**

Receive updates from Jenkins by providing the authorization key in Jenkins.

**Procedure**

1. Log in to your Jenkins account.
2. Click and open the job for which you want to configure your webhook.
3. Click **Configure**.
4. In the **Bindings** tab, click **Add** and select **Jenkins**. For more information about the using the plugin, see **Credentials Binding**.

5. On the Jenkins Credential Provider form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kind</td>
<td>Select <strong>Secret text</strong>.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Secret | Enter authorization key. See Create authorization key for the Jenkins v2 spoke for more information.
ID | Provide unique identifier to identify the record.

6. Click **Add**.

7. In the **Post-build Actions** tab, configure task and specify script to receive updates at your ServiceNow instance.

- **Sample Windows Script:**
  ```bash
  curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: %<ID>%" -d "{"Job_Name": "%JOB_NAME%", "Job_Path": "%JOB_URL%", "Build_Number": "%BUILD_NUMBER%"}"
  ```

- **Sample Shell Script:**
  ```bash
  curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: ${<ID>}" -d "{"Job_Name": "${JOB_NAME}", "Job_Path": "${JOB_URL}", "Build_Number": "${BUILD_NUMBER}"}"
  ```

⚠ **Note:** ID in the script is the ID you had provided in the Jenkins Credential Provider form.

For more information about the using the plugin, see **Post build task**.

8. Click **Apply**.

**Provide description to subflow**

Provide user friendly descriptions to the subflows in the Jenkins v2 spoke.

**Procedure**

1. Navigate to **Jenkins v2 > Webhook Answer Subflows**.
2. Click **New**.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins v2 spoke.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Provide answers to the decision table

Provide subflows as answers to the conditions mentioned in the decision table. When the specified conditions are met, the associated subflow is triggered.

Procedure
1. Navigate to System Definition > Decision Tables.
2. Open the record for the Jenkins v2 spoke.
3. In the Decisions tab, click New.
4. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jenkins. See Jenkins v2 spoke v1.0.3 for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td></td>
<td>a. Click the Lookup icon (🔍).</td>
</tr>
<tr>
<td></td>
<td>b. Select the required subflow from the Document list.</td>
</tr>
<tr>
<td></td>
<td>Note: Ensure that the Table name is Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow].</td>
</tr>
</tbody>
</table>

5. Click Submit.

Customize a webhook

Create a webhook routing policy and customize subflow as per your requirement.

Procedure
1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the required default subflow.

4. Customize the Jenkins Webhook Answer Subflow: Process build information subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and Jenkins v2 spoke v1.0.3 for information about the fields that the routing policies and subflows support.

5. Navigate to Jenkins v2 > WebHook Answer Subflows.
6. Click New.
7. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins v2 spoke.</td>
</tr>
</tbody>
</table>

8. Click Submit.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

10. Open the record for the Jenkins v2 spoke.
11. In the Decisions tab, click New.
12. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Decision form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>Default answer</td>
</tr>
<tr>
<td>Condition</td>
</tr>
<tr>
<td>Answer</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>Click the Lookup icon (🔍).</td>
</tr>
<tr>
<td>b.</td>
<td>Select the required subflow from the Document list.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the **Table name** is Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow].

---

13. Click **Submit**.

**Jira spoke v3.0.4**

Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow. Use bi-directional webhooks and subscribe to Jira with a ServiceNow callback URL.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Note:** This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Integrations - External Authentication Framework (com.glide.external.app)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
**Supported versions**
This spoke was built for API version v2, but may be compatible with later versions.

> Note:

- If your Jira instance supports another API version, specify the API version in **API Version** under the Attributes related list. By default, the **API Version** is 2. See [Create connection records for the Jira spoke](#) for information about creating a Connection record.
- Jira Service Desk is not supported by the spoke.

**Spoke requirements**
Activate the Integrations - External Authentication Framework (com.glide.external.app) plugin.

**Jira Webhooks module**
Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Jira that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jira tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira spoke and has the following modules:

- Jira Webhook Registries
- Jira WebHook Routing Policies

Use the Jira Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Jira. A default routing policy is provided in the Jira WebHook Routing Policies module. The default routing policy supports these fields:

<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Issue Description</td>
</tr>
<tr>
<td></td>
<td>• Created</td>
</tr>
<tr>
<td></td>
<td>• Updated</td>
</tr>
<tr>
<td>Category</td>
<td>Field</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>• Issue Resolution</td>
</tr>
<tr>
<td></td>
<td>• Previous Issue Resolution</td>
</tr>
<tr>
<td></td>
<td>• Issue Summary</td>
</tr>
<tr>
<td></td>
<td>• Issue Type</td>
</tr>
<tr>
<td></td>
<td>• Previous Issue Type</td>
</tr>
<tr>
<td></td>
<td>• Issue Priority</td>
</tr>
<tr>
<td></td>
<td>• Previous Issue Priority</td>
</tr>
<tr>
<td></td>
<td>• Issue Status</td>
</tr>
<tr>
<td></td>
<td>• Previous Issue Status</td>
</tr>
<tr>
<td></td>
<td>• Issue Status Category</td>
</tr>
<tr>
<td></td>
<td>• Previous Issue Status Category</td>
</tr>
<tr>
<td></td>
<td>• Project</td>
</tr>
<tr>
<td>Comment</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Comment</td>
</tr>
<tr>
<td></td>
<td>• Created</td>
</tr>
<tr>
<td></td>
<td>• Updated</td>
</tr>
<tr>
<td></td>
<td>• Issue Summary</td>
</tr>
<tr>
<td></td>
<td>• Issue Type</td>
</tr>
<tr>
<td></td>
<td>• Issue Priority</td>
</tr>
<tr>
<td></td>
<td>• Issue Status</td>
</tr>
<tr>
<td></td>
<td>• Issue Status Category</td>
</tr>
<tr>
<td></td>
<td>• Project</td>
</tr>
<tr>
<td>Worklog</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Worklog Time Spent</td>
</tr>
<tr>
<td></td>
<td>• Created</td>
</tr>
<tr>
<td></td>
<td>• Updated</td>
</tr>
<tr>
<td>Category</td>
<td>Field</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>Attachment</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Created</td>
</tr>
<tr>
<td></td>
<td>• Attachment File Name</td>
</tr>
<tr>
<td></td>
<td>• Attachment Size</td>
</tr>
<tr>
<td></td>
<td>• Attachment Mime Type</td>
</tr>
<tr>
<td>Project</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Project</td>
</tr>
<tr>
<td>Version</td>
<td>• Jira Instance URL</td>
</tr>
<tr>
<td></td>
<td>• Webhook Event</td>
</tr>
<tr>
<td></td>
<td>• Version</td>
</tr>
<tr>
<td></td>
<td>• Version Description</td>
</tr>
<tr>
<td></td>
<td>• Merged To Version</td>
</tr>
<tr>
<td></td>
<td>• Merged To Version Description</td>
</tr>
</tbody>
</table>

To use other conditions in the routing policy, create routing policy in the Jira WebHook Routing Policies module and specify conditions as per your requirement. See [Set up a bi-directional webhook](#) for information regarding setting up and configuring the webhooks.

**Spoke subflow**

The Jira spoke provides a sample subflow to handle various Jira webhook events. The available sample subflow is Process Jira Webhooks. The Process Jira Webhooks subflow supports these fields:

<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue</td>
<td>• User</td>
</tr>
<tr>
<td></td>
<td>• Issue</td>
</tr>
<tr>
<td></td>
<td>• Attachments</td>
</tr>
</tbody>
</table>
To customize the default subflow, you must create a copy of the sample subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Note:**
- You must configure webhooks to use the spoke subflow. See [Set up a bi-directional webhook](#) for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. The subflow can be configured to run as system.

**Spoke actions**

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Copy Attachment</td>
<td>Copies the required attachment associated with the ServiceNow record to the required issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachment</td>
<td>Deletes the required attachment in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user. You can use the Look up Latest Comment on Issue action to verify and validate the latest comment of an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue</td>
<td>Deletes an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Do Transition</td>
<td>Transitions an issue in Jira from one state to another.</td>
</tr>
<tr>
<td></td>
<td>Get Issue By ID</td>
<td>Retrieves the JSON object of the required issue.</td>
</tr>
<tr>
<td></td>
<td>Get Statuses By Project</td>
<td>Retrieves the status of the required project.</td>
</tr>
<tr>
<td></td>
<td>Look up Fields</td>
<td>Retrieves the fields in the required project.</td>
</tr>
<tr>
<td></td>
<td>Look up Issue Priorities</td>
<td>Retrieves the list of issue priorities and details for individual issue priorities.</td>
</tr>
<tr>
<td></td>
<td>Look up Records by JQL Stream</td>
<td>Retrieves the list of the required records by providing a JQL query.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look Up Transitions</td>
<td>Retrieves information about all Transitions in JSON format for a given Issue ID.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates a set number of fields of an issue in Jira with values passed as input.</td>
</tr>
<tr>
<td></td>
<td>Get Issues</td>
<td>Gets a list of Jira issues.</td>
</tr>
<tr>
<td></td>
<td>Get Issues for Sprint</td>
<td>Retrieves the details of all issues for the given sprint.</td>
</tr>
<tr>
<td></td>
<td>Get All Projects</td>
<td>Retrieves information in JSON format for all projects visible to the currently logged in user. A project in Jira is a collection of issues, and is defined according to your organization's requirements.</td>
</tr>
<tr>
<td>SDLC Management</td>
<td>Create Story</td>
<td>Creates a story in Jira, similar to a story in Now Platform Agile Development.</td>
</tr>
<tr>
<td></td>
<td>Look Up Stories</td>
<td>Retrieves information in JSON format for all stories within a specified date range.</td>
</tr>
<tr>
<td></td>
<td>Update Story</td>
<td>Updates a set number of fields of a story in Jira with values passed as input.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users</td>
<td>Fetches a list in JSON format of all active Jira users.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Removes a user from Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Jira Users</td>
<td>Gets all Jira user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Look up Audit Logs Stream</td>
<td>Retrieves the login activity of the Atlassian Jira user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Look up Authenticated User</td>
<td>Retrieves details of the authenticated user account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Group Memberships for User</td>
<td>Retrieves details of all groups of an Atlassian user.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User to Group</td>
<td>Adds given user to a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups Stream</td>
<td>Retrieves all groups in the Atlassian account, including the default groups.</td>
</tr>
<tr>
<td></td>
<td>Look up Users by Group Name Stream</td>
<td>Retrieves details of all members in an Atlassian group.</td>
</tr>
<tr>
<td></td>
<td>Remove Group</td>
<td>Removes the given group from Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes the given user from a group in Jira.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of all fields in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Editable Fields</td>
<td>Retrieves the list of all editable fields in a required Jira issue.</td>
</tr>
<tr>
<td></td>
<td>Get Issue Types</td>
<td>Retrieves the list of all issue types in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Projects for Metadata</td>
<td>Retrieves the list of all Jira projects.</td>
</tr>
<tr>
<td></td>
<td>Get All Boards</td>
<td>Retrieves the details of all boards in Jira.</td>
</tr>
<tr>
<td>Sprint Management</td>
<td>Create Sprint</td>
<td>Creates a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Sprint</td>
<td>Deletes a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get All Sprints By Board</td>
<td>Retrieves the details of all sprints in the required board.</td>
</tr>
<tr>
<td></td>
<td>Get Sprint By ID</td>
<td>Retrieves the details of the required sprint as a JSON object.</td>
</tr>
<tr>
<td></td>
<td>Update Sprint</td>
<td>Updates the details of a sprint in Jira.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Utility Actions</td>
<td>Copy Issue Attachment to Record</td>
<td>Copies Attachment from Jira to any record in ServiceNow instance. When you use this action in a subflow, make sure that the Content URL data pill is specified in the Attachment URL field.</td>
</tr>
<tr>
<td></td>
<td>Look up Fields</td>
<td>Retrieves the internal name and other details of the required field label in Jira.</td>
</tr>
<tr>
<td></td>
<td>Look up Issue from Comment</td>
<td>Retrieves the details of the issue by parsing the payload for the specified comment. You can use this action in the Process Jira Webhook subflow for Jira on-prem server when only comment related information is specified without any details about the Jira issue. For example, when only comment information is specified, this action parses the payload and extracts the issue details.</td>
</tr>
<tr>
<td></td>
<td>Look up Latest Attachment on Issue</td>
<td>Retrieves the latest attachment for the specified issue from Jira. You can use this action in a flow or subflow for validation. For example, a subflow adds an additional attachment only when the latest attachment of an issue in Jira is not as the same specified attachment.</td>
</tr>
<tr>
<td></td>
<td>Look up Latest Comment on Issue</td>
<td>Retrieves the latest comment for the specified issue from Jira. You can use this action in a flow or subflow for validation. For example, a subflow adds an additional attachment only when the latest attachment of an issue in Jira is not as the same specified comment.</td>
</tr>
<tr>
<td>Webhook Management</td>
<td>Look up Webhooks</td>
<td>Retrieves details of all registered webhooks from the Jira instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Subscribe Webhook</td>
<td>Registers a webhook in the Jira instance.</td>
</tr>
<tr>
<td></td>
<td>Unsubscribe Webhook</td>
<td>Deleted the registered webhook in the Jira instance.</td>
</tr>
<tr>
<td></td>
<td>Update Webhook</td>
<td>Updates details of the required webhook in the Jira instance.</td>
</tr>
</tbody>
</table>

**Jira account requirements**

The Jira spoke requires generating an API token for Jira using your Atlassian account.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Jira alias record. To use these actions, you must create a connection record and a credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions run.

**Set up the Jira spoke v3.0.4**

Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub Standard subscription
- Activate the Jira spoke v3.0.4
- Role required: admin

**About this task**

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.
Generate a Jira account API token

Before you begin
Jira requirements:

• Atlassian account
• Atlassian administrator credentials

About this task
Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

Procedure
1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create credential records on your ServiceNow instance.

Create credential records for the Jira spoke
Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Jira Credentials.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the email address of the user.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the API token you generated for Jira.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Search for and select the Jira credential alias.</td>
</tr>
</tbody>
</table>

**Results**
The credential record for the Jira spoke is created.

**Create connection records for the Jira spoke**
Create a connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the alias record for **Jira** that shipped with the spoke.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>Jira Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select <strong>Jira Credentials</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL of your Jira instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

5. **Optional**: If you create a credential record to integrate your ServiceNow instance with another Jira instance, ensure that **api_version** in the Attributes related list in the associated connection record is set to 2 and specify the type...
of Jira subscription in server_type, that is, if the subscription is on-premise or cloud.

1 Note: If your Jira instance supports another API version, specify the API version in API Version in the Attributes related list. By default, API Version is 2.

Results
The Jira spoke is set up and integrated with the ServiceNow® instance.

Set up a bi-directional webhook
Configure a webhook to subscribe to Jira with a ServiceNow callback URL.

Before you begin
• Request an IntegrationHub Standard subscription
• Activate the Jira spoke v3.0.4
• Role required: admin

Create a token
Create a token to embed in the Jira webhook URL.

Before you begin
Role required: admin

Procedure
1. In the navigation filter, enter token_verification.list.
   The system displays records in the Token Verifications table.
2. Click New.
3. On the form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the token. For example, Jira token.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the token.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL.</td>
</tr>
</tbody>
</table>
Results
The token is created to be embedded in the Jira webhook URL.

Register a Jira webhook in ServiceNow
Register a Jira webhook in ServiceNow to notify the ServiceNow app when certain events occur in Jira.

Before you begin
Role required: admin

Procedure
1. Navigate to Jira Webhooks > Jira Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Jira Webhook Registry form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>-----------</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Token</td>
</tr>
<tr>
<td>Path</td>
</tr>
</tbody>
</table>
4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Results
The Jira webhook is registered in your ServiceNow instance.

Add a callback URL in Jira
Provide a webhook callback URL in your Jira Atlassian account to create a webhook.

Before you begin
Role required: admin
Procedure
1. Log in to your Jira Atlassian account.
2. Create a webhook in your Atlassian account.
3. Enter the webhook callback URL in the URL field. See the Atlassian Developer portal documentation for instructions on creating a webhook.

Results
The callback URL is added in your Jira Atlassian account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding the creation of new routing policies and subflows.

Customize a bi-directional webhook
Create a webhook routing policy and subflow as per your requirement.

Before you begin
Role required: admin

About this task
The default routing policy in the Jira WebHook Routing Policies module triggers the Process Jira Webhooks subflow and notifies the ServiceNow app when certain events occur in Jira. See Jira spoke v3.0.4 for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

Procedure
1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the default subflow, Process Jira Webhooks.
4. Customize the subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and Jira spoke v3.0.4 for information about the fields that the default routing policy and subflows support.
6. Click New.
7. On the form, fill in the fields.
**Decision form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>a.</td>
<td>Click the lookup icon ( ).</td>
</tr>
<tr>
<td>b.</td>
<td>Select the required subflow from the Document list.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jira. See Jira webhooks for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

**Results**
The routing policy and subflow are created.

**Kubernetes spoke**
Automate changes in Kubernetes when an event occurs in ServiceNow.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Note:** This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke actions

The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoints</td>
<td>Creates an endpoint in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoints</td>
<td>Deletes an endpoint from the Kubernetes instance.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Create Namespace</td>
<td>Creates a namespace in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Namespace</td>
<td>Deletes a namespace from the Kubernetes instance.</td>
</tr>
<tr>
<td>Node Management</td>
<td>Create Node</td>
<td>Creates a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Node</td>
<td>Inspects a specified node in the Kubernetes instance and returns node information and status.</td>
</tr>
<tr>
<td>Pod Management</td>
<td>Create Pod</td>
<td>Creates a Pod in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Pod</td>
<td>Deletes a pod from the Kubernetes instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Inspect Pod</td>
<td>Inspects the specified pod in the Kubernetes instance and returns pod information and status.</td>
</tr>
<tr>
<td>Secret Management</td>
<td>Create Docker Hub Secret</td>
<td>Creates a secret in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Docker Hub Secret</td>
<td>Deletes a Secret from the Kubernetes instance.</td>
</tr>
<tr>
<td>Service Management</td>
<td>Create Service</td>
<td>Creates a service on a Kubernetes server.</td>
</tr>
<tr>
<td></td>
<td>Delete Service</td>
<td>Deletes a service from the Kubernetes server.</td>
</tr>
<tr>
<td>Volume Management</td>
<td>Create Persistent Volume</td>
<td>Creates a persistent volume in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Create Persistent Volume Claim</td>
<td>Creates a Persistent Volume Claim in a Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume</td>
<td>Deletes a persistent volume from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume Claim</td>
<td>Deletes a persistent volume claim from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Persistent Volume Claim</td>
<td>Inspects a persistent volume claim in a Kubernetes instance and returns claim information and status.</td>
</tr>
</tbody>
</table>

**Kubernetes account requirements**

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any
actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Kubernetes spoke**

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Kubernetes spoke
- Role required: admin

**Generate Kubernetes API token and certificate**

Generate an access token and a certificate from your Kubernetes account for API key authentication.

**Before you begin**

Kubernetes requirements:

- Kubernetes account
- Administrator credentials on the host machine where Kubernetes is installed

**About this task**

Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.
Procedure

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs. This token does not expire.

2. Copy and record the access token to create Credential records on your ServiceNow instance.

3. Generate a client certificate to upload to your ServiceNow instance.

Upload Kubernetes client certificate

Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

Procedure

1. Navigate to System LDAP > Certificates.

2. Click New.

3. Complete the form and enter the certificate in the PEM Certificate field.
   For more information about uploading certificates, see Upload a certificate to an instance.

4. Click Submit.

Create Credential records for the Kubernetes spoke

Create Credential records to your Kubernetes account. The Kubernetes spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.
   The system displays the message What type of Credentials would you like to create?.

3. Select API Key Credentials.
   A blank API Key Credentials form displays.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Kubernetes Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>
Field | Value required
---|---
APISKey | Enter Bearer followed by the access token you obtained from Kubernetes. For example, Bearer {access token}.
Applies to | Select the MID Servers that can use this credential. For example, select All MID Servers.
Order | Select the order to apply this credential. For example, enter 100.

5. Click Submit.

Create Connection records for the Kubernetes spoke

Create Connection records to the Kubernetes engine. The Kubernetes spoke connection and credential alias uses these connections to perform actions in Kubernetes.

**Procedure**

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Kubernetes.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Kubernetes Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Kubernetes. For example, select Kubernetes Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Kubernetes is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Turn off remote SSL host verification

A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the com.glide.communications.httpclient.verify_hostname system property to false to enable the integration.
Procedure

1. Enter `sys_properties.list` in the application navigator. The System Properties [sys_properties] table opens.

2. Search for the `com.glide.communications.httpclient.verify_hostname` system property.

3. Set the value to false.

Microsoft AD spoke
Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke requirements
Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft AD is installed. See Microsoft documentation for information about deploying ADWS.

In the MID Server and Microsoft AD server, run these PowerShell commands to install the Active Directory module:

```
PS> Import-Module ServerManager
PS> Install-WindowsFeature -Name RSAT-AD-PowerShell
```

Spoke flows
The Microsoft AD spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Enables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>

Spoke subflows
This spoke has no sample subflows.
Spoke actions

The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Computer</td>
<td>Deletes a computer from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable Computer</td>
<td>Disables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable Computer</td>
<td>Enables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Get Computer OU</td>
<td>Gets the Organizational Unit (OU) of a Computer Account.</td>
</tr>
<tr>
<td></td>
<td>Is Computer Enabled</td>
<td>Checks the status of the specified computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Move Computer to OU</td>
<td>Changes the Organizational Unit (OU) of a Computer Account in Active Directory.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds an existing Active Directory user to an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks if an existing Active Directory user is a member of an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group</td>
<td>Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remove User From Group</td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Active Directory.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User Password</td>
<td>Changes the user password in AD. The password input must comply with AD password requirements.</td>
</tr>
<tr>
<td></td>
<td>Is User Account Locked</td>
<td>Checks the locked status of the specified user account in AD.</td>
</tr>
<tr>
<td></td>
<td>Reset AD User Password</td>
<td>Resets a user's password in AD.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user with no password in AD. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from AD.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user account in AD.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user account in AD.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks the status of a user account in AD.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Gets the details of a given user in AD.</td>
</tr>
<tr>
<td></td>
<td>Unlock AD Account</td>
<td>Unlocks a user account in AD.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user attributes in AD.</td>
</tr>
<tr>
<td></td>
<td>Update User Home Location</td>
<td>Updates the Home Directory for a User in AD.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Object Management</td>
<td>Create AD Object</td>
<td>Creates an object of any type supported in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete AD Object</td>
<td>Deletes an object of any type from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Query AD</td>
<td>Queries AD for objects specified by a search filter.</td>
</tr>
<tr>
<td></td>
<td>Update AD Object OU</td>
<td>Changes the Organizational Unit (OU) of an object in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Update AD Object Expiration</td>
<td>Update the account expiration date of an object in Active Directory.</td>
</tr>
</tbody>
</table>

**MID server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

⚠️ **Note:** MID and Microsoft AD must be installed on different servers.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AD</td>
<td>Connection to Microsoft Active Directory.</td>
<td>The URL of the host machine where Microsoft Active Directory is installed.</td>
</tr>
</tbody>
</table>
Set up Microsoft AD spoke

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription
- Role required: admin

Create Credential record for the Microsoft AD spoke

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

Before you begin

- Request IntegrationHub subscription
- Role required: admin

Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.
   The system displays the message What type of Credentials would you like to create?.

   A blank Windows Credentials form displays.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter AD_Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
</tbody>
</table>
Create Connection record for the Microsoft AD spoke

Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.

**Before you begin**

- Request IntegrationHub subscription
- Create Credential record for the Microsoft AD spoke
- Role required: admin

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **AD**.
3. From the **Connections** tab, click **New**.
   - The system displays a blank Basic Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows Active Directory. For example, select AD Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
Microsoft AD v3 spoke
Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Microsoft Active Directory.

Spoke requirements
• Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft AD is installed. For more information about ADWS deployment, see Microsoft documentation.

In the MID Server and Microsoft AD server, run the following PowerShell commands to install the Active Directory module:

```
PS> Import-Module ServerManager
PS> Install-WindowsFeature -Name RSAT-AD-PowerShell
```

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• IHUB Spoke Util Pack (com.snc.ihub_spoke_util_pack)
• ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
**Spoke actions**

The Microsoft AD v2 spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group Membership</strong></td>
<td>Add User to Group</td>
<td>Adds an existing user to a group in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Is User in Group</td>
<td>Checks if an existing user is already a member of a group in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes an existing user from a group in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Look up Group Membership Stream</td>
<td>Retrieves list of groups for the specified user as a complex object.</td>
</tr>
<tr>
<td><strong>User Authentication</strong></td>
<td>Change User Password</td>
<td>Changes the user’s password in Active Directory (AD). The specified password has to match the AD password requirements.</td>
</tr>
<tr>
<td></td>
<td>Generate Random Password</td>
<td>Generates the random password according to the Active Directory (AD) password policy.</td>
</tr>
<tr>
<td></td>
<td>Is User Locked</td>
<td>Checks the locked status of the specified user account in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Reset User Password</td>
<td>Resets the password of the specified user in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user account in Active Directory (AD).</td>
</tr>
<tr>
<td><strong>User Management</strong></td>
<td>Delete User</td>
<td>Deletes the specified user from Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user account in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Does User Exist</td>
<td>Checks whether the specified user account exists in Active Directory (AD).</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables an user account in Active Directory (AD).</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Is User Disabled</td>
<td>Checks if the specified user account is disabled in AD</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

ℹ️ **Note:** MID and Microsoft AD must be installed on different servers.

**Set up the Microsoft AD v2 spoke**

Integrate the ServiceNow instance and Microsoft AD v2 spoke by using the Windows credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Microsoft AD v2 spoke.
- Role required: admin

**Create a connection record for the Microsoft AD v2 spoke**

Create a connection record for your Microsoft Active Directory host. The Microsoft AD v2 spoke connection and credential aliases use these connections to perform actions in Microsoft Active Directory.

**Procedure**

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record for AD_v2.
3. From the Connections tab, click New.
4. On the form, fill these fields.
Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft AD v2 Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft AD v2 spoke. For example, Microsoft AD v2 Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. This field is auto-populated with sn_ms_ad_v2_spoke.AD_v2.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the Microsoft AD v2 spoke server is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to. Enter:</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create a credential record for the Microsoft AD v2 spoke

Create a credential record for the Microsoft Active Directory host. The Microsoft AD v2 spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   
   The system displays this message: What type of Credentials would you like to create?
4. On the form, fill these values.
## Windows Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name to uniquely identify the record. For example, Microsoft AD v2 Cred.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td><strong>User name</strong></td>
<td>User name with access to the target Windows host.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>Password for the account.</td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more <strong>Specific MID servers</strong>. Specify the MID Servers that should use this credential in the <strong>MID servers</strong> field.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Order to apply this credential. For example, <strong>100</strong>.</td>
</tr>
<tr>
<td><strong>Credential alias</strong></td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

### Microsoft Azure AD spoke

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

### IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see **Request IntegrationHub**.

### Spoke flows

The Microsoft Azure AD spoke provides sample flows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User Offboarding</strong></td>
<td>Disables an Azure AD user account and removes the user from any Azure AD groups when a ServiceNow user record is deactivated.</td>
</tr>
</tbody>
</table>
### Flow

| User Onboarding | Creates and enables an Azure AD user account when a ServiceNow user record is activated. |

### Spoke subflows

The Microsoft Azure AD spoke provides sample subflows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Looks up the groups that a ServiceNow User record belongs to, and adds the associated Azure AD user account to the same Azure AD groups.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Microsoft Azure AD spoke provides actions to automate Azure Active Directory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Owner To Group</td>
<td>Adds an owner to an existing group in Azure AD.</td>
</tr>
<tr>
<td>Create Office 365 Group</td>
<td>Adds an existing user to a group in Azure AD.</td>
<td></td>
</tr>
<tr>
<td>Create Security Group</td>
<td>Creates an Office 365 Group in Azure AD.</td>
<td></td>
</tr>
<tr>
<td>Look Up Group ID</td>
<td>Create a Security Group in Azure AD.</td>
<td></td>
</tr>
<tr>
<td>Look Up Group Membership</td>
<td>Returns the first Group ID found based on provided search criteria.</td>
<td></td>
</tr>
<tr>
<td>Look Up Group Membership</td>
<td>Retrieves a list of groups for the given user as a JSON string.</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Remove Owner From Group</td>
<td>Removes the owner from a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Azure AD.</td>
</tr>
<tr>
<td>License Management</td>
<td>Assign User License</td>
<td>Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.</td>
</tr>
<tr>
<td></td>
<td>Remove User License</td>
<td>Removes a license from a user in Azure AD.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Reset User Password</td>
<td>Resets the password of the specified Azure AD user account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates an Azure AD user account using the specified account details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks whether the specified user account is enabled in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks whether the specified user account is a member of the specified group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up User ID</td>
<td>Returns the first User ID found based on the provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user properties in Azure AD with the provided details.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.
Microsoft Azure AD account requirements

The Microsoft Azure AD spoke requires creating a custom app on your Azure AD account to generate OAuth 2.0 tokens. See: Create an Azure AD application.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Azure AD.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AzureAD</td>
<td>Connection to Microsoft Azure AD.</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
</tbody>
</table>

Set up Microsoft Azure AD spoke

Integrate the ServiceNow instance and your Microsoft Azure AD account by creating a custom OAuth application in Microsoft Azure AD to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription
- Role required: admin

Create an Azure AD application

Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Azure AD spoke.

Before you begin

- Request IntegrationHub subscription.
- Activate Azure AD spoke.
- Azure AD requirements:
  - Azure AD account
  - Azure AD administrator credentials
- Role required: admin
About this task
Complete these steps from your Azure portal. See the Azure Active Directory for developers documentation for instructions on creating and configuring custom applications.

Procedure
1. From your Azure portal, access Azure Active Directory.
2. Create an Azure AD application.
   a. In Redirect URI, enter your ServiceNow instance URL in this format: https://<Instance-Name>.service-now.com/oauth_redirect.do. See Create an Azure Active Directory application for instructions on registering and configuring an application.
   b. Record the Directory ID to register the app as a third-party OAuth provider on your ServiceNow instance.
   c. Create a Client Secret and record the value to register the app as a third-party OAuth provider on your ServiceNow instance.
   d. Add permissions to access the APIs. Ensure that you provide these permissions:

<table>
<thead>
<tr>
<th>Permission</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory.AccessAsUser.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>User.Read</td>
<td>Delegated</td>
</tr>
<tr>
<td>offline_access</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Application</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Application</td>
</tr>
</tbody>
</table>

   See Add permissions to access web APIs for more information.
   e. Grant admin consent to your application. See Understanding API permissions and admin consent UI for more information.
What to do next
Register Azure AD as OAuth provider

Register Azure AD as OAuth provider

Use the information generated during Azure Active Directory account configuration to register Azure AD as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, create these entries

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter a unique name for the record, such as auth code.</td>
<td>Enter <code>offline_access</code>.</td>
</tr>
</tbody>
</table>
6. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

7. In the OAuth Entity Profiles related list, open the default profile record.

8. Verify that the openid entity scope record created in previous steps appears in the OAuth Entity Profile Scopes related list. If it does not appear, add the record.

Create Credential records for the Azure AD spoke

Create Credential records to the Azure AD custom app registration you created. The Azure AD spoke connection and credential aliases use these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure AD application as an OAuth provider. For example, select Azure OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
Create Connection records for the Azure AD spoke

Create Connection records to your Azure AD account. The Azure AD spoke connection and credential aliases use these connections to perform actions in Azure AD.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the **AzureAD** record.
3. Click the **New** button in the **Connections** related list.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure AD. For example, select Azure AD Credentials.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Regenerate Azure AD OAuth token

Regenerate the Azure AD OAuth token when it expires.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Azure AD spoke OAuth Credential record.

**Example**

For example, select **Azure AD Credentials**.

3. From Related Links, click **Get OAuth Token**.
Microsoft Azure AD spoke action reference

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure AD Connection & Credential Alias record. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in Integration steps. To learn more about the MID Server, see MID Server.

Add Owner To Group

Adds an owner to an existing group in Azure AD.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add an owner to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to make owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Add User To Group

Adds an existing user to a group in Azure AD.
Create Office 365 Group
Creates an Office 365 Group in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable List</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
</tbody>
</table>
Outputs (continued)

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Create Security Group

Create a Security Group in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Is User In Group

Check if an existing user is a member of a group in Azure Active Directory (Azure AD).

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Group ID in which you wish to check the membership of the user.</td>
</tr>
</tbody>
</table>
### Inputs (continued)

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>User ID or User Principal Name of the Azure AD user.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Will be set to Success if the request succeeds or Error if a failure in Azure AD occurs</td>
</tr>
<tr>
<td>Answer</td>
<td>True if the user is a member of the group. False if the user is not a member of the group. Populated only if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up Group ID

Returns the first Group ID found based on provided search criteria.

### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Look Up Group Membership
Retrieves a list of groups for the given user as a JSON string.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the users to retrieve the group for. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
| Groups List             | List of groups in JSON format. For example, 
{Group ID1, Group Name1}, {Group ID2, Group Name2}. If the user is not part of any group, an empty string is returned. |
| Number of Groups Found  | Total number of groups the user is a member of.                              |

Remove Owner From Group
Removes the owner from a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
</tbody>
</table>
## Remove User From Group
Removes an existing user from a group in Azure AD.

### Inputs
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove from the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

### Outputs
<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

## Assign User License
Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

### Inputs
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Remove User License**

Removes a license from a user in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Delete User**

Deletes a user from Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to delete. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>Output</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Disable User
Disables a user in Azure AD.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Enable User
Enables a user in Azure AD.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
</tbody>
</table>
Outputs (continued)

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Look Up User ID**

Returns the first User ID found based on the provided search criteria.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Update User**

Updates user properties in Azure AD with the provided details.

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.
## Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
<tr>
<td>Country</td>
<td>Country of the user.</td>
</tr>
<tr>
<td>Department</td>
<td>Name of the department the user belongs to.</td>
</tr>
<tr>
<td>Mobile</td>
<td>Mobile phone number for the user.</td>
</tr>
<tr>
<td>Job Title</td>
<td>User job title.</td>
</tr>
<tr>
<td>Physical Delivery</td>
<td>Office location of the user.</td>
</tr>
<tr>
<td>Office Name</td>
<td></td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code for the user.</td>
</tr>
<tr>
<td>Preferred Language</td>
<td>Preferred language for the user.</td>
</tr>
<tr>
<td>State</td>
<td>State for the user.</td>
</tr>
<tr>
<td>Street Address</td>
<td>Street address for the user.</td>
</tr>
<tr>
<td>Telephone Number</td>
<td>Telephone number for the user.</td>
</tr>
<tr>
<td>Usage Location</td>
<td>Some Microsoft services are not available in all locations. This property must be defined for the user in Azure AD before a license can be assigned to them.</td>
</tr>
</tbody>
</table>
Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Microsoft Azure Application Insights spoke**

Manage queries, events, and metrics in Microsoft Azure Application Insights account from your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://service-now.com/store) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history](https://service-now.com/store/release_notes).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://service-now.com/store/integrationhub).

**Supported versions**

This spoke was built for Microsoft Azure Application Insights API version v1, but may be compatible with later versions.

**Spoke requirements**

- Register the application in the Microsoft Azure portal and record the access keys and directory IDs. For more information, see [Azure Application Insights Search API](https://azure.microsoft.com/en-us/services/app-insights/) in [Azure Application Insights REST API documentation](https://docs.microsoft.com/en-us/microsoft-azure/app-insights/api-rest).

- Add your the redirect URL of your ServiceNow instance in your registered application. The redirect URL must be in this format: `https://<instance>.service-now.com/oauth_redirect.do`. For more information, see [Authentication and authorization for Azure Time Series Insights API](https://docs.microsoft.com/en-us/azure/insights/doc/authentication) in [Microsoft Docs](https://docs.microsoft.com).

- Create an API key and record the values of API Key and App ID. These values are needed as inputs to the spoke actions. For more information, see [Getting your API key and Application ID](https://docs.microsoft.com/en-us/microsoft-azure/app-insights/api-rest) in [Azure Application Insights REST API documentation](https://docs.microsoft.com/en-us/microsoft-azure/app-insights/api-rest).
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Microsoft Azure Application Insights spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Management</td>
<td>Get By Type</td>
<td>Executes an OData query for event.</td>
</tr>
<tr>
<td></td>
<td>Get Event</td>
<td>Retrieves the data of the required event in JSON format.</td>
</tr>
<tr>
<td></td>
<td>Get Odata Metadata</td>
<td>Retrieves the OData EDMX metadata that describes the event data model.</td>
</tr>
<tr>
<td>Metric Management</td>
<td>Get Metadata</td>
<td>Retrieves metadata describing the available metrics.</td>
</tr>
<tr>
<td></td>
<td>Get Metrics</td>
<td>Retrieves metric values for a single metric.</td>
</tr>
<tr>
<td></td>
<td>Get Multiple</td>
<td>Retrieves metric values for multiple metrics.</td>
</tr>
<tr>
<td>Query Management</td>
<td>Execute Query</td>
<td>Executes the specified analytics query.</td>
</tr>
<tr>
<td></td>
<td>Get Query</td>
<td></td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and
connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft Azure Application Insights spoke

Integrate the ServiceNow instance and Microsoft Azure Application Insights account by creating a custom OAuth application in Microsoft Azure Application Insights to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Application Insights spoke.
- Role required: admin

Register Microsoft Azure Application Insights as an OAuth provider

Use the information generated during the Microsoft Azure Application Insights account configuration to register Microsoft Azure Application Insights as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record, **Azure Application Insights**.
3. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during the Microsoft Azure Application Insights application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Microsoft Azure Application Insights application registration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;directory-id&gt;/oauth2/v2.0/authorize Replace &lt;directory-id&gt; with the directory ID of your Azure Application Insights account.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: //login.microsoftonline.com/&lt;directory-id&gt;/oauth2/v2.0/token</td>
</tr>
</tbody>
</table>
Replace `<directory-id>` with the directory ID of your Azure Application Insights account.

Redirect URL

OAuth callback endpoint in this format: `https://<instance>.service-now.com/oauth_redirect.do`

4. Right-click the form header, and click **Save**.

Create a credential record for the Microsoft Azure Application Insights spoke

Create a credential record for the Microsoft Azure Application Insights account. The Microsoft Azure Application Insights spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays this message: What type of Credentials would you like to create?
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <code>Azure Application Insight OAuth</code></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Entity profile of Azure Resource Management spoke. Azure Application Insights default_profile</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential Alias of the dependant Azure Resource Management spoke. <code>x_snc_app_ins.Azure_Application_Insights</code></td>
</tr>
</tbody>
</table>
5. Right-click the form header and click Submit.

6. To generate the OAuth token, click the Get OAuth Token related link.

**Microsoft Azure Artifacts spoke**

Manage Microsoft Azure Artifacts from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Microsoft Azure Artifacts 6.0-preview.1, but may be compatible with later versions.

**Spoke requirements**

- Azure Devops Account

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
**Spoke actions**

The Microsoft Azure Artifacts spoke provides actions to automate Microsoft Azure Artifacts tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Artifact Management</td>
<td>Get Package Details</td>
<td>Retrieves details of the specified package.</td>
</tr>
<tr>
<td></td>
<td>Get Package Version Details</td>
<td>Retrieves version details of the specified package.</td>
</tr>
<tr>
<td></td>
<td>Look up Package Versions</td>
<td>Retrieves a list of package versions.</td>
</tr>
<tr>
<td></td>
<td>Look up Packages</td>
<td>Retrieves a list of packages.</td>
</tr>
<tr>
<td>Change Tracking Management</td>
<td>Get Feed Change</td>
<td>Retrieves details of the current state of a feed.</td>
</tr>
<tr>
<td></td>
<td>Look up Feed Changes</td>
<td>Retrieves a list of changes of a feed.</td>
</tr>
<tr>
<td></td>
<td>Look up Package Changes</td>
<td>Retrieves a list of packages that changed in a feed.</td>
</tr>
<tr>
<td>Feed Management</td>
<td>Create Feed</td>
<td>Creates a feed to handle various package types.</td>
</tr>
<tr>
<td></td>
<td>Delete Feed</td>
<td>Removes the feed and all the related packages.</td>
</tr>
<tr>
<td></td>
<td>Get Feed Details</td>
<td>Retrieves the details of the feed.</td>
</tr>
<tr>
<td></td>
<td>Look up Feeds</td>
<td>Retrieves a list of feeds.</td>
</tr>
<tr>
<td></td>
<td>Update Feed</td>
<td>Updates the specified feed.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Look up Package IDs</td>
<td>Retrieves the metadata of a list of package IDs.</td>
</tr>
<tr>
<td></td>
<td>Look up Package Version IDs</td>
<td>Retrieves the metadata of a list of package version IDs.</td>
</tr>
<tr>
<td></td>
<td>Look up Projects</td>
<td>Retrieves a list of all project within an organization.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft Azure Artifacts spoke

Integrate the ServiceNow instance and Microsoft Azure Artifacts using Basic Authentication to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Artifacts spoke.
- Create a Personal Access Token in your Azure DevOps account and record it for later use.
- Role required: admin

Create a credential record for the Microsoft Azure Artifacts spoke

Create a credential record for the Azure DevOps portal account. The Microsoft Azure Artifacts spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select Basic Auth Credentials.
4. On the form, fill these values.

Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Azure Artifacts Cred.</td>
</tr>
</tbody>
</table>
Create a connection record for the Microsoft Azure Artifacts spoke

Create a connection record for your Azure Devops account. The Microsoft Azure Artifacts spoke connection and credential aliases use these connections to perform actions in Microsoft Azure Artifacts.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record for **Microsoft Azure Artifacts**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

## Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Azure Artifacts Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Azure Artifacts spoke. For example, <strong>Azure Artifacts Cred</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. The auto-populated value is <strong>sn_ms_artfcts_spke.Microsoft_Azure_Artifacts</strong></td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to <strong>Azure Devops</strong>. Enter: <code>https://feeds.dev.azure.com/</code></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Domain that the action runs in. The auto-populated value is global.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** Make sure that the **Version** field in the **Attributes** is 6.0-preview.1

5. Click **Submit**.

**Microsoft Azure Blob Storage spoke v1.0.4**

Manage Azure blobs and containers from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

Microsoft Azure Resource Management spoke

**Supported versions**

This spoke was built for API version 2019-07-07, but may be compatible with later versions.
Spoke requirements

- Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.

**Note:** Ensure that the user has the Storage Blob Data Owner role. To assign the role:

1. Log in to your storage account and navigate to Access Control (IAM).
2. Click the Add a role assignment and select Storage Blob Data Owner role.
3. Assign access to the required Azure AD user, group, or service principle option. For this, select the email address of the Azure account and save the changes.

### Add role assignment

Select **Storage Blob Data Owner**

Assign access to **Azure AD user, group, or service principal**

For more information, see Use the Azure portal to assign an Azure role for access to blob and queue data.

- Record and save the access keys and Directory ID for later use.

Spoke subflows

The Azure Blob Storage spoke provides sample subflows to demonstrate automating the Azure Blob Storage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Blob</td>
<td>Moves a blob from source container to destination container.</td>
</tr>
<tr>
<td>Rename Blob</td>
<td>Renames the specified blob.</td>
</tr>
</tbody>
</table>
Spoke actions

The Azure Blob Storage spoke provides actions to automate Azure Blob Storage tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blob Management</td>
<td>Attach Blob To ServiceNow Record</td>
<td>Attaches a blob to ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Blob</td>
<td>Copies a blob from one container to another container.</td>
</tr>
<tr>
<td></td>
<td>Delete Blob</td>
<td>Deletes the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Get Blob Details</td>
<td>Retrieves details of the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Lease Blob</td>
<td>Creates a lock on a blob for write and delete operations.</td>
</tr>
<tr>
<td></td>
<td>Look up Blob</td>
<td>Retrieves details of all blobs in a container.</td>
</tr>
<tr>
<td></td>
<td>Release Lease On Blob</td>
<td>Releases a lock on a blob.</td>
</tr>
<tr>
<td></td>
<td>Snapshot Blob</td>
<td>Creates a snapshot for the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Upload ServiceNow Attachment To Container</td>
<td>Uploads a blob to the specified container.</td>
</tr>
<tr>
<td>Container Management</td>
<td>Create Container</td>
<td>Creates a container.</td>
</tr>
<tr>
<td></td>
<td>Delete Container</td>
<td>Deletes the specified container.</td>
</tr>
<tr>
<td></td>
<td>Get Container Details</td>
<td>Retrieves details of the specified container.</td>
</tr>
<tr>
<td></td>
<td>Lease Container</td>
<td>Creates a lock on the container for delete operations.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Container</td>
<td>Retrieves details of all containers.</td>
</tr>
<tr>
<td></td>
<td>Release Lease On Container</td>
<td>Releases a lock on a container.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

⚠️ **Note:** Two Credential aliases are available for the Azure Blob Storage spoke.

**Set up the Azure Blob Storage spoke**

Integrate the ServiceNow instance and your Azure Blob Storage account by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate the Azure Blob Storage spoke.
- User with the Storage Blob Data Owner role
Note:
To assign the role:

1. Log in to your storage account and navigate to Access Control (IAM).
2. Click the Add a role assignment and select Storage Blob Data Owner role.
3. Assign access to the required Azure AD user, group, or service principle option. For this, select the email address of the Azure account and save the changes.

Add role assignment

Role
Storage Blob Data Owner

Assign access to
Azure AD user, group, or service principal

Select

For more information, see Use the Azure portal to assign an Azure role for access to blob and queue data.

- Role required: admin

Register Azure Blob Storage as OAuth provider
Use the information generated during Azure Blob Storage account configuration to register your Azure Blob Storage as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure
1. Navigate to System OAuth > Application Registry.
2. Open the record, Azure Blob Storage Spoke.
   The system displays the Application Registries form.
3. Enter these values.
Field | Value required
--- | ---
Client ID | Client ID you created during the Azure Blob Storage account registration.
Client Secret | Key value you created during the Azure Blob Storage account registration.
Token URL | Token URL in this format: https://login.microsoftonline.com/<directory-id>/oauth2/v2.0/token. Replace <directory-id> with the Directory ID of your Azure Blob Storage account.
Redirect URL | Redirect URI in this format: https://<instance>.service-now.com/oauth_redirect.do. Replace <instance> with the name of your ServiceNow instance.

4. Right-click the form header, and click Save.

Create Credential records for the Azure Blob Storage spoke

Create two Credential records for your Azure Blob Storage account. The Azure Blob Storage spoke connection and credential alias uses these credential records to perform actions in your Azure Blob Storage account.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record, Azure_Blob_Storage.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td><strong>OAuth Entity Profile</strong></td>
<td>Default OAuth Entity Profile. For example, Azure Blob Storage Spoke default_profile.</td>
</tr>
<tr>
<td><strong>Credential alias</strong></td>
<td>Credential record associated with <strong>Azure_Blob_Storage</strong>.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

8. Open for the record, **Azure_Blob_Storage_SAS**.

9. From the **Credentials** tab, click **New**.
   The system displays the message **What type of Credentials would you like to create?**.

10. Select **Azure Shared Access Signature**.

11. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name to uniquely identify the connection record. For example, enter Azure Blob Storage SAS Cred.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td><strong>Shared Access Key Name</strong></td>
<td>Name to identify the Shared Access Key record.</td>
</tr>
<tr>
<td><strong>Shared Access Key</strong></td>
<td>Shared Access Key of your Azure Blob Storage account.</td>
</tr>
<tr>
<td><strong>Credential alias</strong></td>
<td>Credential record associated with <strong>Azure_Blob_Storage_SAS</strong>.</td>
</tr>
<tr>
<td><strong>Authentication For</strong></td>
<td>Azure product for which this credential record is used. Select <strong>Blob Storage</strong>.</td>
</tr>
<tr>
<td><strong>Authentication Algorithm</strong></td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AzureSASAlgo</strong>.</td>
</tr>
</tbody>
</table>

   ⚠ **Note:** Users are cautioned against directly modifying the default authentication algorithm.

12. Click **Submit**.
**Microsoft Azure Cosmos DB spoke v1.0.1**
Manage Microsoft Azure Cosmos DB from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Microsoft Azure Cosmos DB v1, but may be compatible with later versions.

**Spoke requirements**
- Microsoft Azure Portal account

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)

ℹ️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Microsoft Azure Cosmos DB Spoke provides actions to automate Microsoft Azure Cosmos DB tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cassandra Database</td>
<td>Create Cassandan Keyspace</td>
<td>Creates a Cassandra keyspace.</td>
</tr>

</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Microsoft Azure Cosmos DB spoke**

Integrate the ServiceNow instance and Microsoft Azure Cosmos DB by creating a custom OAuth application in Microsoft Azure Portal to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Cosmos DB Spoke.
- Role required: admin

Register Microsoft Azure Cosmos DB as an OAuth provider

Use the information generated during the Azure Portal account configuration to register Microsoft Azure Cosmos DB as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open for the record for Azure Resource Management.
3. On the form, fill these values.

Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Azure Portal account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Azure Portal account configuration.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create a credential record for the Microsoft Azure Cosmos DB spoke**

Create a credential record for the Microsoft Azure Cosmos DB account. The Microsoft Azure Cosmos DB Spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays this message: **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

#### OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Azure Cosmos DB OAuth Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Azure Cosmos DB Spoke as an OAuth provider. For example, Azure Cosmos DB OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more <strong>Specific MID servers</strong>. Specify the MID Servers that should use this credential in the <strong>MID servers</strong> field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.
Microsoft Azure Managed Storage spoke v1.0.6
Manage Microsoft Azure managed disks from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2019-07-01, but may be compatible with later versions.

Spoke requirements
• User account with full access to Microsoft Azure managed disks.
• Microsoft Azure Resource Management spoke

Spoke flows and subflows
This spoke has no flows and subflows.
Spoke actions

The Microsoft Azure Managed Storage spoke provides actions to automate Microsoft Azure disks and disk snapshots when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Management</td>
<td>Create Managed Disk</td>
<td>Creates a disk with the specified disk size in gigabytes (GB).</td>
</tr>
<tr>
<td></td>
<td>Create Managed Disk From Snapshot</td>
<td>Creates a disk using a snapshot.</td>
</tr>
<tr>
<td></td>
<td>Create Managed Upload Disk</td>
<td>Creates a disk with the specified upload size.</td>
</tr>
<tr>
<td></td>
<td>Delete Disk</td>
<td>Deletes the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Get Disk Information</td>
<td>Retrieves the specified disk information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Grant Access To Disk Data</td>
<td>Grants access to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Look up Disks By Resource Group</td>
<td>Retrieves a list of disks for the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Disks By Subscription</td>
<td>Retrieves a list of disks in a subscription.</td>
</tr>
<tr>
<td></td>
<td>Revoke Access From Disk Data</td>
<td>Revokes access to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Set Disk Tags</td>
<td>Assigns tags to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Update Disk Size</td>
<td>Updates the size of the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Update Disk Storage Account</td>
<td>Updates the details of the storage account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Disk Snapshot Management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot of the disk.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Get Snapshot Information</td>
<td>Retrieves information about the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Grant Access to Disk Snapshot</td>
<td>Grants access to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshot By Resource Group</td>
<td>Retrieves a list of snapshots in a resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshot By Subscription</td>
<td>Retrieves a list of snapshots in a subscription.</td>
</tr>
<tr>
<td></td>
<td>Revoke Access From Snapshot</td>
<td>Revokes access to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Set Snapshot Tags</td>
<td>Assigns tags of the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Update Snapshot Size</td>
<td>Updates the disk size of the specified snapshot.</td>
</tr>
<tr>
<td></td>

<td>Updates the details of the storage account associated with the specified snapshot.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any
actions that use the connection. For more information, see Connections and Credentials.

**Set up Microsoft Azure Managed Storage spoke**
Integrate the ServiceNow instance and Azure Managed Storage using OAuth credentials to authenticate ServiceNow requests.

**Before you begin**
- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Managed Storage spoke
- Role required: admin

**Configure app registration for Microsoft Azure Managed Storage spoke**
Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see Quickstart: Configure a client application to access web APIs

**Before you begin**
- Azure account with admin privileges

**Procedure**

1. Sign into Azure portal.
2. Register your app with the following platform settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>Specify the URI in this format: https://&lt;instance&gt;.service-now.com/</td>
</tr>
<tr>
<td></td>
<td>oauth_redirect.doReplace &lt;instance&gt; with the name of your ServiceNow</td>
</tr>
</tbody>
</table>

3. Record the client ID and client secret of the app which are used for authentication.
Register Azure Managed Storage as OAuth provider

Use the authentication information from Azure account configuration to register Azure Managed Storage as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to **System OAuth > Application Registry**.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is \<a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token. Replace &lt;Directory ID&gt; with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is \https://&lt;instance&gt;.servicenow.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
Create Credential records for the Microsoft Azure Managed Storage spoke

Create Credential records to the Azure Managed Storage app registration you created. The Microsoft Azure Managed Storage spoke connection and credential aliases uses these credentials to authorise actions.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Managed Storage.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Managed Storage application as an OAuth provider. Enter Azure Resource Management default_profile</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Managed Storage application. Click the lock icon and enter, sn_azure_ms_spoke.Azure_Managed_Storage, sn_azure_rm_spoke.Azure_Resource_Management, sn_azure_vm_spoke.Azure_Virtual_Machine, sn_azure_vn_spoke.Azure_Virtual_Network</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate OAuth token for Microsoft Azure Managed Storage spoke

Regenerate an OAuth token when it expires.
Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure Managed Storage OAuth Credential record. For example, select Azure Managed Storage credentials.
3. From Related Links section, click Get OAuth Token.

Microsoft Azure Notification Hub spoke v1.01
Integrate ServiceNow instance with Microsoft Azure Notification Hub. Manage Azure notification hubs from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Azure Notification Hub version 2016-03-01, but may be compatible with later versions.

Spoke requirements
• Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.
• Register the application in Microsoft Azure portal and record the access keys and directory IDs.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Flow Designer Action Step - Payload Builder
  (com.glide.hub.action_step.payload)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Microsoft Azure Notification Hub Spoke provides actions to automate Azure Notification Hub tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installation</td>
<td>Delete Installation</td>
<td>Deletes an installation</td>
</tr>
<tr>
<td>Management</td>
<td>Get Installation</td>
<td>Retrieves an installation for the specified installation ID</td>
</tr>
<tr>
<td></td>
<td>Update Installation</td>
<td>Updates the installation partially using the JSON patch.</td>
</tr>
<tr>
<td></td>
<td>Upsert Installation</td>
<td>Creates a new installation or updates an existing installation.</td>
</tr>
<tr>
<td>Namespace</td>
<td>Delete Namespace</td>
<td>Deletes an existing namespace and all the associated notification hubs under the namespace.</td>
</tr>
<tr>
<td>Management</td>
<td>Get Namespace</td>
<td>Retrieves the description of the specified namespace.</td>
</tr>
<tr>
<td></td>
<td>Look up Namespaces By Resource Group</td>
<td>Retrieves a list of available namespaces within a resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Namespaces By Subscription ID</td>
<td>Retrieves a list of available namespaces within the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Namespace</td>
<td>Updates an existing namespace.</td>
</tr>
<tr>
<td></td>
<td>Upsert Namespace</td>
<td>Creates a new namespace or updates an existing namespace.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Notification Hub Management</td>
<td>Delete Notification Hub</td>
<td>Deletes a notification hub associated with a namespace.</td>
</tr>
<tr>
<td></td>
<td>Get Notification Hub</td>
<td>Retrieves a notification hub associated with a namespace.</td>
</tr>
<tr>
<td></td>
<td>Look up Notification Hubs</td>
<td>Retrieves a list of notification hubs associated with a namespace.</td>

</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft Azure Notification Hub spoke

Integrate the ServiceNow instance and Microsoft Azure Notification Hub by creating a custom OAuth application in Microsoft Azure Notification Hub to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Notification Hub Spoke.
- Role required: admin

Register Microsoft Azure Notification Hub as an OAuth provider

Use the information generated during the Microsoft Azure Notification Hub account configuration to register Microsoft Azure Notification Hub as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Click New.
   - The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Microsoft Azure Notification Hub OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Microsoft Azure Notification Hub application registration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Microsoft Azure Notification Hub application registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: //login.microsoftonline.com/&lt;directory-id&gt;/oauth2/v2.0/token Replace &lt;directory-id&gt; with the directory ID of your Azure Notification Hub account.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

Create a credential record for the Microsoft Azure Notification Hub spoke

Create a credential record for the Microsoft Azure Notification Hub account. The Microsoft Azure Notification Hub Spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials & Credential Aliases**.

2. Open the **Azure_Resource_Management** record.

3. From the **Credentials** tab, click **New**.
The system displays this message: What type of Credentials would you like to create?

4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

### OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure Notification Hub OAuth.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Submit**.
7. Navigate to **IntegrationHub > Connections & Credentials > Credentials & Credential Aliases**
8. Open the **Azure_Resource_Management** record.
9. From the **Credentials** tab, click **New**.
   The system displays this message: What type of Credentials would you like to create?
10. Select **Azure Shared Access Signature**.
11. On the form, fill these values.

### Azure Shared Access Signature form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft Azure Notification Hub Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Shared Access Key Name</td>
<td>Name to identify the Shared Access Key record.</td>
</tr>
<tr>
<td>Shared Access Key</td>
<td>Shared Access Key of your Azure Notification Hub account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
<tr>
<td>Authentication For</td>
<td>Azure product for which this credential record is used.</td>
</tr>
<tr>
<td>Authentication For</td>
<td>Select Notification Hub</td>
</tr>
<tr>
<td>Authentication For</td>
<td>Custom authentication algorithm for outbound signing requests. Select AzureSASAlgo.</td>
</tr>
</tbody>
</table>

**Note:** Do not modify the authentication algorithm directly.

12. Click **Submit**.

**Microsoft Azure Resource Management spoke v1.0.5**

Azure Resource Management enables you to create, update, and delete resources in your Azure subscription from within ServiceNow.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub. This spoke is installed automatically when you install the MicrosoftAzure SQL spoke v1.0.1.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke actions
The Azure Resource Management spoke provides actions to automate resource management tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource Management</td>
<td>Get Databases</td>
<td>Retrieves a list of databases in a server.</td>
</tr>
<tr>
<td></td>
<td>Get Elasticpools</td>
<td>Retrieves a list of elastic pools in Azure.</td>
</tr>
<tr>
<td></td>
<td>Get Resources</td>
<td>Retrieves a list of resource groups.</td>
</tr>
<tr>
<td></td>
<td>Get SQL Servers</td>
<td>Retrieves a list of servers in a resource group.</td>
</tr>
<tr>
<td></td>
<td>Get Location</td>
<td>Retrieves a list of locations.</td>
</tr>
<tr>
<td></td>
<td>Get Operational</td>
<td>Generates the operational status of the resource (Virtual Machine, Network,</td>
</tr>
<tr>
<td>Status of Resource</td>
<td>Status of Resource</td>
<td>Disk, and so on) that is created or updated.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Set up the Microsoft Azure Resource Management spoke

Integrate the ServiceNow instance and your Azure Resource Management account by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription.
- Activate the Microsoft Azure Resource Management spoke.
- Role required: admin

Register Azure Resource Management as an OAuth provider

Use the information generated during application configuration in Azure portal to register Azure Resource Management as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open the record, Azure Resource Management.
   The system displays the Application Registries form.
3. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure Resource Management application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure Resource Management application registration.</td>
</tr>
</tbody>
</table>
**Field** | **Value required**
--- | ---
On the Azure page for the app registration, click Endpoints. The Authorization URL is labeled **OAuth 2.0 token endpoint (v2)**. You can copy the URL there.

**Redirect URL** | The format of the Redirect URI is https://<instance>.service-now.com/oauth_redirect.do. Replace <instance> with the name of your ServiceNow instance.

4. Right-click the form header, and click **Save**.

**Create Credential record for the Azure Resource Management spoke**

Create Credential record to the Azure Resource Management custom app registration you created. The Azure Resource Management spoke connection and credential aliases use these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

2. Open for the record, **Azure_Resource_Management**.

3. From the **Credentials** tab, click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.

4. Select **OAuth 2.0 Credentials**.

5. On the form, fill these values.

**Field** | **Value required**
--- | ---
**Name** | Name to uniquely identify the connection record. For example, enter **Azure_RM_Cred**.

**Active** | Option to actively use the credential record.

**OAuth Entity Profile** | Default OAuth Entity Profile. For example, **Azure Resource Management default_profile**.

**Credential alias** | Credential record associated with **Azure_Resource_Management**.

6. Click **Submit**.
Microsoft Azure SQL spoke v1.0.1

Configure and manage Microsoft Azure SQL databases from within ServiceNow. When you install the Azure SQL spoke, you also get the Microsoft Azure Resource Management spoke. Azure Resource Manager provides a management layer that enables you to create, update, and delete resources in your Azure subscription.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke is built for Azure SQL v12, but may be compatible with later versions.

Spoke requirements

• User with full access to Microsoft Azure Cloud Computing.

Spoke actions

The Azure SQL spoke provides actions to automate Microsoft Azure SQL tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Database</td>
<td>Create Database - Generic</td>
<td>Creates a generic database in Azure.</td>
</tr>
<tr>
<td></td>
<td>Create Database - Hyperscale</td>
<td>Creates a Hyperscale database in Azure.</td>
</tr>
<tr>
<td></td>
<td>Create Database - vCore</td>
<td>Creates a vCore database in Azure.</td>
</tr>
<tr>
<td>Database Management</td>
<td>Delete Database - vCore</td>
<td>Deletes the specified database from a server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Database</td>
<td>Retrives details of a database.</td>
<td></td>
</tr>
<tr>
<td>List By Elastic Pool</td>
<td>Retrieves a list of databases in an elastic pool.</td>
<td></td>
</tr>
<tr>
<td>List By Server</td>
<td>Retrieves a list of databases on a server.</td>
<td></td>
</tr>
<tr>
<td>Operational Status</td>
<td>Generates the operational status of a database that is created or updated.</td>
<td></td>
</tr>
<tr>
<td>Rename Database</td>
<td>Renames a database.</td>
<td></td>
</tr>
<tr>
<td>Update Database</td>
<td>Updates SKU or Properties for existing database.</td>
<td></td>
</tr>
</tbody>
</table>

**Set up Microsoft Azure SQL spoke**

Integrate the ServiceNow instance and your Microsoft Azure SQL databases by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

**Before you begin**

- Role required: admin
- Request IntegrationHub subscription.
- Activate Azure SQL spoke.

**Configure an app registration for Azure SQL**

Create a custom app from your Azure account to enable OAuth 2.0 authentication with the Azure SQL spoke.

**Before you begin**

Azure SQL requirements:

- Azure SQL account
- Azure SQL administrator credentials

**About this task**

Complete these steps from your Azure account. See the Azure SQL Database documentation for instructions on creating and configuring custom applications.
Procedure

1. From your Azure account, navigate to Home > App registrations > Register an application.
2. Create an app registration in your Azure Active Directory.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>The format of the Redirect URI is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Click Register.
4. Copy the Application (client) ID. You use this ID when you Register Azure SQL as an OAuth provider.
5. Select Manage > Certificates & secrets and click New client secret.
6. Give the client secret a description, select when it expires, and click Add. Copy the client secret value for use when you Register Azure SQL as an OAuth provider. It will not be available after you leave the Certificates & secrets page.

What to do next
Register Azure SQL as an OAuth provider.

Register Azure SQL as an OAuth provider

Use the information generated during Azure account configuration to register Azure SQL as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Click New. The system displays the message What kind of OAuth application?
3. Select Connect to a third-party OAuth Provider. The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure SQL application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure SQL application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The format of the Redirect URI is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

6. In the OAuth Entity Profiles related list, open the default profile record.

7. Verify that the openid entity scope record created in previous steps appears in the OAuth Entity Profile Scopes related list. If it does not appear, add the record.
Create Credential records for the Azure SQL spoke

Create Credential records to the Azure SQL custom app registration you created. The Microsoft Azure SQL spoke connection and credential aliases use these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure SQL application as an OAuth provider. For example, select Azure OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Click the lock icon, enter sn Azure_sql_spoke.Azure_database, and click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Microsoft Azure SQL spoke

Create Connection records to your Azure account. The Azure SQL spoke connection and credential aliases use these connections to perform actions in Azure SQL.
Before you begin

Procedure
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the **Azure_database** record.
3. Select the **Type** Connection and Credential
4. In the **Connections** related list, click **New**.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure SQL Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure SQL. For example, select Azure SQL Credentials.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Regenerate Azure SQL OAuth token**
Regenerate the Azure SQL OAuth token when it expires.

Before you begin

Procedure
1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Azure SQL spoke OAuth Credential record.

**Example**
For example, select Azure SQL Credentials.

3. From Related Links, click **Get OAuth Token**.

**Microsoft Azure Virtual Machine spoke v1.0.3**
Manage Microsoft Azure Virtual Machine (VM) from your ServiceNow instance.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2019-07-01, but may be compatible with later versions.

Spoke requirements
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure Virtual Network spoke (com.sn.ms.azure.virtual.network.spoke)
- Microsoft Azure Managed Storage spoke (com.sn.ms.azure.managed.storage.spoke)

Spoke flows and subflows
This spoke has no flows and subflows.
**Spoke actions**

The Microsoft Azure Virtual Machine spoke provides actions to automate Microsoft Azure Virtual Machine tasks when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image Management</td>
<td>Create Image From Instance</td>
<td>Creates an image from an existing instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Image</td>
<td>Deletes an image.</td>
</tr>
<tr>
<td></td>
<td>Get Image Information</td>
<td>Retrieves information of an image from a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Images By Resource Group</td>
<td>Retrieves the list of images from a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Images By Subscription ID</td>
<td>Retrieves the list of images with the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Set Tags On Image</td>
<td>Assigns tags to an image.</td>
</tr>
<tr>
<td></td>
<td>Look Up Offers</td>
<td>Retrieves a list of virtual machine images offers for the specified Azure location and publisher name.</td>
</tr>
<tr>
<td></td>
<td>Look Up Publishers</td>
<td>Retrieves a list of virtual machine image publishers for the specified Azure location.</td>
</tr>
<tr>
<td></td>
<td>Look Up SKUs</td>
<td>Retrieves a list of virtual machine image SKUs for the specified Azure location.</td>
</tr>
</tbody>
</table>
### Spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>

</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any
actions that use the connection. For more information, see Connections and Credentials.

**Set up Microsoft Azure Virtual Machine spoke**

Integrate the ServiceNow instance and Azure Virtual Machine using OAuth credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Virtual Machine spoke
- Role required: admin

**Configure app registration for Microsoft Azure Virtual Machine spoke**

Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see Quickstart: Configure a client application to access web APIs.

**Before you begin**

- Azure account with admin privileges

**Procedure**

1. Sign into Azure portal.
2. Register your app with the following platform settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>Specify the URI in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Record the client ID and client secret of the app which are used for authentication.
Register Azure Virtual Machine as OAuth provider

Use the authentication information from Azure account configuration to register Azure Virtual Machine as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to **System OAuth > Application Registry**.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value crated during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is <code>https://login.microsoftonline.com/&lt;Directory ID&gt;/oauth2/v2.0/token</code>. Replace <code>&lt;Directory ID&gt;</code> with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>. Replace <code>&lt;instance&gt;</code> with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
Create Credential records for the Microsoft Azure Virtual Machine spoke

Create Credential records to the Azure Virtual Machine app registration you created. The Microsoft Azure Virtual Machine spoke connection and credential aliases uses these credentials to authorise actions.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Virtual Machine.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Virtual Machine application as an OAuth provider. Enter Azure Resource Management default_profile.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Virtual Machine application. Click the lock icon and enter, sn_azure_ms_spoke.Azure_Managed_Storage, sn_azure_rm_spoke.Azure_Resource_Mangement, sn_azure_vm_spoke.Azure_Virtual_Machine, sn_azure_vn_spoke.Azure_Virtual_Network</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate OAuth token for Microsoft Azure Virtual Machine spoke

Regenerate an OAuth token when it expires.
Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure Virtual Machine OAuth Credential record.
   For example, select Azure Virtual Machine credentials.
3. From Related Links section, click Get OAuth Token.

Microsoft Azure Virtual Network spoke v1.0.4
Manage Microsoft Azure Virtual Network (VNet) from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2019-07-01 for List Network Interface Names by ResourceGroup and Look Up Network Interfaces By Resource Group, 2019-11-01 for other actions but may be compatible with later versions.
Spoke requirements
- Microsoft Azure Resource Management spoke
  (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure subscription with access to Azure Virtual Network service

Spoke flows and subflows
This spoke has no flows and subflows.

Spoke actions
The Microsoft Azure Virtual Network spoke provides actions to automate Microsoft Azure Virtual Network tasks when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Interface Management</td>
<td>Create Network Interface</td>
<td>Creates a network interface.</td>
</tr>
<tr>
<td></td>
<td>Delete Network Interface</td>
<td>Deletes the specified network interface.</td>
</tr>
<tr>
<td></td>
<td>Get Network Interface Information</td>
<td>Retrieves the specified network interface information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Network Interfaces By Resource Group</td>
<td>Retrieves a list of network interfaces in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Network Interfaces By Subscription ID</td>
<td>Retrieves a list of network interfaces in the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Set Network Interface Tags</td>
<td>Assigns tags to the specified network interface.</td>
</tr>
<tr>
<td>Public IP Address Management</td>
<td>Create Public IP Address</td>
<td>Creates a public IP address.</td>
</tr>
</tbody>
</table>

<td></td>
<td>Get Virtual Network Usage Status</td>
<td>Retrieves virtual network usage status in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Virtual Networks By Resource Group</td>
<td>Retrieves a list of virtual networks in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Virtual Networks By Subscription ID</td>
<td>Retrieves a list of virtual network in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Set Virtual Network Tags</td>
<td>Assigns tags on virtual network.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up Microsoft Azure Virtual Network spoke
Integrate the ServiceNow instance and Azure Virtual Network using OAuth credentials to authenticate ServiceNow requests.

Before you begin
- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Virtual Network
- Role required: admin
Configure app registration for Microsoft Azure Virtual Network spoke

Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see Quickstart: Configure a client application to access web APIs.

Before you begin
Azure account with admin privileges

Procedure
1. Sign into Azure portal.
2. Register your app with the following platform settings.

Registration Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>Specify the URI in this format: https://&lt;instance&gt;.service-now.com/</td>
</tr>
<tr>
<td></td>
<td>oauth_redirect.doReplace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Record the client ID and client secret of the app which are used for authentication.

Register Azure Virtual Network as OAuth provider

Use the authentication information from Azure account configuration to register Azure Virtual Network as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Procedure
1. Navigate to System OAuth > Application Registry.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token. Replace &lt;Directory ID&gt; with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create Credential records for the Microsoft Azure Virtual Network spoke**

Create Credential records to the Azure Managed Storage app registration you created. The Microsoft Azure Virtual Network spoke connection and credential aliases uses these credentials to authorise actions.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**

3. Select **OAuth 2.0 Credentials**.

4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Virtual Network.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Virtual Network application as an OAuth provider. Enter Azure Resource Management default_profile</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Virtual Network application. Click the lock icon and enter, sn_azure_ms_spoke.Azure_Managed_Storage, sn_azure_rm_spoke.Azure_Resource_Management, sn_azure_vm_spoke.Azure_Virtual_Machine, sn_azure_vn_spoke.Azure_Virtual_Network</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Regenerate OAuth token for Microsoft Azure Virtual Network spoke**

Regenerate an OAuth token when it expires.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Select the Azure Virtual Network OAuth Credential record.
   For example, select Azure Virtual Network credentials.

3. From Related Links section, click **Get OAuth Token**.

4. Right-click the form header, and click **Save**.
Microsoft Dynamics CRM spoke v1.3
Provide the baseline actions to interact with Microsoft Dynamic Entities through introspection.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows
The Infoblox spoke provides sample flows to create an opportunity in Dynamics CRM.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Opportunity in Dynamics CRM</td>
<td>Creates an opportunity in Dynamics CRM and updates the opportunity record in your ServiceNow instance.</td>
</tr>
</tbody>
</table>

Spoke subflows
This spoke ships with the following subflows.
### Subflow

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Dynamics CRM Webhook</td>
<td>Receives the Dynamic CRM webhook notification and converts it into an array of objects and logs the details.</td>
</tr>
<tr>
<td>Process Dynamics CRM Webhook for Opportunity</td>
<td>Receives the Dynamic CRM webhook notification and updates the opportunity table record.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Microsoft Dynamics CRM spoke provides the baseline actions to interact with Microsoft Dynamic Entities through introspection.

### Available Microsoft Dynamics CRM spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Account</td>
<td>Create an account in Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td></td>

</tbody>
</table>
Available Microsoft Dynamics CRM spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Update Record</td>
<td>Update a record in Microsoft Dynamics CRM.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Microsoft_Dynamics_CRM alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft_Dynamics_CRM</td>
<td>Connection to Microsoft Dynamics CRM</td>
<td>URL configured when you create your application in Azure. This URL ends with dynamics.com.</td>
</tr>
</tbody>
</table>

**Set up Microsoft Dynamics CRM spoke**

Integrate the ServiceNow instance and Microsoft Dynamics CRM by using the Windows credentials to authenticate ServiceNow requests.

**Before you begin**

- Install Microsoft AD
- Request IntegrationHub subscription.
- Activate the Microsoft Dynamics CRM spoke.
- Role required: admin.

**About this task**

- Perform these steps to use all Microsoft Dynamics CRM spoke actions.

**Configure Microsoft Dynamics CRM application**

Create a custom OAuth application from your Microsoft Dynamics CRM account to enable OAuth 2.0 authentication with the Microsoft Dynamics CRM.
Before you begin
Microsoft Dynamics CRM requirements:

- Microsoft Dynamics CRM account
- Microsoft Azure account
- Microsoft Dynamics CRM credentials

About this task
Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the Microsoft Azure App registration portal with your organization credentials.

2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click Register. An overview of the application's basic information is shown.

3. Copy the application ID to a text file. You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.

4. Add a client secret.

   a. In Microsoft Azure, navigate to Manage > Certificates & secrets.

   b. Provide a description and an expiration date and click Add.

   i Note: The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the Microsoft Graph permissions reference.

   a. In Microsoft Azure, navigate to Manage > API permissions.

   b. Click the Microsoft Graph tile.

   c. Select the Delegated or Application permissions that the application supports.
Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.

d. Click **Add permissions**.

What to do next
Register Microsoft Dynamics CRM as OAuth provider.

Register Microsoft Dynamics CRM as OAuth provider
Use the information generated during Microsoft Dynamics CRM account configuration to register Microsoft Dynamics CRM as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
- Request IntegrationHub subscription.
- Activate Microsoft Dynamics CRM.
- Create a Microsoft Dynamics CRM application.

Role required: admin.

Procedure
1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Dynamics CRM OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the Microsoft Dynamics CRM application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon (🔒), enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a> followed by a question mark and the resource attribute of your instance, and then click the lock icon again. The resource attribute of the URL. For example, ?resource=<a href="https://mycompany.crm.dynamics.com">https://mycompany.crm.dynamics.com</a>. This attribute is the URL of your Microsoft application.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon (🔒), enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon (🔒), enter https://&lt;instance&gt;.servicenow.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, edit the provided entity scope to include the URL of your Microsoft Dynamics CRM application. The name and the OAuth scope are often the same string.

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**What to do next**
Create credential record for Microsoft Dynamics CRM.

**Create Credential records for the Microsoft Dynamics CRM spoke**
Create Credential records for the Microsoft Dynamics CRM custom OAuth application you created during Microsoft Dynamics CRM account configuration. The Microsoft Dynamics CRM spoke connection and credential aliases use these credentials to authorize actions.
Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New. The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials. The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Dynamics Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft Dynamics CRM application as an OAuth provider. For example, select Dynamics OAuth profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>
5. Save the record.
6. From Related Links, click Get OAuth Token. The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

⚠ Note: Ensure that you allow pop-up windows in your browser.

Create Connection records for the Microsoft Dynamics CRM spoke
Create Connection records to your Microsoft Azure account. The Microsoft Dynamics CRM spoke connection and credential alias uses these connections to perform actions on Microsoft Dynamics CRM.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the connection and credential alias for the Microsoft Dynamics CRM application.
3. On the Connections tab, click New. The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter MS Dynamics CRM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft Dynamics CRM. For example, select MS Dynamics Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root Dynamics URL. For example, https://&lt;SiteName&gt;.dynamics.com.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Configure Microsoft Dynamics CRM webhook details

Register Microsoft Dynamics CRM webhook in ServiceNow to notify the ServiceNow application when certain events occur in Microsoft Dynamics CRM.

Before you begin
Role required: admin

- Microsoft Dynamics CRM requires registration through the Windows Plugin Registration Tool. To install the Windows Plugin Registration Tool, see the Microsoft document Download tools from NuGet.

- The Endpoint URL is the ServiceNow instance URL to which event information is posted. For example, https://<instance-name>.service-now.com/api/sn_ms_crm_spoke/dynamics_webhook_callbacks.

