Index
Now Platform capabilities

Digitize your workflows and run them at scale by using the core capabilities of the Now Platform®. When you activate and configure these features, you can create custom business logic, manage and secure data, and build alternate user interfaces.

Digitize your workflows with the Now Platform

Use native platform intelligence to predict, prioritize, and proactively manage the work that matters most for your own organization.

View and download the full infocard for a highlight of Now Platform capabilities features.

Create engaging app experiences with Service Portal
Design a portal interface that lets your users browse options, discover articles, or get help.

Improve agent efficiency with Agent Workspace
Enable your agents to work on multiple issues concurrently with an intuitive layout.

Automate work with Flow Designer

Turn business processes into digital workflows to deliver more intuitive experiences by extending ServiceNow solutions or building new workflow apps with no-code development tools.
Connect your enterprise with IntegrationHub

Connect your systems and apps using Now Platform APIs and tools. Use the ServiceNow Store to get access to an entire ecosystem of innovation for enterprise software.

Create engaging app experiences with Service Portal

With Service Portal, you can deliver your apps to employees through a portal that they can access from any device, at any time.
Improve agent efficiency with Workspace

Solve issues faster with a workspace that is built to facilitate resolutions. From a single view, agents get full context and AI-assisted recommendations to resolve issues quickly. Agents can communicate with customers from the same interface while reviewing issues.

• Skills Management
• Subscription Management
• Survey Management
• Task Communications Management
Use the ServiceNow® Advanced Work Assignment (AWA) feature to automatically assign work items to your agents, based on their availability, capacity, and optionally, skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their Agent Workspace inbox.

Customers use different channels to request service, for example, chats, cases, or incidents. Requests from customers create task or interaction records that store information about these objects, called work items.

AWA automatically routes work items to queues that focus on certain types of support, using criteria (such as priority or customer status) that you provide. Queues can be defined based on need or type, for example product or critical cases. You also identify the agent groups responsible for work in the queue. AWA then applies assignment rules that you set and use agent availability, capacity, and skills (if defined) to assign work to the most qualified agent.

Advanced Work Assignment components

Service channels
A means of providing customer service. AWA offers base system channels for chats, cases, incidents, and walk-up centers. For each channel, you can set attributes such as agent capacity and utilization conditions to control the work handled in the channel.

**Work items**
A single piece of work handled by an agent from start to completion. For example, one chat or one case is an object that is routed and assigned to agents.

**Work item queues**
A queue stores a specific type of work item for a service channel. AWA admins can create queues that focus on certain types of support within the channel, such as VIP customers or critical cases. AWA routes work items to queues based on specific conditions or requirements that you define, such as customer status, or region. Groups assigned to each queue handle the incoming work items. Once work items are placed in a queue, AWA can then assign items to available agents based on assignment rules and agent availability and capacity.

**Assignment groups**
Agents belong to specific groups organized by the type of work assigned to them. You provide details about an assignment group including the name and description, manager, and group email. You can also set up roles, groups and group members, queues, and agent capacity overrides for agents in an assignment group.

**Assignment rule**
Criteria that determines how work items are pushed to the appropriate agent within a qualified assignment group.

**Agent capacity**
The maximum number of work items on a particular service channel that an agent may actively work on at one time. Messaging Interactions in an On Hold state are not calculated as part of an agent’s capacity.

**Agent availability**
States that indicate agent presence and whether the agent is available for work or is busy or offline. AWA uses the agent availability state to determine if an agent is able to receive work.

**Inbox layout**
A configuration tied to a service channel that defines which fields of a record representing a work item are shown in agent inboxes. A layout defines what the agent sees in Agent Workspace.

Advanced Work Assignment roles
AWA adds the following roles for users who configure, manage, and receive work assignments.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator [awa_admin]</td>
<td>Admin role for the AWA feature. Configures and administers across all channels.</td>
</tr>
<tr>
<td>AWA agent [awa_agent]</td>
<td>Agent role for the AWA feature. Handles customer interactions and manages workload across multiple service channels.</td>
</tr>
<tr>
<td>AWA developer [awa_integration]</td>
<td>Developer role for using the AWA API.</td>
</tr>
</tbody>
</table>

Reassigning messaging conversations
If you want messaging conversations to be automatically reassigned if the current Assigned To agent on the conversation is not available, set the glide.messaging.reassign.enabled system property to true. The system property only affects messaging conversations and the Assigned To agent is considered not available if the AWA Inbox status is not set to "Available."

Basic process for configuring AWA
Users with the awa_admin role determine:
• What to route – Configure the base service channels to be used.
• Where to route – Define the work item queues and the routing rules, execution order, work item sort order, and strategy
• How to assign work items – Define the assignment rules that determine the work items pushed to agents
• What the agent sees – Set the inbox card layouts and presence (availability) states that agents use in their Agent Workspace inbox.
For details on the AWA components and related configuration, see these sections.

• Get started with Advanced Work Assignment
• Service channels
• Work item queues
• Work assignments
• Using Agent Affinity
• Agent Inbox controls
• Create or modify a work item size override

Related information
AWA for CSM overview

Get started with Advanced Work Assignment
To implement Advanced Work Assignment, complete these initial configuration and setup steps.

Before you begin
Role required: awa_admin and admin

Procedure
1. Activate the Advanced Work Assignment plugin for your instance.
2. Activate related AWA plugins to enable base system service channels and the Performance Analytics Solution for AWA. For example, activate the Agent Chat plugin to enable the Chat service channel and Agent Chat in Agent Workspace.
3. Configure the service channels that you activated.
   • Create or modify an inbox layout.
   • Override agent capacity as needed.
4. Create agent groups to which work items are assigned.
5. Create work item queues for your service channels.
   • Define the pools of agents eligible for assignment (eligibility assignment).
   • Set the sort order for work items in the queue.
6. Configure the work assignment rules used to push work to the appropriate agents.

7. Set the controls that agents use to manage their availability states and assignments in Agent Workspace.
   - Create or update the presence states that agents use to indicate their availability.
   - Create or update the reasons that agents use to decline work assignments.

**Activate Advanced Work Assignment**

You can activate the Advanced Work Assignment plugin (com.glide.awa) if you have the admin role.

**Before you begin**

Role required: admin

**About this task**

Advanced Work Assignment activates the Skills Management plugin (com.snc.skills_management) to implement user and group skills.

<table>
<thead>
<tr>
<th>Plugins for Skills Management</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Plugin</strong></td>
</tr>
<tr>
<td>Skills Management</td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to System Applications > All Available Applications > All.

2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.
What to do next
Activate the related AWA plugins to enable the appropriate service channels and the Analytics and Reporting Solutions for Advanced Work Assignment.

Related information

Activate related plugins for Advanced Work Assignment
After activating the Advanced Work Assignment plugin, activate related AWA plugins to enable other base system service channels and the Performance Analytics Solutions dashboard for AWA.

You must have the admin role to activate these additional plugins for AWA. For details, see Activate a plugin.

Move from Connect Support to Advanced Work Assignment and Agent Chat

Move from ServiceNow® Connect Support to Agent Chat (live chat), which is the messaging system that agents use in Agent Workspace to interact with customers. Moving from Connect Support also involves using Advanced Work Assignment (AWA) to create the chat queues for routing chat work items to agents.

Before you begin
Role required: admin

About this task
Moving to modern applications such as Advanced Work Assignment and Agent Chat offers features and benefits that are not available in Connect Support. These new capabilities include:

• Automatic assignment of chats and work items to agents based on criteria that you define, such as agent availability, capacity, skills, Agent Affinity, and variable work item sizing.
• Automatic queue overflow handling
• Chat timeout reassignment
• Native pre-chat surveys
• Supervisor features, such as Agent Whisper, that enable managers to join ongoing public customer chats with agents or send private messages to agents.
• Agent features, such as workspace inbox controls for viewing, accepting, or rejecting incoming chats.

If you are currently using Connect Support APIs, see AWA Routing API for information on AWA APIs.

Procedure
1. Activate the Advanced Work Assignment and Agent Chat plugins if they are not currently active.
2. If needed, review your existing Connect Support chat queues and determine whether you want to create a similar set of queues for the Chat service channel in AWA.
Note: You cannot use your Connect Support chat queues in AWA. Chat queues for Connect Support are stored in the Chat Queue [chat_queue] table. Chat queues for AWA are stored in the AWA Queue [awa_queue] table.

3. In AWA, configure the Chat service channel and create the associated chat queues. You also must set up agent work assignments.

4. In the Chat Setup form, specify Agent Workspace as the fulfiller interface for live chat and enable other live chat features.
   a. Navigate to Conversational Interfaces > Chat Setup.
   b. In the Global Fulfiller UI list or the Fulfiller UI list for CSM or ITSM, select Agent Workspace.
   c. Consider enabling other live chat features, such as Agent Whisper. For details, see Setting up Agent Chat.
   d. Click Update.

5. Enable the chat client on your end user Service Portal.

Trouble?

Troubleshooting suggestions

Problem: While using AWA, the chat remains in routing and is not offered to an available agent.

Solution: This problem may happen if AWA attempts to route the chat to a Connect Support queue. In this case, the interaction remains assigned to the Virtual Agent user and no awa_work_item record is created. A common cause of this problem is the Chat Setup entry for the chat’s application still being set to Connect.

Problem: When trying to route to a live agent, the requester is incorrectly told that no live agents are available.

Solution: This problem may be caused by one of these situations:

• Queue conditions that depend on checking interaction fields or context were created on the interaction too late for routing.

• Chat service channel is not associated with the Available presence state. A common cause of this problem is deactivating and reactivating the Chat channel.

Debugging suggestions
Here are a few questions to ask and places to look if agents are not receiving chats:

• Does an awa_work_item record exist for the interaction? If it does not, is the Assigned to field for the interaction empty or is it set to Virtual Agent? If the Assigned to field is set to Virtual Agent, it is probably trying to use Connect Support.

• In the Chat setup, are the fulfillers set appropriately for each application?

• In the interaction_json_blob referenced by the interaction.context_document field, is the Liveagent_application variable set to the expected value?

Components installed with Advanced Work Assignment

Several types of components are installed with activation of the Advanced Work Assignment plugin, including tables, user roles, and scheduled jobs.

⚠️ Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Domain separation and Advanced Work Assignment

Domain separation is supported in the Advanced Work Assignment feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Advanced Work Assignment enables the automatic assignment of work items to qualified agents using work item queues defined for specific service channels. Managed Service Providers can create domain-specific queues by specifying a particular domain as a queue routing condition.

How domain separation works in Advanced Work Assignment

When an instance has a domain hierarchy where users and groups belong to different domains, you may need to restrict the visibility of work items to certain agents in a domain. You may also need to ensure that work items are routed to agents in the proper domain. AWA admins can configure service channels and associated work item queues to:

- Route work by domains
  
  To push work items to agents in domains where only certain tasks or interactions are visible to them, use a routing condition that routes those items to the appropriate queues. For example:
• To restrict a queue to only items that match exactly to a particular domain X, specify this condition: [Domain] [is] [X]
• To route all work items in domain X and its child domains to a queue, use the Domain Path field and specify a condition such as: [Domain Path] [starts with] [!!!/!!#/] 

Assign work to agents in the appropriate domain

To assign work items to agents in the appropriate domain, ensure that the assignment groups specified in the queue Eligibility Assignment pools have agents that belong to the domains where they can see the work items routed to the queue.

If a mismatch occurs, and agents in an eligible assignment group cannot see a work item in a queue, AWA may temporarily assign an item to an agent. However, before the item is moved to the agent’s inbox, AWA automatically rejects the assignment with the reason No access. AWA reassigns the work item to a different agent who might have access. If none of the available agents can see the work item, the item could be rejected multiple times.

⚠️ Warning: The item can get stuck in the queue until the AWA admin corrects the eligible assignment configuration.

Domain separation for service providers

Service channels

Provide customer support by automatically routing incoming work to agents through service channels.

A service channel is a means of assigning a specific type and scope work to agents. You can configure base system service channels to set the context and attributes that define work handled in the channel, or create your own custom service channel.

Advanced Work Assignment provides several service channels from which work items originate. These channels are:

<table>
<thead>
<tr>
<th>Service channel</th>

<td></td>
<td>WhatsApp (powered by Twilio) store application.</td>
</tr>
</tbody>
</table>

You can also set up a custom service channel to address work that is not supported in the base system channels. For more information, see Set up a custom service channel.

For each service channel, you set attributes such as:

- Agent capacity: Amount of work that can be handled by the agents supporting the channel.
- Filters: Conditions that filter the type of work handled in the channel.
- Utilization: Conditions that determine when work items are generated.

For each service channel, you also:

- Create the agent inbox card layout used in Agent Workspace.
- Set capacity overrides for specific agents.
- Review and modify associated work item queues. For the Chat service channel, you can create queues using the Queues related list.

**Service channel capacity and utilization**

In Advanced Work Assignment, capacity is the number of work items automatically assigned to agents supporting a service channel. Utilization is the condition that identifies the work item states supported in the channel.

Agents have an assigned capacity for each service channel. This capacity is based on the default capacity set for the channel. The agent capacity for one service channel (for example, chat) does not interfere with the capacity on other service channels (for example, case or incident). Admins can set the Default capacity for a channel on the Service Channel form. This setting applies to all agents supporting the channel.

Managers can override the default capacity for:

- Individual agents, by using the Agent Capacity Override related list on the Service Channel form.
- Groups of agents, by using the Agent Capacity Override related list on the Group form.

If an agent already has a capacity override, setting the override again updates the existing capacity for that agent. Override capacity is stored in the Agent Capacity (awa_agent_capacity) table.
Inbox layout

The inbox layout determines the information shown on work item cards displayed in an agent’s inbox.

The AWA admin (awa_admin) can configure layouts that represent items in an agent inbox. The configuration allows agents to see the most important attributes by service channel work items. The fields specified on the inbox layout determine the information displayed for a work item.

Each base system service channel provides preconfigured inbox layouts for work items. The AWA admin can view and edit these layouts and also create new layouts.

Up to five fields can be shown in the card layout.

• Fields can be added from the table that the service channel points to.
• Fields are dot-walkable.
• The first field added to the layout becomes the title field on the card.

Layout example

For chats that do not have either a contact or consumer, the layout includes only the chat subject. You control the display of the Time to accept count (timer) and the Reject button through the agent assignment rules.

Create a service channel

Create or configure a service channel that is used in Advanced Work Assignment. You can specify additional conditions to filter the work items that are handled in the channel, change the agent capacity (workload) for the
channel, set the inbox layouts that your agents use in Workspace, and view associated work item queues.

Before you begin
Role required: awa_admin or admin

About this task
If you activate the corresponding plugins or install the corresponding store applications, AWA provides base system channels for these services:

• Cases plugin (com.snc_csm.awa)
• Chats plugin (com.glide.interaction.awa)
• Chats - Asynchronous plugin (com.glide.interaction.awa)
• Conversational Integration with Facebook Messenger application (sn_va_fb_messenger)
• Incidents plugin (com.snc.incident.awa)
• Conversational Integration with LINE application (sn_va_line)
• Walk-up interactions plugin (com.snc.walkup)
• Conversational Integration with WhatsApp (powered by Twilio) application (sn_va_whatsapp_twi)

For each channel, you can change certain default settings, such as the default capacity (workload) for agents. You can also use the related lists to review associated queues, define the associated inbox layouts (work item cards) that are displayed in Workspace, and override the agent capacity value.

You can also create a service channel record from the Service Channel module, but you must create a queue, assignment rule, and eligible assignment pool to route work through the service channel. For more information, see Set up a custom service channel.

Procedure
1. Navigate to Advanced Work Assignment > Settings > Service Channels.
   • To create a service channel, select New.
   • To modify a service channel, select the service channel record you want to update.
2. On the form, fill in the fields.

**Logging**

<table>
<thead>
<tr>
<th>Enable logging</th>
<th>Option to record information in the syslog_awa table when AWA events are logged. Specify the level of detail to be recorded in the <strong>Log level</strong> field on this screen.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stop logging at</td>
<td>Date and time that logging should stop. This field appears if <strong>Enable logging</strong> is enabled.</td>
</tr>
</tbody>
</table>

3. Select **Submit** or **Update**. The channel is added to or updated in the Service Channels [awa_service_channel] table.

**What to do next**

- Override the agent capacity for selected agents or groups.
- Create or modify an inbox layout for the service channel.
- Configure agent assignment rules for the channel.
- Define agent pools eligible for assignment.
- Create or modify a work item queue for the channel.
- Create or modify a work item size override for the channel.

**Conversational SMS service channel**

Using the Conversational SMS service channel app on the ServiceNow Store, workspace agents can provide support for long-running SMS conversations and conversations that use multiple service channels.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release
notes information for all released apps, see the ServiceNow Store version history release notes.

**Overview**

Requesters can initiate support conversations through SMS. Since these support conversations can be long-running, workspace agents need the ability to track ongoing conversations while also addressing requesters on other service channels. With the Conversational SMS service channel store app, workspace agents can initiate or continue SMS conversations and also accept SMS work items from the Workspace Inbox. Requesters in SMS conversations see a limited subset of system messages. This minimizes the number of system messages in case the conversation is long-running.