- The key-value pair you use to register the webhook in the Plugin Registration Tool is the same as the Name and Authorization Key in Dynamics CRM Webhook Details.

Procedure

1. Navigate to Dynamics CRM Webhook Details > Client Details.
2. Click New.
3. In the Name field, enter the webhook's plugin key. In the Authorization Key field, enter the value from the webhook's key-value pair.
Configure Microsoft Dynamics CRM webhook decision policy
Create webhook routing policy and subflow according to your requirements.

Procedure
1. Navigate to Flow Designer > Designer
2. Click Subflows.
3. Create a copy of the default subflow, Process Dynamics CRM Webhook.
4. Customize the subflow according to your requirement and publish it. See for more information about creating and using subflows.
5. Navigate to Dynamics CRM Webhook Details > Decision Policy.
7. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Decision form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>Answer</td>
</tr>
<tr>
<td>a.</td>
</tr>
<tr>
<td>b.</td>
</tr>
</tbody>
</table>

| Note: Ensure that the Table name is Dynamics CRM Webhook Answer Subflow [sn_ms_crm_spoke_dynamic_crm_webhook_answer_subflow]. |
| Condition | Conditions to be met when the required events occur in Microsoft Dynamics CRM. |

8. Click Submit.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Results
Decision policy and subflow are created.
Microsoft Exchange Online spoke v2.0.2

The Microsoft Exchange Online spoke creates and manages calendar and mail in Microsoft Exchange Online. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

Note: User and group management can be done using Microsoft Azure AD only and not Microsoft Exchange Online spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Remote Tables (com.glide.script.vtable)
- System Import Data Source (com.glide.system_import_data_source)
- iHub Spoke Util Pack (com.snc.ihub_spoke_util_pack)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

Microsoft Graph REST API v1.0
**Spoke module**
The Microsoft Exchange Online spoke adds the Microsoft Exchange Online application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Events</td>
<td>Displays the list of events in Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Subscriptions</td>
<td>Displays the list of subscriptions in Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Webhook Registry</td>
<td>Displays the list of webhook registries of Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Calendars</td>
<td>Displays a list of calendars in Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Calendar Events Transform Data</td>
<td>Displays the list of records from the data source.</td>
</tr>
</tbody>
</table>

**Spoke flows**
The Microsoft Exchange Online spoke provides sample flows in the published state to demonstrate automating renewing subscriptions. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Renew Subscriptions</td>
<td>Retrieves all the subscription records and renews the subscriptions if a renewal is required, based on the expiration time. If any subscription has its status marked as 'Being deleted', then its record is deleted and is not considered for renewal.</td>
</tr>
</tbody>
</table>

**Spoke subflows**
The spoke provides subflows in the Published state to integrate with Microsoft Exchange Online service. These subflows can be used as part of other subflows and flows.
<table>
<thead>
<tr>
<th>Category</th>
<th>Subflows</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Webhook management</td>
<td>Check Event Subscription</td>
<td>Checks if a webhook subscription with specified event resource, notification URL and change type exists.</td>
</tr>
<tr>
<td></td>
<td>Create or Update Subscription</td>
<td>Checks if the specified subscription record exists in Microsoft Exchange Online and updates the subscription record if it exists. If the subscription record does not exist, a new subscription record is created.</td>
</tr>
<tr>
<td></td>
<td>Delete Subscription</td>
<td>Deletes the specified subscription when the specified subscription is associated only with the specified application.</td>
</tr>
<tr>
<td></td>
<td>Recreate Removed Subscription</td>
<td>Recreates a removed webhook subscription using the details from the associated subscription record.</td>
</tr>
<tr>
<td></td>
<td>Subscription Lifecycle</td>
<td>Manages the lifecycle of a webhook subscription.</td>
</tr>
<tr>
<td>Calendar Management</td>
<td>Calendar Synchronization</td>
<td>Synchronizes the calendar by retrieving events from Exchange Online Calendar Events Transformed Data table and adding the retrieved events to Microsoft Exchange Online Events table. Also, creates a subscription if a valid subscription does not exist.</td>
</tr>
<tr>
<td>Category</td>
<td>Subflows</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td></td>
<td>not exist for the user's specified calendar.</td>
</tr>
<tr>
<td>Delete Calendar</td>
<td>Scheduling Event</td>
<td>Deletes the specified event in Microsoft Exchange Online and the related records from events tables, associated attachments, associated records from event attendees and event to subscription m2m tables.</td>
</tr>
<tr>
<td>Delete Event Record</td>
<td></td>
<td>Deletes the specified event record from events tables and the related attachments, related records from event attendees and event to subscription m2m tables.</td>
</tr>
<tr>
<td>Event Lifecycle Management</td>
<td></td>
<td>Retrieves the event details and updates the records in event, attendees, event to subscription m2m tables accordingly.</td>
</tr>
<tr>
<td>Sync up Events</td>
<td></td>
<td>Syncs the calendar view based on the data from Exchange Online Calendar Events Transformed Data table.</td>
</tr>
<tr>
<td>Update Calendar</td>
<td>Scheduling Event</td>
<td>Updates the properties of an event object in Microsoft Exchange Online and the related record in the events table.</td>
</tr>
</tbody>
</table>
Note:

- Use the Microsoft Exchange Online Webhook Registry table to generate a callback URL and store secret value (Client state) for webhook subscriptions.
- Make sure that webhook subscription is stored in the Microsoft Exchange Online Subscriptions table with the Status field set to Active.

Spoke actions
The Microsoft Exchange Online spoke provides actions to automate calendar and mail tasks when an incident is created in the ServiceNow instance.

Microsoft Exchange Online spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar Management</td>
<td>Copy Attachment to Calendar Event</td>
<td>Copies a ServiceNow attachment to an Exchange calendar event.</td>
</tr>
<tr>
<td></td>
<td>Create Calendar Event</td>
<td>Creates an event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Create Recurring Calendar Events</td>
<td>Creates a recurring event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachment</td>
<td>Deletes the specified attachment in the specified event.</td>
</tr>
<tr>
<td></td>
<td>Delete Calendar Event</td>
<td>Deletes a calendar event.</td>
</tr>
<tr>
<td></td>
<td>Find Meeting Times</td>
<td>Retrieves meeting times and locations based on the availability of the meeting organizer and attendees for the specified time and locations.</td>
</tr>
<tr>
<td></td>
<td>Look up Attachments by Event ID</td>
<td>Retrieves all the attachments in the specified event.</td>
</tr>
</tbody>
</table>

<td>Unsubscribe Webhook</td>
<td>Deletes the specified webhook subscription.</td>
</tr>
</tbody>
</table>

### Microsoft account requirements

The Microsoft Exchange Online spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.
Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up Microsoft Exchange Online spoke
Integrate the ServiceNow instance and Microsoft Exchange Online account by creating a custom OAuth application in Microsoft Exchange Online to authenticate ServiceNow requests.

Before you begin
• Request IntegrationHub Professional subscription
• Activate the Microsoft Exchange Online spoke
• Role required: admin

Register an application using the Microsoft Azure portal
Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Before you begin
Role required: Azure Active Directory admin

About this task
Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

Procedure
1. In the Microsoft Azure portal, add the Redirect URIs in this format: https://<instance-name>.service-now.com/oauth_redirect.do
2. For the Required Permissions, select Microsoft Graph.
3. Record the **Client Secret** for use in later configurations.

**Results**
The ServiceNow application is created with Microsoft Azure AD.

**Register Microsoft Exchange Online as the OAuth provider**

Register Microsoft Exchange Online as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

**About this task**
Use the information generated during the registration of the application in the Microsoft Azure portal.

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Open the record, **Microsoft Exchange Online**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Application Registries form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>---</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
<tr>
<td>Client ID</td>
</tr>
<tr>
<td>Client Secret</td>
</tr>
<tr>
<td>OAuth API Script</td>
</tr>
<tr>
<td>Logo URL</td>
</tr>
<tr>
<td>Default Grant Type</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
</tr>
<tr>
<td>PKCE required</td>
</tr>
</tbody>
</table>

**Note:** You can use only **Authorization Code** as the **Default Grant type** when PKCE is enabled.

<table>
<thead>
<tr>
<th>Application</th>
<th>Application scope that contains this record.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, **Microsoft Exchange Online default_profile**.

5. Navigate to **System OAuth > Application Registry**.

6. Open the record, **Microsoft Exchange Online_clientCredentials**.

7. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Application Registries form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Client ID</td>
</tr>
<tr>
<td>Client Secret</td>
</tr>
<tr>
<td>Default Grant Type</td>
</tr>
<tr>
<td>Redirect URL</td>
</tr>
</tbody>
</table>

8. Right-click the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, **Microsoft Exchange Online_clientCredentials default_profile**.

---

**Create Credential records for the Microsoft Exchange Online spoke**

Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message, **What type of Credentials would you like to create?**
3. Select OAuth 2.0 Credentials.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Credentials.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td><strong>OAuth Entity Profile</strong></td>
<td>OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with Default Grant Type as Authorization Code. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

7. Navigate to **Connections & Credentials > Credentials**.

8. Click **New**.

   The system displays the message, What type of Credentials would you like to create?

9. Select **OAuth 2.0 Credentials**.

10. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Credentials_clientCred.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td><strong>OAuth Entity Profile</strong></td>
<td>OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with Default Grant Type as Client Credentials. For example, Microsoft Exchange Online_clientCredentials default_profile.</td>
</tr>
<tr>
<td><strong>Applies to</strong></td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
11. Right-click the form header and click **Save**.

12. To generate the OAuth token, click the **Get OAuth Token** related link.

**Results**
The credential records for the Microsoft Exchange Online spoke are created.

**Create Connection records for the Microsoft Exchange Online spoke**
Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record, **Microsoft_Exchange_Online**.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Exchange Online. For example, Exchange_Online_Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>
5. Click **Update**.
6. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
7. Open the record, **Microsoft_Exchange_Online_clientCred**.
8. In the Connections related list, click **New**.

### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Online_Connection_clientCred.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Exchange Online. For example, Exchange_Online_Credentials_clientCred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

10. Click **Update**.

**Results**
The Microsoft Exchange Online spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Exchange Online OAuth token**
Authorize the Microsoft Exchange Online spoke by regenerating the Microsoft Exchange Online OAuth token after it expires.

**Before you begin**
Role required: admin
Procedure
1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Exchange Online spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.

Results
The Microsoft Exchange Online spoke receives a new OAuth access token.

**Microsoft Exchange Server spoke v2.1.1**
The Microsoft Exchange Server spoke creates and manages address list, mailbox, and calendar events in Microsoft Exchange mail system.

**Request apps on the Store**
Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](https://store.servicenow.com/v2.1.1).

The Microsoft Exchange Server spoke requires an IntegrationHub subscription.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com/v2.1.1).

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠ **Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported versions

- Exchange Server 2016 installed on Windows Server 2016

Note: The Create Calendar Event For User and Lookup Room Availability actions are supported only on Exchange Server 2013.

- Exchange Server 2013 installed on Windows Server 2012 R2

This spoke may be compatible with the earlier versions of Microsoft Exchange Server.

Spoke requirements

Powershell remoting must be enabled on the target Exchange Server. For more information about the Microsoft Exchange Server, see Exchange Server documentation.

Spoke flows

The Exchange Server spoke provides sample flows to demonstrate automating the Exchange Server tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pull From Subscriptions</td>
<td>Uses the Look up Items From Subscription ID subflow to periodically retrieve the modified items in an active subscription and saves the details in the ServiceNow instance.</td>
</tr>
<tr>
<td>Look up Calendar Item from Item ID Flow</td>
<td>Uses the Look up Items From Subscription ID subflow to display the details of the modified items in a subscription in the Subscription to Events Mapping module.</td>
</tr>
<tr>
<td>Renew Subscription</td>
<td>Uses the Renew Subscription subflow to renew subscription.</td>
</tr>
</tbody>
</table>

Note: Subscriptions are valid for 24 hours and flows renew the subscriptions periodically. If there are failures with the third-party applications, subscriptions will not be renewed. That is, Active is set to False. In the event of failure, you should use the create subscription flow to create a subscription.
**Spoke subflows**
The Exchange Server spoke provides sample subflows to demonstrate automating the Exchange Server tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look up Items From Subscription ID</td>
<td>Saves the details of the modified items in a subscription to the Event to Subscription Mapping table.</td>
</tr>
<tr>
<td>Create Subscription</td>
<td>Creates a subscription for the specified mailbox and adds it to the Subscription table. If the subscription already exists, the subflow adds the application details to the subscription record.</td>
</tr>
<tr>
<td>Renew Subscription</td>
<td>Renews a subscription for the given mailbox.</td>
</tr>
</tbody>
</table>

**Spoke actions**
The Microsoft Exchange Server spoke provides actions to automate address list, mailbox, and calendar event tasks.

**Microsoft Exchange Server spoke actions**

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address List Management</td>
<td>Create Address List Using Included Recipients</td>
<td>Creates a new address list in Exchange Server using the <strong>Included Recipients</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Create Address List Using Recipient Filter</td>
<td>Creates a new address list in Exchange Server using the <strong>Recipient</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Delete Address List</td>
<td>Deletes the required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Address List Details</td>
<td>Retrieves the details of a required address list on a required Exchange Server.</td>
</tr>
</tbody>
</table>
Microsoft Exchange Server spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look Up Address List</td>
<td>Look Up Address List</td>
<td>Retrieves the address list details on a required Exchange Server using a search query.</td>
</tr>
<tr>
<td></td>
<td>Look up Address List Details</td>
<td>Retrieves details of the specified address list by identity.</td>
</tr>
<tr>
<td></td>
<td>Move Address List</td>
<td>Moves an address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td></td>
<td>Synchronize Address List</td>
<td>Refreshes email clients with the latest details, for a required address list in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Included Recipients</td>
<td>Updates details and recipients of a required address list using a the Included Recipients field.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Recipient Filter</td>
<td>Updates details and recipients of a required address list details using the Recipient Filter field.</td>
</tr>
<tr>
<td>Mailbox Management</td>
<td>Create Calendar Event For User</td>
<td>Creates a calendar event in Exchange Server. Calendar event can be either a meeting or appointment.</td>
</tr>
<tr>
<td></td>
<td>Create Mailbox</td>
<td>Creates mailboxes and user accounts simultaneously.</td>
</tr>
<tr>
<td></td>
<td>Delete Mailbox</td>
<td>Deletes a mailbox in Exchange Server.</td>
</tr>
</tbody>
</table>

**Note:**
- This action is supported only on Exchange Server 2013.
- This action uses the Exchange_https connection and credential alias.
Microsoft Exchange Server spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Mailbox</td>
<td>Disables Mailbox</td>
<td>Disables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td>Enable Mailbox</td>
<td>Enable Mailbox</td>
<td>Enables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td>Look up Calendar by Event ID</td>
<td>Look up Calendar by Event ID</td>
<td>Retrieves the list of calendar events.</td>
</tr>
<tr>
<td>Look up Mailbox</td>
<td>Look up Mailbox</td>
<td>Retrieves mailbox properties for a given mailbox in Exchange Server.</td>
</tr>
<tr>
<td>Look up Room Availability</td>
<td>Look up Room Availability</td>
<td>Retrieves the availability response for a given array of room objects.</td>
</tr>
<tr>
<td>Update Mailbox</td>
<td>Update Mailbox</td>
<td>Updates the properties of a mailbox in Exchange Server.</td>
</tr>
<tr>
<td>Set Mailbox Auto Reply</td>
<td>Set Mailbox Auto Reply</td>
<td>Schedules the auto-reply for a given mailbox in Exchange Server.</td>
</tr>
<tr>
<td>Lookup Room Mailboxes</td>
<td>Lookup Room Mailboxes</td>
<td>Retrieves all the room mailboxes in Exchange Server.</td>
</tr>
<tr>
<td>Meeting Management</td>
<td>Look up Meeting Suggestions</td>
<td>Retrieves the meeting suggestions for the specified mailboxes.</td>
</tr>
<tr>
<td></td>
<td>Look up User Availabilities</td>
<td>Retrieves the availability response for a given mailbox.</td>
</tr>
<tr>
<td>Subscription Management</td>
<td>Create Subscription</td>
<td>Creates a new subscription for given mailbox.</td>
</tr>
<tr>
<td></td>
<td>Look up Calendar Item from Item ID</td>
<td>Look up Calendar Item from Item ID</td>
</tr>
<tr>
<td></td>
<td>Look up Events by Subscription ID</td>
<td>Retrieves the calendar information for the given calendar ID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Retrieves the latest changes in the calendar folder for the subscription since the last watermark.</td>
</tr>
</tbody>
</table>

**Note:** The Exchange Server spoke supports the calendar events only.
Microsoft Exchange Server spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment Management</td>
<td>Copy Attachment to Event Record</td>
<td>Copies an calendar event’s attachment to the specified record in the ServiceNow instance.</td>
</tr>
<tr>
<td></td>
<td>Create Attachment</td>
<td>Adds attachment to an event.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachment</td>
<td>Deletes an attachment associated with the provided Attachment ID.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachments from Event Record</td>
<td>Deletes one or more attachments associated with the specified event record.</td>
</tr>
<tr>
<td></td>
<td>Look up Attachment by Attachment ID</td>
<td>Retrieves the specified attachment.</td>
</tr>
</tbody>
</table>

Spoke modules
The Exchange Server spoke adds a Microsoft Exchange Server Spoke module to your ServiceNow instance. Data is these modules is populated when the associated flows are executed:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subscriptions</td>
<td>Displays details of the subscriptions in Exchange Server. Data is populated in this module when the Create Subscriptions and Renew Subscriptions subflows are executed.</td>
</tr>
<tr>
<td>Events</td>
<td>Displays details of the events in Exchange Server. Data is populated in this module when the Look up Calendar Item from Item ID flow is executed.</td>
</tr>
<tr>
<td>Event Attendees</td>
<td>Displays details of the event attendees in the events. Data is populated in this module when the Look up Calendar Item from Item ID flow is executed.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>module when the Look up Calendar Item from Item ID flow is executed.</td>
<td></td>
</tr>
<tr>
<td>Subscription to Events Mapping</td>
<td>Displays details of the subscriptions and events. Data is populated in this module when the Look up Items From Subscription ID subflow is executed.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are created when the Microsoft Exchange Server spoke is activated, Exchange and Exchange_https.

ℹ️ Note:

- The Exchange_https alias is supported only on Exchange Server 2013.
- The Exchange_https alias is required to use the Create Calendar Event For User and Lookup Room Availability actions.

### MID Server requirements

Your instance must have a MID Server set up and configured to run PowerShell 2.0. Use the connection record associated with the Microsoft Exchange alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

### Set up Microsoft Exchange Server spoke

Integrate the ServiceNow instance and Exchange Server by using the Windows credentials to authenticate ServiceNow requests.

### Before you begin

- Request IntegrationHub subscription
- Activate the Microsoft Exchange Server spoke
- Role required: admin
About this task

- Perform these steps to use all Microsoft Exchange Server spoke actions except the Create Calendar Event For User and Lookup Room Availability actions.

- To use the Create Calendar Event For User and Lookup Room Availability actions, perform the same steps again for the Exchange https connection and credential alias. MID Server is not necessary to perform this action.

Note:

- The Create Calendar Event For User and Lookup Room Availability actions are supported only on Exchange Server 2013.

- Ensure that the user details provided in the credential record, has the application impersonation role.

Create Credential record for Microsoft Exchange Server spoke

Authorize the Microsoft Exchange Server spoke actions by creating Windows credential record for the Exchange Server host. The Microsoft Exchange Server spoke connection and credential alias uses these credentials to authorize actions.

About this task
Create two credential records, one for each connection and credential alias.

Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.

   The system displays the message, What type of Credentials would you like to create?

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSEExchangeCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Advanced selection criteria for the credential.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Results**
The Windows credential record for the Microsoft Exchange Server spoke is created.

**Create Connection record for Microsoft Exchange Server spoke**
Perform actions in Microsoft Exchange Server spoke by creating connection records. The Microsoft Exchange Server spoke connection and credential alias uses these connections to perform actions.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Exchange Server spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

**Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for the Microsoft Exchange Server spoke. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name or IP address of the target host where Exchange Server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port that the connection uses.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

**Note:** MID Server is necessary for all the Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.

5. Click **Submit**.

**Results**
The Microsoft Exchange Server spoke is set up and integrated with the ServiceNow instance.

**Microsoft Intune spoke**
Manage devices and applications in Microsoft Intune account from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Microsoft Intune API version v1, but may be compatible with later versions.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Intune spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Managed Application</td>
<td>Retrieves details of the specified application.</td>
</tr>
<tr>
<td></td>
<td>Look up Managed Applications</td>
<td>Retrieves a list of all the applications.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Delete Managed Device</td>
<td>Deletes the specified managed device.</td>
</tr>
<tr>
<td></td>
<td>Get Managed Device</td>
<td>Retrieves details of the specified managed device.</td>
</tr>
<tr>
<td></td>
<td>Look up Managed Devices</td>
<td>Retrieves details of the specified managed device.</td>
</tr>
<tr>
<td></td>
<td>Look up Managed Devices By Application</td>
<td>Retrieves details of the managed device within the specified application.</td>
</tr>
<tr>
<td></td>
<td>Look up Managed Devices By User</td>
<td>Retrieves details of managed device for a specific user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update Managed Device</td>
<td>Updates details of the specified managed device.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Look up Application ID</td>
<td>Returns the Application ID for the dynamic input of the Look up Managed Devices By Application action.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Microsoft Intune spoke**

Integrate the ServiceNow instance and Microsoft Intune account by creating a custom OAuth application in Microsoft Intune to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Microsoft Intune spoke.
- Role required: admin

**Register an application using the Microsoft Azure portal**

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

**Before you begin**

Role required: Azure Active Directory admin

**About this task**

Complete these steps from the Microsoft Azure portal.
Procedure

1. Register an application in the Microsoft Azure portal. For instructions on registering an application, see Tutorial: Register an app with Azure Active Directory in the Microsoft Azure documentation.

2. Add the Redirect URIs in this format: https://<instance-name>.service-now.com/oauth_redirect.do. For more information, see Authentication and authorization for Azure Time Series Insights API in Microsoft Docs.

3. For the Required Permissions, ensure that you provide these permissions:

<table>
<thead>
<tr>
<th>API / Permissions name</th>
<th>Type</th>
<th>Description</th>
<th>Admin consent required</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Graph (1)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DeviceManagementApps.Req.</td>
<td>Delegated</td>
<td>Read and write Microsoft Intune apps</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DeviceManagementApps.Managed.</td>
<td>Delegated</td>
<td>Perform user-impacting remote actions on Microsoft Intune devices</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>DeviceManagementApps.Managed.</td>
<td>Delegated</td>
<td>Read and write Microsoft Intune devices</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>offline access</td>
<td>Delegated</td>
<td>Maintain access to data you have given it access to</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>aop sidelined</td>
<td>Delegated</td>
<td>Sign users in</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>profile</td>
<td>Delegated</td>
<td>View users' basic profile</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>User.Read</td>
<td>Delegated</td>
<td>Sign in and read user profile</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

Other permissions granted for contentspokes

These permissions have been granted for contentspokes but aren’t in the configured permissions list. If your application requires these permissions, you should consider adding them to the configured permissions list. Learn more

<table>
<thead>
<tr>
<th>API / Permissions name</th>
<th>Type</th>
<th>Description</th>
<th>Admin consent required</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Graph (1)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>User.Read/Write.UL</td>
<td>Delegated</td>
<td>Read and write all users’ full profiles</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

For more information, see Quickstart: Configure a client application to access a web API in Microsoft Docs.

4. Create a client secret and record the value of Client Secret for use in later configurations. For more information, see the Option 2: Create a new application secret section in Microsoft Docs.

Results

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Intune as an OAuth provider

Use the information generated during the application configuration in Microsoft Azure portal to register Microsoft Intune as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.
**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record, **Microsoft Intune**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create a credential record for the Microsoft Intune spoke**

Authorize the Microsoft Intune spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Intune connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.

   The system displays this message: **What type of Credentials would you like to create?**

3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.
### OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Intune Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Intune as an OAuth provider. For example, Microsoft Intune default_profile.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

### Create a connection record for the Microsoft Intune spoke

Perform actions in Microsoft Intune by creating connection records for your Microsoft Intune account. The Microsoft Intune connection and credential alias uses these connections to perform actions.

#### Procedure

1. Navigate to **Connections & Credentials** > **Connections & Credentials Aliases**.
2. Open the alias record, **Microsoft_Intune**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Intune Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Intune spoke. For example, MS Intune Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. Enter <a href="https://graph.microsoft.com">https://graph.microsoft.com</a>.</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, specify *v1.0* for **u_version**.

6. Click **Submit**.

**Results**
The Microsoft Intune spoke is set up and Microsoft Intune is integrated with the ServiceNow instance.

**Microsoft OneDrive spoke v2.1.0**
Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.

**Request apps on the Store**
Visit the [ServiceNow Store](https://www.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](https://www.servicenow.com/store).

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com/store).

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note**: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported versions**
API version v1.
Spoke flows

The Microsoft OneDrive spoke provides sample flows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Renew Subscriptions</td>
<td>Renews the expired subscriptions by updating the expiration date of the subscription.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Download New OneDrive File to Servicenow</td>
<td>Downloads the new files uploaded in a resource to a ServiceNow record</td>
</tr>
<tr>
<td>Subscribe to Webhook</td>
<td>Subscribes a listener application to receive notifications when data changes.</td>
</tr>
<tr>
<td>Sync Changes</td>
<td>Tracks changes to a drive and its children over time.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive Management</td>
<td>Look up Drive Info</td>
<td>Gets the metadata of a specific Microsoft OneDrive drive</td>
</tr>
<tr>
<td></td>
<td>Look up Drives (Deprecated)</td>
<td>Retrieves all the available drives associated with a target User, Group, or Site. If you don't provide a User, Group, or Site, then a list of root drives associated with the authenticated user is returned.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Move File Or Folder Item</td>
<td>Moves a file or folder in Microsoft OneDrive to the target location.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Name</td>
<td>Updates the name for a file or folder item by ID.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder Item</td>
<td>Deletes a file or folder from Microsoft OneDrive.</td>
</tr>
<tr>
<td>File Management</td>
<td>Check In File</td>
<td>Checks in a drive item and sends a sharing invitation. When you check in a file, other users can access the checked-in file.</td>
</tr>
<tr>
<td></td>
<td>Check Out File</td>
<td>Checks out a drive item from OneDrive. When you check out a drive item, other users cannot edit the document. Other users also cannot see the changes that you made in the document until you check in the document.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File to Attachment</td>
<td>Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment to OneDrive</td>
<td>Copies an attachment record in ServiceNow to Microsoft OneDrive</td>
</tr>
<tr>
<td></td>
<td>Copy File Or Folder Item</td>
<td>Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.</td>
</tr>
<tr>
<td></td>
<td>Look up Items</td>
<td>Retrieves a list of drive items from a path or the source and source ID of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Look up File Or Folder Item Info By ID</td>
<td>Gets file metadata information from the file or folder ID in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Look up File Or Folder Item Info By Path</td>
<td>Gets file metadata information from the file path in Microsoft OneDrive.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To OneDrive Using Path</td>
<td>Copies an attachment record in ServiceNow to OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File To Attachment Using File Path</td>
<td>Copies a file using its path in OneDrive to an attachment in a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File Version To Attachment</td>
<td>Copies a file in OneDrive to an attachment in a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Delete Version of a File</td>
<td>Deletes the specified version of a file from OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Look up All Versions of a File</td>
<td>Retrieves all the versions a file in OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Restore File Version</td>
<td>Restores the specified file version and make this version the latest.</td>
</tr>
<tr>
<td></td>
<td>Upload and Replace File</td>
<td>Uploads the updated version of an existing file or replaces the existing file with a new file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> The maximum size of the file cannot exceed 4 MB.</td>
</tr>
<tr>
<td>Search Documents</td>
<td>Search Files or Folder Items</td>
<td>Searches the drive items (files or folders) based on metadata attributes such as the item name.</td>
</tr>
<tr>
<td>Document Sharing</td>
<td>Add Collaborator</td>
<td>Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Collaborators</td>
<td>Lists all the collaborator details associated with a file or folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Permission Management</td>
<td>Remove Collaborator</td>
<td>Removes a collaborator from a file or folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Add Permission</td>
<td>Sends a sharing invitation for a drive item. A sharing invitation allows the recipients to access the drive item and optionally sends them an email with a sharing link.</td>
</tr>
<tr>
<td></td>
<td>Create Sharing Link</td>
<td>Creates a sharing link which allows you to share a drive item with other users.</td>
</tr>
<tr>
<td></td>
<td>Delete Permission</td>
<td>Removes access to a drive item.</td>
</tr>
<tr>
<td></td>
<td>Look up Permissions</td>
<td>Retrieves the sharing permissions of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Update Permission</td>
<td>Updates the expiration date of the subscription.</td>
</tr>
<tr>
<td>Webhook Management</td>
<td>Subscribe Webhook</td>
<td>Creates a subscription that sends notifications when data changes.</td>
</tr>
<tr>
<td></td>
<td>Unsubscribe Webhook</td>
<td>Deletes the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Get SyncToken for Subscription</td>
<td>Retrieves the latest sync token for the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Subscriptions</td>
<td>Retrieves the list of active subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Renew Subscription</td>
<td>Updates the expiration date of the subscription.</td>
</tr>
<tr>
<td></td>
<td>Sync Changes</td>
<td>Tracks changes to a drive and drive's children over time.</td>
</tr>
</tbody>
</table>

**Spoke module**

Bi-directional webhooks can be set up to get notifications about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in OneDrive that you want to be notified about. When the conditions are met, a routing policy triggers the associated subflow, which in turn automates the OneDrive tasks.
The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira spoke and has the following modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OneDrive SyncToken</td>
<td>Allows you to view SyncTokens of OneDrive.</td>
</tr>
<tr>
<td>OneDrive Webhook Registries</td>
<td>Allows you to create and view the OneDrive webhooks in ServiceNow.</td>
</tr>
<tr>
<td>OneDrive Webhook Routing Policy</td>
<td>Allows you to create and view the routing policies for the OneDrive webhooks in ServiceNow. You can also customize the conditions in the routing policies as per your requirement.</td>
</tr>
</tbody>
</table>

**OneDrive Online account requirements**

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Single tenant**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

**Multiple tenants**

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. See Create aliases for multiple tenants.
MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft OneDrive spoke

Integrate the ServiceNow instance and Microsoft OneDrive spoke by using Windows credentials to authenticate ServiceNow requests.

Before you begin

• Install Microsoft AD.
• Install the Microsoft OneDrive spoke.
• Request IntegrationHub subscription.
• Activate the Microsoft OneDrive spoke.
• Role required: admin

Configure Microsoft OneDrive application

Create a custom OAuth application from your Microsoft OneDrive account to enable OAuth 2.0 authentication with the Microsoft OneDrive spoke.

Before you begin

Microsoft OneDrive requirements:

• Microsoft OneDrive account
• Microsoft Azure account
• Microsoft OneDrive tenant administrator credentials

About this task

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

Procedure

1. Log in to the Microsoft Azure App registration portal with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click Register.
   An overview of the application’s basic information is shown.
Note: Ensure that you enter the redirect URI in this format: https://<instance>.service-now.com/oauth_redirect.do.

3. Copy the application ID to a text file.
You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.

4. Add a client secret.

   a. In Microsoft Azure, navigate to Manage > Certificates & secrets.

   b. Provide a description and an expiration date and click Add.

   Note: The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the Microsoft Graph permissions reference.

   a. In Microsoft Azure, navigate to Manage > API permissions.

   b. Click the Microsoft Graph tile.

   c. Select the Delegated or Application permissions that the application supports.
Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user. You must mention these API permissions in the OAuth Entity scopes tab while configuring the application registry.
Note: You must ensure that these API permissions are provided for your custom app.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendars.ReadWrite</td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td>email</td>
<td>email</td>
</tr>
<tr>
<td>Files.Read</td>
<td>Files.Read</td>
</tr>
<tr>
<td>Files.Read.All</td>
<td>Files.Read.All</td>
</tr>
<tr>
<td>offline_access</td>
<td>offline_access</td>
</tr>
</tbody>
</table>

d. Click Add permissions.

What to do next
Register Microsoft OneDrive as OAuth provider.

Register Microsoft OneDrive as OAuth provider
Use the information generated during Microsoft OneDrive account configuration to register Microsoft OneDrive as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
• Request IntegrationHub subscription.
• Activate Microsoft OneDrive spoke.
• Create Microsoft OneDrive application.

Role required: admin

Procedure
1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example OneDrive OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the OneDrive application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.servicenow.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the OAuth Entity Scopes related list, add scopes to match the permissions you defined when you configured the Microsoft OneDrive application. Click Insert a new row and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same string. Ensure that these scopes are provided.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendars.ReadWrite</td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td>email</td>
<td>email</td>
</tr>
<tr>
<td>Files.Read</td>
<td>Files.Read</td>
</tr>
<tr>
<td>Files.Read.All</td>
<td>Files.Read.All</td>
</tr>
<tr>
<td>offline_access</td>
<td>offline_access</td>
</tr>
</tbody>
</table>
**Note:** The scopes mentioned here must be same as the API permissions provided during the custom app configuration.

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

**What to do next**

**Create Connection and Credential Alias for Microsoft OneDrive spoke**

Create Connection records to your Microsoft OneDrive account. The Microsoft OneDrive spoke connection and credential aliases use these connections to perform actions in the Microsoft OneDrive.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **IntegrationHub > Connections & Credentials > OneDrive**.
2. From **Related Links**, click **Create New Connection & Credential**.
3. On the form, fill in these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection. This field is automatically set to Microsoft OneDrive Spoke Connection</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL to make connection to the spoke. This field is automatically set to <a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
<tr>
<td>OAuth Entity Name</td>
<td>Name of the OAuth entity profile. This field is automatically set to Microsoft OneDrive Spoke Auth.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of the OneDrive application you registered in Microsoft Azure App registration portal.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret generated when you registered the application in Microsoft Azure portal.</td>
</tr>
</tbody>
</table>
Field | Value required
---|---
OAuth Redirect URL | The redirect URL. The format of the URL is https://<your-instance>.service-now.com/oauth_redirect.do

4. Click Create and Get OAuth Token.

Results
The Microsoft OneDrive spoke is set up and integrated with the ServiceNow instance.

Set up a bi-directional webhook
Configure a webhook to subscribe to OneDrive with a ServiceNow callback URL.

Before you begin
- IntegrationHub Professional subscription
- Activate OneDrive v1.6 spoke
- Role required: admin

Register a OneDrive webhook in ServiceNow
Register a OneDrive webhook in ServiceNow to notify the ServiceNow app when certain events occur in OneDrive.

Before you begin
Role required: admin

Procedure
1. Navigate to Microsoft OneDrive Spoke > OneDrive Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

Microsoft OneDrive Webhook Registries

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, OneDrive webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Path</td>
<td>OneDrive path. By default, this path is set to api/sn_onedrive_spoke/onedrive/subscription</td>
</tr>
<tr>
<td>Secret Key</td>
<td>Secret key for accessing OneDrive webhook.</td>
</tr>
</tbody>
</table>

**Note:** The Secret Key field value is auto-populated when the webhook registry record is saved.

4. Right-click the form header and click **Save**.

5. Click **Callback URL**.
   The system displays the webhook callback URL.

6. Copy and record the webhook callback URL.

**Customize OneDrive bi-directional webhook**

Create a webhook routing policy and subflow according to your requirement.

**Before you begin**

Role required: admin

**About this task**

Routing policies in the OneDrive Webhook Routing Policy module triggers the subflows and notifies the ServiceNow instance when certain events occur in your OneDrive account. See OneDrive spoke for information about the fields that the routing policy and subflows support.

**Procedure**

1. Navigate to **Flow Designer > Designer**.

2. Click **Subflows**.

3. Create a copy of any of the default subflows. For example, Sync Changes.

4. Customize the subflow according to your requirement and publish it. See **Subflows** for more information about creating and using subflows, and **OneDrive spoke v1.6** for information about the supported subflows.

5. Navigate to **Microsoft OneDrive Spoke > OneDrive Webhook Routing Policy**.

6. Click **New**.

7. On the form, fill in the fields.
Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td><strong>a.</strong> Click the lookup icon (🔍).</td>
</tr>
<tr>
<td></td>
<td><strong>b.</strong> Select the required subflow from the Document list.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in OneDrive.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow which is triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

Results
The routing policy and subflow are created.

**Microsoft SCCM spoke**
Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

**Spoke flows & subflows**
This spoke has no sample flows or subflows.
Spoke actions

The Microsoft System Center Configuration Management (SCCM) spoke provides actions to automate SCCM tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Applications</td>
<td>Retrieves the application data from the SCCM server.</td>
</tr>
<tr>
<td>Deployment Management</td>
<td>Get Deployments</td>
<td>Retrieves deployment data from the SCCM server.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Add to Device Collection</td>
<td>Adds a device to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get Device Collections</td>
<td>Retrieves device collection data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Is Device In Collection</td>
<td>Checks if a specified device exists in a device collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From Device Collection</td>
<td>Removes a device from an existing device collection.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add to User Collection</td>
<td>Adds a user to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get User Collections</td>
<td>Retrieves user collection data from the SCCM Server.</td>
</tr>
<tr>
<td></td>
<td>Is User In Collection</td>
<td>Checks if a specified user exists in a user collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From User Collection</td>
<td>Removes a user from a user collection.</td>
</tr>
</tbody>
</table>

To see inputs and outputs for these activities, see SCCM activity pack.

MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>Connection to the SCCM server.</td>
<td>The URL of the host machine where the SCCM server is installed.</td>
</tr>
</tbody>
</table>

Set up SCCM spoke

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Create Credential record for the SCCM spoke

Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

Before you begin

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
   A blank Windows Credentials form displays.

4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SCCM Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

Create Connection record for the SCCM spoke

Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

Before you begin
- Request IntegrationHub subscription
- Create Credential record for the SCCM spoke
- Role required: admin

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for SCCM.
3. From the Connections tab, click New.
   The system displays a blank Basic Connection form.
4. Enter these values, then click Submit.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SCCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows. For example, select SCCM Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MiD server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

**What to do next**

Configure MiD Server as WinRM trusted host

**Microsoft SCCM Usage Metering spoke**

Manage the process of fetching software usage data from a Microsoft System Center Configuration Management (SCCM) Usage Metering server. Get data about software usage metering and when the software was last used using this spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported Versions**

This spoke was built for Microsoft SCCM version 1602, but may be compatible with later versions.
Spoke Requirements

- Microsoft System Center Configuration Management Usage Metering Server version 2012 R2 with software metering enabled. For more information about software metering, see Software metering in Configuration Manager

  Note: Ensure that metering rules are configured in SCCM for the required software.

- Microsoft SQL Server 2014

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft SCCM Usage Metering spoke provides actions to retrieve software usage data from a Microsoft System Center Configuration Management Usage Metering server. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Software Last Used Data</td>
<td>Retrieves the last usage data of the required software from the Microsoft SCCM server.</td>
</tr>
<tr>
<td>Get Software Usage Data</td>
<td>Retrieves usage metering of the required software from the Microsoft SCCM server.</td>
</tr>
</tbody>
</table>

Note:

The spoke actions support a maximum payload of 10 MB from the SCCM server for the JDBC step.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record that is associated with the Microsoft SCCM Usage Metering alias to configure where actions run as well as to set MID Server selection attributes. For more information, see MID server.

**Set up the Microsoft SCCM Usage Metering spoke**

Integrate the ServiceNow instance and SCCM using Java Database Connectivity (JDBC) credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Microsoft SCCM Usage Metering spoke
- Role required: admin

**Create Connection records for the Microsoft SCCM Usage Metering spoke**

Create Connection records to the SCCM server. The SCCM Usage Metering spoke connection and credential aliases use these connections to perform actions in SCCM.

**Procedure**

1. Navigate to **Credentials & Connections > Connections**.
2. Click **New** and select **JDBC Connection**.
3. On the form, fill in the fields.
   The database selection in the **Format** field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the JDBC connection. For example, JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential for the JDBC provider. Enter the user name and password of the database.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with the connection.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Maximum elapsed time the JDBC query allowed to run without a response.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.</td>
</tr>
<tr>
<td>Format</td>
<td>Database type for the connection. The choices are:</td>
</tr>
<tr>
<td></td>
<td>- MySQL</td>
</tr>
<tr>
<td></td>
<td>- Oracle</td>
</tr>
<tr>
<td></td>
<td>- SQLServer</td>
</tr>
<tr>
<td></td>
<td>- None</td>
</tr>
<tr>
<td>Host</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Oracle is selected from the Format list.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle database site identifier. The default value is orcl.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Oracle is selected from the Format list.</td>
</tr>
<tr>
<td>Database name</td>
<td>Name of the database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when MySQL or SQLServer is selected from the Format list.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when MySQL or SQLServer is selected from the Format list.</td>
</tr>
<tr>
<td>Instance name</td>
<td>Instance name for the selected SQLServer.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when SQLServer is selected from the Format list.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Connection URL | URL that MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. For example, `jdbc:<database>://<hostname>;selectMethods=cursor;databaseName=<database_name>`. **Note:** If the format selected is not one of the default databases, you must create the connection URL manually. So that the MID Server can create the connection.
Use MID server | Option to use a MID Server for the action. If selected, define fields in the Advanced MID Server Configuration section.
Capabilities | Capabilities that the MID Server must support to be eligible for selection. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.
MID Application | Application that the MID Server must support to be eligible for selection. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.

## Create Credential records for the Microsoft SCCM Usage Metering spoke
Create Credential records to the SCCM server. The Microsoft SCCM Usage Metering spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select JDBC Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
Active | Option to use the credentials.
Applies to | Option to verify if the credentials apply to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.
Order | Order to apply this credential. For example, enter 100.
User name | User name to access the database.
Password | Password to access the database.
Credential alias | Credential alias associated with the spoke.

5. Click **Submit**.

**Microsoft Security Response Center spoke**

Integrate the Microsoft Security Response Center API with your ServiceNow instance to investigate all reports of security vulnerabilities affecting the Microsoft products and services, and gather information to manage security risks and keep the system protected.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Microsoft Security Response Center API version 2020, but may be compatible with later versions.
**Spoke dependencies**
If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

ℹ️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Microsoft Security Response Center spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abuse Management</td>
<td>Submit Abuse Report</td>
<td>Submits report to the Microsoft Computer Emergency Response Team using the Common Abuse Reporting system (CARS).</td>
</tr>
<tr>
<td>Security Management</td>
<td>Get Security Update Details</td>
<td>Retrieves information about the specific CVRF ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Security Updates</td>
<td>Retrieves the list of all Microsoft security updates.</td>
</tr>
<tr>
<td></td>
<td>Look up Security Updates By Key</td>
<td>Retrieves the list of security updates based on the provided ID, CVE, or year.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.
Set up the Microsoft Security Response Center spoke

Integrate the ServiceNow instance and Microsoft Security Response Center account using the API key credentials to authenticate ServiceNow requests.

Before you begin

- Admin access to the Microsoft Security Update API
- Role required: admin

Procedure

1. Log in to the Microsoft Security Update API with admin credentials and copy and record the value of the API key.

2. Create a credential record for the Microsoft Security Response Center spoke in your ServiceNow instance.

   a. Navigate to Connections & Credentials > Credentials.

   b. Click New.

   The system displays the message What type of Credentials would you like to create?.

   c. Select API Key Credentials.

   d. On the form, fill these values.

      | Field   | Value required                                      |
      |---------|-----------------------------------------------------|
      | Name    | Name to uniquely identify the record. For example, enter MSRC Credentials. |
      | Active  | Option to actively use the credential record.       |
      | API Key | API key copied from the Microsoft Security Update API page. |
      | Order   | Select the order to apply this credential. For example, enter 100.   |

   e. Click Submit.

3. Create a connection record for the Microsoft Security Response Center spoke in your ServiceNow instance.

b. Open the record for Microsoft Security Response Center.

c. From the Connections tab, click New.

d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter MSRC Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Microsoft Security Response Center. For example, select MSRC Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL to connect to the Microsoft Security Response Center API. For example, <a href="https://api.msrc.microsoft.com">https://api.msrc.microsoft.com</a>.</td>
</tr>
</tbody>
</table>

e. In the Attributes tab, specify the Microsoft Security Response Center API version in api-version. For example, 2020.

f. Click Submit.

Microsoft SharePoint spoke v2.0.2
Manages sites, folders, files, groups, lists, and users in Microsoft SharePoint. Adds Microsoft SharePoint data to your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions
API version v1.

Spoke flows
The Microsoft SharePoint spoke provides sample flows in the draft state to demonstrate automating Microsoft SharePoint tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Attachment on Record creates folder,</td>
<td>Creates a Microsoft SharePoint folder with an attachment when the attachment is added to a Knowledge article in ServiceNow.</td>
</tr>
<tr>
<td>and copies attachment</td>
<td></td>
</tr>
<tr>
<td>Create Site For Knowledge Base</td>
<td>Creates a Microsoft SharePoint site when a Knowledge Base is created in ServiceNow.</td>
</tr>
</tbody>
</table>

Note:
- If the single sign-on is setup, configure your flows to retrieve the user details from Microsoft SharePoint using the spoke action, Look Up User Information By Login Name, to verify if the user is authorised to perform the required actions.
- Flow designers and action designers must ensure that user authorisation checks are performed, before the flow or action is executed.

Spoke subflows
The Microsoft SharePoint spoke provides sample subflows in the draft state to demonstrate automating Microsoft SharePoint tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
Remove Then Add A User To A Group

Removes a previous owner from a Microsoft SharePoint group and adds the new owner.

**Note:** Flow designers and action designers must ensure that user authorisation checks are performed, before the flow or action is executed.

### Spoke actions

The Microsoft SharePoint spoke provides actions to automate Microsoft SharePoint tasks when events occur in ServiceNow. The spoke actions use of the three alias records that are available along with the spoke.

These actions use the Sharepoint Online connection and credential alias record:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Management</td>
<td>Create Site</td>
<td>Creates a site or subsite in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Delete Site</td>
<td>Removes a site or subsite from Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Look up Changes For Site</td>
<td>Retrieves the changes for a given site based on the query conditions.</td>
</tr>
<tr>
<td></td>
<td>Look Up Site Collection ID</td>
<td>Looks up a specific site ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sites</td>
<td>Looks up the sites in a given Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Subsite Details</td>
<td>Looks up information about a subsite.</td>
</tr>
<tr>
<td></td>
<td>Update Site Information</td>
<td>Updates a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in a document library on a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder in Microsoft SharePoint.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Files In A Folder</td>
<td>Gets a list of files in a folder.</td>
</tr>
<tr>
<td></td>
<td>List Folders In A Folder</td>
<td>Gets a list of folders in a folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folder</td>
<td>Looks up a folder in Microsoft SharePoint and returns folder properties. For example, use this action to return the relative URL to enter as input in the Rename A Folder action.</td>
</tr>
<tr>
<td></td>
<td>Rename A Folder</td>
<td>Renames a folder in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With Group</td>
<td>Shares a folder with a group in Microsoft SharePoint. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With User</td>
<td>Shares a folder with a user in Microsoft SharePoint. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With Group</td>
<td>Unshares a folder with a group. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With User</td>
<td>Unshares a folder with a user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td>File Management</td>
<td>Attach Sharepoint File To A Record</td>
<td>Attaches a Microsoft SharePoint file to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Check-in File</td>
<td>Checks in a file to Microsoft SharePoint using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Check-out File</td>
<td>Checks a file out of Microsoft SharePoint using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To Folder</td>
<td>Copies a ServiceNow attachment to a Microsoft SharePoint folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File</td>
<td>Copies a file with a new name.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create A Text File</td>
<td>Uploads a text file to Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Delete File</td>
<td>Deletes a file in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Details</td>
<td>Looks up file details in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Move File</td>
<td>Moves a file to another location in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Share File With Group</td>
<td>Shares a file with a group in Microsoft SharePoint. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share File With User</td>
<td>Shares a file with a Microsoft SharePoint user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With Group</td>
<td>Unshares a file with a Microsoft SharePoint group. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With User</td>
<td>Unshares a file with a Microsoft SharePoint user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up User Information By Login Name</td>
<td>Searches the Microsoft SharePoint site for a given user and returns information about the user account.</td>
</tr>
<tr>
<td></td>
<td>Look Up User's Sharepoint Groups</td>
<td>Searches the Microsoft SharePoint site for a given user and returns the user's Microsoft SharePoint groups regardless of which site or subsite the group is a part of.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add Role To Site</td>
<td>Adds a role to a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
<td>Adds a User to a Microsoft SharePoint site group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Delete Group</td>
<td>Delete Group</td>
<td>Deletes a group on a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>Look Up Group By</td>
<td>Look Up Group By Name</td>
<td>Looks up a group by name in the specified site location. If no site location is specified, the spoke searches the tenant root site.</td>
</tr>
<tr>
<td>Remove Role From</td>
<td>Remove Role From Site</td>
<td>Removes permissions from a group or user.</td>
</tr>
<tr>
<td>Remove User From</td>
<td>Remove User From Group</td>
<td>Removes a user from a Microsoft SharePoint site group.</td>
</tr>
<tr>
<td>Update</td>
<td>Update Group Owner (User)</td>
<td>Updates a group owner.</td>
</tr>
<tr>
<td>List Management</td>
<td>Create List Item</td>
<td>Creates a list item in a list.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete List By ID</td>
<td>Deletes a list in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>Look Up List</td>
<td>Look Up List Item By ID</td>
<td>Retrieves a list item with both the List ID and List Item ID.</td>
</tr>
<tr>
<td>Items In A List</td>
<td>Look Up List Items In A List</td>
<td>Retrieves a list of items in the specified list in various useful formats.</td>
</tr>
<tr>
<td>Update</td>
<td>Update List Item By ID</td>
<td>Updates the list item title with the specified ID.</td>
</tr>
<tr>
<td>List Item</td>
<td>Create List</td>
<td>Creates list in a site with the specified title and description.</td>
</tr>
<tr>
<td>Management</td>
<td>Look Up List Details By ID</td>
<td>Retrieves details of the specified list in a site.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete List By ID</td>
<td>Deletes the specified list in a site.</td>
</tr>
</tbody>
</table>
### Look Up List ID By Title
Retrieves details of the specified list in a site, based on the list title.

### Renew List Subscription
Renews a webhook subscription for a list.

### Update List Details
Updates details of the specified list.

**Note:** Flow designers and action designers must ensure that user authorisation checks are performed, before the flow or action is executed.

These actions use the SharePoint Graph connection and credential alias record:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Management</td>
<td>Get Change Query Properties</td>
<td>Retrieves the change query properties which are used to define a query that is performed against the change log.</td>
</tr>
<tr>
<td></td>
<td>Get Delta Link Token For Drive</td>
<td>Retrieves the latest delta link token for a drive.</td>
</tr>
<tr>
<td></td>
<td>Get Next Token</td>
<td>Retrieves the next link token from the SharePoint Resource Next Link Token table.</td>
</tr>
<tr>
<td>File Management</td>
<td>Get File Download Link</td>
<td>Retrieves the download URL of the file from SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Look up Files</td>
<td>Retrieves all the files in a drive.</td>
</tr>
<tr>
<td>List Management</td>
<td>Create List Subscription</td>
<td>Creates a webhook subscription for a list.</td>
</tr>
<tr>
<td></td>
<td>Delete List Subscription</td>
<td>Deletes the webhook subscription for a list.</td>
</tr>
<tr>
<td></td>
<td>Get List</td>
<td>Retrieves the details of a list from SharePoint tenant.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Look up Drives</td>
<td></td>
<td>Retrieves all the drives for a site.</td>
</tr>
<tr>
<td>Site Management</td>
<td>Get Site</td>
<td>Retrieves details of the required site.</td>
</tr>
<tr>
<td></td>
<td>Look up Site Collections</td>
<td>Retrieves all the site collections.</td>
</tr>
<tr>
<td></td>
<td>Look up Subsites</td>
<td>Retrieves details of all the subsites in a site.</td>
</tr>
</tbody>
</table>

The Create Root Site Subscription action uses the SharePoint Graph Root Site Subscription connection and credential alias record. The action can be used to create a webhook subscription for root site.

**SharePoint Online account requirements**

The Microsoft SharePoint spoke requires creating a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See Configure Microsoft SharePoint account.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Single tenant**

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint for a single tenant.

**Multiple tenants**

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. See Create aliases for multiple tenants.
**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Configure Microsoft SharePoint account**

Create a custom OAuth application from your Microsoft SharePoint online or onprem accounts to enable OAuth 2.0 authentication with the Microsoft SharePoint spoke.

**About this task**

- If you want to set up the integration using tenant permissions, see Configure Microsoft SharePoint account with tenant permissions.

- If you want to set up the integration using site collection permissions, see Configure Microsoft SharePoint account with site collection permissions.

After configuring the Microsoft SharePoint account, perform the other spoke setup tasks.

**Configure Microsoft SharePoint account with tenant permissions**

Create a custom OAuth application from your Microsoft SharePoint online or onprem accounts to enable OAuth 2.0 authentication with tenant permissions.

**Before you begin**

Microsoft SharePoint requirements:

- Microsoft SharePoint Online account or Microsoft SharePoint Onprem account
- Microsoft SharePoint tenant administrator credentials

**About this task**

Complete these steps from your Microsoft SharePoint account. See the SharePoint development documentation for instructions on creating and configuring custom applications.

**Procedure**

1. Select Microsoft SharePoint Online account or Microsoft SharePoint Onprem account.

   - For SharePoint Online account, work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint tenant you want to connect to. Record the Directory ID
to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.

- For SharePoint Onprem account, download and run the Hybrid Configuration wizard from the Admin Center. For more information, see Hybrid Configuration wizard.

2. Log in the Azure AD portal as a global administrator.

3. Navigate to **Azure Active Directory** > **Overview**. Record the value of the **Tenant ID**.

4. Identify the root URL for your Microsoft SharePoint tenant. For example, 
   https://<site-name>.sharepoint.com

5. Create an application add-in or app that the Microsoft SharePoint can use to identify the integration connection from the ServiceNow instance.

   a. Open a new tab in your browser and navigate to: https://<site-name>/sharepoint.com/_layouts/15/appregnew.aspx. Replace <site-name> with the site name you had identified earlier.

   b. Fill these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Unique client ID. Click <strong>Generate</strong> to generate a unique client ID.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Unique client secret. Click <strong>Generate</strong> to generate a unique client secret.</td>
</tr>
<tr>
<td>Title</td>
<td>Name to identify the app.</td>
</tr>
<tr>
<td>App Domain</td>
<td>ServiceNow domain URL.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>ServiceNow instance redirect URL.</td>
</tr>
</tbody>
</table>
c. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

6. Provide required permissions to the app.

b. In **AppId**, provide the value of the client ID and click **Lookup**. Values in the other fields are auto-populated.

c. In **Permissions**, enter this XML.

```xml
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest
    Scope="http://sharepoint/content/tenant"
    Right="FullControl" />
</AppPermissionRequests>
```
d. Click Trust It.

7. To use the Graph and Graph Root Site Subscription alias records that are available along with the spoke, perform these configurations:

a. In the Azure AD portal, navigate to App Registrations.

b. In the All Applications tab or Owned Applications tab, identify and open the app you had created.

c. Under Authentication, provide the ServiceNow redirect URL in the Web section. Enter https://<servicenow-instance>/oauth_redirect.do and click Save.

d. Under API Permissions, perform these:
   i. Click Add a permission.
   ii. Select Microsoft Graph.
   iii. Select Delegated Permissions.
   iv. Select the Sites.ReadWrite.All permission from the Sites list and User.Read permission from the Users list.
Configure Microsoft SharePoint account with site collection permissions

Create a custom OAuth application from your Microsoft SharePoint online or onprem accounts to enable OAuth 2.0 authentication with site collection permissions.

Before you begin
Microsoft SharePoint requirements:

- Microsoft SharePoint Online account or Microsoft SharePoint Onprem account
- Microsoft SharePoint site collection administrator credentials

About this task
Complete these steps from your Microsoft SharePoint account. See the SharePoint development documentation for instructions on creating and configuring custom applications.

Procedure

1. Select Microsoft SharePoint Online account or Microsoft SharePoint Onprem account.
   - For SharePoint Online account, work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint tenant you want to connect to. Record the Directory ID to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.
   - For SharePoint Onprem account, download and run the Hybrid Configuration wizard from the Admin Center. For more information, see Hybrid Configuration wizard.

2. Log in to the Azure AD portal as a global administrator.

3. Navigate to Azure Active Directory > Overview. Record the value of the Tenant ID.

4. Identify the root URL for your Microsoft SharePoint tenant. For example, https://<site-name>.sharepoint.com

5. Create an application addin or app that the Microsoft SharePoint can use to identify the integration connection from the ServiceNow instance.

   a. Open a new tab in your browser and navigate to: https://<site-name>.sharepoint.com/sites/<site-collection-name>/_layouts/15/appregnew.aspx. Replace <site-name> with the site name you had identified earlier.
b. Fill these details:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Unique client ID. Click Generate to generate a unique client ID.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Unique client secret. Click Generate to generate a unique client secret.</td>
</tr>
<tr>
<td>Title</td>
<td>Name to identify the app.</td>
</tr>
<tr>
<td>App Domain</td>
<td>ServiceNow domain URL.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>ServiceNow instance redirect URL.</td>
</tr>
</tbody>
</table>

c. Click Create.

d. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

6. Provide required permissions to the app.

b. In Appld, provide the value of the client ID and click Lookup. Values in the other fields are auto-populated.

c. In Permissions, enter this XML.
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest Scope="http://sharepoint/content/sitecollection"
      Right="FullControl" />
</AppPermissionRequests>
d. Click **Trust It**.

7. To use the Graph and Graph Root Site Subscription alias records that are available along with the spoke, perform these configurations:

**a. In the Azure AD portal, navigate to App Registrations.**

**b. In the All Applications tab or Owned Applications tab, identify and open the app you had created.**

**c. Under Authentication, provide the ServiceNow redirect URL in the Web section.** Enter **https://<servicenow-instance>/oauth_redirect.do** and click **Save**.

**d. Under API Permissions, perform these:**

  i. Click **Add a permission**.

  ii. Select **Microsoft Graph**.

  iii. Select **Delegated Permissions**.

  iv. Select the **Sites.ReadWrite.All** permission from the **Sites** list and **User.Read** permission from the **Users** list.
Create aliases for multiple tenants

Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. If configuring an integration for a single tenant, use the existing MicrosoftSharepointOnline alias record.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.

2. Click New.

A blank Connection & Credential Alias record opens

3. On the Connection & Credential Aliases form, fill the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;unique-name&gt;</td>
</tr>
<tr>
<td>Type</td>
<td>Connection and Credential</td>
</tr>
<tr>
<td>Connection type</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

4. Click Submit.

What to do next

Associate a Credential record and a Connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

Define Microsoft SharePoint tenants

Define a profile for your Microsoft SharePoint tenant site. The Microsoft SharePoint spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint.

Procedure

1. Navigate to Microsoft SharePoint Online > Tenants.

2. Click New.

3. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the tenant.</td>
</tr>
<tr>
<td>Alias</td>
<td>Select a connection and credential alias. If configuring the integration for a single tenant, select the <strong>MicrosoftSharepointOnline</strong> alias. If configuring the integration for multiple tenants, select the desired alias.</td>
</tr>
<tr>
<td>Sharepoint Root URL</td>
<td>Enter the root SharePoint URL without the https:// prefix. For example, <code>&lt;SiteName&gt;.sharepoint.com</code></td>
</tr>
<tr>
<td>Tenant Id</td>
<td>Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint tenant you want to connect to. See <a href="#">Configure Microsoft SharePoint account</a>.</td>
</tr>
<tr>
<td>Resource Id</td>
<td>Auto-populated with <code>00000003-0000-0ff1-ce00-000000000000</code>.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**What to do next**
If configuring an integration with multiple Microsoft SharePoint tenants, create additional tenant profiles as needed.

Configure the SharePoint Online connection and credential alias record
Integrate the ServiceNow instance and Microsoft SharePoint by creating a custom OAuth application in Microsoft SharePoint to authenticate ServiceNow requests.

**Before you begin**
- Request IntegrationHub subscription
- Activate Microsoft SharePoint spoke
- Role required: admin

**Register Microsoft SharePoint as OAuth provider**
Use the information generated during Microsoft SharePoint account configuration to register Microsoft SharePoint as an OAuth provider and allow the instance to request OAuth 2.0 tokens.
Procedure

1. Navigate to System OAuth > Application Registry.

2. Click New.
   The system displays the message What kind of OAuth application?

3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID in this format: &lt;ClientID&gt;@&lt;TenantID&gt;.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you created during the Microsoft SharePoint account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Select OAuthUtilSPOnline.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Token URL in this format: <a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a>&lt;TenantID&gt;/tokens/OAuth/2. Replace &lt;TenantID&gt; with your Tenant ID.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

6. Copy the value from Redirect URL.

7. Login to your Microsoft SharePoint account to edit the configuration of your custom SharePoint application.
   For information on how to configure your custom SharePoint application, see Configure Microsoft SharePoint account.

8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Microsoft SharePoint application.

Example
   For example, paste https://instance.service-now.com/oauth_redirect.do.
Results
The instance can request OAuth 2.0 tokens for the spoke.

Create Credential records for the Microsoft SharePoint spoke
Create Credential records to the Microsoft SharePoint custom OAuth application you created during Microsoft SharePoint account configuration. The Microsoft SharePoint spoke connection and credential aliases use these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft SharePoint application as an OAuth provider. For example, select SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. From Related Links, click Get OAuth Token.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

⚠️ Note: Ensure that you allow pop-up windows in your browser.
Create Connection records for the Microsoft SharePoint spoke

Create Connection records to your Microsoft SharePoint account. The Microsoft SharePoint spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint.

Procedure

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the connection and credential alias used in the Tenant record. See Define Microsoft SharePoint tenants and Create aliases for multiple tenants.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>SharePoint Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft SharePoint. For example, select <strong>SharePoint Credentials</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft SharePoint.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root SharePoint URL. For example, https://&lt;SiteName&gt;.sharepoint.com.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
   The Microsoft SharePoint account is integrated with your ServiceNow instance and the spoke is ready to be used.

⚠️ **Note:** If the single sign-on is setup, configure your flows to retrieve the user details from Microsoft SharePoint using the spoke action, Look Up User Information By Login Name, to verify if the user is authorised to perform the required actions.

Configure the SharePoint Graph connection and credential alias record

Integrate the ServiceNow instance and Microsoft SharePoint by creating a custom OAuth application in Microsoft SharePoint to authenticate ServiceNow requests.
Before you begin

- Request IntegrationHub subscription
- Activate Microsoft SharePoint spoke
- Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connections & Credential Aliases.
2. Open the record, MicrosoftSharePointGraph.
3. Click the Create New Connection & Credential related link.
4. On the form, fill these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OAuth Entity Name</td>
<td>Name to identify the OAuth application registry record.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID in this format: &lt;ClientID&gt;@&lt;TenantID&gt;.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret you created during the Microsoft SharePoint account configuration.</td>
</tr>
<tr>
<td>OAuth Token URL</td>
<td>Token URL in this format: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;tenant-id&gt;/oauth2/v2.0/token</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>Token revocation URL in this format: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a> &lt;tenant-id&gt;/oauth2/v2.0/token.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>ServiceNow redirect URL in this format: <a href="https://empipaas.servicenow.com/oauth_redirect.do">https://empipaas.servicenow.com/oauth_redirect.do</a></td>
</tr>
</tbody>
</table>

Note: You may change default values as per your requirement.

5. Click Create and Get OAuth Token.
Configure the SharePoint Graph Root Site Subscription connection and credential alias record

Integrate the ServiceNow instance and Microsoft SharePoint by creating a custom OAuth application in Microsoft SharePoint to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription
- Activate Microsoft SharePoint spoke
- Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connections & Credential Aliases.
2. Open the record, SharePointGraphRootSiteSubscription.
3. Click the Create New Connection & Credential related link.
4. On the form, fill these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OAuth Entity Name</td>
<td>Name to identify the OAuth application registry record.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID in this format: &lt;ClientID&gt;@&lt;TenantID&gt;.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret you created during the Microsoft SharePoint account configuration.</td>
</tr>
<tr>
<td>OAuth Token URL</td>
<td>Token URL in this format: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;tenant-id&gt;/oauth2/v2.0/token</td>
</tr>
</tbody>
</table>

Note: You may change default values as per your requirement.

5. Click Create and Get OAuth Token.

Microsoft Teams spoke

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.
IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Microsoft Teams actions
The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Microsoft Teams Inputs
The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this</td>
</tr>
</tbody>
</table>
(continued)

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action. Refer to the custom incoming</td>
<td>webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>[Optional] Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Fields</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>[Optional] Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

**Example**
You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.
Microsoft Teams Communications spoke v1.1.1

Manage groups calls and meetings in Microsoft Teams Communications account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Microsoft Teams Communications API version v1 and beta version, but may be compatible with later versions.
Note: The Create Online Meeting and Mute Participants spoke actions use the beta API version. All the remaining actions use the API version v1.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Microsoft Teams Communications spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Call Management</td>
<td>Delete Group Call</td>
<td>Deletes the specified active group call.</td>
</tr>
<tr>
<td></td>
<td>Get Group Call Details</td>
<td>Retrieves details of the specified active group call.</td>
</tr>
<tr>
<td></td>
<td>Get Group Call Participant Details</td>
<td>Retrieves the properties and relationships of a participant object or list of participant objects from Microsoft Graph API.</td>
</tr>
<tr>
<td></td>
<td>Invite Participants to Group Call</td>
<td>Invites participants to the specified active group call.</td>
</tr>
<tr>
<td></td>
<td>Keep Group Call Alive</td>
<td>Keeps a group call alive if the keep alive request is made within 45 minutes of the previous request. If the request is not made within 45 minutes, the group call is considered as an inactive call.</td>
</tr>
<tr>
<td></td>
<td>Mute Participants in Group Call</td>
<td>Mutes one or more participants in an active group call.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Start Group Call</td>
<td>Initiates a group call.</td>
</tr>
<tr>
<td>Meeting Management</td>
<td>Create Online Meeting</td>
<td>Creates an online meeting using the Microsoft Graph API.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Microsoft Teams Communications spoke**

Integrate the ServiceNow instance and Microsoft Teams Communications account by creating a custom OAuth application in Microsoft Teams Communications to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Microsoft Teams Communications spoke.
- Role required: admin

**Register a custom application using the Microsoft Azure portal**

Provide authorization to the ServiceNow instance by registering a custom application with Azure AD.

**Before you begin**

- Admin access to Microsoft Teams App Studio
- Role required: Azure Active Directory admin
Procedure

1. Create a custom app in the App Studio. For more information about creating the app, see Tutorial: Extend to Microsoft Teams in the Bot Framework Solutions Documentation site.

2. Create a bot and configure it as per your requirement. For more information about creating and setting up the bot, see Create your app manifest and package in Microsoft Teams admin documentation.
   Update bot endpoint address to point to your bot.

3. Log in the Microsoft Azure portal.

4. From App Registrations, open your custom app.

5. Copy and record the value of Application (client) ID and Directory (tenant) ID.

6. Create a client secret and record the value of Client Secret for use in later configurations. For more information, see the Option 2: Create a new application secret section in Microsoft Docs.

7. Ensure that these permissions are provided to your custom app:
   - User.ReadWrite.All
   - OnlineMeetings.ReadWrite
   - Calls.AccessMedia.All
   - Calls.InitiateGroupCall.All
   - Calls.JoinGroupCall.All
   For more information about the API permissions, see Add permissions to access your web API in Microsoft Docs.

Register Microsoft Teams Communications as an OAuth provider

Use the information generated during the application configuration in Microsoft Azure portal to register Microsoft Teams Communications as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.

2. Click New.
   The system displays this message: What kind of OAuth application?.

3. Select Connect to a third party OAuth Provider.

4. On the form, fill these values.
## Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>Client Credentials</strong>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

6. In the **OAuth Entity Profiles** tab, insert a row and fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the entity profile record. For example, <strong>MS Teams Comm OAuth Prof</strong>.</td>
</tr>
<tr>
<td>Is default</td>
<td>Specifies if the record is the default entity profile.</td>
</tr>
<tr>
<td>Grant type</td>
<td>Grant type used to establish the token. Select <strong>Client Credentials</strong>.</td>
</tr>
</tbody>
</table>

7. In the **OAuth Entity Scopes** tab, insert a row and fill these values:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Teams Comm Cred.</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>OAuth entity scope. Enter .default.</td>
</tr>
</tbody>
</table>

8. Right-click the form header, and click **Save**.

9. In the **OAuth Entity Profiles** tab, open the entity profile record you had created.

10. In the **OAuth Entity Scopes** tab, insert a record.

11. Search and select the OAuth entity scope you had created.

12. Click **Update**.

**Create a credential record for the Microsoft Teams Communications**

Authorize the Microsoft Teams Communications spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Communications connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record, **MSTeamsCommunicationsSpoke**.
3. From the **Credentials** tab, click **New**.
   
The system displays this message: **What type of Credentials would you like to create?**
4. Select **OAuth 2.0 Credentials**.

5. On the form, fill in the fields.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Teams Comm Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
6. Right-click the form header and click Submit.

7. To generate the OAuth token, click the Get OAuth Token related link.

**Microsoft Teams Graph spoke v3.4.0**

The Microsoft Teams Graph spoke creates and manages teams and channels in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**Note:**

- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Azure AD. To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Azure AD.
- User and group management can be done using Microsoft Azure AD only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
- The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Azure AD.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Supported version**

Microsoft Graph REST API v1.0 and Beta API

**Note:** The Notification Management actions use Beta API.
**Spoke actions**
The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

### Microsoft Teams Graph spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team Management</td>
<td>Create Team</td>
<td>Creates a team from an existing Microsoft Office 365 group.</td>
</tr>
<tr>
<td></td>
<td>Update Team</td>
<td>Updates the properties of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Team</td>
<td>Retrieves the properties and relationships of a team.</td>
</tr>
<tr>
<td></td>
<td>Archive Team</td>
<td>Archives a team. Members cannot send messages on the channels of the team. However, members can be added to the group and can search the team content.</td>
</tr>
<tr>
<td></td>
<td>List Teams</td>
<td>Lists teams the specified user is part of.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Team</td>
<td>Restores an archived team. Members can send messages on the channels of the team.</td>
</tr>
<tr>
<td>Channel Management</td>
<td>Create Channel in a Team</td>
<td>Creates a channel in a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel Metadata</td>
<td>Retrieves the properties and relationships of a channel.</td>
</tr>
<tr>
<td></td>
<td>Get Messages From Channel</td>
<td>Retrieves the list of messages in a channel of a team.</td>
</tr>
</tbody>
</table>
### Microsoft Teams Graph spoke actions (continued)

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Management</td>
<td>Get Messages From Chat</td>
<td>Retrieves the list of messages in a chat.</td>
</tr>
<tr>
<td></td>
<td>Look up Chats</td>
<td>Retrieves the list of chats of a user.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post Change Details</td>
<td>Posts details of the required change to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts details of the required incident to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Message</td>
<td>Posts message to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts details of the required problem to a channel.</td>
</tr>
<tr>
<td>Application Management</td>
<td>Get User App Installation</td>
<td>Verifies if the specific application is installed for the given user and retrieves the installation status.</td>
</tr>
</tbody>
</table>

**Note:**
Currently, these actions use Beta API. Hence, when you create the connection record, `api_version` in the Attributes tab is set to `beta` by default.

When Microsoft Teams supports these actions in another API version, you must update `api_version` in the Attributes tab and specify the new API version to use these actions.
**Microsoft Teams Graph spoke actions (continued)**

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Install Application to User</td>
<td>Installs the specified application for the given user and retrieves the installation status.</td>
</tr>
</tbody>
</table>

**Note:** Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to **Teams**, and click **Get link to channel** for the required channel. The channel link contains the required details. For example, if the channel link is https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613%40thread.skype/2520channel%2520in%2520team?groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3&tenantId=a46df9b7-2c9b-49d5-8c9f-d1b3de4ba59f, the group ID and team ID are 7fb91938-5e8c-4968-bf7d-3987df7716f3, and the channel ID is 19:1aa3730712e245a0af31e4095d66d613@thread.skype or 1aa3730712e245a0af31e4095d66d613.

For more information about accessing the channel ID and group ID through Microsoft Teams, see [Microsoft Teams documentation](https://docs.microsoft.com/en-us/microsoftteams/platform/graph/teams-graph-api-overview).

**Microsoft Teams Graph spoke action permissions**

The Microsoft Teams Graph spoke should have the following permissions to perform the relevant actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Permission type</th>
<th>Permissions (from least to most privileged)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td>Update Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td>Action</td>
<td>Permission type</td>
<td>Permissions (from least to most privileged)</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Get Team</td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Archive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Unarchive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Create Channel in a Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel Metadata</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel ID by Name</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Action</td>
<td>Permission type</td>
<td>Permissions (from least to most privileged)</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td>Delete Channel</td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see Microsoft Teams documentation.

**Microsoft account requirements**

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Microsoft Teams Graph spoke**

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Teams to authenticate ServiceNow requests.
Before you begin
- Request IntegrationHub subscription
- Activate the Microsoft Teams Graph spoke
- Role required: admin

Register an application using the Microsoft Azure portal
Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Before you begin
Role required: Azure Active Directory admin

About this task
Complete these steps from the Microsoft Azure portal.

Procedure

1. In the Microsoft Azure portal, copy and record the **Directory ID** for later use. For more information, see [Get tenant and app ID values for signing in](https://<instance-name>.service-now.com/) in Microsoft Azure documentation.

2. Register your application in Azure portal. For instructions on registering an application, see [Tutorial: Register an app with Azure Active Directory](https://docs.microsoft.com/) in the Microsoft Docs.

3. Copy and record the **Application ID** for later use.

4. Add the **Reply URLs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`. For more information, see [Authentication and authorization for Azure Time Series Insights API](https://docs.microsoft.com/) in Microsoft Docs.

5. For the **Required Permissions**, select **Microsoft Graph**. For more information, see [Permissions and consent in the Microsoft identity platform](https://docs.microsoft.com/) in Microsoft Docs. In **Delegated permissions**, provide these permissions in the Azure portal. You can provide more permissions as per your requirement. For more information, see [Microsoft Graph REST API v1.0 reference](https://docs.microsoft.com/) in Microsoft Docs.
6. Record the **Client Secret** for use in later configurations.

Results
The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Teams as the OAuth provider
Register Microsoft Teams as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

About this task
Use the information generated during the registration of the application in the Microsoft Azure portal.

Procedure
1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message, **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>MS Teams</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can use only <strong>Authorization Code</strong> as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter <code>https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</code></td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Insert the following records in the OAuth Entity Scopes related list.

<table>
<thead>
<tr>
<th>Record 1 in the OAuth Entity Scopes related list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>OAuth scope</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Record 2 in the OAuth Entity Scopes related list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>OAuth scope</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, *MS Teams default_profile*.

**Create Credential records for the Microsoft Teams Graph spoke**

Authorize the Microsoft Teams Graph spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Graph spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message, *What type of Credentials would you like to create?*
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Active</td>
</tr>
</tbody>
</table>
5. Right-click the form header and click **Save**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

**Results**

The credential record for the Microsoft Teams Graph spoke is created.

**Create Connection records for the Microsoft Teams Graph spoke**

Perform actions in Microsoft Teams by creating connection records for your Microsoft Teams account. The Microsoft Teams Graph spoke connection and credential alias uses these connections to perform actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Teams Graph spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

**HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsConnection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Teams. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

**Note:**
Currently, the Notification Management actions use Beta API. Hence, api_version in the Attributes tab is set to beta by default.

When Microsoft Teams supports the Notification Management actions in another API version, you must update api_version in the Attributes tab and specify the new API version.

5. Click **Update**.

**Results**
The Microsoft Teams Graph spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Teams OAuth token**
Authorize the Microsoft Teams Graph spoke by regenerating the Microsoft Teams OAuth token after it expires.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Teams Graph spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.

**Results**
The Microsoft Teams Graph spoke receives a new OAuth access token.

**Microsoft 365 Excel spoke v1.0.1**
Manage Microsoft Office 365 Excel workbooks stored in Microsoft OneDrive from your ServiceNow instance.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Microsoft Office 365 Excel v1.0, but may be compatible with later versions.