**Messaging profiles**

Messaging profiles provide a way to match an incoming phone number to a requester:

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>New SMS is received from a requester who is associated to a phone number on the User [sys_user] table but has no messaging profile match</td>
<td>• A messaging profile record is generated to match the number to the User table.</td>
</tr>
<tr>
<td></td>
<td>• An interaction record is associated to the matching User table.</td>
</tr>
<tr>
<td>New message received from a requester who does not have a phone number match in the User table but does have messaging profile match</td>
<td>• An interaction record is associated to the matching messaging profile user.</td>
</tr>
<tr>
<td></td>
<td>• The User table record is not associated to the phone number. The agent can manually verify.</td>
</tr>
<tr>
<td>New message received from a requester who does not have a phone number match in the User table or messaging profiles</td>
<td>• An interaction record is associated to the guest user (Virtual agent or live agent can manually verify).</td>
</tr>
<tr>
<td></td>
<td>• A messaging profile record is generated for the phone number but not associated to a user.</td>
</tr>
<tr>
<td>If</td>
<td>Then</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
</tr>
</tbody>
</table>
| New SMS from a requester that conflicts with an existing User table or messaging profile | • An interaction is associated with the messaging profile/user currently associated with the number.  
• Virtual agent or live agent can verify the user and reassociate the interaction/profile with the correct user. |

**Messaging actions**

Messaging actions provide a way to trigger actions based on messaging activity on a conversation.

<table>
<thead>
<tr>
<th>Messaging action parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event</strong></td>
<td>Sending of a message from a requester or agent starts a timer that can trigger an action</td>
</tr>
<tr>
<td>1. Requester message without agent response</td>
<td></td>
</tr>
<tr>
<td>2. Agent message without requester response</td>
<td></td>
</tr>
<tr>
<td><strong>Duration</strong></td>
<td>Time set to trigger an action based on the Event parameter being set</td>
</tr>
<tr>
<td><strong>Filter conditions</strong></td>
<td>Condition needed on the Interaction record for a messaging action to be triggered (for example, State is &quot;On Hold&quot;)</td>
</tr>
</tbody>
</table>
| **Action** | Possible actions include:  
• Prompt agent – Sent Workspace notification to agent  
• Prompt requester – Sent system message in messaging conversation to requester  
• Reassign – Remove assigned agent from interaction  
• Set state – Set Interaction state to desired state |
Ongoing conversations

The Agent Inbox displays new SMS messages and agents can locate currently assigned SMS conversations in the Ongoing tab. The tab indicator and record highlight indicate when an SMS conversation has a new message. Unlike chat conversations, SMS conversations can be long-running. Completed SMS conversations do not display in the Ongoing tab.

Requester initiated SMS conversations

When a requester initiates a support conversation, a virtual agent or a live agent addresses the conversation. Like other service channels, Advanced Work Assignment handles the routing of SMS conversations to live agents. This is how requester-initiated SMS conversations are handled:
An active SMS interaction represents an ongoing conversation between a requester's phone number and a company's phone number.

**Agent initiated SMS conversations**

To initiate an SMS conversation with a requester, agents can select a provider number for an outbound service or manually enter a provider number. If there is a current ongoing SMS conversation, it automatically appears. When an agent initiates an SMS conversation:

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>There is no active SMS interaction</td>
<td>• Create a new SMS interaction</td>
</tr>
<tr>
<td></td>
<td>• Assign interaction to agent</td>
</tr>
<tr>
<td>There is an active interaction involving an agent</td>
<td>• Inject the message into existing conversation</td>
</tr>
<tr>
<td></td>
<td>• Continue with existing virtual agent topic</td>
</tr>
<tr>
<td></td>
<td>• Track using the same interaction record</td>
</tr>
</tbody>
</table>

<table>
<thead>

If | Then
---|---
There is an active interaction involving VA | • Close existing interaction
• Create a new interaction and assign to agent

There is an active interaction involving a different contact/consumer/user | • Close existing interaction
• Create a new channel user profile and deactivate the existing channel user profile
• Create a new interaction and assign to agent

An active SMS interaction represents an ongoing conversation between a requester’s phone number and a company’s phone number.

**Install Conversational SMS service channel**

You can install the Conversational SMS service channel application (sn_awa_sms_int) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

**Before you begin**

- Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

- The Conversational Messaging plugin (com.glide.messaging.awa) must be installed.

For more information on activating plugins, see Activate a plugin.

Role required: admin

**About this task**

⚠️ **Note:** The Conversational SMS service channel is automatically installed with an application that implements an SMS provider, such as the Conversational SMS Integration with Twilio (sn_va_sms_twilio) application. For more information, see Install Conversational SMS Integration with Twilio.
Procedure

1. Navigate to **System Applications > All Available Applications > All**.

2. Find the Conversational SMS Service Channel (sn_awa_sms_int) application using the filter criteria and search bar.
   
   You can search for the application by its name or ID.
   
   If you cannot find the application, you may have to request it from the ServiceNow Store. Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the **ServiceNow Store version history release notes**.

3. Click **Install**.

4. In the Application installation dialog box, click **Install**.

**What to do next**

Set up Conversational SMS service channel

**Set up Conversational SMS service channel**

Configure the Conversational SMS service channel store app.

**Before you begin**

Role required: admin

Procedure

1. Navigate to **Advanced Work Assignment > Service Channels**.

2. Click the SMS service channel. On the Service Channel - SMS screen, select the Active check box to activate the service channel.

   ![Service Channel - SMS screen](image)

   SMS service channel is connected to an SMS
3. Since the SMS group has no users by default, manually add users to the SMS group. For detailed instructions on how to add a user to a group, see “Add a user to a group” in Create a user group.

5. In the Name column, click **Available**.

7. Select the right-pointing arrow. This moves SMS from the Available column to the Selected column.

8. Click Update.

**Agent initiated SMS conversation**

Customer Service Management supports additional messaging channel such as SMS which tracks interactions between the agent and customer.

**Requirements**

At least one provider configuration for messaging type channel must be available to view the **Compose SMS** option in the agent interaction screen. For more information about provider sys_cs_provider_application.list, see Create a channel identifier.

**Phone number validation**

REST endpoint `/api/now/initiate_message/validate_phone_number` is used to validate if the phone number is in the E.164 format. If the number of a known consumer is not in the E.164 format, the system converts it to the E.164 format based on for example, the location of the consumer. If the location is not found, it will by default convert the number to an E.164 format. For more information about E.164 formats and validation, see Phone number fields.

**Customer profile validation**

REST endpoint `/api/now/initiate_message/validate_profile` is used to validate the channel user profile. When you send an SMS in reply to an interaction of type phone, the message is sent to a consumer originally associated with the interaction. If the same phone number is associated to a different consumer, and you send an SMS, you will get a message that the phone number is currently associated to another consumer and sending the new message will associate the phone number to the current user.

A phone number is associated to consumer A and an interaction has occurred after which the phone number was disconnected for consumer A. There is a new interaction with consumer B and you select the same phone number that was associated with consumer A. A message appears that the phone number is currently associated to consumer A, and sending a new message will associate consumer A’s phone number to consumer B who is the current user.

**Agent initiated SMS conversations**

To initiate an SMS conversation with a requester, agents can select a provider number for an outbound service or manually enter a provider number. If there is
a current ongoing SMS conversation, it automatically appears. When an agent initiates an SMS conversation:

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
</table>
| There is no active SMS interaction | • Create a new SMS interaction  
• Assign interaction to agent |
| There is an active interaction involving an agent | • Inject the message into existing conversation  
• Add agent to live group profile  
• No reassignment |
| There is an active interaction involving VA | • Close existing interaction  
• Create a new interaction and assign to agent |
| There is an active interaction involving a different contact/consumer/user | • Close existing interaction  
• Create a new channel user profile and deactivate the existing channel user profile  
• Create a new interaction and assign to agent |

**Customize the behaviour of send from and to numbers**

The AgentInitiatedConversationUtil extension point is added to implement a customers' logic to change the default behaviour of the **Send from** and **Send to** fields. For more information, see [Associate user profiles on messaging interactions](#). For this store application, AgentInitiatedMessagingUtilExtPointImpl extension point is configured for fetching the from and to numbers.

**Compose an SMS conversation**

An agent can compose an SMS to interact with a customer for resolving various issues. If the interaction is not messaging type, you see the **Compose SMS** option.

**Before you begin**

Role required: agent_workspace_user  
A provider is configured for SMS messaging type channel.
About this task
As an agent, you can compose and send an SMS to an ongoing interaction which is not messaging type.

Procedure

1. Click Compose SMS.
The Send via SMS screen is displayed.

2. Select a phone number from the Send from: drop-down list.
   • If there is only one provider phone number this field is pre-populated with the number.
   • If there are multiple provider profiles available for SMS channels, you can choose from the drop-down list.

3. Select a phone number from the Send to: drop-down list.
   • The phone numbers are pre-populated from the consumer or contact records.
   • If both are not populated, the system looks for the number from the opened for record in the sys_user table.
   • If there is already a channel user profile associated with a consumer or contact, the phone number is pre-populated.

   a. Choose Other and select a phone number in the drop-down list.

   Note: All phone numbers must be in the E.164 format. For more information, about phone number and channel user profile validation, see Phone number validation.

If there is already an ongoing SMS type of interaction with the same or different consumer, you can view the interaction card in the same screen. The interaction card for the consumer number you have selected contains interaction number, message type, last updated time, consumer, and assigned to information.

4. Enter your message in the Message field.

5. Click Attach file, browse, select the file and attach.

   Note: You can attach only image files to the message. For more information about the REST API for uploading attachments, see Attachment - POST /now/attachment/upload.

6. Click Send.
For more information, see Agent initiated SMS conversations.
Set up a custom service channel

Set up a custom service channel to expand the type and scope of work that is routed automatically to your agents.

Before you begin

• Select the table that you want to use to route work to agents automatically. Only Task [task] and Interaction [interaction] tables are supported.

• Ensure that the form layout for the selected table is configured for the workspace view. Record types without a workspace view appear as read-only in Agent Workspace. For more information, see Set up forms in Workspace.

• If you want to open a record in AWA for a table that extends another table that has a service channel defined, ensure that the workspace view for that table has already been defined.

• Assign the awa_agent and workspace_agent roles to whichever agents are receiving work items in Agent Workspace from your custom service channel.

Role required: awa_admin or admin

About this task

You can create a service channel record from the Service Channel module, but you need to create a work item queue, assignment rule, and eligible assignment pool to route work through the service channel. You also need to configure the custom service channel to make it available in an agent's inbox in Agent Workspace.

Procedure

1. Navigate to Advanced Work Assignment > Service Channels, and then click New.

2. Complete the service channel fields, and then click Submit.
   For more information, see Create a service channel.

3. Create an assignment rule.
   For more information, see Configure agent assignment rules.

4. Create a work item queue for your service channel.
   For more information, see Create a work item queue.

5. On the form for the work item queue that you created, go to the Assignment Eligibility related link and create an eligible assignment pool.
   Make sure to associate your assignment rule to the eligible assignment pool.
   For more information, see Define agent pools eligible for assignment.
6. Make your service channel available in Agent Workspace.
   a. Navigate to Advanced Work Assignment > Presence States, and then open Available.
   b. On the form, move your custom service channel to the Selected list.
   c. Select Active option (if not already selected).
   d. Click Update.

7. Optional: Create or modify the inbox card layout to show the most important information from a work item. For more information, see Create or modify an inbox layout.

Results
Your custom service channel routes work to agents. In Agent Workspace, the service channel appears as an available service channel in the agent inbox.

Tutorial: Set up a custom service channel for change requests
Learn how to configure Advanced Work Assignment to automatically assign change requests to agents. Use this tutorial as a guideline to help you understand how service channel records, queues, and assignment rules work together to create a custom service channel.

In this tutorial, you learn how to set up a custom channel that:
• Assigns new change requests to whichever Change Management agent has the most capacity
• Populates the assignee’s agent inbox in Agent Workspace with change requests from the queue
• Displays the change request number, short description, and type on the inbox card
• Enables the agent to accept or reject change requests

For information on setting up custom service channels, see Set up a custom service channel.

Before you begin:
• Ensure that the form layout for the Change Request table is configured for the workspace view; otherwise, work items from the Change Request service channel appear as read-only in Agent Workspace. For more information, see Set up forms in Workspace.
• Assign the awa_agent and workspace_agent roles to the Change Management group so that members can open work items in Agent Workspace.
Create a service channel to route requests
Create a service channel in Advanced Work Assignment so that you can route change requests to agents.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Service Channels, and then click New.
2. On the form, fill in the fields.
   • Name: Change Request
   • Inbox Order: 100
   • Table: Change Request [change_request]
   • Active: Selected
   • Utilization condition: [Active] [is] [true]
3. Click Submit.

Create an assignment rule for change requests
Create an assignment rule in Advanced Work Assignment that assigns change requests to agents who are available to do the tasks.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Assignment Rules, and then click New.
2. On the form, fill in the fields.
   • Name: Change Request Assignment Rule
   • Assign by: Most Capacity
   • Allow agents to reject: Selected
3. Click Submit.

Create a queue to route new change requests
Create a work item queue in Advanced Work Assignment that routes new change requests through the service channel that handles change requests.
Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Queues, and then click New.
2. On the form, fill in the fields.
   • Name: Change Management
   • Service channel: Change Request
   • Condition mode: Simple
   • Work item routing condition: [State] [is] [New]
3. From the form context menu, click Save.

Create an assignment pool of agents
Create an eligible assignment pool in Advanced Work Assignment that receives overflow work items, just in case you need more help from other agents to handle change requests.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Queues, and then open the Change Management queue.
2. On the form, go to the Assignment Eligibility related list and click New.
3. On the form, fill in the fields.
   • Agent assignment rule: Change Request Assignment Rule
   • Groups: Change Management
4. Click Submit.

Make your service channel available in Agent Workspace
Make your service channel available in Agent Workspace so that agents can receive change requests in their inbox.

Before you begin
Role required: awa_admin or admin
Procedure
1. Navigate to Advanced Work Assignment > Presence States, and then open Available.
2. On the form, move Change Request to the Selected list.
3. Select Active (if not already selected).
4. Click Update.

Customize how change requests appear in an agent inbox
Customize how change requests appear in an agent inbox so that agents receive enough information to decide whether to accept or reject the work item.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Service Channels and open the Change Request service channel record.
2. On the Change Request service channel form, go to the Inbox Layouts related list and open Default Change Request layout.
3. On the form, fill in the fields.
   • Field 1: Number
   • Field 2: Short description
   • Field 3: Type
4. Click Update.

Results
When you create a new change request, the item is routed through the Change Request service channel and assigned to the agent in the Change Management assignment group who is available to receive the change request. When the assignee checks their agent inbox, the change request appears with the option for the agent to either reject or accept the work item.
Create or modify an inbox layout

Create or modify the card layout for inbox items for a given service channel. Card layouts are displayed in the agent inbox view of Agent Workspace.

Before you begin
Role required: awa_admin or admin. Users with the awa_manager or agent role can review inbox layouts.

About this task
Cards represent work items in an agent's inbox in Agent Workspace. Each channel has a default layout for these cards, which can display up to five fields from the related table record. Use the Inbox Layout form to change a default layout, such as the name, short description, and the specific fields displayed on the card, for example channel and contact or consumer name. You can also specify certain conditions that determine when the card layout is used.

Procedure
1. Navigate to Advanced Work Assignment > Service Channels and select the service channel to be updated.
2. In the Service Channel form, click the Inbox Layouts related link.
   - To create a layout, click New.
   - To modify a layout, select the layout to be updated.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the inbox layout.</td>
</tr>
<tr>
<td>Service channel</td>
<td>The name of the selected service channel.</td>

</tr>
</tbody>
</table>

4. Click **Submit** for a new layout or **Update** to modify a layout. The layout is added to or updated in the Inbox Layout [awa_inbox_layout] table.

**What to do next**

As needed:

- **Override the agent capacity** value for selected agents or groups.
- **Create or modify a work item queue** for the channel.

**Override agent capacity for selected agents**

Change the default number of work items that an agent can handle for a service channel.

**Before you begin**

Role required: awa_manager, awa_admin, or admin

**About this task**

To change the capacity for selected agents, use the **Agent Capacity Override** related list for the service channel. To change the capacity for one or more members of a selected group, use the **Agent Capacity Override** related list for the group (**Advanced Work Assignment > Groups**).

**Procedure**

1. Navigate to **Advanced Work Assignment > Service Channels** and select the desired service channel.
2. In the **Agent Capacity Override** related list, click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Channel</td>
<td>Name of the selected channel.</td>
</tr>
<tr>
<td>Override Capacity</td>
<td>Number of work items that the selected agents can handle.</td>
</tr>
</tbody>
</table>
What to do next
If you are configuring a service channel, you can create or change an inbox layout for the channel.

Create or modify a work item size override
Create a work item size override if you want Agent Affinity to calculate an agent’s workload using a work item size other than the default.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Service Channels and select the desired service channel.

2. On the form, select the Work Item Size Override list.
   • To create an override, click New.
   • To modify an existing override, select the override that you want to update.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users</td>
<td>Agents to which this override applies. Move the agent names from the Available list to the Selected list. You can use the filter to identify conditions that restrict the list of agents.</td>
</tr>
<tr>
<td>Note:</td>
<td>The filter shows only users or groups that have AWA roles (awa_agent, awa_manager, awa_admin, admin).</td>
</tr>
</tbody>
</table>

4. Click Submit.
   The selected agents and their associated capacity values are listed in the Agent Capacities table.

Change work item size form

<table>
<thead>
<tr>

<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Service Channel</td>
<td>Service channel that is assigned to the override.</td>
</tr>
<tr>
<td>Override Size</td>
<td>Size to use instead of the default.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which Advanced Work Assignment considers this size override.</td>
</tr>
<tr>
<td>Condition mode</td>
<td>Type of condition for routing work items using this size override:</td>
</tr>
<tr>
<td></td>
<td>• Simple: Specify a routine condition using the condition builder.</td>
</tr>
<tr>
<td></td>
<td>• Advanced: Specify a JavaScript scripted condition.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Condition that applies to the override work item sizes. This field appears when you select <strong>Simple</strong> in the <strong>Condition mode</strong> field.</td>
</tr>
<tr>
<td>Script</td>
<td>JavaScript condition statement that specifies the override work item size. The condition must evaluate to true. This field appears when you select <strong>Advanced</strong> in the <strong>Condition mode</strong> field.</td>
</tr>
</tbody>
</table>

4. Click **Submit** to create the override or **Update** to modify the override.

**Work item queues**

In Advanced Work Assignment, queues store a specific type of work item for a service channel.