Spoke requirements
• Microsoft Azure Portal account
• Client ID and Client Secret of the application registered in Azure Portal

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)

⚠ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Microsoft 365 Excel Spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell and Range Management</td>
<td>Get Cell Details</td>
<td>Retrieves the properties of the specified cell.</td>
</tr>
<tr>
<td></td>
<td>Get Cells</td>
<td>Retrieves the properties of the selected range of cells.</td>
</tr>
<tr>
<td></td>
<td>Update Cells</td>
<td>Updates the properties of the selected range of cells.</td>
</tr>
<tr>
<td>Table Management</td>
<td>Add Rows</td>
<td>Adds one or more rows to the given table.</td>
</tr>
<tr>
<td></td>
<td>Create Table</td>
<td>Adds a table to the worksheet.</td>
</tr>
<tr>
<td></td>
<td>Get Table Cells</td>
<td>Retrieves the properties of the selected range of table cells.</td>
</tr>
<tr>
<td></td>
<td>Get Table Details</td>
<td>Retrieves the properties of the specified table.</td>
</tr>
<tr>
<td></td>
<td>Look up Table Columns</td>
<td>Lists the details of the specified range columns from the selected table.</td>
</tr>
<tr>
<td></td>
<td>Look up Table Rows</td>
<td>Lists the details of the specified range of rows from the selected table.</td>
</tr>
<tr>
<td>Workbook Management</td>
<td>Look up Workbooks</td>
<td>Lists all the workbooks in the specified folder.</td>
</tr>
<tr>
<td>Worksheet Management</td>
<td>Add Worksheet</td>
<td>Adds a worksheet to a workbook.</td>
</tr>
<tr>
<td></td>
<td>Get Used Cells</td>
<td>Retrieves the properties of the specified range of cells in the worksheet.</td>
</tr>
<tr>
<td></td>
<td>Get Worksheet Details</td>
<td>Retrieves the properties of the worksheet.</td>
</tr>
<tr>
<td></td>
<td>Look up Worksheets</td>
<td>Lists all the worksheets in the workbook.</td>
</tr>
<tr>
<td></td>
<td>Update Worksheet</td>
<td>Updates a worksheet of a workbook.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** You must specify the input values for **Update Cells** and **Add Row** actions as shown in the following examples.
Add Row action: The action input, Value 1 corresponds to the first row in your table. The values Hello and 100 correspond to the values of the first and second column respectively.

Update Cells action: The action input, Value 1 corresponds to the first row in your range. The values Hello and 100 correspond to the values of the first and second column respectively.

must provide values in the same format for the action inputs: Formulas, Formulas R1C1, Formulas Local, and Number Format. For more information, see Add Row.

Update Rage.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft 365 Excel spoke

Integrate the ServiceNow instance and Microsoft 365 Excels by using the OAuth credentials to authenticate ServiceNow requests.
Before you begin

• Request an IntegrationHub subscription.
• Activate Microsoft 365 Excel Spoke.
• Role required: admin

Create a credential record for the Microsoft 365 Excel spoke

Create a credential record for the Microsoft Azure Portal account. The Microsoft 365 Excel Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

• Register your ServiceNow instance in Microsoft Azure Portal and record the client ID and client secret. Also, add the offline_access, Files.ReadWrite.All, and Files.ReadWrite scopes in the API permissions for the application. For more information, see Quickstart: Register an application with the Microsoft identity platform.

Note: Ensure that the Redirect URI of the instance is in the https://<instance>.service-now.com/oauth_redirect.do format.

Procedure

1. Navigate to IntegrationHub > Connections & Credentials > Connection and Credential Aliases.
2. Open the Microsoft_365_Excel record.
3. Click the Create New Connection & Credential related link.
4. On the form, fill these values.

Connection and Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. This field is automatically set to Microsoft 365 Excel Spoke Connection Cred.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL used for connecting to Microsoft Office 365 Excel. This field is automatically set to <a href="https://graph.microsoft.com/v1.0">https://graph.microsoft.com/v1.0</a></td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name of the credential. This field is automatically set to Microsoft 365 Excel Spoke Credential</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth Entity Name</td>
<td>Name of the OAuth entity profile. This field is automatically set to Microsoft 365 Excel Spoke OAuth.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of the Microsoft Office 365 Excel application you registered in Azure Portal.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret that you request for the registered application in Azure Portal.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>The redirect URL. The format of the URL is https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.

**Miro spoke**

The Miro spoke provides actions to view and analyze meaningful usage data for Miro software subscriptions. Analyze usage for your Miro Enterprise account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Spoke requirements**

- Miro Company Admin account
- SSO/SAML enabled on your Miro account

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Miro spoke provides actions to automate Miro tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Deactivate User</td>
<td>Deactivates a Miro user account.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from a Miro account.</td>
</tr>
<tr>
<td></td>
<td>Look up Organization ID</td>
<td>Retrieves the organization ID of the authenticated user account.</td>
</tr>
<tr>
<td></td>
<td>Look up Organization Members</td>
<td>Retrieves information about the members within an enterprise organization.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Miro spoke
Integrate the ServiceNow instance and Miro by creating a custom OAuth application in Miro to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate Miro spoke.
Create a Miro Enterprise OAuth 2.0 application

Create a Miro Enterprise OAuth 2.0 application to enable access to the Miro API.

Before you begin
Miro role required: Company Admin

Procedure
1. From a web browser, open the Miro Platform.
2. If you have not created any teams within your organization or you want to build and test the OAuth 2.0 application using fake data, get a developer team.
3. On the page header of the Miro Platform, click Your Apps.
   The sign up page opens.
4. Sign in using your Company Admin credentials.
   Your default organization profile opens.
5. At the top of the left navigation pane, click the organization profile icon to select the organization that you want to build the OAuth 2.0 application for.
   The profile for the selected organization opens.
6. On the left navigation pane, click Profile settings.
7. Select the API, SDK & Embed tab of your profile settings.
8. In the Your apps section, select the I agree to the Terms and Conditions check box and then click Create new app.
   The Create new app dialog box opens.
9. On the dialog box, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>App name</td>
<td>Name of the OAuth 2.0 application.</td>
</tr>
<tr>
<td>Description</td>
<td>Brief description of the OAuth 2.0 application.</td>
</tr>
</tbody>
</table>

10. Select the team that you want to build the OAuth 2.0 application for.
11. Click Create app.
   The settings for your newly created app open.
12. In the Your app <app-name> section, copy the values in the **Client id** and **Client secret** fields. Save them in a secure location for later use.

13. In the Redirect URLs section, enter the URL of the OAuth provider that users are redirected to after authentication and then click **Add**. Enter https://<instance>.service-now.com/oauth_redirect.do, where <instance> is the name of your ServiceNow instance.

14. In the OAuth scopes section, enable the **organizations:read** OAuth scope. OAuth scopes specify the level of access that the application has to your protected resources. The organizations:read OAuth scope enables your application to read information about your organizations and organization members.

**What to do next**
Keep your organization profile open so that you can enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account.

**Enable SCIM on your Miro Enterprise account**
Enable SCIM (System for Cross-domain Identity Management) on your Miro Enterprise account so that you can generate an API access token for authenticating your Miro API requests.

**Before you begin**
Miro role required: Company Admin

**Procedure**
1. On the left navigation pane of your Miro organization profile, click **Security**.
2. On the Security page, select the option to **Enable SSO/SAML**.
3. After SSO/SAML is enabled, select the option to enable **SCIM Provisioning**. Miro automatically generates and displays your API access token in the **Api Token** field.
4. **Optional**: Select the **Send email notifications to users provisioned by SCIM** check box to allow Miro to send email notifications to all users that have been provisioned using SCIM.
5. Copy the API access token in the **Api Token** field. Save it in a secure location for later use.

**Create a Miro Enterprise connection**
Create a connection between your Miro Enterprise applications and your ServiceNow instance.
Before you begin
ServiceNow role required: admin

Procedure
1. From your ServiceNow instance, navigate to Process Automation > Flow Designer.
   The Flow Designer launches in a new tab.
2. Select the Connections tab.
3. Click View Details for your Miro Enterprise connection.
4. From your Miro Enterprise connection details, click Add Connection.
   The Create Connection dialog box opens.
5. On the dialog box, fill in the fields.

<table>
<thead>
<tr>
<th>Create Connection dialog box</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>---------------------------</td>
</tr>
<tr>
<td>Connection Information</td>
</tr>
<tr>
<td>Connection Name</td>
</tr>
<tr>
<td>Credential Information</td>
</tr>
<tr>
<td>OAuth Client ID</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
</tr>
</tbody>
</table>

6. Click Create and Get OAuth Token.
   The Miro OAuth authorization dialog box opens.
7. On the dialog box, locate the team that you built the Miro Enterprise OAuth 2.0 application for and then click Install.
   The OAuth access token becomes available for authorizing your Miro Enterprise connection.
Create a Miro Enterprise SCIM connection

Create a connection between the Miro Enterprise SCIM and your ServiceNow instance.

Before you begin
ServiceNow role required: admin

Procedure

1. From your ServiceNow instance, navigate to Process Automation > Flow Designer.
   The Flow Designer launches in a new tab.
2. Select the Connections tab.
3. Click View Details for your Miro Enterprise SCIM connection.
4. From your Miro Enterprise SCIM connection details, click Add Connection.
   The Create Connection dialog box opens.
5. On the dialog box, fill in the fields.

    Create Connection dialog box

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Information</td>
<td></td>
</tr>
<tr>
<td>Connection Name</td>
<td>Name of the Miro Enterprise SCIM connection. This field populates automatically.</td>
</tr>
<tr>
<td>Credential Information</td>
<td></td>
</tr>
<tr>
<td>API Token</td>
<td>API access token for authenticating Miro API requests. Enter the same API access token that you generated and copied in Enable SCIM on your Miro Enterprise account.</td>
</tr>
</tbody>
</table>

6. Click Create Connection.

monday.com spoke

The monday.com spoke provides actions to view and analyze meaningful usage data for monday.com software subscriptions. Analyze usage for a monday.com account to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release
notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke requirements
- monday.com admin account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The monday.com spoke provides actions to automate monday.com tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Management</td>
<td>Look up Board Activities</td>
<td>Retrieves the list of activities on your monday.com boards.</td>
</tr>
<tr>
<td></td>
<td>Look up Boards</td>
<td>Retrieves the list of monday.com boards.</td>
</tr>
<tr>
<td></td>
<td>Look up Updates</td>
<td>Retrieves the list of updates to your monday.com boards.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look up Users</td>
<td>Retrieves the list of monday.com users.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and
connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the monday.com spoke**

Integrate the ServiceNow instance and monday.com by creating a custom OAuth application in monday.com to authenticate ServiceNow requests.

**Before you begin**
- Request an IntegrationHub subscription.
- Activate monday.com spoke.
- monday.com role required: admin
- ServiceNow role required: admin

**Create a monday OAuth2 application**

Create a monday OAuth2 application to authorize access to the monday.com API.

**Before you begin**
- monday.com role required: admin

**About this task**

A monday application enables you to build workflows, user experiences, and products on top of the existing monday.com work operating system (Work OS). When you configure a monday application to use OAuth2, it is granted access to the monday.com API so that it can read and modify user data.

**Procedure**

1. From a web browser, go to monday.com.
2. Log in using your admin credentials.
3. At the bottom of the left navigation menu, click your profile icon and then select Developers.
   The My Apps page opens.
4. Click Create App.
   The Basic Information page for the new application opens.
5. In the Display Information section, fill in the fields.
6. **Optional:** In the same section, add your own application icon by clicking the auto-generated icon and then selecting an icon image. You can also change the icon color by clicking **App Color** and then selecting either a preset or custom color. If you do not add your own application icon or select an icon color, the application uses the auto-generated icon and default icon color.

7. In the App Credentials section, copy the values in the **Client ID** and **Client Secret** fields. Save them in a secure location for later use.

8. Click **Save App**.

9. From the left navigation menu of the new application, navigate to **General > OAuth**. The **Scopes** tab of the OAuth & Permissions page opens.

10. In the Scopes section, specify how the application can access or use different types of user data by selecting the checkbox for the following OAuth scopes:
   - **me**:read
   - **boards**:read
   - **users**:read
   - **updates**:read

11. Click **Save Feature**.

12. Select the **Redirect URLs** tab of the OAuth & Permissions page.

13. In the Redirect URLs section, enter the URL of the OAuth provider that users are redirected to after authentication. Enter `https://instance.service-now.com/oauth_redirect.do`, where `<instance>` is the name of your ServiceNow instance.

14. Click **Save Feature**.

   **Create a monday connection**
   Create a connection between your monday applications and your ServiceNow instance.
Before you begin
ServiceNow role required: admin

Procedure
1. From your ServiceNow instance, navigate to Process Automation > Flow Designer.
   The Flow Designer launches in a new tab.
2. Select the Connections tab.
3. Locate your monday connection and then click Add Connection.
   The Create Connection and Credential dialog box opens.
4. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL for the monday.com API. This field is automatically set to <a href="https://api.monday.com/v2">https://api.monday.com/v2</a>.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID that is assigned to your monday application.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client secret that is assigned to your monday application.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>URL of the OAuth provider that users are redirected to after authentication. This field populates automatically based on the redirect URL that you specified in Create a monday OAuth2 application.</td>
</tr>
</tbody>
</table>

5. Click Create and Get OAuth Token.
   The Authorize App dialog box opens.
6. In the dialog box, sign in using the same monday.com credentials that you used to create your monday application.
7. Click Allow.
   The OAuth access token becomes available for authorizing your monday connection.
Okta spoke v 4.1.1
Use Okta to manage users, passwords, and groups.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• com.glide.cobject.sys.com.glide.script.vtable
• com.snc.remote_directory_sync
• XML Parser for ServiceNow IntegrationHub (com.glide.hub.action_step.xmlparser)
• Flow Designer Designer Model (com.glide.hub.designer_backend.model)
• Complex Object (com.glide.cobject)

⚠ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions
API version v1.
Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke subflows

The Okta spoke provides sample subflows to demonstrate automating Okta tasks. Available subflows are:

<table>
<thead>
<tr>
<th>Subflow category</th>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Webhook management</td>
<td>Check Activate Application Event Hook</td>
<td>Verifies if an event hook for the application-lifecycle-activate exists in Okta.</td>
</tr>
<tr>
<td></td>
<td>Inbound Integration from Okta to ServiceNow</td>
<td>Allows inbound integration from Okta to a ServiceNow instance. Verifies if an event hook already exists for an application. If the event hook does not exist, a new event hook is created.</td>
</tr>
</tbody>
</table>
Subflow category | Subflow | Description
--- | --- | ---
| | | **Note:** Make sure that **Configuration URI** field value is in this format: https://<instance-name>.service-now.com/api/sn_okta_spoke/oktawebhook

| Group Management | Get Groups | Updates an existing group or creates a group in Okta.
| Application Management | Create or Update Okta Applications Record | Creates a Okta application record or updates an existing Okta application record.

**Spoke module**
The Okta spoke adds the Okta application to your ServiceNow instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Okta Applications</td>
<td>Shows the list of applications.</td>
</tr>
<tr>
<td>Okta groups</td>
<td>Shows the list of user groups in Okta.</td>
</tr>
<tr>
<td>Okta Users</td>
<td>Shows the list of users in Okta.</td>
</tr>
<tr>
<td>Okta Webhook Registry</td>
<td>Shows the list of webhook registries.</td>
</tr>
</tbody>
</table>

**Spoke actions**
The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.</td>
</tr>
<tr>
<td></td>
<td>Clear User Session</td>
<td>Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates the specified user in Okta with the specified standard, optional, and mandatory field values.</td>
</tr>
<tr>
<td></td>
<td>(deprecated)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: Do not perform this action on users with a DEPROVISIONED status.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met.</td>
</tr>
<tr>
<td></td>
<td>Is User Account</td>
<td>Determines if a user account is locked.</td>
</tr>
<tr>
<td></td>
<td>Locked</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Lookup Okta User</td>
<td>Retrieves the Okta user ID for the specified Okta login ID or login short name.</td>
</tr>
<tr>
<td></td>
<td>ID</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User's Password</td>
<td>Changes the specified user's password after validating the user's current password.</td>
</tr>
<tr>
<td></td>
<td>Expire User Password</td>
<td>Expires the specified user's password within Okta. This action is commonly used as a reaction to stop breaching attempts.</td>
</tr>
<tr>
<td></td>
<td>Reset to Temporary Password</td>
<td>Resets the specified user's password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.</td>
</tr>
<tr>
<td></td>
<td>Look up Users Stream</td>
<td>Retrieves users from Okta based on the filter value.</td>
</tr>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the Unsuspend action.</td>
</tr>
<tr>
<td></td>
<td>Restart User Activation</td>
<td>Restarts the specified user's activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the Activate User Action.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile (deprecated)</td>
<td>Updates the user profile details for the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unsuspend User</td>
<td>Unsuspends the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Account Details by User ID</td>
<td>Retrieves user details for the specified Okta user ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Profile by User ID</td>
<td>Retrieves user profile details for the specified Okta user ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Reset User Factors</td>
<td>Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.</td>
</tr>
<tr>
<td></td>
<td>Set User Password</td>
<td>Sets the specified user's password in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user in Okta.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds the specified user to the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Get Groups</td>
<td>Retrieves all new and updated groups in Okta.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Determines if the specified user is a member of the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group Details by Group ID</td>
<td>Retrieves group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID By Name</td>
<td>Retrieves group details and group ID for the specified Okta group name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group (deprecated)</td>
<td>Removes the specified user from the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups Stream</td>
<td>Retrieves groups from Okta, based on the filter criteria.</td>
</tr>
<tr>
<td>Group Membership Management</td>
<td>Look up Group Members Stream</td>
<td>Retrieves users from the specified Okta group.</td>
</tr>
<tr>
<td></td>
<td>Look up User Groups Stream</td>
<td>Retrieves the group information from Okta to which the user belongs to.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application Access Management</td>
<td>Look up Users by Application ID Stream</td>
<td>Retrieves users who have access to the specified application.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups by Application ID Stream</td>
<td>Retrieves groups who have access to the specified application.</td>
</tr>
<tr>
<td></td>
<td>Revoke User Application Access</td>
<td>Revokes access to an application for the required user.</td>
</tr>
<tr>
<td>Application Management</td>
<td>Look up Applications Stream</td>
<td>Retrieves applications from Okta, based on the filter criteria. For more information about the criteria you can specify in the Filter input, see List applications in Okta Developer Documentation.</td>
</tr>
<tr>
<td></td>
<td>Look up Application by Application ID</td>
<td>Retrieves details of the specified application ID in Okta.</td>
</tr>
<tr>
<td>Logs Management</td>
<td>Look up Okta Logs Stream</td>
<td>Retrieves the logs in Okta that are filtered by the given filter value and within the specified time duration. For more information about the event types and system logs, see Event Types in Okta Developer Documentation.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Look up Additional Fields for User</td>
<td>Retrieves the metadata of the additional fields for a user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Look up Applications Metadata</td>
<td>Retrieves the metadata of applications in Okta.</td>
</tr>
<tr>
<td></td>
<td>Look up Event Hooks Metadata</td>
<td>Retrieves the metadata of the event hooks in Okta.</td>
</tr>
</tbody>
</table>

**Note:** Make sure that you use this action along with the actions that use Event Hook ID as a dynamic input.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>

</tr>
</thead>
<tbody>
<tr>
<td>Webhook Management</td>
<td>Look up Groups Metadata</td>
<td>Retrieves the metadata details of the groups in Okta.</td>
</tr>
<tr>
<td></td>
<td>Activate Event Hook</td>
<td>Changes the status of the specified event hook to active in Okta.</td>
</tr>
<tr>
<td></td>
<td>Create Event Hook</td>
<td>Creates an active event hook in Okta.</td>
</tr>
<tr>
<td></td>
<td>Note: Make sure that <strong>Configuration URI</strong> field value is in this format: <code>https://&lt;instance-name&gt;.service-now.com/api/sn_okta_spoke/oktawebhook</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Deactivate Event Hook</td>
<td>Sets the status of the specified Okta event hook to inactive.</td>
</tr>
<tr>
<td></td>
<td>Look up Event Hook by ID</td>
<td>Retrieves details of the Okta event hook for the specified ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Event Hooks</td>
<td>Retrieves details of all the event hooks in Okta.</td>
</tr>
<tr>
<td></td>
<td>Update Event Hook</td>
<td>Updates the specified event hook in Okta.</td>
</tr>
<tr>
<td></td>
<td>Note: Make sure that <strong>Configuration URI</strong> field value is in this format: <code>https://&lt;instance-name&gt;.service-now.com/api/sn_okta_spoke/oktawebhook</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Verify Event Hook</td>
<td>Verifies and retrieves an external service endpoint configured for an event hook in Okta.</td>
</tr>
</tbody>
</table>

**Okta account requirements**

The Okta spoke requires generating and configuring your Okta account to use a web API key.

**Credential and connection alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
This spoke uses the Okta Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Okta spoke**

Integrate the ServiceNow instance and your Okta account using an API key or OAuth credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Okta spoke
- Role required: admin

**About this task**

Depending on your requirement, you set up the spoke using API key or OAuth credentials. However, you can use only one alias at a time for a ServiceNow domain.

**Set up Okta spoke using API Key**

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

**Generate Okta account API token**

Configure your Okta account to generate an access token for API key authentication.

**Before you begin**

Okta requirements:

- Okta organization or developer account
- Okta administrator credentials

**About this task**

Complete these steps from your Okta organization or developer account. See the Okta for developers documentation for instructions on creating and configuring your account.
Procedure
1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Okta spoke
Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter ssWS followed by the access token you obtained from Okta. For example, ssWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Okta spoke v1.1.1
Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.
Procedure

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

2. Open for the record for **Okta**.

3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Okta. For example, select Okta Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter your Okta organization URL. For example, <a href="https://dev-418994.oktapreview.com">https://dev-418994.oktapreview.com</a>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Set up Okta spoke using OAuth credentials**

Integrate the ServiceNow instance and your Okta account by creating a custom OAuth application in Okta to authenticate ServiceNow requests.

**Before you begin**

- Access Okta Developer Console
- Role required: admin

**Configure Okta app**

Create a custom OAuth application in Okta account to enable OAuth 2.0 authentication with the Okta spoke.

**Before you begin**

Role required: admin

**Procedure**

1. Create an application in the Okta Developer Console. For more information, see *Create an OAuth 2.0 app in Okta* in *Okta Developer Documentation*.

2. In the Okta API Scopes tab, ensure that you provide these permissions:
okta.users.manage
okta.apps.manage
okta.logs.read
okta.groups.read
okta.groups.manage
okta.users.read
okta.apps.read

For more information about the API scopes, see Define allowed scopes in Okta Developer Documentation.

3. From the General tab:

a. Ensure that you select these Allowed grant types:
   • Authorization Code
   • Refresh Token
   • Implicit (Hybrid)
     ◦ Allow ID Token with implicit grant type
     ◦ Allow access token with implicit gran type

b. In Login redirect URIs and Logout redirect URIs, add the ServiceNow instance in this format: https://<servicenow-instance-name>.service-now.com/oauth_redirect.do

c. Copy and record the values of Client ID and Client secret.

Add Okta connection in ServiceNow instance
Add the Okta connection in Flow Designer to configure the Okta spoke.

Procedure
1. Navigate to Flow Designer > Designer.
2. Click Connections.
3. On the Okta spoke tile, click View Details.
4. In the Connections page, click Configure.
   The pop-up window displays a blank Configure Connection form.
5. On the form, fill these values.
### Configure Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>URL to connect to the Okta instance. In the Connection URL field, enter <code>https://&lt;yourOktaDomain&gt;.com</code>, where <code>&lt;yourOktaDomain&gt;</code> is your organization domain name.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The authorization URL, token URL, and token revocation URL generate automatically based on the connection URL that you specify.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of your Okta app.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client secret of your Okta app.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>Redirect URL of the ServiceNow instance in this format: <code>https://&lt;servicenow-instance-name&gt;.service-now.com/oauth_redirect.do</code>.</td>
</tr>
</tbody>
</table>

6. Click **Configure and Get OAuth Token**.  
The OAuth Access token is generated for the Okta spoke.

### Fetch Okta groups

Fetch Okta groups into your instance so that you can assign them to different users. You can fetch the groups on an as-needed or scheduled basis.

**Before you begin**  
Role required: okta.admin

**Procedure**

1. To fetch Okta groups on an as-needed basis.
   
   **a.** Navigate to **Okta spoke > Okta groups**.
   
   **b.** Click **Fetch Okta groups**.
   
   **c.** From the Okta groups list, you can review the following:
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Okta group.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Okta group.</td>
</tr>
<tr>
<td>Group ID</td>
<td>Group ID of the Okta group.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the Okta group.</td>
</tr>
<tr>
<td>Group creation date</td>
<td>Date when Okta group was created.</td>
</tr>
<tr>
<td>Group last updated date</td>
<td>Date when Okta group was last updated.</td>
</tr>
<tr>
<td>Created</td>
<td>Date when Okta group was first synchronized with your ServiceNow instance.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date when Okta group was last synchronized with your ServiceNow instance.</td>
</tr>
</tbody>
</table>

2. To fetch Okta groups on a scheduled basis.

   a. Navigate to **System Definition > Scheduled Jobs**.

   b. Open the **Fetch Okta Groups** record.

   c. Update the fields, as needed.

      🔄 **Note:** Make sure that the **Active** option is selected so that the scheduled job is activated for use.

   d. Click **Update**.

**Set up a bi-directional webhook for Okta spoke**

Configure a webhook to subscribe to Okta with a ServiceNow callback URL.

**Before you begin**

- Request an IntegrationHub <> subscription
- Activate the Okta spoke
- Role required: admin
Register Okta webhook
Register a Okta webhook in your ServiceNow instance to notify the ServiceNow app when certain events occur in Okta.

Before you begin
Role required: admin

Procedure
1. Navigate to Okta Spoke > Okta Webhook Registry.
2. Click New.
3. On the form, fill in these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the webhook registry.</td>
</tr>
<tr>
<td></td>
<td>Note: The name must be only Okta Webhook Authentication.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the webhook registry.</td>
</tr>
<tr>
<td>Authentication Key</td>
<td>Authentication key used for connecting to Okta webhook.</td>
</tr>
<tr>
<td>Authentication Value</td>
<td>Authentication value used for connecting to Okta webhook.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Oracle Autonomous DB spoke v1.0.2
Manage the Oracle Autonomous Database operations from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Oracle Autonomous DB 20160918, but may be compatible with later versions.

Spoke requirements
- Oracle Autonomous DB account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Oracle Cloud IAM spoke (com.sn.oci.iam.spoke)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Oracle Autonomous DB spoke provides actions to automate Oracle Autonomous DB tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Backup Management</td>
<td>Create Database Backup</td>
<td>Creates an Autonomous Database backup for the specified database based on the specified request parameters.</td>
</tr>
<tr>
<td></td>
<td>Get Database Backup</td>
<td>Retrieves the details of the specified Autonomous Database backup.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look up</td>
<td>Database Backups</td>
<td>Retrieves a list of Autonomous Database backups based on the specified database ID or compartment ID.</td>
</tr>
<tr>
<td>Create Database</td>
<td></td>
<td>Creates an Autonomous Database.</td>
</tr>
<tr>
<td>Create Database</td>
<td>by Cloning</td>
<td>Creates a clone of the existing Autonomous Database.</td>
</tr>
<tr>
<td>Delete Database</td>
<td></td>
<td>Deletes the specified Autonomous Database.</td>
</tr>
<tr>
<td>Deregister</td>
<td>Database Data Safe</td>
<td>Deregisters the specified Autonomous Database asynchronously with data safe.</td>
</tr>
<tr>
<td>Failover</td>
<td>Database</td>
<td>Initiates a failover database of the specified Autonomous Database to a standby.</td>
</tr>
<tr>
<td>Get Database</td>
<td></td>
<td>Retrieves details of the specified Autonomous Database.</td>
</tr>
<tr>
<td>Look up Databases</td>
<td></td>
<td>Retrieves a list of Autonomous Databases.</td>
</tr>
<tr>
<td>Register</td>
<td>Database Data Safe</td>
<td>Registers the specified Autonomous Database asynchronously with data safe.</td>
</tr>
<tr>
<td>Restart Database</td>
<td></td>
<td>Restarts the specified Autonomous Database.</td>
</tr>
<tr>
<td>Start Database</td>
<td></td>
<td>Starts the specified Autonomous Database.</td>
</tr>
<tr>
<td>Stop Database</td>
<td></td>
<td>Stops the specified Autonomous Database.</td>
</tr>
<tr>
<td>Update Database</td>
<td></td>
<td>Updates the specified Autonomous Database.</td>
</tr>
<tr>
<td>Look up</td>
<td>Database Versions</td>
<td>Retrieves the list of supported Autonomous Database versions.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Oracle Autonomous DB spoke
Integrate the ServiceNow instance and Oracle Autonomous DB by using the credentials to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate Oracle Autonomous DB spoke.
• Install the Oracle Cloud IAM spoke before installing the Oracle Autonomous DB spoke
• Role required: admin

Create a credential record for the Oracle Cloud IAM spoke
Create a credential record for the Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Use the public key from the Java Keystore (JKS) file and generate a fingerprint from your Oracle Cloud account. For more information about fingerprint, see Required Keys and OCIDs.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays this message: What type of Credentials would you like to create?
3. Select OCI SHA256WithRSA Signature.
4. On the form, fill these values.
### OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the OCI Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/key_fingerprint.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select OCI SHA256RSA Signing Algorithm</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

### Create a connection record for the Oracle Cloud IAM spoke

Create a connection record for your Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential aliases use these connections to perform actions in Oracle Cloud IAM.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record for **OracleIAM_credentialANDconnecton**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.
### Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle IAM conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Autonomous DB spoke. For example, Oracle IAM Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Search and select sn_oci_iam_spoke.OracleIAM_credentialAN</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the Oracle Cloud IAM server is hosted. For example, database.ap-mumbai-1.oraclecloud.com.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Cloud IAM. For example, <a href="https://database.ap-mumbai-1.oraclecloud.com">https://database.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Create a credential record for the Oracle Autonomous DB spoke**

Create a credential record for the Oracle Autonomous DB account. The Oracle Autonomous DB spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.

   The system displays this message: What type of Credentials would you like to create?

3. Select **OCI SHA256WithRSA Signature**.

4. On the form, fill these values.
OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the OCI Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID (kid) helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/&lt;key_fingerprint&gt;.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record. If you have already created a credential alias, search and select the record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select OCI SHA256RSA Signing Algorithm</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

Create a connection record for the Oracle Autonomous DB spoke

Create a connection record for your Oracle Autonomous DB account. The Oracle Autonomous DB spoke connection and credential aliases use these connections to perform actions in Oracle Autonomous DB.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record for **Oracle Autonomous Database**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.
Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Auto DB Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Autonomous DB spoke. For example, Oracle ADB Creds.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Search and select sn oci adb spoke Oracle Autonomous Database</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the Oracle Autonomous DB server is hosted. For example, database.ap-mumbai-1.oraclecloud.com.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Autonomous DB. For example, <a href="https://database.ap-mumbai-1.oraclecloud.com">https://database.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Servers for this connection. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Oracle Block Storage spoke v1.0.1**

Manage block storage and volumes in the Oracle Block Storage account from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Supported versions
This spoke was built for Oracle Block Storage API version 20160918, but may be compatible with later versions.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• Oracle Cloud IAM spoke v1.0.4
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Oracle Block Storage spoke provides actions to automate Oracle Block Storage tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Volume Backup</td>
<td>Change Volume Backup</td>
<td>Moves a volume backup into a different compartment within the same tenancy.</td>

</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
Set up the Oracle Block Storage spoke

Integrate the ServiceNow instance and Oracle Block Storage account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

• Activate and set up the Oracle Cloud IAM spoke v1.0.4
• Role required: admin

Procedure

1. Optional: Create a JKS certificate. You can create a JKS certificate for the Oracle Block Storage spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.

2. Optional: Create X.509 certificate. You can create a X.509 certificate for the Oracle Block Storage spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.

3. Create a child alias in the Oracle Cloud IAM spoke connection and credential alias.

   b. Click New.

   c. On the form, fill these values:

      | Field          | Description                                                      |
      |----------------|------------------------------------------------------------------|
      | Name           | Name to identify the alias record. For example, Oracle Block Storage Alias. |
      | Parent Alias   | Connection and credential alias record of the Oracle Cloud IAM spoke. For example, sn oci iam spoke.OracleIAM_credentialANDconnection |

   d. Right-click the form header and click Save.
4. Create credential record for the Oracle Block Storage spoke.

a. Navigate to Connections & Credentials > Credentials.

b. Click New.
   The system displays this message: What type of Credentials would you like to create?

c. Select OCI SHA256WithRSA Signature.

d. On the form, fill these values.
   
   Note: You can specify details of the certificates you created specifically for the Oracle Block Storage spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Block Storage Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/&lt;key_fingerprint&gt;.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select OCI_SHA256RSA Signing Algorithm</td>
</tr>
</tbody>
</table>

e. Right-click the form header and click Submit.

5. Create connection record for the Oracle Block Storage spoke.

b. Open the child alias record you had created. For example, Oracle Obj Storage Alias.

c. From the Connections tab, click New.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Block Storage conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Block Storage spoke. For example, Oracle Block Storage Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Block Storage. For example, <a href="https://iaas.ap-mumbai-1.oraclecloud.com">https://iaas.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. Click Submit.

The ServiceNow instance and Oracle Block Storage account are integrated. You can use the spoke actions to build flows and automate tasks as required.

**Oracle Boot Volume spoke v1.0.2**

Manage boot volumes, backups, and KMS keys in Oracle Boot Volume account from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Oracle Boot Volume API version 20160918, but may be compatible with later versions.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM spoke v1.0.4
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Oracle Boot Volume spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Oracle Boot Volume spoke

Integrate the ServiceNow instance and Oracle Boot Volume account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

• Activate and set up the Oracle Cloud IAM spoke v1.0.4
• Role required: admin

Procedure

1. Optional: Create a JKS certificate. You can create a JKS certificate for the Oracle Boot Volume spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.

2. Optional: Create X.509 certificate. You can create a X.509 certificate for the Oracle Boot Volume spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.

3. Create credential record for the Oracle Boot Volume spoke.

   a. Navigate to Connections & Credentials > Credentials.

   b. Click New.

      The system displays this message: What type of Credentials would you like to create?

   c. Select OCI SHA256WithRSA Signature.

   d. On the form, fill these values.
Note: You can specify details of the certificates you created specifically for the Oracle Boot Volume spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Boot Vol Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the Signing Certificate.</td>
</tr>
<tr>

</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select OCI SHA256RSA Signing Algorithm</td>
</tr>
</tbody>
</table>

e. Right-click the form header and click Submit.

4. Create connection record for the Oracle Boot Volume spoke.

b. Open the alias record of the Oracle Boot Volume spoke. For example, Oracle_Boot_Volume_Connection.

c. From the Connections tab, click New.

d. On the form, fill these fields.
Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Boot Volume Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Boot Volume spoke. For example, Oracle Boot Vol Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Boot Volume. For example,</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. Click Submit.

The ServiceNow instance and Oracle Boot Volume account are integrated. You can use the spoke actions to build flows and automate tasks as required.

Oracle Cloud IAM spoke v1.0.4

Manage user identities and user access in Oracle Infrastructure Identity and Access Management (IAM) from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Oracle Cloud IAM 20160918, but may be compatible with later versions.
Spoke requirements

- Oracle Cloud account

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Oracle Cloud IAM spoke provides actions to automate Oracle Cloud IAM tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compartment Management</td>
<td>Bulk Delete Resources</td>
<td>Deletes multiple resources from the specified compartment in a batch.</td>

</tbody>
</table>

**Connection and credential alias requirements**
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Oracle Cloud IAM spoke**
Integrate the ServiceNow instance and Oracle Cloud IAM by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

**Before you begin**
- Request an IntegrationHub subscription.
- Activate Oracle Cloud IAM spoke.
- Role required: admin

**Create a Java KeyStore (JKS) certificate**
Use the keytool utility to generate, import, and export certificates.

**Before you begin**
Make sure that the keytool utility is installed on your computer.
**Procedure**

1. Change to the directory where the certificate is to be saved. By default, keytool creates a keystore file in the directory where the keystore commands are run.

2. Enter the following keytool command to generate the certificate in the keystore file, keystore.jks:
   
   ```
   keytool -genkey -alias <alias> -keyalg RSA -keypass <keypass> -storepass <storepass> -keystore keystore.jks
   ```

   **Note:** Replace the placeholders `<alias>`, `<keypass>`, and `<storepass>` with your alias, key password, and store password in all the sample commands.

3. Enter your first name and last name, organization, and other details in the keytool prompt. These details are required for generating the certificate.

4. Enter the following commands in the following sequence.
   
   ```
   keytool -export -alias sample -storepass <storepass> -file server.cer -keystore keystore.jks
   keytool -import -v -trustcacerts -alias sample -file server.cer -keystore cacerts.jks
   keytool -export -alias sample -keystore keystore.jks -rfc -file public.cert
   keytool -export -alias sample -keystore keystore.jks -rfc -file certificate.pem
   keytool -list -rfc -keystore keystore.jks -alias sample -storepass <storepass>
   keytool -importkeystore -srckeystore keystore.jks -destkeystore keystore.p12
   -deststoretype PKCS12 -srcalias <alias> -deststorepass <storepass> -destkeypass <keypass>
   openssl pkcs12 -in keystore.p12 -nokeys -out cert.pem
   openssl pkcs12 -in keystore.p12 -nodes -nocerts -out PrivateKey.pem
   openssl rsa -in key.pem -pubout -out PublicKey.pem
   keytool -list -v -keystore keystore.p12 -storetype PKCS12 -storepass <storepass>
   ```

   Verify the generated keystore.jks file in the target directory.

5. Enter the following command to extract public key from the Java Keystore file.
   
   ```
   openssl x509 -pubkey -noout -in cert.pem > publickey.pem
   ```

**Create X.509 certificate for the Oracle Cloud IAM spoke**

You must create a X.509 certificate and attach the Java Keystore file to it. This certificate is used for connecting to Oracle Cloud IAM.

**Before you begin**

Role required: admin
Procedure
1. Navigate to System Definition > Certificates.
2. Click New.
3. In the form, fill in these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the certificate. For example, OCI IAM certificate</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select Java Key Store.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>List of persons who are to be notified when a certificate is about to expire.</td>
</tr>
<tr>
<td>Keystore password</td>
<td>Password of the keystore.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days when a warning is sent to the user before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the certificate active.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description for the keystore.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon and upload the keystore.jks file.

Create a credential record for the Oracle Cloud IAM spoke
Create a credential record for the Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential alias uses these credentials to authorize actions.

Before you begin
Use the public key from the Java Keystore (JKS) file and generate a fingerprint from your Oracle Cloud account. For more information about fingerprint, see Required Keys and OCIDs.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays this message: What type of Credentials would you like to create?

3. Select OCI SHA256WithRSA Signature.

4. On the form, fill these values.

### OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle IAM Cloud Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the OCI Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/&lt;key_fingerprint&gt;.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select OCI SHA256RSA Signing Algorithm</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.

Create a connection record for the Oracle Cloud IAM spoke

Create a connection record for your Oracle Cloud IAM account. The Oracle Cloud IAM spoke connection and credential aliases use these connections to perform actions in Oracle Cloud IAM.

**Procedure**

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record for OracleIAM_credentialANDconnection.
3. From the Connections tab, click New.
4. On the form, fill these fields.
### Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle IAM conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Autonomous DB spoke. For example, Oracle IAM Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Search and select sn_oc_iam_spoke.OracleIAM_credentialAN</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Cloud IAM. For example, <a href="https://database.ap-mumbai-1.oraclecloud.com">https://database.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Oracle Compute Engine spoke v1.0.1**

Manage images and instance in the Oracle Compute Engine account from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Oracle Compute Engine API version 20160918, but may be compatible with later versions.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
Spoke actions

The Oracle Compute Engine spoke provides actions to automate Oracle Compute Engine tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom Image Management</td>
<td>Change Image Compartement</td>
<td>Moves an Image into a different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Image</td>
<td>Creates a custom image in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Delete Image</td>
<td>Deletes the specified custom image.</td>
</tr>
<tr>
<td></td>
<td>Export Image</td>
<td>Exports the specified image to the Oracle Cloud Infrastructure Object Storage service.</td>
</tr>
<tr>
<td></td>
<td>Get Image</td>
<td>Retrieves a specified custom image.</td>
</tr>
<tr>
<td></td>
<td>Look up Images</td>
<td>Retrieves a list of available images in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Image</td>
<td>Updates details of the specified custom image.</td>
</tr>
<tr>
<td>Image Shape Compatibility</td>
<td>Add Image Shape Compatibility</td>
<td>Adds a shape to the compatible shapes list for the image.</td>
</tr>
</tbody>
</table>

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Image Shape Compatibility</td>
<td>Deletes an image shape compatibility entry.</td>
</tr>
<tr>
<td></td>
<td>Get Image Shape Compatibility</td>
<td>Retrieves a specified image shape compatibility entry.</td>
</tr>
<tr>
<td></td>
<td>Look up Image Shape Compatibilities</td>
<td>Retrieves a list of all the compatible shapes for the specified image.</td>
</tr>
<tr>
<td>Instance Configuration Management</td>
<td>Change Instance Configuration Compartment</td>
<td>Moves an Instance Configuration into a different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Instance Configuration</td>
<td>Creates an instance configuration.</td>
</tr>
<tr>
<td></td>
<td>Delete Instance Configuration</td>
<td>Deletes the specified instance configuration.</td>
</tr>
<tr>
<td></td>
<td>Get Instance Configuration</td>
<td>Gets the specified instance configuration.</td>
</tr>
<tr>
<td></td>
<td>Look up Instance Configurations</td>
<td>Retrieves a list of instance configurations in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Instance Configuration</td>
<td>Updates details of the specified instance configuration.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Change Instance Compartment</td>
<td>Moves an Instance into a different compartment within the same tenancy.</td>

<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update Instance</td>
<td>Updates details of the specified instance.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Oracle Compute Engine spoke

Integrate the ServiceNow instance and Oracle Compute Engine account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

#### Before you begin

- Activate and set up the Oracle Cloud IAM spoke v1.0.4
- Activate and set up the Oracle Object Storage Management spoke v1.0.1
- Role required: admin

#### Procedure

1. **Optional:** Create a JKS certificate. You can create a JKS certificate for the Oracle Compute Engine spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.

2. **Optional:** Create X.509 certificate. You can create a X.509 certificate for the Oracle Compute Engine spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.

3. Create credential record for the Oracle Compute Engine spoke.
   
   a. Navigate to Connections & Credentials > Credentials.

   b. Click New.

      The system displays this message: What type of Credentials would you like to create?
c. Select **OCI SHA256WithRSA Signature**.

d. On the form, fill these values.

**Note:** You can specify details of the certificates you created specifically for the Oracle Compute Engine spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

### OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle CE Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/&lt;key_fingerprint&gt;.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>OCI SHA256RSA Signing Algorithm</strong></td>
</tr>
</tbody>
</table>

e. Right-click the form header and click **Submit**.

4. Create connection record for the Oracle Compute Engine spoke.

   a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

   b. Open the alias record of the Oracle Boot Volume spoke. For example, **Oracle_Compute_Engine**.
c. From the Connections tab, click New.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle CE Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Boot Volume spoke. For example, Oracle CE Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Compute Engine. For example, <a href="https://iaas.ap-mumbai-1.oraclecloud.com">https://iaas.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. Click Submit.

The ServiceNow instance and Oracle Compute Engine account are integrated. You can use the spoke actions to build flows and automate tasks as required.

**Oracle EBS spoke v1.3**

Manage sales orders, procurement, finance, customers, ledgers, and so on, in the Oracle EBS instance from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**Note:** The packages should be redeployed when you are upgrading to the Oracle EBS spoke v1.1 from Oracle EBS spoke v1. For more information, see Set up the Oracle EBS spoke.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for these versions, but may be compatible with later versions.

- Operating system version: Oracle Linux 7
- Oracle database version: 19.6.0.0.0
- Oracle E-Business Suite application tier version: 12.2.9
- Oracle WebLogic Server version: 10.3.6.0.171017 PSU
- Oracle WebTier version: 11.1.1.9
- Oracle Forms and Reports: 10.1.2.3

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows
The Oracle EBS spoke provides a sample flow, Look up Daily Rates to demonstrate automating tasks. The flow runs daily and retrieves the Daily Currency Exchange Rates from Oracle EBS for the current date and saves the details in your ServiceNow instance.

Spoke subflows
The Oracle EBS spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:
<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP Invoices - Create Interface Entries</td>
<td>Creates interface entries of AP Invoices in Oracle EBS.</td>
</tr>
<tr>
<td>AP Invoices - Get Processing Details</td>
<td>Retrieves the concurrent program status and other details from Oracle EBS.</td>
</tr>
<tr>
<td>Fixed Assets - Create Interface Entries</td>
<td>Creates interface entries of fixed assets in Oracle EBS.</td>
</tr>
<tr>
<td>Fixed Assets - Get Processing Details</td>
<td>Retrieves the concurrent program status and other details from Oracle EBS.</td>
</tr>
<tr>
<td>Get Journal Posted Status</td>
<td>Retrieves the current status of a GL journal header.</td>
</tr>
<tr>
<td>Goods Receipts - Create Interface Entries</td>
<td>Creates interface entries of Goods Receipts in Oracle EBS.</td>
</tr>
<tr>
<td>Goods Receipts - Get Processing Details</td>
<td>Retrieves the concurrent program status and other details from Oracle EBS.</td>
</tr>
<tr>
<td>Purchase Orders - Create Interface Entries</td>
<td>Creates interface entries of purchase orders in Oracle EBS.</td>
</tr>
<tr>
<td>Purchase Orders - Get Processing Details</td>
<td>Retrieves the concurrent program status and other details from Oracle EBS.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Oracle EBS spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer</td>
<td>Look up Customer Accounts</td>
<td>Retrieves details of the customer accounts.</td>
</tr>
<tr>
<td></td>
<td>Look up Customer Contacts</td>
<td></td>
</tr>
<tr>
<td>Finance</td>
<td>Create AP Invoice</td>
<td>Creates an AP invoice.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Oracle EBS alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps.

ℹ️ **Note:** If your Oracle EBS instance is only accessible on a private network, you must use MID Server.

**Set up the Oracle EBS spoke**

Integrate the ServiceNow instance and your Oracle EBS instance using a basic authentication to authenticate the ServiceNow requests.
Before you begin

- Request IntegrationHub subscription.
- Activate the Oracle EBS spoke.
- Admin access to the Oracle EBS account.
- Role required: admin

Procedure

1. From the ServiceNow® Store download the project file, Oracle_e-business_suite spoke_dependencies.zip and save it in the required local folder.
2. Unzip the contents of the Oracle_e-business_suite spoke_dependencies.zip file.
3. In SQL Developer or an SQL client, compile all the PKB and PLS files in the APPS schema.
4. In Oracle EBS server, deploy the Oracle EBS REST API. For steps to enable the REST API per extension, see Administering Custom Integration Interfaces and Services.
   
   You must perform these steps for every PLS file. While deploying each PLS file, you must provide the relevant values. Here, the procedure is outlined using XXSN_CREATE_PO_PKG.pls as an example.
a. Copy and upload the compiled package .pls files to these respective directories:

- `$PO_TOP/patch/115/sql/tmp/
- `$PO_TOP/patch/115/sql/

**Note:** Ensure that you replace the `$PO_TOP` with the module the package belongs to such as, `$AP_TOP`, `$PO_TOP`, and so on.

b. Log in to PuTTY of your Oracle EBS server and execute the Integration Repository Parser.

i. To generate an iLDT (*.ildt) file, execute the Integration Repository Parser using this syntax:

```
$IAS_ORACLE_HOME/perl/bin/perl $FND_TOP/bin/irep_parser.pl -g -v -username=sysadmin
po:patch/115/sql:XXSN_CREATE_PO_PKG.pls:12.0=$PO_TOP/patch/115/sql/tmp/XXSN_CREATE_PO_PKG.pls
```

ii. If you aren’t generating .ildt file for the XXSN_CREATE_PO_PKG.pls file, replace `po` and `$PO_TOP` with required Top.

iii. If you aren’t generating .ildt file for the XXSN_CREATE_PO_PKG.pls file, replace `XXSN_CREATE_PO_PKG.pls` with the required package name.

```
# Interface Repository Annotation Processor, 12.0.0
#
# Generating annotation output.
# Processing file 'XXSN_CREATE_PO_PKG.pls'.
# Using YAPP-based parser.
# Found a package-level annotation for 'XXSN_CREATE_PO_PKG'.
# Found a detail-level annotation...
# Found a procedure named 'CREATE_PURCHASE_ORDER'.
# Found a detail-level annotation...
# Found a procedure named 'SUBMIT_PURCHASE_ORDER_CC'.
# Found a detail-level annotation...
# Found a procedure named 'CANCEL_PO'.
# Done all files.
```

c. Upload the generated iLDT file to Integration repository by executing this command:

```
$fnd_top/bin/fndload apps/apps 0 Y UPLOAD $fnd_top/patch/115/import/wfirep.lct
XXSN_CREATE_PO_PKG_pls.ildt
```

**Note:** Replace `XXSN_CREATE_PO_PKG` with the required package name.
d. Log in to your Oracle E-Business Suite instance as system administrator.

e. Switch to the Integrated SOA Gateway responsibility and select Integration Repository.

f. Search for the web service with the internal name, XXSN_CREATE_PO_PKG.

g. Click the link in the search result to access the list of available methods in the interface package.
Note: In the PL/SQL interface type, both SOAP and REST web services are available. However, this procedure focuses on the REST web service.

h. Click the REST Web Service tab.

i. Set an alias for this service. For example, hr.

ii. Click Deploy.

i. To view the Create PO method, click the REST Web Service tab.
j. Enter the unique service alias name, select the **Create PO** method, and click **Deploy**.
A confirmation message is displayed that the service is successfully deployed.

**k.** Click **View WADL** to access the physical location of the service endpoint where the service is hosted.

**l.** Open the **Grants** tab, select **Create PO**, and click **Create Grant**.

**m.** Select a grantee type, enter the user name to whom you want to give the grant access to use the web service, and click **Create Grant**.
A confirmation message is displayed mentioning that the grant has been successfully created.

**Note:** To revoke grant, click **Revoke Grants** in the **Grants** tab and select the required users.

Perform the above steps for all the required actions and ensure that you use the same names (associated with the respective action) as mentioned in the Resource Path column of the following table:
<table>
<thead>

o. Restart the server and using PuTTY, perform these steps up on logging in to the Oracle EBS server.

i. Execute the commands: `cd $ADMIN_SCRIPTS_HOME` and `./adadminsrvctl.sh stop`.

ii. Enter the WebLogic password and EBS password.

iii. Execute the command, `./adadminsrvctl.sh start`.

iv. Enter the WebLogic password and EBS password.

v. To check the status, execute the command, `./adadminsrvctl.sh status`.

5. Create a credential record for the Oracle EBS spoke.

a. Navigate to Connections & Credentials > Credentials.

b. Click New.
   The system displays the message What type of Credentials would you like to create?.

c. Select Basic Auth Credentials.

d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential record. For example, OEBS Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to the Oracle EBS instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to the Oracle EBS instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

e. Click Submit.

6. Create a connection record for the Oracle EBS spoke.

b. Open the record for the Oracle EBS spoke.

c. From the Connections tab, click New.

d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, OEBS Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the Oracle EBS spoke.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL to connect to your Oracle EBS instance.</td>
</tr>
</tbody>
</table>

e. Click Submit.

**Oracle Financial Cloud spoke v1.0.3**

Manage invoices, ledger, and records in Oracle Financial Cloud instance from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Oracle Financial Cloud API version 11.13.18.05, but may be compatible with later versions.
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Utility Actions spoke v1.0.1
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows
The Oracle Financial Cloud spoke provides sample flows to demonstrate automating the Oracle Financial Cloud tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Accounted AP Invoices</td>
<td>Retrieves information about the accounted AP invoices. This flow triggers the Get Accounted AP Invoice subflow and includes the Look up Record Details action.</td>
</tr>
<tr>
<td>Import Journals</td>
<td>Imports the journal records from your ServiceNow instance to Oracle Financial Cloud system. To import the journal records, you must create the required records in the GL Interface module.</td>
</tr>
<tr>
<td>Import AP Invoices</td>
<td>Imports accounts payable invoice line and accounts payable invoice records from your ServiceNow instance to Oracle Financial Cloud system. To import the accounts payable invoice line and accounts payable invoice records, you must create the required records in the AP Invoices Interface and AP Invoices Lines Interface modules respectively.</td>
</tr>
</tbody>
</table>
Note: The success message displayed after flow executions during the data imports from ServiceNow instance to Oracle Financial Cloud system, only indicates that data has been successfully pushed to Oracle Financial Cloud system. You must verify that the data import is successfully completed by accessing the Oracle Financial Cloud system.

Spoke subflows
The Oracle Financial Cloud spoke provides sample subflow, Get Accounted AP Invoice, to demonstrate automating Oracle Financial Cloud tasks. The subflow retrieves the accounted AP invoice records and is used in the Get Accounted AP Invoices flow. To customize the sample subflow, copy it to a new application scope.

Spoke actions
The Oracle Financial Cloud spoke provides actions to automate Oracle Financial Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Record Management</td>
<td>Create Record</td>
<td>Creates an object.</td>
</tr>
<tr>
<td></td>
<td>Look up Record Details</td>
<td>Retrieves record details in an object.</td>
</tr>
<tr>
<td></td>
<td>Look up Record Details By ID</td>
<td>Retrieves details of the specified record in an object.</td>
</tr>
<tr>
<td></td>
<td>Import AP Invoices</td>
<td>Imports the actionable payment invoices.</td>
</tr>
<tr>
<td></td>
<td>Look up AP Invoice Lines</td>
<td>Retrieves information about the accounts payable invoice lines.</td>
</tr>
<tr>
<td></td>
<td>Look up AP Invoices</td>
<td>Retrieves information about the actionable payment invoices.</td>
</tr>
<tr>
<td>Currency Conversion</td>
<td>Look up Currency Rates</td>
<td>Retrieves information about the currency rates.</td>
</tr>
<tr>
<td>General Ledger</td>
<td>Get Code Combinations Details</td>
<td>Retrieves information about the code combinations.</td>
</tr>
<tr>
<td></td>
<td>Get Subledger Balances</td>
<td>Retrieves information about the subledger balances.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Import Journals</td>
<td>Imports details about the journals.</td>
</tr>
<tr>
<td></td>
<td>Look up Ledger Balance</td>
<td>Retrieves information about the ledger balances.</td>
</tr>
<tr>
<td>Supplier Record Management</td>
<td>Look up Suppliers</td>
<td>Retrieves information about the suppliers.</td>
</tr>
</tbody>
</table>

**Spoke modules**

The Oracle Financial Cloud spoke adds the Oracle Financial Cloud application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounted AP Invoices</td>
<td>Displays information about the accounted AP invoices. This information is retrieved when the Get Accounted AP Invoices flow is triggered.</td>
</tr>
<tr>
<td>AP Invoices Interface</td>
<td>Displays the accounts payable invoice records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td>AP Invoices Lines Interface</td>
<td>Displays the accounts payable invoice line records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td>BI Report Paths</td>
<td>Displays information about the folder path where the required report is saved. The Get Subledger Balances and Get Code Combinations Details actions retrieve the subledger balances from these folder paths. Admin must create two records for the two actions and specify the folder path in this module.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Currency Rates</td>
<td>Displays information about the currency rates. The currency rates are retrieved from the remote table, Get Currency Rates [sn_ofc_spoke_st_get_currency_rates]. You can use the remote table as reference and create another remote table for currency rates as per your requirement.</td>
</tr>
<tr>
<td>GL Interface</td>
<td>Displays the journal records. The Import Journals flow imports these records from your ServiceNow instance to Oracle Financial Cloud system. Admin must create the required journal records in this module.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

Two connection and credential records are available along with the spoke. You must configure these alias record to use the spoke. See [Set up the Oracle Financial Cloud spoke](#) for more information.

**Note:** Depending on the Oracle Financial Cloud policies and account settings, you may have to change or refresh the credentials in your credential record periodically.

**Set up the Oracle Financial Cloud spoke**

Integrate the ServiceNow instance and Oracle Financial Cloud instance by using the basic auth credentials to authenticate ServiceNow requests.
Before you begin

- Request an IntegrationHub subscription.
- Activate Oracle Financial Cloud spoke.
- Role required: admin

Create a credential record for the Oracle Financial Cloud spoke

Create a credential record for your Oracle Financial Cloud server. The Oracle Financial Cloud spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.

   The system displays this message: What type of Credentials would you like to create?

3. Select Basic Auth Credentials.

4. On the form, fill these values.

   Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, OFC Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your Oracle Financial Cloud server.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your Oracle Financial Cloud server.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

Note: Depending on the Oracle Financial Cloud policies and account settings, you may have to change or refresh the credentials in your credential record periodically.

5. Click Submit.
Create a connection record for the Oracle Financial Cloud spoke

Create a connection record for your Oracle Financial Cloud server. The Oracle Financial Cloud spoke connection and credential aliases use these connections to perform actions in Oracle Financial Cloud.

Procedure
1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, OracleCloudFinancials.
3. From the Connections tab, click New.
4. On the form, fill these fields.

Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, OFC Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Financial Cloud spoke. For example, OFC Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to the server on which Oracle Financial Cloud is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.
7. Open the alias record, OracleCloudFinancialsReport.
8. From the Connections tab, click New. This connection record is required to generate and import custom reports using the public report service.
9. On the form, fill these fields.

Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, OFC Reports Conn.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record is not required for this connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to the Oracle Financial Cloud public report service. Enter the URL in this format, <code>https://&lt;oracle-financial-cloud-host&gt;/xmlpserver/services/PublicReportService</code></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

10. In the **Attributes** tab, provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your Oracle Financial Cloud account.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name with permission to access the public report service, to log in to your Oracle Financial Cloud account.</td>
</tr>
</tbody>
</table>

11. Click **Submit**.

**What to do next**
Create the required records in these spoke modules:

- AP Invoices Interface
- AP Invoices Lines Interface
- BI Report Paths
- GL Interface

**Oracle HCM Cloud spoke v2.1**
Manage workstructures and human capital in Oracle HCM Cloud instance from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Oracle HCM Cloud API version 11.13.18.05, but may be compatible with later versions.

Spoke requirements
• Oracle HCM Cloud subscription

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
• ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
• Large JSON and XML Payload Builder API (com.glide.streaming_builder)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows
The Oracle HCM spoke provides sample subflows to demonstrate automating Oracle HCM Cloud tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
### Subflow

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Active</td>
<td>Retrieves the active Department information by calling the <strong>Look up Departments</strong> action.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Oracle HCM spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Record Management</td>
<td>Look up Record Details</td>
<td>Retrieves all record details.</td>
</tr>
<tr>
<td></td>
<td>Look up Benefit Enrollments</td>
<td>Retrieves the benefit enrollment details of an employee.</td>
</tr>
<tr>
<td>Compensation Management</td>
<td>Get Total Rewards</td>
<td>Retrieves the total rewards details of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Look up Individual Compensation</td>
<td>Retrieves the individual compensation details of an employee.</td>
</tr>
<tr>
<td>Employee Atom Feeds</td>
<td>Look up Atom Feeds Employees Assignments Stream</td>
<td>Retrieves the changes made in employees assignments information.</td>
</tr>
<tr>
<td></td>
<td>Look up Atom Feeds Employees Newhire Stream</td>
<td>Retrieves the new hire employees information.</td>
</tr>
<tr>
<td></td>
<td>Look up Atom Feeds Employees Termination Stream</td>
<td>Retrieves the employees termination information.</td>
</tr>
<tr>
<td></td>
<td>Look up Atom Feeds Employees Update Stream</td>
<td>Retrieves the employees update information.</td>
</tr>
<tr>
<td>Human Capital Management</td>
<td>Look up Departments Stream</td>
<td>Retrieves information about departments.</td>
</tr>
<tr>
<td></td>
<td>Look up Employee Assignments</td>
<td>Retrieves information about employees assignments.</td>

<td></td>
<td>Look up Atom Feeds Organizations Stream</td>
<td>Retrieves the changes made in organizations.</td>
</tr>
<tr>
<td></td>
<td>Look up Atom Feeds Positions Stream</td>
<td>Retrieves the changes made in positions.</td>
</tr>
</tbody>
</table>
Spoke module
The Oracle HCM spoke adds the Oracle HCM Cloud application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BI Report Paths</td>
<td>Lists the BI report paths for the actions.</td>
</tr>
<tr>
<td>Look up Holiday Calendars</td>
<td>Lists the holiday calendars.</td>
</tr>
<tr>
<td>New Positions</td>
<td>Lists the available new positions.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Oracle HCM Cloud spoke
Integrate the ServiceNow instance and Oracle HCM Cloud instance by using the basic auth credentials to authenticate ServiceNow requests.

Before you begin
- Request an IntegrationHub subscription.
- Activate Oracle HCM Cloud spoke.
- Role required: admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays this message: What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
4. On the form, fill these values.
### Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle HCM Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your target host on which Oracle HCM Cloud is installed.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your target host on which Oracle HCM Cloud is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

6. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

7. Open the alias record, **OracleCloudHCM**.

8. From the **Connections** tab, click **New**.

9. On the form, fill these fields.

### Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle HCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Financial Cloud spoke. For example, Oracle HCM Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to the server on which Oracle HCM Cloud is installed in this format: https://&lt;hostname&gt;.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

10. Click **Submit**.
Create BI report paths for Oracle HCM Cloud spoke

Create BI reports paths to specify the folder paths where the reports are saved.

**Before you begin**
Role required: admin

**Procedure**
2. Click **New**.
3. On the form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report Name</td>
<td>Name of the BI report.</td>
</tr>
<tr>
<td>Action Name</td>
<td>Name of the action.</td>
</tr>
<tr>
<td>Folder Path</td>
<td>Folder path of Oracle HCM Cloud.</td>
</tr>
</tbody>
</table>

**Sample BI Report Paths**

<table>
<thead>
<tr>
<th>Report Name</th>
<th>Action Name</th>
<th>Folder Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Holiday Calendar Report.xdo</td>
<td>Look up Holiday Calendar</td>
<td>/Custom/Human Capital Management/</td>
</tr>
<tr>
<td>Legislative datagroup Report.xdo</td>
<td>Get Legislative Group ID</td>
<td>/Custom/Human Capital Management/</td>
</tr>
<tr>
<td>USOnlinePayslip.xdo</td>
<td>Look up Payroll</td>
<td>/Human Capital Management/Payroll/</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Payment Distribution/US/</td>
</tr>
<tr>
<td>Element Screen Entry Values.xdo</td>
<td>Look up Payroll Elements</td>
<td>/Custom/Human Capital Management/</td>
</tr>
<tr>
<td>Individual Compensation Report.xdo</td>
<td>Look up Individual Compensation</td>
<td>/Custom/Human Capital Management/</td>
</tr>
</tbody>
</table>

**Note:** Report Name and Folder Path may vary based on the Oracle HCM Cloud instance.
Oracle Object Storage Management spoke v1.0.1
Manage objects, buckets, and namespace in the Oracle Object Storage Management account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Oracle Object Storage Management API version 20160918, but may be compatible with later versions.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Oracle Cloud IAM spoke v1.0.4
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Oracle Object Storage Management spoke provides actions to automate Oracle Object Storage Management tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket Management</td>
<td>Create Bucket</td>
<td>Creates a bucket in the specified Oracle Cloud Namespace.</td>
</tr>
<tr>
<td></td>
<td>Delete Bucket</td>
<td>Deletes the specified bucket.</td>
</tr>
<tr>
<td></td>
<td>Get Bucket</td>
<td>Retrieves details of the specified bucket.</td>
</tr>
<tr>
<td></td>
<td>Look up Buckets</td>
<td>Retrieves a list of buckets in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Re-encrypt Bucket</td>
<td>Re-encrypts the specified bucket.</td>
</tr>
<tr>
<td></td>
<td>Update Bucket</td>
<td>Updates details of the specified bucket.</td>
</tr>
<tr>
<td>Namespace Metadata</td>
<td>Get Namespace</td>
<td>Retrieves the name of the Object Storage namespace for the user.</td>
</tr>
<tr>
<td>Object Management</td>
<td>Copy Object</td>
<td>Creates a request to copy an object within a region or to another region.</td>
</tr>
<tr>
<td></td>
<td>Create or Update Object</td>
<td>Creates a new object or overwrites an existing object with the same name</td>
</tr>
<tr>
<td></td>
<td>Delete Object</td>
<td>Deletes the specified object.</td>
</tr>
<tr>
<td></td>
<td>Get Object</td>
<td>Retrieves the specified object.</td>
</tr>
<tr>
<td></td>
<td>Look up Objects</td>
<td>Retrieves a list of objects in the specified bucket.</td>
</tr>
<tr>
<td></td>
<td>Re-encrypt Object</td>
<td>Re-encrypts the specified object.</td>
</tr>
<tr>
<td></td>
<td>Rename Object</td>
<td>Renames the specified object.</td>
</tr>
<tr>
<td></td>
<td>Restore Object</td>
<td>Restores the specified object.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
Set up the Oracle Object Storage Management spoke

Integrate the ServiceNow instance and Oracle Object Storage Management account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

Before you begin

- Activate and set up the Oracle Cloud IAM spoke v1.0.4
- Role required: admin

Procedure

1. **Optional:** Create a JKS certificate. You can create a JKS certificate for the Oracle Object Storage Management spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.

2. **Optional:** Create X.509 certificate. You can create a X.509 certificate for the Oracle Object Storage Management spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.

3. Create a child alias in the Oracle Cloud IAM spoke connection and credential alias.

   b. Click New.

   c. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the alias record. For example, Oracle Obj Storage Alias.</td>
</tr>
<tr>
<td>Parent Alias</td>
<td>Connection and credential alias record of the Oracle Cloud IAM spoke. For example, sn_oci_iam_spoke.OracleIAM_credentialANDconnection</td>
</tr>
</tbody>
</table>

   d. Right-click the form header and click Save.
4. Create credential record for the Oracle Object Storage Management spoke.

a. Navigate to **Connections & Credentials > Credentials**.

b. Click **New**.

   The system displays this message: **What type of Credentials would you like to create?**

c. Select **OCI SHA256WithRSA Signature**.

d. On the form, fill these values.

   - **Note:** You can specify details of the certificates you created specifically for the Oracle Object Storage Management spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>OCI Obj Cred</strong>.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
</tbody>
</table>
   | Key ID              | Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and Fingerprint in this format: `ocid1.tenancy.oc1..<unique_ID>/ocid1.user.oc1..<unique_ID>/<key_fingerprint>`.
   | Applies to          | Option to specify if the credential applies to all MID Servers in the network. |
   | Active              | Option to actively use the credential record. |
   | Authentication Algorithm | Custom authentication algorithm for outbound signing requests. Select **OCI SHA256RSA Signing Algorithm** |

  e. Right-click the form header and click **Submit**.
5. Create connection record for the Oracle Object Storage Management spoke.

a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

b. Open the child alias record you had created. For example, **Oracle Obj Storage Alias**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Obj Storage conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Object Storage Management spoke. For example, OCI Obj Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Object Storage Management. For example, <a href="https://objectstorage.ap-mumbai-1.oraclecloud.com">https://objectstorage.ap-mumbai-1.oraclecloud.com</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. Click **Submit**.

The ServiceNow instance and Oracle Object Storage Management account are integrated. You can use the spoke actions to build flows and automate tasks as required.

**Oracle Peoplesoft Financial spoke v1.0.3**

Manage finances and procurement in the Oracle Peoplesoft Financial instance from your ServiceNow instance.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
• PeopleSoft FSCM 9.2 Update Image 37
• PeopleTools 8.58.05
• Oracle Database 19.3.0.0
• Elasticsearch 7.0.0
• Kibana 7.0.0
• Oracle Linux 7.8x
• Oracle Database version above 12.2.0.0
• PeopleTools above 8.56

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Remote Tables (com.glide.script.vtable)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
• ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
• ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)
Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows
The Oracle Peoplesoft Financial spoke provides a sample flow, Create PO, to demonstrate automating the PO creation. To customize the sample flow, copy it to the required application scope.

Spoke subflows
The Oracle Peoplesoft Financial spoke provides sample subflows to demonstrate automating tasks. To customize a sample subflow, copy it to the required application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BU and Vendor Validation</td>
<td>Validates if a vendor or business unit exists in Oracle Peoplesoft Financial.</td>
</tr>
<tr>
<td>Create PO After BU Validation</td>
<td>Validates a business unit before creating a purchase order using that business unit.</td>
</tr>
<tr>
<td>Polling Suppliers</td>
<td>Retrieves details of the daily suppliers based on the mentioned polling frequency and creates or updates records in PSFT data table based on Vendor ID.</td>
</tr>
</tbody>
</table>

Spoke actions
The Oracle Peoplesoft Financial spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finance</td>
<td>Create Bulk Journals</td>
<td>Creates bulk journals.</td>
</tr>
<tr>
<td></td>
<td>Create Invoice</td>
<td>Creates an invoice in Oracle Peoplesoft Financial.</td>
</tr>
<tr>
<td></td>
<td>Get Business Unit By Business Unit ID</td>
<td>Retrieves details of the specified business unit.</td>
</tr>
<tr>
<td></td>
<td>Get Department By Department ID</td>
<td>Retrieves the department cost center details of the specified department.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>

</tr>
<tr>
<td></td>
<td>Lookup PO Header</td>
<td>Retrieves details of the PO header, based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Lookup PO Line</td>
<td>Retrieves details of the PO line, based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Lookup Ship To Locations</td>
<td>Retrieves list of all the ship to locations, based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Lookup Suppliers</td>
<td>Retrieves details of all the suppliers, based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Update PO</td>
<td>Updates details of the PO.</td>
</tr>
<tr>
<td>Utility</td>
<td>Process Trigger</td>
<td>Triggers the specified process.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Oracle Peoplesoft Financial spoke**

Integrate the Oracle Peoplesoft Financial and ServiceNow instances, and authenticate the requests using the basic authentication.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate the Oracle Peoplesoft Financial spoke.
- Ensure that you have access to Oracle Peoplesoft Application Designer.
- Roles required: ServiceNow admin and Oracle Peoplesoft Financial System Admin

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. In the Application Designer, import the Oracle Peoplesoft Financial project.

   a. From the ServiceNow® Store download the project file, SN_PS_FSCM_INTEGRATION.zip and save it in the required local folder.

   b. Import the Oracle Peoplesoft Financial project to the target environment that is, Oracle Peoplesoft Application Designer.

   c. Navigate to **Copy Project > From File** and select the project file.

   ![Image showing the Copy From File dialog box]

   d. Click **Copy** to copy the definition types.
e. Verify that the project has all the objects: Application packages, Records, Services, and Service Operations.

f. Build the project by navigating to **Build > Project**.

g. Select **Create Tables**, **Create Views**, and **Execute and build script** options.
The required tables are created in the target Oracle Peoplesoft Financial database.

2. Enable the required web services on your Oracle Peoplesoft Financial instance.

   a. Log in to your Oracle Peoplesoft Financial instance as an System Admin.

   b. Navigate to **Navigator > People Tools > Integration Broker > Web Services > Provide Web Service**.

   c. In the Search Criteria, specify `sn_` for **Service Name** and click **Search**.
d. Select the check box against the required web services and click Next.
Note: Ensure that you select 24 ServiceNow web services.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
e. Under Operations, select the check box against the required web service and click Next.

f. Click View WSDL to view the WSDL file and click Next.

g. In Specify Publishing Options, click Finish.
   Generated WSDL URL is displayed in this format: <Base-URL>/<webservice-endpoint>.wsdl

h. Navigate to Navigator > People Tools > Integration Broker > Web Services > CI-Based Services.

i. Perform the same steps that you had earlier performed for the webservices.

   Note: Configure the webservices as per your requirement.

3. Provide the required permissions to the web services.

   a. Log in to your Oracle Peoplesoft Financial instance as a System Admin.

   b. Navigate to Navigator > People Tools > Integration Broker > Web Services > Service Utilities > Service Operation Permissions.

   c. Select Service option, specify the service name in Service, and click Search.
d. Select the check box against the required web service and click **Set Security**.
e. In **Web Service Access**, provide access as per your requirement and click **Save**.

**Web Service Access**

**Operation:** SN_GET_ASSET_SO

**Permission**

**Permission List**

**Access**

![Permission List Image]

**Save** **Return to Search**

4. Using SQL Developer or Data Mover in Oracle Peoplesoft Application Designer, connect to the database and run these scripts to ensure that the journal entry, SN_ACCT_ENTRY is built.

```sql
SET DEFINE OFF;

Insert into PS_SOURCE_TBL
VALUES
('SHARE','SN',to_date('01-JAN-00','DD-MON-RR'),'A','ServiceNow','R','R','R','D','D','R','D','D','N','D','D',' ',' ',' ',' ',' ','D',' ');

5. Create a credential record for the Oracle Peoplesoft Financial spoke.

a. Log in to the ServiceNow instance as an admin.

b. Navigate to Connections & Credentials > Credentials.

c. Click New.
   The system displays the message What type of Credentials would you like to create?.

d. Select Basic Auth Credentials.

e. On the form, fill these values.

<table>
<thead>
<tr>
<th>Name</th>
<th>Name to identify the credential record. For example, Peoplesoft Cred.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Username</td>
<td>Username with the required permissions to log in to the Oracle Peoplesoft Financial instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to the Oracle Peoplesoft Financial instance.</td>
</tr>
</tbody>
</table>
Active | Option to actively use the credential record.
---|---

f. Click **Submit**.

6. Create a connection record for the Oracle Peoplesoft Financial spoke.
   
a. Log in to the ServiceNow instance as an admin.
   
b. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
   
c. Open for the record for the Oracle Peoplesoft Financial spoke.
   
d. From the **Connections** tab, click **New**.
   
e. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Peoplesoft Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Jenkins. For example, select <strong>Peoplesoft Cred</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL obtained from the generated WSDL URL.</td>
</tr>
</tbody>
</table>

f. Click **Submit**.

7. Provide Oracle Peoplesoft Financial credentials to use the Process Trigger action.
   
a. Log in to the ServiceNow instance as an admin.
   
b. Navigate to **Oracle Peoplesoft Credentials > Oracle Peoplesoft Credentials**.
   
c. Click **New**.
   
d. On the form, enter the username and password of user with the required permissions.
   
e. Click **Submit**.

8. Retrieve details of the daily suppliers up to the required date.
a. Log in to the ServiceNow instance as an admin.

b. Navigate to **PSFT Flow Execution > PSFT Flow Executions**.

c. Click **New**.

d. Select the date up to which you want to retrieve the daily suppliers data in **Last Successfull Execution**.

e. Click **Submit**.

Based on the trigger you have configured in the Polling Suppliers subflow, data is retrieved periodically. To view the data, navigate to **PSFT > PSFT Data**.

---

**Oracle Virtual Cloud Network spoke v1.0.1**

Manage networks, route tables, security lists, and subnets in Oracle Virtual Cloud Network account from your ServiceNow instance.

---

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

---

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

---

**Supported versions**

This spoke was built for Oracle Virtual Cloud Network API version 20160918, but may be compatible with later versions.

---

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- **Oracle Cloud IAM spoke v1.0.4**
- **ServiceNow IntegrationHub Action Step - REST** (com.glide.hub.action_step.rest)
- **ServiceNow Flow Designer - Dynamic Inputs** (com.glide.hub.dynamic_inputs)
- **Complex Object** (com.glide.cobject)
- **ServiceNow IntegrationHub Runtime** (com.glide.hub.integration.runtime)
**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Oracle Virtual Cloud Network spoke provides actions to automate Oracle Virtual Cloud Network tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Management</td>
<td>Change Network Compartment</td>
<td>Moves the specified VCN to a different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Network</td>
<td>Creates a virtual cloud network.</td>
</tr>
<tr>
<td></td>
<td>Delete Network</td>
<td>Delete the specified VCN.</td>
</tr>
<tr>
<td></td>
<td>Get Network</td>
<td>Retrieves details of the required VCN.</td>
</tr>
<tr>
<td></td>
<td>Look up Networks</td>
<td>Lists the VCNs in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Network</td>
<td>Updates details of the specified VCN.</td>
</tr>
<tr>
<td>Route Table Management</td>
<td>Change Route Table Compartment</td>
<td>Moves a route table to different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Route Table</td>
<td>Creates a route table for the specified VCN.</td>
</tr>
<tr>
<td></td>
<td>Delete Route Table</td>
<td>Delete the specified route table.</td>
</tr>
<tr>
<td></td>
<td>Get Route Table</td>
<td>Retrieves the specified route table details.</td>
</tr>
<tr>
<td></td>
<td>Look up Route Tables</td>
<td>Lists the route table in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Route Table</td>
<td>Updates details of the specified route table.</td>
</tr>
<tr>
<td>Security List Management</td>
<td>Change Security List Compartment</td>
<td>Moves the specified security list to different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Security List</td>
<td>Creates a security list for the specified VCN.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Security List</td>
<td>Deletes the specified security list.</td>
</tr>
<tr>
<td></td>
<td>Get Security List</td>
<td>Retrieves specified security list's information.</td>
</tr>
<tr>
<td></td>
<td>Look up Security Lists</td>
<td>Lists the security lists in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Security List</td>
<td>Updates display name or rules of the specified security list.</td>
</tr>
<tr>
<td>Subnet Management</td>
<td>Change Subnet Compartment</td>
<td>Moves the specified subnet to a different compartment within the same tenancy.</td>
</tr>
<tr>
<td></td>
<td>Create Subnet</td>
<td>Creates a subnet in the specified VCN.</td>
</tr>
<tr>
<td></td>
<td>Delete Subnet</td>
<td>Deletes the specified subnet.</td>
</tr>
<tr>
<td></td>
<td>Get Subnet</td>
<td>Retrieves details of the specified subnet.</td>
</tr>
<tr>
<td></td>
<td>Look up Subnets</td>
<td>Lists the subnets in the specified compartment.</td>
</tr>
<tr>
<td></td>
<td>Update Subnet</td>
<td>Updates subnet in the specified VCN.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Oracle Virtual Cloud Network spoke**

Integrate the ServiceNow instance and Oracle Virtual Cloud Network account by using the OCI SHA256WithRSA Signature credentials to authenticate ServiceNow requests.

**Before you begin**

- Activate and set up the Oracle Cloud IAM spoke v1.0.4
- Role required: admin
Procedure

1. **Optional:** Create a JKS certificate. You can create a JKS certificate for the Oracle Virtual Cloud Network spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating the JKS Certificate, see Create a Java KeyStore (JKS) certificate.

2. **Optional:** Create X.509 certificate. You can create a X.509 certificate for the Oracle Virtual Cloud Network spoke or use the certificate created for the Oracle Cloud IAM spoke. For information about creating a X.509 certificate, see Create X.509 certificate for the Oracle Cloud IAM spoke.

3. Create credential record for the Oracle Virtual Cloud Network spoke.

   a. Navigate to **Connections & Credentials > Credentials**.

   b. Click **New**.

      The system displays this message: **What type of Credentials would you like to create?**

   c. Select **OCI SHA256WithRSA Signature**.

   d. On the form, fill these values.

      **Note:** You can specify details of the certificates you created specifically for the Oracle Virtual Cloud Network spoke or specify details of the existing certificates you had created for the Oracle Cloud IAM spoke.

### OCI SHA256WithRSA Signature Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Oracle Virtual Cloud Network Cred.</td>
</tr>
<tr>
<td>Certificate Sys ID</td>
<td>Sys ID of the Signing Certificate.</td>
</tr>
<tr>
<td>Alias</td>
<td>Alias of the KeyStore.</td>
</tr>
<tr>
<td>Alias Password</td>
<td>Alias password of the KeyStore.</td>
</tr>
<tr>
<td>Key ID</td>
<td>Key ID helps identify which key is used when multiple keys are used to sign tokens. The Key ID must be slash (/) separated values of Tenancy OCID, User OCID, and</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Fingerprint in this format:</td>
<td>ocid1.tenancy.oc1..&lt;unique_ID&gt;/ocid1.user.oc1..&lt;unique_ID&gt;/&lt;key_fingerprint&gt;.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in the network.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Authentication</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>OCI SHA256RSA Signing Algorithm</strong></td>
</tr>
</tbody>
</table>

**e.** Right-click the form header and click **Submit**.

4. Create connection record for the Oracle Virtual Cloud Network spoke.

**a.** Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

**b.** Open the alias record of the Oracle Virtual Cloud Network spoke. For example, **Oracle_VCN_Connection**.

**c.** From the **Connections** tab, click **New**.

**d.** On the form, fill these fields.

---

**Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Oracle_VCN_Conn</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Virtual Cloud Network spoke. For example, <strong>Oracle Virtual Cloud Network Cred</strong></td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Oracle Virtual Cloud Network. For example, <strong><a href="https://iaas.ap-mumbai-1.oraclecloud.com">https://iaas.ap-mumbai-1.oraclecloud.com</a></strong></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. Click **Submit**.

The ServiceNow instance and Oracle Virtual Cloud Network account are integrated. You can use the spoke actions to build flows and automate tasks as required.

**Qualtrics spoke**
Integrate ServiceNow instance with Qualtrics. Manage web-based survey distribution in Qualtrics from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Qualtrics v3, but may be compatible with later versions.

**Spoke requirements**
- Qualtrics account

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke flows**

The Qualtrics spoke provides sample flows to demonstrate automating the Qualtrics tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create distribution when incident is closed</td>
<td>Creates a distribution for a survey and sends the survey to the incident caller, when an incident is closed.</td>
</tr>
</tbody>
</table>

**Spoke subflows**

The Qualtrics spoke provides sample subflows to demonstrate automating Qualtrics tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look up Contact in Mailing List</td>
<td>Retrieves the look up ID of the specified contact.</td>
</tr>
<tr>
<td>Look up Mailing List by Name</td>
<td>Retrieves ID of the mailing list for the specified name.</td>
</tr>
<tr>
<td>Look up Message by Name</td>
<td>Retrieves ID of the message for the specified name.</td>
</tr>
<tr>
<td>Look up Survey by Name</td>
<td>Retrieves ID of the survey with the specified name.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Qualtrics spoke provides actions to automate Qualtrics tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Management</td>
<td>Create Contact</td>
<td>Creates a contact in the specified directory.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Contact Distribution</td>
<td>Retrieves the distribution email history for the specified contact in a directory.</td>
</tr>
<tr>
<td></td>
<td>Email History</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look up Contact Distribution</td>
<td>Retrieves a list of distribution response history for a specified contact in a directory.</td>
</tr>
<tr>
<td></td>
<td>Response History</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look up Contacts</td>
<td>Retrieves a list of contacts from a directory.</td>
</tr>
<tr>
<td></td>
<td>by Email</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Update Contact</td>
<td>Updates the specified contact details in the specified directory.</td>
</tr>
<tr>
<td>Distribution</td>
<td>Management</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Create Distribution</td>
<td>Creates a distribution for a survey.</td>
</tr>
<tr>
<td></td>
<td>Look up Distribution Links</td>
<td>Retrieves a list of distribution links for an existing distribution of the specified survey.</td>
</tr>
<tr>
<td>Library</td>
<td>Management</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look up Library Messages</td>
<td>Retrieves a list of messages in a library.</td>
</tr>
<tr>
<td>Mailing List</td>
<td>Management</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Create Contact in Mailing List</td>
<td>Creates a directory contact in a specified mailing list.</td>
</tr>
<tr>
<td></td>
<td>Get Contact in Mailing List</td>
<td>Retrieves a contact from a mailing list in the specified directory.</td>
</tr>
<tr>
<td></td>
<td>Look up Mailing Lists</td>
<td>Retrieves a list of mailing lists in a directory.</td>
</tr>
<tr>
<td></td>
<td>Remove Contact from Mailing List</td>
<td>Removes a contact from the specified mailing list.</td>
</tr>
<tr>
<td>Metadata</td>
<td>Retrieval</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Metadata - Look up Directories</td>
<td>Retrieves the metadata of a list of directories within a brand.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Ensure that this action is always used along with relevant actions that use dynamic inputs.</td>
</tr>
<tr>
<td></td>
<td>Metadata - Look up Libraries</td>
<td>Retrieves a list of libraries.</td>
</tr>
</tbody>
</table>
**Category** | **Action** | **Description**  
--- | --- | ---  
Survey Management | Look up Surveys | Retrieves a list of surveys available to the user.

### Note:
Ensure that this action is always used along with relevant actions that use dynamic inputs.

### Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Qualtrics spoke
Integrate the ServiceNow instance and Qualtrics by registering Qualtrics as an OAuth provider to authenticate ServiceNow requests.

#### Before you begin
- Request an IntegrationHub subscription.
- Activate Qualtrics spoke.
- Register your ServiceNow instance in Qualtrics and record the Client ID and Client secret for authentication.
- Role required: admin

#### Register Qualtrics as an OAuth provider
Register Qualtrics as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

#### Procedure
1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Qualtrics OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Qualtrics account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Qualtrics account configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: https://&lt;your_data_center&gt;.qualtrics.com/oauth2/token</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Client Credentials</strong> or <strong>Authorization Code</strong> based on your Qualtrics account configuration.</td>
</tr>
<tr>
<td>Refresh Token</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Lifespan</td>
<td></td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can use only <strong>Authorization Code</strong> as the <strong>Default Grant type</strong> when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

6. In the **OAuth Entity Scopes** tab, insert one record for each OAuth scope and provide **Name** to identify the OAuth scope record. You can provide OAuth scopes as per your requirement. For more information about the scopes, see **OAuth 2.0 Scopes** in Qualtrics API Docs.

7. Right-click the form header, and click **Save**.

8. In the **OAuth Entity Profiles** tab, open the default record. For example, **Qualtrics app registry default_profile**.

9. In the **OAuth Entity Profile Scopes** tab, insert a row; one for each OAuth scope and select the OAuth scope records.
10. Right-click the form header, and click **Save**.

### Create a credential record for the Qualtrics spoke

Create a credential record for the Qualtrics account. The Qualtrics spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.

   The system displays this message: **What type of Credentials would you like to create?**

3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

   **OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Qualtrics Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Qualtrics as an OAuth provider. For example, Qualtrics OAuth Profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.
Create a connection record for the Qualtrics spoke

Create a connection record for your Qualtrics account. The Qualtrics spoke connection and credential aliases use these connections to perform actions in Qualtrics.

**Procedure**

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record for Qualtrics.
3. From the Connections tab, click New.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Qualtrics Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Qualtrics spoke.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Default alias is sn_qualtrics_spoke.Qualtrics</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Qualtrics. Enter: https:&lt;your_data_center&gt;.qualtrics.com/API/v3</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**PagerDuty spoke**

The PagerDuty spoke provides actions to view and analyze meaningful usage data for PagerDuty software subscriptions. Analyze on-call users to determine which licenses are stale so that you can reclaim these licenses and realize your potential savings.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for PagerDuty v1.0.3, but may be compatible with later versions.

Spoke requirements
• PagerDuty global admin account

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows
The PagerDuty spoke provides sample subflows to demonstrate automating PagerDuty tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PagerDuty Download Subscriptions</td>
<td>Downloads user subscriptions from the PagerDuty portal.</td>
</tr>
<tr>
<td></td>
<td>To use this subflow, perform the steps outlined in Integrating with PagerDuty.</td>
</tr>
<tr>
<td>PagerDuty Reclaim Subscription</td>
<td>Deactivates user accounts in PagerDuty.</td>
</tr>
<tr>
<td></td>
<td>To use this subflow, perform the steps outlined in Integrating with PagerDuty.</td>
</tr>
<tr>
<td>PagerDuty Update User Activity</td>
<td>Retrieves the activity of users who are on an on-call schedule.</td>
</tr>
</tbody>
</table>
### Spoke actions

The PagerDuty spoke provides actions to automate PagerDuty tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Look Up Users</td>
<td>Retrieves all PagerDuty user subscriptions. To use this action, perform the steps outlined in Integrating with PagerDuty.</td>
</tr>
<tr>
<td></td>
<td>Look Up On Call Users</td>
<td>Retrieves information about the last time that a user was on an on-call schedule. To use this action, perform the steps outlined in Integrating with PagerDuty.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Deactivates a user account in PagerDuty. To use this action, perform the steps outlined in Integrating with PagerDuty.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Plivo spoke

Enable communications with your customers using the Plivo platform from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Plivo API version v1, but may be compatible with later versions.

Spoke requirements
• Admin access to the Plivo console.
• AUTH ID and AUTH TOKEN. You can find these values in the dashboard of your Plivo account. For more information, see Authentication in the Plivo documentation.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows
The Plivo spoke provides sample subflows to demonstrate automating the Plivo tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plivo Call Handler</td>
<td>Manages calls associated with the Plivo account.</td>
</tr>
<tr>
<td>Plivo SMS Handler</td>
<td>Manages SMS associated with the Plivo account.</td>
</tr>
</tbody>
</table>

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note:

- You must configure webhooks to use the spoke subflow. See Set up a webhook for the Plivo spoke for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. The subflow can be configured to run as system.

**Spoke actions**

The Plivo spoke provides actions to automate the Plivo tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Create Application</td>
<td>Creates an application.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes an application.</td>
</tr>
<tr>
<td></td>
<td>Get Application</td>
<td>Retrieves details of an application.</td>
</tr>
<tr>
<td></td>
<td>Look up Applications</td>
<td>Retrieves list of all application IDs.</td>
</tr>
<tr>
<td></td>
<td>Update Application</td>
<td>Updates details of an application.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Get Call</td>
<td>Retrieves Call Detail Record (CDR) of the call.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Call</td>
<td>Ends an ongoing call or cancel a queued outbound call.</td>
</tr>
<tr>
<td></td>
<td>Look up Call</td>
<td>Retrieves details of the specified call.</td>
</tr>
<tr>
<td></td>
<td>Make Call</td>
<td>Initiates an outbound call.</td>
</tr>
<tr>
<td></td>
<td>Start Recording Call</td>
<td>Starts recording an ongoing outbound call.</td>
</tr>
<tr>
<td></td>
<td>Stop Recording Call</td>
<td>Stops all the ongoing recordings for the specified call UUID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conference Management</td>
<td>Get Conference</td>
<td>Gets details of a conference.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Conference</td>
<td>Hangs up all ongoing conferences in your account.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Member</td>
<td>Hangs up a member in a conference.</td>
</tr>
<tr>
<td></td>
<td>Kick Member</td>
<td>Disconnects a member in a conference.</td>
</tr>
<tr>
<td></td>
<td>Look up Conferences</td>
<td>Retrieves a list of all conferences that are ongoing on your account.</td>
</tr>
<tr>
<td></td>
<td>Mute Member</td>
<td>Mutes members in a conference.</td>
</tr>
<tr>
<td></td>
<td>Unmute Member</td>
<td>Unmutes members in a conference.</td>
</tr>
<tr>
<td>SMS Management</td>
<td>Get Message</td>
<td>Retrieves the details of the specified message.</td>
</tr>
<tr>
<td></td>
<td>Look up Message</td>
<td>Retrieves the details of the messages.</td>
</tr>
<tr>
<td></td>
<td>Send Bulk SMS</td>
<td>Sends SMS to the multiple numbers.</td>
</tr>
<tr>
<td></td>
<td>Send SMS</td>
<td>Sends the SMS to the specified number.</td>
</tr>
</tbody>
</table>

**Spoke module**

Webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Plivo that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Plivo tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Plivo spoke adds the Plivo Spoke application to your instance and includes these modules:
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plivo Webhook Registries</td>
<td>Create and view the Plivo webhooks in ServiceNow.</td>
</tr>
<tr>
<td>Plivo Webhook Routing Policy</td>
<td>Create and view the routing policies for the Plivo webhooks in ServiceNow. You can also customise the conditions in the routing policies as per your requirement.</td>
</tr>
</tbody>
</table>

Use the Plivo Webhook Registries module to register a Plivo webhook. You must generate a Callback URL and provide this URL in your Plivo account.

Routing policies and subflows support these Plivo fields:
- Keywords
- Call Event
- Caller Name
- Event Type
- SMS Text
- To Number
- Show Related Fields

Create routing policy in the Plivo WebHook Routing Policies module and specify conditions as per your requirement. See Set up a webhook for the Plivo spoke for information regarding setting up and configuring the webhooks.

**Spoke user roles**

The Plivo spoke provides a Plivo Admin (sn_plivo_spoke.Plivo_Admin) role.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Set up the Plivo spoke

Integrate the ServiceNow instance and Plivo account by using the basic authentication to authenticate ServiceNow requests.

Before you begin

- Request IntegrationHub subscription.
- Activate Plivo spoke.
- Role required: admin

Create Credential record for the Plivo spoke

Create credential record for the Plivo account. The Plivo spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
4. On the Basic Auth Credentials form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Plivo Credential.</td>
</tr>
<tr>
<td>User name</td>
<td>Auth ID of your Plivo account.</td>
</tr>
<tr>
<td>Password</td>
<td>Auth token of your Plivo account.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.

Create Connection record for the Plivo spoke

Create connection record for your Plivo account. The Plivo spoke connection and credential aliases use these connections to perform actions in Plivo.
Procedure

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, Plivo.
3. From the Connections tab, click New.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Plivo Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Plivo. For example, select Plivo Credential.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Plivo. Enter <a href="https://api.plivo.com">https://api.plivo.com</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auth ID</td>
<td>Auth ID of your Plivo account.</td>
</tr>
<tr>
<td>API version</td>
<td>API version of your Plivo account. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Set up a webhook for the Plivo spoke

Configure a webhook to subscribe to your Plivo account with a ServiceNow callback URL.
Before you begin
- Request IntegrationHub subscription
- Activate the Plivo spoke
- Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

Register a Plivo webhook in ServiceNow
Register a Plivo webhook in your ServiceNow instance to notify the ServiceNow app when certain events occur in Plivo.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

Procedure
1. Navigate to Plivo Spoke > Plivo Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, Plivo webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Path</td>
<td>Plivo webhook path. By default, this path is set to api/</td>
</tr>
<tr>
<td></td>
<td>sn_plivo_spoke/plivo_webhook_handler/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

Results
The Plivo webhook is registered in your ServiceNow instance.

Add a callback URL in Plivo
Provide a webhook callback URL in your Plivo account to create a webhook.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin
Procedure
1. Log in to your Plivo console.
2. Create an application in the Plivo console as per your requirement. For more information about creating an application in the Plivo console, see the Create an Application section in the Make your first Outbound Call page of the Plivo documentation. You can also refer to the Plivo Application documentation for more information about creating and updating an application using Plivo APIs.
3. Enter the webhook callback URL in MESSAGE URL and ANSWER URL, and configure the application as per your requirement.

Results
The callback URL is added in your Plivo account. You can create routing policies and subflows as per your requirement. See Create routing policy and customize webhook for information regarding the creation of new routing policies and subflows.

Create routing policy and customize webhook
Create a webhook routing policy and subflow as per your requirement.

Before you begin
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

About this task
Routing policy in the Plivo WebHook Routing Policy module triggers the subflows and notifies the ServiceNow instance when certain events occur in your Plivo account. See Plivo spoke for information about the fields that the routing policy and subflows support.

Procedure
1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the default subflow. Two subflows are available along with Plivo spoke; Plivo Call Handler and Plivo SMS Handler. You can create a copy of either of these subflows as per your requirement.
4. Customize the subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows, and Plivo spoke for information about the supported fields.
6. Click **New**.
7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td><strong>a.</strong> Click the lookup icon (🔍).</td>
</tr>
<tr>
<td></td>
<td><strong>b.</strong> Select the required subflow from the Document list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the <strong>Table name</strong> is <code>Flow [sys_hub_flow]</code>.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Plivo.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

Routing policies and subflows support these Plivo fields:

- Keywords
- Call Event
- Caller Name
- Event Type
- SMS Text
- To Number
- Show Related Fields

8. Click **Submit**.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

**Results**
The routing policy and subflow are created.

**Pluralsight spoke v1.1**
Manage users, learning, courses, and so on in the Pluralsight Skills account from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Pluralsight GraphQL API version v1, but may be compatible with other future API versions.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Pluralsight spoke provides actions to automate Pluralsight tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Course Management</td>
<td>Look up Courses</td>
<td>Retrieves details of the specified Pluralsight courses.</td>
</tr>
<tr>
<td>Learning Management</td>
<td>Look up Learning Status for Course</td>
<td>Retrieves the learning status of the specified Pluralsight course.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Learning Status for User</td>
<td>Retrieves the learning status for the specified Pluralsight user.</td>
</tr>
<tr>
<td></td>
<td>Look up Learning Status Data Stream</td>
<td>Retrieves the learning status of the specified course in Pluralsight.</td>
</tr>
<tr>
<td>Skill Management</td>
<td>Look up Skill Assessment Results</td>
<td>Retrieves the skill assessment results in Pluralsight.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look up Skill Assessments</td>
<td>Retrieves the list of all available skill assessments in Pluralsight that can be taken by a user.</td>
</tr>
<tr>
<td></td>
<td>Look up Skill IQ Summary</td>
<td>Retrieves the skill IQ summary in Pluralsight.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in Pluralsight.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Removes a user's license from plan in Pluralsight.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Invite User</td>
<td>Invites the specified user to a plan in Pluralsight.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look up Users</td>
<td>Retrieves details of the users in Pluralsight.</td>
</tr>
</tbody>
</table>

**Note:**
- Pluralsight Enterprise Plan is required to use this action.
- The action output, **Attempt Number** starts with 0 and this value is synchronised with value from Pluralsight.
See **Set up the Pluralsight spoke** for information about setting up the Pluralsight spoke.

**Set up the Pluralsight spoke**
Integrate the ServiceNow instance and your Pluralsight Skills account using an API key to authenticate the ServiceNow requests.

**Before you begin**
- Request IntegrationHub subscription.
- Activate the Pluralsight spoke.
- Admin access to the Pluralsight Skills account.
- Role required: admin

**Procedure**
1. Create an API key in your Pluralsight Skills account.
   
   a. Log in to your **Pluralsight Skill account** as an admin.
   
   b. Navigate to **Account** and click the **Integrations** tab.
   
   c. Click the **Pluralsight Developer Portal** link.

   ![Pluralsight Developer Portal](image)

   d. In the **Pluralsight Developer Portal**, click the **Manage Keys** tab.

   e. Click **Add Api Key**.
f. On the form, fill the fields and provide write permissions to the API Key.
g. Copy the API Key for later use.

2. Create a credential record for the Pluralsight spoke.
   a. Navigate to Connections & Credentials > Credentials.

   b. Click New.
      The system displays the message What type of Credentials would you like to create?.

   c. Select API Key Credentials.

   d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential record. For example, Pluralsight Cred.</td>
</tr>
<tr>
<td>API Key</td>
<td>Value of the API key you created in the Pluralsight Skills account.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

   e. Click Submit.

3. Create a connection record for the Pluralsight spoke.

   b. Open the record for the Pluralsight spoke.
c. From the **Connections** tab, click **New**.

d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, Pluralsight Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the Pluralsight spoke.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL to connect to your Pluralsight account. Enter <code>https://paas-api.pluralsight.com</code>.</td>
</tr>
</tbody>
</table>

e. Click **Submit**.

**Salesforce spoke v2.0.4**

The Salesforce spoke is built by Bristelcone, Inc. Access and manage data in the Account, Contact, Case, Lead, Opportunity, Order, and User objects of your Salesforce instance from the ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Supported version**

This spoke was built for the Salesforce API version v45.0, but may be compatible with later versions.
Spoke requirements

- Salesforce account
- Salesforce admin credentials
- Salesforce connected app configured to integrate with ServiceNow
- Salesforce connected app details such as, consumer key and consumer secret.
- IntegrationHub subscription

**Note:** For users who have installed Salesforce spoke v1, you can't upgrade from Salesforce spoke v1 to Salesforce spoke v1.2 directly. To upgrade, you must uninstall the Salesforce spoke v1 and then, install the Salesforce spoke v1.2.

You must also note that, Salesforce spoke v1 is certified on New York and Salesforce spoke v1.2 is certified on Orlando and Paris.

Spoke subflows

The Salesforce spoke provides subflows to access and manage data in the Salesforce Account, Case, Contract, and Opportunity objects.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Subflow</td>
<td>Processes data in the account object when the Salesforce webhook is triggered.</td>
</tr>
<tr>
<td>Case Subflow</td>
<td>Processes data in the case object when the Salesforce webhook is triggered.</td>
</tr>
<tr>
<td>Contract Subflow</td>
<td>Processes data in the contract object when the Salesforce webhook is triggered.</td>
</tr>
<tr>
<td>Opportunity Subflow</td>
<td>Processes data in the opportunity object when the Salesforce webhook is triggered.</td>
</tr>
<tr>
<td>Salesforce Subflow</td>
<td>Processes data in any Salesforce object when the Salesforce webhook is triggered.</td>
</tr>
</tbody>
</table>

Spoke actions

The Salesforce spoke provides actions to access and manage data in the Salesforce, Account, Contact, Case, Lead, Opportunity, Order, and User objects.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Account</td>
<td>Creates an account in Salesforce.</td>
</tr>
<tr>
<td></td>
<td>Look up Accounts</td>
<td>Retrieves all the account details based on the specified SOQL query.</td>
</tr>
<tr>
<td></td>
<td>Look up Records for Account</td>
<td>Retrieves all the records for an account based on the given relationship name.</td>
</tr>
<tr>
<td>Record Management</td>
<td>Create Record</td>
<td>Creates a record in Salesforce.</td>
</tr>
<tr>
<td></td>
<td>Delete Record</td>
<td>Deletes a record in Salesforce.</td>
</tr>
<tr>
<td></td>
<td>Get Record Details</td>
<td>Retrieves the specific record in Salesforce by Record ID.</td>
</tr>
<tr>
<td></td>
<td>Get Record Details Copy</td>
<td>Retrieves the record for the selected object name and for the given Record ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Attachment For Records</td>
<td>Retrieves an attachment for a record.</td>
</tr>
<tr>
<td></td>
<td>Look up Contracts</td>
<td>Retrieves the contract details based on the specified SOQL query.</td>
</tr>
<tr>
<td></td>
<td>Look up Related Records</td>
<td>Retrieves all the records for the specified object name associated with their given relationship name.</td>
</tr>
<tr>
<td></td>
<td>Subflow Helper Action</td>
<td>Parses the subflow's JSON input and generates an array of object.</td>

**Salesforce account requirements**

The Salesforce spoke requires configuring your Salesforce account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Salesforce alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up the Salesforce spoke**

Integrate your Salesforce account with your ServiceNow instance. Create a custom OAuth application in Salesforce and authenticate requests from ServiceNow.

**Before you begin**

- Request an IntegrationHub subscription
- Activate Salesforce spoke
- Role required: admin

**Create a connected app in Salesforce**

Create a connected app in your Salesforce account to enable OAuth 2.0 authentication with the Salesforce spoke.

**Before you begin**

- Salesforce account
- Role required: Salesforce admin

**About this task**

Complete these steps from your Salesforce account. See Create a Connected App in Salesforce Trailblazer forum documentation for instructions on creating and configuring connected apps.

**Procedure**

1. From your Salesforce account, create a connected app.
2. Configure the connected app to enable your Salesforce application to share data with your ServiceNow instance.
   
   a. Select **Enable OAuth Settings** and configure the authentication settings.
   b. Select **Use Digital Signatures** and upload a Java KeyStore (JKS) certificate.
   c. Select the OAuth scopes:
• Access and manage your data (api)
• Perform requests on your behalf at any time (refresh_token, offline_access)

d. Specify ServiceNow instance URL in Callback URL in this format: https://<instance-name>.service-now.com/oauth_redirect.do

e. After creating the connected app, under OAuth Policies on the Edit Policies page, set these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Users</td>
<td>Admin approved users are pre-authorized</td>
</tr>
<tr>
<td>IP Restrictions</td>
<td>Relax IP Restrictions</td>
</tr>
</tbody>
</table>

f. Configure user provisioning for the connected app as per your requirement.

3. Record the values of Consumer Key and Consumer Secret.

Results
The connected app is created in Salesforce.

Attach a Java Key Store certificate to the Salesforce spoke
Enable the JSON Web Token (JWT) Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Salesforce spoke.

Before you begin
• Valid Java KeyStore certificate
• Role required: admin

Procedure
1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.
**X.509 Certificate form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Salesforce Certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Option to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users that are notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
<tr>
<td>Format</td>
<td>Certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Valid from</td>
<td>Date from which the certificate is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date on which the certificate expires.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Contents of the X509 certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.

5. Click **Validate Stores/Certificates**.

**Results**
The JKS certificate is created and attached to the Salesforce spoke.

**Create a JWT signing key for the Salesforce spoke**
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

**Before you begin**
Role required: admin
Procedure

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT signing key. For example, <em>Salesforce JWT Keys</em>.*</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate attached in the previous task. For example, <em>Salesforce Certificate</em>.*</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select <em>Salesforce spoke</em>.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Results**
The JWT key is created and assigned to the JKS certificate.

Create a JWT provider for the Salesforce spoke

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.
**JWT Provider form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT provider. For example, Salesforce JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number, in seconds, to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key from the previous step. For example, Salesforce JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
The Standard Claims and Custom Claims related lists are displayed.

5. In the **Standard Claims** related list, enter values for **iss**, **sub**, and **aud**. See [OAuth 2.0 JWT Bearer Flow for Server-to-Server Integration in Salesforce Trailblazer forum documentation](#) for instructions.

6. Click **Update**.

**Results**
The JWT provider is added to your ServiceNow instance.

**Register Salesforce as an OAuth Provider**

Use the information generated during Salesforce connected app configuration to register Salesforce as an OAuth provider and enable the instance to request OAuth 2.0 tokens.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
The system displays a blank Application Registrries form.
4. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Salesforce OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Consumer key that you generated during the Salesforce connected app configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Consumer secret that you generated during the Salesforce connected app configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select JWT Bearer.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Salesforce.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Field Value required</td>
<td>• For production instance, enter <a href="https://login.salesforce.com/services/oauth2/token">https://login.salesforce.com/services/oauth2/token</a>.</td>
</tr>
<tr>
<td></td>
<td>• For sandbox instance, enter <a href="https://test.salesforce.com/services/oauth2/token">https://test.salesforce.com/services/oauth2/token</a>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

• The system validates the OAuth credentials and populates the **Redirect URL** field.

• The system populates **OAuth Entity Profile** with **Grant Type** as **JWT Bearer**. For example, **OAuth Entity Profile** is created with default **Name**, **Salesforce JWT provider default_profile**.

6. Copy the value from the **Redirect URL** field.

7. Click **Update**.

8. Log in to your Salesforce account to edit the configuration of your connected app. See the Salesforce Trailblazer forum documentation for instructions.

9. Paste the Redirect URL value into the Callback URL of your Salesforce connected app. For example, paste https://<instance-name>.service-now.com/oauth_redirect.do.

**Results**
The instance can request OAuth 2.0 tokens for the Salesforce spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, a user with the admin role can regenerate the spoke OAuth token.

**Create credential records for the Salesforce spoke**
Create Credential records for the Salesforce connected app that you created. The Salesforce spoke connection and credential alias use these credentials to authorize actions.

**Before you begin**
Role required: admin
Procedure

1. Navigate to Connections & Credentials > Credentials.

2. Click New.
   The system displays the message What type of Credentials would you like to create?.

3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Salesforce Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile that you created when you registered the Salesforce connected app as an OAuth provider. For example, select Salesforce OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. Click the Get OAuth Token related link to generate the OAuth token.

Results
The credential record for the Salesforce spoke is created.

Create connection records for the Salesforce spoke
Create connection records for your Salesforce account. The Salesforce spoke connection and credential alias use these connections to perform actions in Salesforce.

Before you begin
Role required: admin

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.

2. Open for the record for Salesforce.
3. On the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <em>Salesforce Connection</em>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you that created for Salesforce. For example, select <em>Salesforce Credentials</em>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Salesforce instance. Enter <em><a href="https://ap8.salesforce.com">https://ap8.salesforce.com</a></em>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If you select this check box, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.

6. Ensure that **api_version** is set to **v45.0** in the Attributes related list.

**Results**
The Salesforce spoke is set up and integrated with the ServiceNow instance.

**Set up a bi-directional webhook**
Configure a webhook to subscribe to Salesforce events with a ServiceNow callback URL.

**Before you begin**
- Set up the Salesforce spoke
- Role required: admin
Procedure

1. Log in as an administrator to your Salesforce instance.

2. Obtain the Salesforce instance details. For more information, see the View instance information for your Salesforce Organization knowledge article in Salesforce Trailblazer forum.
   
a. If you don't have Salesforce custom domains, obtain the Salesforce instance name from the Company Information page.

b. If you have custom domains, navigate to Domain Management > My Domain and copy the domain name. For example, if the complete domain name on the page is newdomain-customdomain.my.salesforce.com, copy and record the value newdomain-customdomain.

3. Obtain the 18-digit Organization ID of your Salesforce instance.
   
a. Navigate to the Developer Console in your Salesforce instance and run this query:

   Select Id from Organization

   b. Copy and record the value of the 18-digit Organization ID.

4. Log in to your ServiceNow instance.

5. Create a webhook registry.

   a. Navigate to Salesforce Webhook Registry > Salesforce Webhook Registries.

   b. Click New.

   c. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization ID</td>
<td>18-digit Organization ID of your Salesforce instance.</td>
</tr>
<tr>
<td>Instance Name</td>
<td>Name of the Salesforce instance obtained from the Company Information page or custom domain of the Salesforce instance obtained</td>
</tr>
</tbody>
</table>
6. Obtain the resource path from your ServiceNow instance.

   a. Navigate to System Web Services > Scripted Web Services > Scripted REST APIs.

   b. Open the record, Salesforce Webhook Callbacks.

   c. In the Resources tab, click the Default Callback record.

   d. Copy and record the value of Resource path. The required ServiceNow endpoint URL is: https://<instance-name>.service-now.com/<resource-path>

7. Configure the default subflows or create subflows as per your requirement. These subflows are triggered when the required events occur in Salesforce instance. For more information, see Subflows.

8. Configure the webhook routing policy.

   a. Navigate to System Definition > Decision Tables.

   b. Open the record, Salesforce Decision Webhook Policy.

   c. In the Decisions tab, click New.

   d. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Option to specify if this is the default answer.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Salesforce.</td>
</tr>
</tbody>
</table>

**Note:** By default, these Salesforce objects are supported in the webhook routing policies:

- Account
- Case
- Contract
- Opportunity

You can configure the default decision table to support other Salesforce objects as per your requirement.

e. Click **Save**.

9. From your Salesforce instance, create outbound message. For information about creating the outbound message, see [Outbound Message Actions](#) in Salesforce Trailblazer forum.

   In the **Endpoint URL**, enter the ServiceNow endpoint URL in this format: https://<instance-name>.service-now.com/<resource-path>.

10. From your Salesforce instance, create a workflow rule and configure it to trigger the outbound message you had earlier created. For information about creating the workflow rule, see [Create a Workflow Rule](#) in Salesforce Trailblazer forum.

**Salesforce Marketing Cloud spoke**

The Salesforce Marketing Cloud spoke is built by Bristlecone, Inc. This spoke provides actions to retrieve records from your Salesforce Marketing Cloud data extensions and retrieve and update user information.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Salesforce Marketing Cloud Corporate Edition.

Spoke requirements
• Admin user with privileges to create new users and roles in Salesforce Marketing Cloud

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

<i>Note:</i> Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Salesforce Marketing Cloud spoke provides actions to automate Salesforce Marketing Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Extension Management</td>
<td>Look up Data Extension Attributes</td>
<td>Retrieves records from data extensions with less than 2500 records.</td>
</tr>
<tr>
<td></td>
<td>Look up Data Extension Attributes for Bulk Records Stream</td>
<td>Retrieves bulk records from data extensions.</td>
</tr>
</tbody>
</table>
### Look up Users Stream
Retrieves user properties for your Salesforce Marketing Cloud users based on the specified user properties and associated filters.

### Update User by User ID
Updates user properties based on the user ID.

## Spoke tables
The Salesforce Marketing Cloud spoke adds the following table:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configurations</td>
<td>Displays the list of Salesforce Marketing Cloud configurations, such as data extensions.</td>
<td>• Configuration Type</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Configuration Value</td>
</tr>
</tbody>
</table>

## Connection and credential alias requirements
The Salesforce Marketing Cloud spoke uses a Connection & Credential alias for the connection setup and the user profile that is attached to the SOAP security policies for the credential setup. If you are connecting to multiple Salesforce Marketing Cloud environments, you must use the same credential information in each environment.

## Set up the Salesforce Marketing Cloud spoke
Integrate the ServiceNow instance and Salesforce Marketing Cloud by using Salesforce Marketing Cloud credentials to authenticate ServiceNow requests.

### Before you begin
- Request an IntegrationHub subscription.
- Activate Salesforce Marketing Cloud spoke.
- Salesforce Marketing Cloud role required: admin user with privileges to create new users and roles
- ServiceNow role required: admin
Create a user for accessing the Salesforce Marketing Cloud SOAP API

Create a user with which you can access the Salesforce Marketing Cloud SOAP API. The SOAP API enables you to retrieve records from your Salesforce Marketing Cloud data extensions and get information about your Salesforce Marketing Cloud users.

Before you begin
Salesforce Marketing Cloud role required: admin user with privileges to create new users and roles

Procedure
1. From a web browser, go to your Salesforce Marketing Cloud instance.
2. Log in using your admin credentials.
3. On the page header of your instance, click your profile icon and then select Setup.
The Setup page opens.
4. Create a Salesforce Marketing Cloud user.

a. Navigate to Administration > Users > Users and then click Create.
The New User form opens.

b. In the General Settings form section, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the user.</td>
</tr>
<tr>
<td>Reply Email Address</td>
<td>Email address that you want to send and reply to email messages from. Salesforce Marketing Cloud also sends forgotten password requests to this email address. After you enter an email address, click Verify to verify the email address.</td>
</tr>
<tr>
<td>Add to From Name Dropdown</td>
<td>Option to send the reply email address through a domain verification process before the email address populates in an email.</td>
</tr>
<tr>
<td>Notification Email Address</td>
<td>Email address that you want to send Salesforce Marketing Cloud notifications to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Username</td>
<td>Username for the user.</td>
</tr>
<tr>
<td>External Key</td>
<td>Key that uniquely identifies the user during API calls.</td>
</tr>
<tr>
<td>Time Zone</td>
<td>Time zone in which the user is located.</td>
</tr>
<tr>
<td>Culture Code</td>
<td>Language that is used on the Salesforce Marketing Cloud user interface for this user.</td>
</tr>
<tr>
<td>API User</td>
<td>Option indicating whether the user can access the Salesforce Marketing Cloud APIs. Select the check box to enable this option.</td>
</tr>
<tr>
<td>Temporary Password</td>
<td>Temporary password with which the user can log in for the first time. The user is prompted to change this password on the first login.</td>
</tr>
<tr>
<td>Verify Password</td>
<td>Field to verify the temporary password.</td>
</tr>
</tbody>
</table>

**c. Click Save.**

**5. Create a user role that enables assigned users to access the Salesforce Marketing Cloud SOAP API and also manage users and data extensions.**

**a. Navigate to Administration > Users > Roles and then click Create.**
The New Role form opens.

**b. In the Properties form section, fill in the fields.**

<table>
<thead>
<tr>
<th>Properties</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the user role.</td>
</tr>
<tr>
<td>External Key</td>
<td>Key that uniquely identifies the user role.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the user role.</td>
</tr>
</tbody>
</table>

**c. In the Permissions form section, expand the Email > Subscribers > Data Extension permission category and then select the Allow check box for the View and Manage Data access permissions.**
d. Expand the Email > Admin > API Access permission category and then select the Allow check box for the WebService API access permission.

e. Expand the Administration > Users permission category and then select the Allow check box for the following access permissions:
   • View
   • Update
   • Disable
   • Manage Business Units

f. Click Save.

6. Assign the user role to your Salesforce Marketing Cloud user.

   a. Navigate to Administration > Users > Users.

   b. From the list of available users, select the check box for the user that you created in step 4.

   c. Click Manage Roles.
      The Roles form for the selected user opens.

   d. In the Roles form section, click Edit Roles.

   e. When the list of available roles appears, select the check box for the user role that you created in step 5.

   f. Click Save.

Create a connection and credential for Salesforce Marketing Cloud

Create a connection and credential for Salesforce Marketing Cloud so that you can connect your ServiceNow instance with the Salesforce Marketing Cloud SOAP API.

Before you begin
ServiceNow role required: admin
**Procedure**

1. From your ServiceNow instance, navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. From the list of available connection and credential aliases, select **SalesforceMarketingCloud**.
3. On the Connection & Credential Aliases form, click the **Create New Connection & Credential** related link.
   The Create Connection and Credential dialog box opens.
4. In the dialog box, fill in the fields.

Create Connection and Credential dialog box

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Please Enter the Connection Information</td>
<td></td>
</tr>
<tr>
<td>Connection Name</td>
<td>Name of the connection.</td>
</tr>
<tr>
<td>SOAP Connection URL</td>
<td>URL of your SOAPConnection endpoint. Enter https://&lt;subdomain&gt;.soap.marketingcloudapis.com/Service.asmx, where &lt;subdomain&gt; is your Salesforce Marketing Cloud subdomain.</td>
</tr>
<tr>
<td>Please Enter the Credential Information</td>
<td></td>
</tr>
<tr>
<td>Username Profile Name</td>
<td>Name of your credentials.</td>
</tr>
<tr>
<td>Username</td>
<td>Username of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the username of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the user that you can access the Salesforce Marketing Cloud SOAP API with. Enter the password of the user that you created in Create a user for accessing the Salesforce Marketing Cloud SOAP API.</td>
</tr>
</tbody>
</table>

5. Click **Create**.

**SAP Ariba spoke v1.0.3**

Manage the master and transactional data of buying and sourcing suites in SAP Ariba instance from your ServiceNow instance.
**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke requirements**

- Enable ITK by creating a shared secret. Copy and record the integration password for later use.

  **Note:** If you want to create two shared secrets, one for sourcing suite and another for buying suite, you must provide the same shared secret.
  - To create shared secret for sourcing suite, navigate to Administration in your SAP Ariba solution.
  - To create shared secret for buying suite, navigate to Core Administration in your SAP Ariba solution.

  For more information, see Shared secret-based authentication in SAP Help Portal.

- Copy and record the realm of your SAP Ariba instance.

- In Administration, create an inbound endpoint in End Point Configuration under Integration Manager. Copy and record the login password you have provided under HTTP Authentication. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.
  
  Enable SOAP service of the Import Sourcing Project task for your inbound endpoint in Integration Configuration under Integration Manager.
  
  - Copy and record the URL in the Integration Task URL field.
  
  - Open the WSDL file. Copy and record the value of the targetNamespace parameter.
  
  For information about Integration Task URL and targetNamespace, see Enable an Integration Task in SAP Help Portal.

- In Core Administration, create an inbound endpoint in End Point Configuration under Integration Manager. Copy and record the login password you have provided under HTTP Authentication. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.
Enable SOAP service of the Import Suppliers task for your inbound endpoint in **Integration Configuration** under **Integration Manager**.

- Copy and record the URL in the Integration Task **URL** field.
- Open the WSDL file. Copy and record the value of the `targetNamespace` parameter.

For information about Integration Task **URL** and `targetNamespace`, see Enable an Integration Task in SAP Help Portal.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)
- Utility Actions spoke v1.0.1

⚠ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke flows**
The SAP Ariba spoke provides sample flows to demonstrate automating the SAP Ariba tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ITK Import Supplier Organizations Buyer</td>
<td>Imports supplier organizations to the buying suite of your SAP Ariba instance.</td>
</tr>
<tr>
<td>ITK Import Supplier Organizations Sourcing</td>
<td>Imports supplier organizations to the sourcing suite of your SAP Ariba instance.</td>
</tr>
</tbody>
</table>
**Spoke actions**

The SAP Ariba spoke provides actions to automate SAP Ariba tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata Retrieval</td>
<td>Get Ariba Additional Fields</td>
<td>Retrieves additional input fields for the specified action.</td>
</tr>
<tr>
<td>SAP Ariba ITK Export</td>
<td>Copy Ariba File To Data Source</td>
<td>Takes sys ID of the source record and transfers the attachment to the target data source.</td>
</tr>
<tr>
<td></td>
<td>Execute Ariba Export Task</td>
<td>Executes the Ariba export task event where a file is received as response and stored to the Ariba task execution table records.</td>
</tr>
<tr>
<td>SAP Ariba ITK Import</td>
<td>Execute Ariba Import Task</td>
<td>Triggers the SAP Ariba import task for the specified operation.</td>
</tr>
<tr>
<td>Sourcing Project</td>
<td>Create Sourcing Project</td>
<td>Creates a sourcing project in SAP Ariba.</td>
</tr>
<tr>
<td></td>
<td>Update Sourcing Project</td>
<td>Updates the project header fields of the specified sourcing project.</td>
</tr>
<tr>
<td>Supplier</td>
<td>Create Suppliers</td>
<td>Creates suppliers in the SAP Ariba buying suite.</td>
</tr>
</tbody>
</table>

**Spoke module**

The SAP Ariba spoke adds the SAP Ariba Spoke application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ariba Export Configuration Definition</td>
<td>Displays the list of available export configurations. By default, 33 export configurations are available along with the spoke. You can modify the default export configuration or create export configurations, as per requirements.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ariba Export Task Execution</td>
<td>Displays the CSV files generated when data is exported from your SAP Ariba instance to ServiceNow instance. You must copy these records to data source. Else, the records are deleted after the time period mentioned in the Ariba Export Task Scheduler scheduled script has lapsed.</td>
</tr>
<tr>
<td>Ariba Import Configuration</td>
<td>Displays the list of available import configurations. By default, two import configurations are available along with the spoke. You must use Execute Ariba Import Task action in your flow to create the required records.</td>
</tr>
<tr>
<td></td>
<td>• If you have selected the <strong>MasterDataBatchPull</strong> task in the Execute Ariba Import Task action, the master data records for the sourcing suite are created or updated in your SAP Ariba instance.</td>
</tr>
<tr>
<td></td>
<td>• If you have selected the <strong>CombinedDataPull</strong> task in the Execute Ariba Import Task action, the master data records for the buying suite are created or updated in your SAP Ariba instance.</td>
</tr>
<tr>
<td>Supplier IDs Buyer</td>
<td>Displays information about the suppliers in the buying suite. Admin must create the supplier records here.</td>
</tr>
<tr>
<td></td>
<td>The Look Up Supplier IDs Buyer Records action in the ITK Import Supplier</td>
</tr>
</tbody>
</table>

For example, if you have used the Execute Ariba Export Task action in your flow to export receipts, data is retrieved from your SAP Ariba instance to ServiceNow instance. You must copy these records to data source. Else, the records are deleted after the time period mentioned in the Ariba Export Task Scheduler scheduled script has lapsed. You can use the Copy Ariba File To Data Source action in your flow to copy the record to your data source.
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organizations Buyer sample flow</td>
<td>Organizations Buyer sample flow uses these records to run the flow.</td>
</tr>
<tr>
<td>Supplier IDs Sourcing</td>
<td>Displays information about the suppliers in the sourcing suite. Admin must create the supplier records here. The Look Up Supplier IDs Sourcing Records action in the ITK Import Supplier Organizations Sourcing sample flow uses these records to run the flow.</td>
</tr>
<tr>
<td>Supplier Organizations Buyer</td>
<td>Displays information about the supplier organizations in the buying suite. Admin must create records here. The Look Up Supplier Organizations Buyer Records action in the ITK Import Supplier Organizations Buyer sample flow uses these records to run the flow.</td>
</tr>
<tr>
<td>Supplier Organizations Sourcing</td>
<td>Displays information about the supplier organizations in the sourcing suite. Admin must create records here. The Look Up Supplier Organizations Sourcing Records action in the ITK Import Supplier Organizations Sourcing sample flow uses these records to run the flow.</td>
</tr>
</tbody>
</table>

Data accessed through these spoke modules is stored in these tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ariba Export Configuration Definition</td>
<td>Stores information about the export configurations.</td>
</tr>
<tr>
<td>[sn_sap_ariba_spoke_ariba_file_definition]</td>
<td></td>
</tr>
<tr>
<td>Ariba Import Configuration Definition</td>
<td>Stores information about the import configurations.</td>
</tr>
<tr>
<td>[sn_sap_ariba_spoke_ariba_import_configuration_definition]</td>
<td></td>
</tr>
<tr>
<td>Ariba Export Task Execution</td>
<td>Stores information.</td>
</tr>
<tr>
<td>[sn_sap_ariba_spoke_ariba_task_execution]</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Supplier Organizations Sourcing</td>
<td>Stores information about the supplier organizations in the sourcing suite. Admin must create these records in the Supplier Organizations Sourcing module.</td>
</tr>
<tr>
<td>[sn_sap_ariba_spoke_import_supplier_organizations_csv]</td>
<td></td>
</tr>
<tr>
<td>Supplier IDs Sourcing [sn_sap_ariba_spoke_supplier_ids]</td>
<td>Stores information about the suppliers in the sourcing suite. Admin must create these records in the Supplier IDs Sourcing module.</td>
</tr>
<tr>
<td>Supplier IDs Buyer [sn_sap_ariba_spoke_supplier_ids_buyer]</td>
<td>Stores information about the suppliers in the buying suite. Admin must create these records in the Supplier IDs Buyer module.</td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Supplier Organizations Buyer [sn_sap_ariba_spoke_supplier_organizations]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stores information about the supplier organizations in the buying suite. Admin must create these records in the Supplier Organizations Buyer module.</td>
<td></td>
</tr>
</tbody>
</table>

### Spoke scheduled script and system property

A scheduled script, Ariba Export Task Scheduler, and system property, `sn_sap_ariba_spoke.ariba.export.task.scheduler`, are available along with the spoke. The system property defines the number of days by which all the records older than this will be purged. The script uses this value to purge the records that have not been copied to data source.

- To view the scheduled script, enter `sysauto_script_list.do` in the filter navigator and search for the script, Ariba Export Task Scheduler.

- To view the system property, navigate to System Properties > All Properties and search for the system property, `sn_sap_ariba_spoke.ariba.export.task.scheduler`.

You can configure the scheduled script and system property as per your requirement.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Four connection and credential alias records are available along with the spoke:

- SAP_Ariba_Import
- SAP_Ariba_ITK
• SAP_Ariba_Sourcing
• SAP_Ariba_Suppliers

**MID Server requirements**
These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the SAP Ariba alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps

⚠️ **Note:** You must set up MID Server to use the Execute Ariba Export Task action.

**Set up the SAP Ariba**
Integrate the ServiceNow instance and SAP Ariba by using the Basic Auth and API Key credentials to authenticate ServiceNow requests.

**Before you begin**
• Request an IntegrationHub subscription.
• Activate SAP Ariba spoke.
• Role required: admin

**Create credential records for the SAP Ariba**
Create credential records for the SAP Ariba instance. The SAP Ariba connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Create credential record for the SAP Ariba ITK Export actions.

   a. Navigate to Connections & Credentials > Credentials.

   b. Click New.
      
      The system displays this message: What type of Credentials would you like to create?

   c. Select API Key Credentials.

   d. On the form, fill these values.
API Key Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, ITK Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>Integration password provided for shared secret-based authentication. For more information, see Shared secret-based authentication in SAP Help Portal.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use this credential in the MID servers field.</td>
</tr>
<tr>
<td></td>
<td>Note: You must set up MID Server to use the Execute Ariba Export Task action.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

2. Create credential record for the Sourcing Project actions.

**a. Navigate to Connections & Credentials > Credentials.**

**b. Click New.**

The system displays this message: What type of Credentials would you like to create?

**c. Select Basic Auth Credentials.**

**d. On the form, fill these values.**

Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Ariba_Sourcing Cred.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP Ariba instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Login password provided under HTTP Authentication when you created an inbound endpoint in Administration. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

**3. Create credential record for the Supplier action.**

**a. Navigate to Connections & Credentials > Credentials.**

**b. Click New.**

The system displays this message: What type of Credentials would you like to create?

**c. Select Basic Auth Credentials.**

**d. On the form, fill these values.**

**Basic Auth Credentials form**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Ariba_Supplier Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP Ariba instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Login password provided under HTTP Authentication when you created an inbound endpoint in Core Administration. For information about creating an endpoint, see Create New Integration End-Point in SAP Help Portal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
</tbody>
</table>
Create connection records for the SAP Ariba

Create connection records for your SAP Ariba instance. The SAP Ariba connection and credential aliases use these connections to perform actions in SAP Ariba.

Procedure

1. Create connection record for the SAP Ariba Export ITK actions.
   b. Open the alias record, SAP_Ariba_ITK.
   c. From the Connections tab, click New.
   d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, ITK Exp Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for ITK. For example, ITK Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to SAP Ariba instance. Enter: <a href="https://sl.ariba.com">https://sl.ariba.com</a></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>
| Use MID server         | Option to use a MID Servers for this connection. Select the checkbox and define the fields in the Advanced MID Server Configuration related list.

e. Click Submit.
e. In the **Attributes** tab, enter the value of realm of your SAP Ariba instance in **Realm**.

f. Click **Submit**.

2. Create connection record for SAP Ariba ITK Import actions.
   
a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

b. Open the alias record, **Ariba_Import**.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name to uniquely identify the record. For example, <strong>ITK Imp Connection</strong>.</td>
</tr>
<tr>
<td><strong>Credential</strong></td>
<td>Credential record is not necessary for this connection record.</td>
</tr>
<tr>
<td><strong>Connection alias</strong></td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td><strong>Connection URL</strong></td>
<td>Base URL to connect to SAP Ariba instance. Enter: <strong><a href="https://sl.ariba.com">https://sl.ariba.com</a></strong></td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td><strong>Domain</strong></td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

e. In the **Attributes** tab, provide these values:
f. Click **Submit**.

3. Create connection record for the Sourcing Project actions.

   a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

   b. Open the alias record, **SAP_Ariba_Sourcing**.

   c. From the **Connections** tab, click **New**.

   d. On the form, fill these fields.

   **Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <em>Ariba Sourcing Connection</em></td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for ITK. For example, <em>Ariba_Sourcing Cred</em></td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Integration Task <strong>URL</strong> created when you enabled SOAP service of the Import Sourcing Project task for the inbound endpoint in <strong>Administration</strong>. For information about Integration Task <strong>URL</strong> and <strong>targetNamespace</strong>, see <strong>Enable an Integration Task in SAP Help Portal</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>
e. In the **Attributes** tab, for **Target Namespace**, provide the value of the `targetNamespace` parameter in WSDL file created in **Administration**. For information about Integration Task **URL** and `targetNamespace`, see Enable an Integration Task in SAP Help Portal.

f. Click **Submit**.

4. Create connection record for the Supplier action.

   a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

   b. Open the alias record, **SAP_Ariba_Suppliers**.

   c. From the **Connections** tab, click **New**.

   d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Connection form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Ariba Supplier Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for ITK. For example, <strong>Ariba_Supplier Cred</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Integration Task <strong>URL</strong> created when you enabled SOAP service of the Import Suppliers task for the inbound endpoint in <strong>Core Administration</strong>. For information about Integration Task <strong>URL</strong> and <code>targetNamespace</code>, see Enable an Integration Task in SAP Help Portal.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

   e. In the **Attributes** tab, for **Target Namespace**, provide the value of the `targetNamespace` parameter in WSDL file created in **Core Administration**. For
information about Integration Task URL and targetNamespace, see Enable an Integration Task in SAP Help Portal.

f. Click Submit.

What to do next
Create buyer and supplier records in these spoke modules:

• Supplier IDs Buyer
• Supplier IDs Sourcing
• Supplier Organizations Buyer
• Supplier Organizations Sourcing

Actions in the sample flows require these records.

SAP ECC IDoc spoke v1.2
Manage finance, items, and procurement in SAP ECC IDoc account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for these SAP ECC IDoc versions, but may be compatible with later versions:

• SAP application version: SAP ECC6 (Spoke is developed on Ehp8.)
• NetWeaver Version: SAP NW 7.5
• SAP JCo:3.0.20
Spoke requirements

• Contact the admin of your SAP ECC IDoc account and obtain these SAP proprietary JAR files and other required files:
  ◦ sapidoc3.jar and sapjco3.jar.
  ◦ libsapjco3.so: If your MID Server is installed on a Linux machine, obtain this file.
  ◦ sapjco3.dll: If your MID Server is installed on a Windows machine, obtain this file.
  
A JAR file, sapConnector-1.0.jar is available along with the spoke to provide a custom interface between SAP ECC IDoc account and ServiceNow instance. The JAR file is installed as part of the spoke in your ServiceNow instance.

• Copy and record the client value of the target host where the SAP ECC IDoc server is installed.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SAP ECC IDoc spoke provides actions to automate SAP ECC IDoc tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finance</td>
<td>Create Fixed Assets</td>
<td>Creates fixed asset in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Create GL Account</td>
<td>Creates a GL account in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Create Invoice</td>
<td>Creates an invoice document in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Post Journal Entry</td>
<td>Posts a journal entry in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Update Fixed Assets</td>
<td>Updates details of the fixed assets in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Update GL Account</td>
<td>Updates details of the specified GL account in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Items</td>
<td>Create Material</td>
<td>Creates a material (item) in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Update Material</td>
<td>Updates details of the specified material (item) in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Procurement</td>
<td>Create Goods Receipt</td>
<td>Creates a goods receipt in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Create Purchase Order</td>
<td>Creates a purchase order in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Create Vendor</td>
<td>Creates a vendor in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td></td>
<td>Update Purchase Order</td>
<td>Updates details of the specified purchase order in your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Customer</td>
<td>Create Customer</td>
<td>Creates a customer account in SAP ECC IDoc.</td>
</tr>
<tr>
<td></td>
<td>Update Customer</td>
<td>Update details of the required customer account in SAP ECC IDoc.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the SAP ECC IDoc alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps.

**Set up the SAP ECC IDoc spoke**

Integrate the ServiceNow instance and SAP ECC IDoc spoke by using the Basic Auth credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate SAP ECC IDoc spoke.
- Role required: admin

**Configure MID Server for the SAP ECC IDoc spoke**

Configure MID Server using the SAP proprietary JAR files to integrate SAP ECC IDoc account with your ServiceNow instance.

**Procedure**

1. **Optional:** Navigate to System Properties > Security.
   
   ![Note](image)
   
   **Note:** This is applicable only if your MID Server is installed on a Linux machine

2. **Optional:** Disable the MIME type validation for file attachments.
   
   ![Note](image)
   
   **Note:** This is applicable only if your MID Server is installed on a Linux machine

3. Navigate to MID Server > JAR Files.

4. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP ECC IDoc admin. For more information, see Synchronize a JAR file to MID Servers.

**What to do next**

Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren’t synchronised, restart the MID Server.
Create a credential record for the SAP ECC IDoc spoke

Create a credential record for the SAP ECC IDoc account. The SAP ECC IDoc spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
The system displays this message: What type of Credentials would you like to create?
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

### Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <em>SAP ECC IDoc Cred.</em></td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your SAP ECC IDoc account.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, <em>100.</em></td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create a connection record for the SAP ECC IDoc spoke

Create a connection record for your SAP ECC IDoc account. The SAP ECC IDoc spoke connection and credential aliases use these connections to perform actions in SAP ECC IDoc.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record for SAP ECC IDoc.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

**Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SAP ECC IDoc Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for SAP ECC IDoc spoke. For example, SAP ECC IDoc Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the SAP ECC IDoc server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. Select the check box and define the fields in the Advanced MID Server Configuration tab.</td>
</tr>
</tbody>
</table>

5. In the **Advanced MID Server Configuration** tab, provide these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

6. In the **Attributes** tab, provide these details.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client</td>
<td>Client value of the target host where the SAP ECC IDoc server is installed.</td>
</tr>
<tr>
<td>u_system_number</td>
<td>System number of the target host where the SAP ECC IDoc server is installed.</td>
</tr>
<tr>
<td>u_lang</td>
<td>Language selected in the target host where the SAP ECC IDoc server is installed.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.

**SAP Commerce Cloud**
Retrieve shopping cart content, order details, and order history for a selected customer.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for SAP Commerce Cloud Version:
2011.4-2011-20210310.1-32b1627-2011- spartacus (Major Version: 201, but may be compatible with later versions.

**Spoke requirements**
- SAP Commerce Cloud subscription

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The SAP Commerce Cloud provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Management</td>
<td>Look Up Order Details</td>
<td>Retrieves order details of the specified order.</td>
</tr>
<tr>
<td></td>
<td>Look Up Orders</td>
<td>Retrieves the order history for the specified user ID.</td>
</tr>
<tr>
<td>Shopping Cart</td>
<td>Look Up Shopping Cart</td>
<td>Retrieves the shopping cart content for the specified user ID.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the SAP Commerce Cloud
Integrate the ServiceNow instance and SAP Commerce Cloud by creating a custom OAuth application in SAP Commerce Cloud to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate SAP Commerce Cloud.
• Role required: admin
Create a credential record for the SAP Commerce Cloud

Integrate the ServiceNow instance and SAP Commerce Cloud spoke by creating a custom OAuth application in SAP Commerce Cloud to authenticate ServiceNow requests.

Before you begin

- Request an IntegrationHub subscription.
- Activate SAP Commerce Cloud.
- Role required: admin

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>OAuth 2.0 Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SAP Commerce Cloud cred Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of SAP Commerce Cloud as an OAuth provider. For example, SAP Commerce Cloud default_profile OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use this credential in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>
Create a connection record for the SAP Commerce Cloud

Create a connection record for your SAP Commerce Cloud account. The SAP Commerce Cloud connection and credential aliases use these connections to perform actions in SAP Commerce Cloud.

Procedure

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record for SAP Commerce Cloud.
3. From the Connections tab, click New.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SAP Commerce Cloud Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for SAP Commerce Cloud spoke. For example, SAP Commerce Cloud Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>IP address of the target host where the SAP Commerce Cloud server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click Submit.

SAP ECC RFC spoke v1.2.1

Manage items, journals, procurements, and others, in SAP ECC RFC account from your ServiceNow® instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release
notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for these SAP ECC RFC versions, but may be compatible with later versions:

- SAP application version: SAP ECC6 (Spoke is developed on EHp8.)
- NetWeaver Version: SAP NW 7.5
- SAP JCo:3.0.20

Spoke requirements

- Contact the admin of your SAP ECC RFC account and obtain these SAP proprietary JAR files and other required files:
  - sapjco3.jar.
  - libsapjco3.so: If your MID Server is installed on a Linux machine, obtain this file.
  - sapjco3.dll: If your MID Server is installed on a Windows machine, obtain this file.

A JAR file, sapConnector-1.0.jar, is available along with the spoke to provide custom interface to interact and execute RFCs and IDocs in the SAP ECC RFC account. The JAR file is installed as part of the spoke in your ServiceNow instance.

- Copy and record the client value of the target host where the SAP ECC RFC server is installed.

- Configure the values of these system properties:
  - com.snc.process_flow.reporting.serialized.val_size_limit: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Flow Designer system properties.
  - glide.rest.max_content_length: This property specifies the payload size. Specify the maximum payload size you want to use in your flows. The maximum value you can specify for this property is, 25 MB.
Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows
The SAP ECC RFC spoke provides sample flows to demonstrate automating the SAP ECC RFC tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retrieve Users By Role</td>
<td>Retrieves details of the SAP ECC RFC users with the specified role. The user details can be accessed by navigating to <a href="#">SAP ECC RFC Spoke &gt; SAP ECC Users</a>.</td>
</tr>
<tr>
<td>Retrieve Incoming Invoice</td>
<td>Retrieves details of the incoming SAP ECC RFC invoices. The invoice details can be accessed by navigating to <a href="#">SAP ECC RFC Spoke &gt; SAP ECC Invoices Data</a>.</td>
</tr>
<tr>
<td>Create Sales Order and Look up Status</td>
<td>Creates a sales order and retrieves the status information.</td>
</tr>
</tbody>
</table>

Spoke actions
The SAP ECC RFC spoke provides actions to automate SAP ECC RFC tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>

</table>

**Spoke modules**

The SAP ECC RFC spoke adds the SAP ECC RFC Spoke application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP ECC Flow Executions</td>
<td>Displays the last successful execution date of the Retrieve Incoming Invoice flow. Before the first flow execution, you must create a record in this module to specify the date from which the incoming invoice details should be fetched.</td>
</tr>
<tr>
<td>SAP ECC Invoices Data</td>
<td>Displays the records retrieved by the Retrieve Incoming Invoice flow.</td>
</tr>
<tr>
<td>SAP ECC RFCs</td>
<td>Displays the list of BAPIs. The Execute RFC action uses this as input.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SAP ECC Users</td>
<td>Displays details of the SAP ECC RFC users. The Retrieve Users By Role flow retrieves details of the users with the specified role.</td>
</tr>
</tbody>
</table>

**Spoke user roles**

The SAP ECC RFC spoke provides the `sn_sap_ecc_rfc_spo.SAP_ECC_RFC_Spoke_Admin` user role to control access to data. Users with the `sn_sap_ecc_rfc_spo.SAP_ECC_RFC_Spoke_Admin` role have access to the spoke tables.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the SAP ECC RFC spoke alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps.

ℹ️ **Note:**

- If the MID Server is installed on a Linux machine, perform the configurations as outlined in Configure MID Server for the SAP ECC RFC spoke.
- If the MID Server is installed on a Windows machine, no configurations are needed.

**Set up the SAP ECC RFC spoke**

Integrate the ServiceNow instance and SAP ECC RFC account by using the Basic Auth credentials to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate SAP ECC IDoc spoke.
- Role required: admin
Configure MID Server for the SAP ECC RFC spoke

Configure MID Server using the SAP proprietary JAR files to integrate SAP ECC RFC account with your ServiceNow® instance.

Procedure

1. **Optional:** Navigate to **System Properties > Security.**
   - **Note:** This is applicable only if your MID Server is installed on a Linux machine

2. **Optional:** Disable the MIME type validation for file attachments.
   - **Note:** This is applicable only if your MID Server is installed on a Linux machine

3. Navigate to **MID Server > JAR Files.**

4. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP ECC RFC admin. For more information, see Synchronize a JAR file to MID Servers.

**What to do next**

Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronised, restart the MID Server.

Create a credential record for the SAP ECC RFC spoke

Create a credential record for the SAP ECC RFC account. The SAP ECC RFC spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to **Connections & Credentials > Credentials.**
2. Click **New.**
   - The system displays this message: What type of Credentials would you like to create?
3. Select **Basic Auth Credentials.**
4. On the form, fill these values.
Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SAP ECC RFC Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP ECC RFC account.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your SAP ECC RFC account.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create a connection record for the SAP ECC RFC spoke

Create a connection record for your SAP ECC RFC account. The SAP ECC RFC spoke connection and credential aliases use these connections to perform actions in SAP ECC RFC.

Procedure
1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record for SAP ECC RFC.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SAP ECC RFC Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for SAP ECC RFC spoke. For example, SAP ECC RFC Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Host</strong></td>
<td>IP address of the target host where the SAP ECC RFC server is installed.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td><strong>Domain</strong></td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td><strong>Override default port</strong></td>
<td>Target port used by the connection. If blank, the system uses the default port.</td>
</tr>
<tr>
<td><strong>Use MID server</strong></td>
<td>Option to use a MID Server for this connection. Select the check box and define the fields in the Advanced MID Server Configuration tab.</td>
</tr>
</tbody>
</table>

5. In the **Advanced MID Server Configuration** tab, provide these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Capabilities</strong></td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td><strong>MID Application</strong></td>
<td>Application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

6. In the **Attributes** tab, provide these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Client</strong></td>
<td>Client value of the target host where the SAP ECC RFC server is installed.</td>
</tr>
<tr>
<td><strong>System Number</strong></td>
<td>System number of the target host where the SAP ECC RFC server is installed.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Language | Language selected in the target host where the SAP ECC RFC server is installed.

7. Click **Submit**.

**SAP Fieldglass spoke v1.0.1**
Manage job postings, workers, timesheets and expenses, and approvals in SAP Fieldglass account from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for SAP Fieldglass 2020.05, but may be compatible with later versions.

**Note:** SAP Fieldglass APIs doesn’t support JSON by default. You must reach out to the SAP Fieldglass support to enable JSON support for the APIs.

**Spoke requirements**
- Copy and record the API Key. Contact the SAP Fieldglass support team if you don’t have the value.
- By default, all APIs are not enabled. Contact the SAP Fieldglass support team to enable these APIs and enable JSON support for these APIs:

<table>
<thead>
<tr>

</tbody>
</table>

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke flows**

The SAP Fieldglass spoke provides sample flows to demonstrate automating the tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sample Look up Approval and Metadata Flow</td>
<td>Approves the pending approvals in SAP Fieldglass.</td>
</tr>
<tr>
<td>Sample Look up Flow</td>
<td>Retrieves or downloads data related to currently active workers and data related to workers who had revisions since the last successful run date of the connector.</td>
</tr>
</tbody>
</table>
Spoke actions

The SAP Fieldglass spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buyer - Approvals and Rejection</td>
<td>Approve</td>
<td>Approves the pending approvals in SAP Fieldglass.</td>

</tr>
<tr>
<td>Supplier - Job Posting</td>
<td>Get Job Posting</td>
<td>Retrieves details of the required job posting.</td>
</tr>
<tr>
<td></td>
<td>Submit Job Seeker</td>
<td>Submits a job seeker in SAP Fieldglass.</td>
</tr>
<tr>
<td>Supplier - Work Order</td>
<td>Accept Work Order Multiple Rates</td>
<td>Accepts work order multiple rates in SAP Fieldglass.</td>
</tr>
<tr>
<td></td>
<td>Accept Work Order Offer</td>
<td>Accepts work order in SAP Fieldglass.</td>
</tr>
<tr>
<td></td>
<td>Accept Work Order Revision</td>
<td>Accepts the revised work order in SAP Fieldglass.</td>
</tr>
</tbody>
</table>
### Spoke modules

The SAP Fieldglass spoke adds the SAP Fieldglass Spoke application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Worker Downloads</td>
<td>Displays details of the active workers. Data is retrieved when you run the Look up Active Workers spoke action.</td>
</tr>
<tr>
<td>Create Job Postings</td>
<td>Displays details about the job postings. Data is retrieved from the SAP Fieldglass instance after you set up the webhook. For more information, see <a href="#">Set up webhook for the SAP Fieldglass spoke</a>.</td>
</tr>
<tr>
<td>SAP Fieldglass Buyer Credentials</td>
<td>Displays the buyer credential records.</td>
</tr>
<tr>
<td>SAP Fieldglass Modules</td>
<td>Displays details about the modules. The spoke actions internally use these modules during flow execution. You can manage the modules as per your requirement.</td>
</tr>
<tr>
<td>SAP Fieldglass Supplier Credentials</td>
<td>Displays the supplier credential records.</td>
</tr>
<tr>
<td>SAP Fieldglass Webhook Registries</td>
<td>Displays the webhook registries. You can create webhook registry for an event as per your requirement. For more information, see <a href="#">Set up webhook for the SAP Fieldglass spoke</a>.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available along with spoke: one record for supplier and another record for buyer.

Set up the SAP Fieldglass spoke
Integrate the ServiceNow instance and SAP Fieldglass account using API keys to authenticate ServiceNow requests.

Before you begin
• Request an IntegrationHub subscription.
• Activate SAP Fieldglass spoke.
• Role required: admin

Procedure
1. Create a credential record for the SAP Fieldglass buyer instance.
   a. Navigate to Connections & Credentials > Credentials.
   b. Click New.
      The system displays this message: What type of Credentials would you like to create?
   c. Select SAP Fieldglass Buyer Credentials.
   d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, SAP FG Buyer Creds.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP Fieldglass buyer instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to your SAP Fieldglass buyer instance.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key of your SAP Fieldglass buyer instance.</td>
</tr>
<tr>
<td>Access Token</td>
<td>Leave this field empty.</td>
</tr>
<tr>
<td>Token Status</td>
<td>Don’t change the default value.</td>
</tr>
<tr>
<td>Expiry</td>
<td>Leave this field empty.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

**2. Create a connection record the SAP Fieldglass buyer instance.**

**a. Navigate to Connections & Credentials > Connections & Credentials Aliases.**

**b. Open the record, SAPFieldGlassBuyer.**

**c. From the Connections tab, click New.**

**d. On the form, fill these fields.**

**Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the connection record. For example, SAP FG Buyer Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Associated credential record. For example, SAP FG Buyer Creds.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the SAP Fieldglass buyer instance.</td>
</tr>
</tbody>
</table>
e. Click Submit.

3. Create a credential record for the SAP Fieldglass supplier instance.

a. Navigate to **Connections & Credentials > Credentials**.

b. Click **New**.

The system displays this message: What type of Credentials would you like to create?

c. Select **SAP Fieldglass Supplier Credentials**.

d. On the form, fill these values:

<table>
<thead>
<tr>
<th>SAP Fieldglass Buyer Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, SAP FG Supplier Creds.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your SAP Fieldglass supplier instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to your SAP Fieldglass supplier instance.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key of your SAP Fieldglass supplier instance.</td>
</tr>
<tr>
<td>Access Token</td>
<td>Leave this field empty.</td>
</tr>
<tr>
<td>Token Status</td>
<td>Don't change the default value.</td>
</tr>
<tr>
<td>Expiry</td>
<td>Leave this field empty.</td>
</tr>
</tbody>
</table>

e. Click **Submit**.

4. Create a connection record the SAP Fieldglass supplier instance.

b. Open the record, SAPFieldGlassSupplier.

c. From the Connections tab, click New.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the connection record. For example, SAP FG Supplier Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Associated credential record. For example, SAP FG Buyer Creds.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the SAP Fieldglass supplier instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

e. Click Submit.

5. Create flow to generate buyer token.

b. Create a flow and include the Get Buyer Token spoke action. For more information about creating flows, see Flows.

c. Select the buyer credential record for Credentials [SAP Fieldglass Buyer Credentials].
d. Test the flow.
After successful execution, these fields are auto-populated in the SAP Fieldglass Buyer credential record:

- **Access Token**: Access token is generated.
- **Token Status**: Status is set to **Active**.
- **Expiry**: Expiry date and time of the access token is displayed.

6. Create flow to generate supplier token.

a. Navigate to **Flow Designer > Designer**.

b. Create a flow and include the Get Supplier Token spoke action. For more information about creating flows, see **Flows**.

c. Select the supplier credential record for **Credentials [SAP Fieldglass Supplier Credentials]**.

d. Test the flow.
After successful execution, these fields are auto-populated in the SAP Fieldglass Supplier credential record:

- **Access Token**: Access token is generated.
- **Token Status**: Status is set to **Active**.
- **Expiry**: Expiry date and time of the access token is displayed.

**Set up webhook for the SAP Fieldglass spoke**

Retrieve the required information from SAP Fieldglass instance to your ServiceNow instance by setting up webhook to authenticate the requests.

**Before you begin**
Role required: admin

**Procedure**
1. Navigate to **SAP Fieldglass Spoke > SAP Fieldglass Webhook Registries**.
2. Click **New**.
3. On the form, fill these values:
## SAP Fieldglass Webhook Registry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP Fieldglass Event</td>
<td>Event for which you want to set up the webhook. For example, <em>Create job posting.</em></td>
</tr>
<tr>
<td>User name</td>
<td>Leave this field empty.</td>
</tr>
<tr>
<td>Password</td>
<td>Leave this field empty.</td>
</tr>
<tr>
<td>SAP Fieldglass Instance</td>
<td>URL of your SAP Fieldglass instance.</td>
</tr>
</tbody>
</table>

4. Click **Generate UserName and Password**. **UserName** and **Password** are displayed.

5. Copy and record the values.

6. Contact the SAP Fieldglass team to configure the webhook endpoint. Also, share the user name and password combination with the SAP Fieldglass team.

## SAP S4 HANA RFC spoke v1.0.2

Manage procurement, records, journals, and others, in SAP S4 HANA RFC account from your ServiceNow® instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

### Supported versions

This spoke was built for these SAP S4 HANA RFC versions, but may be compatible with later versions:

- SAP application version: SAP S4 HANA 1909
- NetWeaver Version: SAP NW 7.5
- SAP JCo:3.0.20
Spoke requirements

- Contact the admin of your SAP S4 HANA RFC account and obtain these SAP proprietary JAR files and other required files:
  - sapjco3.jar.
  - libsapjco3.so: If your MID Server is installed on a Linux machine, obtain this file.
  - sapjco3.dll: If your MID Server is installed on a Windows machine, obtain this file.

A JAR file, sapConnector-1.0.jar, is available along with the spoke to provide custom interface to interact and execute RFCs and IDocs in the SAP S4 HANA RFC account. The JAR file is installed as part of the spoke in your ServiceNow instance.

- Copy and record the client value of the target host where the SAP S4 HANA RFC server is installed.

- Configure the values of these system properties:
  - `com.snc.process_flow.reportingserialized.val_size_limit`: This property serializes JSON objects and ensures that the data is in the required format. Specify the number of bytes as per your requirement. For more information, see Flow Designer system properties.
  - `glide.rest.maxcontent_length`: This property specifies the payload size. Specify the maximum payload size you want to use in your flows. The maximum value you can specify for this property is 25 MB.

⚠️ Note: To retrieve information for authorization purposes, use the Execute RFC spoke action.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
Spoke flows

The SAP S/4 HANA RFC spoke provides sample flows to demonstrate automating the SAP S4 HANA RFC tasks. To customize a sample flow, copy it to the required application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retrieve Incoming Invoice</td>
<td>Retrieves the invoice data periodically. This data is displayed in the SAP S/4HANA Invoice Data module.</td>
</tr>
<tr>
<td>Retrieve Users by Role</td>
<td>Retrieves details of the users, based on the provided user role. This data is displayed in the SAP S/4HANA Users Records module.</td>
</tr>
</tbody>
</table>

Spoke actions

The SAP S/4 HANA RFC spoke provides actions to automate SAP S4 HANA RFC tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Items</td>
<td>Look up Material Groups</td>
<td>Retrieves details of the material groups.</td>
</tr>
<tr>
<td></td>
<td>Look up Materials by Plant</td>
<td>Retrieves details of the materials (items) based on plant selection criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Materials by Storage Locations</td>
<td>Retrieves details of the materials (items) based on storage location selection criteria.</td>
</tr>
<tr>
<td>Journals</td>
<td>Post Journal Entry</td>
<td>Posts a journal entry to a GL Account in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td></td>
<td>Reverse Journal Entry</td>
<td>Reverses a journal entry in a GL Account in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td>Lookups</td>
<td>Look up Cost Centers by Controlling Area</td>
<td>Retrieves details of the cost centers based on the controlling area.</td>
</tr>
<tr>
<td>Metadata</td>
<td>Get RFC Input Schema</td>
<td>Dynamically retrieves the input schema for the RFC.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get RFC Output Schema</td>
<td>Schema</td>
<td>Dynamically retrieves the output schema for the RFC.</td>
</tr>
<tr>
<td>Procurement</td>
<td>Create Fixed Asset</td>
<td>Creates a fixed asset in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td></td>
<td>Create Goods Receipt</td>
<td>Creates a goods receipt document in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td></td>
<td>Create Invoice</td>
<td>Creates an invoice document in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td></td>
<td>Create Purchase Order</td>
<td>Creates a purchase order in SAP S4 HANA RFC.</td>
</tr>
<tr>
<td></td>
<td>Look up Invoices by Date</td>
<td>Retrieves details of the invoices based on entry date.</td>
</tr>
<tr>
<td></td>
<td>Update Purchase Order</td>
<td>Updates details of the specified purchase order.</td>
</tr>
<tr>
<td>Records Management</td>
<td>Execute RFC</td>
<td>Executes an RFC from the available list.</td>
</tr>
</tbody>
</table>

**Spoke module**

The SAP S/4 HANA RFC spoke adds the SAP S4 HANA RFC Spoke application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAP S/4 HANA - RFCs</td>
<td>Displays the list RFCs. Some RFCs are provided along with spoke. You can create additional RFCs as per your requirement. The Execute RFC action uses these records as an input.</td>
</tr>
<tr>
<td>SAP S/4 HANA Flow Executions</td>
<td>Displays the dates on which the Retrieve Incoming Invoice flow is executed. After you set up the SAP S4 HANA RFC spoke, create a record to specify the date up to which you want to retrieve the invoice data. For more information, see <a href="#">Set up the SAP S4 HANA RFC spoke</a>.</td>
</tr>
<tr>
<td>SAP S/4 HANA Invoice Data</td>
<td>Displays details of the invoice data. Customize and execute the default flow, Retrieve Incoming Invoice to retrieve the invoice data.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SAP S/4 HANA Users</td>
<td>Displays details of the users, based on their user role. Customize and execute the default flow, Retrieve Users by Role to retrieve the user information.</td>
</tr>
</tbody>
</table>

### Spoke user roles

The SAP S4 HANA RFC provides the sn_sap_s4_hana_rfc.SAP_S4_HANA_RFC_Spoke_Admin user role to control access to data. Users with the sn_sap_s4_hana_rfc.SAP_S4_HANA_RFC_Spoke_Admin role have access to the spoke tables.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with SAP S4 HANA RFC spoke alias to configure where actions run as well as set MID Server selection attributes. For more information about running actions on the MID Server, see Integration steps.

#### Note:

- If the MID Server is installed on a Linux machine, perform the configurations as outlined in Set up the SAP S4 HANA RFC spoke.
- If the MID Server is installed on a Windows machine, no configurations are needed.

### Set up the SAP S4 HANA RFC spoke

Integrate the ServiceNow instance and SAP S4 HANA RFC spoke by using the Basic Auth credentials to authenticate ServiceNow requests.
Before you begin

• Request an IntegrationHub subscription.
• Activate SAP S4 HANA RFC spoke.
• Role required: admin

ℹ️ Note: To retrieve information for authorization purposes, use the Execute RFC spoke action.

Procedure

1. Configure MID Server using the SAP proprietary JAR files.

   a. Optional: Navigate to **System Properties > Security**.

      ℹ️ Note: This is applicable only if your MID Server is installed on a Linux machine

   b. Optional: Disable the MIME type validation for file attachments.

      ℹ️ Note: This is applicable only if your MID Server is installed on a Linux machine.

   c. Navigate to **MID Server > JAR Files**.

   d. Upload the required SAP proprietary files (JAR, SO, or DLL) obtained after contacting your SAP S4 HANA RFC admin. For more information, see [Synchronize a JAR file to MID Servers](#).

      ℹ️ Note: Ensure that the files are synchronised in the `<MID-Server-root-directory>/agent/extlib` directory. If the files aren't synchronised, restart the MID Server.

2. Create a credential record for the SAP S4 HANA RFC account.

   a. Navigate to **Connections & Credentials > Credentials**.

   b. Click **New**.

      The system displays this message: *What type of Credentials would you like to create?*
c. Select **Basic Auth Credentials**.
d
d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Basic Auth Credentials form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>------------</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>User name</td>
</tr>
<tr>
<td>Password</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Order</td>
</tr>
<tr>
<td>Credential alias</td>
</tr>
</tbody>
</table>

e. Click **Submit**.

3. Create a connection record for your SAP S4 HANA RFC account.

a. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.

b. Open the alias record for SAP S4 HANA RFC.

c. From the **Connections** tab, click **New**.

d. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Connection form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>------------</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Credential</td>
</tr>
<tr>
<td>Connection alias</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
<tr>
<td>Host</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Domain</td>
</tr>
<tr>
<td>Override default port</td>
</tr>
<tr>
<td>Use MID server</td>
</tr>
</tbody>
</table>

e. In the **Advanced MID Server Configuration** tab, provide these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Selection</td>
<td>Option to select MID Server as required. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Option to use a MID Server to run the SFTP step. This field is available when Define Connection Inline is selected from the Source Connection list and Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capability of the MID Server. Select SSH. This field is available when Define Connection Inline is selected from the Source Connection list and Auto-Select MID Server is selected from the MID Selection list.</td>
</tr>
<tr>
<td></td>
<td>Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Data pill of the required MID Server. This field is available when Define Connection Inline is selected from the Source Connection list and Specific MID Server is selected from the MID Selection list.</td>
</tr>
</tbody>
</table>
f. In the Attributes tab, provide these details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_client</td>
<td>Client value of the target host where the SAP S4 HANA RFC server is installed.</td>
</tr>
<tr>
<td>u_system_number</td>
<td>System number of the target host where the SAP S4 HANA RFC server is installed.</td>
</tr>
<tr>
<td>u_lang</td>
<td>Language selected in the target host where the SAP S4 HANA RFC server is installed.</td>
</tr>
</tbody>
</table>

g. Click Submit.

4. Create a record in the SAP S/4HANA Flow Executions module to specify date up to which you want to retrieve the invoice data.

b. Click New.

c. In Last Successful Execution, specify the date up to which you want to retrieve the invoice data.

d. Click Submit.

The Retrieve Incoming Invoice flow takes this date as an input and retrieves the invoice data. Depending on the configured flow trigger, the Retrieve Incoming Invoice flow periodically retrieves the invoice data. To view the invoice data, navigate to SAP S/4HANA - RFC Spoke > SAP S/4HANA Invoice Data.

SAP SuccessFactors spoke v3.0.0
Manage data and entities in SAP SuccessFactors from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Remote Tables (com.glide.script.vtable)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke flows

The SAP SuccessFactors spoke provides sample flows in the draft state to demonstrate automating the SAP SuccessFactors tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Todo</td>
<td>Creates a todo record in SAP SuccessFactors.</td>
</tr>
<tr>
<td>Update Todo</td>
<td>Updates details of the specified todo record in SAP SuccessFactors.</td>
</tr>
<tr>
<td>Run SuccessFactors Integration Flow</td>
<td>Retrieves entire data or only updates made after the last refresh, for</td>
</tr>
</tbody>
</table>
**Flow** | **Description**
---|---
| the selected entities, from SAP SuccessFactors to your ServiceNow instance. By default, you can retrieves data from these entities in SAP SuccessFactors:
| - Department
| - Location
| - Job Profile
| - Workers Profile
| - Effective Workers Profile
| - Job History Including Secondary Assignments
| - Todo

**Note:** The Create Todo and Update Todo flows demonstrate the todo record management when events occur in ServiceNow. You can customize these flows as per your requirement to manage records of other entities from your ServiceNow instance.

**Spoke subflows**

The SAP SuccessFactors spoke provides sample subflows in the draft state to demonstrate automating the SAP SuccessFactors tasks. To customize a sample subflow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retrieve Departments</td>
<td>Retrieves the department data from SAP SuccessFactors and stores it in SuccessFactors Departments Staging Table.</td>
</tr>
<tr>
<td>Retrieve Effective Worker Profiles</td>
<td>Retrieves the Effective Worker Profiles data from SAP SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.</td>
</tr>
<tr>
<td>Retrieve Job History Including Secondary Assignments</td>
<td>Retrieves the job history data, including secondary assignments, from SAP SuccessFactors and stores it</td>
</tr>
</tbody>
</table>
Subflow | Description
--- | ---
Retrieve Job Profiles | Retrieves the job profile data from SAP SuccessFactors and stores it in SuccessFactors Job Profile Staging Table.
Retrieve Locations | Retrieves the location data from SAP SuccessFactors and stores it in SuccessFactors Locations Staging Table.
Retrieve Todos | Retrieves the todo data from SAP SuccessFactors and stores it in SuccessFactors Inbound Todos Staging Table.
Retrieve Worker Profiles | Retrieves the Worker Profiles data from SAP SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.
Run SuccessFactors Service | Retrieves entire data or only updates made from the last successful runtime, for the selected entities.
Process SuccessFactors Webhooks | Processes the SAP SuccessFactors webhook event. For more information about setting up the webhooks, see Set up webhook for the SAP SuccessFactors spoke.

<td>Displays the direct deposit details of the logged in user.</td>
</tr>
<tr>
<td>View My Total Rewards</td>
<td>Displays the total rewards of the logged in user.</td>
</tr>
</tbody>
</table>

To retrieve the data, run Run SuccessFactors Integration Flow. The data in the staging tables is available for 7 days. During this time period, you must use transform maps to save this data in the required target ServiceNow tables as per your requirement.

**Spoke transform maps**

The SAP SuccessFactors spoke provides sample transform maps in inactive state and associated sample target tables to demonstrate using transform maps to save SAP SuccessFactors data in your ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps as per your requirement.

For more information, see [Transform maps](#).
Spoke user roles
These user roles are available along with the spoke:

- **SuccessFactors Admin (sn_successfactors.SuccessFactors Admin):** Users with this role have access to all spoke modules and tables.

- **SuccessFactors Private Data (sn_successfactors.SuccessFactors Private Data):** Users with this role have access to data in these spoke modules:
  - View My Direct Deposit Information
  - View My Total Rewards

- **SuccessFactors Public Data (sn_successfactors.SuccessFactors Public Data):** Users with this role have access to data in these spoke modules:
  - View My Time Off Balance
  - View My Time Off Details
  - View My Time Card Details For Past 1 Month
  - View My Worker Profile
  - View My Holiday Calendar
  - View My Reporting Structure

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available with the SAP SuccessFactors spoke; one for the SOAP API and other for the OData API.

Set up the SAP SuccessFactors spoke
Integrate the ServiceNow instance with your SAP SuccessFactors instance using basic credentials.

Before you begin
- Request IntegrationHub subscription
- Activate the SAP SuccessFactors spoke
- Enable these system properties:
• glide.pf.rest.response_payload_max_size: The maximum value is, 10240.
• com.snc.process_flow.reportingserialized.val_size_limit: The maximum value is, 16384.
• com.glide.transform.json.max-partial-length: The maximum value is, 65536.

• Role required: admin

Create Credential record for the OData API
Create Credential record for the OData APIs in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the OData API.

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter SAPSF OData Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with the OData API permission in this format: &lt;username&gt;@&lt;SAP-SuccessFactors-CompanyID&gt;.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Results
The credential record to authorize actions using the OData API is created.
Create Credential record for the SOAP API

Create Credential record for the SOAP APIs in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the SOAP APIs.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
   A blank SuccessFactors SOAP Credentials form displays.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter SAPSF Comp Emp Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with the SOAP API permission.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Results

The credential record to authorize actions using the SOAP API is created.

Create Connection record for the OData API

Create a Connection record for the OData API in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these connections to perform actions in SAP SuccessFactors.

Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for SuccessFactors OData API. For example, SuccessFactors_OData.
3. From the Connections tab, click New.
The system displays a blank HTTP(s) Connection form.

4. On the form, fill these values.

<table>
<thead>
<tr>
<th>HTTP(s) Connection form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SF_REST.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the OData API. For example, SAPSF OData Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Results
The connection record for the OData API in SAP SuccessFactors is created.

Create Connection record for the SOAP API
Create a Connection record for the SOAP API in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these connections to perform actions in SAP SuccessFactors.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for SuccessFactors SOAP API. For example, SuccessFactors_Comp_Emp.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these values.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SF_REST.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the SOAP API. For example, SAPSF Comp Emp Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>SAP SuccessFactors connection URL. For example, <a href="https://salesdemo4.successfactors.com/sfapi/v1/soap">https://salesdemo4.successfactors.com/sfapi/v1/soap</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, provide these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company Id</td>
<td>Immutable Company ID of your SAP SuccessFactors instance.</td>
</tr>
<tr>
<td>Flow Timeout (seconds)</td>
<td>Maximum time in seconds up to which data can be received from SAP SuccessFactors during the flow execution. If the time taken to retrieve data from SuccessFactors exceeds the timeout duration, the flow or subflow is cancelled. Default value is, 30.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Results**
The connection record for the SOAP API in SAP SuccessFactors is created.

**Synchronise data between SAP SuccessFactors and ServiceNow**
Customise the sample flows as per your requirement to synchronise data between your SAP SuccessFactors and ServiceNow instances.

**Todo entity**
The SAP SuccessFactors spoke provides sample flows to synchronise data bi-directionally for the todo entity. The sample flow, Run SuccessFactors Integration Flow can customised to retrieve data from SAP SuccessFactors, while the Create Todo and Update Todo flows creates or updates the todo records in SAP
SuccessFactors when events occur in ServiceNow. While customising the sample flows, ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

**Other default entities**
For these entities, the sample flow, Run SuccessFactors Integration Flow, can be customised to retrieve data from SAP SuccessFactors:

- Department
- Location
- Job Profile
- Workers Profile
- Effective Workers Profile
- Job History Including Secondary Assignments

To create or update records in SAP SuccessFactors for these entities when events occur in ServiceNow:

- Create flows or subflows as per your choice or customise the sample flows and subflows.
- Use Metadata Retrieval and Record Management actions in your flows.
- Ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

**Other SAP SuccessFactors entities**
Depending on the SAP SuccessFactors permissions and configurations, you can also synchronise data of other entities as per your requirement.

**Set up webhook for the SAP SuccessFactors spoke**
Configure a webhook to subscribe to your SAP SuccessFactors account with a ServiceNow callback URL.

**Before you begin**

- Set up the SAP SuccessFactors spoke
- Role required: admin
Procedure

1. Configure the default decision table.

   a. Navigate to System Definition > Decision Tables.

   b. Search for the record, Successfactors Webhook and open it.

   c. In the Decision Inputs tab, open the Webhook Event record.

   d. In the Choices tab, create record for the event for which you want to subscribe. For example, enter Employee Time Off in Label and Name to subscribe to the Employee Time Off events.

   e. Navigate back to the Successfactors Webhook record.

   f. In the Decisions tab, open the Default Decision record.

   g. Select the required webhook event in Condition and select the subflow in Answer.

      When the specified webhook event occurs, the associated subflow is triggered.

      ❖ Note: You can customise the default subflow or create a subflow as per your requirement.

2. Create a webhook registry.

   a. Navigate to SuccessFactors Spoke > Webhook Registry.

   b. Click New.

   c. On the form, enter SuccessFactors Webhook Authentication for Name and provide Description.

      ❖ Note: The Name of the webhook registry must be SuccessFactors Webhook Authentication.

   d. Click Generate Username and Password.

      Username and Password are generated and the values are displayed.

   e. Copy and record the values of the generated values for later use.
3. Copy and record the value of **Resource path**.
   a. Navigate to **System Web Services > Scripted REST APIs**.
   b. Search for the record, *SuccessfactorsWebhook* and open it.
   c. In the **Resources** tab, click the **processWebhook** record.
   d. Copy and record the value provided in **Resource path**.

4. Configure events in your SAP SuccessFactors instance.
   a. Log in to your SAP SuccessFactors instance and navigate to **Admin Center > Event Notification Subscription**.
   b. In the **External Event** tab, provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint URL</td>
<td>ServiceNow instance endpoint URL in this format: https://&lt;servicenow-instance&gt;.com/&lt;resource-path&gt;</td>
</tr>
<tr>
<td>Authentication</td>
<td>Select <em>Basic</em>.</td>
</tr>
<tr>
<td>User</td>
<td>User name generated when the webhook registry is created.</td>
</tr>
<tr>
<td>Password</td>
<td>Password when the webhook registry is created.</td>
</tr>
</tbody>
</table>

   c. Configure the subscriber in the **Subscriber** tab as per your requirement.
   d. Select the required **Service Event Bus Topic** in the **SEB External Event** tab as per your requirement and select the events for which you want to receive notifications. For example, Employee Time Off.

**Secureworks CTP spoke**

Integrate ServiceNow instance with Secureworks Counter Threat Platform (CTP). Manage events and tickets in Secureworks Counter Threat Platform from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release
notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Secureworks CTP V4, but may be compatible with later versions.

**Spoke requirements**
- Secureworks portal account

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The Secureworks CTP spoke provides actions to automate Secureworks CTP tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Management</td>
<td>Get Event Details</td>
<td>Retrieves the details of a specific event.</td>
</tr>
<tr>
<td></td>
<td>Get Recent Events</td>
<td>Retrieves details of a list of recent events.</td>
</tr>
<tr>
<td>Ticket Management</td>
<td>Assign Ticket To Secureworks SOC</td>
<td>Assigns a ticket to the Secureworks Security Operations Centers (SOC) Team.</td>
</tr>
<tr>
<td></td>
<td>Close Secureworks Ticket</td>
<td>Closes the specified Secureworks ticket.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Get Ticket Details</td>
<td>Retrieves the details of the specified Secureworks ticket.</td>
</tr>
<tr>
<td></td>
<td>Look up Tickets</td>
<td>Retrieves a list of tickets from Secureworks.</td>
</tr>
<tr>
<td></td>
<td>Post Worklog to Secureworks Ticket</td>
<td>Adds a worklog to the Secureworks ticket.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Secureworks CTP spoke**

Integrate the ServiceNow instance and Secureworks CTP by registering a custom application in Secureworks Portal to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Secureworks CTP spoke.
- Create an API password from the Account Management section of your Secureworks CTP account.
- Role required: admin

**Create a credential record for the Secureworks CTP spoke**

Create a credential record for the Secureworks CTP account. The Secureworks CTP spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   
   The system displays this message: What type of Credentials would you like to create?
3. Select API Key Credentials.
4. On the form, fill these fields.

API Key Credentials

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Secureworks Cred</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated in your Secureworks account. Enter the API key in this format: APIKEY username:password</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence in which the credential is applied.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Alias to use the credential. Click the padlock icon and enter sn_sw_ctp_spoke.Secureworks</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.

Create a connection record for the Secureworks CTP spoke

Create a connection record for your Secureworks account. The Secureworks CTP spoke connection and credential aliases use these connections to perform API actions in Secureworks portal.

Procedure

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record for Secureworks.
3. From the Connections tab, click New.
4. On the form, fill these fields.
Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Secureworks Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Secureworks CTP spoke. Enter the credential you created. For example Secureworks Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. The default alias is sn_sw_ctp_spoke.Secureworks.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Secureworks. Enter: <a href="https://api.secureworks.com">https://api.secureworks.com</a></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.

ServiceNow Kafka Consumer
Integrates your ServiceNow instance with Kafka Consumer and stores data in the ServiceNow tables.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Confluent REST Proxy API v2.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
The plugins mentioned include:

- Confluent Kafka REST Proxy spoke
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - RTE (com.glide.hub.action_step.rte)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

ServiceNow Kafka Consumer uses the connection and credential alias of the Confluent Kafka REST Proxy spoke.

### Configure ServiceNow Kafka Consumer

Retrieve events pertaining to the specified topics and store it in the required ServiceNow tables.

**Before you begin**

- Request IntegrationHub subscription.
- Activate and set up the Confluent Kafka REST Proxy spoke.
- Activate ServiceNow Kafka Consumer.
- Define entities and mapping between entities. For information, see Robust Import Set Transformers.
- Role required: import_admin

**Procedure**

1. Navigate to Process Automation > Kafka Consumer.
2. Click New.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Broker Connection Alias</td>
<td>Connection alias of the Confluent Kafka REST Proxy spoke.</td>
</tr>
<tr>
<td>Topic</td>
<td>Topic from which you want to retrieve the events.</td>
</tr>
<tr>
<td>Robust Transformer Definition</td>
<td>Robust Transformer Definition that is used for the event transformation and data storage in ServiceNow tables. For information, see Robust Import Set Transformers.</td>
</tr>
<tr>
<td>Offset Starting Point</td>
<td>Value of the Kafka Consumer auto.offset.reset. This specifies what the Kafka Consumer should do when there is no initial offset or if the current offset does not exist any more on the server. See the Kafka 2.7 documentation for more information.</td>
</tr>
<tr>
<td>Partitions per group</td>
<td>Number of partitions per consumer thread.</td>
</tr>
<tr>
<td>Page size (bytes)</td>
<td>Maximum size of a request.</td>
</tr>
<tr>
<td>Page limit</td>
<td>Maximum number of requests per iteration.</td>
</tr>
<tr>
<td>Embedded Format</td>
<td>Format of the Kafka message for the topic.</td>
</tr>
<tr>
<td>Request timeout (ms)</td>
<td>Value of the Kafka Consumer consumer.request.timeout.ms. This specified the maximum amount of time the client waits for the response of a request. See the Kafka 2.7 documentation for more information.</td>
</tr>
<tr>
<td>Stop Upon Transform Errors</td>
<td>Option to stop listening when transformation errors are encountered.</td>
</tr>
<tr>
<td>Verbose transformation</td>
<td>Option to log all the imported events to import set and produce additional debug logs for transformation.</td>
</tr>
</tbody>
</table>
Note: You must create one Kafka Consumer record for each topic.

4. Click the Start Sink Listener related link. The Kafka Partition Group Listener States table is populated with the topic partition data.

5. Optional: If you want to stop listening, click the Start Sink Listener related link.

7. Open the record, Kafka Consumer Trigger.

8. From the Trigger Type list, select Interval.

9. Click Update.

ServiceNow Remote Instance spoke v2.1.2
Integrate your local and remote ServiceNow instances to export, import, and manage records from your local instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for the Orlando version and later.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

⚠ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke requirements
Ensure that the spoke users have only the required minimum permissions to access data in ServiceNow tables. Do not assign elevated privilege roles to users of this spoke unless very much required. This practice ensures controlled access to data.

Spoke actions
The ServiceNow Remote Instance spoke provides actions to export, import, and manage records when events occur in your local ServiceNow instance. Available actions include:

⚠ Note: The terms remote instance and local instance are used in these contexts:
• Local instance: This is the ServiceNow instance from which the communication is initiated and established.
• Remote instance: This is the ServiceNow instance with which the local instance communicates.

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change request Management</td>
<td>Export Change Request Record</td>
<td>Exports a change request record to a remote instance from the local instance.</td>

<td>Import Record Using Import Set</td>
<td>Imports a record from table in the remote instance to the local instance.</td>
</tr>
<tr>
<td></td>
<td>Look Up Remote Record</td>
<td>Retrieves the required record from the remote instance.</td>
</tr>
<tr>
<td></td>
<td>Look Up Remote Records</td>
<td>Retrieves multiple records from the remote instance table.</td>
</tr>
<tr>
<td></td>
<td>Update Remote Record</td>
<td>Updates the required record in the remote instance.</td>
</tr>
</tbody>
</table>
Note: The Company field is required to import or export records using the default transform maps. However, users can modify the transform maps as per their requirement. Also, use the import sets when working with integration involving data transfer.

Spoke transform maps
The ServiceNow Remote Instance spoke provides sample transform maps in active state and associated sample target tables to demonstrate using transform maps to save the remote ServiceNow instance data in your local ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps as per your requirement.

For more information, see Transform maps.

Note:
• By default, the sample transform maps uses sys_id as the coalesce field. You can customise the transform map script as per your requirement to change the coalesce field.
• By default, the export and import actions use the spoke tables. You can change this to use different import sets.
• The time zones may be different in your ServiceNow instances. Ensure that you customise flows accordingly.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are required for this spoke; one for the local instance and other for the remote instance.

Set up the ServiceNow Remote Instance spoke
Integrate the local and remote ServiceNow instances by creating an OAuth API endpoint in the remote ServiceNow instance to authenticate requests.

Before you begin
• Request IntegrationHub subscription.
• Activate ServiceNow Remote Instance spoke in remote and local ServiceNow instances.
Role required: admin

⚠️ Note: Admin role is required to only set up the spoke.

To use the spoke, ensure that the spoke users have only the required minimum permissions to access data in ServiceNow tables. Do not assign elevated privilege roles to users of this spoke unless very much required. This practice ensures controlled access to data.

Register remote ServiceNow instance as an OAuth provider

Register remote ServiceNow instance as an OAuth provider so that the local ServiceNow instance can request OAuth 2.0 tokens.

Before you begin

• In the remote ServiceNow instance:
  ◦ Create an OAuth API endpoint for external clients. In Redirect URL, specify the URL of the local ServiceNow instance in this format: https://<instance-name>.service-now.com/oauth_redirect.do. For more information, see Create an endpoint for clients to access the instance.
  ◦ Copy and record the values of Client ID and Client Secret.

• Role required: admin

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open for the record, RemoteSpoke.
3. On the form, fill these values.

Application Registry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created in the remote ServiceNow instance.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created in the remote ServiceNow instance.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>URL of the remote ServiceNow instance in this format: https://&lt;instance-name&gt;.service-now.com/oauth_auth.do.</td>
</tr>
<tr>
<td>Token URL</td>
<td>URL of the remote ServiceNow instance in this format: https://&lt;instance-name&gt;.service-now.com/oauth_token.do.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the local ServiceNow instance in this format: https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note:</td>
<td>You can use only <strong>Authorization Code</strong> as the Default Grant type when <strong>PKCE</strong> is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create Credential record for the remote ServiceNow instance**

Create credential record for the remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Remote Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
### Create Connection record for the remote ServiceNow instance

Create Connection record for your remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record, **ServiceNowRemoteInstance**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

**HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Remote Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for remote ServiceNow instance. For example, Remote Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the remote ServiceNow instance. For example, https://&lt;remote-instance-name&gt;service-now.com/.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
Create Credential record for the local ServiceNow instance

Create credential record for the local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

Procedure
1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Local Credentials.</td>
</tr>
<tr>
<td>Username</td>
<td>Username to log in to the local ServiceNow instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to the local ServiceNow instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

Create Connection record for the local ServiceNow instance

Create Connection record for your local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

Procedure
1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record, **ServiceNowRemoteInstanceLocalAlias**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Local Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for local ServiceNow instance. For example, Local Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the local ServiceNow instance. For example, https://&lt;local-instance-name&gt;service-now.com/.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Shodan spoke**
Manage exploits, alerts, hosts, and others, in Shodan account from your ServiceNow® instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Shodan spoke provides actions to automate Shodan tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exploit Management</td>
<td>Exploit Search</td>
<td>Searches for exploits from vulnerability data sources.</td>
</tr>
<tr>
<td></td>
<td>Get Exploit Count</td>
<td>Retrieves the number of exploits for a specific query.</td>
</tr>
<tr>
<td>Network Alert Management</td>
<td>Get Alert Details</td>
<td>Retrieves details of the specific network alert.</td>
</tr>
<tr>
<td></td>
<td>Look up Alerts</td>
<td>Retrieves the list of network alerts.</td>
</tr>
<tr>
<td>Search Management</td>
<td>Get Host Details</td>
<td>Retrieves details of all services that are associated with specified host IP.</td>
</tr>
<tr>
<td></td>
<td>Get Host Count</td>
<td>Retrieves the total number of hosts that match the provided query and requested facet information.</td>
</tr>
<tr>
<td></td>
<td>Search Shodan</td>
<td>Retrieves details from a Shodan search.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Two connection and credential alias records are available along with the Shodan spoke.

**Set up the Shodan spoke**

Integrate the Shodan account and your ServiceNow® instance using the API keys.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Shodan spoke.
- API key of your Shodan account.
- Role required: admin

**Procedure**

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, Shodan.
3. From the Connections tab, click New.
4. On the form, fill these fields.

**Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Shodan Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>✂ Note: Credential record isn't required.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host. Enter api.shodan.io.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. Select the check box and define the fields in the Advanced MID Server Configuration tab.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, for Key, specify the API key of your Shodan account.
6. Click Submit.

8. Open the alias record, Shodan Exploit.

9. From the Connections tab, click New.

10. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Shodan Exploit Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>🔔 Note: Credential record isn't required.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host. Enter exploits.shodan.io.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. Select the check box and define the fields in the Advanced MID Server Configuration tab.</td>
</tr>
</tbody>
</table>

11. In the Attributes tab, for Key, specify the API key of your Shodan account.

12. Click Submit.

**Slack spoke v1.5.6**

Use Slack to post messages and manage access to channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Slack account requirements**

The Slack spoke requires creating a workspace and custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. See Configure Slack app.
Note: The spoke set up procedure outlined here requires bot user tokens only. You can’t use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account and set up the Slack spoke as outlined in Set up Slack spoke.

Spoke subflows
The Slack spoke provides a sample subflow to demonstrate automating Slack workspace tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert Slack User Details by Member ID</td>
<td>Inserts details of the required user in the Slack User Cache module, based on the Member ID.</td>
</tr>
<tr>
<td>Insert Slack User Details by User ID</td>
<td>Inserts details of the required user in the Slack User Cache module, based on the User ID.</td>
</tr>
<tr>
<td>Post Actionable Message</td>
<td>Posts an actionable message to a Slack channel.</td>
</tr>
<tr>
<td>Note: This subflow requires an outbound configuration as an input. Customise the default outbound configurations or create outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.</td>
<td></td>
</tr>
<tr>
<td>Post Approval Message</td>
<td>Posts an approval message to a Slack channel.</td>
</tr>
<tr>
<td>Note: This subflow requires an outbound configuration as an input. Customise the default outbound configurations or create outbound configuration as per your requirement. For more information, see Configure outbound configurations in ServiceNow instance.</td>
<td></td>
</tr>
<tr>
<td>Respond to Slack Approval Message</td>
<td>Posts an acknowledgement message on a Slack channel.</td>
</tr>
<tr>
<td>Respond to Slack Command</td>
<td>Posts a response to command on a Slack channel.</td>
</tr>
<tr>
<td>Respond to Slack Message Action</td>
<td>Posts a notification on a Slack channel.</td>
</tr>
</tbody>
</table>
While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Spoke actions**

The Slack spoke provides actions to automate Slack workspace tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel Management</td>
<td>Add User to Channel</td>
<td>Adds an existing user to the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Archive Channel</td>
<td>Archives the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Conversation Rename</td>
<td>Renames the specified conversation.</td>
</tr>
<tr>
<td></td>
<td>Conversation Info</td>
<td>Retrieves information about a conversation.</td>
</tr>
<tr>
<td></td>
<td>Create Channel</td>
<td>Creates the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Look Up Attachments By Conversation / Member ID</td>
<td>Retrieves attachments associated with the relevant channel, member, or bot user.</td>
</tr>
<tr>
<td></td>
<td>Look Up Channel History</td>
<td>Retrieves history of the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Look Up Conversation</td>
<td>Retrieves the conversation messages for a particular thread from the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Look Up Conversation IDs By Member ID</td>
<td>Retrieves details of the Conversation IDs associated with the specified member on Slack.</td>
</tr>
<tr>
<td></td>
<td>Set Topic For Channel</td>
<td>Sets the topic for a Slack channel.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Remove User from Channel</td>
<td>Removes a user from the specified channel in the Slack workspace.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post Actionable Message</td>
<td>Posts an actionable message to a Slack channel.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: This action requires an outbound configuration as an input. Customise the default outbound configurations or create outbound configuration as per your requirement. For more information, see <a href="#">Configure outbound configurations in ServiceNow instance</a>.</td>
</tr>
<tr>
<td>Post Approval Message</td>
<td>Post Approval Message</td>
<td>Posts an approval message to a Slack channel.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: This action requires an outbound configuration as an input. Customise the default outbound configurations or create outbound configuration as per your requirement. For more information, see <a href="#">Configure outbound configurations in ServiceNow instance</a>.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts Change record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts Incident record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Message</td>
<td>Posts a message to a Slack Channel.</td>
</tr>
<tr>
<td></td>
<td>Post Response to Slack</td>
<td>Posts a response message to Slack.</td>
</tr>
<tr>
<td></td>
<td>Update Approval Record</td>
<td>Updates the specified approval record.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts Problem record details to the specified channel.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in the specified Slack workspace.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This action requires user token from your Slack account. If you have bot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>user tokens, you can’t use this action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The procedure outlined here requires bot user tokens only. To use this</td>
</tr>
<tr>
<td></td>
<td></td>
<td>action, obtain user token and set up the Slack spoke as outlined in Set up</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Slack spoke.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user from a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• This action requires user token from your Slack account. If you have bot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>user tokens, you can’t use this action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The procedure outlined here requires bot user tokens only. To use this</td>
</tr>
<tr>
<td></td>
<td></td>
<td>action, obtain user token and set up the Slack spoke as outlined in Set up</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Slack spoke.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Returns information about the specified user or bot. The information can</td>
</tr>
<tr>
<td></td>
<td></td>
<td>be name, time zone, workspace admin rights, and team ownership of a user or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>bot.</td>
</tr>
<tr>
<td></td>
<td>Deactivate</td>
<td>Deactivates a user subscription in Slack. To use this action, perform the</td>
</tr>
<tr>

<td>perform the steps outlined in the</td>
</tr>
</tbody>
</table>
Create a Slack Enterprise Grid application and
Create a Slack Enterprise connection sections in
Integrating with Slack.

Note:

• Create User and Deactivate User actions require the admin scope. The
 spoke set up procedure outlined here requires bot user tokens only. You
 can’t use the Create User and Deactivate User actions while using the
 bot token scopes. To use these actions, you must obtain user token from
 your Slack account and set up the Slack spoke as outlined in Set up Slack
 spoke.

• The admin scope is available to Slack workspace owners only.

Spoke modules
The Slack spoke adds the Slack application to your ServiceNow instance. The
Slack application includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack Modal</td>
<td>Create modals and specify fields that should be displayed in your Slack modal.</td>
</tr>
<tr>
<td>Configuration</td>
<td></td>
</tr>
<tr>
<td>Slack User Cache</td>
<td>Access information about users who have performed actions on the Slack channel that needed updates in ServiceNow instance or response from ServiceNow instance.</td>
</tr>
<tr>
<td>Slack Channel Cache</td>
<td>Access information about the channels on which actions are performed that needed updates in ServiceNow instance or response from ServiceNow instance.</td>
</tr>
<tr>
<td>Inbound Decisions</td>
<td>Specify events in your Slack application for which actions must be performed in ServiceNow instance.</td>
</tr>
</tbody>
</table>

For example, you can specify inbound decisions to update the task details in your ServiceNow instance when an approver approves the task on the relevant Slack channel. Five sample inbound decisions are available for your reference. Customise these decisions or create inbound decisions as per your requirement.

When conditions mentioned in the inbound decisions are met, the associated subflow is triggered and record
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack Outbound Choices</td>
<td>Choices that should be displayed as a list on the Slack channels.</td>
</tr>
<tr>
<td>Inbound Slack Message</td>
<td>Access information about the inbound messages to your ServiceNow instance from the Slack application.</td>
</tr>
<tr>
<td>Outbound Configurations</td>
<td>Specify events in ServiceNow instance for which actions must be performed on your Slack application. For example, you can specify outbound configurations to send a message on the relevant Slack channel asking for approval when a task is created in your ServiceNow instance. Three sample outbound configurations are available for your reference. Customise these configurations or create outbound configurations as per your requirement. The outbound configurations also provide a template to the Post Actionable Message and Post Approval Message actions. For example, you can configure the outbound configurations to display the <strong>Approve</strong> and <strong>Reject</strong> buttons in the approval message that is sent on the relevant Slack channel. When configurations mentioned in the outbound configurations are met, the relevant subflow is triggered to perform actions in the Slack application.</td>
</tr>
<tr>
<td>Slack Configurations</td>
<td>Provide information about the Slack app and Signing Key.</td>
</tr>
</tbody>
</table>

Data in these modules is populated from these spoke tables:

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

**Set up Slack spoke**

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Slack spoke.
- Slack account.
- Add Slack users to the User [sys_user] table of your ServiceNow instance, with Email being the unique identifier.
- Role required: admin

**About this task**

The spoke set up procedure outlined here requires bot user tokens only. You can't use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account and set up the Slack spoke as outlined in Set up Slack spoke.

**Configure Slack app**

Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

**About this task**

Complete these steps from your Slack account. You can create an app or configure an existing app as per the configurations outlines here.
Procedure

1. Create a Slack workspace. For more information about creating a Slack workspace, see Create a Slack workspace.

2. Navigate to the Slack API console and create an app. For more information, see the Create a Slack App step.

3. From the Basic Information page, copy and record the values of Client ID, Client Secret, and Signing Secret of your Slack app. For more information, see the Get Client ID and Secret for later step.

4. On the OAuth & Permissions page:

   a. Specify the ServiceNow instance URL in Redirect URLs in this format: https://<instance-name>.service-now.com/oauth_redirect.do.

   b. Add these bot token scopes:

      - channels:history
      - channels:manage
      - channels:read
      - chat:write
      - chat:write.customize
      - groups:read
      - im:read
      - mpim:read
      - groups:history
      - groups:write
      - im:history
      - im:write
      - mpim:history
      - mpim:write
      - users:read
      - users:read.email
      - files:read
For more information, see Scopes and permissions.

⚠️ **Note:** The spoke set up procedure outlined here requires bot user tokens only. You can’t use the Create User and Deactivate User actions while using the bot token scopes. To use these actions, you must obtain user token from your Slack account and set up the Slack spoke as outlined in Set up Slack spoke.

5. On the Slash Commands page, create a command. Specify these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>/now</td>
</tr>
<tr>
<td>Request URL</td>
<td>https://&lt;instance-name&gt;.service-now.com/api/sn_slack_ah_v2/</td>
</tr>
<tr>
<td></td>
<td>command_service/&lt;slack-app-name&gt;</td>
</tr>
<tr>
<td>Short Description</td>
<td>Description about the command.</td>
</tr>
<tr>
<td>Usage Hint</td>
<td>List of parameters than can be passed. For example,</td>
</tr>
<tr>
<td></td>
<td>[operation] [table].</td>
</tr>
</tbody>
</table>

For more information, see the Creating a Slash command step.

6. On the Interactivity & Shortcuts page:

   a. Enable **Interactivity** and specify the ServiceNow instance URL in **Request URL** in this format: https://<instance-name>.service-now.com/api/sn_slack_ah_v2/slack/<slack-app-name>/interactivepayload. For more information, see the Preparing your app for user interactions section.

   b. Create a shortcut that appears on messages and enter the value, post_message_now for **Callback ID**. For more information, see the Creating a shortcut section.

7. Create a Slack bot. Add the bot to your Slack app and required channels. For more information, see Create a bot for your workspace.

**Add Slack connection in ServiceNow instance**

Add the Slack connection in Flow Designer to configure the Slack spoke.

**Before you begin**

Role required: admin
Procedure
1. Navigate to **Flow Designer > Designer**.
2. Click **Connections**.

   Note: You can add multiple connections for your Slack spoke; one for each Slack workspace.
3. On the Slack spoke tile, click **View Details**.
4. In the Connections page, click **Configure**.
   The pop-up window displays a blank Configure Connection form.
5. On the form, fill these values.

   **Configure Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>URL to connect to Slack. Enter <a href="https://slack.com">https://slack.com</a>.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, Slack Cred.</td>
</tr>
<tr>
<td>OAuth Name</td>
<td>Name to identify the OAuth record. For example, Slack OAuth.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of your Slack app.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret of your Slack app.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>Redirect URL provided in your Slack app. This value is auto-populated.</td>
</tr>
</tbody>
</table>

6. Click **Configure and Get OAuth Token**.
7. In the pop-up window, click **Allow**.
   The OAuth Access token is generated for the Slack spoke.

**Provide Signing Key in ServiceNow instance**

Provide Slack app details and Signing Key in your ServiceNow instance for authenticating requests from ServiceNow.

**Before you begin**

Role required: admin
Procedure

1. Navigate to Slack > Slack Configurations.
2. Open the default record. You can also create new record to provide other signing keys.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Slack Configuration form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Slack App</td>
</tr>
<tr>
<td>Connection Alias</td>
</tr>
<tr>
<td>Property Name</td>
</tr>
<tr>
<td>Client Secret</td>
</tr>
</tbody>
</table>

4. Click Update.

Configure outbound configurations in ServiceNow instance

Specify events in ServiceNow instance for which actions must be performed on your Slack spoke application.

Before you begin

Role required: admin

About this task

The outbound configurations provide a template to the Post Actionable Message and Post Approval Message actions and subflows. You can customise the default outbound configurations or create outbound configuration as per your requirement.

Procedure

1. Navigate to Slack > Outbound Configurations.
2. Click New to create a outbound configuration template or click the default outbound configuration to configure it.
3. On the Outbound Configuration form, fill these values.
Outbound Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the outbound configuration record.</td>
</tr>
<tr>
<td>Message Title</td>
<td>Title of message that is posted in the Slack spoke channel. For example, Pending approvals for {0}.</td>
</tr>
<tr>
<td>Target Table</td>
<td>ServiceNow table from which the record details are retrieved.</td>
</tr>
<tr>
<td>Fields</td>
<td>Fields from the ServiceNow table whose values must be displayed in the message that is posted in the Slack spoke channel.</td>
</tr>
<tr>
<td>Buttons</td>
<td>Buttons for the relevant users to take action in the Slack spoke channel. For example, Approve or Reject a request. For more information about buttons and their styling, see Button element.</td>
</tr>
</tbody>
</table>

⚠️ Note: Users must have the required permissions to perform the necessary actions. For example, user must have the required permissions to approve or reject a request. These permissions are based on user roles assigned to users in your ServiceNow instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice List</td>
<td>Slack outbound choices such as, Reject. These options are displayed as a list in the Slack channel.</td>
</tr>
<tr>
<td>Action ID</td>
<td>Unique identifier of the outbound configuration.</td>
</tr>
</tbody>
</table>

⚠️ Note: Action ID of the outbound configuration must be used in the relevant inbound decision to complete the flow. For example, Action ID of the Approval Message outbound configuration is provided in the Approval Decision inbound decision. This ensures that upon the request approval or rejection, update is made to the relevant record in your ServiceNow instance.

4. Click Submit.

Configure inbound decisions in ServiceNow instance

Specify events in your Slack spoke application for which actions must be performed in ServiceNow instance.

Before you begin
Role required: admin
Procedure

1. Navigate to Slack > Inbound Decisions.
2. Click New.
4. On the Decision form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name to identify the inbound decision.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>a.</td>
<td>Click the lookup icon (🔍).</td>
</tr>
<tr>
<td>b.</td>
<td>Select the required subflow from the Document list.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the Table name is Flow [sys_hub_flow].

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Conditions to be met in your Slack application for which actions must be performed in ServiceNow instance. For updating relevant record in your ServiceNow instance, specify the Action ID value you had provided while configuring outbound configurations in the condition.</td>
</tr>
</tbody>
</table>

**Note:** Action ID of the outbound configuration must be used in the relevant inbound decision to complete the flow. For example, Action ID of the Approval Message outbound configuration is provided in the Approval Decision inbound decision. This ensures that upon the request approval or rejection, update is made to the relevant record in your ServiceNow instance.

5. Click Submit.

When events meet conditions specified in the policy, the associated subflow is triggered.
Note: These inbound decisions are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

If you want to display modals in Slack, see Configure Slack modals in ServiceNow instance.

Configure Slack modals in ServiceNow instance
Create modal and specify fields that should be displayed in your Slack modal. Modal UI can be generated in two ways: automatically using a ServiceNow table and manually using a custom View Payload.

Before you begin
Role required: admin

About this task
For example, if you want to create incident using modal in Slack, the Create Incident modal requires Priority, Category, and Short Description fields.

Note: Modals can be triggered from these interactive Slack components:
- Command,
- Block action,
- Global shortcut, and
- Message shortcut.

Procedure
1. To create a modal with UI that is automatically generated using a ServiceNow table:

a. Navigate to Slack > Slack Modal Configuration.

b. Click New.

   c. On the Slack Modal Configuration form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, Modal to create incident.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Modal Title</td>
<td>Modal title that is displayed on Slack. For example, Create Incident.</td>
</tr>
<tr>
<td>Table</td>
<td>ServiceNow table corresponding to the modal fields. For example, Incident [incident].</td>
</tr>
<tr>
<td>Custom Modal</td>
<td>Option to configure a custom modal. Do not select this check box.</td>
</tr>
<tr>
<td>Input Fields</td>
<td>Inputs fields that should be displayed on Slack. For example, select Priority, Category, and Short Description. Ensure that these modal fields correspond to the selected ServiceNow table. For example, you can't display task related fields on a modal that creates an incident.</td>
</tr>
<tr>
<td>Note: Only the string, date, and choice field types are supported.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the record.</td>
</tr>
<tr>
<td>Script Validation</td>
<td>Script to validate inputs provided by the user in the modal. To validate the user-provided inputs, ensure that you are aware of the format in which values are retrieved from the modal and parse the response from Slack. The sample payload when user provides values for the Priority, Category, and Short Description fields in the Create Incident modal is:</td>
</tr>
<tr>
<td></td>
<td>{&quot;priority&quot;:{&quot;4gk&quot;:{&quot;type&quot;:&quot;static_select&quot;,&quot;selected_option&quot;:{&quot;text&quot;:{&quot;text&quot;:&quot;1 - Critical&quot;,&quot;emoji&quot;:true},&quot;value&quot;:&quot;1&quot;}}},&quot;category&quot;:{&quot;iV7&quot;:{&quot;type&quot;:&quot;static_select&quot;,&quot;selected_option&quot;:{&quot;text&quot;:{&quot;text&quot;:&quot;Software&quot;,&quot;emoji&quot;:true},&quot;value&quot;:&quot;software&quot;}}},&quot;short_description&quot;:{&quot;XS/Q-&quot;:{&quot;type&quot;:&quot;plain_text_input&quot;,&quot;value&quot;:&quot;hemanth&quot;}}}</td>
</tr>
<tr>
<td></td>
<td>To display validation errors in the modal, configure the script to return an object keys, status, and errorObject. errorObject should have a value of object that will be displayed on Slack. The object should have response_action and error. Also, configure the script to return an object with keys of status and statusMessage when there are no</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>validation errors. statusMessage is optional and you can configure it as per your requirement.</td>
</tr>
</tbody>
</table>