AWA administrators can create or modify queues based on customer need. As part of creating or modifying a queue, the awa_admin identifies some information about the queue, including the service channel to which the queue belongs and which agent groups handle the incoming work items.

The awa_admin can select a schedule that defines when the queue is available and identify a time limit within which an agent should accept a work item in the queue. If the selected service channel is **Chat**, the awa_admin creates the chat messages that are displayed to users.

© 2021 ServiceNow, Inc. All rights reserved.

Routing conditions identify the work items that are routed to a queue. Create routing conditions in one of two ways:

- Simple: use a condition builder to select routing conditions. The fields available for selection are based on the selected service channel.
- Advanced: use a JavaScript script to identify routing conditions.

The awa_admin can also create a queue without routing conditions so that work items are not routed to that queue automatically. Customers can manually assign work items to the queue or assign work items using assignment tools such as matching rules or Flow Designer.

When a case in a queue is assigned manually, the case is removed from the queue. The state of the work item is set to **Canceled** and the cancellation reason is set to **Manually assigned**.

**Note:** New work items may not be assigned if they are routed to queues containing more than 10,000 work items in the queued state.

**Configure routing rules that use chat context variables**

You can specify queue routing rules that use chat context variables in the condition builder. You define chat context variables in Chat Setup. These variables can store contextual information that can be used in routing conditions that control where chat work items are routed.

For example, you can define chat context variables to store user responses from pre-chat surveys. If you store these responses in chat context variables, such as a user's department or a product name, you can specify the context variables in queue routing conditions to direct where the live chat is routed. When you specify a routing condition using the condition builder, you can dot walk to the Context fields. In the fields menu, select **Show Related Fields** and open the fields menu again to select **Context → Interaction Context fields**.
You can then select from the available chat context variables in the condition builder. For example, choosing `csp_category` becomes `Context.csp_category`.

### Assign pools of agents eligible to work on a queue

Assign one or more agent groups to a queue using the [Eligibility Assignment](#) related list. These groups are eligible to receive work items from the queue, which allows work to get prioritized to eligible agents.

Select an agent assignment rule and any eligibility time constraints for each group. The eligibility time constraints are used to determine when the next pool of agents is eligible for assignment. For example, you can assign one group to handle work items immediately and a second group to handle the overflow from the first group after work items sit in the queue for a specified amount of time.

**Note:** If no groups are assigned to a queue, work items can be routed to the queue but Advanced Work Assignment does not assign them.

### Create a sort order for a queue

Use the Work Item Sort Order related list to create one or more sort conditions for work items in a queue. For each sort condition, specify a field from the selected service channel table and the direction to sort, either ascending or descending. Items in the queue are sorted and assigned to agents based on these conditions.

### Create a work item queue

Define or modify a queue so that you can determine which specific work items are routed automatically to agents through a given service channel.
Before you begin
Role required: awa_admin or admin

About this task
Depending on the service channel, additional configuration options are available. For example, in the chat channel you define the standard messages displayed during a chat session with a user.

Procedure
1. Navigate to Advanced Work Assignment > Settings > Queues.
   - To create a queue, click New.
   - To modify a queue, select the queue record to be updated.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue. A default queue may be available for the service channel you activated through the AWA-related plugins.</td>

</tr>
<tr>
<td>Max wait time message</td>
<td>Message that users see when a chat ends because the Max Wait Time has elapsed. This field is required if the Max Wait Time is greater than 0.</td>
</tr>
<tr>
<td>Target wait time</td>
<td>Estimated time (Days or Hours, minutes, seconds) allotted for an agent to accept an item in the queue.</td>
</tr>
<tr>
<td>Max Wait Time</td>
<td>Maximum amount of time that an agent has to accept or reject a chat request. After time runs out, the requester receives the No Agents Available Message that is defined in Chat Setup.</td>
</tr>
<tr>
<td>Note: The Max Wait Time field is available after you associate the queue to the chat service channel.</td>
<td></td>
</tr>
<tr>
<td>Chat Messages</td>
<td>For the chat service channel.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example: How can we help you?</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Message to users acknowledging the chat request. For example: Thank you for contacting support. Someone will be with you shortly to assist you.</td>
</tr>
</tbody>
</table>

3. Click **Submit** for a new queue or **Update** to modify the queue. The queue is added to or updated in the Queues [awa_queue_list] table.
What to do next

- Define the Assignment Eligibility.
- Optionally, define the Work Item Sort Order.
- Optionally, define the Set Agent Affinity rules.

Define agent pools eligible for assignment

Specify pools of agents eligible to receive overflow work assignments for a queue. An eligible assignment pool can consist of one or more groups of agents available to work on items in the queue. This feature enables Advanced Work Assignment to find a qualified agent from a wider pool of agents.

Before you begin

Role required: admin

About this task

Use the Assignment Eligibility related link to expand the pool of agents eligible to work on items in the queue when other agents are busy or unavailable. For each agent pool, select the assignment rule that determines the assignment eligibility. If you do not define an eligible assignment pool for a queue, work items are routed to the queue but AWA does not assign them.

Procedure

1. Navigate to Advanced Work Assignment > Queues and in the Queues [awa_queues] table, click the queue to update.

2. To create an assignment pool, go to the Assignment Eligibility related link.
   - To create a new eligible assignment pool, click New.
   - To modify the assignment eligibility for a pool of agents, select the pool to be updated.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent assignment rule</td>
<td>The name of the rule that determines how work items are to be assigned. Select an assignment rule from the list.</td>
</tr>
<tr>
<td>Eligible at</td>
<td>The length of time in seconds before AWA considers the next set of agents for assignment.</td>
</tr>
</tbody>
</table>
### Field | Definition
--- | ---
Groups | The set of groups eligible for assignment.
| • Click the lock icon to unlock it and select the agent groups in the eligible assignment pool.
| • Click the lock icon to lock it.

4. Click **Submit** to create the eligible or **Update** if modifying an eligible assignment pool.
The Queues [awa_queues] table is updated with the eligible assignment pool.

**Set work item sort order**
Specify the order in which work items in a queue are sorted.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to **Advanced Work Assignment > Queues > Module** and select the queue.
2. Click the **Work Item Sort Order** related list and click **New**.
3. In the Work Item Sort Order form, select:
   a. **Field**: The field to be used for the sort. The fields are from the table for the associated channel. For example, the fields available for the chat service channel are from the Interaction table.
   b. **Sort Direction**: The order in which work items are sorted. Select either Ascending (smallest to largest or oldest to newest ) or Descending (largest to smallest or newest to oldest).
   c. **Order**: The value of the Order value relative to other items in the queue.
4. Click **Submit**.

**Use external routing**
Configure Advanced Work Assignment to route work items in the queues using external routing.

Before you begin
Role required: awa_admin or admin
About this task
When you configure AWA to use external routing:

- Queues do not check for available agents.
- Work items remain in the queue with a status of “Queued” until the external system routes the work item or the maximum wait time is reached.
- Queues do not need to have Assignment Eligibility Groups defined.
- Related lists do not display at the bottom of the Queues screen.
- Create a REST API to support the external routing system. For information on creating a REST API, see AWA Assignment API.

Procedure
1. Navigate to Advanced Work Assignment > Settings > Queues.
2. If the External field does not appear, select the Update Personalized List icon (🔍) and add the External field to the screen.
3. To use external routing, set the External field to true. If you do not want to use external routing, set the External field to false.

Tutorial: Route interactions by context
Learn how you can configure Advanced Work Assignment to route conversations to agents according to the context of the conversation.

Before you begin
Activate the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin.

A basic understanding of context variables is required. For more information on context variables, see Virtual Agent scripts.

Role required: awa_admin or admin

About this task
The What can we help you with? record producer is available by default with the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin. In the record producer, chat requesters can specify one of three issue categories that they need help with:

- Product
- Billing
- Order
Whichever category they select passes a value through the `liveagent_csp_category` context variable. Learn how to create queues that route conversations to agents according to the values passed through this context variable.

**Create a queue for product issues**
Create a queue for the Chat service channel that routes product issues.

**Procedure**
1. Navigate to **Advanced Work Assignment > Queues**, and then click **New**.
2. Enter the following information in the fields listed:
   - Name: Product Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

   ```javascript
   (function executeCondition(/* glide record */ current) {
       var contextTable = current.getValue('context_table');
       var interactionBlobRecord = new GlideRecord(contextTable);
       interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
       interactionBlobRecord.query();

       if(interactionBlobRecord.next()){
           var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
           if(jsonBlob.liveagent_csp_category == 'product')
               return true;
       }
       return false;
   })(current);
   ```
4. Click **Submit**.

**Create a queue for billing issues**
Create a queue for the Chat service channel that routes billing issues.

**Procedure**
1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
3. In the **Script** field, enter this script:

```javascript
(function executeCondition(/* glide record */ current) {
    var contextTable = current.getValue('context_table');
    var interactionBlobRecord = new GlideRecord(contextTable);
    interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
    interactionBlobRecord.query();

    if(interactionBlobRecord.next()){
        var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
        if(jsonBlob.liveagent_csp_category == 'billing')
            return true;
    }
    return false;
})(current);
```

4. Click **Submit**.

**Create a queue for order issues**

Create a queue for the Chat service channel that routes order issues.

**Procedure**

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   - Name: Order Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

```javascript
(function executeCondition(/* glide record */ current) {
    var contextTable = current.getValue('context_table');
    var interactionBlobRecord = new GlideRecord(contextTable);
    interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
    interactionBlobRecord.query();

    if(interactionBlobRecord.next()){
        var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
        if(jsonBlob.liveagent_csp_category == 'order')
            return true;
    }
    return false;
})(current);
```
4. Click **Submit**.

**Work assignments**

After routing work items to the appropriate queues and corresponding agent
groups, Advanced Work Assignment pushes work to the most qualified agent
using the assignment criteria that you specify.

Administrators can choose to push work items to agents based on one of these
assignment rules:

- **Most capacity**: This option pushes work to agents that have the most capacity
  (availability for work) for a given channel. For example, suppose that two
  available agents, John and Beth have different capacities. John has capacity
  for three chats, but Beth has capacity for two chats and is currently working
  on one chat. AWA assigns the next work item to John since he has the most
  capacity.

- **Last assigned**: This option pushes work to the agent who has gone the longest
  without a work assignment in the service channel. If more than one agent has
  the same spare capacity in a service channel, AWA creates and assigns the
  next work item to the agent who has gone the longest without work in the
  service channel.

In addition to selecting the assignment rule, AWA admins can also determine
whether:

- Agents can reject work items
- A timer is used to set a timeout period (the length of a time that an agent has
  to reject or accept a work item)
- Agent skills are to be considered in assignment

**Assignment process**

When an agent is available, AWA:

- Checks the queue priority and gets an item from the queue with the highest
  priority. AWA also reviews items that have timed out or have been rejected by
  agents.

- Identifies the eligible assignment pool. The eligibility assignment pool widens
  the group of agents who are eligible to work on an item.
• Determines the available agents based on their presence state, the assignment rule selected (most capacity or last assigned), and also skills, if defined. Agents have spare capacity when they decline, transfer, or complete a work item. For example, after an agent transfers a chat, the agent has additional capacity.

• Pushes the item to the inbox of most qualified agent (the timer begins).

Skill-based work assignment
In AWA, you can enable skill-based assignment and if needed, make skill assignment mandatory. The basic process for setting up skills involves the following steps:

1. Identify agents that have specific skills (for example, a foreign language or expertise in a certain area such as network routers) and assign the skills to those agents using the Skills Management feature.

2. Make the agents members of the assignment groups for the work item queues involving those skills.

3. Create an assignment rule in AWA that enables skill handling for the specific skills.

4. Create the work item queue with a routing condition that includes the specific skill, and include the appropriate group in the eligible assignment pool.

5. Create a scripted business rule that includes the skill in the table associated with the relevant service channel (for example, the Case table).

During work assignment, AWA routes and assigns work items that require the skills to the Agent Workspace inbox of the most qualified agent.

Configure agent assignment rules
Set the criteria for assigning work items to agents. Choose the assignment rule that considers the agent with the most capacity or the agent who has gone the longest without work. Select the timeout period for rejecting work items and indicate whether agent skills are to be considered during assignment.

Before you begin
• A basic understanding of the Skills Management feature is recommended.

• If you want agent skills to be considered when work is routed to the appropriate agents, define the skills for your agents or groups. When you
enable the skill handling options in the Assignment Rules form. AWA assigns the users in groups with the appropriate skills to corresponding work items.

- You can use rules to identify skills and assign it to work items. For more information on defining and assigning skills for work items, refer to Using rules to identify skills for work items

Role required: admin or awa_admin

**Procedure**

1. Navigate to Advanced Work Assignment > Settings > Assignment Rules.
   - To create a new rule, select **New**.
   - To modify a rule, select the layout to be updated.

2. On the form, fill in the fields.

<table>

3. Select **Submit** for a new rule or **Update** if modifying the rule. The assignment rule is added to or updated in the Assignment Rules [awa_assignment_rule] table.

**Tutorial: Assign work to agents by skill**

Learn how you can configure Advanced Work Assignment to route cases to agents who speak German. Use this tutorial as a guideline to help you understand how you can route work items to agents according to their designated skills.

Before you begin:

- Activate the Skills Management (com.snc.skills_management) plugin.
- A basic understanding of the Skills Management feature is required.
- To have skills automatically assigned to cases, consider activating the Skill Determination (com.snc.skill_determination) plugin.
- Create a group of users who work in customer support.
- Assign the awa_agent and workspace_agent roles to the customer support group.

**Create a skill**

Create a "German" skill.

**Before you begin**

Role required: skill_admin or admin

**Procedure**

1. Navigate to **Skills > All Skills**, and then click **New**.
2. Enter the following information in the fields listed:
• Name: German
  • Active: Selected

3. Click **Submit**.

**Create an assignment rule**
Create an assignment rule that routes cases according to skills.

**Before you begin**
Role required: awa_admin or admin

**Procedure**
1. Navigate to **Advanced Work Assignment > Assignment Rules**, and then click **New**.
2. Enter the following information in the fields listed:
   • Name: Case Assignment Rule with Skills
   • Assign by: Most Capacity
   • Enable skills: Selected
   • Enforce mandatory skills: Selected
3. Click **Submit**.

**Create a queue**
Create a queue where you can route work to agents who have the German skill.

**Before you begin**
Role required: awa_admin or admin

**Procedure**
1. Navigate to **Advanced Work Assignment > Queues**, and then click **New**.
2. Enter the following information in the fields listed:
   • Name: German Cases
   • Service channel: Case
3. Click **Submit**.

**Define assignment eligibility**
Define who is eligible to receive cases from the German Cases queue.
Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Queues, and then open the German Cases queue.
2. On the form, go to the Assignment Eligibility related link and click New.
3. In the Agent assignment rule field, select Case Assignment Rule with Skills.
4. In the Groups field, select your customer support group.
5. Click Submit.

Results
Cases that require German speakers are routed to users in your customer support group who have the German skill.

Using Agent Affinity
Agent Affinity is an Advanced Work Assignment feature that lets you assign work items by an agent’s work history, related task, or account team affinity.

Advanced Work Assignment assigns work items to agents by their availability, capacity, and skills. You can use Agent Affinity to customize this AWA assignment process and identify the agent best suited for the work item. Agent Affinity ensures that the same agent is assigned to a similar work item instead of orienting a new agent every time.

ℹ️ Note: Agent Affinity rules do not override assignment eligibility or constraints that are specified on AWA assignment rules.

The types of affinities are:

- **Historical**
  Identifies the best agent based on the agent’s history of serving the same customer.

- **Related task**
  Identifies the best agent based on the agent’s past assignments of related tasks.

- **Account team**
  Identifies the best agent based on the agent’s responsibility or role in the account team.
**Note:** Account team affinity is available only to Customer Service Management (CSM) customers.

Affinity rules are associated with AWA queues. Up to three rules can be associated with each queue. The affinity order determines how the assignment engine ranks the agents. The agent with the higher order affinity rule is considered as the best agent first.

The following example shows how AWA uses Agent Affinity to determine the best agent for a work item. In this example, AWA is configured to use all three affinities in this order: related task affinity, account team affinity, and historical affinity. George Warren, who is a customer at the Boxeo company, has a router problem. George previously contacted support to report an issue. That case was assigned to agent Ned. The primary support agent for Boxeo is agent John. Within the past seven days, another agent, agent Beth, addressed a chat with Boxeo.

The next time George initiates a customer service chat from the case page, the case is automatically added as a related task to the chat interaction. Agent Affinity uses the related task affinity to look for an agent who has fulfilled past assignments for a related task. Because agent Ned was assigned to a related task on the record, AWA assigns the work item to agent Ned if he is available and has the capacity.

**Example of related task affinity**

If agent Ned is unavailable or doesn’t have the capacity, AWA uses the account team affinity. AWA looks for another agent based on an agent’s responsibility or role in the account team. Because agent John is the primary support agent for the Boxeo company, AWA assigns the work item to Agent John if he is available and has the capacity.
Example of account team affinity

If agent John is not available, AWA uses the historical affinity and looks for an agent that has recently interacted with the company. This information is stored on the Agent Affinity screen. Because agent Beth addressed a chat with Boxeo within the past seven days, AWA assigns the work item to agent Beth if she is available and has the capacity.

Example of historical affinity

Activate Agent Affinity

You can activate the Agent Affinity plugin (com.glide.awa.agent_affinity) if you have the admin role. This also activates the Advanced Work Assignment plugin.

Before you begin
Role required: admin

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for &lt;plugin name&gt;.

### Configure Agent Affinity rules

Create or modify the Agent Affinity rules that route work items in Advanced Work Assignment.

**Before you begin**

Role required: awa_admin or admin

**Procedure**

1. Navigate to Advanced Work Assignment &gt; Settings &gt; Agent Affinity Rules.
   - To create a new affinity rule, click **New**.
   - To update an existing affinity rule, click the affinity rule.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the affinity rule.</td>
</tr>
<tr>
<td>Service channel</td>
<td>Service channel that the rule applies to.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application.</td>
</tr>
<tr>
<td>Affinity based on</td>
<td>Type of affinity. Only affinity types corresponding to your selection appear.</td>
</tr>
<tr>
<td></td>
<td>• History</td>
</tr>
<tr>
<td></td>
<td>• Related Tasks</td>
</tr>
<tr>
<td></td>
<td>• Account Team Responsibility</td>
</tr>
</tbody>
</table>
Field | Definition
---|---
Agent's affinity to | Account level or contact level. This field appears when you select History in the Affinity based on field.
Number of days | Past number of days during which the agent has worked with the customer. The maximum number of days is 30. This field appears when you select History in the Affinity based on field.
Responsibility | Agent who is part of the account team. This field appears when you select Account Team Responsibility in the Affinity based on field.

3. Click **Submit** for a new affinity rule or **Update** to modify an existing affinity rule.

### Set Agent Affinity rules

Specify the Agent Affinity rules to determine the order in which work items in a queue are sorted.

**Before you begin**

Role required: awa_admin or admin

**Procedure**

1. Navigate to **Advanced Work Assignment > Settings > Queues** and select the queue.
2. Click the Agent Affinity related list.
   - To create a new Agent Affinity rule mapping, click **New**.
   - To modify an existing Agent Affinity rule mapping, select the mapping to be updated.
3. On the form, fill in the fields.

### Agent Affinity Rule Mapping form

Field | Definition
---|---
Agent Affinity Rule | Agent Affinity rule to be used for the sort.
Order | Value of this rule relative to the other rules in the queue. Rules are ordered
### Field | Definition
---|---
| | from lowest to highest so a rule with an order of 100 is considered before a rule with an order of 200.

4. Click **Submit**.
   You can specify a maximum of three Agent Affinity rules per queue.

**Deactivate Agent Affinity**

Deactivate Agent Affinity if you do not want Agent Affinity to assign work assignments to agents.

**Before you begin**
Role required: awa_admin or admin

**Procedure**

1. In the navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.

2. In the **Search** field, enter `glide.awa.agent_affinity.enabled`.

3. Click `glide.awa.agent_affinity.enabled`.

4. On the system property screen, change **Value** from `true` to `false` and click **Update**.
   Agent Affinity is now deactivated.

**Agent Inbox controls**

Control certain elements of the agent experience in Agent Workspace. Define the agent presence (availability) states and the work item rejection reasons used by agents to decline work assignments in their Agent Workspace inbox.
Agent presence states

Agent availability in Agent Workspace Inbox

AWA admins can define the presence states that agents choose in their inbox to indicate their availability. The default states are

- Available: Solid green bubble indicates that the agent is available to receive work.
- Away: Solid yellow bubble indicates that the agent is not available to receive work.
- Offline: Solid grey bubble indicates that the agent is not available to receive work.

AWA developers with the awa_integration_user role can also use JavaScript or REST APIs to get or set agent presence and agent channel availability. For more information, see

- Agent Presence API (REST APIs)
- Agent - Global (JavaScript APIs)

Agent rejection controls

AWA admins can give agents the option to reject work assignments and specify the reason for rejecting it. The **Reject** button displays on work assignment cards. When an agent rejects an assignment, a pop-up window enables the agent to select a reason for declining the work item.

Configure agent presence states

Create or modify the availability states that agents use to indicate whether they can receive work or are offline or away. Agents set these states in their Agent Workspace Inbox.
Before you begin
Role required: awa_admin or admin. Users with the awa_manager and awa_agent roles can review the presence states.

About this task
The default presence states are Available, Away, and Offline. For the Available state, be sure to enable it (using the Active check box) so that AWA can route work to agents.

Procedure
1. Navigate to Advanced Work Assignment > Settings > Presence States.
   • To create a new presence state, click New.
   • To update an existing presence state, click the presence record.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the presence state, for example: Out of office. The default presence states are Available, Away, or Offline.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box for enabling this presence state for agents.</td>
</tr>
<tr>
<td></td>
<td>Note: For the default Available state, be sure to enable this Active check box so that work items are routed to available agents. If the Active state is not enabled, AWA does not route work items to agents.</td>
</tr>
<tr>
<td>Available to receive work items</td>
<td>Check box for indicating that agents can handle work items in this presence state. If the presence state is Away or Offline, this box is not selected.</td>
</tr>
<tr>
<td>Service channels</td>
<td>The service channels that can use this presence state. To select a service channel, move the channel name</td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the state.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which this state is displayed in the agent inbox.</td>
</tr>
<tr>
<td>Show channels</td>
<td>Check box that enables you to restrict the service channels in which agents can update their presence using this state. When you select this field, the <strong>Restrict agent updates</strong> field is displayed.</td>
</tr>
<tr>
<td>Restrict agent updates</td>
<td>The service channels in which agents cannot use this state to update their presence. Click the lock icon and select the appropriate channels. When you complete your selections, click the lock icon to lock the field.</td>
</tr>
<tr>
<td>Apply to all groups</td>
<td>Check box that indicates all groups can use this presence state. To specify only certain groups that can use this presence state, unselect this check box to display the <strong>Apply to groups</strong> list.</td>
</tr>
<tr>
<td>Apply to groups</td>
<td>The selected groups that can use this presence state. To select a group, move the group name from the <strong>Available</strong> list to the <strong>Selected</strong> list.</td>
</tr>
</tbody>
</table>

3. Click **Submit** for a new presence state or **Update** if modifying an existing presence state.

The presence state is added to or updated in the Presence States [awa_presence_state] table. The presence state is also listed in the Availability section of the Agent Workspace Inbox for the agents belonging to the groups and channels that use this state.

**Configure reasons for rejecting work items**

Define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox. A reject reason can apply to all service channels or a single channel that you specify.
Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to Advanced Work Assignment > Settings > Reject Reasons.
   • To create a new rejection reason, click New.
   • To update an existing rejection reason, click the reason record.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>Name of the reason for rejecting work items.</td>
</tr>
<tr>
<td>Agent selectable</td>
<td>Indicates the reject reason is selectable by agents in their Agent Workspace Inbox.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the reject reasons are listed in the agent inbox.</td>
</tr>
<tr>
<td>Apply to all service channels</td>
<td>Indicates the reject reason applies to all service channels. To make the reason available to a single channel, unselect this check box and in the Service channel field, select the appropriate channel.</td>
</tr>
<tr>
<td>Service channel</td>
<td>Service channel that the rule applies to. This field is displayed when Apply to all service channels is not enabled.</td>
</tr>
<tr>
<td>Reassignable</td>
<td>Indicates if the work item can be reassigned to the agent who rejected it.</td>
</tr>
</tbody>
</table>

3. Click Submit for a new reason, or if changing an existing reason, click Update. The rejection reason is added to or updated in the Reject Reasons [awa_reject_reason] table.

Reassign rejected or timed-out work items
Configure whether an agent who rejected a work item is eligible to be offered the same work item.
Before you begin
Role required: admin

Procedure
1. Navigate to Advanced Work Assignment > Settings > Reject Reasons.
2. Click the reason record you want to change.
3. On the form, configure the Reassignable field:
   - If you want to have an agent who rejected a work item be eligible to be offered the same work item, select the Reassignable field.
   - If you do not want to have an agent who rejected a work item be eligible to be offered the same work item, unselect the Reassignable field.

Management
Configure Advanced Work Assignment properties using the Management menu options.
Only users with awa_manager privileges can access the Management menu options.

Operations dashboard
Enable managers to monitor Operation [operation] work items so that their agents can better support customer needs.
This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see Analytics and Reporting Solutions for Advanced Work Assignment.
End users and roles

<table>
<thead>

</tr>
<tr>
<td>AWA manager: Identifies the areas of concern for routing and assignment of work items across service channels.</td>
<td>awa_manager</td>
</tr>
<tr>
<td>Agent manager: Manages agents or agent groups. The agent manager wants to know what agents are working on to make sure that customer needs are being met.</td>
<td>sn_customerservice_manager</td>
</tr>
<tr>
<td>Performance Analytics administrator: Ensures that business managers are making the best use of Performance Analytics solutions.</td>
<td>pa_admin or pa_viewer</td>
</tr>
</tbody>
</table>

Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

Indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Work Items</td>
<td>Total number of interaction work items that were created today. The goal for this indicator is to minimize the number of interaction work items that agents receive.</td>
</tr>
<tr>
<td>Accepted Work Items</td>
<td>Percentage of interaction work items that agents have accepted.</td>
</tr>
<tr>
<td>Indicator</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Exceeding Target Work Items</td>
<td>Percentage of interaction work items that have exceeded the target wait time.</td>
</tr>
<tr>
<td>Rejected Work Items</td>
<td>Percentage of interaction work items that agents have rejected.</td>
</tr>
<tr>
<td>Timed Out Work Items</td>
<td>Percentage of interaction work items that timed out.</td>
</tr>
<tr>
<td>Weekly Trends</td>
<td>Number of work items in each of the following states for the past week:</td>
</tr>
<tr>
<td></td>
<td>• New</td>
</tr>
<tr>
<td></td>
<td>• Exceeding Target</td>
</tr>
<tr>
<td></td>
<td>• Abandoned</td>
</tr>
<tr>
<td></td>
<td>• Rejected</td>
</tr>
<tr>
<td></td>
<td>• Timed Out</td>
</tr>
</tbody>
</table>

**Breakdowns**

To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
- Assignment Group

For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

**Reports**

<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepted Work Items - Last Hour</td>
<td>Single</td>
<td>Number of interaction work items that agents have accepted in the past hour.</td>
</tr>
</tbody>
</table>

### Title | Type | Description
--- | --- | ---
Abandoned Work Items - Last Hour | Single | Number of interaction work items that agents have abandoned in the past hour.

| Score | 42 |

Average Wait Time - Last Hour | Single | Average amount of time that customers have spent waiting for an agent response in the past hour.

| Score | 42 |

---

#### Check for an agent’s presence and capacity

View a list of agents in Advanced Work Assignment, their presence status, and capacity for each of the agent's service channels to see which agent can handle a case. This list is filtered across different teams, channels in teams, and channels dashboards.

**Before you begin**

Role required: awa_admin or admin

**Procedure**

1. Navigate to **Advanced Work Assignment > Management > Agent Presence & Capacity**.
2. In the list, check which agent is available to handle a case:

#### AWA Agent Presence and Capacities form

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>Name of the agent.</td>
</tr>
<tr>
<td>Current presence state</td>
<td>Presence state that is currently assigned to the agent.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that this agent was last updated.</td>
</tr>
<tr>
<td>Channel</td>
<td>Service channel that is assigned to the agent.</td>
</tr>
</tbody>
</table>
Field | Definition
--- | ---
Capacity in use | Current workload of agent.
Capacity | Maximum capacity that the agent can handle.

Check unassigned interactions
View a list of unassigned interactions in Advanced Work Assignment from chat and phone that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are not being assigned.

Before you begin
Role required: awa_manager or admin

Procedure
1. Navigate to **Advanced Work Assignment > Management > Unassigned interactions**.
2. In the list, check the unassigned interactions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Interaction number.</td>
</tr>
<tr>
<td>Type</td>
<td>How the interaction began (for example, chat, phone, or walk-up).</td>
</tr>
<tr>
<td>Created</td>
<td>Date that the interaction was created.</td>
</tr>
<tr>
<td>Opened for</td>
<td>Name of the user starting the interaction.</td>
</tr>
<tr>
<td>Account</td>
<td>Name of the company that is associated with the interaction.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User that is assigned to the interaction.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the interaction.</td>
</tr>
<tr>
<td>Queue</td>
<td>Queue that is assigned to the interaction.</td>
</tr>
<tr>
<td>Offered on</td>
<td>Date that the interaction was first offered to an agent.</td>
</tr>
<tr>
<td>Rejected</td>
<td>Interaction that was rejected by the agent.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Timed Out</td>
<td>Interaction that has exceeded the timeout specified in assignment rule.</td>
</tr>
<tr>
<td>Exceeded Queue Target Wait Time</td>
<td>Interaction that has waited longer than the target wait time of the queue.</td>
</tr>
</tbody>
</table>

**Check unassigned task work items**

View a list of unassigned task work items in Advanced Work Assignment, such as cases and incidents, that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are unassigned.

**Before you begin**

Role required: awa_manager or admin

**Procedure**

1. Navigate to **Advanced Work Assignment > Management > Unassigned Task Work Items**.
   - To create a task, click **New**.
   - To modify an existing task, select the task to be updated.
2. On the form, fill in the fields.

**Work Item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Whether the task is still being worked on or is complete.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Task name.</td>
</tr>
<tr>
<td>Offered on</td>
<td>Date that the task was first offered to an agent.</td>
</tr>
<tr>
<td>State</td>
<td>List that shows the status of the task:</td>
</tr>
<tr>
<td></td>
<td>• Accepted</td>
</tr>
<tr>
<td></td>
<td>• Cancelled</td>
</tr>
<tr>
<td></td>
<td>• Pending Accept</td>
</tr>
<tr>
<td></td>
<td>• Queued</td>
</tr>
<tr>
<td>Assignment rule</td>
<td>Rule that assigns cases that meet the matching rule criteria to a customer service agent.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Exceeded Queue Target Wait Time</td>
<td>Task that has waited longer than the target wait time of the queue.</td>
</tr>
<tr>
<td>Rejected</td>
<td>Task that was rejected by the agent.</td>
</tr>
<tr>
<td>Timed Out</td>
<td>Task that has exceeded the timeout specified in the assignment rule.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User that is assigned to the task.</td>
</tr>
<tr>
<td>Document ID</td>
<td>Document ID that is assigned to the task.</td>
</tr>
<tr>
<td>Previous Work Item</td>
<td>Reference to a previous work item for the same Document ID.</td>
</tr>
<tr>
<td>State changed on</td>
<td>Date that the task state was most recently changed.</td>
</tr>
<tr>
<td>Cancelled reason</td>
<td>Reason that the task was canceled:</td>
</tr>
<tr>
<td></td>
<td>• Disqualified from service channel</td>
</tr>
<tr>
<td></td>
<td>• Manually assigned</td>
</tr>
<tr>
<td></td>
<td>• Time out</td>
</tr>
<tr>
<td></td>
<td>• Transfer was cancelled or rejected</td>
</tr>
<tr>
<td>Is Dismissed</td>
<td>Whether the task has been dismissed.</td>
</tr>
<tr>
<td>Work Item Size</td>
<td>Amount of an agent’s capacity that is used if this task is assigned.</td>
</tr>
<tr>
<td>Wait time</td>
<td>Length of time the task has waited in the queue before being assigned.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Group that is assigned to the task.</td>
</tr>
<tr>
<td>Document table</td>
<td>Document table that is assigned to the task.</td>
</tr>
<tr>
<td>Queue</td>
<td>Queue that is assigned to the task.</td>
</tr>
</tbody>
</table>

3. Click **Submit** to create the task or **Update** to modify the task.

**Using Advanced analytics to access AWA dashboards**

Advanced analytics enable you to view cards that represent the Advanced Work Assignment dashboards that you have access to. You can also see a dashboard picker, which lets you view the cards for all the dashboards in a group. You can then search and choose a dashboard from a list.

Navigate to **Advanced Work Assignment > Management > Advanced Analytics**.
The advanced analytics for the dashboards lets you see the dashboards in one of these categories: by default, the Recent category is selected when you visit the advanced analytics for the dashboards.

- **Recent** shows up to nine dashboards that you have visited recently. The most recent are shown first.
- **Owned by me** shows the dashboards that you have created and those dashboards to which you have been assigned ownership.
- **Shared with me** shows the dashboards which have been shared with you as a user, or member of a group or role.
- **All** shows all the dashboards that you have access to.

**Note:** The category that you choose limits the dashboard groups and individual dashboards that you see when you choose from the Groups list and the **Dashboard Picker** field. If no dashboards in the incident group have been shared with you, and you select Incident from the Groups list, then the overview displays a note that no dashboards match your search.

All tabs except for the Recent tab are sorted in ascending order by:

1. **Dashboard group — Order**
   
   The owner of the dashboard can specify an order number in the dashboard group’s form. This field is optional.

2. **Dashboard group — Name**

3. **Dashboard — Order**
   
   The owner of the dashboard can specify an order number in the dashboard’s form. This field is optional.