```javascript
var data = JSON.parse(payload);
var key = object.keys(data.short_description);
var shortdesc = data.short_description[key[0]].value;
var result = new Object();
if (shortdesc.length > 10) {
  var obj = {
    response_action: "errors",
    errors: {
      short_description: "You have reached your maximum limit of characters allowed"
    }
  };
  result = {
    status: "error",
    errorObject: obj
  };
  return result;
}
else {
  result = {
    status: "success",
    statusMessage: "Request submitted successfully."
  };
  return result;
}
```

**d.** Right-click the form header and click **Save**. The Create Incident modal is created in Slack.

![Create Incident modal in Slack](image)

**2.** To create a modal with UI that is manually generated using a custom View Payload:

**a.** Navigate to **Slack > Slack Modal Configuration**.

**b.** Click **New**.
c. On the Slack Modal Configuration form, fill these values.

**Slack Modal Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to identify the record. For example, <em>Modal to create incident</em>.</td>
</tr>
<tr>
<td>Custom Modal</td>
<td>Option to configure a custom modal. Select this check box.</td>
</tr>
<tr>
<td>View Payload</td>
<td>Payload generated by Slack Block Kit Builder that defines the modal UI. For more information, see <a href="https://www.service-now.com/builder/">Block Kit</a> and <a href="https://www.service-now.com/builder/build-modal.html">Building with Block Kit</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the record.</td>
</tr>
</tbody>
</table>
| Script Validation | Script to validate inputs provided by the user in the modal. To validate the user-provided inputs, ensure that you are aware of the format in which values are retrieved from the modal and parse the response from Slack. The sample payload when user provides values for the *Priority*, *Category*, and *Short Description* fields in the Create Incident modal is:  

```json
{"priority": {"4gk": {"type": "static_select", "selected_option": {"text": {"type": "plain_text", "text": "1 - Critical"}, "emoji": true}, "value": "1"}}, "category": {"iV7": {"type": "static_select", "selected_option": {"text": {"type": "plain_text", "text": "Software"}, "emoji": true}, "value": "software"}}, "short_description": {"XS/Q": {"type": "plain_text_input", "value": "hemanth"}}}
```

To display validation errors in the modal, configure the script to return an object keys, status, and errorObject. errorObject should have a value of object that will be displayed on Slack. The object should have response_action and error.

Also, configure the script to return an object with keys of status and statusMessage when there are no validation errors. statusMessage is optional and you can configure it as per your requirement.
d. Right-click the form header and click **Save**.  
The Create Incident modal is created in Slack.

3. Specify conditions to define when the modals should be displayed:

   a. Select **Slack Inbound Policy For Modals**.

   b. On the Decision form, fill these values.

```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name to identify the inbound modal decision.</td>
</tr>
<tr>
<td>Answer</td>
<td>Modal that must be displayed when the specified conditions are met. Ensure that you select the required record from the Slack Modal Configuration [sn_slack_ah_v2_slack_modal_configuration] table.</td>
</tr>
<tr>
<td>Default</td>
<td>Option to specify if this is the default modal. The default modal is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met in your Slack application to display the modal.</td>
</tr>
</tbody>
</table>
```
Note:

- Copy and record the value of sys_id. You can use this sys_id as the unique value in **Callback ID** while configuring the shortcut or message shortcut in your Slack app.

To display modals for the required shortcut, in **Condition**, provide the sys_id of the modal's inbound policy record.

- To display modals for the required Slack commands, in **Condition**, provide the required command for which the modal should be displayed.
c. Click Submit.
   When events in Slack meet conditions specified in the policy, the associated modal is displayed.

   ![Note:](image) These inbound decisions are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

4. Specify tasks to be performed when user provides values in the modals by creating an inbound policy:

   a. Navigate to Slack > Inbound Decisions.

   b. Click New.

   c. Select Slack Inbound Policy For Subflows.

   d. On the Decision form, fill these values.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name to identify the inbound decision.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable:</td>
</tr>
<tr>
<td>i.</td>
<td>Click the lookup icon (🔍).</td>
</tr>
<tr>
<td>ii.</td>
<td>Select the required subflow from the Document list.</td>
</tr>
</tbody>
</table>

   ![Note:](image) Ensure that the Table name is `Flow [sys_hub_flow]`. Ensure that you have configured the subflow to process the response payload.

| Condition      | Conditions to be met to perform tasks in ServiceNow instance. Specify the modal record in the condition. |
### Automate and customize Slack tasks

Automate Slack tasks as per your requirement, using the sample these scenarios as a reference.

You can use the default outbound configurations, inbound decisions, and subflows as reference to customize tasks as per your requirement.

#### Example: Automate Slack commands

Perform these steps to automate events such as, create incident records, based on the Slack commands:

1. Configure the Slack commands on the Slash Commands page of your custom application. For more information, see Configure Slack app.

2. In Flow Designer, create a subflow configure to create the incident records as per your requirement or create a copy of the default subflow, Respond to Slack Command, and configure it.

   - **Note:** Create an action and use the payload in the subflow input as per your requirement.
3. Configure inbound decisions in ServiceNow instance.

   a. In the **Condition**, ensure that you specify the value of **command** as `/now` and specify the required parameters.

   🔄 **Note**: You can specify up to 2 parameters in your condition to trigger the required subflow.

   ![Decision condition diagram]

   b. In **Answer**, select the subflow you had configured.

   When a Slack user enters the command, `/now create incident <text>`, the condition specified in inbound decision is met and the associated subflow is triggered. Similarly, you can customize subflows and inbound decisions to configure more Slack commands such as:

   - `/now list incidents` to list all active incidents assigned to the logged in user.
   - `/now help` to display all available commands and their describe usage.
   - `/now note [note]` to add notes to the required incident.
   - `/now create incident [short description] > [optional: urgency] > [optional: impact]` to create an incident with specified short description, urgency, and impact. For example, `/now create incident Email is not working > 3 > 2`.

**Example: Automate message actions**

1. In your Slack custom application, create a shortcut that appears on messages and enter the value, `post_message_now` for **Callback ID**. For more information, see Configure Slack app.

2. In Flow Designer, create a subflow configure to create the incident records as per your requirement or create a copy of the default subflow, Respond to Slack Message Action, and configure it.
Note: Create an action and use the payload in the subflow input as per your requirement.

3. Configure inbound decisions in ServiceNow instance.
   a. In the Condition, ensure that you specify the value of **callback_id** as **post_message_now** and specify the required parameters.

   ![Condition Image]

   b. In **Answer**, select the subflow you had configured.

**Example: Post an approval message**
Perform these steps to automate posting an approval message on a Slack channel.

1. In Flow Designer, create a copy of the default subflow, Respond to Slack Approval Action, and configure it as per your requirement.
   
   Note: Create an action and use the payload in the subflow input as per your requirement.

2. Configure outbound configurations in ServiceNow instance.
   a. Open the default outbound configuration, **Approval Message**.
   b. In **Action ID**, specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be **approval_request**.

3. Configure inbound decisions in ServiceNow instance.
a. In the **Condition**, ensure that you specify the value of **Action ID** as `approval_request`. You can specify other conditions as per your requirement.

b. In **Answer**, select the subflow you had configured.

When the Slack events match the relevant the action ID, the associated subflow, that is, the Respond to Slack Approval Action subflow is triggered. This subflow contains the logic to update the required record and send the relevant acknowledgement message on Slack channel.

**Example:** **Assign request based on acknowledgement**

Perform these steps to automate assigning request:

1. In Flow Designer, create a copy of the default subflow, On-Call Assign by Acknowledgement, and configure it as per your requirement.

   **Note:** Create an action and use the payload in the subflow input as per your requirement.

2. **Configure outbound configurations in ServiceNow instance.**
   
   a. Open the default outbound configuration, **On Call: Assign by Acknowledgement**.
   
   b. In **Action ID**, specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be `on_call_assign_by_acknowledgement`.

3. **Configure inbound decisions in ServiceNow instance.**
   
   a. In the **Condition**, ensure that you specify the value of **Action ID** as `on_call_assign_by_acknowledgement`. You can specify other conditions as per your requirement.
   
   b. In **Answer**, select the subflow you had configured.

**Example:** **Post an actionable message**

Perform these steps to automate posting an actionable message:
1. Configure outbound configurations in ServiceNow instance.
   a. Open the default outbound configuration, **On Call: Assign by Acknowledgement**.
   b. Select **Target Table** and **Fields** as per your requirement. For example, `short_description` and `priority` from the `Task [task]` table.
   c. Select **Buttons** as per your requirement. For example, **Accept** and **Reject**.
   d. In **Action ID**, specify the unique identifier for automating the task of posting an acknowledgement message. For example, value of **Action ID** can be `on_call_assign_by_acknowledgement`.

2. In Flow Designer, create a copy of the default subflow, Post Actionable Message, and configure it as per your requirement.

   - **Note:** Create an action and use the payload in the subflow input as per your requirement.

   a. In the **Record Sys.ID** input, provide the sys ID of the required record. For example, specify the sys ID of the task record.
   b. In the **Template** input, select template you had created in the outbound configurations.

3. Configure inbound decisions in ServiceNow instance.
   a. In the **Condition**, ensure that you specify the value of **Action ID** as `on_call_assign_by_acknowledgement`. You can specify other conditions as per your requirement.
   b. In **Answer**, select the subflow you had configured.

**Smartsheet spoke**

The Smartsheet spoke provides actions to view and analyze Smartsheet software subscriptions.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
**Supported versions**

This spoke was built for Smartsheet v1.0.1, but may be compatible with later versions.

**Spoke requirements**

• Smartsheet admin account

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke subflows**

The Smartsheet spoke provides sample subflows to demonstrate automating Smartsheet tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smartsheet Download Subscriptions</td>
<td>Downloads user subscriptions from the Smartsheet portal.</td>
</tr>
<tr>
<td></td>
<td>To use this subflow, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td>Smartsheet Update User Activity</td>
<td>Retrieves Smartsheet user activity.</td>
</tr>
<tr>
<td></td>
<td>To use this subflow, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td>Smartsheet Reclaim Subscription</td>
<td>Deactivates user accounts in Smartsheet.</td>
</tr>
<tr>
<td></td>
<td>To use this subflow, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
</tbody>
</table>
Spoke actions

The Smartsheet spoke provides actions to automate Smartsheet tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Check Event Reporting</td>
<td>Checks whether you have the Event Reporting add-on in Smartsheet. To use this action, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td></td>
<td>Get Admin User</td>
<td>Retrieves the admin user that generated the Smartsheet API access token. To use this action, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td></td>
<td>Get User Activity</td>
<td>Retrieves meaningful Smartsheet user activity. To use this action, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users</td>
<td>Retrieves all Smartsheet user subscriptions. To use this action, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Deactivates a user account in Smartsheet. To use this action, perform the steps outlined in Integrating with Smartsheet.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

SurveyMonkey spoke v2.0.2

Manage surveys, responses, collectors, and so on in the SurveyMonkey account from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for SurveyMonkey API version v3, but may be compatible with later versions.

Spoke requirements

Admin access to SurveyMonkey API Developer Portal.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The SurveyMonkey spoke provides actions to automate SurveyMonkey tasks when events occurs in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collector Management</td>
<td>Create Collector</td>
<td>Creates a collector for the given survey. Public app users need access to the Create/Modify Collectors scope.</td>
</tr>
<tr>
<td></td>
<td>Delete Collector</td>
<td>Deletes the specified collector. Public app users need access to the Create/Modify Collectors scope.</td>
</tr>
<tr>
<td></td>
<td>Get Collector Details</td>
<td>Retrieves details of the specified collector. Public app users need access to the View Collectors scope.</td>
</tr>
<tr>
<td></td>
<td>Look up Collectors Stream</td>
<td>Retrieves details of collectors in the specified survey.</td>
</tr>
<tr>
<td>Contact Management</td>
<td>Add Contacts to Contact List</td>
<td>Creates multiple contacts in a contact list. Public app users need access to the Create/Modify Contacts scope.</td>
</tr>
<tr>
<td></td>
<td>Create Contact List</td>
<td>Creates a contact list. Public app users need access to the Create/Modify Contacts scope.</td>
</tr>
<tr>
<td></td>

<tr>
<td></td>
<td>Look up Team Members Stream</td>
<td>Retrieves details of all members in the specified team.</td>
</tr>
<tr>
<td></td>
<td>Look up Teams Stream</td>
<td>Retrieves details of all teams that the authenticated user account belongs to.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get User Details</td>
<td>Retrieves the current user’s account details including their plan. Public app users need access to the View Users scope.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the SurveyMonkey spoke**

Integrate the ServiceNow instance and SurveyMonkey account by creating a custom OAuth application in SurveyMonkey API Developer Portal to authenticate ServiceNow requests.

**Before you begin**

Role required: admin
Procedure

1. Log in to SurveyMonkey API Developer Portal as an admin and add an app.
   a. In OAuth Redirect URL, enter the ServiceNow instance URL in this format:
   b. Copy and record the values of Client ID and Secret.
   c. Provide these scopes for the app:
      • Create/Modify Surveys
      • Create/Modify Collectors
      • Create/Modify Responses
      • View Response Details
      • View Contacts
      • Create/Modify Webhooks
      • View Library Assets
      • View Surveys
      • View Collectors
      • View Responses
      • Create/Modify Contacts
      • View Users
      • View Webhook

   i Note: If you provide any additional scopes, ensure that you add these scopes in the OAuth Entity Scopes tab of the default application registry available in your ServiceNow instance.

2. Configure the default application registry.
   a. Navigate to System OAuth > Application Registry.
   b. Open the record, Survey Monkey.
   c. On the form, fill these values:
### Field | Description
--- | ---
Client ID | Client ID of the app created in SurveyMonkey API Developer Portal.
Client Secret | Secret of the app created in SurveyMonkey API Developer Portal.
Redirect URL | ServiceNow instance URL in this format: https://<instance-name>.service-now.com/oauth_redirect.do. Replace <instance-name> with your instance name.

⚠ **Note:** If you have provided additional scopes, create records for those scopes in the OAuth Entity Scopes tab.

3. **Create a credential record.**

   a. **Navigate to Connections & Credentials > Credentials.**
   
   b. **Click New.**
   
      The system displays the message *What type of Credentials would you like to create?*.
   
   c. **Select OAuth 2.0 Credentials.**
   
   d. **On the form, fill in the fields.**

### Field | Value required
--- | ---
Name | Name to uniquely identify the record. Enter SurveyMonkey Credentials.
Active | Option to actively use the credential record.
OAuth Entity Profile | OAuth profile you created when you registered the SurveyMonkey app as an OAuth provider. Select Survey Monkey default_profile.
Applies to | MID Servers that can use this credential. Select All MID Servers.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order to apply this credential. Enter 100.</td>
</tr>
</tbody>
</table>

4. Create a connection record.

   b. Open for the record for SurveyMonkey.

   c. From the Connections tab, click New.

   The system displays a blank HTTP(s) Connection form.

   d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter SurveyMonkey Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select SurveyMonkey Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your SurveyMonkey account. Enter <a href="https://api.surveymonkey.net">https://api.surveymonkey.net</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

e. Optional: In the Attributes tab, the default value of API Version is v3. If you are using different SurveyMonkey API version, specify the version number.

f. Click Submit.

The ServiceNow instance and SurveyMonkey account are integrated.
Trello spoke

Manage Trello Enterprise subscriptions using your ServiceNow instance. Analyze data usage for Trello enterprise and reclaim idle subscriptions.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke requirements

- Trello Enterprise admin access
- Ensure that your Trello subscription is linked to Atlassian account.
- Ensure that your authorized account has both Trello Enterprise admin and Atlassian account admin access.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Trello provides actions to automate Trello tasks when events occur in your ServiceNow instance. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Look up Enterprise ID</td>
<td>Retrieves the organization ID of the authenticated user account.</td>
</tr>
<tr>
<td></td>
<td>Look up Enterprise Members Stream</td>
<td>Retrieves details of all members in an enterprise organization.</td>
</tr>
<tr>
<td></td>
<td>Update Enterprise Member’s Active Status</td>
<td>Updates the active status of the specified member in an enterprise.</td>
</tr>
<tr>
<td></td>
<td>Update Enterprise Member’s License Status</td>
<td>Updates whether the provided member should use one of the enterprise’s available licenses or not.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Generate Trello API key and token**

Generate a Trello API key and token to get access to the Trello portal.

**Before you begin**

Trello role required: admin

Ensure that you have a managed user account and Atlassian admin access.

**Procedure**

1. Go to [Trello](#).
2. Log in as an enterprise admin.
3. Go to [Developer API Keys](#).
4. Click **Show API Key**.
   - The Developer API key shows an API key.
5. Copy the API key from the Developer API key.
6. In the following link, replace `{YourAPIKey}` with the API key that you copied in the last step and open the link.
https://trello.com/1/authorize?
expiration=never&scope=read,write,account&response_type=token&name=ServerToken&key={YourAPIKey}
For example, if your API key is 123xyz, then open
the following link- https://trello.com/1/authorize?
expiration=never&scope=read,write,account&response_type=token&name=ServerToken&key=123xyz
MyPersonalToken page appears and asks if you want to give access to your account.

7. Click Allow.
An API token is generated. Copy this API token and store it securely.

Set up your ServiceNow instance for Trello
Set up your ServiceNow instance to add the Trello API key and API token.

Before you begin
ServiceNow role required: admin

Procedure
1. Log in to your ServiceNow instance.
The Connection & Credentials Aliases page appears and shows the list of apps.
3. Locate and open the Connection & Credentials record for Trello.
The Trello Connection & Credentials Aliases form appears.
The Trello Credentials form appears.
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Trello Credentials form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Any name of your choice. For example, Trello integration.</td>
</tr>
<tr>
<td>API Key</td>
<td>The API Key that you copied from the Trello portal.</td>
</tr>
<tr>
<td>API Token</td>
<td>The API token that you copied from the Trello portal.</td>
</tr>
</tbody>
</table>
6. Click Submit.
Twilio spoke v1.1.2

Use the Twilio spoke to send SMS, make voice calls, create conference calls, manage calls, manage short codes, notify services, and messaging services.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Twilio Base version 2010-04-01, Twilio Messaging version v1, and Twilio Notify version v1, but may be compatible with later versions.

Spoke requirements

- Twilio account.
- **AccountSid** and **AuthToken** of the account to create a Basic Auth credential.
- Activate these plugins:
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
  - ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

See Twilio documentation for instructions on creating an account.

Spoke actions

The Twilio spoke provides actions to automate sending SMS, making voice calls, and creating conference calls when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>Send SMS</td>
<td>Sends an SMS to a phone number.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** To receive information about Status Callbacks, you must configure webhooks in Twilio. See [Twilio documentation](https://www.twilio.com/docs/sms) for instructions on creating and configuring webhooks.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](https://service.now.com/docs/).  

⚠️ **Note:** Three connection and credential alias records are needed for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each alias should be associated with the respective Twilio API.

**Set up Twilio spoke**

Integrate the ServiceNow instance and Twilio using basic authentication to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate Twilio spoke
- Role required: admin

**Create Credential records for the Twilio spoke**

Create Credential records to the Twilio server. The Twilio spoke connection and credential alias uses these credentials to authorize actions.
**About this task**
Create three credential records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each credential should be associated with the respective Twilio API.

**Procedure**
1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message *What type of Credentials would you like to create?*
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Twilio Base, Twilio Notify, or Twilio Messaging.</td>
</tr>
<tr>
<td>User name</td>
<td>Twilio Account SID.</td>
</tr>
<tr>
<td>Password</td>
<td>Twilio AuthToken.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Results**
The three required credential records are created for Twilio Base, Twilio Notify, and Twilio Messaging.

**Create Connection records for the Twilio spoke**
Create Connection records to your Twilio account. The Twilio spoke connection and credential alias uses these connections to perform actions on Twilio.

**About this task**
Create three connection records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each connection record should be associated with the respective Twilio API.
Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open record of the Twilio spoke.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Twilio Base Connection, Twilio Notify Connection, or Twilio Messaging Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Twilio. For example, select Twilio Base for Twilio Base Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for Twilio Base, enter <a href="https://api.twilio.com/">https://api.twilio.com/</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for Twilio Notify, enter <a href="https://notify.twilio.com/">https://notify.twilio.com/</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for Twilio Messaging, enter <a href="https://messaging.twilio.com/">https://messaging.twilio.com/</a>.</td>
</tr>
</tbody>
</table>

5. In the Attributes related list:
   • For the connection record of Twilio Base, enter Account SID.
   • Enter Page size.
   • Don't modify the default value of the Version.

6. Click Submit.

Results
The three connection records are created. The ServiceNow instance and Twilio are integrated.

Twitter spoke v1.1.1
Use the Twitter spoke to automatically tweet messages or media in your Twitter account from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

⚠️ Note: This spoke is available to new customers as part of an IntegrationHub Professional subscription. Existing customers can use this spoke as part of an IntegrationHub Standard subscription.

Supported versions

API version v1.1.

Spoke requirements

• Twitter developer account
• Twitter developer app to access the Twitter APIs
• Access token and secret of your Twitter developer app
• Consumer key and secret from your Twitter developer app

See the Twitter Developers documentation for instructions on creating the developer application and gathering the required details.

Spoke actions

The Twitter spoke provides actions to automate tweeting when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tweet</td>
<td>Tweets a message or media. Messages and media are tweeted as per Twitter limits.</td>
</tr>
</tbody>
</table>

⚠️ Note: If you wish to tweet media, use the Look Up Attachment Records action before this action in your custom flow to retrieve the required media.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: Two connection and credential alias records are needed for the Twitter spoke; one for tweeting messages and other for tweeting media. Each alias should be associated with the respective Twitter API.

Create Credential records for the Twitter spoke

Authorize the Twitter spoke actions by creating credential records for the application registered in the Twitter developer account. The Twitter spoke connection and credential alias uses these credentials to authorize actions.

About this task
You must create two credential records; one for tweeting messages and other for tweeting media.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
3. Select Twitter Credentials.
4. On the form, fill in the fields.

Twitter Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, TwitterCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Consumer Key</td>
<td>Consumer key of your Twitter developer app.</td>
</tr>
<tr>
<td>Consumer Secret</td>
<td>Consumer secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Access Token</td>
<td>Access token of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token Secret</td>
<td>Access token secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias record associated with this credential.</td>
</tr>
</tbody>
</table>

**Note:**
- If the credential record is created for tweeting messages, select the credential alias that is associated with the Twitter messaging API.
- If the credential record is created for tweeting media, select the credential alias that is associated with the Twitter media API.

5. Right-click the form header and click **Save**.

**Results**
The credential record for the Twitter spoke is created.

**Create Connection records for the Twitter spoke**
Perform actions in Twitter by creating connection records for your Twitter account. The Twitter spoke connection and credential alias uses these connections to perform actions.

**About this task**
Two connection and credential alias records are available by default; one for tweeting messages and other for tweeting media. Perform these steps to associate each alias with the respective Twitter API.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the required Twitter spoke record.

    **Note:** There are two connection and credential records: **Twitter** and **Twitter_Media**. The **Twitter** record is for tweeting messages and **Twitter_Media** is for tweeting media.
3. In the Connections related list of the required record, click **New**.
4. On the form, fill in the fields.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Twitter Base Or Twitter Media.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Twitter spoke. For example, Twitter.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for tweeting messages, enter <a href="https://api.twitter.com">https://api.twitter.com</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for tweeting media, enter <a href="https://upload.twitter.com">https://upload.twitter.com</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

**Results**
The Twitter spoke is set up and integrated with the ServiceNow instance.

**Udemy spoke**
Manage learnings, courses, and so on, in the Udemy instance from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Udemy API version v2, but may be compatible with later versions.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Udemy spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Look up Courses Stream</td>
<td>Retrieves details of the courses in Udemy.</td>
</tr>
<tr>
<td>Learning Management</td>
<td>Look up Course Synchronization Stream</td>
<td>Retrieves details of the required courses.</td>
</tr>
<tr>
<td></td>
<td>Look up Course Synchronization Token</td>
<td>Retrieves the synchronization token to fetch the next set of updated or created course.</td>
</tr>
</tbody>
</table>
### Category

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look up User</td>
<td>Retrieves the course progress data.</td>
</tr>
<tr>
<td>Course Activity Stream</td>
<td></td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the Udemy spoke

Integrate the ServiceNow instance and your Udemy instance using an API key to authenticate the ServiceNow requests.

### Before you begin

- Request IntegrationHub subscription.
- Activate the Udemy spoke.
- Admin access to the Udemy instance.
- Role required: admin
Procedure

1. Generate API key from your Udemy instance.

   a. Log in to your Udemy instance and obtain the values of **Client ID** and **Client Secret**.

   b. Provide the values of **Client ID** and **Client Secret** in `GET /api-2.0/organizations/{organization_id}/courses/list/`. 
The API key is generated and displayed in **Authorization**. Copy and record the value for later use.

2. Create a credential record for the Udemy spoke.

   a. Navigate to **Connections & Credentials > Credentials**.

   b. Click **New**.

   The system displays the message *What type of Credentials would you like to create?*.

   c. Select **API Key Credentials**.

   d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential record. For example, Udemy Cred.</td>
</tr>
<tr>
<td>API Key</td>
<td>Value of the API key you created in the Udemy instance.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

**e. Click Submit.**

3. Create a connection record for the Udemy spoke.

**a. Navigate to Connections & Credentials > Connection & Credential Aliases.**

**b. Open the record for the Udemy spoke.**

**c. From the Connections tab, click New.**

**d. On the form, fill these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, Udemy Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the Udemy spoke.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL to connect to your Udemy instance.</td>
</tr>
</tbody>
</table>

**e. Right-click the form header and click Save.**

**f. In the Attributes tab, fill these details.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain_id</td>
<td>Domain ID of your Udemy instance.</td>
</tr>
<tr>
<td>domain_name</td>
<td>Domain name of your Udemy instance.</td>
</tr>
<tr>
<td>api_version</td>
<td>Udemy API version. The default value is, api-2.0.</td>
</tr>
</tbody>
</table>

**g. Right-click the form header and click Save.**
**UiPath spoke v2.0.1**

Automate business processes in UiPath from your ServiceNow® instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke was built for these UiPath versions, but may be compatible with later versions.

- Platform version 2020.4.1
- Cloud Platform version 2020.4.3

**Spoke requirements**

Ensure that you have UiPath account information before you Set up the UiPath spoke.

- If you are using the UiPath Cloud Platform:
  - Token URL
  - Client Id
  - Account Logical Name
  - Tenant Logical Name
  - User Key
- If you are using the UiPath Platform installed on private or public cloud:
  - Tenant Name
  - Credentials to authenticate the UiPath Orchestrator API

See the UiPath documentation for more information about obtaining the required details.
Spoke actions
The UiPath spoke provides actions to manage environments, jobs, machines, processes, robots, and so on, when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment Management</td>
<td>Get Environment By ID</td>
<td>Retrieves the details of the required environment.</td>
</tr>
<tr>
<td></td>
<td>Lookup Environments</td>
<td>Retrieves the details of the required environments. The environments are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Get Job By ID</td>
<td>Retrieves the details of the required job.</td>
</tr>
<tr>
<td></td>
<td>Lookup Jobs</td>
<td>Retrieves the details of the required jobs. The jobs are retrieved based on the filter query.</td>
</tr>
<tr>
<td></td>
<td>Start Jobs</td>
<td>Starts the jobs to execute the required process.</td>
</tr>
<tr>
<td>Machine Management</td>
<td>Get Machine By ID</td>
<td>Retrieves the details of the required machine.</td>
</tr>
<tr>
<td></td>
<td>Lookup Machines</td>
<td>Retrieves the details of the required machines. The machines are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Process Management</td>
<td>Lookup Processes</td>
<td>Retrieves the details of the required processes. The processes are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Queue Management</td>
<td>Add Item To Queue</td>
<td>Adds a new item to a the specified queue.</td>
</tr>
<tr>
<td></td>

<td>Retrieves the details of the required robot.</td>
</tr>
<tr>
<td>Robot Management</td>
<td>Lookup Robots</td>
<td>Retrieves the details of the required robots. The robots are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Session Management</td>
<td>Lookup Sessions</td>
<td>Retrieves the details of the required sessions. The sessions are retrieved based on the filter query.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Salesforce alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).
Set up the UiPath spoke
Integrate the ServiceNow instance with your UiPath account using to authenticate ServiceNow requests.

Before you begin
• Request IntegrationHub subscription
• Activate the UiPath spoke
• Role required: admin

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for UiPath.
3. Select Configuration Template as per your requirement.
4. Click the Create New Connection & Credential related link.
5. On the form, fill these fields.
   • If you have selected UiPath Configuration Template - UiPath Cloud for Configuration Template, fill these fields.

Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, UiPath Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL in this format: <a href="https://platform.uipath.com/">https://platform.uipath.com/</a></td>
</tr>
<tr>
<td></td>
<td>&lt;account-logical-name&gt;/&lt;instance-logical-name&gt;</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, UiPath Credential.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens. For example, <a href="https://account.uipath.com/oauth/token">https://account.uipath.com/oauth/token</a>.</td>
</tr>
<tr>
<td>Client Id</td>
<td>Client ID specific to the UiPath Orchestrator application.</td>
</tr>
<tr>
<td>Account Logical Name</td>
<td>Unique URL of the UiPath site.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Tenant Logical Name</td>
<td>Logical name of the service.</td>
</tr>
<tr>
<td>User Key</td>
<td>Unique login key you had generated.</td>
</tr>
</tbody>
</table>

- If you have selected **UiPath Configuration Template - Private/Public Cloud** for **Configuration Template**, fill these fields.

### Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, UiPath Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>UiPath instance URL.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, UiPath Credential.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens in this format: <code>http://&lt;instance-URL&gt;/api/account/authenticate</code></td>
</tr>
<tr>
<td>Tenant Name</td>
<td>Tenant logical name.</td>
</tr>
<tr>
<td>Username or email</td>
<td>Username or email address to authenticate the UiPath Orchestrator API.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
</tbody>
</table>

**Note:** You must enable **Use MID server** option in the connection record and create a SSL certificate from a trusted authority for on-prem support.

6. Click **Create**.

7. Click **Submit**.  
A Connection and Credential is created.

8. Open the UiPath Connection record, from the **Connections** tab.

9. Select a value for the **Orchestrator Feature Enabled** field.
Results
The Connection and Credential alias is configured and the UiPath spoke is set up.

UKG spoke v3.2.0
Manage time off requests in Kronos from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Kronos version v1, but may be compatible with later versions.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke flows
The UKG spoke provides sample flows to demonstrate automating the Kronos tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:
<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kronos - Create Manager Time Off Request</td>
<td>Creates the time of request for a manager or employee.</td>
</tr>
<tr>
<td>Kronos - Get New Refresh And Access Token</td>
<td>Retrieves access token for Kronos and generates a new refresh token periodically.</td>
</tr>
<tr>
<td>Kronos - Refresh The Access Token</td>
<td>Refreshes the access token for Kronos.</td>
</tr>
<tr>
<td>Kronos - Retrieve And Update Manager Time Off Request Status</td>
<td>Retrieves status of the time off request status and updates the details of the associated request item.</td>
</tr>
<tr>
<td>Kronos - Time Off Details House Keeping</td>
<td>Deletes the time off requests based on the provided criteria. By default, the flow deletes time off requests that have been approved 7 days ago.</td>
</tr>
</tbody>
</table>

Every flow triggers an associated subflow.

**Spoke subflows**

The Kronos spoke provides sample subflows to demonstrate automating Kronos tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kronos - Get Kronos Token</td>
<td>Uses the details provided during spoke setup to retrieve a valid refresh token from Kronos.</td>
</tr>
<tr>
<td>Kronos - Create Manager Time Off Request</td>
<td>Creates the time off request and saves the information in your ServiceNow instance.</td>
</tr>
<tr>
<td>Kronos - Manager Time Off Request</td>
<td>Creates the time off request for a manager or employee.</td>
</tr>
<tr>
<td>Kronos - Retrieve Manager Time Off Request Status Update</td>
<td>Retrieves status of the time off request status and updates the details of the associated request item.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Kronos - Time Off Request Housekeeping</td>
<td>Deletes the time off requests based on the provided criteria. By default, the subflow deletes time off requests that have been approved 7 days ago.</td>
</tr>
<tr>
<td>Kronos - Report Missed Punches as Employee</td>
<td>This subflow creates a task which allows the employee’s manager to punch the employee's missing entry.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The UKG spoke provides actions to automate Kronos tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Management</td>
<td>Get Kronos Refresh Token</td>
<td>Retrieves the Refresh Token for Kronos.</td>
</tr>
<tr>
<td></td>
<td>Get Kronos Token</td>
<td>Retrieves the Token for Kronos.</td>
</tr>
<tr>
<td>Persons</td>
<td>Create Persons</td>
<td>Creates records for one or more persons.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Person by ID</td>
<td>Retrieves the details of a person for the specified record ID.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Persons</td>
<td>Retries the record details of a list of persons based on the search criteria.</td>
</tr>
<tr>
<td></td>
<td>Update Persons</td>
<td>Updates the records of one or more persons.</td>
</tr>
<tr>
<td>Scheduling</td>
<td>Retrieve Employee Schedule</td>
<td>Retrieves the schedule of an employee.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Retrieve Manager</td>
<td>Schedule</td>
<td>Retrieves the schedule of a list of employees.</td>
</tr>
<tr>
<td>Default</td>
<td>Add Timestamp</td>
<td>Adds or records a timestamp for a punch transaction of an employee.</td>
</tr>
<tr>
<td></td>
<td>Approve Timecard Employee</td>
<td>Approves the employee timecard for the specified range of dates.</td>
</tr>
<tr>
<td></td>
<td>Approve Timecard Manager</td>
<td>Adds manager approval for the specified employee’s timecard.</td>
</tr>
<tr>
<td></td>
<td>Look up Shift Cover Requests as Manager</td>
<td>Retrieves one or more shift cover requests matching specified search criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Open Shift Requests Manager</td>
<td>Retrieves a list of Open Shift Requests based on the Employee ID or Person Number.</td>
</tr>
<tr>
<td></td>
<td>Look up Self Schedule Requests Manager</td>
<td>Retrieves a list of Self Schedule requests based on the Employee ID or Person Number.</td>
</tr>
<tr>
<td></td>
<td>Look up Shift Swap Requests Manager</td>
<td>Retrieves a list of swap requests based on the Employee ID or Person Number.</td>
</tr>
<tr>
<td></td>
<td>Look up Manager Availability Requests</td>
<td>Retrieves all availability requests for the given criteria.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Employee Timecard Request</td>
<td>Retrieves the timecard details of the specified employee.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Retrieve Employee Timecards Request</td>
<td>Retrieves the details of a list of timecards for the specified employees or for the specified Hyperfind details.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Timecard</td>
<td>Retrieves the timecard of the specified manager.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Timecards</td>
<td>Retrieves the details of a list of timecards for the specified managers or the specified Hyperfind details.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Timecard Approvals Employee</td>
<td>Retrieves a list of employee timecard approvals for the specified date range.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Timecard Approvals Manager</td>
<td>Returns a list of manager timecard approvals for the specified date range.</td>
</tr>
<tr>
<td></td>
<td>Update Timecard</td>
<td>Updates the timecard of the specified employee.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Accrual Codes</td>
<td>Retrieves a list of accrual code types according to the user's access rights.</td>
</tr>
<tr>
<td></td>
<td>Look Up Cost Centers</td>
<td>Retrieves a list of available cost centers.</td>
</tr>
<tr>
<td></td>
<td>Look Up Jobs</td>
<td>Retrieves a list of available jobs.</td>
</tr>
<tr>
<td></td>
<td>Look Up Labor Categories</td>
<td>Retrieves a list of available categories.</td>
</tr>
<tr>
<td></td>
<td>Look Up Labor Category Entries</td>
<td>Retrieves a list of available labor category entries.</td>
</tr>
<tr>
<td></td>
<td>Look Up Work Rules</td>
<td>Retrieves a list of available work rules.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Hyperfind Queries</td>
<td>Retrieves a list of Hyperfind queries.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Licenses</td>
<td>Retrieves a list of licenses.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Pay Rules</td>
<td>Retrieves a list of pay rules.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Symbolic Period ID</td>
<td>Retrieves the specified symbolic period.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>All Pay Codes</td>
<td>Retrieves all the play code in Kronos.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Employee Request Subtype</td>
<td>Retrieves a list of request subtypes associated with the required Person Number.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Manager Request Subtype By Employee ID</td>
<td>Retrieves a list of request subtypes associated with the required Employee ID.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Manager Request Subtype By Person Number</td>
<td>Retrieves a list of request subtypes associated with the required Person Number. The action output is necessary for subsequent actions such as, the Retrieve Employee Accrual Balance action from manager's perspective.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Manager Symbolic Amount Qualifiers By Employee ID</td>
<td>Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Employee ID.</td>
</tr>
<tr>
<td>Retrieve</td>
<td>Manager Symbolic Amount</td>
<td>Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Person Number.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Qualifiers</td>
<td>Retrieve Symbolic Periods</td>
<td>Retrieves all the symbolic periods.</td>

<td>Retrieves details of the time off requests based on the specified search criteria and Person Number.</td>
</tr>
<tr>
<td></td>
<td>Update Employee Time Off Request</td>
<td>Updates the state of an employee time off request.</td>
</tr>
<tr>
<td></td>
<td>Update Manager Time Off Requests</td>
<td>Updates the state of a manager time off request.</td>
</tr>
<tr>
<td></td>
<td>Get Employee Accruals by Person Number</td>
<td>Retrieves different types of employee accrual balances.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Timecard Approvals Manager</td>
<td>Retrieves a list of timecard approvals within the specified date range.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Kronos spoke adds a Kronos application to your ServiceNow instance. The Kronos application has these modules.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credentials</td>
<td>Details of the Kronos users with permissions to perform the required actions.</td>
</tr>
<tr>
<td>Time Off Request Details</td>
<td>Details of the time off requests, along with the status.</td>
</tr>
<tr>
<td>Time Off Request Details</td>
<td>Details of the time off requests from the staging tables.</td>
</tr>
<tr>
<td>Staging Tables</td>
<td></td>
</tr>
</tbody>
</table>
**Kronos spoke account requirements**

The Kronos spoke requires registering an OAuth 2.0 application in your Kronos account to generate OAuth 2.0 tokens for the Kronos spoke. Record the generated Client ID, Client Secret, and Application key for later use.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the UKG spoke**

Integrate your Kronos application with your ServiceNow instance. Register an OAuth application in Kronos and authenticate requests from ServiceNow.

**Before you begin**

- Request IntegrationHub subscription
- Activate the UKG spoke
- Kronos manager user or superuser credentials
- Role required: admin

<i>Note: Make sure that the application registry, connections, and credentials are within the application scope.</i>

**Register Kronos as an OAuth provider**

Use the information generated during the Kronos application creation and configuration to register Kronos as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

**Procedure**

1. Navigate to *System OAuth > Application Registry*.
2. Open the record for the Kronos spoke.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Kronos OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in Kronos.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in Kronos.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Resource Owner Password Credentials.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Kronos Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry. Select the option.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://&lt;Kronos-Instance&gt;.com/api/authentication/access_token.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. For example, https://&lt;ServiceNow-Instance&gt;.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

5. In the **OAuth Entity Scopes** tab, insert a row and provide these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Kronos</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>givenName mail nonce openid profile sn uid</td>
</tr>
</tbody>
</table>

6. Click **Update**.

7. In the **OAuth Entity Profile** tab, click the default profile, **Kronos OAuth default_profile**.

8. Insert a record in the OAuth Entity Scope related list and select the default entity scope for the Kronos spoke. For example, **Kronos**.

9. Click **Update**.
Create Credential record for the Kronos spoke

Authorize the Kronos spoke actions by creating credential records for the application registered in Kronos. The Kronos spoke connection and credential alias uses these credentials to authorize actions.

Procedure

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Kronos Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record. Select the option.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Default OAuth entity profile of the Kronos spoke. For example, select Kronos oAuth default_profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

Provide Kronos user credentials

Create a record to provide details and credentials of the required Kronos user. The Kronos spoke uses these user credentials to perform actions in Kronos.

About this task

Ensure that you provide credentials of a manager user or Kronos superuser. With these credentials, time off requests of both employee and manager can be managed.

Procedure

1. Navigate to Kronos > Credentials.
2. Click New.
3. On the form, fill these values.
Kronos Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Application Key</td>
<td>Application Key of the Kronos user.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to the user's account in Kronos.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Kronos user account.</td>
</tr>
<tr>
<td>Connection &amp; Credential Alias</td>
<td>Default alias record associated with the Kronos spoke.</td>
</tr>
<tr>
<td>Refresh Token Expires</td>
<td>Date and time by when the Kronos refresh token expires. The Kronos spoke generates a new refresh token periodically, before the current refresh token expires.</td>
</tr>
</tbody>
</table>

4. Click Submit.

5. To generate the Kronos token, click the Get Kronos Token related link.

Results
The Kronos - Get Kronos Token subflow is triggered. The subflow uses the details provided during spoke setup to retrieve a valid refresh token from Kronos. The subflow then, updates the value of Refresh Token Expires.

Note: To access more details about the Kronos refresh token, navigate to System OAuth > Manage Tokens. Here, a record is created for each refresh token.

Create Connection record for the Kronos spoke
Create Connection records to your Kronos application. The Kronos spoke connection and credential alias uses these connections to perform actions in Kronos.

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for the Kronos spoke.
3. From the Connections tab, click New.
4. On the form, fill these values.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Kronos Conn.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Kronos. For example, select Kronos Cred. See Create Credential record for the Kronos spoke for more information.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Kronos instance.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection. Select the option.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_app_key</td>
<td>Application Key of the Kronos user.</td>
</tr>
<tr>
<td>u_version</td>
<td>Kronos version of your instance. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Create request as manager using the Kronos catalog item

Trigger events in Kronos when an item is requested in the Service Catalog.

Before you begin
- Set up the UKG spoke
- Role required: admin

About this task
The Kronos spoke adds a catalog item for use with the Kronos spoke sample flows.
Procedure

1. Navigate to Self-Service > Service Catalog.
2. Click Kronos.
3. Click Kronos - Create Time Off Request As Manager (Super Access).
4. Provide details of the time off request.

   Note: After you have provided a valid Employee ID or Person Number(Qualifier), the system may take some time to populate the values in the Subtype Name using Employee ID and Symbolic Amount Qualifier By Employee ID, or Subtype Name using Person Number and Symbolic Amount Qualifier By Person Number lists.

5. Click Order Now.
   A request item is generated and its generated number is displayed.
6. Click the request number and change the value of Approval to Requested, Approved, or Rejected.
7. Click Update.

Results

- The Kronos - Create Manager Time Off Request flow is triggered.
- A record is created in the Time Off Request Details module. The status of the time off request is updated when the Kronos - Retrieve And Update Manager Time Off Status flow is triggered.

Utility Actions spoke v1.0.1
Create file attachments and zip attachments in your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke is compatible with ServiceNow instance of Rome and later versions.
Spoke dependencies
If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions
The Utility Actions spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add File to Zip</td>
<td>Adds the file to list of files to be zipped.</td>
</tr>
<tr>
<td>Append to Delimited File</td>
<td>Creates a file line record, corresponding to a row in the delimited file.</td>
</tr>
<tr>
<td>Append to File</td>
<td>Creates a file line record, corresponding to a line in the file to be created.</td>
</tr>
<tr>
<td>Begin File</td>
<td>Creates a file record, to which the actual file would be attached.</td>
</tr>
<tr>
<td>Begin Zip</td>
<td>Creates a file set record, to which the zip file would be attached.</td>
</tr>
<tr>
<td>Build File</td>
<td>Generates the file and attaches it to the file record specified.</td>
</tr>
<tr>
<td>Build Zip</td>
<td>Generates the zip file and attaches it to the file set record specified.</td>
</tr>
</tbody>
</table>

⚠️ **Note:** This action requires at least one MID Server with the IntegrationHub Utilities capability.

Spoke module and tables
The Utility Actions spoke includes these tables:
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
</table>
| File [sn_utility_spoke_file] | Information about every file that has been created. The associated file is attached to the record. | • File Name  
• File Type  
• Schema |
| **Note:** You must specify Schema if you specify Delimited File for File Type. |
| File Line [sn_utility_spoke_file_line] | Information about each row in delimited file. | • File  
• Line Content |
| File Mapping [sn_utility_spoke_file_mapping] | Information about files mapped to a ZIP file. For example, if four files are zipped to a ZIP file, four records are created in this table for each file. | • File  
• File Set |
| File Schema [sn_utility_spoke_file_schema] | Information regarding the delimited files. | • Schema Name  
• Columns  
• Delimiter  
• Has Header  
• Quoted |
| File Set [sn_utility_spoke_file_set] | Information about the zip files. The associated ZIP file is attached to the record. | Zip File Name |

The Utility Actions spoke adds the IntegrationHub Utilities application to your instance and includes the File Schemas module. The module displays records from the File Schema table.

Auto Flush data retention policies are available for the File and File Set tables. By default, the system retains data in the spoke tables, except the File Schema table, up to 7 days.
Note:

- Auto Flush data retention policies don’t apply to records in the File Schema table.
- When the file records in the File table are deleted, the corresponding file line records in the File Line table are also deleted.
- When the file set records in the File Set table are deleted, the corresponding file mapping records in the File Mapping table are also deleted.

To modify the data retention policy, change the value of **Age in seconds** in the Auto Flush form of the required table. For more information, see **Autoflush form**.

**Connection and credential alias requirements**

This spoke doesn’t require configuration of connection and credential alias.

**MID Server requirements**

These actions use REST calls, which can run on a MID Server. For more information, see **MID server**.

Note:

- The Build Zip action in the spoke requires at least one MID Server with the capability IntegrationHub Utilities or ALL. To set up and configure the MID Server, user must have the role sn_utility_spoke.utility_actions_admin role.
- Create a MID Server property with **Value** as `*.service-now.com`.

**Create schema**

Create schema to create delimited files in your ServiceNow instance.

**Before you begin**

Role required: sn_utility_spoke.utility_actions_admin

**Procedure**

1. Navigate to **IntegrationHub Utilities > File Builder > File Schemas**.
2. Click **New**.
3. On the form, fill these values.
### File Schema form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Schema Name</strong></td>
<td>Name to identify the schema record. For example, <em>Incident Schema</em>.</td>
</tr>
<tr>
<td><strong>Delimiter</strong></td>
<td>Delimiter in the file. For example, <code>,</code> and \t. The default value is comma.</td>
</tr>
<tr>
<td><strong>Has Header</strong></td>
<td>Option to specify if the schema has header.</td>
</tr>
<tr>
<td><strong>Quoted</strong></td>
<td>Option to escape the delimiters and surround all values with quotation marks.</td>
</tr>
<tr>
<td><strong>Columns</strong></td>
<td>Columns of the schema as a JSON array. For each column, specify column name and data type. For example,</td>
</tr>
</tbody>
</table>