4. **Dashboard — Name**

**Using Advanced Analytics tiles**

Tiles on Advanced Analytics show thumbnails of the widgets on the dashboard, the dashboard group, your level of access on the dashboard, the name of the dashboard, and the owner of the dashboard. Dashboard access levels are Owner, Editor, and Viewer. For more information, see .
Note: If you can't view a dashboard widget, you'll see a message that prompts you to contact the administrator. You may not be able to view a dashboard widget because of wrong configuration settings, access restrictions, or because there is no data to display.

Using the Advanced Analytics Groups list
The advanced analytics screen defaults to showing only the AWA-related dashboards. You can see other dashboards by changing the Groups list to show only those dashboards in another single group. The Groups list shows all dashboard groups without applying ACL rules. You may see dashboard groups in this list that have not been explicitly shared with you.

Click New to create a responsive dashboard.

Create or modify groups for Advanced Work Assignment queues
Create or manage groups that have associated Advanced Work Assignment queues. Groups are sets of users who share a common purpose. By creating these groups, information that is displayed in AWA is limited to only users that are in AWA groups.

Before you begin
Role required: awa_manager or admin
Procedure

1. Navigate to **Advanced Work Assignment > Management > Groups**.
   - To create a group, click **New**.
   - To modify a group, select the group you want to update.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Groups form</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Name of the group.</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the group.</td>
<td></td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates whether the group is active or inactive. Inactive groups still appear in any reference field that already references the group but are not visible by non-admin users in:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Lists of groups</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The reference lookup list for reference fields</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• The auto-complete list of groups displayed when you enter information into a reference field</td>
<td></td>
</tr>
<tr>
<td>Manager</td>
<td>Group manager or lead.</td>
<td></td>
</tr>
<tr>
<td>Group email</td>
<td>Group email distribution list or the email address of the point of contact, such as the group manager.</td>
<td></td>
</tr>
<tr>
<td>Parent</td>
<td>Other group of which this group is a member. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group are not members of the parent group. For example, if an incident is assigned to the parent group and you click the Assigned to look up icon, only the members in the parent group are available. The members of the child group are not available.</td>
<td></td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that this group was last updated.</td>
<td></td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Properties for Advanced Work Assignment**

The Advanced Work Assignment Properties page provides configuration options for AWA.
Users with the admin role can access these properties by navigating to **System Properties > All Properties**.

**Properties for AWA**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Disable Query Business Rules glide.awa.query_br_disable | If the property is enabled, AWA disables before query business rules during its execution. For example, if enabled, an instance can have a custom before query business on the interaction table without affecting how AWA routes/assigns interactions.  
  - **Type**: true | false  
  - **Default value**: false  
  - **Location**: System Properties > All Properties |

For information on adding a system property, see **Work items**

**Work items**

View Advanced Work Assignment work items using the Work Items menu options.

Work items are a single piece of work handled by an agent from start to finish. For example, one chat or one case is an object that is routed and assigned to agents. Only users with awa_manager privileges can access the Management menu options.

Only users with awa_manager privileges can access the Management menu options.

**Check work items and AWA events**

View a list of work items and AWA events.

**Before you begin**

Role required: awa_admin or admin

**Procedure**

1. Navigate to Advanced Work Assignment > Work Item > All.
   
   A list of the work items appears.

2. Select the preview button ( ) for the work item you want to view.
3. On the Work Item modal, select **Open Record**.

### Work Item form

Activate Conversational Messaging

You can activate the Conversational Messaging plugin (com.glide.messaging.awa) if you have the admin role.

**Before you begin**
Role required: admin

**Procedure**

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

- **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Configure messaging actions

Create or modify messaging actions that are performed when an event occurs. These actions apply only to messaging.

**Before you begin**

Activate the Conversational Messaging plugin (com.glide.messaging.awa). For information on activating this plugin, see [Activate Messaging Actions](#).

Role required: admin

**About this task**

- For the Requester Message without Agent Response event, the default length of time that elapses before an agent is sent a reminder is 30 minutes.

- For the Agent Message without Requester Response event, the default length of time that elapses before the conversation is set to the Closed Abandoned state is 2 days.

If you’re using both Virtual Agent and Live Agent, the system closes an abandoned live conversation based on the lowest timeout value for closing conversations. Be aware that other conversation timeout behavior can affect idle live chat timeouts, regardless of the **Duration** and **Action** that you specify. For details, see [Duration and Action](#).

**Procedure**

1. Navigate to **Conversational Interfaces > Messaging > Actions**.
   - To create a new messaging action, click **New**.
   - To update an existing messaging action, click the messaging action.

2. On the form, fill in the fields.

**Messaging Action form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the messaging action.</td>
</tr>
<tr>
<td>Field</td>

<tr>
<td>Action</td>
<td>Action to perform after the duration of time has elapsed:</td>
</tr>
<tr>
<td></td>
<td>• Prompt Agent - prompt the agent using a Workspace notification.</td>
</tr>
<tr>
<td></td>
<td>• Prompt Requester - display system message with prompt to requester.</td>
</tr>
<tr>
<td></td>
<td>• Reassign - clear the <strong>Assigned to</strong> field of the interaction so that it can be rerouted to another agent.</td>
</tr>
<tr>
<td></td>
<td>• Set State - set the interaction to the given state.</td>
</tr>
<tr>
<td>Prompt</td>
<td>Message displayed to requester. This field appears when you select <strong>Prompt Agent</strong> in the <strong>Action</strong> field.</td>
</tr>
<tr>
<td>State</td>
<td>State of the interaction. This field appears when you select <strong>State</strong> in the <strong>Action</strong> field.</td>
</tr>
</tbody>
</table>

3. Click **Submit** for a new messaging action or **Update** to modify an existing messaging action.
Enable logging for Advanced Work Assignment

Enable logging to monitor AWA routing and assignment.

Before you begin
Role required: awa_admin or admin

Procedure
1. In the navigation filter, enter sys_properties.list.

2. In the System Property [sys_properties] table, click New and add the com.snc.awa.syslog.enabled property:
   - Name: com.snc.awa.syslog.enabled
   - Description: Log AWA work item routing and assignments in the system log.
   - Type: true | false

3. Set the Value to true.

4. Click Submit.
   Logging for the AWA assignment engine is enabled in the syslog table.

5. To view the system log, navigate to System Logs > System Log > All and perform a search where the Source is AdvancedWorkAssignment.

Analytics and Reporting Solutions for Advanced Work Assignment

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

⚠️ Note: Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable a solution for Advanced Work Assignment, an admin navigates to System Definitions > Plugins and activates the Performance Analytics - Content Pack - Advanced Work Assignment plugin.

Advanced Work Assignment dashboard for interactions

Enable managers to monitor Interaction [interaction] work items so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see Analytics and Reporting Solutions for Advanced Work Assignment.

End users and roles

<table>
<thead>
<tr>
<th>End user and goal</th>
<th>Required role</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator: Configures Advanced Work Assignment to best fit the business needs of customer service.</td>
<td>awa_admin</td>
</tr>
<tr>
<td>AWA manager: Identifies the areas of concern for routing and assignment of work items across service channels.</td>
<td>awa_manager</td>
</tr>
<tr>
<td>Agent manager: Manages agents or agent groups. The agent manager needs to know what agents are</td>
<td>sn_customerservice_manager</td>
</tr>
</tbody>
</table>
Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

Indicators

<table>
<thead>

**Workspace**

A workspace is a suite of tools that provides agents, case managers, help desk professionals, and managers with tools to help answer customer questions and resolve customer problems. ServiceNow provides many workspaces, each is targeted at a specific user. For example, workspaces are designed for tier 1 agents who solve internal or external customer issues.

Workspaces include all the tools that agents need to find, research, and resolve issues. ServiceNow provides different workspaces for different issue types. For example, agents using IT Service Management Workspace (ITSM) track and resolve IT issues. Agents using Customer Service Management Workspace (CSM) resolve customer cases, such as sending a piece of computer hardware to fulfill a customer's request.

**Workspace in action**

Here's how agents use Workspace.

Workspace overview.

Troubleshoot and get help
• Ask or answer questions in the Workspace community forum
• Search the Known Error Portal for known error articles
• Contact Customer Service and Support

Exploring Workspace
Get an overview of workspace so you can understand how to set it up and use it for your organization.

Workspace landscape
Workspace is a single-pane view that tier 1 agents use to respond to all task types, view the full context of an issue, and get relevant recommendations to resolve issues.
With Workspace, agents can have multiple issues open at the same time in a tabbed format. Agents can quickly move between each issue without going to a different screen. They can use the ribbon to get useful, high-level information about an issue and use the activity stream to communicate with requesters or view a history of agent and requester interactions. The sidebar on the right automatically provides recommendations that help agents resolve issues.

Agents use the following views in workspace:

- **Landing page**—The first page that an agent sees when opening Workspace shows which issues the agent can work on. For example, the agent can look at the landing page to see the number of open issues and the work that is assigned to the agent.

- **List view**—A filtered list of all records in the database that agents use to see, for example, all cases, only open cases, and only their cases. Agents use this view to find issues to work on.

- **Record view**—The view that agents use to work on issues. This view includes in-depth record information and suggestions about how to resolve issues and communicate with requesters.

- **Agent Chat**—Enables agents to chat with requesters. Automatically route incoming chat requests to appropriate agents.

### Key features

**Single-pane view**

Agents can see all details that are related to an issue in one place.

**Integrated communication channels**
Agents can communicate in real time with customers by Agent Chat or phone in the same interface.

**Integrated email client**

Agents can read and respond to emails side by side.
Agent assistance

Agents can close cases and incidents faster with artificial-intelligence-assisted recommendations.

Playbook

Agents can accomplish business process workflows in a simple, task-oriented view.
Workspace types

All Workspace enable agents to find issues, solve them, and communicate the solutions to requesters. Each workspace is tailored to the kind of issue that the agents work on. ServiceNow supports the following workspaces:

- **Agent Workspace for Configuration Management Database (CMDB)**—Agent Workspace for CMDB provides an easy-to-navigate interface that helps service agents access essential CMDB configuration items and drill down to related items such as changes, incidents, and timeline.

- **Agent Workspace for HR Service Delivery (HR)**—HR agents interact with employees, respond to inquiries, and resolve issues.

- **Agent Workspace for Request Management**—Agent Workspace for Request Management integrates the platform functionality specific to tier 1 agents into an easy-to-navigate interface.

- **Customer Service Management Agent Workspace (CSM)**—Agents support external customers through communication channels such as chat, telephone, and email. (CSM)—Agents support external customers through communication channels such as chat, telephone, and email.

- **Dispatcher Workspace**—Dispatcher Workspace is a configurable service desk application that provides an integrated and intuitive user experience enabling dispatchers to be more efficient.

- **Field Service in CSM Agent Workspace (FS)**—Agents help resolve tasks that need to be performed locally.

- **IT Service Management Agent Workspace (ITSM)**—Agents assign, resolve, and escalate internal incidents.
• **Operator Workspace service monitor**—The Operator Workspace monitors services in your Event Management environment.

• **Project Workspace**—Project Workspace enables project managers to define, plan, track, and monitor a project in a single location.

• **Service Owner Workspace**—Service Owner Workspace provides a premium Service Portfolio Management experience. If you’re a portfolio manager or service owner, you can manage and monitor portfolios and services in one integrated and graphically intuitive user interface.

• **Survey Designer**—Survey administrators use Survey Designer to create pre-chat surveys for gathering information used to route requesters to qualified agents.

• **Vendor Manager Agent Workspace (VM)**—Agents manage and monitor vendor performance and vendor-related information.

• **Workforce Optimization for Customer Service**—Manage and maintain the productivity of your workforce from a single application using Workforce Optimization for Customer Service.

• **Workforce Optimization for ITSM**—Manage and maintain the productivity of your workforce from a single location using Workforce Optimization for ITSM.

**Accessibility**

Accessibility enables agents to use shortcuts to navigate Workspace lists.

<table>
<thead>
<tr>
<th>Keyboard shortcuts for lists</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>← or →</td>
<td>Navigate between cells.</td>
</tr>
<tr>

<td>Go to the first or last cell in a row.</td>
</tr>
<tr>
<td>Enter or Space bar</td>
<td>Change the focus to an individual cell. Use the Tab key to navigate within the cell.</td>
</tr>
<tr>
<td>Escape</td>
<td>Change the focus from a cell back to the list.</td>
</tr>
</tbody>
</table>

**Browser support for workspaces**

Do not use Internet Explorer 11 to access any workspaces. Internet Explorer 11 is not supported. See [KB0683275](#) for more information on Internet Explorer 11.
and see **Generally supported browsers** for more information about supported browsers that you can use across the platform.

**Next steps**

Do this next if you are a:

- System administrator—Start setting up your workspace
- Agent—Start using your workspace

**Domain Separation in Workspace**

This overview describes domain separation in the Workspace. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

- Includes **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see **Application support for domain separation**.

**Overview**

The Workspace tabbed navigation is fundamentally different from the typical UI framework: In the Platform, an agent looks at one record at a time (though multiple records may be open in separate browser tabs). Workspace’s tabbed navigation supports multi-tasking across incidents or cases in the same browser session.

In the Paris release, agents can multi-task across domains in a single Workspace browser tab.

**How domain separation works in Workspace**

With Workspace, rather than having fulfillers directly interact with the data model (by selecting domains via the Platform domain picker), the core
functionality is seamless to the agent. There is no domain picker in the Workspace global header.

When interacting with existing records:

- Records open in the domain of the record, not the user’s domain session.
  - Form layout: Fields and values (Choice, References, and the like) display based on the domain of the record.
  - Form header: Primary and secondary fields display based on the domain of the record and can be tailored per customer.
  - Related lists layouts use the record domain of the parent.
  - UI actions respect the record's domain and show only what is applicable (such as "Condition evaluates true").
  - Ribbon: Load ribbon components are based on the domain of the record. Any UI actions trigger the record session or carry it over to child records.
  - Knowledge and Catalog display based on the user criteria and domain that the user session has access to. However, any records that display should be filtered based on the record domain.

- You can use an optional Forms enhancement to provide contextual awareness of the company or domain of an existing record using the company/account logo in the Form Header. To learn more see Set up form headers in workspace

When you create new records from a record (cross-tenant intelligence):

- Records created from another record inherit the domain of the originating record.
  - Records created via UI action on a record carry over the domain of the originating record domain.
  - Records created from a parent record (for example, from a related list), carry over the domain of the parent record domain.
  - The new record loads (process/data) in the domain assigned to the originating record. (For example: **Incident > Change > Incident**

- New Interactions are created in the domain "Opened for" (not the domain of the user).

- New records can be created in the domain of the "caller" or "contact (for example, "Opened for") based on an admin configurable interstitial form that allows the safe creation of new records in the correct domain.
User or company record is typically used to determine domain (for example, selecting the user populates the company field and sets the domain). The single owner of the instance determines what sets the domain for that instance on each table.

Those with access to more than one domain can use a configurable lightweight form to populate the fields to set the domain. The user selects companies or accounts, or users from the domains the fulfiller has access to.

The Next button becomes active once the required fields are populated.

Unlike with the platform domain picker, agents can set the domain of the new record without changing their domain session.

Note: The domain determining field doesn’t need to be pre-populated or even configured. It functions much like the platform does. The form waits for the record to be saved before showing the domain-specific process configuration.

New features in the Paris release
Change the domain of an existing record

• An administrator can configure a specific field that controls the domain for a record, such as "company." The same functionality can be achieved with the following system properties.
  ◦ glide.sys.domain.domain_determining_field.default
  ◦ glide.sys.domain.domain_determining_field.[table_name]
  ◦ glide.sys.domain.use_domain_determining_field

• When the specified field is changed, the record’s sys_domain value is set to the domain of the new reference; the domain of the record is changed.

• When you submit the change, a message displays that the domain will be changed and warns of potential data loss.

• When the record is saved, the sys_domain value changes and all the references to the record are removed according to the business rule "Domain-Cascade Domain-Task."

Toggle Domain Scope (Platform Feature Parity)

• Users with the domain_expand_scope role can select the domain scope from the Toggle Domain Scope UI action on the form.

• When record scope is in effect (default), you can click the UI action to expand to session scope and see any data accessible to the user’s domain and child domains.
• When session scope is in effect, you can click the UI action to collapse the record scope and see only data for the current record’s domain.

• Clicking **Toggle Domain Scope** expands the domain scope on a record for related list actions and reference field queries.

To learn more, see **Domain scope**.

Ability for agents to pick one company to see their data (via “My Lists”)

• You can create a “my list” for a curated list, or filter an existing list by company. The platform domain picker acts similarly by filtering data based on domain. When you create a new case or incident without a parent, begin typing in the field used to designate domain to quickly populate the domain.

To learn more, see **Lists**.

**Related information**

**Domain separation for service providers**

**Domain separation and Workspace landing pages**

Landing pages are still an option when you are using domain separation in Workspace. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Workspace landing pages**

Landing pages are the pages that agents see when they open their workspace. The pages typically include:

• Now Intelligence visualizations and widgets; for example, the number of open issues

• Lists of records; for example, all records that are assigned to the agent

Use these guidelines to set up Workspace landing pages when you are using domain separation.

**Creating a page**

Admins can create landing pages that are domain-separated and override (sys_override) certain settings (such as Active) per domain.

**Note:** “Macroponents” are not domain-separated; any changes you make affect all landing pages that use the value stored in this reference field.
Editing an existing page in a subdomain

- Users in a subdomain can edit the global pages.
- If a user creates an override in a subdomain (for example, to change the name or element within components), the changes are saved at the global page.
- Adding a page in a subdomain changes the global page. It does not change the domain of the page but edits the definition of the page itself.
- To make a change in a subdomain, users must create a copy in the domain they want to edit, and then edit that new page.

To learn more, see Workspace landing pages.