```json
[
  {
    "name" : "Number",
    "type" : "string"
  },
  {
    "name" : "Caller First Name",
    "type" : "string"
  },
  {
    "name" : "Caller Last Name",
    "type" : "string"
  },
  {
    "name" : "Short Description",
    "type" : "string"
  },
  {
    "name" : "State",
    "type" : "choice",
    "choices" : [
      {
        "label" : "New",
        "value" : "New"
      },
      {
        "label" : "In Progress",
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;value&quot; : &quot;In Progress&quot;</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot; : &quot;On Hold&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot; : &quot;On Hold&quot;</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot; : &quot;Resolved&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot; : &quot;resolved&quot;</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot; : &quot;Closed&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot; : &quot;closed&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

. For more information, see Create a data gathering action for a dynamic template.

Note: Ensure that you surround the key and value with quotation marks.

4. Click Submit.

Build a flow using the Utility Actions spoke actions
Create a flow in Flow Designer using the Utility Actions spoke actions to create two files; one for incident records and other for user records, and zip these two files.

About this task
This sample flow demonstrates using the Utility Actions spoke actions to create files. You can configure the flow as per your requirement.

Procedure
1. Navigate to Flow Designer > Designer.
2. Create a flow. See Flows for more information about creating flows.
3. In the flow, add these spoke actions or flow logics:

a. Look Up Incident Records action to retrieve the incident records.

b. Begin File action to create a file that will contain the incident records.

c. For Each flow logic to apply the Append to Delimited File action to the list of incident records.

d. Build File action to add rows. Each incident record is added as a row in the file.

e. Perform similar steps to retrieve records from the User [sys_user] table.
f. Begin Zip action to build the ZIP file for the incident and user records.

g. Add File To Zip action to add file containing the incident records to the ZIP file.

h. Add File To Zip action to add file containing the user records to the ZIP file.
1. Build Zip action to create the ZIP file containing the incident and user records.
4. Save, test, and publish the flow to use it.
**Actions**

1. Look Up Incident Records

2. Begin File

3. For Each Item in 1→Incident Records
   3.1 Append to Delimited File

4. Build File

5. Look Up User Records

6. Begin File

7. For Each Item in 5→User Records
   7.1 Append to Delimited File

8. Build File

9. Begin Zip

© 2021 ServiceNow, Inc. All rights reserved.

Unified Compliance Framework (UCF) spoke
Manage processes to collect and coordinate the compliance requirements applicable to your organization from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version
This spoke was built for UCF v2.0, but may be compatible with later versions.

Spoke requirements
- Common Control Hub (CCH) account
- CCH administrator credentials

Spoke actions
The UCF spoke provides actions to automate UCF tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Record</td>
<td>Get Authority Documents</td>
<td>Retrieves authority documents that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td>Management</td>
<td>Get Citation Control Objective Mapping</td>
<td>Retrieves the Citation and Control objective mapping information.</td>
</tr>
<tr>
<td></td>
<td>Get Citation Documents</td>
<td>Retrieves the citations that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Control Objective Documents</td>
<td>Retrieves the citation to controls that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td></td>
<td>Get Authority Document List</td>
<td>Retrieves the current user's authority document lists.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the UCF spoke

Integrate the ServiceNow instance and UCF by creating a custom OAuth application in UCF to authenticate ServiceNow requests.

#### Before you begin

- Request IntegrationHub subscription
- Activate the UCF spoke
- Role required: admin

#### Create application in UCF

Create application in Common Controls Hub (CCH) to enable OAuth 2.0 authentication with the UCF spoke.
Before you begin
Role required: CCH administrator

Procedure
1. Create application in UCF. For information about creating an application using your CCH account, see the CCH Support documentation.
2. While creating the application, ensure that you provide this information:
   - **Redirect URL**: ServiceNow instance URL in the format, https://<Instance-Name>.service-now.com/oauth_redirect.do
   - **Authorization URL**: Location on your website to which CCH redirects the interested users.
3. Copy and record the **Client ID** and **Client Secret** for later use.

Results
The application is created in CCH to enable OAuth 2.0 authentication with the UCF spoke.

Register UCF as OAuth provider
Use the information generated during the application configuration in CCH, to register UCF as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. Navigate to System OAuth > Application Registry.
2. Open for the record for UCF.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <strong>UCF OAuth profile</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in CCH.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in CCH.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select UCF Spoke.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You must ensure that the application scope is UCF Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. For example, <a href="https://auth.unifiedcompliance.com/authorize">https://auth.unifiedcompliance.com/authorize</a>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, <a href="https://auth.unifiedcompliance.com/token">https://auth.unifiedcompliance.com/token</a>.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry. This is the URL of the ServiceNow instance in this format: https://&lt;Instance-Name&gt;/service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation.</td>
</tr>
<tr>
<td></td>
<td>This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
The system validates the OAuth credentials and populates the Redirect URL.

5. Insert a row in the OAuth Entity Profiles tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>UCF OAuth</td>
</tr>
<tr>
<td>Is default</td>
<td>true</td>
</tr>
<tr>
<td>Grant type</td>
<td>Authorization Code</td>
</tr>
</tbody>
</table>

6. Insert a row in the OAuth Entity Scopes tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>read</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>read</td>
</tr>
<tr>
<td>Application</td>
<td>UCF Spoke</td>
</tr>
<tr>
<td>In default profile</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Right-click the form header, and click Save.

8. Open the record in the OAuth Entity Scopes tab. For example, open the UCF OAuth record. Details of the OAuth Entity Profile record is displayed.

9. In the OAuth Entity Scopes tab, select the OAuth Entity Scope you had earlier created. For example, select read.

10. Right-click the form header, and click Save.

Results
The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

Create Credential records for the UCF spoke
Authorize the UCF spoke actions by creating credential records for the application registered in UCF. The UCF spoke connection and credential alias uses these credentials to authorize actions.
Before you begin
Role required: admin

Procedure

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message *What type of Credentials would you like to create?*.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>UCF Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of UCF spoke as an OAuth provider. For example, select <strong>UCF OAuth profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Results
The credential record for the UCF spoke is created.

Create Connection record for the UCF spoke
Create Connection records to your UCF account. The UCF spoke connection and credential alias uses these connections to perform actions in UCF.

Before you begin
Role required: admin
Procedure

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for UCF.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter UCF Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for UCF. For example, select UCF Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://api.unifiedcompliance.com/">https://api.unifiedcompliance.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Results
The connection record is created for UCF spoke.

Workday Financials spoke v1.2.2
The Workday Financials spoke is built by Bristelcone, Inc. Manage resources, business units, journals, cost centers, and so on, in Workday Financials application from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Workday Financials SOAP API version v33.2, but may be compatible with later versions.

© 2021 ServiceNow, Inc. All rights reserved.
**Spoke requirements**
To set up the integration, perform these:

1. Register Integration System User.

   - **Note:** While filling account information details, ensure that you select the **Do Not Allow UI Sessions** check box.

2. Create a security group and assign it to the integration system user.
   a. In **Action**, navigate to **Security Group > Maintain Domain Permissions for Security Group** and provide these permissions:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Only</td>
<td>Set Up: Worktags - Business Units</td>
<td></td>
<td>Common Financial Management Worktags</td>
</tr>
<tr>
<td>Get Only</td>
<td>Set Up: Ledger and Book</td>
<td></td>
<td>Common Financial Management</td>
</tr>
<tr>
<td>Get and Put</td>
<td>Process: Journals - Core</td>
<td></td>
<td>Financial Accounting</td>
</tr>
<tr>
<td>Get Only</td>
<td>Process: Journals - View</td>
<td></td>
<td>Financial Accounting</td>
</tr>
<tr>
<td>Get and Put</td>
<td>Process: Purchase Order - Cancel</td>
<td></td>
<td>Procurement</td>
</tr>
<tr>

<td></td>
<td>Integration</td>
</tr>
<tr>
<td>View Only</td>
<td>Integration Security</td>
<td></td>
<td>Integration</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the domain security policies are activated for the security group.
b. Configure the business process policies of your security group and provide these permissions:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Business Process Type</th>
<th>Functional Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate (Register Asset (Web Service))</td>
<td>Asset Registration Event</td>
<td>• Business Asset Accounting</td>

</tr>
<tr>
<td>Initiate (Submit Supplier (Web Service))</td>
<td>Supplier Event</td>
<td>Supplier</td>
</tr>
<tr>
<td>Initiate (Submit Supplier Invoice (Web Service))</td>
<td>Supplier Invoice Event</td>
<td>Supplier Accounts</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the business process security policies are activated for the security group.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
• Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Authentication
Workday provides an open SOAP API for programmatic access to on-demand business management services. Workday SOAP APIs require basic authentication; that is, user name and password are required.

Note: This spokes doesn’t require you to set up the connection and credential alias.

Spoke subflows
The Workday Financials spoke provides sample subflows to demonstrate automating Workday Financials tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create PO</td>
<td>Creates a purchase order record in the Purchase Order table. To use the subflow, Set up webhook for your Workday Financials spoke.</td>
</tr>
<tr>
<td>Get Supplier Invoice Details</td>
<td>Retrieves details of the specified supplier invoice.</td>
</tr>
</tbody>
</table>

Spoke actions
The Workday Financials spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Financial Management</td>
<td>Get Account Set By ID</td>
<td>Retrieves details of the specified account set.</td>
</tr>
<tr>
<td></td>
<td>Get Business Unit By ID</td>
<td>Retrieves details of the specified business unit.</td>
</tr>
<tr>
<td></td>
<td>Get Cost Center By ID</td>
<td>Retrieves details of the specified cost center.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------</td>
<td>------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Ledger By ID</td>
<td>Retrieves details of the specified ledger record.</td>
</tr>
<tr>
<td></td>
<td>Look up Account Sets</td>
<td>Retrieves details of the required account sets, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Business Units</td>
<td>Retrieves details of the required business units, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Cost Centers</td>
<td>Retrieves details of the required cost centers, based on the provided filter criteria.</td>
</tr>
<tr>

<tr>
<td></td>
<td>Look up Supplier Invoices</td>
<td>Retrieves details of the required supplier invoices, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Suppliers</td>
<td>Retrieves details of the required suppliers, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Submit Purchase Order</td>
<td>Submits the specified purchase order.</td>
</tr>
<tr>
<td></td>
<td>Submit Purchase Order Change Order</td>
<td>Submits change order associated with the specified purchase order.</td>
</tr>
<tr>
<td></td>
<td>Submit Receipt</td>
<td>Submits the specified receipt.</td>
</tr>
</tbody>
</table>

### Spoke module

The Workday Financials spoke adds the Workday Finance application to your instance and includes these modules:
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Contains information about the base URL of the Workday instance or tenant, and API version.</td>
</tr>
<tr>
<td>Get Business Units</td>
<td>Displays information about the business units. Admin should configure the sample remote table as per their requirement.</td>
</tr>
<tr>
<td>Purchase Orders</td>
<td>Displays information about the purchase orders whenever they are created in the Workday application. To retrieve this information to the ServiceNow instance, you must Set up webhook for your Workday Financials spoke.</td>
</tr>
<tr>
<td>Webhook Registries</td>
<td>Contains records of webhooks registries. Admin should create record here Set up webhook for your Workday Financials spoke for the required Workday event.</td>
</tr>
</tbody>
</table>

**Set up the Workday Financials spoke**

Integrate the ServiceNow instance Workday instance by using the WS-Security Username Profile to authenticate ServiceNow requests.

**Before you begin**

- Request an IntegrationHub subscription.
- Activate Workday Financials spoke.
- Role required: admin

**Provide the Workday Financials base URL**

Provide the base URL of your Workday Financials instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

**Procedure**

1. Navigate to **System Definition > Tables**.
2. Filter and search for the Connection Details table.
3. Click the **Show List** related list.
4. Click **New**.
5. On the form, fill these values.
Connection Details form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base URL</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the API. For example, enter v33.2.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

Create a WS-Security Username Profile for the Workday Financials spoke

Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

Procedure

1. Navigate to **IntegrationHub > SOAP Integrations > WS-Security Username Profiles**.
2. Click **New**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify this credential. For example, enter WorkdayFinancials User.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select <strong>Workday Financials Spoke</strong>.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

Configure the SOAP security policy for the Workday Financials spoke

Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.
Procedure

1. Navigate to IntegrationHub > SOAP Integrations > SOAP Security Policies.
2. Open the record, WorkdayFinancials.
3. For WS-Security Username Profile, select the security username profile you had created for the Workday Financials spoke. See Create a WS-Security Username Profile for the Workday Financials spoke for more information.
4. Do not provide value in WS-Security X.509 Profile.
5. Right-click the form header and click Save.

Set up webhook for your Workday Financials spoke

Retrieve details of an onboarded employee in the Workday application to your ServiceNow instance by setting up the webhooks.

Before you begin

- Set up the Workday Financials spoke
- Role required: admin

Generate user name and password in your ServiceNow instance

Generate user name and password in your ServiceNow instance to authenticate requests and retrieve the required data from the Workday application.

Procedure

1. Navigate to System Definition > Table.
2. Filter and search for the Workday Financials spoke webhook registry table. For example, WorkdayFin Webhook Registry.
3. Click the Show List related list.
4. Click New.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the webhook registry record. Enter Workday event and authentication for Create PO.</td>
</tr>
<tr>
<td>UserName</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
<tr>
<td>Workday Event</td>
<td>Event for which the webhook is set up. Enter CreatePO.</td>
</tr>
<tr>
<td>Workday Instance</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.

7. Click **Generate UserName And Password**.
   Copy and record the values of user name and password. These values must be specified in the Workday instance to authenticate the webhook requests.

**Retrieve the resource path from your ServiceNow instance**

Retrieve the resource path from your ServiceNow instance for later use to authenticate requests and retrieve the required data from the Workday application.

**Procedure**

1. Navigate to **System Web Services > Scripted Web Services > Scripted REST APIs**.
2. Open the record for the Workday Financials spoke.
3. In the **Resources** tab, click the **Callback** record.
4. Record and save the value of **Resource path** for later use.

**Import CLAR file to your Workday instance**

Import CLAR file available at ServiceNow Store to set up webhooks and authenticate requests from ServiceNow instance.

**Before you begin**

- Workday Studio should be installed.
- Access to custom report creation policy.
Create custom report in Workday based on the Purchase_order_report structure and share the report with ISU user.

Ensure that you select all companies in company prompt in report.

- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

⚠️ Note: Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.

**Procedure**

1. From the Workday Financials spoke page on ServiceNow Store, download the Workday-Finance-Webhook-Studio-Sample file from Supporting Links and Docs.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the Properties tab of the StartHere component, navigate to Services and select the RAAS report created for this webhook.
5. Choose the environment where your report exists such as, implementation or sandbox, and configure the report as per your requirement.

6. Provide a report name and select the required report.

7. Provide the alias name of the report.
8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.

9. In the **Set Headers** component, provide your Workday instance for the **WorkdayInstance** header.

10. In the properties of **HttpOut**, fill in these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint</td>
<td>REST endpoint</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> See Retrieve the resource path from your ServiceNow instance for more information.</td>
</tr>
</tbody>
</table>
11. Save the changes.

12. In the project explorer, select the integration and deploy it in your Workday system.

13. Log in to your Workday instance and navigate to **Integration > Integration System > Configure Integration Attributes**.

14. Provide user name and password in **Configure Integration Attributes** that you have generated in **Generate user name and password in your ServiceNow instance**.
15. Modify a business process and add this integration in your business process.
   
a. Edit definition of the business process.

b. Search for Purchase Order business process in Workday. If within one customer environment there are more than one purchase order business processes, all the business processes should be configured to enable this webhook for all purchase orders.

c. Select the effective date and click Ok.

d. Click the + sign and add a new business process step in BP.

e. Select an order, which is after the completion step of business process.

f. Select **Type** as Integration.
g. Provide ISU username in **Run as User** and click **Ok**.

h. Click **Configure Integration** on the newly added business process step in hire BP.

i. On the Configuration Integration Step page, click **Ok**.

j. In integration criteria, select value type as **Determine value at runtime** and select value as **PO Number**.

Selected **PO Number** should be as shown below.
k. Click Ok.

l. Create a report for the webhook with these details:

Purchase Order report definition:

Column labels:

Filter:
Workday HR spoke v1.5
The Workday HR spoke is built by Bristelcone, Inc. Manage staffing, resources, payroll, benefits and so on, in Workday HR system from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Workday HR SOAP API version v33.2 and REST API version v1, but may be compatible with later versions.

Spoke requirements
To set up the integration, perform these:

1. Register an Integration System User.
   
   Note: While filling account information details, ensure that you select the Do Not Allow UI Sessions check box.

2. Create a security group and assign it to the integration system user.
a. In **Action**, navigate to **Security Group** > **Maintain Domain Permissions for Security Group** and provide these permissions:

**Domain security policy permissions**

</tbody>
</table>
### Operation | Business Process Type | Functional Area
--- | --- | ---
Initiate (Terminate Employee (Web Service)) | Termination | Staffing

**Note:** Ensure that the business process security policies are activated for the security group.

**Note:** If you have installed Workday HR spoke v1, uninstall it and install the Workday HR spoke v1.1.

Workday REST and Report-as-a-Service (RAAS) API works with OAuth 2.0 to authorize access to resources in your Workday tenant. To use OAuth 2.0, you must register your client in the tenant, using the Register API Client task.

Record and save these values while registering your client:

- Client ID
- Client Secret
- Workday REST API Endpoint
- Token Endpoint
- Authorization Endpoint

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- System Import Data Source (glide.system_import_data_source)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
Spoke flows
The Workday HR spoke provides a sample flow, Verify User Sample Flow that demonstrates automating the Workday HR tasks. This flow calls the subflow with the same name to verify if the user who raised request is a valid user in Workday system. To customize a sample flow, copy it to a new application scope.

Spoke subflows
The Workday HR spoke provides sample subflows to demonstrate automating Workday HR tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify User Subflow</td>
<td>Verifies if the user who raised request is a valid user in Workday system.</td>
</tr>
<tr>
<td>Get WID For Worker</td>
<td>Retrieves WID details of the employee using the Look up Worker Profile action.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user in the ServiceNow when the user is onboarded in the Workday system. To use this subflow, you should Set up webhook for your Workday HR spoke.</td>
</tr>
</tbody>
</table>

Spoke actions
The Workday HR spoke provides actions to automate Workday tasks when events occurs in your ServiceNow instance. Available actions include:
Note: These spoke actions use the Workday REST API and require you to perform the configurations mentioned in Configurations to use Workday REST API:

- Get My Reporting Structure
- Look up Object Custom Fields
- Update Object Custom Fields
- Look up Payslip
- Look up Total Rewards Using Report
- Look up Custom Reports
- Look up Inbox Items
- Look up Merit And Benefit Plan Details Of An Employee
- Look up Holiday Calendars Reference WID Of An Employee
- Look up Schedule Calendars Reference WID Of An Employee
- Look up Holiday Calendars Of An Employee

All other actions use the Workday SOAP web services and require you to perform the configurations mentioned in Configurations to use Workday SOAP web services.

**Spoke modules**

The Workday HR spoke adds the Workday application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Contains information about the base URL of the Workday instance or tenant, and API version.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Custom Objects</td>
<td>To use the custom actions, create a record in the Custom Objects module and provide these details:</td>
</tr>
<tr>
<td></td>
<td>• Parent Object WS Alias</td>
</tr>
<tr>
<td></td>
<td>• Extension Object WS Alias</td>
</tr>
<tr>
<td></td>
<td>• Extension Object Fields</td>
</tr>
<tr>
<td></td>
<td>• Extension Object Field Data Type</td>
</tr>
<tr>
<td></td>
<td>• Field Type</td>
</tr>
<tr>
<td>Get My Holiday Calendar</td>
<td>Sample remote table that you should customise to retrieve details of the holiday calendar for the logged in employee. From the Get My Holiday Calendar remote table definition, the Get My Holiday Calendar action is called to retrieve the data.</td>
</tr>
<tr>
<td>Get Payroll Results</td>
<td>Sample remote table that you should customise to retrieve the payroll information. From the Get Payroll Results remote table definition, the Look up Payroll Results action is called to retrieve the data.</td>
</tr>
<tr>
<td>RAAS Report Access Details</td>
<td>To use actions based on Workday Report as a Service API, create a record in the RAAS Report Access Details module and provide details of the ServiceNow user along with the Workday report owner name and Workday report name. Ensure that the user is entitled to access these reports. Create a record and fill in these values:</td>
</tr>
<tr>
<td></td>
<td>• <strong>User ID</strong>: User ID of the ServiceNow user, who is entitled to access the required reports.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Report Name</strong>: Name of the RAAS API while configuring it in Workday system.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Report Owner Username</strong>: Username of the RAAS owner.</td>
</tr>
<tr>
<td>Remote Table Configurations</td>
<td>An entry of column and table name that consists of Workday employee ID of the logged in user should be made into this table. For example, Employee Number column of the User Table. That is, <strong>Table Name</strong> is <code>sys_user</code> and <strong>Field Name</strong> is <code>employee_number</code>.</td>
</tr>
</tbody>
</table>
Module | Description
---|---
View My Direct Deposit Information | Sample remote table that you should customise to retrieve the direct deposit information. From the View My Direct Deposit Information remote table definition, the Look up Direct Deposit Information Details action is called to retrieve the data.
View My Total Rewards | Sample remote table that you should customise to retrieve the total rewards for a logged in employee. From the View My Total Rewards remote table definition, the Look up Total Rewards action is called to retrieve the data.
View Time Off Balance | Sample remote table that you should customise to retrieve the time off balance for a logged in employee. From the View Time Off Balance remote table definition, the Look up Time Off Balance action is called to retrieve the data.
Webhook Registry | Contains records of webhooks registries. Admin should create record here to Set up webhook for your Workday HR spoke for the required Workday HR event.

Note: Ensure that you provide the internal name of the table and field.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Workday HR spoke
Integrate the ServiceNow instance Workday instance by using the OAuth 2.0 to authenticate ServiceNow requests.

Before you begin
- Request an IntegrationHub subscription.
- Activate Workday HR spoke.
- Role required: admin
Configurations to use Workday SOAP web services

Configure your ServiceNow instance to perform actions that use the Workday SOAP web services.

About this task
Most actions use the Workday SOAP web services and require you to perform the configurations mentioned in this section. You don’t need to configure Workday REST API, unless you intend to use these spoke actions:

- Get My Reporting Structure
- Look up Object Custom Fields
- Update Object Custom Fields
- Look up Payslip
- Look up Total Rewards Using Report
- Look up Custom Reports
- Look up Inbox Items
- Look up Merit And Benefit Plan Details Of An Employee
- Look up Holiday Calendars Reference WID Of An Employee
- Look up Schedule Calendars Reference WID Of An Employee
- Look up Holiday Calendars Of An Employee

Provide the Workday HR base URL

Provide the base URL of your Workday HR instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

Procedure

1. Navigate to System Definition > Tables.
2. Filter and search for the Connection Details table.
3. Click the Show List related list.
4. Click New.
5. On the form, fill these values.
Connection Details form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base URL</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the API. For example, enter v33.2.</td>
</tr>
<tr>
<td>Webservice Type</td>
<td>Type of web service. Select SOAP.</td>
</tr>
</tbody>
</table>

6. Click Save.

Create a WS-Security Username Profile for the Workday HR spoke

Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

Procedure

1. Navigate to IntegrationHub > SOAP Integrations > WS-Security Username Profiles.
2. Click New.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify this credential. For example, enter WorkdayHR User.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select Workday HR Spoke.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
</tbody>
</table>

4. Click Save.

Configure the SOAP security policy for the Workday HR spoke

Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.
Procedure

1. Navigate to IntegrationHub > SOAP Integrations > SOAP Security Policies.

2. Open the record for the Workday HR spoke. For example, WorkdayHR.

   **Note:** If you intend to use another SOAP security policy record and not the default record, you must ensure that you select that record in all the actions that use Workday SOAP web services.

   ![Image showing SOAP security policy settings]

   Except these listed actions, all other actions use Workday SOAP web services:
   - Get My Reporting Structure
   - Look up Object Custom Fields
   - Update Object Custom Fields
   - Look up Payslip
   - Look up Total Rewards Using Report
   - Look up Custom Reports
   - Look up Inbox Items
   - Look up Merit And Benefit Plan Details Of An Employee
   - Look up Holiday Calendars Reference WID Of An Employee
   - Look up Schedule Calendars Reference WID Of An Employee
   - Look up Holiday Calendars Of An Employee

3. For **WS-Security Username Profile**, select the security username profile you had created for the Workday HR spoke. See [Create a WS-Security Username Profile for the Workday HR spoke](#) for more information.

4. Do not provide value in **WS-Security X.509 Profile**.

5. Right-click the form header and click **Save**.
Configurations to use Workday REST API

Configure your ServiceNow instance to perform actions that use the Workday REST API.

About this task
Configure your ServiceNow instance to use the Workday REST API only if you need to use these actions:

• Get My Reporting Structure
• Look up Object Custom Fields
• Update Object Custom Fields
• Look up Payslip
• Look up Total Rewards Using Report
• Look up Custom Reports
• Look up Inbox Items
• Look up Merit And Benefit Plan Details Of An Employee
• Look up Holiday Calendars Reference WID Of An Employee
• Look up Schedule Calendars Reference WID Of An Employee
• Look up Holiday Calendars Of An Employee

Register Workday HR as an OAuth provider
Register the Workday HR instance as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Procedure
1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

   Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Workday HR OAuth</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select <strong>Workday HR Spoke</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID generated while registering your client.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret generated while registering your client.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Authorization endpoint generated while registering your client.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Token endpoint generated while registering your client.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**. An OAuth entity profile is created.

**Create a credential record for the Workday HR spoke**

Create a credential record for the Workday HR instance. The Workday HR spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.

The system displays this message: What type of Credentials would you like to create?

3. Select **OAuth 2.0 Credentials**.

4. On the form, fill these values.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Workday HR Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
OAuth Entity Profile | OAuth entity profile created during the registration of Workday HR as an OAuth provider. For example, OAuth Profile.

5. Right-click the form header and click **Submit**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

### Create a connection record for the Workday HR spoke

Create a connection record for your Workday HR instance. The Workday HR spoke connection and credential aliases use these connections to perform actions in Workday HR.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record, **WorkdayHR**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

   **Note:** Ensure that you create the connection record in the **Workday HR Spoke** application.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Workday HR Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Workday HR spoke. For example, <strong>Workday HR Cred</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to your Workday HR instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, fill in these values.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Set up webhook for your Workday HR spoke

Retrieve details the required employees in the Workday HR application to your ServiceNow instance by setting up the webhooks.

Before you begin
- Set up the Workday HR spoke
- Role required: admin

Generate user name and password in your ServiceNow instance

Generate user name and password in your ServiceNow instance to authenticate requests and retrieve the required data from the Workday application.

Procedure

1. Navigate to System Definition > Table.
2. Filter and search for the Workday HR spoke webhook registry table. For example, Workday Webhook Registry.
3. Click the Show List related list.
4. Click New.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the webhook registry record. Enter Workday event and authentication for Create User.</td>
</tr>
<tr>
<td>UserName</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workday Event</td>
<td>Event for which the webhook is set up. Enter CreateUser.</td>
</tr>
<tr>
<td>Workday Instance</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.

7. Click **Generate UserName And Password**.

Copy and record the values of username and password. These values must be specified in the Workday instance to authenticate the webhook requests.

**Retrieve the resource path from your ServiceNow instance**

Retrieve the resource path from your ServiceNow instance for later use to authenticate requests and retrieve the required data from the Workday application.

**Procedure**

1. Navigate to **System Web Services > Scripted Web Services > Scripted REST APIs**.
2. Open the record for the Workday HR spoke.
3. In the **Resources** tab, click the **Callback** record.
4. Record and save the value of **Resource path** for later use.

**Import CLAR file to your Workday instance**

Import CLAR file available at ServiceNow Store to set up webhooks and authenticate requests from ServiceNow instance.

**Before you begin**

- Workday Studio should be installed.
- Access to custom report creation policy.
  Create custom report in workday based on the New_Hire_record report structure and share the report with ISU user.
- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin
Note: Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.

Procedure
1. From the Workday HR spoke page on ServiceNow Store, download the Workday-HR-Webhook-Studio-Sample file from Supporting Links and Docs.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the Properties tab of the StartHere component, navigate to Services and select the RAAS report created for this webhook.
5. Choose the environment where your report exists such as, implementation or sandbox and configure the report as per your requirement.
6. Provide a report name and select the required report.
7. Provide the alias name of the report.

8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.
9. In the **Set Headers** component, provide your Workday instance for the **WorkdayInstance** header.

10. In the properties of **HttpOut**, fill in these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint</td>
<td>REST endpoint</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>See Retrieve the resource path from your ServiceNow instance for more information.</td>
</tr>
<tr>
<td>Http Method</td>
<td>POST</td>
</tr>
</tbody>
</table>

11. Save the changes.
12. In the project explorer, select the integration and deploy it in your Workday system.

13. Log in to your Workday instance and navigate to **Integration > Integration System > Configure Integration Attributes**.

14. Provide user name and password in **Configure Integration Attributes** that you have generated in **Generate user name and password in your ServiceNow instance**.

15. Modify a business process and add this integration in your business process.
a. Edit definition of the business process.

b. Select the effective date and click Ok.

c. Click the + sign and add a new business process step in BP.

d. Select an order, which is after the completion step of business process.

e. Add the business process and select Type as Integration.

f. Provide ISU username in Run as User and click Ok.

g. Click Configure Integration on the newly added business process step in Hire BP.
h. In integration criteria, select value type as **Determine value at runtime** and select value as **Employee ID**.

Selected **Employee ID** field in value is displayed.

i. Click **Ok**.

j. Create a report for the webhook with these details:

   Report definition:
### Report Definition: New_Hire_record

<table>
<thead>
<tr>
<th>Report Name</th>

- Work Address - Formatted Line 2
Filter and prompt details:

Workplace from Facebook v3.0.3
Manage users, groups, and notifications in Workplace from Facebook account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Note: Workplace from Facebook is compatible with ServiceNow version, Paris with Patch 3 and later.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

⚠️ Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke subflows
The Workplace from Facebook spoke provides a sample subflow, Fetch Workplace from Facebook Groups that demonstrates automating group management tasks. To customize the sample flow, copy it to the required application scope.

Spoke actions
The Workplace from Facebook spoke provides actions to manage users, groups, and notifications. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds a user to a group in Workplace from Facebook.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Workplace from Facebook.</td>
</tr>
<tr>
<td></td>
<td>Deactivate Groups</td>
<td>Deactivates groups that have not been updated during the last execution of the Fetch Workplace from Facebook Groups subflow.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID</td>
<td>Retrieves the group ID for a given group name in Workplace from Facebook.</td>
</tr>
<tr>
<td></td>
<td>Lookup Groups</td>
<td>List all groups in Workplace from Facebook.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in Workplace from Facebook.</td>
</tr>
<tr>
<td>Group Post Management</td>
<td>Post Message</td>
<td>Posts a message to a Workplace from Facebook group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>

<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>your requirement. For example, a credential record for each Workplace from Facebook instance.</td>
<td></td>
</tr>
<tr>
<td>Install on your Workplace</td>
<td>Displays the default credential record to set up the Workplace from Facebook spoke. For more information, see Set up Workplace from Facebook spoke.</td>
</tr>
<tr>
<td>Groups Cache</td>
<td>Displays details of the groups in Workplace from Facebook. When you click Synchronise Cache, the Fetch Workplace from Facebook Groups subflow is triggered and the groups details are retrieved.</td>
</tr>
</tbody>
</table>

**Set up Workplace from Facebook spoke**

Integrate the ServiceNow instance and your Workplace from Facebook account using the Workplace from Facebook credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription
- Activate the Workplace from Facebook spoke
- Role required: admin

**Procedure**

1. Navigate to **Workplace from Facebook > Install on your Workplace**.
2. Click **Install on your Workplace**.
   
   You will redirected to the **Workplace sign-up/sign-in page**.
3. Log in to your Workplace from Facebook account using your credentials.
   
   Add ServiceNow Spoke to Workplace pop-up window is displayed.
4. Click **Add to Workplace**.
The ServiceNow spoke is added to Workplace account and a confirmation message is displayed.

Successfully installed ServiceNow Spoke on your Workplace.
5. Click **Done**.
   You will be redirected back to your ServiceNow instance and the relevant fields are updated.

**Results**
The Workplace from Facebook account is integrated with your ServiceNow instance.

**Wrike spoke**
Manage approvals, attachments, folders, projects, and so on, in the Wrike account from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**
This spoke was built for Wrike API version v4, but may be compatible with later versions.

ℹ️ **Note:** You must have the Wrike Enterprise account to create an app and obtain values of Client ID and Client Secret from the Wrike account.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
† Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Wrike spoke provides actions to automate Wrike tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approvals Management</td>
<td>Create Approval for Folder</td>
<td>Creates an approval for the specified folder or project.</td>
</tr>
<tr>
<td></td>
<td>Create Approval for Task</td>
<td>Creates an approval for the specified folder task.</td>
</tr>
<tr>
<td></td>
<td>Delete Approval</td>
<td>Cancels the specified approval.</td>
</tr>
<tr>
<td></td>
<td>Look up Approvals</td>
<td>Retrieves details of the approvals based on the filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Approvals by Folder</td>
<td>Retrieves all approvals on the specified folder or project.</td>
</tr>
<tr>
<td></td>
<td>Look up Approvals by Task</td>
<td>Retrieves all approvals on the specified task.</td>
</tr>
<tr>
<td></td>
<td>Update Approval</td>
<td>Updates details of the specified approval.</td>
</tr>
<tr>
<td>Attachment Management</td>
<td>Delete Attachment</td>
<td>Deletes the specified attachment.</td>
</tr>
<tr>
<td></td>
<td>Download Attachment to ServiceNow</td>
<td>Downloads attachment to the specified ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Look up Attachments</td>
<td>Retrieves list of attachments.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment</td>
<td>Updates a previously uploaded attachment with the new version.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment to Folder</td>
<td>Uploads an attachment to the specified folder.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment to Task</td>
<td>Adds an attachment to a task record.</td>
</tr>
<tr>
<td>Comment Management</td>
<td>Create Comment in Folder</td>
<td>Creates a comment in the folder.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>

<tr>
<td></td>
<td>Delete Comment</td>
<td>Deletes the specified comment.</td>
</tr>
<tr>
<td></td>
<td>Look up Comments by Folder ID</td>
<td>Retrieves the folder comments.</td>
</tr>
<tr>
<td></td>
<td>Look up Comments by Task ID</td>
<td>Retrieves the task comments.</td>
</tr>
<tr>
<td></td>
<td>Update Comment</td>
<td>Updates the specified comment.</td>
</tr>
<tr>
<td>Folder and Project</td>
<td>Create Folder</td>
<td>Creates a folder within a folder.</td>
</tr>
<tr>
<td>Management</td>
<td>Create Project</td>
<td>Creates a project within a folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder or Project</td>
<td>Moves folder, project and all descendant folders and tasks to Recycle Bin unless they have parents outside of deletion scope.</td>
</tr>
<tr>
<td></td>
<td>Look up Folders</td>
<td>Retrieves the list of entries required to build a folder tree for the current account.</td>
</tr>
<tr>
<td></td>
<td>Update Folder</td>
<td>Updates details of the folder.</td>
</tr>
<tr>
<td></td>
<td>Update Project</td>
<td>Updates details of the project.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates group in account.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups</td>
<td>Retrieves all groups in the account.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates details of the specified group.</td>
</tr>
<tr>
<td>Task Management</td>
<td>Create Task</td>
<td>Creates a task in folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Task</td>
<td>Deletes the specified task.</td>
</tr>
<tr>
<td></td>
<td>Look up Tasks</td>
<td>Retrieves details of all tasks in current account.</td>
</tr>
<tr>
<td></td>
<td>Update Task</td>
<td>Updates details of the specified task.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get User Details</td>
<td>Retrieves information about the specified user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Contacts</td>
<td>Retrieves contacts of all users and user groups in the current account.</td>
</tr>
<tr>
<td></td>
<td>Update User Details</td>
<td>Updates details of the specified user.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Wrike spoke**

Integrate the ServiceNow instance and Wrike account by creating a custom OAuth application in Wrike API Developer Portal to authenticate ServiceNow requests.

**Before you begin**

Role required: admin

**Procedure**

1. Log in to [Wrike account](#) as an admin and add an app. For more information about creating an app, see [OAuth 2.0 Authorization](#). Copy and record the values of **Client ID** and **Client Secret** for later use.

   - **Note:** You must have the Wrike Enterprise account to create an app and obtain values of Client ID and Client Secret from the Wrike account.

2. Configure the default application registry.

   a. Navigate to [System OAuth > Application Registry](#).

   b. Open the record, **Wrike**.

   c. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the app created in <a href="#">Wrike</a> account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret of the app created in Wrike account.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>ServiceNow instance URL in this format: https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance-name&gt; with your instance name.</td>
</tr>
</tbody>
</table>

**Note:** If you have provided additional scopes, create records for those scopes in the **OAuth Entity Scopes** tab. Enter the scopes separated by comma (,).

3. Create a credential record.

   a. Navigate to **Connections & Credentials > Credentials**.

   b. Click **New**.

      The system displays the message **What type of Credentials would you like to create?**.

   c. Select **OAuth 2.0 Credentials**.

   d. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. Enter Wrike Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
e. Right-click the form header and click Save.

4. Create a connection record.

b. Open for the record for Wrike.

c. From the Connections tab, click New. The system displays a blank HTTP(s) Connection form.

d. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter Wrike Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select Wrike Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Wrike account. Enter <a href="https://www.wrike.com/api">https://www.wrike.com/api</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
e. Optional: In the Attributes tab, the default value of API Version is v4. If you are using different Wrike API version, specify the version number.

f. Click Submit.

The ServiceNow instance and Wrike account are integrated.

Vonage spoke v1.0.1
Manage communications through calls, SMS, and WhatsApp by using the Vonage account from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Vonage for these versions, but may be compatible with later versions:
• Messages API version v0.1
• Voice API version v1

Spoke requirements
• Admin access to Vonage account and Vonage API Dashboard.
• Record the values of API key and API Secret. You can access these values from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.
• Record and save the value of the Signature Secret. You can access this value in the Account Settings in Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• Complex Object (com.glide.cobject)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke subflows**

The Vonage spoke provides sample subflows to demonstrate automating Vonage tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vonage SMS Webhook</td>
<td>Processes the SMS requests from Vonage.</td>
</tr>
<tr>
<td>Vonage Voice Webhook</td>
<td>Processes the voice requests from Vonage.</td>
</tr>
<tr>
<td>Vonage WhatsApp Webhook</td>
<td>Processes the WhatsApp requests from Vonage.</td>
</tr>
</tbody>
</table>

To customize the default subflow, you must create a copy of the sample subflow and customize the subflow as per your requirement. While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Spoke actions**

The Vonage spoke provides actions to automate Vonage tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Account Balance</td>
<td>Retrieves the current balance of the Vonage account.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Play DTMF tone into Call</td>
<td>Plays DTMF (Dual-tone multi-frequency) tones into an active call</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Attach Recording To ServiceNow</td>
<td>Attaches a call recording to the target ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Record</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Create Outbound Call</td>
<td>Creates an outbound call to a phone number.</td>
</tr>
<tr>
<td></td>
<td>Generate NCCO</td>
<td>Constructs a Nexmo Call Control Objects (NCCO) that is used in Create an Outbound Call action.</td>
</tr>
<tr>
<td></td>
<td>Get Call Details</td>
<td>Retrieves the details of the specified call.</td>
</tr>
<tr>
<td></td>
<td>Look up Calls</td>
<td>Retrieves details of the specified calls.</td>
</tr>
<tr>
<td></td>
<td>Play Audio into Call</td>
<td>Plays an audio file into an active call.</td>
</tr>
<tr>
<td></td>
<td>Play Text to Speech into Call</td>
<td>Plays text-to-speech into an active call.</td>
</tr>
<tr>
<td></td>
<td>Stop Playing Audio into Call</td>
<td>Stops playing an audio file into an active call.</td>
</tr>
<tr>
<td></td>
<td>Stop Text to Speech In Call</td>
<td>Stops text-to-speech into an active call.</td>
</tr>
<tr>
<td></td>
<td>Update Call</td>
<td>Updates the status of an active call.</td>
</tr>
<tr>
<td>Number Management</td>
<td>Look up Your Own Numbers</td>
<td>Retrieves all the inbound numbers associated with the Vonage account.</td>
</tr>
<tr>
<td>SMS Management</td>
<td>Send SMS</td>
<td>Sends an SMS (Short Message Service) to a phone number.</td>
</tr>
<tr>
<td>WhatsApp Management</td>
<td>Send Contacts</td>
<td>Sends contacts to a WhatsApp number.</td>
</tr>
<tr>
<td></td>
<td>Send Location</td>
<td>Sends geographic coordinates of a location to a WhatsApp number.</td>
</tr>
<tr>
<td></td>
<td>Send Media Message</td>
<td>Sends a media message to a WhatsApp number.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Send Text Message</td>
<td>Sends a text message to a WhatsApp number.</td>
</tr>
<tr>
<td></td>
<td>Send Text Message Using Template</td>
<td>Sends a text message using the template to a WhatsApp number.</td>
</tr>
</tbody>
</table>

**Spoke module**

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Vonage that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Vonage tasks. By default, the Vonage Spoke application is available and has the following modules:

- Vonage Webhook Registries
- Vonage WebHook Routing Policies

Use the Vonage Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Vonage. Default routing policies are provided as a reference in the Vonage WebHook Routing Policies module. Customize these routing policies as per your requirement. The routing policy supports these fields:

- Keywords
- Call Direction
- Call Status
- Event Type
- From
- SMS Status
- SMS Text
- To
- WhatsApp Message Status
- WhatsApp Text
- Show Related Fields

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the
connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are available along with the Vonage spoke:

<table>
<thead>
<tr>
<th>Vonage alias</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VonagePrimary</td>
<td>Required for the actions that manage SMS, number, and account.</td>
</tr>
<tr>
<td>Vonage</td>
<td>Required for the actions that manage calls and WhatsApp.</td>
</tr>
</tbody>
</table>

**Set up the Vonage spoke**

Integrate the ServiceNow instance and Vonage instance by using the API credentials to authenticate ServiceNow requests.

**Before you begin**

- Request IntegrationHub subscription.
- Activate Vonage spoke.
- Role required: admin

**Configure the default connection and credential alias records**

Configure the default alias records for your Vonage account. The Vonage spoke connection and credential aliases use these connections to perform the actions in Vonage account.

**Procedure**

1. **Navigate to** Connections & Credentials > Connections & CredentialsAliases.
2. **Open the alias record**, VonagePrimary.
3. **Click the Create New Connection & Credential** related link.
4. **On the form, fill these fields.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Vonage Primary Connection.</td>
</tr>
</tbody>
</table>
5. Click Create.

**Note:** Credential record isn’t required for the VonagePrimary alias.

7. Open the alias record, Vonage.

8. Click the Create New Connection & Credential related link.

9. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Vonage Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Vonage account. Enter: <a href="https://api.nexmo.com">https://api.nexmo.com</a></td>
</tr>
<tr>
<td>Message API Version</td>
<td>Version of the message API. Enter v0.1.</td>
</tr>
<tr>
<td>Voice API Version</td>
<td>Version of the voice API. Enter v1.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to uniquely identify the record. For example, Vonage Credential.</td>
</tr>
<tr>
<td>Application Name</td>
<td>Name to uniquely identify the application in your Vonage account.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key of your Vonage account. You can access this value from the Vonage API Dashboard. For more information,</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>see the Authentication page in the Vonage API Developer documentation site.</td>
</tr>
<tr>
<td>API Secret</td>
<td>API secret of your Vonage account. You can access this value from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.</td>
</tr>
<tr>
<td>Signature Secret</td>
<td>Signature secret of your Vonage account for signed webhook requests. You can access this value in the Account Settings in Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.</td>
</tr>
</tbody>
</table>

10. Click **Create**.

- An application with the provided name is created in your Vonage account. You can access this application by logging in to Vonage API Dashboard and navigating to Your applications.

- A credential record with the name as **Vonage Credential** is created for Vonage alias.

- Application ID and private key are retrieved from the Vonage account and saved in the **Vonage Credential** record.

- JWT token is generated for the **Vonage Credential** record.

  **Note:** If you generate another private key, ensure that you update the private key in the **Vonage Credential** record and click **Generate Jwt Token**. It might take sometime, that is 20 minutes approximately, for the new private key to be synchronised.

- Voice and message webhooks are set up and configured in the **Vonage spoke > Vonage webhook Registries**.

  - In the Applications Edit page in Vonage API Dashboard, under **Capabilities**, these voice and message URLs are configured to integrate with your ServiceNow instance:
    - Event URL
    - Answer URL
    - Inbound URL
    - Status URL

  For more information, see the Overview page in the Vonage API Developer documentation site.
Create webhook for SMS management

Create webhook to manage SMS.

Procedure

1. Navigate to Vonage spoke > Vonage webhook Registries.
2. Click New.
3. On the form, fill in these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the webhook record.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the webhook record.</td>
</tr>
<tr>
<td>Event Type</td>
<td>Type of event for which the webhook is set up.</td>
</tr>
<tr>
<td></td>
<td>Select SMS.</td>
</tr>
<tr>
<td>Secret Key</td>
<td>Secret key to authenticate the webhook requests.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.

5. Click Callback URL.
   The system displays the webhook callback URL.

6. Copy and record the webhook callback URL.

7. Log in to the Vonage API Dashboard and navigate to the account settings.

8. Under Default SMS Setting, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery receipts</td>
<td>Webhook callback URL</td>
</tr>
<tr>
<td>Inbound messages</td>
<td>Webhook callback URL</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>POST-JSON</td>
</tr>
</tbody>
</table>

9. Click Save changes.
   SMS settings for the application are saved.

10. Optional: To configure the SMS settings for a particular number:

   a. Log in to the Vonage API Dashboard and navigate to Numbers.

   b. Click Your Numbers.
c. Click the Manage icon for the required number.

d. Enter the webhook callback URL in **Inbound Webhook URL** and **Event Webhook URL**.

⚠️ Note: These URLs override the SMS settings specified for the application.

**Customize webhooks and routing policies**

Customise the webhook routing policy and subflow as per your requirement.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **Flow Designer > Designer**.
2. Click **Subflows**.
3. Create a copy of the required default subflow.
4. Customize the subflow as per your requirement and publish it. See **Subflows** for more information about creating and using subflows and **Vonage spoke v1.0.1** for information about the fields that the default routing policy and subflows support.
5. Navigate to **Vonage Spoke > Vonage WebHook Routing Policy**.
6. Click **New**.
7. On the form, fill in the fields.

**Decision form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
</tbody>
</table>

a. Click the lookup icon (👇).  

b. Select the required subflow from the Document list.

⚠️ Note: Ensure that the **Table name** is **Flow [sys_hub_flow]**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Vonage. The supported Vonage fields are:</td>
</tr>
<tr>
<td></td>
<td>• Keywords</td>
</tr>
<tr>
<td></td>
<td>• Call Direction</td>
</tr>
<tr>
<td></td>
<td>• Call Status</td>
</tr>
<tr>
<td></td>
<td>• Event Type</td>
</tr>
<tr>
<td></td>
<td>• From</td>
</tr>
<tr>
<td></td>
<td>• SMS Status</td>
</tr>
<tr>
<td></td>
<td>• SMS Text</td>
</tr>
<tr>
<td></td>
<td>• To</td>
</tr>
<tr>
<td></td>
<td>• WhatsApp Message Status</td>
</tr>
<tr>
<td></td>
<td>• WhatsApp Text</td>
</tr>
<tr>
<td></td>
<td>• Show Related Fields</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click Submit.

ℹ️ Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

**YouTube spoke**

Manage your videos, channels, subscriptions, and playlists in YouTube account, and access analytics and statistics from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
**Supported versions**
This spoke was built for these YouTube versions, but may be compatible with later versions.

- Reporting API version v1
- Data API version v3
- Analytics API version v2

**YouTube spoke requirements**
The YouTube spoke requires a custom app that you create in Google Cloud Platform.

**Spoke dependencies**
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

⚠️ Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**
The YouTube spoke provides actions to automate YouTube tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics</td>
<td>Audience Retention Stats</td>
<td>Retrieves information about the audience retention statistics.</td>
</tr>
<tr>
<td></td>
<td>Basic Statistics</td>
<td>Retrieves information about the basic statistics.</td>
</tr>
<tr>
<td></td>
<td>Demographics</td>
<td>Retrieves information about the demographics. That is, details about the age, gender, and geographical location of your audience.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Device/OS Statistics</td>
<td>Retrieves information about the devices from which your audience access your content.</td>
<td></td>
</tr>
<tr>
<td>Get Country Codes (Metadata)</td>
<td>Retrieves details of countries and their ISO codes. Note: This is a metadata action.</td>
<td></td>
</tr>
<tr>
<td>Traffic Source Statistics</td>
<td>Retrieves information about the various traffic sources.</td>
<td></td>
</tr>
<tr>
<td>Captions</td>
<td>Delete Caption</td>
<td>Deletes captions on a video.</td>
</tr>
<tr>
<td></td>
<td>Look up Captions</td>
<td>Retrieves information about the captions on a video.</td>
</tr>
<tr>
<td>Comments</td>
<td>Delete Comment</td>
<td>Delete the specified comment on a video.</td>
</tr>
<tr>
<td></td>
<td>Look up Comments</td>
<td>Retrieves details about the top level comments in a comment thread.</td>
</tr>
<tr>
<td></td>
<td>Post Comment</td>
<td>Posts a top level comment on a video.</td>
</tr>
<tr>
<td></td>
<td>Reply to Comment</td>
<td>Posts a reply to a top level comment on a video.</td>
</tr>
<tr>
<td>Groups</td>
<td>Create Groups</td>
<td>Creates a group for videos, channels, or playlists.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group.</td>
</tr>
<tr>
<td></td>
<td>Delete Group Item</td>
<td>Deletes the specified group item.</td>
</tr>
<tr>
<td></td>
<td>Insert Item into Group</td>
<td>Inserts an item in the specified group.</td>
</tr>
<tr>
<td></td>
<td>Look up Group-Items</td>

</tbody>
</table>
Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the YouTube spoke
Integrate the ServiceNow instance and YouTube account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

Before you begin
• Request IntegrationHub subscription.
• Activate YouTube spoke.
• Role required: admin

Configure the YouTube application
Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the YouTube spoke.

About this task
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

Procedure
1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type OAuth client ID.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register YouTube as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register YouTube as an OAuth provider

Use the information generated during the YouTube application configuration to register YouTube as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Procedure

1. Navigate to System OAuth > Application Registry.
2. Open for the record, Youtube.
3. On the form, fill these values.

**Application Registries form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the YouTube application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the YouTube application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Ensure that these scopes are available in the OAuth Entity Scopes tab.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>YouTube Partner</td>
<td><a href="https://www.googleapis.com/auth/youtubepartner">https://www.googleapis.com/auth/youtubepartner</a></td>
</tr>
<tr>
<td>YouTube Reporting S1</td>
<td><a href="https://www.googleapis.com/auth/yt-analytics.readonly">https://www.googleapis.com/auth/yt-analytics.readonly</a></td>
</tr>
<tr>
<td>YouTube Reporting S2</td>
<td><a href="https://www.googleapis.com/auth/yt-analytics-monetary.readonly">https://www.googleapis.com/auth/yt-analytics-monetary.readonly</a></td>
</tr>
<tr>
<td>YouTube Scope</td>
<td><a href="https://www.googleapis.com/auth/youtube">https://www.googleapis.com/auth/youtube</a></td>
</tr>
<tr>
<td>Name</td>
<td>OAuth scope</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------</td>
</tr>
<tr>
<td>YouTube Scope Force SSL</td>
<td><a href="https://www.googleapis.com/auth/youtube.force-ssl">https://www.googleapis.com/auth/youtube.force-ssl</a></td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.

**Create a credential record for the YouTube spoke**

Create a credential record for the YouTube application. The YouTube spoke connection and credential alias uses these credentials to authorize actions.

**Procedure**

1. Navigate to **Connections & Credentials > Connections & Credential Aliases**.
2. Open record for the YouTube spoke. For example, **YouTube**.
3. In the **Credentials** tab, click **New**.
4. Select **OAuth 2.0 Credentials**.
5. Enter a unique name for the credential, for example, **Youtube_Cred**.
6. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you configured when you registered the YouTube service as an OAuth provider. See **Register YouTube as an OAuth provider** for more information.
7. Right-click the form header and click **Save**.
8. Click **Get OAuth Token**.

**Zoom spoke v2.0**

The Zoom spoke helps you create and manage meetings. Add participants, retrieve details, end or delete a meeting. Use the spoke to fetch the participant details of a conference.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see **Request IntegrationHub**.
Supported versions
Zoom API version v2.0.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Key Management Framework (com.glide.kmf.global)
- NOW Platform Encryption (com.glide.now.platform.encryption)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Spoke flows
This spoke has no sample flows.

Spoke subflows
This spoke has no sample subflows.

Spoke modules
The Zoom spoke adds the Zoom application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone Numbers</td>
<td>Displays a list of Zoom phone numbers.</td>
</tr>
<tr>
<td>Zoom Webhook Registries</td>
<td>Displays a list of webhook registries associated to Zoom.</td>
</tr>
</tbody>
</table>

Spoke actions
The Zoom spoke provides actions to automate Zoom tasks when events occur in the Now Platform. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Recording Management</td>
<td>Get Meeting Recording Settings</td>
<td>Retrieve the settings of the meeting’s cloud recordings.</td>
</tr>
<tr>
<td></td>
<td>Get Meeting Recordings</td>
<td>Retrieves all the recorded meeting for the specified meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Recordings</td>
<td>Lists all the recorded meetings of the specified user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><em>Note:</em> Meeting password is retrieved and displayed as plain text.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Phone Management</td>
<td>Assign Calling Plan To User</td>
<td>Assigns a calling plan to a user.</td>
</tr>
<tr>
<td></td>
<td>Assign Phone Number To User</td>
<td>Assigns a phone number to a user who has already enabled Zoom Phone.</td>
</tr>
<tr>
<td></td>
<td>Look up Account Call Logs</td>
<td>Retrieve the call logs for an account.</td>
</tr>
<tr>
<td></td>
<td>Look up Calling Plans</td>
<td>Retrieves a list of calling plans.</td>
</tr>
<tr>
<td></td>
<td>Look up Phone Number Details</td>
<td>Retrieves the details of a specified phone number in a Zoom account.</td>
</tr>
<tr>
<td></td>
<td>Look up Phone Numbers</td>
<td>Retrieves the list of phone numbers.</td>
</tr>
<tr>
<td></td>
<td>Look up Phone Users</td>
<td>Retrieves all the users associated to an account who have assigned Zoom Phone licenses.</td>
</tr>
<tr>
<td></td>
<td>Look up User Call Logs</td>
<td>Retrieves the call logs of a user’s Zoom phone.</td>
</tr>
<tr>
<td></td>
<td>Look up User Profile</td>
<td>Retrieves a Zoom Phone user’s profile.</td>
</tr>
<tr>
<td></td>
<td>Look up User Recordings</td>
<td>Retrieves a Zoom phone user’s recordings.</td>
</tr>
<tr>
<td></td>
<td>Look up User Settings</td>
<td>Retrieve a user’s zoom phone profile.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up User Voicemails</td>
<td>Retrieve a Zoom phone user’s voicemails.</td>
</tr>
<tr>
<td></td>
<td>Unassign User Calling Plan</td>
<td>Unassigns a calling plan to a user who has enabled Zoom Phone.</td>
</tr>
<tr>
<td></td>
<td>Unassign User Phone Number</td>
<td>Unassigns a phone number to a user who has enabled Zoom Phone.</td>
</tr>
<tr>
<td></td>
<td>Update Main Company Number</td>
<td>Update the main company number of an account.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Update a user’s Zoom Phone profile.</td>
</tr>
<tr>
<td>Meeting Management</td>
<td>Add Meeting Registrant</td>
<td>Register a participant for a specific meeting.</td>
</tr>
<tr>
<td></td>
<td>Create Meeting</td>
<td>Create a meeting for a user using their Zoom user ID or the email address.</td>
</tr>
<tr>
<td></td>
<td>Delete Meeting</td>
<td>Delete a specific meeting by using its meeting ID</td>
</tr>
<tr>
<td></td>
<td>End Meeting</td>
<td>Ends an ongoing meeting.</td>
</tr>
<tr>
<td></td>
<td>Get Meeting Details</td>
<td>Get details of a specific meeting by its meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Ended Meeting Instances</td>
<td>Lists all the meeting instances that were ended.</td>
</tr>
<tr>
<td></td>
<td>Look Up Live Meetings by User</td>
<td>Lists all the live or ongoing meetings for a specific user.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get User Details</td>
<td>Get details of a specific user on your account with their user ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users</td>
<td>Retrieves all the users associated to your account.</td>
</tr>
</tbody>
</table>

**Zoom account requirements**

The Zoom spoke requires configuring your Zoom account to generate an OAuth 2.0 token.
Zoom spoke requirements
These actions use REST calls, which can run on an instance or Zoom spoke. Use the connection record associated with the Zoom alias to configure where actions run as well as set Zoom spoke selection attributes.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Zoom Connection & Credential Alias record to authorize actions.

Setup Zoom spoke
Integrate your Zoom account with your ServiceNow instance. Create a custom OAuth application in Zoom and authenticate requests from ServiceNow.

Before you begin
Role required: admin
  - Request IntegrationHub subscription
  - Activate Zoom spoke

Create a connected app in Zoom
Create a connected app in your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke

Before you begin
1. Zoom account
2. Role required: Zoom admin

About this task
Complete the following steps from your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke.

Procedure
1. Login to Zoom marketplace
2. Navigate to Develop > Build App
3. Choose OAuth card from the available cards.

4. Use the toggle button to disable the option: Would you like to publish this app on Zoom App Marketplace?

5. Click Create.

6. Name the app and choose the app type as Account-level app. Account level apps must be installed by admin and can manage all users in the account.

7. Optionally, in the subsequent screens, enter the details as appropriate. For example, basic information, description and so on.

8. In the Add Scopes screen, add the actions in the scope as in the screenshot.

### Add scopes

- Meeting
  - Webinar
  - Recording
  - User
  - Account
  - Billing
  - Contacts
  - Dashboard
  - Group
  - Devices (H323)

- View and manage sub account's user meetings
  - meeting:master

- View all user meetings
  - meeting:read:admin

- View and manage all user meetings
  - meeting:write:admin
Note: The next step is to register Zoom as an OAuth provider. However, ServiceNow ships Zoom as a registered OAuth provider in the Application Registry.

What to do next
Record the Client ID and the Client Secret from the App credentials screen to use them for the application registry.
Related information

Register Zoom as OAuth provider

Register Zoom as OAuth provider

Use the information generated during Zoom account configuration to register Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin
Role required: admin

Procedure
1. Navigate to System OAuth > Application Registry.
2. Click Zoom.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. This is set to 473,040,000 seconds.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. Specify the profile for the mutual authentication.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Results
The instance can request OAuth 2.0 tokens for the spoke.

Create credential records for the Zoom spoke
Create Credential records for the Zoom connected app you created. The Zoom spoke connection and credential alias uses these credentials to authorize actions.
Before you begin
Role required: admin, Zoom admin

Procedure
1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. Enter Zoom Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Zoom connected app as an OAuth provider. Select Zoom default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. Select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. Enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

Create connection records for the Zoom spoke
Create Connection records to your Zoom account. The Zoom spoke connection and credential alias uses these connections to perform actions in Zoom.

Before you begin
Role required: admin

Procedure
1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Zoom.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter Zoom Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select Zoom Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Zoom instance. Enter <a href="https://api.zoom.us">https://api.zoom.us</a></td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Option to use a MID Server. Define the fields in the Advanced MID Server Configuration related list if you select this option.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.

**Set up a bi-directional webhook for Zoom spoke**

Configure a webhook to subscribe to Zoom with a ServiceNow callback URL.

**Before you begin**

- Request an IntegrationHub Starter subscription package
- Activate the Zoom spoke
- Role required: admin

**Add an endpoint URL in Zoom account**

Specify an endpoint URL in your Zoom account to create a webhook for Zoom spoke.

**Before you begin**

Role required: admin
Procedure

1. Log in to Zoom account.
2. Create a webhook app according to your requirements.
   For more information about Zoom webhook only app, see Create a Webhook-only App.
3. Generate a verification token and record it.
4. Enable Event Subscriptions and enter the Event notification endpoint URL in the following format.
   https://<instance-name>.service-now.com/api/sn_zoom_spoke/zoom_webhook_endpoint/webhook
5. Specify the Event Types according to your requirement.

Results
The endpoint URL is added in your Zoom account. You can create webhook registries and subflows according to your requirements.

Register a Zoom webhook in ServiceNow
Register a Zoom webhook in ServiceNow to notify the ServiceNow app when certain events occur in Zoom.

Before you begin
Role required: admin

Procedure
1. Navigate to Zoom Spoke > Zoom Webhook Registries.
2. Click New.
3. On the form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger Type</td>
<td>Type of the Zoom event that triggers the subflow.</td>
</tr>
<tr>
<td>Token</td>
<td>Verification token from your Zoom account used for validating event notification.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subflow Name</td>
<td>Subflow which is to be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td>Input</td>
<td>Input for the webhook registry.</td>
</tr>
<tr>
<td>Trigger Object</td>
<td>Zoom object which is used to trigger the subflow.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the webhook registry.</td>
</tr>
</tbody>
</table>

## IntegrationHub - Import

Automate data import tasks from a new design environment that consolidates several legacy forms into a single modern interface. Define external data sources, specify target tables, map how source data becomes target data, and schedule regular imports.