Workspace domain separation plugins and tables

When using domain separation in Workspace, you need the domain separation plugins and table properties. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Plugins

Workspace domain separation uses the Platform Domain Separation plugin. When you activate the Domain Separation plugin, the following features are enabled for Workspace:

- You create process separation by record domain. This includes:
  - Form layout
  - UI actions
  - Form header
  - Related lists
  - Policy
  - Client scripts
  - Business rules
  - Reference values
- Change domain and Toggle domain scope
- Cross-tenant intelligence
Note: When you create new records from Related lists, use the parent record domain.

• Record domain context applies to all form components automatically.
  ◦ Internally, the record domain context is added to all enclosed GraphQL queries.

Plugin configuration
These features need additional configuration:

• When configuring a pre-form to select a domain before you create a new record with no parent (domain unknown):
  ◦ If the domain is not passed in and the user has access to multiple domains, the user can be promoted to input the domain determining the field before creating a record.
  ◦ Extra fields can be specified for the agent’s convenience (such as Short description or Notes). However, the pre-form:
    ▪ Shows only the default domain determining field or the fields specified for a specific table.
    ▪ Does not support dependent fields.
    ▪ Does not support dynamic reference qualifiers.
    ▪ Does not support UI policies or client scripts.
    ▪ Does not support dictionary overrides.
  ◦ This interstitial form acts similarly to the platform wizard or interceptor.
  ◦ The new record is initialized with values from the previous form with processes based on the selected domain:
    ▪ Business rules
    ▪ Form layout
    ▪ UI actions
    ▪ Related lists
    ▪ UI policies
    ▪ Client scripts
  ◦ Reference fields only show domain allowed values.
Tables

• The domain determining field (default and by table) is configured via system properties:
  ◦ glide.sys.domain.use_domain_determining_field
  ◦ glide.sys.domain.domain_determining_field.default
  ◦ glide.sys.domain.domain_determining_field.[table_name]

</tbody>
</table>

See [setting up workspace](#) for additional Workspace configuration options.

### Workspace Agent Chat

Workspace enables agents to interact directly with requesters using chat. The chat system starts with virtual chat, which is autonomous chat powered by artificial intelligence. A requester can request to chat with a live agent through virtual chat. That chat is called Agent Chat. Configure Workspace Agent Chat to enable customers to ask questions and receive information by chatting with a live agent. Through Agent Chat, agents communicate with customers, create incident or case records, or transfer chats to another agent or queue.

Agent Chat uses a persistent widget for chat conversations on any portal page of the portal that you’re using. You can establish assignment rules to enable chat conversations to reach the best agent available who has the capacity and skills to handle the job. The agent can transfer the chat to another agent if necessary. Agents can use response templates to enable reusable, consistent messages to requesters.
Virtual chat conducts a survey before and after the Agent Chat. The pre-survey gets preliminary information about the requester to aid in the chat session. The post-chat survey gets feedback on the requester's satisfaction with the agent who helped.

Workspace displays a chat inbox icon that agents use to enter chats. Agents set their status to Available or Away to open or close their inbox for chat requests. The icon displays numbers when chats are waiting to be answered.

The chat interface is integrated into workspace so agents can chat while working onscreen with all of other features provided by workspace.

**Routing chats**

Requesters start chats with virtual chat. When they request to chat with a live agent on Agent Chat, their request goes into a queue controlled by Advanced Work Assignment (AWA), which routes chats to different agents based on availability, queue length, and expertise.
Agent Whisper overview

Agent Whisper lets agents and chat managers have a conversation without the requester knowing.

During a chat between a requester and an agent, the agent may want to privately ask a chat manager for assistance or a chat manager and an agent may want to converse without the requester knowing. Using Agent Whisper, the agent can request help and the chat manager and agent can send messages to each other without the requester knowing.

For example, if an agent is newly hired, still in training, or unsure about how to proceed with a requester's request, the agent can request for a chat manager to join the conversation to help walk the agent through the steps of the procedure privately.

Another scenario is if an agent needs to escalate a customer conversation to a chat manager. Agents can request help and chat managers can join the chat conversations publicly to communicate directly with the customer to help deescalate the situation.

For instructions on how to set up Agent Whisper, see Setting up Agent Whisper.

Using the Help quick action

Agents can ask chat managers to join chat conversations with requesters by raising the help flag. Agents can open the Quick Action menu or enter /help to request for help. When using the help quick action, agents can also type a brief private message explaining what they need help with. This way, when a chat manager enters the conversation, they already know what the agent needs.

Chat managers can view the conversations with help requested from different views: interactions list view, manager dashboard, and lists.

• Interactions list view: Agents can navigate to the interactions list view and add in the help requested column to see which conversations agents have requested help in. From here, managers can click directly into the interaction record and join the conversation with the agent and requester.

• Manager dashboard: With the Workforce Optimization for Customer Service (com.snc.wfo.csm) plugin installed, managers can see that
the Help requested tile on the manager dashboard homepage.

- Lists: From Conversation Monitoring > Help Requested, managers can view a list of chat interactions in which agents have requested help.
To learn more about Workforce Optimization for CSM, see Workforce optimization for customer service.

Sending and receiving messages in Private Chat

The agent and chat manager can converse without the requester knowing that they are having a conversation. Messages that only seen by the agent and chat manager are private messages. The requester does not see private messages. The agent and chat manager can toggle between the public and private messages using the Public Chat and Private Chat tabs. The Private Chat tab has a yellow background with "Message only visible internally" and private messages appear on the yellow background. When someone types in the Private Chat tab, the typing event indicator does not display. For example, when the chat manager types in the Private Chat tab, the agent's and requester's screen do not display the typing event indicator.

The tab that the agent types on and sends the message from determines whether a message is posted privately or publicly. If an agent starts typing a message on the Public Chat tab and then switches to the Private Chat tab, the Private Chat tab does not display the message. If the agent then goes back to the Public Chat tab, the message is still there. However, agents can see private messages regardless of whether they are on the Private Chat tab or the Public Chat tab.
Public versus Private chat

Example of public and private messages

- **Public message**: give me a min
- **Private message**: Is requestors service up and running?
Joining a chat conversation in Private Chat

The first time a chat manager switches from a private conversation (on the Private Chat tab) to a public conversation (on the Public Chat tab), a dialog box displays. The dialog box informs the chat manager that they are about to join the public conversation and the requester will be notified that the chat manager is joining the conversation. The chat manager can select **Yes, I'm sure** to join the public conversation or select **Cancel** to remain in the private conversation.
Sharing attachments in Private Chat

If agents send an attachment while on the Private Chat tab, the attachment is sent only to the agent and chat manager. Message Sent confirmation messages do not display for private message conversations.

Private messages stored in internal chat transcripts

Once the conversation ends, one external transcript and one internal chat transcript are generated.

The public chat transcript does not include private messages and is accessible for the requester to download if the Download Transcript capability has been enabled.

The private chat transcript is shown on the interaction record by default and does include private messages exchanged between agents and managers. Private messages are prefixed with the word [PRIVATE] to clearly indicate when a message came through the Private Chat.

To learn more about downloading the chat transcript, see Download chat transcript.

Custom report

Admins can build a custom report to track the number of help requests. See Build a report to track the number of help requests for instructions.
Chat surveys in Agent Chat

Display conversational questionnaires to your end users to gather important information from them, before and after they chat with a live or virtual agent. For example, you can run pre-chat surveys to collect preliminary information about your requesters and use that information to route chats to appropriate live agents. Use post-chat surveys to get user feedback on their experience with your support agents.

How chat surveys work

Instead of using forms to collect information from your requesters, you can create different questionnaires that run in the chat client to capture preliminary user information or post-chat feedback. The questions in this pre-chat survey example ask users to identify their service issue and to provide additional details.

Example pre-chat survey conversation

Survey administrators and administrators use Survey Designer to:

• Build survey content: Survey Designer provides various controls for defining survey questions. The example above shows the choice list control, which displays a list of items that your users can choose from. Each survey question has corresponding properties that you can set to manage survey behavior. For instance, you can make a survey response mandatory. If you make a survey response optional, users can skip the question in the survey. You can also configure your survey so that an introductory note starts the survey and an end note displays after users finish the survey.
• (Optional) Save certain survey responses as chat context: When defining your survey, you can map a particular survey question to a chat context variable so that survey responses are stored in the context variable. You can then use these variables to route chats to live agents in certain queues (specify the chat context variables in routing conditions) or to the virtual agent.

After creating the surveys, administrators configure the surveys to run as conversations in the chat client. The chat client renders the chat survey as a live chat conversation.

What to do next
Setting up chat surveys involves these main steps:

1. (Optional) Define chat context
   Use the Chat Setup form to set live agent controls and define the chat context variables for storing survey responses.

2. Create your chat surveys
   In Survey Designer, build your conversational questionnaires for gathering pre-chat information and post-chat feedback from your requesters. If you defined chat context variables to store certain survey responses, you can map the appropriate survey question to the corresponding chat context variable.

3. Define pre-chat survey configurations
Determine the pre-chat questionnaire to be presented to your requesters based on conditions that you apply.

4. Define post-chat survey configurations

Control the post-chat questionnaire displayed to your requesters to gather feedback on their experience with live agents.

Quick actions in Workspace Agent Chat

Set up shortcuts in Workspace Agent Chat so agents can work more efficiently with their customers.

Using quick actions

In Workspace chat, an agent can insert a quick action in any of the following ways:

- Enter a command after the forward slash (/).
- Select the lightning bolt icon (⚡) and select a quick action from the menu.
- If available, select the quick action button on the toolbar.

For example, an agent can transfer a conversation to another queue by entering /tq in the message input field.
An agent can also initiate a queue transfer by selecting the lightning bolt icon and then selecting `/tq` from the menu.
Initiate a queue transfer from the quick action menu

Alternatively, an agent can transfer to another queue by selecting the arrow button (→) on the toolbar.
Initiate a queue transfer from the toolbar

Active Chat

PLEASE STAND BY WHILE I CONNECT YOU TO A LIVE AGENT.

Thank you for contacting support. I am looking into your question now and will be with you shortly.

Note: Agents must have the quickactions_user role to use quick actions.
Display chat context details

An agent can view context relevant to a chat interaction. An agent can use a context quick action to show a card with context variables: sysparm_portal, sysparm_page, table, sys_id, and sysparm_language. The agent can initiate this quick action by typing `/context` in the message input field.

Parameters

Some quick actions require a secondary menu so that agents can further control the quick action. For example, after an agent initiates a queue transfer, the agent must select which queue to transfer to. The items that appear on the secondary menu are called parameters.

The following figure shows that, after an agent inserts a quick action to transfer to another queue, the agent sees a list of available queues. The default parameters for the quick action are queues that are available to agents.
To create a quick action that requires a secondary menu, you must define parameters for the quick action. For more information, see Define a quick action parameter for Workspace chat.

**Default quick actions**
The following quick actions are available by default with Workspace chat:

<table>
<thead>
<tr>
<th>Command name</th>
<th>Toolbar button</th>
<th>Action</th>
<th>Default parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>autopilot</td>
<td></td>
<td>Starts a Virtual Agent topic (Conversation Autopilot).</td>
<td>Available topics</td>
</tr>
<tr>
<td>help</td>
<td></td>
<td>Indicates to the chat supervisor that an agent needs help with a conversation. To use this quick action, new customers must enable Agent Chat and Agent Whisper and update customers must enable Agent Whisper on chat setup.</td>
<td></td>
</tr>
<tr>
<td>r</td>
<td></td>
<td>Uses response templates to insert as text in a conversation.</td>
<td>Available response templates</td>
</tr>
</tbody>
</table>
### Activation information

To enable your agents to use quick actions, you must activate the Agent Chat [com.glide.interaction.awa] plugin, which is required for chat in Workspace.

As of the New York release, quick actions replace Connect actions in Workspace chat. If you activated the Agent Chat [com.glide.interaction.awa] plugin prior to New York, your Connect actions are no longer available in Workspace chat. You may need to create new quick actions.

### Conversation Autopilot in Agent Chat

Agents can use Conversation Autopilot to display Virtual Agent topics during Agent Chat conversations. While the requester interacts with the Virtual Agent topics, agents can multitask and work on other items.

While talking to a requester in an Agent Chat conversation, agents can start Conversation Autopilot by using autopilot quick actions to invoke Virtual Agent topics. Depending on the information entered by the requester, agents can search for a specific Virtual Agent topic and display it with parameters. The requester views the topic and responds as needed and Virtual Agent captures the requester’s input.

> **Note:** For the best experience, enable the setting that turns on system messages during autopilot.

### Configuring Autopilot

You must have the Glide Virtual Agent plugin and the Agent Chat plugin installed to view and access the quick action for Autopilot. Admins can setup which Virtual Agent topics are available to agents in Agent Chat.

> **Note:** Admins must be able to configure a quick action based on their organization’s business need and set it up for agents to use as required.

---

<table>
<thead>
<tr>
<th>Command name</th>
<th>Toolbar button</th>
<th>Action</th>
<th>Default parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>ta</td>
<td></td>
<td>Transfers the conversation to another agent.</td>
<td>Available agents</td>
</tr>
<tr>
<td>tq</td>
<td></td>
<td>Transfers the conversation to another queue.</td>
<td>Available queues</td>
</tr>
</tbody>
</table>

**Note:** Only response templates that have a condition of [Type][is] [Chat] are available in Agent Chat.
For information on using quick actions in Agent Chat, see Quick actions in Workspace Agent Chat.

**Using Autopilot**

The agent is able to use quick actions to search for and invoke an Autopilot topic of their choice during their conversation with a requester. The agent can only select Autopilot topics that are relevant to the channel. For example, only topics optimized for SMS are selectable when conversing with a requester who is using SMS.

The agent can have a system message display informing the requester that they are interacting with a bot when autopilot is in use. The agent can hide this message completely so the requester is not explicitly informed that they are interacting with a bot. The requester assumes they are conversing with the agent even when Autopilot is in progress.

The agent is informed by system messages when an Autopilot topic has been initiated and ended. These messages can be configured by admins.
While Autopilot is on

While Autopilot is on, the requester can use the rich controls for text but agents see a read-only version of the rich controls rendered to the requester.
When Autopilot is in use, public chat with the requester is disabled, but agents can contact other agents and supervisors for help. If Agent Whisper is on, the Private Chat tab in Agent Whisper functions normally during Autopilot. While Autopilot is in use, the agent’s capacity is not freed up and messaging actions configured by customers are disabled.

**When Autopilot is ended**
The agent receives a desktop notification in the Notifications tab in Workspace stating that the Virtual Agent topic has ended or been completed by the requester. At this point, the agent resumes control of the conversation.
Download chat transcript

Once a conversation between a requester and a live agent ends, the requester can download a transcript of the conversation.

After a conversation between a requester and a live agent ends, the requester’s chat window displays a **Download** button which enables the requester to download a chat transcript. If the requester clicks the **Download** button, a .txt file is automatically downloaded from the window of the requester’s current web browser. The chat transcript contains only the written text from the conversation; attachments and images from the conversation appear as URLs. Even after the requester starts a new chat session, the **Download** button from the previous session is still available if the requester scrolls up. The chat transcript files are generated at the end of each chat session and multiple chat sessions are not combined into one file.

The requester must be configured for chat transcript downloads for the **Download** button to appear. For information about configuring the download of chat transcripts, see .

Two types of chat transcripts are generated from the conversation: internal and external.

**Internal chat transcripts**

- Available only to the agent and chat supervisor.
- Include any conversations between the requester and virtual agent.
- Include any conversations between the agent and chat supervisor that occurred through Agent Whisper.

**External chat transcripts**
Dynamic Translation for Agent Chat Overview

Dynamic Translation for Agent Chat (DTAC) translates chat conversations from one language to another. This translating enables agents and requesters to have chat conversations with each other without the need of a shared language.

For example, a requester who only speaks French starts a chat conversation with a live agent who only speaks English. From the requester’s view, the entire conversation is conducted in French, while from the agent’s view, the entire conversation is conducted in English.

DTAC enables cross-locale support teams and merger and acquisition projects to save time and money by handling larger volumes of chat conversations from other regions.

Note: DTAC is supported on Agent Workspace, not on Connect Support.

Note: DTAC is currently not supported when autopilot is in progress. When the requester responds to prompts from autopilot topics, these responses are not translated for the agent, even if DTAC is turned on for that conversation. See Autopilot in Agent Chat for more information.

How DTAC works

DTAC uses Dynamic Translation and a translation service provider to translate chat conversations in real time. Available translation service providers include:

• Google Cloud Translator Service
• IBM Translator Service
• Microsoft Azure Translator Service

Watch the 3-minute overview video to learn more about DTAC. Dynamic translation for Agent Chat overview video

Prerequisite steps

These tasks must be completed prior to activating DTAC:
Integrate with a translation service provider
Migrate to version v3 of a translator configuration
Translate a knowledge article

Activating DTAC

DTAC translates chat conversations from one language to another. The preferred languages for the agent and requester are based on their user profiles and a translation service translates the messages into the defined language of the other participant. Translation service providers support language detection for requesters who are not logged in to ServiceNow®, also referred to as guest users.

DTAC is inactive by default. Before activating DTAC, the following requirements must be completed:

• Activate Dynamic Translation and translation service provider
• Set up Workspace Agent Chat
• Activate languages for static translation

This also activates these plugins:

• Dynamic Translation (com.glide.dynamic_translation)
• Conversational Dynamic Translation (com.glide.dynamic_translation.va_async)

and these system properties:

• true - sync
• false - async
• absence of this property - async

Dynamic Translation for Agent Chat considerations and behavior

This section highlights how Dynamic Translation for Agent Chat (DTAC) works with other Agent Chat features and also lists some practical ways of working with the feature.

Language limitations

DTAC can translate in the languages supported by each translation service listed above. Even though the corresponding I18N plugins are activated, DTAC does not support the following language translations:
• Simplified and Traditional Chinese
• Brazilian Portuguese
• Canadian French

Translation support limited to one language
DTAC can only support translation from one language to another therefore additional agents or managers joining chat sessions should speak the same language as the primary agent.

• Agent chat transfers – Agents transferring a chat conversation should both speak the same language.
• Managers joining chat conversation – Managers joining chat conversation to monitor or assist agents should speak the same language as the primary agent.

Attachments within DTAC
When inserting an attachment into a chat, DTAC does not translate the file name or the contents of the attachment.

Admins using Workspace
Set up Workspace for agents, so that they can find, work on, and resolve issues efficiently.

Your job is to make the work that your agents do as effortless as possible. When configuring Workspace, you set up all the tools that agents need to complete their work and eliminate anything extraneous.

Browser requirements
ServiceNow workspaces do not support mobile devices, and, starting with the Orlando release, Internet Explorer, or Microsoft Edge. Instead, use Microsoft Edge-Chromium or one of the other supported browsers listed in Generally supported browsers Browser support. See the Internet Explorer 11 Performance [KB0683275] article in Now Support for more information.

Different ways to set up Workspace components
Workspace provides the following ways that you can access configuration settings:
• Application navigator—Navigate to configuration pages using the application navigator, for example, **Workspace Experience > Forms > Ribbon Settings**.

• Workspace—In the menu under your profile image, you see the following menu items:

  ![Configuration menu](image)

  - **Configure workspace**—Opens the Workspace configuration page where you can set up list categories, list filters, landing pages, and the record types that agents can create. You can also configure the modules that appear on the far left of the screen, such as Home (HOME) and Lists (LISTS).

  - **Configure page**—Provides shortcuts to configuration settings that are based on the page content. This option only works when you are in record view.

The instructions in this documentation use the application navigator.

**Setting up workspace**

Set up Workspace either by:

• Following the Workspace Guided Setup.

  The guided setup walks you through a sequence of tasks that helps you set up Workspace. To start with Workspace Guided Setup, navigate to **Workspace Experience > Agent Workspace Guided Setup**.
• Using the instructions in the following sections.

The following sections provide more details than the guided setup about how to set up workspace components. To start, go to Get started setting up your workspace.

Note: After completing the setup procedures in this guide, your workspace may have a few additional setup procedures that are unique to your workspace. Return to your product documentation, such as the Customer Service Management (CSM) documentation, and complete those procedures.

Get started setting up your workspace

Set up user roles, global search, and service catalogs to give agents the permissions, source documents, and catalogs they need for resolution of issues.

Before you begin

Role required: workspace_admin

About this task

These sections provide general setup instructions. Following these topics are configuration instructions for landing pages, list view, and record view.

Procedure

1. Activate the plugins for your product.

   ITSM plugins are active by default. If you’re using another workspace, such as CSM, you must activate its plugins.

   a. Navigate to System definition > Plugins.

   b. In the search bar, enter your product name.

   c. Click Install for the plugins that are related to your product.

      For more information, see Activate the plugins for your product.

      If you intend to use performance analytics and reports on landing pages you create, make sure to activate the Performance Analytics plugin.

      It’s active by default in new instances starting with Orlando but not for upgraded instances.

2. To assign roles to people in your organization, use the following table. How you assign your agents to these roles is beyond the scope of this documentation.
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace agent [agent_workspace_user]</td>
<td>Required to use Workspace. The itil and sn_esm_agent for CSM roles also contain this role.</td>
<td>• None</td>
</tr>
<tr>
<td>Workspace list administrator [workspace_list_admin]</td>
<td>Required to create list categories and to create and assign filtered lists. This is an elevated role. For more information on elevated roles, see Elevated privilege.</td>
<td>• agent_workspace_user</td>
</tr>
</tbody>
</table>
| Workspace administrator [workspace_admin] | Required to configure Workspace.                                                                                       | • form_admin  
• chat_admin  
• template_editor  
• ui_action_admin  
• personalize_form  
• interaction_admin  
• workspace_list_admin                                                                 |

3. Identify a source of information that agents use when doing searches in Workspace.

   a. Navigate to **Workspace Experience > Administration > Search Sources**.

   b. Click **New** or open an existing record to edit.

   c. On the form, fill in the fields.

   **Search Source form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the search source. This name appears as a search category in the workspace search.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that your search source is associated with.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions for your search source.</td>
</tr>
</tbody>
</table>

d. Click Submit.

4. **Optional**: Configure the global search.
   Global search is the field at the top of Workspace that enables agents to search across all records.

   ![Global search](image)

   a. Open the Settings menu by clicking your profile image.

   b. Select **Configure Workspace**.

   c. In **Global Search Data Config**, click the search icon (🔍) and specify a search configuration, or, to create a new configuration, click **New** and fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configuration name.</td>
</tr>
<tr>
<td>Application ID</td>
<td>Name of the application this configuration is meant for.</td>
</tr>
<tr>
<td>Search Results Limit</td>
<td>Maximum number of search results that are returned by global search.</td>
</tr>
<tr>
<td>Suggestions limit</td>
<td>Maximum number of type-ahead suggestions that appear as agents type.</td>
</tr>
</tbody>
</table>

d. In **Global Search View Config**, click the search icon (🔍) and specify a view configuration, or, to create a new configuration, click **New** and fill in the form.
Global Search Configuration Settings form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configuration name.</td>
</tr>
<tr>
<td>Recent Items count</td>
<td>Number of recently selected search results that appear in the global search field. The default is 5.</td>
</tr>
<tr>
<td>Recent terms count</td>
<td>Number of recently searched terms that appear in the global search field. The default is 5.</td>
</tr>
<tr>
<td>Recent TTL (days)</td>
<td>Time To Live, which is the length of time in days that recently searched terms and recently selected search results remain in the search history. The default is 30.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this global search. Typically, leave the value as <strong>Global</strong>.</td>
</tr>
<tr>
<td>Tab drill-down items per page</td>
<td>Number of search results that appear at one time when you view search results for a specific search category. The default is 25.</td>
</tr>
<tr>
<td>Tab overview items per section</td>
<td>Number of items that appear in the search results by section. The default is 10.</td>
</tr>
</tbody>
</table>

**e.** Click **Submit**.

**f.** When you return to the Workspace form, select the **Search enabled** check box to use the search parameters that you configured.

(Optional) The **Active** check box must also be selected for all of the parameters on the Workspace form to take effect.

**g.** Click **Update**.

> **Note:** If any access control lists (ACLs) are configured to prevent users from accessing information, the search results show a message about security constraints. For more information on limiting access using ACL rules, see [Access control list rules](#).

**h. Optional:** Hide global search result counts if desired.

**5. Optional:** Associate a Service Catalog with Workspace and add items to it.
A service catalog lists items that an agent can send to a requester, for example, a keyboard, desk chair, phone, and so on. Your implementation of Workspace may or may not require that agents have access to a service catalog. If you associate a service catalog with Workspace, all agents have access to it. For more information about adding a service catalog to Workspace or to add items to a catalog, see Assign a Service Catalog to Workspace. Agents typically use service catalogs in the contextual side panel to resolve requester issues.

What to do next

• Optionally, brand your workspace with your company logo and colors.
• If your agents use a service catalog to send items to requesters, assign a service catalog to your workspace.
• Set up a landing page, which is the page agents typically see when opening your workspace.

Brand your workspace

Customize the look of your workspace with your company's logo and up to two brand colors.

Before you begin

Role required: workspace_admin

About this task

You can replace the ServiceNow logo with your company's logo and use your company's colors to brand the look of your workspace.

Procedure

1. Open the workspace that you want to brand.
   • To brand a workspace that's already open, open the Settings menu by clicking your profile picture and selecting Configure workspace.
   • Navigate to Work Experience > Administration > All Workspaces and click a workspace.
2. On the Workspace form, enter hex values using the format #FFFFFF as color values for **Brand color 1** and **Brand color 2**.

**Brand color 1** specifies the color of the branding bar above the Workspace. **Brand color 2** appears in the heading of the Settings menu and in the left, side pane that contains the icons for home (🏠) and list (≡). Workspace automatically applies different intensities of the colors in different places.

![United Wealth Group](image)

**Note:** Some brand color combinations may make parts of the workspace interface illegible or otherwise fail accessibility requirements. For guidance about color combinations, see sites such as Color Safe.

3. Upload an image for your custom logo by clicking **Click to add** next to **Custom Logo**.

The image can be no larger than 120 kb. It displays 24 pixels high with a maximum width of 400 pixels. Supported file types include .jpg, .png, .bmp, .gif, .jpeg, .ico, and .svg.

4. **Optional:** To revert to the original colors and ServiceNow logo, remove the colors that are specified for **Brand color 1** and **Brand color 2** and delete the uploaded image.

**What to do next**

Set up the landing page for your agents, which is the page they see first when using your workspace.
Assign Service Catalog to a workspace

Assign Service Catalog to a workspace to let agents find and order catalog items to fulfill customer requests.

Before you begin
Role required: workspace_admin

About this task
Service catalogs give agents a way of ordering items to fulfill customer requests. The following image shows categories of items that an agent can order from a service catalog.

You can create service catalogs and fill them with only the items that agents should have access to. For information about creating a service catalog, see Service Catalog.

An overview of catalog items in the Service Catalog: what they are, and how to create and define variables for them.

Catalog items can appear in Agent Assist recommendations.
Agent Assist

This image shows two catalog items as recommended solutions in Agent Assist.

Procedure
1. Navigate to Service Portal > Portals.
2. Click a portal, for example, Service Workspace Portal.
   Alternately, you can create a new portal. For more information, see Create a portal.
3. In the related lists, click the Catalogs tab and click a catalog, for example, Service Catalog.
4. Optional: On the Catalog form, make a catalog active by selecting the Active check box.
5. Optional: In the related lists, click the Categories tab to see the categories of items in the catalog.
6. Optional: In the related lists, click the Catalog Portal pages tab to set up the catalog pages. For more information, see Set up catalog portal pages.
7. Optional: In the related lists, click the Sites tab to select which catalogs are supported within the content management system (CMS) sites.
   (Optional) When your organization uses a CMS as well as a service catalog, you can select which catalogs are supported. For more information, see Manage catalogs in CMS sites.
8. Optional: In the related lists, click the Catalog Items tab to see the items in the catalog.
9. **Optional:** To add items to the catalog, click **New**.

   a. On the form, fill in the fields.

   **Portal Catalog New record form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the item.</td>
</tr>
<tr>
<td>Catalogs</td>
<td>Catalog(s) that the item will be added to.</td>
</tr>
<tr>
<td>Category</td>
<td>Type of item, for example, office, software, and laptops.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the item appear in the catalog(s).</td>
</tr>
</tbody>
</table>

   b. On the related lists, click the **Item Details** tab and enter a short and long description of the item.

c. On the related lists, click the **Picture** tab to upload a picture of the item.

d. On the related lists, click the **Pricing** tab to enter the price of the item.

e. **Optional:** Click **Try it** to view how the item will appear in the catalog.

   f. Click **Submit**.

10. Click **Update**.

**What to do next**

   Set up the landing page for your agents, which is the page they typically see first when using your workspace.

**Hide global search result counts in your workspace**

Disable the display of search result counts in global search for a workspace.

**Before you begin**

Role required: admin

**About this task**

Global search for a workspace displays result counts reflecting the total number of records that match a query. Some matching records may be inaccessible to
your end users for security reasons, causing the global search result counts to be inaccurate for these users. To avoid confusing your users, you can hide the global search result counts for your workspace.

Procedure
1. Navigate to **Workspace Experience > Administration > All Workspaces**. The Workspaces list opens, displaying a record for each of your workspaces.
2. Configure the list layout, adding the **Hide Search Results Count** field to the list of selected fields. The **Hide Search Results Count** field appears in the Workspaces list.
3. Select the **Agent Workspace** application from the application picker.
4. Use the list editor to set the value of the **Hide Search Results Count** field to **true** for each workspace where you want to hide global search result counts.

**Setting up landing pages in a workspace**
Set up the landing pages that were supplied with Workspace or create landing pages starting with an empty page to show agents the issues that need to be resolved.

Landing pages are the pages that agents see when they open their workspace. The pages typically include:

- Performance Analytics and Reporting (PAR) visualizations and widgets, for example, the number of open issues
- Lists of records, for example, all records that are assigned to the agent
Every workspace should have at least one landing page. You can either:

- Use the supplied landing pages or modify them.
- Create a landing page starting from an empty page using the legacy User Interface Builder (UI Builder). The legacy UI Builder enables you to build a landing page. The new UI Builder enables you to build a Configurable Workspace, and is only compatible with CSM. For more information on the new UI Builder, see UI Builder.

**Domain Separation for landing pages**

Domain separation enables the following functionality for landing pages.

- Create a landing page: You can create landing pages that are domain separated. Domain separation enables landing pages to override settings for a specific domain.

  **Note:** Macroponents are not domain separated. Changes made to macroponents affect all landing pages that use the value stored in this reference field.
• Editing a landing page in a sub-domain: To make a change in a sub-domain, you must create a copy in the domain you want to edit and edit the new landing page.

You can edit landing pages in sub-domains that are set to Global. Editing landing pages in sub-domains enables you to change the name or element within a component. The changes are saved to the Global landing page. The definition of the landing page is changed and the domain is unaffected.

Creating custom landing pages for workspaces

Use the User Interface Builder (UI Builder) to create custom landing pages for your agents.

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

UI Builder overview

UI Builder is a drag-and-drop tool that enables you to arrange workspace components to create custom landing pages. To build a page, all you have to do is:

Note: Only custom landing pages can be created the legacy UI Builder. To build configurable Workspaces, see UI Builder. Configurable Workspaces are only compatible with CSM.

1. Drag components from the +Add component tab on the Page management pane onto the pane in the middle of UI Builder called the Stage.

2. Select each component that you dragged into the Stage. Then, in the Configuration pane, enter configuration values for each selected component.
You can add, remove, and group components to create a landing page that contains the important information you want agents to see when they open their workspace.
Plugin
The Now Experience UI Builder requires the com.sn_ui_builder plugin, which comes by default on new and upgraded instances.

If you intend to use Performance Analytics and Reporting on landing pages you create, make sure to activate the Performance Analytics plugin. It's active by default in new instances starting with Orlando but not in upgraded instances.

Constraints
• The domain separation for Now Experience UI Builder landing pages is the same as the workspace’s.
• The Now Experience UI Builder does not work on the mobile platform.
• Now components cannot talk to one another.

Next steps
Use the tutorial to get familiar with UI Builder.

UI Builder landing page tutorial
Learn how to use the legacy UI Builder to create a custom landing page.
Before you begin

**Important:** The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

This task pertains to the legacy of UI Builder which only enables you to create a landing page. Use the new version of UI Builder to create a Configurable Workspace. For more information, see UI Builder.

Role required: workspace_admin or ui_builder_admin

**About this task**
Before you create your landing page, let’s see how UI Builder works by exploring an existing landing page.

**Procedure**

1. Navigate to **Workspace Experience > Administration > All Workspaces** and click a workspace to open it.
2. If the page that opens is not editable, click the **here** link in To edit this record click here to make the page editable.
3. Click **Open in UI Builder**.
4. In the Page management pane, on the **Pages** tab, click the **Incident Overview** landing page.

This landing page appears in the Stage pane. Notice the **Status** and **Application** fields above the Configuration pane. The **active** status means that the landing page is currently being used. The **Application** field shows that the landing page is being used by ITSM Agent Workspace. If you clicked:

- **Deactivate**, the status would change to **Inactive** and the landing page would no longer display in workspace.

**Deactivate** button would be replaced by the **Activate** button, which would enable you to publish the landing page in workspace.

You typically deactivate landing pages when you're working on them. For example, to update the current landing page, you could:

- a. Clone your current landing page.
- b. Work on it in the inactive state.
- c. Make the updated version **Active**.
- d. Make the original version **Inactive**.
• **Save** button, you would save any changes you made to the landing page. If the **Status** is:
  - **Active**, the changes appear immediately in workspace.
  - **Inactive**, the changes are saved but not published.

5. Click the components and see how the configuration parameters change in the Configuration pane.

6. Click **Happening Now**.

   The container becomes visible around the four, smaller components. **Happening Now** is the container's label. Look in the Configuration pane under **Label**. Containers are how you group other components.

7. With the container still highlighted, slide the **Show border** slider to the right.

   A border appears, which shows the container.

8. Slide the **Can collapse** slider to the right.

   A caret icon (верхняя стрелочка) appears above the container. An agent can click the caret to collapse the container and everything in it.

9. On the top right of the Configuration pane, click the right arrow (>) to collapse the pane.

10. In the Stage pane, click the container and then click its configuration icon (перемещать).

    ![](image)

    The Configuration pane reopens.

    You also notice the move icon (перемещать) that you can use to drag a component around. Don't do that yet.
The **Collapsed** slider in the Configuration pane means that the container starts out collapsed and appears as a downward arrow (▼) that an agent can click to expand the container.

Now that you have seen how to use the different parts of the interface, let’s see how to create a landing page.

**Create new landing page tutorial**

Create a new landing page.

**Procedure**

1. On the **Pages** tab, click the plus icon (+) to open a new landing page.

   ![Page management](image)

   ![Pages](image)

   ![Landing pages](image)

   ![Default Landing Page](image)

   ![Incident Overview](image)

   You can also create a new page by clicking **Page actions > +New page**.