Managing imports through IntegrationHub simplifies the process of importing data from external sources and transforming it to ServiceNow tables. You can configure, run, and schedule your data imports all through a single interface.

⚠ **Note:** Imports in IntegrationHub require the ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin. For more information, see Request IntegrationHub.

### Benefits

Managing your imports through IntegrationHub provides these benefits.

- Consolidates multiple data integration capabilities into a single environment, eliminating the need to create and manage several forms throughout the platform.
- Enables you to manage multiple integrations through a single interface.
- Guides you through the configuration of data sources and target tables.
- Enables you to map and transform data from a single simplified interface.
- Enables you to schedule data imports or manually import data on demand.
- Provides usage information about data imports run and details about imported rows, updates, and errors.

### Overview of the import process

There are three steps to importing data.

1. **Configure a data source.**
The data source specifies how and where to get the data to import. In IntegrationHub, the data source uses a Data Stream action to get data from an external source. A Data Stream action sends a REST, SOAP, or JDBC request to an API and returns a stream of data.

2. Map the data to a target table.

The target table is the table you want to transform the data to. Once you’ve selected a target table, you can specify how the source data should be transformed to it. Creating a data map outlines how to transform the data, the data isn’t transformed until you run the import.

3. Run or schedule the import.

After you’ve configured the data source and determined the data mapping, you can run the import. You can also schedule the import to run later. When the import runs, data is gathered from the source, moved to a staging table, then transformed to the target table according to the specifications in your mapping.

For more details about how importing data works, see Import sets.

IntegrationHub import environment

The IntegrationHub import environment consists of the following interfaces.

• Landing page
• Source configuration
• Map to target
• Schedule imports
• Execution details

The following sections explain each interface in greater detail. Each section includes a screenshot of the interface. The screenshots are from an integration that uses the Cornerstone spoke to retrieve employee data and transform it to a ServiceNow table.

Landing page

Create and access integrations through the landing page.
The landing page has these components.

1. **List of integrations**
   Integrations created through the IntegrationHub import interface are accessible here.

2. **Create new integration button**
   Button to start building a new integration.

**Source configuration**
Define a data source for an import through the source configuration page. The data source must be from a data stream action.

The source configuration section has these components.

1. **Data Stream action section**
Section where you can select the Data Stream action for the data source. Choose a Data Stream action from the list.

2. Data Stream action information

Icon to click for more information about the selected Data Stream action. Clicking this icon opens the Data Stream action's configuration page in Flow Designer.

3. Data Stream action inputs section

Section to enter the inputs for the selected Data Stream action. This section only displays after you select a Data Stream action, and only if the Data Stream action has inputs. Data Stream actions with inputs have unique inputs, so the fields that appear here depend on which Data Stream action you select and its configuration.

Map to target

Select the target table and determine how the source data is mapped to it. Map data by dragging data pills from the source to the target or by using the pill picker. Transform the data in the target table by applying transform functions.

The Map to target section has two parts. In the first part, select the target table. In the second part, map the data to the target table.

Table selection user interface

The table selection section has these components.

1. Target table card

Card with the name and description of the target table. Click the card to open the data-mapping interface and begin mapping the data.

2. Properties button

Button to view or edit the name of the integration and its description.

3. Add a target table

Button to add a target table. There is one target table per integration.
The data-mapping section has these components.

1. **Target table name**
   Name of the target table. There is one target table per integration.

2. **Source data section**
   Section that displays the source data as data pills. To map the data, drag the data pills to the target table data section. You can also use the pill picker.

3. **Target table data section**
   Section that displays how each field in the target table maps to the source data.

4. **Match toggle switch**
   Toggle switch to specify fields where the system should check for matching data and, if found, update existing records instead of creating new ones. In this image, the **Match** toggle switch is turned on for the **user id** field. If a record in the source data has a user id that matches the user id for a record in the target table, the system will update the existing record in the target table instead of creating a new one.

5. **Table Properties button**
   Button to view or edit the options to run the table's business rules when importing and to run the import synchronously.
6. Data pill picker

Button to open the data pill picker. You can use the pill picker to map source data pills to field values in the target table.

7. Transform function icon

Button to open the list of available transform functions. Use transform functions to change or modify your data. For example, the Trim transform function removes white space from the beginning and end of an input string.

Schedule imports

Run an import immediately, or schedule it to run at a specific time, at regular intervals, or after a parent import. Schedule large imports to run concurrently to reduce processing time.

Schedule imports section user interface

The schedule imports section has these components.

1. Schedule an import button

Button to create an import schedule.

2. Scheduled imports

List of import schedules. Each import schedule appears in its own button.

3. Executions section

Section with information about executed imports. Includes links to execution records, execution context records, and scheduled import records. This section only appears after an import is run.

4. Execution records
List of execution records. Each execution record provides information about an execution, including the imported rows, errors, and log messages.

5. Execution context records

List of execution context records. Each execution context record specifies the next scheduled import to use when processing a hierarchical scheduled import.

6. Scheduled import records

List of scheduled import records. Each record provides the name, data source, schedule, and partition method for the scheduled import.

Execution details

View details for each import, such as the execution time and date, and execution context. Open the import’s execution records to view the import state and the imported rows, errors, and logs.

 Execution details section user interface

The execution details section has these components.

1. Execution information
Section providing the number of the execution record, the name of the scheduled import, the import set number, and the date it was updated.

2. Execution Details

Section with cards displaying the total number of rows imported, processed, pending, or skipped, and the number of errors that occurred. If the import is processed concurrently, this section also includes the Partitions card. For more information, see Concurrent imports.

You can click the cards to filter the results. Filtered results display in the Import Set Rows tab toward the bottom of the page. For example, clicking the Pending card displays the pending rows. Clicking Total rows imported or Clear Selection clears the filters.

⚠️ Note: Card filtering is only available for import set rows. To see the filtered list, make sure you’re on the Import Set Rows tab.

3. Partitions card

Graphical view of the import set partitions. The partitions card only appears for concurrent import sets. You can click a partition to view its details. You can also use the Execution Details cards for additional filtering. When you combine the partition filter with the card filters, the system uses an AND operation for filtering. For example, if you click a partition, then click the Errors card, the Import Set Rows tab displays only the errors for that partition.

4. Partitions list view

Option to view the details for each partition, including the import set number, and the type and state for each import set job. The partitions list view only appears for concurrent import sets. The partitions list view provides the same filtering capabilities as the Partitions card, so you can use either to filter a partition.

5. Import details

Section detailing the import set rows, outbound HTTP requests, action execution history, import logs, and errors for each execution record.

IntegrationHub import terms
Imports in IntegrationHub have these components.

Data source
A data source is a configuration record that defines the type of data to import and the endpoint where your instance can get it.

**Data Stream action**

A *Data Stream action* is an action that sends REST, SOAP, or JDBC requests from Flow Designer to APIs. It returns either a stream of response data larger than 10 MB, or paginated results.

**Target table**

A *target table* is the table you want your source data to be transformed to.

**Transform function**

A *transform function* is a function that changes or modifies your data. For example, a function that transforms an input string to all uppercase characters.

**Execution**

An *execution* is a run-time record that contains the execution details for a single import. Each execution provides import details for a specific target, including rows imported, log messages, and errors.

**Execution context**

An *execution context* is a record that specifies the next scheduled import to use when processing a hierarchical scheduled import.

**Import set**

An *import set* is a set of run-time records that contain the raw data imported from a data source. The system stores imported records in an Import Set staging table.

**Design considerations**

Follow these guidelines to achieve the benefits offered by IntegrationHub imports.

**Create all IntegrationHub imports from within IntegrationHub**

Only integrations created in the IntegrationHub import environment are accessible there. For example, you can't configure a data source and mapping through platform forms, but then schedule the import from within IntegrationHub. Only integrations created in IntegrationHub appear on the landing page.

**Don't alter configuration records outside of IntegrationHub**

Alteration configuration records directly might change if and how data is imported and mapped. If you need to change the
configuration of the data source, mapping, or import schedule, do so from within the IntegrationHub import interface.

**Avoid modifying Data Stream actions used in data sources**

Modifying Data Stream actions used as data sources might change the mapping from source to target. When the output for a Data Stream action changes, the Map to target page displays a warning that the complex object schema has changed. You might need to reconfigure the mapping.

**Configure a data source**

Start importing data with IntegrationHub by creating a data source. A data source specifies how and where to get the data you want to import.

**Before you begin**

- Imports in IntegrationHub require the ServiceNow IntegrationHub Action Template - Data Stream [com.glide.hub.action_type.datastream] plugin. For more information, see Request IntegrationHub.

- Data sources in IntegrationHub use Data Stream actions to collect and load the data. Data Stream actions have unique inputs, so make sure to familiarize yourself with the one you plan to use. To learn more, see Data Stream actions and pagination. Data Stream actions with dynamic inputs or outputs are not supported.

- Role required: admin or ih_import.

**About this task**

Configuring a data source is the first step to importing data in IntegrationHub. After you set up the data source, you can select a target table, determine how data is transformed to the target table, and run and schedule the import.

**Procedure**

1. Navigate to IntegrationHub > IntegrationHub - Import.
2. Click Create new integration.
3. On the New Integration screen, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your integration.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description of your integration.</td>
</tr>
</tbody>
</table>

4. Click Save & Continue.
5. Under Data Source, select a Data Stream action. When you select a Data Stream action, the form automatically saves. If the Data Stream action has inputs, a Data Stream action inputs section appears. Data Stream actions with inputs have unique inputs, so the fields in this section depend on which Data Stream action you select and its configuration. You can view the details of the Data Stream action by clicking the information icon (i) next to it. Clicking the icon opens the Data Stream action's configuration in Flow Designer.

6. In the Data Stream action input form, fill in the fields.

7. Click Save.

What to do next
Map source data to a target table.

Map source data to a target table
Specify how source data is transformed to your target table.

Before you begin
Configure a data source.

Role required: admin or ih_import.

Procedure
1. Navigate to IntegrationHub > IntegrationHub - Import.
2. On the landing page, select your integration.
3. On the left navigation panel, click Map to Target.
4. On the Target table page, click Add a target table.
5. In the Select Target Table form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target table</td>
<td>Name of the table to transform your data to. You can select one table per integration.</td>
</tr>
<tr>
<td>Run table's business rules when importing</td>
<td>Option to run the target table’s business rules when you import the data.</td>
</tr>
<tr>
<td>Run the import synchronously</td>
<td>Option to run the import synchronously. If checked, it ensures there's only one record with a unique match field value by synchronizing record inserts.</td>
</tr>
</tbody>
</table>
6. Click Save.

7. Click the button with your target table name to begin mapping your data. The left side of the page shows the source data. The right side shows the target table. To map the data, drag the data pills from the source to the Value column on the target. You can also map data by using the pill picker ( ) on the right side of the target table. You can enter more than one value in the Value column, you can also enter text.

8. Optional: Use the Match toggle switch to specify fields where the system should check for matching data and, if found, update existing records instead of creating new ones.

(Optional) For example, if a target table has an Order number field and a record with an order number of 743, there are two options for handling potential matches.

• If the Match toggle switch for the Order number field is on, the system checks for matching data. If the source data has a record with the same order number, the system updates the existing record in the target table.

• If the Match toggle switch for the Order number field is off, the system doesn’t check for matching data. If the source data has a record with the same order number, the system creates a new record in the target table. In this case, the target table will have two records, both with an order number of 743.

9. Optional: For choice and reference fields, specify what to do if the choice or reference doesn’t exist in the target table.

a. Click the gear icon ( ).

b. Select one of the following options.

• Create a new choice/record: Creates the choice or record in the target table.

• Ignore this field: Ignores only the field in the target table.

• Skip this record: Skips the entire record in the target table.

c. Click Done.

10. Optional: Change or modify your data by applying transform functions. For example, you can use the Uppercase transform function to change an input string to all uppercase characters. For more information, see the Flow Designer documentation on Transform functions.
Note: Not all of the transform functions available in Flow Designer are available in IntegrationHub - Import.

a. Click the transform function icon (fx).

b. Select a transform function from the menu, then click OK.

c. To apply additional transform functions, click Add a new transform. Transform functions are applied in the order they are selected.

d. After you’ve selected all your transform functions, click Done.

11. When you’re done with your mapping, click Save.

What to do next
Run or schedule a data import.

Run or schedule a data import
Specify when to run a data import by creating a schedule. Schedule an import to run at a specific time, at regular intervals, or after a parent import. You can also run your import immediately.

Before you begin
Configure a data source, then Map source data to a target table.
Role required: admin or ih_import.

Procedure
1. Navigate to IntegrationHub > IntegrationHub - Import.
2. On the landing page, select your integration.
3. On the left navigation panel, click Schedule imports.
4. On the Run and schedule imports page, click Schedule an import.
5. On the New schedule form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduled Data Import</td>
<td>Name to uniquely identify the import schedule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source for the import. This field is automatically set to the name of your integration.</td>
</tr>
<tr>
<td>Run as</td>
<td>Name of the user or user role the import executes with. For example, the import may run as the System Administrator, or it may run with the roles of a specified user.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the import schedule. Global is the default.</td>
</tr>
<tr>
<td>Run</td>
<td>Option to specify when the import runs. Select one of the following.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Daily</strong>: Runs every day.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Weekly</strong>: Runs every week.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Monthly</strong>: Runs every month.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Periodically</strong>: Runs at regular intervals.</td>
</tr>
<tr>
<td></td>
<td>• <strong>After Parent Runs</strong>: Runs after another import.</td>
</tr>
<tr>
<td>Day</td>
<td>Day of the week or month to run the import. Entered as a number. This field appears only when <strong>Weekly</strong> or <strong>Monthly</strong> is selected from Run.</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Amount of time to wait between imports. Entered in days, hours, minutes, and seconds. This field appears only when <strong>Periodically</strong> is selected from Run.</td>
</tr>
<tr>
<td>Parent</td>
<td>Name of the parent import. The parent import must finish before the current import begins. This field appears only when <strong>After Parent Runs</strong> is selected from Run.</td>
</tr>
<tr>
<td>Time</td>
<td>Time of day to run the import. Entered in hours, minutes, and seconds.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the import schedule active.</td>
</tr>
<tr>
<td>Advanced</td>
<td></td>
</tr>
<tr>
<td>Concurrent import</td>
<td>Option to divide the data into multiple import sets and process them concurrently.</td>
</tr>
<tr>
<td>Partition Method</td>
<td>Option to specify how to partition the data. Select one of the following.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Custom size</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Round Robin</strong></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Number of records for the partition size. Must be greater than or equal to 1000. This field appears only when <strong>Custom size</strong> is selected from <strong>Partition Method</strong>.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

7. **Optional:** To add a prescript or postscript, click the more options icon ( ⋯ ) and select **Advanced setup**. This option opens the form for the scheduled data import, where you can add a script to run before or after your import.

8. **Optional:** Run your scheduled import right away by clicking the more options icon ( ⋯ ) and selecting **Execute Now**. After you run the import, refresh the Executions list to view the execution record.

What to do next
Your import will run at the scheduled time. After it runs, an Executions section appears on the Run and schedule imports page. The Execution section has execution records where you can view details about your import, including its runtime, the number of imported rows, and any errors or log messages.

Connections dashboard
View and configure your connection and credential aliases through a simplified interface. Add new connections, edit existing connections, and view connection details.

Benefits
The Connections dashboard provides these benefits:

- Enables connection admins to manage multiple connections through a single interface.
- Provides simplified processes for adding, editing, and configuring connections.
- Displays details about an alias and all associated child connections in a single location.

Landing page
The dashboard landing page displays all the connection and credential aliases available on your instance. You can search for an alias by name, sort aliases by date created, or sort them alphabetically in ascending or descending order.

Each alias is displayed in a card format. Cards display the following:
• The application’s icon.
• The name and scope of the parent alias.
• A short description of the application associated with the alias. This option only appears when there are no connections.
• The total number of connections.
• A list of all the connections associated with the alias. The first connection is the default parent connection.
• A View Details option that displays specific information about the alias and any child connections.
• An Advanced Setup option. This option only appears when an alias doesn’t have a configuration template.
• An Add Connection option. This option is only available when an alias has a configuration template.

Each page of the Connections dashboard displays a maximum of 12 aliases. Page through to see additional aliases.

Detailed view
View details about an alias and any child connections by clicking the View Details option on the alias card. The details page has two columns. The first column displays:
• The application’s icon.
• The name and scope of the parent alias.
• An option to View connection alias, which opens the associated Connection & Credential Aliases record.

The second column of the detailed view displays:
• An Add Connection or Advanced Setup option, depending on whether the alias has a configuration template.
• The number of connections associated with the alias.
• A list of connections associated with the alias. The default connection is marked.

Connections that are not configured have a Configure option. Connections that are configured have an Edit option. Each configured connection displays the connection name, endpoint, credential name, and credential type.
If an alias uses an OAuth credential, the OAuth access or refresh token status is displayed with each connection. For connections that require a new token, you can request one by clicking **Get OAuth Token.**

**Configuration templates**

Configuration templates enable you to set up complex integrations using a single form. For example, an OAuth integration requires registering an OAuth provider, generating a token, and creating several connection and credential records. But if you use a configuration template to set up an OAuth integration, you only need to fill in one form. The system creates the associated records. To learn more about templates, see **Connection and Credential configuration templates.**

To add, edit, or configure connections directly through the dashboard, an alias must have a configuration template. Not all aliases have templates. Templates were first introduced in the Orlando release, so aliases from previous versions may not have them yet. An alias without a template displays an **Advanced Setup** option on both its dashboard and detailed view. Clicking **Advanced Setup** opens the alias’s connection and credential record, where you can set up the alias. For more information about working with aliases that don’t have templates, see **Create a Connection and Credential alias.**

**Unconfigured connections**

When you transfer an alias or promote it to production, its underlying connection information doesn’t get transferred with it. In this situation, the connection is in an unconfigured state and must be reconfigured before you can use it. You can reestablish the underlying connections either through the dashboard or through the platform user interface.

- If the alias has a template, you can configure the connection through the dashboard.
- If it doesn’t have a template, configure it through the platform user interface. For more information about configuring a connection without a template, see **Getting started with connections.**

**Roles**

To access the Connections dashboard, you must have the connection_admin or admin role.

**Add a connection**

Add a connection through the Connections dashboard.
Before you begin
Role required: connection_admin or admin

Procedure

1. Navigate to Process Automation > Flow Designer and click the Connections tab.
2. Locate the alias you want to add a connection to and select Add Connection.
   If there isn’t an Add Connection option, the alias doesn’t have a configuration template. To add a connection through the dashboard, the parent alias must have a template. Not all aliases have templates. Templates were first introduced in the Orlando release, so aliases from previous versions may not have them yet. If yours doesn’t, you can set up your alias through the platform user interface instead. Select the Advanced Setup option to get started. For more information, see Create a Connection and Credential alias. To learn more about templates, see Connection and Credential configuration templates.
3. On the form, fill in the fields.
   The fields that appear on the form depend on which configuration template the parent alias has. For details on each specific template, visit Connection and Credential configuration templates.
4. To submit the form, click Create Connection.

Results
The alias card displays the new connection under the Connections list.

Configure a connection
Configure a connection through the Connections dashboard.

Before you begin
Role required: connection_admin or admin

About this task
When you transfer an alias or promote it to production, its underlying connection information doesn’t get transferred with it. In this situation, the connection is in an unconfigured state and must be reconfigured before you can use it.

Procedure
1. Navigate to Process Automation > Flow Designer > and click the Connections tab.
2. Locate the alias that you want to add a connection to and click View Details.
3. In the detailed view, locate the connection that you want to configure and click **Configure**.

4. On the Configure Connection form, fill in the fields. The fields that appear on the form depend on which configuration template the parent alias has. For details on each specific template, see [Connection and Credential configuration templates](#).

   Configuring a connection through the dashboard requires the parent alias to have a configuration template. If yours doesn’t, clicking **Configure** opens the Connection and Credential Alias record for your alias instead of the Configure Connection form. For more information about configuring your connection in the Connection and Credential Alias record, see [Create a Connection and Credential alias](#).

5. To submit the form, click **Configure**.

**Results**
The detailed view displays the new connection in the Connections list.

### Domain separation and IntegrationHub

Domain separation is supported for IntegrationHub. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: Standard**
The support level is Standard but has some exceptions or special conditions.

- Includes **Basic** level
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.

- The instance owner must be able to configure minimum viable product (MVP) business logic and data parameters. This configuration is done per tenant, as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see [Application support for domain separation](#).
Overview
In general, IntegrationHub inherits the domain separation features of Flow Designer. As each spoke (application) can have its own domain separation relationship, there is no one specific support level to associate with IntegrationHub. To learn more, see Domain separation and Flow Designer.

Related information
Domain separation for service providers

Support multiple connections
Support several connections to a single integration provider. Select connections for flows, subflows, and actions directly from a flow.

Benefits
Multiple connections support offers these benefits.

• Have more than one connection to the same integration provider. For example, you can establish connections to several different Jira environments.

• Select which connection you want to use in a flow. Override preset connections for flows, subflows, and actions directly through Flow Designer.

• When a flow is promoted to production, reestablish a connection to each account without needing to modify the flow.

To learn more about connections, see Connections and Credentials.

Create connections
There are two ways to add a child connection to a parent alias.

Through the Connections dashboard
The Connections dashboard provides a simplified way to add a connection to an alias. For more information about the Connections dashboard, including how to add a connection, see Connections dashboard.

Through the platform user interface
Manually create a child connection by setting up connection and credential records. To create a connection with this method, see Create a Connection and Credential alias.

Flow-level connection selection
You can choose a connection for a flow or subflow directly from the flow’s main page. When you select a new connection, it overrides any preconfigured
connection for that flow. To choose a connection, click the More Actions menu icon (⋮), and select the **Configure connections** option. This option opens the Configure Connections window, where you can select the connections for your flow. The Configure Connections window displays:

- All the aliases used in the flow.
- The icon and name for each alias.
- A list of the configured connections for each alias. The default connection is listed first. Other connections are listed alphabetically.
- An information icon for each alias. Clicking the icon opens the Connection & Credential Aliases record for the default connection shown in the list.
- A **Manage Connections** option that opens the connections dashboard.
- Options to **Cancel** connection selection or **Update** your connection choice.

Each alias has one entry in the Configure Connections window, regardless of how many actions or subflows may use that alias. When you select a connection at the flow level, the new connection applies to all the actions and subflows using that alias. For example, if a flow has several actions that use a Slack service, changing the connection for the Slack service changes the connection for all the Slack service actions within the flow.

You can see which parts of a flow a connection change affects by matching the alias icons in the flow to the ones in the Configure Connections window. An action that impacts a Slack service has a Slack icon next to the action in the flow. The Slack icon also appears next to the alias name in the Configure Connections window.

The Configure Connections window is automatically updated whenever you add or delete a flow component that has connections. When you add an action or subflow to a flow, the Configure Connections window displays the connections for the action or subflow that you just added. If you remove an action or subflow, the connection information is removed from the Configure Connections window.

You can choose whether to display the **Configure connections** option with the `sn_flow_designer.connections_override_enabled` system property. Setting the property to **true** displays the **Configure connections** option, while setting it to **false** hides it. If you delete the system property or it doesn’t exist, the **Configure connections** option is displayed by default.

View which connection your flow ran with by examining the Step Configuration section of the flow’s execution details. The connection alias listed in the **CONFIGURATION** column is the alias that the flow was originally designed to
run with. The alias listed in the RUNTIME VALUE column is the one that the flow actually ran with.

Execution details page

Action-level connection selection

You can select connections for individual actions within a flow. This functionality is useful if a flow must interact with multiple configurations of the same provider. For example, downloading a file from one configuration of a file storage provider then uploading the file to a different configuration of the same file storage provider.

To select a connection for an individual action in a flow or subflow, click Advanced Options. This option shows the name of the alias that the action uses and a list of all the alias’s associated connections. The first connection on the list is the default connection. Other connections are listed alphabetically. Selecting a connection from the list overrides the connection for that action and for any dynamic inputs inside the action.

You can enable or disable action-level overrides by clicking the More actions icon (⋯) and selecting Flow Preferences. The Configurations window has a Show advanced connection options option. This option is disabled by default, so actions don’t show the Advanced Options button. When enabled, the option is available if the action has a connection alias that can be overridden.

Dynamic inputs

You can select connections for flows and subflows containing actions with dynamic inputs. When a connection override is specified at the flow level, the dynamic action uses the flow-level override. For example, in a flow with a data-gathering action, the action uses the flow’s override connection for the data-gathering step rather than the action’s default connection. If an override is specified at the action level, the dynamic action uses the action-level override.

Multiple overrides within a flow

When there is more than one override in a flow, they’re applied according to the following rules:
• Action-level overrides always apply.
• Subflow-level overrides always apply to the subflow. The override also applies to actions within the subflow that don’t have their own overrides configured.
• Flow-level overrides apply to subflows and actions that don’t have their own overrides configured.

Flow promotion
When you move a flow to a production instance, the alias information is transferred with it, but the underlying connection information is not. An alias functions as a type of container for connections. The container moves with the flow, but the specific connection information doesn’t. Any connections associated with the alias become unconfigured and must be reconfigured before you can use them in the new environment.

You can configure connections without having to modify the flow because you already have the base alias set up. To configure a connection:

• If the alias has a template, configure the connection through the Connections dashboard. See Configure a connection for instructions.

• If an alias doesn’t have a template, configure it through the platform user interface. For more information about configuring a connection without a template, see Getting started with connections.

Additional considerations
To add a connection through the Connections dashboard, the parent alias must have a configuration template. Templates first became available in the Orlando release, so aliases from previous releases may not have templates yet. For more information about configuration templates, see Connection and Credential configuration templates.

Override a connection in a flow
Override a connection for a flow, subflow, or action.

Before you begin
For details about flow overrides, including how they affect actions with dynamic inputs and how multiple overrides are applied, see Support multiple connections.

Role required: flow_designer or admin
Procedure

1. Navigate to **Process Automation > Flow Designer**.
2. Select the flow or subflow that has the connection you want to modify.
3. Click the More actions icon (Ξ), and select **Configure connections**.
4. In the Configure Connections window, identify the alias associated with the connection that you want to override and select a new connection from the list.
5. Click **Update**.

   **Note:** If the option is enabled, you can also override a connection at the action level. Click **Advanced Options** below the action. Choose the new connection from the list, then click **Done**. This option is only available if the action has an overridable connection.

What to do next
Test the flow.

Data Stream actions and pagination

Send REST, SOAP, or JDBC requests from Flow Designer to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.

For example, create a Data Stream action to import a large quantity of employee data from a third-party HR site. The Data Stream action sends a REST request to the third-party site and processes the response to populate records in the User [sys_user] table.

Benefits

Data Stream actions offer these benefits.

- Parse and format a stream of response data larger than 10 MB.
- Automatically send multiple requests to APIs that paginate results, if applicable.
- Enable flow designers to process large requests without complex coding or configuration.
- Enable flow designers to process each object within a data stream using **For each** flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to
a flow, Flow Designer automatically adds the action to a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See [Use a Data Stream action in a flow](#).

- Enable flow designers to reuse Data Stream actions in multiple flows, using the same source of data in multiple ways.

### Running a Data Stream action

There are two ways to run a Data Stream action.

**From a flow**

You can process each object within a data stream using **For each** flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See [Use a Data Stream action in a flow](#).

**From a script**

You can start a Data Stream using the `executeDataStreamAction()` method in the FlowAPI class. For more information, see [FlowAPI](#).

### Action outline

Data Stream actions follow a set structure. Follow prompts to add and remove steps from the action outline. You cannot manually add steps to a Data Stream action.
**Note:** Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

**Action Preprocessing**

Use the Action Preprocessing category to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or...
set default values. Preprocessing executes once per action, before the first API request.

Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

This is an optional Data Stream action component that runs on either the instance or a MID Server.

**Request**

Use the Request category to configure how the action sends API requests. The Request section executes once per page of results. Request components provide these configuration options.

**Pagination Setup step**

Request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. Use the pagination setup step to set up pagination options required by the API. Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the Limit / Offset template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

**Note:** For licensing purposes, each request counts as one transaction, including each request for the next page of results.

The value of the reserved, read-only **getNextPage** variable determines whether to request another page of results. As long as the **getNextPage** variable is true and the previous page contains data, the action continues to send requests for the next page.

**Note:** You must explicitly set the value to true in the script or it will default to false.

This is an optional Request component that only runs on the instance.

**Note:** Pagination isn't applicable to the JDBC step.

**Script step**
Run a script before every request for the next page of results. Use this script for data validation and transformation when calling a paginated API. For example, generate a JSON payload for the next page request. Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

This is an optional Request component that runs on either the instance or a MID Server.

REST or SOAP step

Send a REST or SOAP request to a third-party API. Select a data format to add an associated step to the Data Stream action. For more information, see REST step and SOAP step.

This is a mandatory Request component that runs on either the instance or a MID Server.

JDBC step

Send a JDBC request to a third-party API. Use transform script to format data and add an associated step to the Data Stream action. For more information, see JDBC step and Test JDBC step. All data is retrieved and pagination is not needed.

This is a mandatory Request component that runs on either the instance or a MID Server.

Parsing in REST and SOAP steps

Use the Parsing category to configure how the action separates data stream elements into complex data objects. Use the Splitter step to identify and separate items from an XML or JSON stream, and use the Script Parser step to transform each item into a complex object. The Parsing section executes once per item in the stream. You can access outputs from previous steps in your data stream action using the \texttt{fd\_data} object, excluding:

- REST or SOAP step Response Body, Stream, or Error Message outputs
- Splitter step outputs
For more information about complex data, see Complex data. Parsing components provide these configuration options.

**Splitter step**

Identify the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Select a splitter type to identify and separate repeated items in an XML or JSON data stream.

- **JSON**: Identifies objects in a stream of JSON data.
- **XML**: Identifies objects in an XML document.

This is a mandatory Parsing component that only runs on the instance.

**Script Parser step**

Use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item...
identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items. This is a mandatory Parsing component that only runs on the instance.

REST and SOAP Data Stream action overview

Transform script in JDBC step

JDBC data stream action doesn’t require pagination. Also, splitter and parser steps aren’t required.

The JDBC step generates a complex object for each of the retrieved record. Hence, action preprocessing and transform script in the JDBC data stream action are optional. When using the transform script, action designer must specify the internal name of the table columns in the transform script.
Data Stream outputs in SOAP and REST steps
When designing a Data Stream action, you must create a single output of type Object or Dynamic Object. The Script Parser step maps items in the stream to this object using the `targetObject` global object.

At runtime, the system splits and parses the stream of response data according to the Data Stream configuration. Each item in the stream maps to the complex object structure defined by the Script Parser step and the object output, resulting in a large series of complex objects. For more information about complex data, see Complex data.

Data Stream outputs in JDBC step
The output of JDBC steps is a complex object stream. Entire data is retrieved in one request only.
Note:

• You can only retrieve data and can’t update or delete records using the JDBC data stream action.

• The fields, **Maximum Row** and **Maximum Payload Size (KB)** that are available in JDBC step aren’t available in the JDBC data stream action.

**Execution details in REST and SOAP steps**

View the configuration and runtime results for each item processed by a Data Stream action. Select a record number to see its configuration and runtime details. By default, the execution details include requests for the last 1000 items. To change the number of items in the execution details, update the `com.snc.process_flow.reporting.datastream.item.lastn` system property.
Data stream summary

View an overview of the execution that includes this information.

- **Page count**: Number of pages returned by a paginated API.
- **Total item count**: Number of items in the response stream mapped to complex object outputs.
- **Error count**: Number of errors encountered.

Page details
View runtime data for each step within the Data Stream action. Select a page to view runtime details for each request to a paginated API. By default, the execution details include requests for the last five pages. To change the number of requests in the execution details, update the `com.snc.process_flow.page.reporting.lastn` system property. Set the value to 0 to remove pages from the execution details and -1 to include all pages.

**Note:** Including all pages can affect performance and is not recommended.

### Execution details in JDBC step

Construction of the output complex object schema isn’t needed for the JDBC data stream action. You can test the query and see
the query result. See Test JDBC step for more information. Configure
the MID Server properties `mid.jdbc.datastream.max.record.size` and
`mid.jdbc.datastream.fail.when.attachment.limit.exceeded` to retrieve data as
per your requirement. See MID Server properties for more information.

Data Stream action design considerations
Follow these considerations when creating a Data Stream action and when
adding a Data Stream action to a flow to prevent errors and performance
issues.

Considerations when creating a Data Stream action
Create Data Stream actions with these considerations in mind.

Write pagination logic according to third-party requirements
Evaluate and understand the format required by your third-party
endpoint. For example, you may need to write a script that sets the
built-in `getNextPage` variable to true as long as there is a `nextPage`
token in the response. If the response does not contain the token,
then set the variable to false. Access variables in script using
bracket or dot notation. For example, `variables['getNextPage']`. This
variable only accepts the Boolean data type. The default value is
false.

Convert pagination variable data types to perform math operations
Pagination variables only support the string data type. To perform
math operations, you must convert the value to an integer, perform
any required operations, then convert it back to a string.

```javascript
variables['offset'] = (parseInt(variables['offset']) +
parseInt(variables['limit'])).toString();
```

Ensure that the pagination script has an end condition
Avoid infinite loops in pagination requests by creating a condition
that sets the `getNextPage` variable to false. Cancel any long-running
flows. Always test Data Stream actions before using them in
production.

Clear configuration page options carefully
Clearing an option in a configuration page removes the step from
the Data Stream outline and deletes all data associated with the
step.

Consider the size of each page returned
When configuring pagination options, try to ensure that the size of each page returned is under one GB. This ensures that flow designers who use the action won’t encounter size limit issues when retrieving data from a MID Server. If the action returns more than one GB of data per page, the flow designer may need to increase the attachment size limit. For more information, see MID Server support for Data Stream actions.

**Note:**

- Nesting Data Stream actions is not supported.
- When using the retry policy, ensure that you are aware of these considerations:
  - Only a fixed time interval strategy is honoured for the data stream actions.
  - The total delay (count multiplied by the interval) can’t exceed 30 seconds. For example, if you want retry for a maximum of 3 times, the maximum delay for each retry is 10 seconds.
  - Data stream step doesn’t go into the waiting state during retry.

**Considerations when adding a Data Stream action to a flow**

Add a Data Stream action to a flow with these considerations in mind.

**Do not add actions with wait conditions to a Data Stream For Each logic block**

You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

Some actions and steps always pause a flow and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may pause the flow depending on how they are configured. Check the action configuration to ensure it does not pause the flow at runtime.

<table>
<thead>
<tr>
<th>Always pauses the flow (unsupported with Data Stream actions)</th>
<th>Ask for Approval action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Ask for Approval step</td>
</tr>
<tr>
<td></td>
<td>Wait for Condition action</td>
</tr>
<tr>
<td></td>
<td>Wait for Condition step</td>
</tr>
</tbody>
</table>
May pause the flow depending on configuration

Create Catalog Task action
Create Task action
Create Task step

Do not add actions that run on the MID Server to a Data Stream For Each logic block

Some actions and steps always run on a MID Server and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may run on a MID Server depending on how they are configured. Check the action configuration to ensure it does not run on the MID Server at runtime.

<table>
<thead>
<tr>
<th>Always runs on a MID Server (unsupported with Data Stream actions)</th>
<th>JDBC step</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PowerShell step</td>
</tr>
<tr>
<td></td>
<td>SSH step</td>
</tr>
<tr>
<td>May run on a MID Server depending on configuration</td>
<td>REST step</td>
</tr>
<tr>
<td></td>
<td>Script step</td>
</tr>
<tr>
<td></td>
<td>SOAP step</td>
</tr>
</tbody>
</table>

Turn off reporting when consuming a large number of records in the For Each logic block

Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the com.snc.process_flow.reporting.level system property. For more information, see Flow Designer system properties.

MID Server support for Data Stream actions

Get data through a ServiceNow® MID Server when running a Data Stream action.

When selected, the MID Server retrieves the data and sends each page to the instance as an attachment to process.

⚠️ Important: When running the Data Stream action within flow, the actions in the For Each block always run on the instance.

These steps can run on either the MID Server or the instance:
• Action Preprocessing Script
• Request Script step
• REST or SOAP step

Note: Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

To learn more about running a step on a MID Server, see Integration steps.

Size limits
If your system encounters a timeout or size limit issue, try making one of these adjustments:

Increase the REST transaction quota rule

If the connection between the instance and the MID Server slows down, you may encounter a timeout while waiting for a response from the REST step. Increase the default timeout by updating the REST Attachment API request timeout transaction quota rule.

• Default: 60 seconds
• Maximum: 300 seconds

Increase the instance timeout

By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the datastream_alternative_env_fetch_page_timeout_seconds system property.

• Default: 600 seconds
• Maximum: 7200 seconds

Increase attachment size

The MID Server sends each page of data to the instance as an attachment. If a page of data is large, it may exceed the allowed attachment size. Increase the allowed size by updating the com.glide.attachment.max_size system property.
Create a Data Stream action

Create a reusable action to process a stream of response data within a flow.

**Before you begin**

- Set up an application in Guided Application Creator to store Flow Designer content.
- Disable any conflicting business rules or workflows before creating an action.
- Role required: action_designer or admin

**About this task**

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

**Note:** Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

**Procedure**

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select Data Stream.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
</tbody>
</table>
An empty Data Stream action opens.

4. Define action inputs to make data available to the action steps.

   a. Select + Create Input and complete the fields. For more information about action inputs, see Action Designer. Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Click Action Preprocessing in the Data Stream outline and configure the desired options.

   a. Select Enable preprocessing script to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

      Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

      This section can run on either the MID Server or the instance. The environment is determined by the script step's Required Runtime field.

6. Click Request in the Data Stream outline and configure the desired options.

   a. In the How will you get data field, select REST Step, SOAP Step, or JDBC Step. Selecting an option adds the associated step to the Data Stream action. For more information, see REST step, SOAP step, and JDBC step.

      This section can run on either the MID Server or the instance. The environment is determined by the Use MID server field in the associated Connection [sys_connection] record.

   Note:
   - If you are using the JDBC step, you must test it. Upon successful execution, you can use the result to create the step output and data stream action output.
   - If you are using the REST step or SOAP step, you must manually create the data stream action output.
b. Select **Enable pagination** to request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. This option adds a Pagination Setup step to the Data Stream outline.

⚠ **Note:** For a JDBC step, pagination is not applicable. Each page can retrieve up to 1 GB data and one request can retrieve up to 8 GB data.

c. Select **Run a script before each request** to run a script before every request for the next page when calling a paginated API. For example, write a script to transform variable data types from the initial response before sending a request for the next page. Selecting this option adds a script step to the Data Stream action. For more information, see **Script step**.

⚠ **Note:** For a JDBC step, this is not applicable.

This section can run on either the MID Server or the instance. The environment is determined by the script step's **Required Runtime** field.

⚠ **CAUTION:** Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

7. **Optional:** If pagination is enabled, configure the Pagination Setup step. Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the **Limit / Offset** template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

a. Create pagination variables. For example, if the third-party API takes a limit parameter in the request, create the limit variable and set the initial value to limit the number of results per page. The initial value is only used in the first request. The getNextPage variable is a reserved, read-only variable. As long as the getNextPage variable is true and the previous page contains data, the action continues to send requests for the next page.

b. In the **Next Value From** field, define how pagination variables receive a value for subsequent requests.
(Optional) Choose from:

- **Script**: Write a Pagination Variables Script to define how variables are populated. Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

- **Response Body**: Use a value in the response from the previous request to populate the variable. If the response is JSON format, set Extract value using to JSONPath Expression and provide the path to the value in the Expression field. If the response is XML format, set Extract value using to XPath Expression and provide the path to the value.

**Example**
In this example, the `getNextPage` variable is true until the `nextOffset` variable reaches the total count value returned in the API response header. As long as the `getNextPage` variable is true and the previous page contains data, the action continues to send requests for the next page. This example includes a common limit/offset pagination configuration. The third-party APIs that your Data Stream action interacts with may use a page token or other method.
1. **Pagination Setup step**

**Pagination Variables**

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial Value</th>
<th>Next Value From</th>
</tr>
</thead>
<tbody>
<tr>
<td>getNextPage</td>
<td>false</td>
<td>Script</td>
</tr>
<tr>
<td>limit</td>
<td>100</td>
<td>Script</td>
</tr>
<tr>
<td>offset</td>
<td>0</td>
<td>Script</td>
</tr>
</tbody>
</table>

**Pagination Variables Script**

```javascript
function paginate(variables, pageResponse) {
  var limit = parseInt(variables.limit);
  var totalCount = parseInt(pageResponse.response.headers['X-Total-Count']);
  var currentOffset = parseInt(variables.offset);
  var nextOffset = currentOffset + limit;
  if (nextOffset < totalCount) {
    variables.getNextPage = true;
    variables.offset = nextOffset.toString();
  } else {
    variables.getNextPage = false;
  }
}
```

**Important:** Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

8. Click **Parsing** in the Data Stream outline and configure the desired options.

**Note:** For a JDBC step, this is not applicable.

a. In the **How will you identify each record** field, select **JSON/XML Splitter**. This adds a Splitter step to the Data Stream outline.

b. In the **How will you parse each item into an object** field, select **Script Parser**. This adds a Script Parser step to the Data Stream outline.

9. Configure the Splitter step. This step identifies the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.
Note: For a JDBC step, this is not applicable.

a. In the Source Format field, select the format returned by the Request section.
   - JSON: Identifies objects in a stream of JSON data.

b. In the Item Path field, define the absolute path to the object. For example, use $.result in JSON or /result in XML to separate a result object.

   Note: The system ignores XML namespaces.

Example
If the REST step returns the following JSON content, you would enter $response.result.companies as the item path to process each company object.

```json
{
    "response": {
        "result": {
            "companies": [
                {
                    "name": "company1"
                },
                {
                    "name": "company2"
                },
                {
                    "name": "company3"
                }
            ],
            "metadata": {
                "token": 1558666526
            }
        }
    }
}
```

Example
If the REST step returns the following XML document, you would enter /response/result/companies/company as the item path to process each company object.
10. In the Script Parser step, use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

**Note:** For a JDBC step, this is not applicable.

You can access outputs from previous steps in your data stream action using the `fd_data` object, excluding:

- REST or SOAP step Response Body, Stream, or Error Message outputs
- Splitter step outputs

**Example**
An example script that parses a JSON response.

```javascript
(function parse(inputs, outputs) {
  var record = JSON.parse(inputs.sourceItem);
  outputs.targetObject.id=record.number;
});
```
Example
An example script that parses an XML response.

```
(function parse(inputs, outputs) {
    var xmlDoc = new XMLDocument(inputs.sourceItem, false);
    outputs.targetObject.id = xmlDoc.getNodeText("/result/number");
    outputs.targetObject.name = xmlDoc.getNodeText("/result/short_description");
})(inputs, outputs)
```

11. Optional: If you selected the JDBC step, click Transform. After successfully testing the JDBC step, click Use Result to create the step output and data stream action output. You can use this result or customize it using the transform script.

   a. Select the Enable Transform Script check box to transform and customize the default data stream output.

12. Create a complex object output.

   ![Note](https://via.placeholder.com/15)
   Note: For a JDBC step, this is not applicable.

   a. Select Outputs in the Action Outline and click + to create an output.

   b. Update the Label field to represent the object. For example, if the action parses a stream of company records, add the Company label.

   c. Update the Type field to Object. This is the complex object output represented by the targetObject global object in the Script Parser step.

   d. Add child fields to the complex object using the + icon.

   e. Make the name of each child field more user-friendly so that you can meaningfully refer to it in script. The value in the Name field is the internal name used in the Script Parser step. For example, to refer to the City output in the Script Parser step, you would use outputs.targetObject.city.
13. Click **Save**.
   Action Designer saves a draft of the action.

**What to do next**

**Test a Data Stream action.**

**Test a Data Stream action**

Test your Data Stream action to ensure that it works the way you expect before you add it to a flow.

**Before you begin**

- Create a Data Stream action
- Role required: action_designer or admin

**About this task**

Testing a Data Stream action returns the first 20 items by default. To change this value, add the `com.glide.hub.action_type.datastream.test_max_iterations` system property with a value between one and 50.

**Procedure**

1. Open the Data Stream action you want to test.
   a. Navigate to **Flow Designer > Designer**.
   b. Select the Actions tab.
   c. Select the row for the Data Stream action you want to test.

2. Select **Test**.
   The system displays the Test Action dialog. The contents of the Test Action dialog depend on the Data Stream action inputs.

3. In the Test Action dialog, provide values for any action inputs and select **Run Test**.
4. Open the Execution Details to ensure that the action executed as expected. The Execution Details **Runtime Value** returns the first 20 items returned by the Data Stream action.

**What to do next**
Use a Data Stream action in a flow.

**Use a Data Stream action in a flow**
Data Stream actions use the **For each** flow logic option to process stream data in a flow. For example, suppose that you want to use a Data Stream action that imports document data from a third-party site. When added to a flow, the action appears as a **For each** flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream.

**Before you begin**
Role required: flow_designer or admin

**Procedure**
1. Open the flow you want to add the Data Stream action to.
2. Add the Data Stream action to the flow.
   The action appears as a **For Each** flow logic block.

3. Add a child action within the **For Each** flow logic block. This action runs on each object within the data stream.

**Note:** You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic. For more information, see [Data Stream action design considerations](#).
4. Click **Save**.
   Flow Designer saves a draft of the flow, trigger, and actions.

**What to do next**
Test the flow until it is ready to be activated.

**Note:** The system only triggers active flows.

**REST API trigger**
Start a flow from an inbound API call or webhook from an external system.
Configure the trigger start conditions without having to write or maintain custom code.

For example, you can create a flow that starts when a third-party IT ticket tracking system sends an inbound request to the instance. You can then parse the data from the inbound REST request into a complex data object and use the values to open an Incident on your instance.

Once you activate the flow, the endpoint that you created appears in the API explorer under the namespace you created. You can use this page to help define the webhook in your third-party system and to test your flow.

To learn more about flow triggers, see [Flow trigger types](#).

**Note:** Use the REST API Trigger to start flows from REST calls from external systems. To start a flow from a script or API call from the same instance, use a subflow, code snippet, or Flow Designer API. See [API access to Flow Designer](#) and [Create code snippets for flows, sub-flows, and actions](#).

**Available data pills**
Depending on how you configure the endpoint, flow designers have access to these data pills from the trigger:

**Path Parameters**
An object containing path parameters in the inbound request.

**Query Parameters**
An object containing query parameters in the inbound request.

**Request Headers**
An object containing headers in the inbound request.

**Request Body**
Complex data object that defines the body structure of the inbound request. For more information on complex objects, see [Complex data](#).

When setting up the trigger, define what the inbound data will look like. You can then use the associated data pills within the actions in your flow. When the system receives an inbound request that starts the flow, it uses the runtime values sent in the request.

### Create a flow using the REST API trigger
Create a flow that starts when a third-party system sends a REST request to your instance.

**Before you begin**
Role required: flow_designer or admin

> **Note:** This feature requires an IntegrationHub Enterprise subscription. For more information, see [Request IntegrationHub](#).

**Procedure**

1. Open Flow Designer and create a flow. See [Create a flow](#).
   
   Keep in mind that the scope of your flow is included in the REST endpoint you create.

2. In the TRIGGER section, select the **REST API - Asynchronous** trigger.

3. In the **HTTP Method** field, set the HTTP method for the endpoint.
   
   Options include:
   
   - POST
   - GET
   - DELETE
   - PUT
   - PATCH

4. Create any path parameters required for the endpoint and add them to the relative path in the Path field.
   
   The relative path to the endpoint is in the format `/api/<flow-application-scope>/<flow-name>/<path-parameters>`.
You can click **Copy** to copy the full path to the endpoint. Use this path when configuring the endpoint for the REST call in your third-party system.
a. Create variables in the **Path Parameters** section.

b. Drag the data pill that represents the path parameter into the empty input in the **Path** field. This field only accepts data pills from the **Path Parameters** section.

5. Select **Requires authentication** to require authentication headers in the inbound REST request.

6. If **Requires authentication** is selected, add the roles required to authorize the request in the **Requires roles** field.

7. In the **Body** field under the **Request Content** section, create a complex data object that defines the body structure of the inbound request. For more information on building a complex object, see **Complex data**.

**Note:** The **Request Content** section only appears when the **HTTP Method** is POST, PUT, or PATCH.

This example body finds the Description field in an inbound payload that contains ticket information from a third-party ticket-tracking system.
8. In the **Headers** field, define the headers to be sent in the inbound request. Select **Required** to require that the inbound request include them.

9. In the **Query Parameters** field, define the query parameters to be sent in the inbound request. Select **Required** to require that the inbound request include them.

10. Add actions to your flow that execute when the endpoint is called. You can use the data pills from the REST API trigger in your flow actions. This action creates an Incident record and maps the Description and Assignment Group fields from the incoming payload to the Incident.

11. Test and activate the flow. For more information, see **Test a flow** and **Activate a flow**.
Once activated, the endpoint displays in the REST API Explorer. You can use this page to further test your endpoint, or configure the request from your third-party system.

12. Configure the REST request from your third-party system.

**Example**

For example, you can send this cURL request to trigger the flow defined in previous steps.

```bash
curl 
"https://your-instance.servicenow.com/api/now/create_incident_from_external_event/assignment_group/287ebd7da9fe198100f92cc8d1d2154e" 
--request POST 
--header "Accept:application/json" 
--header "Content-Type:application/json" 
--data "{
  fields: {
    description: "Major outage with data loss"
  }
}"
--user 'username':'password'
```

**Results**

The flow executes and the REST request returns the execution ID.
What to do next

Copy the execution ID in the result and navigate to the Executions tab in Flow Designer. You can filter by execution ID to locate the execution details and view the status of the execution.

To troubleshoot issues, you can debug the REST query or check the flow execution details. See and Flow execution details.

Integration steps

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

Note: Only Flow Designer admin and Connection admin can execute flows using IntegrationHub.

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate
MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.

**Available integration steps**

These integration steps are available from Action Designer.

<table>
<thead>
<tr>
<th>Integration step</th>
<th>Description</th>
<th>Step runs from</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC step</td>
<td>Create a reusable action to send SQL commands to a relational database.</td>
<td>MID Server</td>
</tr>
<tr>
<td>Payload Builder step</td>
<td>Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.</td>
<td>• Instance</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• MID Server</td>
</tr>
<tr>
<td>PowerShell step</td>
<td>Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.</td>

<td>script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.</td>
<td></td>
</tr>
</tbody>
</table>

**Training**

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

**Connection attributes**

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

**MID Server connection aliases**

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

**MID Server selection**

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see MID Server selection.
Design considerations

Design integration steps using the following guidelines.

• Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.

• When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.

• The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

Roles

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.

Federal Information Processing Standards (FIPS) support for outbound integrations

ServiceNow National Security Cloud (NSC) is designed for U.S. federal, state, and local government customers. NSC is authorized and compliant with the Federal Risk and Authorization Management Program (FedRAMP) High and Department of Defense (DoD) Impact Level 5 (IL-5) requirements.

FedRAMP

FedRAMP provides a standardized approach to security and risk assessment for cloud technologies and U.S. federal agencies. For more information about FedRAMP, visit https://www.fedramp.gov/

The FIPS 140-2 standard specifies the security requirements for cryptographic modules that include hardware, software, and firmware for U.S. federal agencies. For more information about FIPS 140-2 standards, see https://csrc.nist.gov/publications/detail/fips/140/2/final.
The FIPS 140-2 standard has security requirements that cover 11 areas that are related to design and implementation of a cryptographic module. Four security levels are specified for each of the 11 areas. Each security level offers increased security over the preceding level. Each module defines its own security policy (which means the accurate specification of the security rules under which it operates) and employs approved cryptographic algorithms, cryptographic key management, and authentication techniques.

The Bouncy Castle (BC) FIPS Java APIs are a suite of FIPS approved algorithms that are implemented in Java. For more information about Bouncy Castle, see [https://www.bouncycastle.org/documentation.html](https://www.bouncycastle.org/documentation.html).

**Enabling the FIPS approved mode**

By using the `org.bouncycastle.fips.approved_only` system property, you can enable the FIPS approved mode. For assistance on how to enable the FIPS approved mode, contact Now Support.

When the FIPS approved mode is enabled, FIPS-compliant ciphers and random generators are used for data-in-transit, and Transport Layer Security (TLS) protocols are used for data-in-rest.

- For outbound HTTPS calls, only TLS v1.2 and v1.3 protocols are supported. You can use any action or step that has a **Connection** field to specify a connection to a URL endpoint, such as the **REST step**, **SOAP step**, **PowerShell step**, and **Data Stream Actions**.
- Only **ServiceNow SSH step** is supported.

⚠️ **Note**: The FIPS approved mode can be enabled only for National Security Cloud (NSC) DoD IL-5 environments.

For the non-FIPS mode, the `org.bouncycastle.fips.approved_only` system property is set to false by default.

**JDBC step**

Create a reusable action to send SQL commands to a relational database.
Note:

• The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.

• The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

Roles and availability
The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs
Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

SQL operations inclusion list
By default, you can run the following SQL operations.

• SELECT
• INSERT
• UPDATE
• DELETE
• SHOW
• DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, mid.property.jdbc_operations and enter the SQL operations, separated by comma. To learn more about MID Server properties, see MID Server properties.
## Fields

<table>

**Test JDBC step**

Test the JDBC step before testing or publishing an action that contains the JDBC step.

**About this task**

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

**Procedure**

1. Navigate to **Process Automation > Flow Designer**.
2. Create an action with a JDBC step.
3. Click **Test JDBC Step**.
   The **Test JDBC Step** pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the **Step input pills** field to test the JDBC step.

   - **Note:** Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.

   - When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.

   - **Note:** **Use Result** is not displayed when records are updated, inserted, or deleted.

7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the **Step input pills** field and click **Run Test**.

**Results**

When a SELECT query is executed in the JDBC step, **ResultSet** is displayed under **Outputs**. The relevant complex object output is populated. To learn more about complex objects, see **Complex data**.

**What to do next**

Test and publish the action.

**JSON parser step**

Identify structured data from a JSON payload without having to write a script. Map incoming JSON content to a complex object output that you can use in other steps or actions. At runtime, values from a JSON payload populate the complex object output.

To learn more about complex objects, see **Complex data**.

- **Note:** The JSON parser step is not available in the base system and requires the IntegrationHub Standard Pack Installer. After the required plugin is activated, the step is visible under Integrations.
Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Payload size limit

At runtime, JSON parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information on Data Stream actions, see Data Stream actions and pagination.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Source              | In the **Source data** field, select or drag a data pill that contains the source JSON payload. For example, a REST step **Response Body** data pill. At runtime, values from the data source populate the complex object output. Under **Source data** and in the scripting window, enter an example payload to generate your complex object. For example, if parsing the response from a REST step that returns a list of users, enter the expected JSON object for a single user. You can create any example JSON payload with the following limitations:  
  - Multidimensional arrays are not supported.  
  - Hyphens, periods, spaces, double colons, and the @ symbol in JSON keys are not supported.  
  - Your example payload can't exceed 2 MB. |
<p>| Structured Payload View | View your example payload as regular JSON, or toggle <strong>Structured Payload View</strong> to view the payload in a structured node tree. Select a node in the tree to copy the element's JSONPath. If you add new elements in the <strong>Target</strong> field manually, you can paste this JSONPath under an element's advanced options. |
| Generate Target     | Select <strong>Generate Target</strong> to create the step's output structure from your example payload. Your output data structure appears in the <strong>Target</strong> field. Child elements for each object are automatically generated as type String. Alternatively, you can manually create your target complex object by adding elements in the <strong>Target</strong> field. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Target  | View or edit the JSON payload's output structure. Create a structured output by clicking **Generate Target**, or manually add elements. Each element contains the following information in the Edit Object view:  
  - **Label**: Data pill label. By default, the system uses the JSON key name.  
  - **Name**: Internal name for the output element.  
    - **Note**: Exclamation marks, double colons, the @ symbol, or numbers only aren't valid values for an element's name.  
  - **Type**: Data type, which must be String, Object, Array.String, or Array.Object. The top-level element must be an Object.  
  - **Mandatory**: Toggle to make the element required. This only applies to elements of type String.  
  - **Add child item**: Select the add child item icon (➕) to add a nested child element.  
  
Elements of type Object contain the **Save as Template** advanced option, which allows you to save your object's structure as a complex object template. You can then use this template to define the schema of an Object output for your action.  
For elements of type String, you can also add a max length, hint, and default value as advanced options.  
In the Target header, select **Exit Edit Mode** when you're done making changes to your output's structure. You can then select the toggle advanced inputs icon (🔧) to view the following options for each element:  
  - **JSONPath**: Path to the element. Modify the JSONPath to change how your source data elements map to elements in your output. If manually adding elements, you can copy the JSONPath from a node in your example payload and paste it under an element's advanced options.

JSON parser step example

This example tracks newly created problems from a production instance as defects in a test instance. First, create a new action named **Parse Problems from Production**. Add a REST step to retrieve a list of problems from the production instance. Then, add the JSON parser step to parse the REST step’s **Response Body** and provide a complex object output that represents the Problem [problem] table’s schema. Finally, create an action output of type Object named **Problems from Production**. Drop the root data pill from the JSON parser step into this output’s value field.

Next, create a new flow named **Sync New Problems**, which is triggered daily at midnight. The first action in the flow is the **Parse Problems from Production** action. Then, add a **For Each** flow logic block and drop the **Problems from Production > response** data pill into the **Item** field. Within the **For Each** block, add an **If** flow logic block that checks if each problem’s state is new, then creates a defect record in the test instance whose assignment group and short description is mapped to each new problem from the production instance.
Sync New Problems flow

Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name Value Pairs</td>
<td>The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The Name becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.</td>
</tr>
<tr>
<td></td>
<td>• Name: short_description</td>
</tr>
<tr>
<td></td>
<td>• Value: [action]-&gt;[short_description]</td>
</tr>
</tbody>
</table>

When the system formats the name-value pair as JSON:

`"short_description": "[action]->[short_description]"`

When the system formats the name-value pair as XML:
<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit if empty</td>
<td>The option to exclude a name-value pair if the value is empty or null.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible after clicking the down arrow to display advanced options.</td>
</tr>
<tr>
<td>Output Format</td>
<td>The payload file format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>JSON</strong>: Select to format the payload as a JSON document.</td>
</tr>
<tr>
<td></td>
<td>• <strong>XML</strong>: Select to format the payload as an XML document.</td>
</tr>
<tr>
<td>Namespace</td>
<td>The XML namespace to apply to each element. For example, when the namespace is set to <code>incident</code>:</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is only visible when the <strong>Output Format</strong> is set to <strong>XML</strong>.</td>
</tr>
<tr>
<td>Include Outer Structure</td>
<td>The option to include or exclude a top level container appropriate to the output format. When the <strong>Output Format</strong> is JSON, curly braces contain the name-value pairs. When the <strong>Output Format</strong> is XML, a specified XML element contains the name-value pairs.</td>
</tr>
<tr>
<td></td>
<td>For example, when the system formats the name-value pair as JSON:</td>
</tr>
<tr>
<td></td>
<td><code>{   &quot;short_description&quot;: &quot;[action]-&gt;[short_description]&quot; }</code></td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as XML:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;xml&gt;   &lt;short_description&gt;[action]-&gt;[short_description]&lt;/short_description&gt; &lt;/xml&gt;</code></td>
</tr>
<tr>
<td>Send Empty Structure</td>
<td>The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload.</td>
</tr>
<tr>
<td></td>
<td>For example, when the system formats an empty structure as JSON:</td>
</tr>
<tr>
<td></td>
<td><code>{ }</code></td>
</tr>
<tr>
<td></td>
<td><code>&lt;xml&gt;   &lt;short_description&gt;&lt;/short_description&gt; &lt;/xml&gt;</code></td>
</tr>
<tr>
<td>Fields</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| {} | When the system formats an empty structure as XML:  
<xml></xml>  
Disable this option to produce an empty payload.  
Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values. |
| Parent Node | The name of the XML element that contains the name-value pairs. The default parent node element is `xml`.  
**Note:** This field is only visible when the **Output Format** is set to **XML** and the option to **Include Outer Structure** is enabled. |
| Preview | The read-only payload the step produces. |

**PowerShell step**

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
</tbody>
</table>
### Field Description

- **Explicit Remoting (Most Common):** Establish a connection with and run the script on a remote server.

- **Implicit Remoting (Advanced):** Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the **Remote name prefix** and **Modules to import** fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.

- **Run on a MID Server or have your script establish a remote session:** Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.

  **Note:** To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft's documentation on Windows Powershell parameters at [https://technet.microsoft.com/](https://technet.microsoft.com/).

<table>

<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>• Name: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>• Type: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>• Value: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td>⚠ Note: This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is Run on a MID Server or have your script establish a remote session, some reserved variables are available in addition to input variables.
Input variable syntax

By default, prefix variable names with a $ character. For example, if an input variable is named `message`, use `$message` to access the variable in script.

If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see MID Server parameters.

Reserved variables

When the Remoting Type is Run on a MID Server or have your script establish a remote session, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>

The following variable names are reserved for internal processing and should not be used as input variables.

- `script`
- `useCred`
- `isMid`
- `isDiscovery`
- `debug`
- `user`
REST step
Send an outbound REST web service request to an external system.

Note: REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>

| Request Body [Text]         | Body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the sys_id of the attachment record containing the response.  
**Note:** This field is editable if you select **Text** from the Request Type list. |
| Attachment                  | Attachment record containing the request. You can look up or create this record in a prior step and define it as an input variable. Create it using the JSONStreamingBuilder and XMLStreamingBuilder APIs in the Script step.                                                            
**Note:** This field is available when you select **Binary** from the Request Type list. |
| Name, Type, Value           | Content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type.  
For attachments, specify:  
• **Type:** attachment.  
• **Value:** The sys_id of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.  
**Note:** These fields are available when you select **Multipart** from the Request Type list. |
| Name, Value                 | Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.  
**Note:** This field is available when you select **Form URL-Encoded** from the Request Type list.                                                                                                                                |
<p>| Enable Retry Policy         | Option to enable the retry policy. For more information, see <strong>Retry policy</strong>.                                                                                                                                                                                                 |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This check box is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Save As Attachment</td>
<td>Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Name of the attachment created by the REST response. For example, rest-response.txt.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Save As Attachment is selected.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Target record to which the attachment is associated. The target record must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Save As Attachment is selected.</td>
</tr>
</tbody>
</table>

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the glide.pf.rest.response_payload_max_size system property. This system property supports a maximum value of 10 MB.

**OpenAPI support in the REST step**

Populate REST step fields and action inputs with information imported from an OpenAPI Specification. Import specifications by providing a URL to the YAML or JSON, or copying and pasting content.
Benefits
OpenAPI support in the REST step offers these benefits.

- Use information imported from an OpenAPI Specification to configure REST step operations, HTTP methods, parameters, request body, path, and headers.
- Review available API operations without leaving the Flow Designer interface.
- Generate inputs required for the REST step to send valid requests to an OpenAPI service and add them to the REST step in the correct location.

Note: Always review REST step values imported from an OpenAPI Specification before sending a request. Remove parameters, headers, and inputs that the API does not require.

Generated inputs
When you import an OpenAPI Specification, the system creates any required inputs and adds them to the REST step form where appropriate. At runtime, the system sends a REST request that contains input values provided to the action. For example, if an API requires a name parameter passed in the request, the system creates a name input and adds it to the REST step. When you add the action to the flow, name becomes an input to the action.

The system maps OpenAPI data types to Flow Designer data types. For example, if the OpenAPI Specification requires a user object, then the system creates a complex data object as input. For more information, see Complex data.

Specification size limit
By default, the system can import OpenAPI Specifications up to 10 MB. To increase the import size, update the glide.rest.openapi.max_request_size system property. The maximum value is 100 MB.

Specification management
Import an OpenAPI Specification by selecting options in the REST step. For more information, see REST step. Importing an OpenAPI Specification creates a record in the OpenAPIs [sys_openapi] table. You can view or delete specification records directly from this table. To update a specification, delete it and import it again.

Design considerations
Create a REST step from an OpenAPI Specification with these considerations in mind.

- Remove unnecessary REST step parameters
When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.

**Make input labels user-friendly**

Ensure that input labels required for the REST step are clear and understandable. Clear labels enable flow designers to easily understand the required inputs when using the action in a flow.

**Remove inputs that do not require flow designer configuration**

When importing an OpenAPI Specification, the system adds all inputs present in the specification to the action input section. Remove any inputs that do not require a flow designer to configure. For example, if a REST step variable receives a value from another step in the action, an action input is not required.

**Avoid changing the API operation**

Changing the value of the API Operation field removes all values dependent on that operation. If you configure the OpenAPI Specification values in the REST step form, then change the operation, the system does not save your configuration. Values that are entered manually by a user are not affected.

**Limitations**

Create a REST step from an OpenAPI Specification with these limitations.

**Request body media types**

The request body only supports JSON and XML-based media types. If the selected operation from the imported OpenAPI Specification contains a request body with a different media type, the system adds a data pill of type String to the Request body field.

**OpenAPI 3.0 components**

OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the REST step supports some, but not all of these components. The REST step does not currently support these components.

- Schema Object: oneOf, anyOf properties
- Discriminator Object
• Info object: termsOfService, contact, license fields
• Example Object
• Link Object
• Callback Object
• Security Scheme Object
• Security Requirements Object
• Tag Object
• External Documentation Object
• Server Object
• Specification extensions
• Recursive references

More information on these components is available in the OpenAPI documentation. See OpenAPI Specification.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

⚠ **Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

• Action designers need the web_service_admin role to perform these web services tasks.
  ◦ Select WSDL
  ◦ Load new WSDL
  ◦ Select a WS-Security policy

• The ServiceNow® MID Server doesn’t support WS-Security policies

<td>Option to exclude a name-value pair if the value is empty or null.</td>
</tr>
</tbody>
</table>
**SOAP response size limit**

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**SSH step**

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

*Note:*

- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

**Roles and availability**

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Sanitizing inputs**

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the Command input.

</tr>
</tbody>
</table>
For more information, see SSH credentials.

**Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()}` parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()}` parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a function from
# myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py
```

To see the list of available MID Server scripts, navigate to **MID Server > Script Files**.

**XML parser step**

Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.

To learn more about complex objects, see **Complex data**.
Note: The XML parser step is not available in the base system and requires the IntegrationHub Standard Pack Installer. After the required plugin is activated, the step is visible under Integrations.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Payload size limit

At runtime, XML parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information, see Data Stream actions and pagination.

At design time, XML parser step supports sample payloads up to 64,000 characters.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Source  | In the **Source data** field, select or drag a data pill that contains the source XML data. For example, a REST step **Response Body** data pill. At runtime, values from the data source populate the complex object output. Under Source data and in the scripting window, enter an example payload to generate a complex object. For example, if parsing the response from a REST API step that returns a list of users, enter the expected XML for a single user. This field accepts XML with the following limitations:

• XML namespaces are not applied to the complex object. More than one namespace in an XML file is not supported and generates an error message.

• Multidimensional arrays are not supported.

• Some special characters are not supported, such as hyphen and period. Double colons (::) are not supported in attribute values.

• Payloads larger than 2 MB cannot be saved and generate an error message. However, if working with a large example, you can generate the complex object and delete the example payload before saving the step. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structured Payload View</td>
<td>Select a view for the example payload.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Raw (edit mode):</strong> Displays editable XML.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Structured:</strong> Displays XML in a tree view. Click an element in the tree to copy the element XPath. If creating complex data in the <strong>Target</strong> field manually, you can paste the XPath into the target XPath field.</td>
</tr>
<tr>
<td>Generate Target</td>
<td>Select <strong>Generate Target</strong> to create the step’s output structure from your example payload. Your output data structure appears in the <strong>Target</strong> field. Child elements for each object are automatically generated as type String. Alternatively, you can manually create your target complex object by adding elements in the <strong>Target</strong> field.</td>
</tr>
<tr>
<td>Target</td>
<td>View or edit the XML payload’s output structure. Create a structured output by clicking <strong>Generate Target</strong>, or manually add elements.</td>
</tr>
<tr>
<td></td>
<td>Each element contains the following information in the <strong>Edit Object</strong> view:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Label:</strong> Data pill label. By default, the system uses the XML element’s name.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name:</strong> Internal name for the output element.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Note:</strong> Exclamation marks, double colons, the @ symbol, or numbers only aren’t valid values for an element’s name.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> Data type, which must be String, Object, Array.String, or Array.Object. The top-level element must be an Object.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Mandatory:</strong> Toggle to make the element required. This only applies to elements of type String.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Add child item:</strong> Select the add child item icon (+) to add a nested child element.</td>
</tr>
<tr>
<td></td>
<td>Elements of type Object contain the <strong>Save as Template</strong> advanced option, which allows you to save your object’s structure as a complex object template. You can then use this template to define the schema of an Object output for your action.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
| For elements of type String, you can also add a max length, hint, and default value as advanced options. In the Target header, select **Exit Edit Mode** when you’re done making changes to your output’s structure. You can then select the toggle advanced inputs icon (idores) to view the following options for each element:
  - **XPath**: Path to the element. Modify the XPath to change how source data elements map to complex data variables. If manually adding complex data variables, you can copy the XPath from the **Payload view** field and paste it in a complex data variable XPath field to ensure the correct hierarchy. Conditional XPath expressions are not supported.

### IntegrationHub Remote Process Sync

IntegrationHub Remote Process Sync enables you to set up one-way or bidirectional integrations among multiple ServiceNow® instances so that your process flows stay in sync.

**Note:** IntegrationHub Remote Process Sync requires a subscription to the IntegrationHub Enterprise package. For more information, see Request IntegrationHub.

An IntegrationHub Remote Process Sync integration lets you span automated workflows for your business process across multiple ServiceNow instances. As a service provider, keep multiple customer instances in sync automatically, using Flow Designer subflows to automate your process’s workflows for all of your customers.
Benefits
IntegrationHub Process Sync provides you with these benefits:

• Automate cross-enterprise automated processes that span multiple instances, keeping various process stakeholders up-to-date

• Manage how to synchronize and correlate your record, attachment, and journal field data across multiple instances

• Ensure order delivery for data updates in remote instances, using a standalone correlation engine and queueing system

• Manage and troubleshoot errors and outages in your automated multi-instance processes with Flow Designer’s built-in execution engine

Roles
By default, Remote Process Sync provides the following roles that you can assign to users:
# Role Users with this role can

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ih_process_sync</code></td>
<td>Create, update, or delete process sync definitions and related records.</td>
</tr>
<tr>
<td><code>ih_process_sync_api</code></td>
<td>Access Remote Process Sync APIs only.</td>
</tr>
<tr>
<td><code>ih_process_sync_run_as</code></td>
<td>Run outbound and inbound flows associated with a process sync definition. This user must have access to the tables for which any records are created or updated in the flow.</td>
</tr>
</tbody>
</table>

## Domain separation

You can use Remote Process Sync to synchronize process flows among multiple domain-separated instances. In a domain-separated environment, the following conditions apply:

1. **When building your integration**
   - Configuration tables have a `sys_domain`, and data is domain separated.
   - Configuration tables are meant to be in the same domain as the parent configuration record.
   - Subflows may be chosen from the current or any parent domain.
   - No tables have `sys_overrides`, and thus cannot override business rules or UI actions from parent domains.

2. **When your integration runs**
   - Only records from the configuration domain and associated child domains are captured.
   - Queue tables have a `sys_domain`. The outbound record is stored in the same domain as the captured source record. The inbound record is stored in the same domain as the Inbound API user in the Remote System record.
   - The outbound subflow runs in the same domain as the queued record.
   - The inbound subflow runs in the same domain as the user specified in the Remote System record's Run Inbound Flows as field.

## Getting started

Before deciding to move forward with Remote Process Sync as your integration framework, consider how this framework compares to other multi-instance Now Platform® integrations. While solutions such as Instance Data Replication and the Remote Instance spoke support simple multi-instance integrations, Remote
Process Sync supports more complex multi-instance integration use cases, focusing on integrating instances by high-level business processes.

Comparison of Instance Data Replication, Remote Instance spoke, and Remote Process Sync

<table>
<thead>
<tr>
<th>Instance Data Replication</th>
<th>Remote Instance spoke</th>
<th>Remote Process Sync</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Is optimized for replicating an entire table from one instance to another instance</td>
<td>• Supports ad-hoc integrations in Flow Designer</td>
<td>• Is process-oriented</td>
</tr>
<tr>
<td>• Supports syncing of data in bulk to build foundation for your integration</td>
<td>• Export, import, and manage data in a single environment</td>
<td>• Supports data transformations and mapping via Flow Designer</td>
</tr>
<tr>
<td>• Business rules can trigger post-replication workflows, such as send notifications or updating records</td>
<td>• Queries data from remote instances on-demand</td>
<td>• Focuses on executing cross-instance workflows</td>
</tr>
<tr>
<td>• Data that is in transit during a crash is recoverable</td>
<td>• Interacts with standard Platform APIs, such as:</td>
<td>• Has a standalone correlation framework that supports multi-record and multi-instance correlation</td>
</tr>
<tr>
<td>• Supports data transformations and mapping</td>
<td>• Import Set</td>
<td>• Supports domain separation</td>
</tr>
</tbody>
</table>

When you're ready to start building and managing a Remote Process Sync integration, learn the basics of Getting started with Remote Process Sync.

Getting started with Remote Process Sync

Learn the basics of setting up a Remote Process Sync integration in order to link the automated processes among two or more ServiceNow® instances together.

Note: IntegrationHub Remote Process Sync requires a subscription to the IntegrationHub Enterprise package. For more information, see Request IntegrationHub.

Before getting started with your Remote Process Sync integration

Before deciding to move forward with Remote Process Sync as your integration framework, consider how this framework compares to other multi-instance Now Platform® integrations. While solutions such as Instance Data Replication and the Remote Instance spoke support simple multi-instance integrations, Remote Process Sync supports more complex multi-instance integration use cases, focusing on integrating instances by high-level business processes.

<td>Requires full privileges when local and remote instances connect</td>
<td>Supports domain separation</td>
</tr>
</tbody>
</table>

If you choose to use Remote Process Sync as your multi-instance integration framework, the next step is to learn about the difference between:

1. Building your integration, and
2. Managing your integration

*Building your integration* involves creating and configuring a process sync definition and its related records. For more information on how to get started with building your Remote Process Sync integration, either step through an example of how to *Build your first Remote Process Sync integration*, or learn about *Process sync definitions*. 
Managing your integration involves monitoring the outbound and inbound queues and checking for errors related to any triggered process sync definitions. For more information on how to monitor and check for errors with your Remote Process Sync integration, see Outbound queues and inbound queues and Monitoring and troubleshooting your integration. You may also want to periodically evaluate the outbound and inbound flows that run automatically for your integration and determine whether to make any changes to these flows in Flow Designer.
Note: Both building and managing a Remote Process Sync integration on your instance also requires that you collaborate effectively with users of the remote instance, or remote instances. Be sure to meet with the stakeholders involved in your integration regularly to plan, manage, and continually improve the automated business processes that your multi-instance integration handles.

Managing your Remote Process Sync integration

**Process sync definitions**

A *process sync definition* contains all of the configurations for your Remote Process Sync integration. Start by creating a new Process Sync Definition record for your integration. Navigate to **IntegrationHub > Remote Process Sync > Process Sync Definitions**, and then click **New**. In the Process Sync Definition form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name that accurately describes which part of your business process your instance handles. For example, if users on your instance...</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Optionally, describe which part of your business process that this process sync definition handles.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically set to your current application scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>If your process relates to a specific domain, choose a domain other than global. For more information, see .</td>
</tr>
</tbody>
</table>

Click **Submit**, and then you can see your newly created Process Sync Definition record in the list. Next, select the Process Sync Definition record that you just created. You can see that your Process Sync Definition record has the following related lists:

- Capture Definitions
- Process Events
- Remote Systems
- Outbound Flows
- Inbound Flows

Refer to the following sections to learn how to set the configurations for each of these related items.

**Capture definitions**

A **capture definition** specifies when your instance should send data to a remote instance and what data your instance should send. A capture definition contains the configurations for your process sync definition's **trigger** and **captured fields**. The trigger specifies what record operation, such as creating, updating, or deleting a record, causes your instance to send data to a remote instance. When a Capture Definition is triggered, it creates an object from a source record, which contains captured fields. Then, the outbound flow starts running and correlates the captured fields from the source record to fields in a related record on the remote system.

A Capture Definition record has the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>In the Capture Definition form, use the lookup using list icon (🔍) to choose the Process Event record that you want to associate with this capture definition. If no process event exists yet, enter a name for your process event, and the system automatically creates a Process Event record and associates the record with your capture definition. For more information, see Process Events.</td>
</tr>
<tr>
<td>State</td>
<td>Choose Active to activate this capture definition so that the parent process sync definition triggers when the conditions you set in this form's Trigger section are met.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a value for the order in which you want your capture definition to trigger relative to other capture definitions. Lower order values are honored before higher order values.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically set to your current application scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>If your process relates to a specific domain, choose a domain other than global. For more information, see .</td>
</tr>
</tbody>
</table>

In the Trigger section, choose an authorized source table whose records you want to trigger your process sync definition. You can also add field conditions that, when met, cause your process sync definition to trigger. When the conditions are met for the trigger specified in your capture definition, any outbound flows associated with your process sync definition start running. For more information, see Outbound flows and inbound flows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table Name</td>
<td>Choose an authorized table whose records will trigger your process sync</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Filter</td>
<td>Use the condition builder to add conditions that, when met, will trigger your process sync definition. For example, selecting <code>[State] &gt; [is] &gt; [Work In Progress]</code> causes your process sync definition to trigger every time a record in your selected table’s State is updated to Work In Progress.</td>
</tr>
</tbody>
</table>

Lastly, in the Capture section, add fields to the Selected list that you want to include in the payload for your outbound flow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include fields</td>
<td>Add fields to the Selected list which you want to sync with fields in the remote instance every time your process sync definition triggers. Use the add item icon () to add fields from the Available list to the Selected list.</td>
</tr>
</tbody>
</table>

**Note:**
- When your integration runs, the outbound payload that is sent to remote instances always contains these captured fields, regardless of whether they were updated or not.
- You can map these captured fields to fields in the remote instance by configuring mappings in the remote instance's inbound flow that is associated with the same process event. For more information, see Outbound flows and inbound flows.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include Attachments</td>
<td>If selected, any attachments that are associated with triggering records on your local instance will sync with attachments in correlated records on the remote instance. For more information, see Note: Only interactive session changes are captured by Capture Definitions. Non-interactive session changes, such as flows or business rules updating records, do not trigger a Process Sync Definition.</td>
</tr>
</tbody>
</table>

**Process events**

A process event specifies which part of your business process begins in your local instance and ends in the remote instance. The Process Event record in your local instance and in the remote instance should have the same name because the process event signifies the link between these instances that allows them to share parts of the same business process. A Process Event record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name that describes the part of your business process that begins in your local instance and ends in the remote instance. For example, if users in your instance request software that will be provisioned in the remote instance, you can name the process event <strong>User requests software</strong>. Note: An administrator for the remote instance, or remote instances, must also create a process event with the same name that you use here. Creating these process events in separate instances creates the logical link that allows you to integrate data among multiple instances.</td>
</tr>
</tbody>
</table>
Remote systems

A remote system contains the configurations for the outbound and inbound connections related to another ServiceNow instance. A Remote System record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name that describes the remote instance. For example, if the instance is managed by one of your customers, Customer A, enter Customer A's Instance in the name field.</td>
</tr>
<tr>
<td>Description</td>
<td>Optionally, enter more details that describe the remote instance's general purpose in your business process.</td>
</tr>
<tr>
<td>External ID</td>
<td>Enter the Sys ID for the Remote System record that shares the same process event with your instance. To get a record's Sys ID, select Copy sys_id from the context menu (≡) in the record's form view. For example, if your Remote Process Sync integration spans two instances, Instance A and Instance B, use the Sys ID from Instance A's Remote System record as the External ID in Instance B and vice-versa. Connecting the Sys IDs and External IDs in this way helps multiple instances know which instance to connect to when the automated outbound and inbound flows run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically set to your current application scope.</td>
</tr>
<tr>
<td>Domain</td>
<td>If your process relates to a specific domain, choose a domain other than global. For more information, see.</td>
</tr>
<tr>
<td>Error Subflow</td>
<td>Select the lookup using list icon ( ) to find and choose a subflow that you want to run when the connection to the remote instance fails. The subflow that you select will run whenever your local instance can’t connect to the remote instance after your process sync definition triggers. You can view remote systems that your instance fails to connect to by navigating to IntegrationHub &gt; Remote Process Sync &gt; Remote Systems - With Errors.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the lookup using list icon ( ) to find and choose a Connection &amp; Credential Alias record that you want to use to authenticate with the remote instance. If you haven’t set up a Connection &amp; Credential Alias record for this purpose yet, create a new record with Connection and Credential in the Type field. For more information, see Create a Connection and Credential alias.</td>
</tr>
<tr>
<td>Outbound State</td>
<td>Set to Disabled by default. You can change this field’s value to Active by selecting the Validate and Activate Remote System related link in this Remote System record’s form view after you finish creating the record.</td>
</tr>
<tr>
<td>Inbound API User</td>
<td>User who can connect to the remote instance. This user must have credentials that match those of the</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run Inbound Flows as</td>
<td>Select the lookup using list icon to find and choose a user that you want to run the inbound flow for the associated process event. Use this option to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Settings for the Run as option in a flow don’t apply to child subflows.</td>
</tr>
<tr>
<td>Inbound State</td>
<td>Set to Disabled by default. You can change this field’s value to Active by selecting the Validate and Activate Remote System related link in this Remote System record’s form view after you finish creating the record.</td>
</tr>
</tbody>
</table>

**Note:** After creating a Remote System record with the appropriate fields filled in, you must then click the Validate and Activate Remote System related link. Clicking this link checks that you can successfully connect to the remote instance and then activates the outbound and inbound connections.

After creating a Process Event record and a Remote System record, you can then associate Flow Designer subflows with these records so that automated actions run whenever your process sync definition triggers.

**Outbound flows and inbound flows**
An outbound flow specifies which Flow Designer subflow your instance uses to:
1. Process local data, as fields captured in the capture definition, that will be sent to the remote instance
2. Correlate this data with data on the remote instance
3. Send this data to the remote instance

An Outbound Flow record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>Select the lookup using list icon (🔍) to find and choose the Process Event record that you want to associate with this outbound flow. The process event that you select should logically relate to the automated actions that the outbound flow will run when your process sync definition triggers. For example, if your outbound flow maps fields from a Service Catalog Item Request record submitted by users in your local instance to related fields in the remote instance, then choose a process event related to users making Service Catalog item requests.</td>
</tr>
<tr>
<td>Outbound Subflow</td>
<td>Select the lookup using list icon (🔍) to find and choose the Flow Designer subflow that you want to run whenever your process sync definition triggers. Your instance provides you with a Remote Process Sync Outbound Flow Template - Basic subflow that you can use as a template in any Outbound Flow record. However, you can customize the Remote Process Sync Outbound Flow Template - Basic subflow so that it meets the needs of your business process. You can customize this subflow using the Remote Process Auto-Start feature.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td><strong>Remote System</strong></td>
</tr>
<tr>
<td></td>
<td>Select the lookup using list icon (🔍) to find and choose the Remote System record that you want to connect to when your outbound flow runs automated actions that require authenticating with the remote instance. The Remote System record you choose should be the remote instance that handles the inbound part of your Remote Process Sync integration.</td>
</tr>
<tr>
<td></td>
<td><strong>Application</strong></td>
</tr>
<tr>
<td></td>
<td>Automatically set to your current application scope.</td>
</tr>
<tr>
<td></td>
<td><strong>Domain</strong></td>
</tr>
<tr>
<td></td>
<td>If your process relates to a specific domain, choose a domain other than global. For more information, see .</td>
</tr>
</tbody>
</table>

An inbound flow specifies which Flow Designer subflow your instance uses to:

1. Correlate data on the local instance with the data sent from the remote instance
2. Map fields sent from the remote instance to fields on the local instance
3. Process data sent from the remote instance to the local instance

An Inbound Flow record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>Select the lookup using list icon (🔍) to find and choose the Process Event record that you want to associate with this inbound flow. The process event that you select should logically relate to the automated actions that the inbound flow will run when your local instance is ready to handle the</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>payload sent by the remote instance. For example, if your inbound flow maps fields from a Service Catalog Item Request record that users in the remote instance submitted to related fields in your local instance, then choose a process event related to users making Service Catalog item requests.</td>
</tr>
<tr>
<td>Inbound Subflow</td>
<td>Select the lookup using list icon ( ) to find and choose the Flow Designer subflow that you want to run whenever your instance handles data sent by a remote instance. Your instance provides you with a Remote Process Sync Inbound Flow Template - Basic subflow that you can use as a template in any Inbound Flow record. However, you can customize the Remote Process Sync Inbound Flow Template - Basic subflow so that it meets the needs of your business process. You can customize this subflow using the Remote Process Sync inbound actions. For more information, see .</td>
</tr>
<tr>
<td>Remote System</td>
<td>Select the lookup using list icon ( ) to find and choose the Remote System record that you want to connect to when your inbound flow runs automated actions that require authenticating with the remote instance. The Remote System record you choose should be the remote instance that handles the outbound part of your Remote Process Sync integration.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically set to your current application scope.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Domain</td>
<td>If your process relates to a specific domain, choose a domain other than global. For more information, see .</td>
</tr>
</tbody>
</table>

⚠️ **Note:** Each outbound flow and inbound flow must always be associated with one process event and one remote system only.

Before simply choosing the system-provided Remote Process Sync Outbound Flow Template - Basic or Remote Process Sync Inbound Flow Template - Basic subflows for your process sync definition, you may want to customize these subflows in Flow Designer. For an example of how to customize these template subflows, see .

### Syncing attachments

You can choose to send attachments associated with your local record by using the Include Attachments option in your capture definition. However, Remote Process Sync handles attachments differently from other data in your integration due to security and attachment file size issues:

- The first time that a record in your integration syncs, all attachments are sent in the outbound payload. Subsequent syncs can send either changes to attachments or all attachments.

- Attachment metadata is always sent with the outbound payload. This metadata includes an encrypted synthetic key, hash, file name, content type, and size.

- The remote instance decides which attachments to receive by comparing each hash and file name from the inbound payload to those on the instance. Then, the following process occurs:
  1. The originating system validates the key and pushes attachments to the correlation record.
  2. The originating system notifies the remote system that the attachments are complete.
  3. The remote system moves the attachments from the correlation record to the target record.

### Syncing comments and work notes

In your integration, comments are work notes are synced among instances only when changes occur to those journal fields. Change metadata is included in payloads so that remote systems can identify which user created the comment or work note and when it was created.
Outbound queues and inbound queues

After building your Remote Process Sync integration by creating and configuring the records mentioned in the previous sections, you can then manage your integration by monitoring the outbound queue and inbound queue in your instance.

An outbound queue contains the status, error information, retry data, and flow context information for outbound subflows that ran for data that was sent out of your instance. To view the records in your outbound queue, navigate to IntegrationHub > Remote Process Sync > Outbound Queue State.

An Outbound Queue State record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date that the automated action in your integration occurred</td>
</tr>
<tr>
<td>Error info</td>
<td>Status message for the outbound payload</td>
</tr>
<tr>
<td>Process Event</td>
<td>Process event</td>
</tr>
<tr>
<td>Remote System</td>
<td>Remote System</td>
</tr>
<tr>
<td>Retry metadata</td>
<td>Metadata for any retry policies configured for your outbound payload</td>
</tr>
<tr>
<td>Status</td>
<td>Processing status of the payload in the outbound queue. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Ready</td>
</tr>
<tr>
<td></td>
<td>• Processed</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Skipped</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain in which the automated action for your integration ran</td>
</tr>
<tr>
<td>Outbound Subflow Context</td>
<td>Sys ID of the execution record for the outbound flow that processed the payload</td>
</tr>
</tbody>
</table>

Note: You can get more detailed troubleshooting information for outbound payloads in associated Outbound Queue records. To access these records, navigate to IntegrationHub > Remote Process Sync > Outbound Queue.
An inbound queue contains the status, processing sequence, and correlation information for inbound subflows that ran for data that was sent from a remote instance to your local instance. To view the records in your inbound queue, navigate to IntegrationHub > Remote Process Sync > Inbound Queue.

An Inbound Queue record has the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sequence</td>
<td>Order in the queue. A lower number is processed before a higher number.</td>
</tr>
<tr>
<td>Status</td>
<td>Processing status of the payload in the inbound queue. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Ready</td>
</tr>
<tr>
<td></td>
<td>• Processed</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Skipped</td>
</tr>
<tr>
<td>Note:</td>
<td>If an Inbound Queue record has an Error status, change the status to Ready to retry processing the inbound payload.</td>
</tr>
<tr>
<td>Process Event</td>
<td>Process event associated with the integration action</td>
</tr>
<tr>
<td>Operation</td>
<td>Type of record operation that the remote instance performed, which caused the remote instance to trigger and send data. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Create</td>
</tr>
<tr>
<td></td>
<td>• Update</td>
</tr>
<tr>
<td></td>
<td>• Delete</td>
</tr>
<tr>
<td>Transform Context</td>
<td>Sys ID of the execution record for the inbound flow that processed the payload</td>
</tr>
<tr>
<td>Local Correlation ID</td>
<td>Correlation ID on the local instance</td>
</tr>
<tr>
<td>Remote Correlation ID</td>
<td>Correlation ID on the remote instance</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote System</td>
<td>Remote System record associated with the instance that sent the data</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain in which the automated action for your integration ran</td>
</tr>
<tr>
<td>Payload</td>
<td>String as JSON payload for inbound data</td>
</tr>
</tbody>
</table>

**Note:** Both the Outbound Queue and Inbound Queue tables are maintained by table cleaners that remove records from these tables every 30 days.

### Monitoring and troubleshooting your integration

You can use the following tables to monitor your Remote Process Sync integration, once it is built and running:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML Stats</td>
<td>View the <code>process_sync_queue</code> section for information about the outbound and inbound queues for your integration, including the size of the queue as well as error and processing rates.</td>
</tr>
<tr>
<td>Outbound Queue</td>
<td>View the capture data for records that are staged to be sent out of your instance.</td>
</tr>
<tr>
<td>Outbound Queue State</td>
<td>View the state of records in the Outbound Queue table.</td>
</tr>
<tr>
<td>Inbound Queue</td>
<td>View the combined inbound queue and record table.</td>
</tr>
<tr>
<td>Logs</td>
<td>Start by turning on debugging by setting the <code>glide.ih.process.sync.debug</code> system property to <code>true</code>. Then, scan the Logs for error messages beginning with <code>OutboundQueueDao</code> and <code>InboundQueueDao</code> to find log messages with more...</td>
</tr>
</tbody>
</table>
If an error occurs with your Remote Process Sync integration, begin by confirming whether the error is a connection error or a data processing error:

**Connection errors**

Outbound connection errors automatically retry several times before setting the Remote System record's Outbound State to Error. If errors keep occurring for an outbound connection, confirm that nothing has changed with the Remote System's Inbound API User, such as a change in the user's credentials. Then, validate and activate the Remote System record again.

**Data processing errors**

Data processing errors typically occur as a result of errors in an outbound flow or inbound flow. To troubleshoot these errors, you can add error handling actions to your flow, such as a Log action or Send Email action, when the flow's State changes to Error. You can also add actions that reprocess or skip processing of records in the Outbound Queue or Inbound Queue tables if an error with the flow occurs.

**Build your first Remote Process Sync integration**

Step through an example of how to build a Remote Process Sync integration in order to link the automated processes of two ServiceNow® instances together.

**Before you begin**

- Activate Remote Process Sync on each instance in your integration by purchasing the IntegrationHub Enterprise package. For more information, see Request IntegrationHub.
- Activate the explicit roles security feature on each instance in your integration. For more information, see Explicit Role plugin.
- Learn about how to build and manage an IntegrationHub Remote Process Sync integration by checking out Getting started with Remote Process Sync.
- Confirm the instances that you'll link together in the following example are not production instances. It is recommended to test this example on sub-production instances only in order to avoid overwriting any important data on either instance. You might also want to use a Personal Developer Instance for testing this example integration.
• Confirm that you do not have any existing business rules, workflows, or Flow Designer flows whose logic will conflict with the flows we'll create in the following example.

• Role required: admin

About this task
In the following example, you'll step through how to link two ServiceNow instances' automated processes together. The use case for this example is that a customer creates requests for hardware that are fulfilled by a vendor. We'll refer to the customer's instance as Instance A, and the vendor's instance as Instance B. We'll start by setting up credentials in each instance that can access the remote instance. We'll also create a user in each instance that can run the outbound and inbound flows.

Procedure
1. In Instance A, ensure that your domain is set to global, and then navigate to System Security > Users and Groups > Users.

2. Select New to open a new User form view, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Enter rps.api.instance.a</td>
</tr>
<tr>
<td>First name</td>
<td>Enter RPS API User for Instance A</td>
</tr>
<tr>
<td>Password</td>
<td>Enter rpsdemoa</td>
</tr>
</tbody>
</table>

Finally, select Submit to finish creating the User record.

3. From the list, select the User record that you just created.

   a. Navigate to and select the Roles related list.

   b. Select Edit... to configure the user's roles.

   c. In the search window above Collection, enter ih_process_sync_api.

   d. Select ih_process_sync_api and snc_external from the Collection list, and then select the add button ( ) to add these roles to the Roles List.
Note: The snc_external role restricts the access of external users to only the resources they have been explicitly granted access to.

e. Select Save.

4. Select New to open a new User form view, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Enter rps.run.as</td>
</tr>
<tr>
<td>First name</td>
<td>Enter RPS Run as User</td>
</tr>
<tr>
<td>Password</td>
<td>Enter rpsdemoa</td>
</tr>
</tbody>
</table>

Finally, select Submit to finish creating the User record.

5. From the list, select the User record that you just created.
   a. Navigate to and select the Roles related list.
   b. Select Edit... to configure the user’s roles.
   c. In the search window above Collection, enter ih_process_sync_run_as.
   d. Select ih_process_sync_run_as from the Collection list, and then select the add button ( ) to add that role to the Roles List.
   e. select Save.

6. In Instance B, ensure that your domain is set to global, and then navigate to System Security > Users and Groups > Users.

7. Select New to open a new User form view, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Enter rps.api.instance.b</td>
</tr>
<tr>
<td>First name</td>
<td>Enter RPS API User for Instance B</td>
</tr>
<tr>
<td>Password</td>
<td>Enter rpsdemob</td>
</tr>
</tbody>
</table>

Finally, select Submit to finish creating the User record.

8. From the list, select the User record that you just created.
a. Navigate to and select the Roles related list.

b. Select Edit... to configure the user's roles.

c. In the search window above Collection, enter `ih_process_sync_api`.

d. Select `ih_process_sync_api` and `snc_external` from the Collection list, and then select the add button (>) to add these roles to the Roles List.

Note: The `snc_external` role restricts the access of external users to only the resources they have been explicitly granted access to.

e. Select Save.

9. Select New to open a new User form view, and then fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>Enter rps.run.as</td>
</tr>
<tr>
<td>First name</td>
<td>Enter RPS Run as User</td>
</tr>
<tr>
<td>Password</td>
<td>Enter rpsdemob</td>
</tr>
</tbody>
</table>

Finally, select Submit to finish creating the User record.

10. From the list, select the User record that you just created.

a. Navigate to and select the Roles related list.

b. Select Edit... to configure the user's roles.

c. In the search window above Collection, enter `ih_process_sync_run_as`.

d. Select `ih_process_sync_run_as` from the Collection list, and then select the add button (>) to add that role to the Roles List.

e. Select Save.

11. In Instance A, navigate to IntegrationHub > Connections & Credentials > Credentials, and then select New.

a. From the list of connection options, select Basic Auth Credentials.

b. In the form, fill in the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter RPS Vendor Credentials</td>
</tr>
<tr>
<td>User name</td>
<td>Enter rps.api.instance.b</td>
</tr>
<tr>
<td>Password</td>
<td>Enter rpsdemob</td>
</tr>
</tbody>
</table>

Note: The credentials you enter must match the credentials for the RPS API User that you created in Instance B.

c. Select Submit.

12. While still in Instance A, navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases, and then select New.

a. In the Name field, enter RPS Vendor Demo.
   Leave all other fields as they are, and then select Submit.

b. From the list, select the RPS Vendor Demo record that you just created.

c. In the Connections related list, select New.

d. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter RPS Vendor.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the lookup using list icon ( ), and then select the RPS Vendor Credentials record from the list.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the base URL of Instance B. The URL should begin with https:// and end with .service-now.com/</td>
</tr>
</tbody>
</table>

e. Leave all other fields as they are, and then select Submit.

13. In Instance B, navigate to IntegrationHub > Connections & Credentials > Credentials, and then select New.
a. From the list of connection options, select **Basic Auth Credentials**.

b. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter <strong>RPS Customer Credentials</strong></td>
</tr>
<tr>
<td>User name</td>
<td>Enter <strong>rps.api.instance.a</strong></td>
</tr>
<tr>
<td>Password</td>
<td>Enter <strong>rpsdemoa</strong></td>
</tr>
</tbody>
</table>

**Note:** The credentials you enter must match the credentials for the RPS API User that you created in Instance A.

c. Select **Submit**.

14. While still in Instance B, navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases**, and then select **New**.

a. In the Name field, enter **RPS Customer Demo**. Leave all other fields as they are, and then select **Submit**.

b. From the list, select the **RPS Customer Demo** record that you just created.

c. In the Connections related list, select **New**.

d. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter <strong>RPS Customer</strong></td>
</tr>
<tr>
<td>Credential</td>
<td>Select the lookup using list icon ( ), and then select the <strong>RPS Customer Credentials</strong> record from the list.</td>
</tr>
</tbody>
</table>
e. Leave all other fields as they are, and then select Submit.

We’ve successfully created credentials that can be used to access each remote instance. Now, let’s ensure that we can send and receive data between instances by configuring the Remote System record for a Process Sync Definition in each instance.

15. In Instance A, navigate to IntegrationHub > Remote Process Sync > Process Sync Definitions, and then select New.

a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Hardware Request Process</td>
</tr>
<tr>
<td>Description</td>
<td>Enter Process for requesting hardware and handling fulfilled hardware requests</td>
</tr>
</tbody>
</table>

b. Leave all other fields as they are, and then select Submit.

c. From the list, select the Hardware Request Process record that you just created.

a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Vendor Instance - Instance B</td>
</tr>
<tr>
<td>Description</td>
<td>Enter Vendor instance that fulfills hardware requests</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the lookup using list icon ( ), and then select the RPS API</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>User for Instance A</td>
<td>Record from the list.</td>
</tr>
<tr>
<td>Inbound API User</td>
<td>Select the lookup using list icon ( ), and then select the RPS Vendor record from the list.</td>
</tr>
<tr>
<td>Run as</td>
<td>Select the lookup using list icon ( ), and then select the RPS Run as User record from the list.</td>
</tr>
</tbody>
</table>

b. In the context header, select the additional actions icon ( ) and then select **Copy sys id**.
You'll need this Sys ID as the value for the External ID field of the Remote System record in Instance B.

c. Leave all other fields as they are, and then select **Submit**.

17. In Instance B, navigate to **IntegrationHub** > **Remote Process Sync** > **Process Sync Definitions**, and then select **New**.

a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Hardware Fulfillment Process</td>
</tr>
<tr>
<td>Description</td>
<td>Enter Process for fulfilling hardware requests</td>
</tr>
</tbody>
</table>

b. Leave all other fields as they are, and then select **Submit**.

c. From the list, select the **Hardware Fulfillment Process** record that you just created.

18. In the Remote Systems related list, select **New**.
a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Customer Instance - Instance A</td>
</tr>
<tr>
<td>Description</td>
<td>Enter Customer instance that requests hardware</td>
</tr>
<tr>
<td>External ID</td>
<td>Paste the value of the Sys ID that you copied from the Remote System record in Instance A.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the lookup using list icon ( ), and then select the RPS API User for Instance B record from the list.</td>
</tr>
<tr>
<td>Inbound API User</td>
<td>Select the lookup using list icon ( ), and then select the RPS Customer record from the list.</td>
</tr>
<tr>
<td>Run as</td>
<td>Select the lookup using list icon ( ), and then select the RPS Run as User record from the list.</td>
</tr>
</tbody>
</table>

b. Leave all other fields as they are, and then select Submit.

c. From the Remote Systems related list, select the Customer Instance - Instance A record.

d. In the Related links section, select Validate and Activate Remote System. You should see a message that displays Remote system validated and activated successfully. If you see an error message instead, go back and check the configuration for the Remote System record.

e. In the context header, select the additional actions icon ( ) and then select Copy sys_id. You'll need this Sys ID as the value for the External ID field of the Remote System record in Instance A.
19. In Instance A, navigate to IntegrationHub > Remote Process Sync > Remote Systems - All, and then select the Vendor Instance - Instance B record from the list.

   a. In the External ID field, paste the value of the Sys ID that you copied from the Remote System record in Instance B.

   b. Select Update to save your changes to the record.

   c. From the list, select the Customer Instance - Instance A record.

   d. In the Related links section, select Validate and Activate Remote System. You should see a message that displays Remote system validated and activated successfully. If you see an error message instead, go back and check the configuration for the Remote System record.

We’ve successfully connected Instance A and Instance B together so that they can share data across their process workflows. Now, we’ll define how our integration will trigger and run automatically, as well as which fields we want to capture and sync between instances.

20. In Instance A, navigate to IntegrationHub > Remote Process Sync > Process Sync Definitions, and then select the Hardware Request Process record from the list.

   a. In the Name field, enter Request Hardware.

   b. Leave all other fields as they are, and then select Submit.

22. In the Process Events related list, select New.

   a. In the Name field, enter Hardware Request Fulfilled.

   b. Leave all other fields as they are, and then select Submit.

23. In the Capture Definitions related list, select New.

   a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>select the lookup using list icon ( ), and then select the Request Hardware record from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>State</td>
<td>Select <strong>Active</strong></td>
</tr>
<tr>
<td>Source Table Name</td>
<td>Select <strong>Incident [incident]</strong></td>
</tr>
<tr>
<td>Filter</td>
<td>In the condition builder, select <strong>Assignment Group &gt; is</strong> and then select the lookup using list icon (⠣). Choose the <strong>Hardware</strong> record from the list.</td>
</tr>
<tr>
<td>Include fields</td>
<td>Select the following fields and then select the add item button (⠣) to add them to the Selected list:</td>
</tr>
<tr>
<td></td>
<td>• Number</td>
</tr>
<tr>
<td></td>
<td>• Short description</td>
</tr>
<tr>
<td></td>
<td>• Assignment group</td>
</tr>
<tr>
<td></td>
<td>• Severity</td>
</tr>
<tr>
<td></td>
<td>• State</td>
</tr>
<tr>
<td>Note:</td>
<td>Sys ID is already included in the Selected list. Leave this field in the Selected list as well.</td>
</tr>
</tbody>
</table>

**b.** Leave all other fields as they are, and then select **Submit**.

24. In the Outbound Flows related list, select **New**.

**a.** In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>From the list, select <strong>Request Hardware</strong>.</td>
</tr>
<tr>
<td>Outbound Subflow</td>
<td>Select the lookup using list icon (⠣), and then select the <strong>Remote Process Sync Outbound Flow Template - Basic</strong> record from the list. This template subflow handles the correlation of local and remote</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>records and sends the captured payload to the remote instance.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** When building your own integration, you can add Remote Process Sync actions to personalize this template subflow to your needs. To edit this template subflow in Flow Designer, select the Configure Subflow icon ( ).

Remote System  
Select the lookup using list icon ( ), and then select the Vendor Instance - Instance B record from the list.

b. Leave all other fields as they are, and then select Submit.

25. In Instance B, navigate to IntegrationHub > Remote Process Sync > Process Sync Definitions, and then select the Hardware Fulfillment Process record from the list.

26. In the Process Events related list, select New.
   a. In the Name field, enter Request Hardware.
   b. Leave all other fields as they are, and then select Submit.

27. In the Process Events related list, select New.
   a. In the Name field, enter Hardware Request Fulfilled.
   b. Leave all other fields as they are, and then select Submit.

**Note:** It is recommended to create Process Event records in both instances with names that match. This will help you keep track of the linked process workflows between instances.

28. In the Capture Definitions related list, select New.
a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>select the lookup using list icon (🔍), and then select the Hardware Request Fulfilled record from the list.</td>
</tr>
<tr>
<td>State</td>
<td>Select Active</td>
</tr>
<tr>
<td>Source Table Name</td>
<td>Select Incident [incident]</td>
</tr>
<tr>
<td>Filter</td>
<td>In the condition builder, select Assignment Group &gt; is and then select the lookup using list icon (🔍). Choose the Hardware record from the list. Then, select AND to add another condition and select Incident state &gt; is &gt; Resolved.</td>
</tr>
</tbody>
</table>
| Include fields       | Select the following fields and then select the add item button (▶) to add them to the Selected list:  
  • Number  
  • State  
  • Resolved by  
  • Resolution notes  

⚠️ Note: Sys ID is already included in the Selected list. Leave this field in the Selected list as well.

b. Leave all other fields as they are, and then select Submit.

29. In the Outbound Flows related list, select New.
a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>From the list, select <strong>Hardware Request Fulfilled</strong>.</td>
</tr>
<tr>
<td>Outbound Subflow</td>
<td>Select the lookup using list icon (🔍), and then select the <strong>Remote Process Sync Outbound Flow Template - Basic</strong> record from the list. This template subflow handles the correlation of local and remote records and sends the captured payload to the remote instance.</td>
</tr>
<tr>
<td>Remote System</td>
<td>Select the lookup using list icon (🔍), and then select the <strong>Vendor Instance - Instance B</strong> record from the list.</td>
</tr>
</tbody>
</table>

**Note:** When building your own integration, you can add **Remote Process Sync actions** to personalize this template subflow to your needs. To edit this template subflow in Flow Designer, select the **Configure Subflow icon (🔍).**

b. Leave all other fields as they are, and then select **Submit**.

We’ve successfully set up how our Remote Process Sync integration will trigger and which fields will be captured and sent to either remote instance. In this final section, we’ll customize the inbound flows in Flow Designer so that they properly transform inbound data.

30. In Instance B, navigate to **IntegrationHub > Remote Process Sync > Process Sync Definitions**, and then select the **Hardware Fulfillment Process** record from the list.

31. In the Inbound Flows related list, select **New**.
a. In the form, fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>From the list, select <strong>Request Hardware</strong>.</td>
</tr>
<tr>
<td>Inbound Subflow</td>
<td>Select the lookup using list icon (🔍), and then select the <strong>Remote Process Sync Inbound Flow Template - Basic</strong> record from the list. We'll customize this template subflow in the next step.</td>
</tr>
<tr>
<td>Remote System</td>
<td>Select the lookup using list icon (🔍), and then select the <strong>Customer Instance - Instance A</strong> record from the list.</td>
</tr>
</tbody>
</table>

b. Leave all other fields as they are, and then select **Submit**.

c. In the Inbound Flows related list, select the **Request Hardware** record that you just created.

d. Next to the Inbound Subflow field, select the Configure Subflow icon (🔍). The subflow opens in the Flow Designer design environment.

32. Expand the **Transform Payload from Inbound Sample** action.

a. In the Sample Payload field, enter the following sample payload:

```json
{"capture_metadata":{"changed_by":"admin","timestamp":"2020-09-24 19:26:59"},
"changed_fields":{
  "display_value":"","value":"incident","key":"sys_class_name"},
  "display_value":"","value":"552c48888c033300964f4932b03eb092","key":"sys_id"},
  "display_value":"","value":"INC0040015","key":"number"},
  "display_value":"","value":"","key":"short_description"},
  "display_value":"Hardware","value":"9f5b572d9cd82010f877a5cfd1fdce30","key":"assignment_group"},
```
Note: This payload is a complex object that represents the captured metadata and fields that are sent from Instance A to Instance B.

b. Select Done.

33. Select Add an Action, Flow Logic, or Subflow, and then select Action. In the action picker, search for and then select the Look Up Correlation By Active Correlation ID action.

a. Add the following action inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote System</td>
<td>Select the data pill picker icon ( ), Dot-walk to and then select Subflow - Inputs &gt; Remote System.</td>
</tr>
<tr>
<td>Local Correlation</td>
<td>Select the data pill picker icon ( ), Dot-walk to and then select Subflow - Inputs &gt; Local Correlation ID.</td>
</tr>
</tbody>
</table>

b. Select Done.

34. Select Add an Action, Flow Logic, or Subflow, and then select Action. In the action picker, search for and then select the Look Up Record action.

a. Add the following action inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select Incident [incident].</td>
</tr>
<tr>
<td>Conditions</td>
<td>In the condition builder, select Sys ID &gt; is, and then select the data pill picker icon ( ). Dot-walk to and then select 2 - Look Up</td>
</tr>
</tbody>
</table>
**b. Select Done.**

35. Select **Add an Action, Flow Logic, or Subflow**, and then select **Flow Logic**. From the list, select the **If** flow logic.

**a. Add the following inputs:**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Enter local record doesn't exist.</td>
</tr>
<tr>
<td>Condition 1</td>
<td>In the condition builder, select the data pill picker icon ( ). Dot-walk to and then select 3 - Look Up Record &gt; Status. Then, select is &gt; Error.</td>
</tr>
</tbody>
</table>

**b. Select Done.**

36. Under the **If** flow logic that you just created, next to **then**, select the plus icon ( ) and then select **Action**.

In the action picker, search for and then select the **Create Record** action.

**a. In the Table input, select Incident [incident].**

**b. In the Fields input, add the following fields and associated values:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Select the data pill picker icon ( ). Dot-walk to and then select 1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; short_description.</td>
</tr>
<tr>
<td>Description</td>
<td>Select the data pill picker icon ( ). Dot-walk to and then select 1 -</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Transform Payload from Inbound Sample &gt; Changed Fields &gt; short_description.</td>
<td></td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the data pill picker icon (eventName). Dot-walk to and then select 1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; assignment_group.</td>
</tr>
<tr>
<td>Urgency</td>
<td>Select the data pill picker icon (eventName). Dot-walk to and then select 1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; severity.</td>
</tr>
<tr>
<td>State</td>
<td>Select the data pill picker icon (eventName). Dot-walk to and then select 1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; state.</td>
</tr>
</tbody>
</table>

**c. Select Done.**

37. Under the **Update Record** action that you just created, within the same **If** flow logic block, select the plus icon ((eventName)) and then select **Action**. In the action picker, search for and then select the **Create Correlation** action.

**a. Add the following action inputs:**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Correlation ID</td>
<td>Select the data pill picker icon (eventName). Dot-walk to and then select <strong>Subflow - Inputs &gt; Remote Correlation ID</strong>.</td>
</tr>
<tr>
<td>Local Correlation ID</td>
<td>Select the data pill picker icon (eventName). Dot-walk to and then select <strong>Subflow - Inputs &gt; Local Correlation ID</strong>.</td>
</tr>
</tbody>
</table>
### Input | Description
--- | ---
Remote System | Select the data pill picker icon (estruction). Dot-walk to and then select **Subflow** - **Inputs** > **Remote System**.

Local Record | Select the data pill picker icon (estruction). Dot-walk to and then select **5** - **Create Record** > **Incident Record**.

---

b. **Select Done.**

38. Select **Add an Action, Flow Logic, or Subflow**, and then select **Flow Logic**.
From the list, select the **Else** flow logic.

39. Under the **Else** flow logic that you just created, select the plus icon (estruction) and then select **Action**.
In the action picker, search for and then select the **Update Record** action.

a. In the **Record** input, select the data pill picker icon (estruction). Dot-walk to and then select **3 - Look Up Record** > **Incident Record**.
This automatically populates the Table input with the value **Incident [incident]**.

b. In the **Fields** input, add the following fields and associated values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Select the data pill picker icon (estruction). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample</strong> &gt; <strong>Changed Fields</strong> &gt; <strong>short_description</strong>.</td>
</tr>
<tr>
<td>Description</td>
<td>Select the data pill picker icon (estruction). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample</strong> &gt; <strong>Changed Fields</strong> &gt; <strong>short_description</strong>.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the data pill picker icon (estruction). Dot-walk to and then select **1 - **</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td><strong>Transform Payload from Inbound Sample &gt; Changed Fields &gt; assignment_group.</strong></td>
</tr>
<tr>
<td>Urgency</td>
<td>Select the data pill picker icon ( Респект). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; severity.</strong></td>
</tr>
<tr>
<td>State</td>
<td>Select the data pill picker icon ( Респект). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; state.</strong></td>
</tr>
</tbody>
</table>

**c. Select Done.**

40. In the main header, select **Save** to save the changes to the flow.

41. In Instance A, navigate to **IntegrationHub > Remote Process Sync > Process Sync Definitions**, and then select the **Hardware Request Process** record from the list.

42. In the Inbound Flows related list, select **New**.

  **a. In the form, fill in the following fields:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Event</td>
<td>From the list, select <strong>Hardware Request Fulfilled.</strong></td>
</tr>
<tr>
<td>Inbound Subflow</td>
<td>Select the lookup using list icon ()، and then select the <strong>Remote Process Sync Inbound Flow Template - Basic</strong> record from the list. We'll customize this template subflow in the next step.</td>
</tr>
<tr>
<td>Remote System</td>
<td>Select the lookup using list icon ()، and then select the <strong>Vendor Instance - Instance B</strong> record from the list.</td>
</tr>
</tbody>
</table>
b. Leave all other fields as they are, and then select **Submit**.

c. In the Inbound Flows related list, select the **Hardware Request Fulfilled** record that you just created.

d. Next to the Inbound Subflow field, select the **Configure Subflow icon ( )**.

The subflow opens in the Flow Designer design environment.

43. Expand the **Transform Payload from Inbound Sample action**.

a. In the Sample Payload field, enter the following sample payload:

```json
{"capture_metadata":{"changed_by":"admin","timestamp":"2020-10-26 14:18:45"},
"changed_fields":{
  "display_value":"","value":"incident","key":"sys_class_name"},
  "display_value":"","value":"d4cdfe8db4c2410cfe4d9595e96197b","key":"sys_id"},
  "display_value":","value":"INC0040014","key":"number"},
  "display_value":","value":"101","key":"state"},
  "display_value":"System Administrator","value":"6816f79cc0a8016401c5a33be04be441","key":"resolved_by"},
  "display_value":","value":",key":"close_notes"}}
```

> **Note:** This payload is a complex object that represents the captured metadata and fields that are sent from Instance B to Instance A.

b. Select **Done**.

44. Select **Add an Action, Flow Logic, or Subflow**, and then select **Action**.

In the action picker, search for and then select the **Look Up Correlation By Active Correlation ID** action.

a. Add the following action inputs:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote System</td>
<td>Select the data pill picker icon ( ). Dot-walk to and then select <strong>Subflow</strong> - Inputs &gt; Remote System.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Local Correlation</td>
<td>Select the data pill picker icon ( ). Dot-walk to and then select <strong>Subflow</strong> - <strong>Inputs</strong> &gt; <strong>Local Correlation ID</strong>.</td>
</tr>
</tbody>
</table>

**b. Select Done.**

**45. Select Add an Action, Flow Logic, or Subflow**, and then select **Action**.
In the action picker, search for and then select the **Look Up Record** action.

**a. Add the following action inputs:**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select <strong>Incident [incident]</strong>.</td>
</tr>
<tr>
<td>Conditions</td>
<td>In the condition builder, select <strong>Sys ID &gt; is</strong>, and then select the data pill picker icon ( ). Dot-walk to and then select <strong>3 - Look Up Correlation By Active Correlation ID &gt; Correlation Detail &gt; Local Record</strong>.</td>
</tr>
</tbody>
</table>

**b. Select Done.**

**46. Select Add an Action, Flow Logic, or Subflow**, and then select **Flow Logic**.
From the list, select the **If** flow logic.

**a. Add the following inputs:**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>Enter <strong>local record exists</strong>.</td>
</tr>
<tr>
<td>Condition 1</td>
<td>In the condition builder, select the data pill picker icon ( ). Dot-walk to and then select <strong>4 - Look Up Record &gt; Status</strong>. Then, select <strong>is &gt; Success</strong>.</td>
</tr>
</tbody>
</table>

**b. Select Done.**
47. Under the **if** flow logic that you just created, select the plus icon (➕) and then select **Action**. In the action picker, search for and then select the **Update Record** action.

a. In the **Record** input, select the data pill picker icon (🔍). Dot-walk to and then select **4 - Look Up Record > Incident Record**. This automatically populates the **Table** input with the value `Incident[incident]`.

b. In the **Fields** input, add the following fields and associated values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>Select the data pill picker icon (🔍). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; state</strong>.</td>
</tr>
<tr>
<td>Resolved by</td>
<td>Select the data pill picker icon (🔍). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; resolved_by</strong>.</td>
</tr>
<tr>
<td>Resolution notes</td>
<td>Select the data pill picker icon (🔍). Dot-walk to and then select <strong>1 - Transform Payload from Inbound Sample &gt; Changed Fields &gt; close_notes</strong>.</td>
</tr>
</tbody>
</table>

c. Select **Done**.

We've finished building our Remote Process Sync integration. The integration will now trigger whenever a user creates an Incident record with the Hardware assignment group in Incident A. When this happens:
• The fields specified in Instance A’s Capture Definition are captured and stored in a local record.
• The local record is correlated with a remote record in Instance B.
• The captured fields are mapped to the fields we specified in Instance B’s Inbound Flow.

Then, when a user resolves the correlated Incident record in Instance B:
• The fields specified in Instance B’s Capture Definition are captured and stored in a local record.
• The local record is correlated with the remote record in Instance A.
• The captured fields are mapped to the fields we specified in Instance A’s Inbound Flow.

What to do next
Test out your Remote Process Sync integration by creating an Incident record in Instance A with the Hardware assignment group. Then, resolve the correlated Incident record in Instance B. If your correlated records don’t sync as expected, check your Inbound API User’s credentials and Process Sync Definition configuration in each Instance. If you continue to experience issues with your example integration, refer to Monitoring and troubleshooting your integration.

Remote Process Sync actions
Learn how to use actions in outbound and inbound flows for your IntegrationHub Remote Process Sync integration.

Remote Process Sync provides you with a collection of Flow Designer actions that you can use to customize the default outbound and inbound flow templates. These actions let you:
• Create correlations between records on local and remote instances
• Manage attachments between local and remote instances
• Send captured payloads to a remote instance
• Transform inbound payloads to complex objects

Remote Process Sync action dependencies
Certain Remote Process Sync actions are dependent upon other actions, and thus are generally intended for you to use together. The following use cases describe situations in which you might consider using dependent Remote Process Sync actions in your outbound and inbound flows.

Correlate a record with a captured payload
Use these actions in the following order to automatically correlate a record with a captured payload to be sent to a remote system:

1. **Look Up Correlation By Local Correlation ID** - Use this action to determine if a correlated record exists between your staged local record and a record on the remote system.

2. **Send Captured Payload to Remote System** - Use the Correlation Detail output data pill from the **Look Up Correlation By Local Correlation ID** record as the value for the Correlation Detail input in this action. This enables you to correlate the local record containing the outbound payload to a record on the remote system.

**Note:** The Remote Process Sync Outbound Flow Template – Basic provides you with these two actions so that you don’t need to set up this correlation yourself.

**Identify and request missing attachments from a remote system**

Use these actions in the following order to automatically look up and request attachments from a remote system that don’t exist in your local system:

1. **Identify New Attachments** - Use this action to look up any attachments that exist on the remote system but don’t exist on your local system for correlated records.

2. **Request Attachments from Remote System** - Use this action to request the transfer of identified attachments from the remote system to your local system.

**Create Correlation action**

Create a correlation between a record on the local instance and a record on a remote instance. A correlation identifies a remote system and a local record to synchronize. Each instance maintains a copy of the correlation, which contains a set of shared correlation identifiers. Remote Process Sync actions and flows use the correlation identifiers to synchronize records.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**
This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

**Remote Correlation ID**

*Data type: String*

Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

**Local Correlation ID**

*Data type: String*

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

**Remote System**

*Data type: Record*

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Local Record**

*Data type: Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Correlation Detail**

*Data type: Object*
Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

**Status**

Data type: *String*

Status code returned by the action.

**Error**

Data type: *String*

Error returned by the action.

**Get Attachment Metadata for Local Record action**

Get the list of attachments associated with a specified local record. Use the output of this action to synchronize the attachments of a local record with the attachments of a remote record.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Local Record**

Data type: *Record*

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

**Strategy**

Data type: *Choice*
Level of attachment detail to gather. The available options are All or Deltas. Use the All option to gather all synchronized attachments. Use the Deltas option to gather only attachments that have changed since the last synchronization.

**Remote System**

Data type: **Record**

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Correlation Detail**

Data type: **Object**

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

**Attachments**

Data type: **Array of Objects**

Array containing a list of attachment objects to evaluate.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Attachments**

Data type: **Array of Objects**

Array containing information about the attachments to synchronize.

**Identify New Attachments action**

Identify the attachments a local record already has to determine which remote attachments need synchronization. Use the output of this action to request missing attachments from a remote system.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**
This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag and drop pills from the Data panel or select them from the pill picker.

**Attachments**

Data type: **Array of Objects**

Array containing a list of attachment objects to evaluate.

**Local Record**

Data type: **Record**

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Attachments**

Data type: **Array of Objects**

Array containing information about the attachments to synchronize.

**Count**

Data type: **Integer**

Number of attachments identified.

**Look Up Correlation by Local Correlation ID action**

Look up an active correlation by a specified local correlation ID. The local correlation ID identifies the correlation on the local instance. Remote Process Sync actions and flows use the returned correlation to synchronize a local record with a record on a remote system.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**
This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Remote System**

Data type: Record

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Local Correlation ID**

Data type: String

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Correlation Detail**

Data type: Object

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

**Status**

Data type: String

Status code returned by the action.

**Look Up Correlation by Local Record action**

Look up an active correlation by a specified local record sys_id. The local record is the record the correlation synchronizes on the local instance.
Sync actions and flows use the returned correlation to synchronize a local record with a record on a remote system.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see [Request IntegrationHub](#).

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see [User access to Flow Designer](#).

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Remote System**

Data type: **Record**

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Local Record**

Data type: **Record**

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Correlation Detail**

Data type: **Object**

Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.
Status
Data type: String
Status code returned by the action.

Move Attachments action
Move attachments from a correlation record to the local record it synchronizes. This action looks up the correlation record by its sys_id.

Roles and availability
Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements
This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

Role requirements
This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

Inputs
Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Correlation ID
Data type: String
Globally unique ID of a correlation record on the local instance.

Outputs
This action has no outputs.

Request Attachments from Remote System action
Request the transfer of the identified attachments using the specified correlation. The system moves attachments associated with the record on the remote system to the local system.

Roles and availability
Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements
This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Attachments**

Data type: **Array of Objects**

Array containing a list of attachment objects to evaluate.

**Remote System**

Data type: **Record**

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Correlation Detail**

Data type: **Object**

Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Status**

Data type: **String**

Status code returned by the action.

**Send Captured Payload to Remote System**

Generate a captured payload, and send it to a remote system. This action should follow a Look Up Correlation action. Remote Process Sync flows use the returned correlation to check if a new correlation should be created.
Roles and availability
Available as a ServiceNow Core Remote Process Sync action.

Subscription requirements
This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

Role requirements
This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

Inputs
Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

Remote System
Data type: Record
Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

CRUD Operation
Data type: Choice
Database operation that triggered the process event. The available options are Create, Update, or Delete.

Process Event
Data type: String
Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

Payload
Data type: Object
Object containing changes generated by a capture definition. For example, a list of field changes for a case record on the local instance. The system transforms this object to a JSON string to send it to a remote instance.

Correlation Detail
Data type: Object
Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

**Outputs**
These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Status**
Data type: String
Status code returned by the action.

**Error Message**
Data type: String
Error returned by the action.

**Local Correlation ID**
Data type: String
Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

**Remote Correlation ID**
Data type: String
Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

**Transform Payload from Inbound Sample action**
Transform a Remote Process Sync payload from a JSON string to a complex object. Generate the object structure from a sample of the inbound payload.

**Roles and availability**
Available as a ServiceNow Core Remote Process Sync action.

**Subscription requirements**
This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**
This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Payload**

- **Data type:** String
- JSON string containing changes generated on a remote instance. For example, a list of field changes for a case record from a remote instance. The system transforms this JSON string to an object on the local instance.

**Sample Payload**

- **Data type:** String
- Portion of a JSON payload you want to use to generate an object structure. Select the elements of the JSON structure you want to map to elements of an object structure.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Capture Metadata**

- **Data type:** Object
- Object containing information about the capture definition that created the payload.

**Changed Fields**

- **Data type:** Dynamic Object
- Object containing information about the field value changes. The system uses these changes to synchronize correlation and local records.

**Attachment Metadata**

- **Data type:** Array of Object
- Array containing information about the attachments to synchronize.

**Error Message**

- **Data type:** String
Error returned by the action.

**Update Correlation State action**

Enable or disable synchronization of records by the specified correlation. Set an active correlation to inactive to disable synchronization of records. Set an inactive correlation to active to resume synchronization of records.

**Roles and availability**

Available as a ServiceNow Core Remote Process Sync action.

- **Subscription requirements**
  
  This action requires an IntegrationHub Enterprise subscription. For more information, see [Request IntegrationHub](#).

- **Role requirements**
  
  This action requires roles granted by delegated development or assigned to the user. For more information, see [User access to Flow Designer](#).

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

- **Correlation Detail**
  
  Data type: **Object**
  
  Object containing correlation information about a synchronized record. The object identifies the local and remote correlation IDs associated with a local record.

- **State**
  
  Data type: **Choice**
  
  Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

- **Correlation Detail**
  
  Data type: **Object**
Object containing correlation information about a record. The object identifies the local and remote correlation IDs associated with a local record.

**Status**

Data type: **Choice**

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

**Error**

Data type: **String**

Error returned by the action.

**Remote Process Sync sample subflows**

Copy and configure the sample subflows to synchronize processes between multiple instances. Use an inbound subflow to parse incoming record data. Use an outbound subflow to send record data to a remote instance.

Remote Process Sync provides you with sample inbound and outbound subflows for you to use as templates. These subflows let you:

- Receive record data from a remote instance and process it as incidents
- Send incident record data to a remote instance for processing

**Remote Process Sync Inbound Flow Template - Basic**

A sample Remote Process Sync subflow to process incoming payloads received from a remote instance. This subflow creates a correlation between a remote record and a local incident record. Copy this subflow and edit the actions that refer to the Incident table.

**Roles and availability**

Available as a Global Remote Process Sync subflow.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.
Inputs

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Wait for Completion**

Data type: True/False

Option to require the parent flow to wait for the subflow to complete. If enabled, the parent flow cannot proceed to the next action until the subflow completes.

**Remote System**

Data type: Record

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**Remote Correlation ID**

Data type: String

Globally unique ID of a correlation on a remote instance you are synchronizing processes with. This ID uniquely identifies the correlation for outbound transactions.

**Local Correlation ID**

Data type: String

Globally unique ID of a correlation on the local instance you are synchronizing processes with. This ID uniquely identifies the correlation for inbound transactions.

**Process Event**

Data type: String

Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

**Payload**

Data type: String

JSON string containing changes generated on a remote instance. For example, a list of field changes for a case record from a remote instance. The system transforms this JSON string to an object on the local instance.

**CRUD Operation**
Data type: **Choice**

Database operation that triggered the process event. The available options are Create, Update, or Delete.

**Outputs**

These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

**Error Message**

Data type: **String**

Error returned by the action.

**Status**

Data type: **Choice**

Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

**Remote Process Sync Outbound Flow Template - Basic**

A sample Remote Process Sync subflow to send outgoing payloads to a remote instance. This subflow creates a correlation between a remote record and a local incident record. Copy this subflow and edit the input for the local record to the table of your choice.

**Roles and availability**

Available as a Global Remote Process Sync subflow.

**Subscription requirements**

This action requires an IntegrationHub Enterprise subscription. For more information, see Request IntegrationHub.

**Role requirements**

This action requires roles granted by delegated development or assigned to the user. For more information, see User access to Flow Designer.

**Inputs**

Provide a value for each input that your action needs. To add dynamic values, you can also drag pills from the Data panel or select them from the pill picker.

**Wait for Completion**

Data type: **True/False**
Option to require the parent flow to wait for the subflow to complete. If enabled, the parent flow cannot proceed to the next action until the subflow completes.

**Local Record**

Data type: `Record`

Reference to a record on the local instance you are synchronizing with another instance. The data pill contains all the field values for the specified record. For example, a case record on the local instance.

**Remote System**

Data type: `Record`

Reference to the Process Sync Remote System record for the remote instance you are synchronizing processes with. This record identifies the instance that receives outbound synchronization changes or that sent inbound synchronization changes.

**CRUD Operation**

Data type: `Choice`

Database operation that triggered the process event. The available options are Create, Update, or Delete.

**Trigger/Capture Definition**

Data type: `Record`

Reference to the Capture Definition record that the system uses to create an outbound payload. The data pill contains all the field values for the specified record. For example, a capture definition for case records.

**Process Event**

Data type: `String`

Name of the process event to run. The name is the same on each instance that participates in process synchronization. For example, case-to-incident.

**Payload**

Data type: `Object`

Object containing changes generated by a capture definition. For example, a list of field changes for a case record on the local instance. The system transforms this object to a JSON string to send it to a remote instance.
Outputs
These outputs appear in the Data panel. You can use them as inputs elsewhere in your flow.

Status
Data type: Choice
Synchronization state of records. The available options are Active or Inactive. Active records are being synchronized. Inactive records are not synchronized.

Error Message
Data type: String
Error returned by the action.

Correlation
Establish a synchronization relationship between records that reside on separate instances.

A correlation identifies record data from a remote instance you want to use on a local instance. An integration can use data from a correlated remote record to update a local record. Typically, integrations correlate records to synchronize them and ensure that record changes propagate across instances.

There are two types of correlation available.
- Classic correlation field
- IntegrationHub Correlation records

Classic correlation field
Prior to IntegrationHub Remote Process Sync, you could only create correlations with a limited set of record types that had a Correlation ID field. By default, the Correlation ID field is only available to Configuration Item, Service, and Task records. The Correlation ID field stores the globally unique ID of a matching remote record. The Correlation ID identifies the remote record whose data values should be used to update the local record. For example, suppose incident record INC100001 correlates to problem record PRB123456 on a remote instance. Whenever changes are made to fields in remote problem PRB123456, the system uses the Correlation ID to identify that local incident INC100001 receives the same field updates.

A classic correlation creates a one-to-one relationship between a record on the local system and a record on a remote system. One local record can only ever correlate to one remote record. The correlation provides no information...
about the remote system nor the current state of the correlation. Administrators manually manage classic correlations from the records being updated.

Sample classic correlation field

<table>
<thead>
<tr>
<th>Local Instance</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number</strong></td>
<td>INC100001</td>
<td><strong>Short Description</strong></td>
<td>Cannot connect to network</td>
<td><strong>State</strong></td>
</tr>
<tr>
<td><strong>Correlation ID</strong></td>
<td>sys_id of PRB123456</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Remote Instance</th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Number</strong></td>
<td>PRB123456</td>
<td><strong>Short Description</strong></td>
<td>Cannot connect to network</td>
<td><strong>State</strong></td>
</tr>
<tr>
<td><strong>Correlation ID</strong></td>
<td>sys_id of INC100001</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IntegrationHub Correlation records

IntegrationHub Remote Process Sync extends the functionality of classic correlation with the introduction of dedicated Correlation [ih_sync_correlation] records.

A Correlation record contains these fields.

**Local Correlation ID**

The globally unique ID that identifies the correlation on the local system. By default, IntegrationHub Remote Process Sync generates a unique sys_id value for this field. The distinct sys_id acts as an alias which prevents the correlation from breaking due to changes in the local record. When IntegrationHub Remote Process Sync sends this ID value to a remote system, the receiving instance uses it as the Remote Correlation ID.

**Remote Correlation ID**

The globally unique ID that identifies the correlation on the remote system. By default, IntegrationHub Remote Process Sync generates a unique sys_id value for this field. The distinct sys_id acts as an alias which prevents the correlation from breaking due to changes in the remote record. When IntegrationHub Remote Process Sync sends this ID value to a remote system, the receiving instance uses it as the Local Correlation ID.

**Local Table**

The table where the correlation creates or updates records. An IntegrationHub Remote Process Sync capture definition monitors this table for record changes. IntegrationHub Remote Process Sync uses this field to find correlations by table name.
Local Record

The record created or updated by a correlation. This field stores the same value as the Correlation ID field from a classic correlation. When other business logic makes changes to this record, the changes do not overwrite the correlation.

Remote System

The remote instance where IntegrationHub Remote Process Sync sends and receives record changes. Each correlation record can only refer to one remote instance. To correlate the same local record to multiple remote systems simultaneously, you can create multiple correlation records.

State

The synchronization state of the correlation. Active correlations receive additions and updates. Inactive correlations do not produce additions or updates, but can be queried for auditing purposes and reactivated as needed.

⚠️ CAUTION: IntegrationHub Remote Process Sync manages correlation records for you. Directly editing correlation records may prevent synchronization of records, and may result in data loss.

Sample IntegrationHub Correlation record

<table>
<thead>
<tr>
<th>Customer</th>
<th>Local Correlation ID</th>
<th>Remote Correlation ID</th>
<th>Local Table</th>
<th>Local Record</th>
<th>Remote System</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>COR1</td>
<td>COR5</td>
<td>Incident</td>
<td>INC1</td>
<td>Vendor</td>
<td></td>
<td>Active</td>
</tr>
<tr>
<td>COR2</td>
<td>COR6</td>
<td>Incident</td>
<td>INC1</td>
<td>Vendor</td>
<td></td>
<td>Active</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vendor</th>
<th>Local Correlation ID</th>
<th>Remote Correlation ID</th>
<th>Local Table</th>
<th>Local Record</th>
<th>Remote System</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>COR5</td>
<td>COR1</td>
<td>Problem</td>
<td>PRB1</td>
<td>Customer</td>
<td></td>
<td>Active</td>
</tr>
<tr>
<td>COR6</td>
<td>COR2</td>
<td>Problem</td>
<td>PRB2</td>
<td>Customer</td>
<td></td>
<td>Active</td>
</tr>
</tbody>
</table>

Correlation records offer several advantages over a single correlation field.

- Allow management of correlations by Remote Process Sync
- Identify the remote system associated with a correlation
- Provide separate Correlation ID values for the local and remote systems
- Allow correlation of a single local record with multiple remote systems
- Allow correlations to be deactivated and reactivated as needed
- Allow Correlation ID values to be distinct from the sys_id of a remote record

**Remote Process Sync system properties**

Refer to the list of system properties for Remote Process Sync to learn how to manage your process-oriented, multi-instance integration.

Adjust the values for the following properties at **System Properties > All Properties** to manage your Remote Process Sync integration:

<table>
<thead>
<tr>
<th>System Property</th>
<th>Description</th>
<th>Default value</th>
<th>Minimum value</th>
<th>Maximum value</th>
</tr>
</thead>
</table>
| glide.hub.process.sync.jobs.outbound.context_reporting | outbound scheduled jobs:  
  • Use the standard FlowAPI instead of the quick API (default)  
  • Write flow contexts to the outbound queue  
  • Write outbound records to the Outbound Queue States [ih_sync_outbound_record] table | | Not applicable | Not applicable |
<p>| glide.hub.process.sync.jobs.inbound.context_reporting | inbound scheduled jobs: | | Not applicable | Not applicable |</p>
<table>
<thead>
<tr>
<th>System Property</th>
<th>Description</th>
<th>Default value</th>
<th>Minimum value</th>
<th>Maximum value</th>
</tr>
</thead>
<tbody>

</thead>
<tbody>
<tr>
<td>glide.process_sync.outbound_queue.table_cleaner_batch_size</td>
<td>Number of outbound queue records to process per batch when purging expired records.</td>
<td>10000</td>
<td>1000</td>
<td>500000</td>
</tr>
</tbody>
</table>

**Important:**
Records in the skipped state will not be processed. Review and fix the process definition and its related records. To reprocess records in the outbound queue, set the state to Ready. To ignore these records, leave the state as skipped.
Password reset using IntegrationHub

Create subflows in IntegrationHub to automate and customize the password reset process for users managed by third-party applications such as Okta or Microsoft Azure AD.

Create subflows in IntegrationHub to automate password reset processes. Use the Password Reset application to enable an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users. See Customize password reset processes and integrate third-party credential services for more information.

Password reset IntegrationHub usage overview

Navigate to Password Reset > Usage Overview view the count of password reset transactions performed using IntegrationHub for your instance.

⚠️ Note: Admin must activate the Password Reset - Orchestration Add-on (com.glideapp.password_reset.addon.orchestration) plugin to view the dashboard.

Client Software Distribution using IntegrationHub

Use Client Software Distribution (CSD) to distribute software from the Service Catalog using third-party management systems.

Create all the records necessary to deploy software from Service Catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and revocation of software from an SCCM host using the Microsoft SCCM spoke. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using IntegrationHub flows, subflows, and actions.

Integrates with Software Asset Management to manage license counts for deployed software.
Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to IntegrationHub.

Before you begin
Role required: admin

About this task
The Client Software Distribution plugin activates the System Center Configuration Manager plugin that contains the Microsoft SCCM spoke actions to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

Note: The Client Software Distribution plugin runs in its own application scope.

Procedure
1. Navigate to System Definition > Plugins.
2. Click Request Plugin.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time that must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>
Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.

4. Click Submit.

Components installed with client software distribution
Several types of components are installed with client software distribution (CSD).

Tables installed
These tables are installed with the Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

### Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

**Before you begin**

Role required: sam or admin

You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license **Valuation** is greater than 0, and the license type is **Not allocated**, CSD assumes that the license is available for the software.

**Procedure**

1. Navigate to **Software Asset > Software Licenses**.
2. Add a new software license for the software model you used in CSD.
3. Navigate to **Software Asset > Reconciliation > Software Counters**.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

**Client software distribution ordering process**

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.
Client Software Distribution catalog items have different options, depending on how ordering is configured.

**Lease start and end dates**

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Asset Lease Management plugin that is activated automatically with CSD. The system pre-populates the **Lease start** field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the **Lease end** field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The **Lease end** field is not mandatory and can be left blank to order software with no end date.

ℹ️ **Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the **Lease end** field is only available if the **SCCM configuration** specifies an uninstall collection.

**Software offered only to the logged in user**

If the software catalog item is configured with the **Order on behalf of** check box cleared, the **User** field does not appear on the order form. The logged in user selects the device on which to deploy the software from the **Device to install this software on** field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the **Lease end** field is not available.
Software ordered on behalf of another user

If the software catalog item is configured with the Order on behalf of check box selected, the User field appears on the form. The logged in user can select any user from this field. The Device to install this software on field only lists the devices assigned to the user selected in the User field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the User field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Before you begin
Role required: Any system user

About this task
If your software has a lease end date defined, and the software status is Installed, you can request an extension of the lease, pending any approvals your organization requires.

Procedure
1. Navigate to Service Catalog > My Requested Software.
   The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under Related Links click Extend Lease.
4. In the dialog box that appears, select a new lease end date in the calendar and click OK.
You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.

**Client software distribution from SCCM**

Use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The Microsoft SCCM spoke contains actions that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.
Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

Before you begin

SCCM role required: Application Administrator

About this task

These instructions are for Microsoft 2012 R2 Server.

Procedure

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
7. Log into SCCM as the user with the Application Administrator role.

8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.
Connect to PowerShell

9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

Update the SCCM cmdlet libraries

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

Before you begin

SCCM role required: Either current user or system administrator, depending on settings.

About this task

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.

Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

**Procedure**

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
3. Select **Connect via Windows PowerShell**.
4. Run one of these commands to disable the update check:
   - **Per-user**: `Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0`
   - **Per-system**: `Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0`

```
Important: The per-system cmdlet must run in an elevated Windows PowerShell session.
```
5. Run the `Get-CMCmdletUpdateCheck` command to refresh the console and check the settings.
6. Ensure that the value of the `IsEnabled` configuration variable has changed to `False`.
   This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the `-IsUpdateCheckEnabled 1` command for either the current user or for the system.

**Configure the MID Server for SCCM activities**

To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Before you begin**

Role required: admin

**Procedure**

1. In the navigation filter, enter `cmdb_ci_dns_name.list`.
2. Click **New**.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select **Save**.
5. In the **IP Address** related list, click **New**.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select **eth0** or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click **Submit**.

**Create Connection and Credential alias for SCCM deployments**

Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Before you begin**
Role required: sn_client_sf_dist.csd_admin or admin

**About this task**
Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

**Procedure**
1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Click **New**.
3. On the form, fill in the fields.

**Connection & Credential Aliases form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, CSD Alias.</td>
</tr>
<tr>
<td>ID</td>
<td>System generated unique ID.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Type</td>
<td>Alias type. Select <strong>Connection and Credential</strong>.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Connection type. Select <strong>Basic</strong>.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Option to specify if the alias supports multiple active connections.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default Retry Policy</td>
<td>Default retry policy associated with <strong>Connection Alias</strong>.</td>
</tr>
<tr>
<td>Configuration Template</td>
<td>Template that defines the inputs required to set up the spoke.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

5. Click the **Create New Connection & Credential** related link.

6. On the form, fill in the fields.

**Create Connection and Credential form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Server Instance Name</td>
<td>Name to uniquely identify the SCCM server.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the SCCM server is installed.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Credential record associated with the connection and credential alias.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name with access to the target Windows host.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
</tbody>
</table>

7. Click **Create**.

**Results**

Connection record and SCCM Server Instance are created and associated with the connection and credential alias.

**Retrieve SCCM data for client software distribution**

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

**Before you begin**

**Role required:** sn_client_sf_dist.csd_admin or admin

Before starting this procedure:
• Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.

• **Configure a user** with the Application Deployment Manager role on the SCCM server.

• Set up the MID Server to communicate with the SCCM server.

• Add Powershell credentials to the ServiceNow Credentials [discovery_credentials] table for the SCCM user who has the Application Deployment Manager role.

**About this task**
To populate the Client Software Distribution application with SCCM data:

**Procedure**

1. Navigate to **Client Software Distribution > SCCM > SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and select the connection and credential alias.

   - **Note:** Leave the **Fully qualified domain name** field empty.
4. Click **Submit**.
   The new SCCM server appears in the list.
5. Open the new SCCM record and click **Discover now** under **Related links**.
   The system runs the Discover SCCM flow that retrieves the application, collection, and deployment data from the SCCM server.
SCCM server Discovery for client software distribution

Discovery flow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** flow from an **SCCM Server Instance** record to populate the following ServiceNow tables:

### SCCM data populated in ServiceNow tables

</table>

⚠️ **Note:** For details about the actions used in this flow to extract data from an SCCM server, see Microsoft SCCM spoke.

### Set up a software model for an SCCM application

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

**Before you begin**

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See Retrieve SCCM data for client software distribution for details.
About this task
You can link an SCCM application to an existing software model or create a new model.

Procedure
1. Navigate to Client Software Distribution > SCCM > SCCM Applications. A list of applications discovered on the SCCM server appears.
2. Open an SCCM application record.
3. To link to an existing model, click the magnifying glass icon in the Model field and select a model from the list.

4. To create a model, click Create Software Model under Related Links.
   a. Complete the software model fields. See for details.
   b. Click Submit. The view returns to the SCCM Applications form.

Define an SCCM configuration
To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you begin
Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

Role required: sn_client_sf_dist.csd_admin or admin
About this task
The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an install deployment. Client Software Distribution (CSD) allows you to revoke unentitled software using an SCCM server when that software can be removed using an uninstall collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.

SCCM table references

Procedure
1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
2. Open an application that has a configured software model.
3. Under Related Links, click Create Software Configuration.
4. Complete the form, using the fields in the table.
### SCCM configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the <strong>install</strong> deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
<tr>
<td>SCCM uninstall collection</td>
<td>Name of the collection associated with the <strong>uninstall</strong> deployment for the selected application on the SCCM server. You must specify an uninstall collection to:</td>
</tr>
<tr>
<td></td>
<td>- Define a lease end date for deployed software.</td>
</tr>
<tr>
<td></td>
<td>- Allow lease extensions.</td>
</tr>
<tr>
<td></td>
<td>- Revoke software from a user’s machine.</td>
</tr>
<tr>
<td>Discovery model</td>
<td>Discovery model that links the unentitled software installation with the SCCM configuration. From the SCCM configuration record, Client Software Distribution can determine</td>
</tr>
</tbody>
</table>
Field | Description
---|---
| which collection to use to revoke the software. Unentitled software is software found on the user's machine that the user is not entitled to use.

Create a catalog item for an SCCM application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the SCCM server.

**Before you begin**

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

**Procedure**

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**. A list of applications discovered on the SCCM server appears.
2. Open a record for an SCCM application.
3. Under **Related Links**, click **Create Catalog Item**. A new SCCM Application Catalog Item record appears with preconfigured information.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item \[sn_client_sf_dist_cat_item\] table by the Client Software Distribution plugin:

### SCCM fields in the catalog item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the <strong>Order on behalf of</strong> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
<tr>
<td>Note:</td>
<td>There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the <strong>Skip approval</strong> check box to determine if the software item requires approval by the requester's manager.</td>
</tr>
<tr>
<td>Check license compliance (check_license_compliance)</td>
<td>Check box that forces the system to determine if deploying this item is allowed under the current license.</td>
</tr>
<tr>
<td>Order on behalf of</td>
<td>Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the <strong>Skip approval</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>is skipped if the requestor is the named user's manager.</td>
<td></td>
</tr>
<tr>
<td>Software items requested from the service catalog on behalf of a different user require the following information:</td>
<td></td>
</tr>
<tr>
<td>• <strong>User</strong>: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Device to install this software on</strong>: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Lease start</strong>: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time.</td>
<td></td>
</tr>
<tr>
<td>SCCM configuration</td>
<td>Name of the SCCM configuration record for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server.</td>
</tr>
</tbody>
</table>

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list. By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

6. Click **Update**.
   The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.
SCCM deployment process

Order an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the **Skip approval** check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user's manager for approval.

2. If the **Check license compliance** check box is selected in the software catalog item, the flow performs a software license check. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.

3. The Order Client Software flow triggers the Deploy SCCM Application flow as a subflow. This subflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection actions in the Microsoft SCCM spoke.

4. If the software configuration specifies **SCCM uninstall collection** in the software catalog item, the Deploy SCCM Application subflow checks if the user or device exists in the uninstall collection. The flow uses the Is Device in Collection or Is User in Collection in the Microsoft SCCM spoke. If the user or device exists in the uninstall collection, the flow removes the device or user. The subflow uses the Remove from Device Collection or Remove from User Collection action in the Microsoft SCCM spoke before adding it to the SCCM install collection.

Client software distribution validation process

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.
The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation [cmdb_sam_sw_install] table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the `sn_client_sf_dist.softwareInstallExpDays` property.
- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

**SCCM software revocation**

Revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

**Revoke software deployed through the service catalog**

Software deployed by SCCM can be revoked, but only when the status of software is **Installed** and the application associated with the software configuration has an uninstall collection configured.

**Before you begin**

- Create an **SCCM configuration record** for the application that names an appropriate uninstall collection.
- Associate the **CSD catalog item** for the application with the SCCM configuration that specifies the uninstall collection.

Role required: `sn_client_sf_dist.csd_admin` or `admin`

A subflow called **Revoke SCCM Application** moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**Procedure**

1. Navigate to **Client Software Distribution > Reports > Requested Software**.
2. Open the record for the SCCM software package you want to revoke.
The package must have a **Status** of **Installed** to be revocable.

3. **Under Related Links**, click **Revoke software**.

This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**Revoke unentitled software**

Revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

**Before you begin**

To revoke software using SCCM, you must create an **SCCM configuration record** for the application, in which the appropriate software Discovery model is defined. See **Software discovery models**.

**Role required**: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses **Software Asset Management** to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

**Procedure**

1. **Navigate to Client Software Distribution > Reports > Installed Software Not Entitled**.
2. Select the record for the installation that has unentitled users.
3. **Under Related Links**, click **Revoke software**.

This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

**SCCM software revocation flow**

The Revoke SCCM Application flow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation subflow to run, the software package must have a status of Installed and must be pre-configured for an appropriate uninstall collection. See [Revoke software deployed through the service catalog](#) for configuration instructions. When an administrator initiates the revocation process, the system launches the Revoke SCCM Application subflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The subflow employs two custom actions in the Microsoft SCCM spoke, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The subflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

ℹ️ **Note:** This subflow is triggered by the Revoke Client Software subflow.
Client software distribution dashboard

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

CSD dashboard

To access the CSD dashboard, navigate to Client Software Distribution > Requested Software > Dashboard.

Sample report from CSD dashboard

Client software distribution reports

<table>
<thead>
<tr>
<th>Report</th>
<th>Description</th>

Usage Overview dashboard

Navigate to **Client Software Distribution > Usage Overview** to view the current transaction count for your instance.

Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.
CAUTION: The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the flows, subflows, and extension points for a customized software distribution process.

Before you begin

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

Procedure

1. Navigate to **Client Software Distribution > Extensions > Providers**.
2. Click **New**.
3. Complete the form using the fields in the table.

![Client Software Distribution Provider - Casper](image)

Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item [cmdb_ci] table. For example, you might call your table Casper Server Instance [cmdb_ci_casper_server_instance].</td>
</tr>
<tr>
<td>Discover And Store SCCM Data subflow</td>
<td>Subflow that discovers the provider server and returns the data from that server back to the instance. This is</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Software configuration</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration [sn_client_sf_dist_software_config] table. For example, you might create a table called Casper Software Configuration [sn_client_sf_dist_casper_sf_config].</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The <strong>SetDeploymentData</strong> key provided with CSD. This key sets up the data for the software ordering and deployment flow.</td>
</tr>
<tr>
<td>Deploy Client Software flow</td>
<td>Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The <strong>SetRevocationData</strong> key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revoke SCCM Application subflow</td>
<td>Subflow that revokes an installation from a provider server. This is the subflow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
</tbody>
</table>

**Client software distribution extension keys**

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.

These pre-defined keys allow you to generate input variables for flows that deploy and revoke software from external distribution providers:
• **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment flow.

• **SetRevocationData**: Generates the input variables for the revocation flow.

• **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

**Client software distribution extension points**

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation flows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

**SetDeploymentData**

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentWorkflowInputs**: Object that specifies the deployment flow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.

**CheckRevocable**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to **true** or **false**, depending on whether the software configuration specifies uninstallation.

**SetRevocationData**

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution
record in the Software Configuration [sn_client_sf_dist_software_config] table. All providers' software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationWorkflowInput**: Object that specifies the revocation flow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.

### Interaction Management

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat.

The Now Platform offers several forms of queueing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

### Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction) to access the functionality.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the Interaction Logging, Routing, and Queueing plugin plugin (com.glide.interaction) using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   ! **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Components installed with Interaction Management

Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

   ! **Note:** The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

#### Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction Administrator [interaction_admin]</td>
<td>Configure interactions for users.</td>
<td>• interaction_agent</td>
</tr>
<tr>
<td>Interaction Agent [interaction_agent]</td>
<td>Create and edit interactions. Transfer interactions to different agents or queues.</td>
<td>None</td>
</tr>
</tbody>
</table>

#### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction [interaction]</td>
<td>Table for all interaction records.</td>
</tr>
<tr>
<td>Interaction JSON blob [interaction_json_blob]</td>
<td>List of records that store context information for each interaction.</td>
</tr>
<tr>
<td>Interaction related record [interaction_related_record]</td>
<td>List of related records that have been associated with an interaction.</td>
</tr>
</tbody>
</table>
Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.

Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the on Created state would have a script that creates an interaction and then adds the end user as the 'opened for'. The script then sends a message to the end user to let them know that the interaction has been opened.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table.</td>
</tr>
<tr>
<td>On Hold</td>
<td>The interaction is waiting for assignment.</td>
</tr>
<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction.</td>
</tr>
<tr>
<td>Wrap Up</td>
<td>This state indicates that the agent has completed a conversation with a customer and is wrapping up the interaction.</td>
</tr>
<tr>
<td></td>
<td>This state is available if an interaction wrap up configuration has been created for the specific type of interaction and that configuration is active.</td>
</tr>
<tr>
<td></td>
<td>For more information, see Interaction wrap up.</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction.</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive.</td>
</tr>
</tbody>
</table>
Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

**Context**

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default, however you can use any table to store a context record.

**Channel metadata**

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

Create an interaction

Most interaction creation takes place in other applications as interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.

**Before you begin**

Role required: interaction_agent

**Procedure**

1. Navigate to Interaction > All.
2. Click New.
3. In the Type field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the Opened for field, type the name of the user starting the interaction.
5. Include any additional information in the short description and the work notes fields.
6. Click Submit.

**What to do next**

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.
Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Before you begin
Role required: interaction_agent

Procedure
1. Navigate to Interaction > Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click New to create a record.
8. Click OK.
9. Click Submit.

Results
The associated record appears in the Related Tasks related list for the interaction.

Interaction wrap up

Interaction wrap up provides agents with a brief wrap-up period at the end of customer conversations. Agents can use this time to complete their work before moving on to assist other customers.

Interaction wrap up is a feature available for all types of interactions. When enabled, an interaction record moves from the Work In Progress to the Wrap Up state at the end of a customer conversation. This brief, configurable period enables agents to complete tasks such as posting work notes and updating record information before moving on to other work items.

While in the Wrap Up state, an agent’s capacity is not reduced until the state of the interaction moves to Closed Complete.

Note: The interaction wrap up feature works with multiple types of communication channels. This feature supports a chat and messaging interactions base system.
Configuring interaction wrap up

Users with the system administrator role create an interaction wrap up configuration for the desired communication channel. Creating a configuration automatically enables the feature and the Wrap Up state for interactions that match the configuration settings.