2. On the **OK. Let's get some general info for this page** modal, enter the name of your landing page and click **Create landing page**.

   This title appears above the Stage but not on your landing page.

   ![UI Builder](image)

   ![Agent Workspace](image)

   ![My Landing Page](image)

   ![Configuration](image)

**Add and configure components tutorial**

Add and configure components on a landing page.

**Procedure**

1. Click the **+Add component** tab and drag an image component into the Stage pane.

   Parameters for the image appear in the Configuration pane.
2. Drag a data visualization component far below the image and drop it.
   The component does not appear in the Stage pane.

3. Drag a data visualization component over the image component but do not drop it. Move the data visualization component around the edges of the image component.
   The side of the image component highlights when you move the data visualization component over it.

4. Hold the data visualization component over the left side of the image and drop it.
   The data visualization component appears to the left of the image component.
5. Click and then grab the move icon (drag icon) above the data visualization component and drag it over the bottom edge of the image component and drop it.

Now, you know how to move a component on the landing space. The data visualization component is blank. Let's fill it so it's visible.

A type-ahead list of possible entries appears.

7. Click Open incidents by Priority in the list.

That report opens in the component.

8. In the Configuration pane, delete Open incidents by Priority and in the PA Widget field, type incident.

A type-ahead list of possible entries appears. These entries are Performance Analytics (PA) widgets.

You can only put one data visualization in the component. So, you can either display a report or a PA widget but not both. If you put entries for both a report and a PA widget, UI Builder only displays the report.

You now know how to add and arrange components on a landing page. Let's now see how to group them.

Group and arrange components tutorial
Group and arrange components on a landing page.

Procedure

1. Click Page actions, select Delete page, and then confirm the deletion.

2. Select the data visualization component, click the trash icon (trash icon) and then the delete check mark icon (check mark icon) above the component to remove it.

You have now deleted components on a landing page. If you like, you can also remove the image component.

3. Drag a container component into the Stage pane.

4. In the Component pane, enter a value in the Label field for the container and push the Show border slider to the right so you can see the container.

5. In the Label field, add a title to the container, for example, Important lists.

6. Drag a list component into the container.

7. In the Component pane, in the Table field, enter a value for the table where the list of records comes from, for example, incident.

8. Drag another list component into the container.
You can drop the list inside or outside of the container. Drop it inside the container.

9. In the Component pane, in the **Table** field, enter a value for a different table where the list of records comes from, for example, task.

You now have two list components inside a container component, which has a label that describes the lists.

10. Continue adding components inside or outside of the container and using the move icon (_drag) to drag the components around so that you can get used to adding, deleting, moving, and grouping components.

11. Click **Save**.

If you were making a real landing page, you'd also click **Activate**. Because you're not making a real landing page in this tutorial, let's delete this practice landing page.

**Delete a landing page tutorial**

Delete a landing page.

**Procedure**

1. On the **Pages** tab, select your landing page.

2. Under **Page actions**, click **Delete page**.
What to do next
You now have an idea how to use UI Builder. You’re ready to create your first landing page.

Create a custom landing page in UI Builder
Create a custom landing page to show agents the important tasks they can undertake.

Before you begin
Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Role required: workspace_admin or ui_builder_admin

About this task
A landing page is an agent’s initial view of their workspace. Fill the landing page with the minimal amount of information that your agents need so that they can start working on the most important tasks. Your instance should have at least one landing page.
Procedure

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace.

2. If the page that opens is not editable, click the here link in To edit this record click here.

3. Click Open in UI Builder.

4. To create a landing page, do one of the following:

<table>
<thead>
<tr>
<th>To do this task</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Click Page Actions and select +New Page.</td>
<td>You can also click the plus icon (+) on the Pages tab.</td>
</tr>
<tr>
<td></td>
<td><img src="https://example.com/image.png" alt="Page Actions and +New Page" /></td>
</tr>
<tr>
<td>Create a landing page starting with no components</td>
<td>b. On the modal, in Enter the name of your landing page, enter the name of the new landing page.</td>
</tr>
<tr>
<td></td>
<td>c. In the Application field, specify what applications that you want this new landing page to appear in.</td>
</tr>
<tr>
<td></td>
<td>d. In the Protection field, specify a policy. None—Enables anyone to view and modify the landing page. Read-only—Enables anyone to view but not modify the landing page. Protected—Prevents everyone but you from viewing or modifying the landing page. In all of these options, the page creator, can view and modify the landing page.</td>
</tr>
</tbody>
</table>
**To do this task** | **Do this**
--- | ---
| Copy a landing place to use as a starting point for a new landing page | a. Click **Pages** and click the landing page that you want to copy.  
b. Click **Page Actions** and select **Copy Page**.  
c. On the modal, in **Enter the name of your landing page**, enter the name of the new landing page.  
d. In the **Application** field, specify what applications that you want this new landing page to appear in.  
e. In the **Protection** field, specify a policy. **None**—Enables anyone to view and modify the landing page. **Read-only**—Enables anyone to view but not modify the landing page. **Protected**—Prevents everyone but you from viewing or modifying the landing page. In all of these options, the page creator, can view and modify the landing page.  
f. Click **Create copy**.  

5. Click **Save**.

**Example:**
In the following example, you can see the two places that the value, *My first landing page*, for **Enter the name of your landing page** appears, and where the value for **Application**, *Agent Workspace*, appears.
What to do next
Now that you’ve created a landing page, you can add components to it.

Add components to a landing page in UI Builder
Drag and drop components into the Stage pane to create a landing page.

Before you begin

**Important:** The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

- You must have created a landing page.
- Role required: workspace_admin or ui_builder_admin

About this task
You add components to landing pages by dragging and dropping components from the +Add component tab into the Stage pane.

Procedure

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace to open it.
2. If the page that opens is not editable, click the here link, in To edit this record click here.
3. Click Open in UI Builder.
4. In the Page management pane, on the Pages tab, click the landing page that you want to add components to.

5. Click the +Add component tab to open the list of components that you can add to your landing page.

6. Add components by dragging one component at a time from the +Add component tab into the Stage pane.

When you drag a component, click it first to select it. A box appears around the component when it's selected. When you drop components into the Stage pane, make sure to point to a component that's already on the landing page. Highlights appear where you can drop the component. For more information about dragging and dropping, see the tutorial.

You can add these components:
• Container—Container in which you can group other components, for example, a heading and two data visualization reports. For more information, see Container component in UI Builder.

• Report/PA Widget—Performance Analytics and Reporting visualizations. These values can be updated periodically. For more information, see Data Visualization components in UI Builder.

• Image—Image. For more information, see Image component in UI Builder.

• Rich text—String to use anywhere on the landing page. For more information, see Rich Text component in UI Builder.

• Data visualization—New report visualizations, and visualizations from existing reports and widgets. These values can be updated periodically. For more information, see Data Visualization components in UI Builder.

• Heading—String to use as the title of a landing page. For more information, see Heading component in UI Builder.

• List—List of records that come from a single table. For more information, see List component in UI Builder.

7. Optional: To remove a component from your landing page:

   a. Click the component and click the trashcan icon (🗑️) that appears.

   b. Confirm the deletion by clicking the check mark icon (✓) in the Delete element? pop-up window.

8. Optional: To move a component, click it, use your mouse to grab the move icon ( draggable), and drag the component to a new location.

9. Click each component in the Stage pane and enter values for the component properties that appear in the Configuration pane.
For descriptions of component properties, see the Component reference for UI Builder.

10. Click **Save**.

11. Click **Activate** when you're ready to use the landing page.

**Update a landing page's name in UI Builder**

Update a landing page's name to better reflect its purpose.
Before you begin

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Role required: workspace_admin or ui_builder_admin

About this task

You can revise the name of your landing page but not its properties, such as the application associated with the landing page. The landing page name does not appear on the landing page itself. It only appears above the Stage pane and on the Pages tab in UI Builder, as shown in the following figure. To put a name on your landing page, add a heading component.

Procedure

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace.
2. If the page that opens is not editable, click the here link in To edit this record click here.
3. Click Open in UI Builder.
4. In the Page management pane, on the Pages tab, click the landing page that you want to modify.
5. Click Page Actions and select Edit page properties.
6. In Enter the name of your page, revise the name of the landing page.
OK. Let's update your My revised name landing page

Enter the name of your page

My revised name

Protection

None (default)

Application

Global

This image shows that the new landing page's name is My revised name.

7. Click Update.

Delete a landing page in UI Builder

Delete a landing page when it's no longer needed.

Before you begin

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Role required: workspace_admin or ui_builder_admin

Procedure

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace.

2. If the page that opens is not editable, click the here link in To edit this record click here.

3. Click Open in UI Builder.

4. In the Page management pane, on the Pages tab, click the landing page that you want to delete.

5. Click Page Actions and select Delete page.
6. Confirm the deletion.

Component reference for UI Builder

The information in the following sections helps you to understand the parameters for the Now components that are used in UI Builder.

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Container components in UI Builder

Use a container component in UI Builder to group other, similar components, such as multiple data visualization components. You can add a title to a container to help agents understand the reason for the grouping.

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.
You can insert any component into a container component. The container has a label that helps agents understand the grouping of the other components. In the following example, the container contains two data visualization components.

The following table explains the container component parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Label</td>
<td>String that appears as a title for the container. In the previous image, see &quot;Container label here.&quot;</td>
</tr>
<tr>
<td>Type</td>
<td>Style component. Use the Visualizations type to darken the container, which makes the components inside it stand out.</td>
</tr>
<tr>
<td>Type</td>
<td>Style component. Use the Neutral-1 type to darken the container. Use the Neutral-0 type to prevent the container from being darkened. Both values override the Visualizations type.</td>
</tr>
</tbody>
</table>
Container component parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show border</td>
<td>Toggle to show or hide an outline around a component. The container border is darker and thicker than the other component borders.</td>
</tr>
<tr>
<td>Can collapse</td>
<td>Toggle to enable/disable a component to collapse. When enabled, a caret icon (↑) appears in the component that a user can click to collapse the component.</td>
</tr>
<tr>
<td>Collapsed</td>
<td>Toggle to start or not-start the component in a collapsed state. When enabled, the collapsed component appears as a downward arrow (▼) on the landing page.</td>
</tr>
</tbody>
</table>

Data visualization components in UI Builder

To view overview information relevant to your goals, you can add Performance Analytics and Reporting data visualizations to a workspace landing page.

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Heading components in UI Builder

Add a title to your landing page using a header component.

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

The image shows the heading, My Heading, as the title for a landing page.

The following table explains the heading component parameters.
## Heading component parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Label</td>
<td>Text of the heading.</td>
</tr>
<tr>
<td>Style</td>
<td>Size of the heading text.</td>
</tr>
<tr>
<td>Disable text wrap</td>
<td>Toggle to wrap or not wrap the heading text. If you set the heading text not to wrap and the heading is wider than the landing page, UI Builder truncates the end of the heading and appends an ellipsis. If the user widens the landing page, more of the heading text appears.</td>
</tr>
<tr>
<td>Hide bottom margin</td>
<td>Toggle to show or hide a blank line below the heading text.</td>
</tr>
</tbody>
</table>

### Image components in UI Builder

Add images to your landing page with an image component.
Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

When you drag the image component icon ( ![image](image) ) into the Stage pane, a stock image appears that you can change and resize. You can change the stock image by supplying your image's URL.

The following table explains the parameters of the image component.

<table>
<thead>
<tr>
<th>Image component parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>Component name</td>
</tr>
<tr>
<td>Alt Text</td>
</tr>
</tbody>
</table>
### Image component parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image URL</td>
<td>URL for the image.</td>
</tr>
</tbody>
</table>
| Fit | Image size control.  
  - **Expand to fill** zooms in or out on the image in both X and Y axises proportionally so the image fills the container.  
  - **Stretch to fit** zooms in on the image so it fills the container but the image does not expand proportionally.  
  - **Keep original size** displays the image in its original size, which may be larger or smaller than the container. |
| Position | Location of the image in the container. For example, **Bottom-right** places the image at the bottom-right of the container. This parameter only works when the image is smaller than the container. |
| Height | Height of the image measured by the number of pixels high. If this height is shorter than the image height, the parameter cuts off the top of the image. The width is not reduced proportionally. |

### List components in UI Builder

Use a list component to add lists to your landing page.

> **Important:** The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see [Now Experience UI Builder](#).

When you drag the list component icon ( ![List](#)) into the Stage pane, a sample list appears. List components have the following parts:
The following table explains the list component parameters. Use the previous image for the location of the parameter values in the list component.

### List component parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component Name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>List Title</td>
<td>Title of your list.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table hat the records come from that appear in the list.</td>
</tr>
<tr>
<td>Query</td>
<td>Button that you use to open the condition builder, which enables you to filter the records that are included in the list. For example, you might display only list records from <strong>Table</strong> that satisfy the conditions: <strong>Active is true</strong> and <strong>Priority is 1 – Critical</strong>. The badge and</td>
</tr>
</tbody>
</table>
### List component parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count icon ( )</td>
<td>show the number of filters applied. If there is no badge, there are no filters.</td>
</tr>
<tr>
<td>Columns</td>
<td>Number of columns that you specify to appear in the list instead of the default columns. Use the parameter multiple times to display multiple columns.</td>
</tr>
<tr>
<td>Max Rows</td>
<td>Maximum number of rows that you specify to appear in the list. The default is 5. The maximum is 100.</td>
</tr>
<tr>
<td>Max Columns</td>
<td>Maximum number of columns that you specify to appear in the list. The default is 5. If the number of columns is greater than the value of this parameter, only the first columns appear.</td>
</tr>
<tr>
<td>Hide Header</td>
<td>Toggle to show or hide the list's header.</td>
</tr>
<tr>
<td>Hide Title</td>
<td>Toggle to show or hide the list's title.</td>
</tr>
<tr>
<td>Hide Badge with Record Count</td>
<td>Toggle to show or hide the list's badge and record count. The number is the total number of records in the list. Only some records may be seen in the current display.</td>
</tr>
<tr>
<td>Hide Refresh Button</td>
<td>Toggle to show or hide the refresh button.</td>
</tr>
<tr>
<td>Hide &quot;Last Refreshed&quot; Text</td>
<td>Toggle to show or hide the &quot;Last refreshed&quot; text.</td>
</tr>
<tr>
<td>Hide Links</td>
<td>Toggle to make the values in the Number column links or not. If they are not links, the number text is black. In the following image, the numbers on the left are not links. The numbers on the right are links.</td>
</tr>
</tbody>
</table>
List component parameters (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Active Tasks 384</td>
<td><img src="image" alt="Table showing active tasks" /></td>
</tr>
<tr>
<td>Last refreshed 6h ago</td>
<td></td>
</tr>
<tr>
<td>Number  - Priority</td>
<td></td>
</tr>
<tr>
<td>CHG00000001 3 - Moderate</td>
<td></td>
</tr>
<tr>
<td>CHG00000004 4 - Low</td>
<td></td>
</tr>
<tr>
<td>CHG00000005 4 - Low</td>
<td></td>
</tr>
<tr>
<td>All Active Tasks 384</td>
<td><img src="image" alt="Table showing active tasks" /></td>
</tr>
<tr>
<td>Last refreshed 6h ago</td>
<td></td>
</tr>
<tr>
<td>Number  - Priority</td>
<td></td>
</tr>
<tr>
<td>CHG00000001 3 - Moderate</td>
<td></td>
</tr>
<tr>
<td>CHG00000004 4 - Low</td>
<td></td>
</tr>
<tr>
<td>CHG00000005 4 - Low</td>
<td></td>
</tr>
<tr>
<td>Hide &quot;View All&quot; Footer</td>
<td>Toggle to show or hide the &quot;View all&quot; link in the footer.</td>
</tr>
<tr>
<td>Hide Highlighted Values</td>
<td>Toggle to show or hide highlights that have been configured to appear in specified list fields. For more information, see <a href="highlight_list_fields">Highlight list fields in Workspace</a>.</td>
</tr>
<tr>
<td>Hide Empty State Image</td>
<td>Toggle to show or hide the image that appears when filter conditions prevent any records from appearing in the list. The intention is to show a response so agents realize that the list is empty. You cannot change the image.</td>
</tr>
</tbody>
</table>

Rich text components UI Builder

Add text to your landing page with a rich text component to explain parts of your landing page, for example, "Tackle these priority 1 incidents first."

**Important:** The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see [Now Experience UI Builder](now_experience_ui_builder).

![Rich Text Component](image)
The following table explains the rich text component parameters.

### Rich text parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>HTML</td>
<td>HTML editor that you use to enter text.</td>
</tr>
</tbody>
</table>

Create User Experience filters

Create a single filter for use across all the visualizations in a workspace.

**Before you begin**

Important: The Now Experience Builder described on this page is for building and editing landing pages in all workspaces except CSM. For information about the new UI Builder that builds and edits all pages in CSM Workspace, see Now Experience UI Builder.

Role required: admin
Procedure

1. Navigate to **User Experience Framework > Experiences**.

2. Click the **Admin panel** entry of the experience that you want to filter.

3. On the configuration page, click **Open in UI Builder**. The UI Builder opens in a new window or tab.

4. Create a page template.

5. Select the variant of the page you want to filter.

6. Select the Toolbox icon and drag a filter onto the workspace.
7. In the sidebar, name the filter and select the first table and field that you want to filter. For example, Incident and State.

8. **Optional:** Click **Add** to add another table. When your User Experience contains information from multiple tables, for example Problems and Incidents, you can filter on the same field, such as State, in both.

9. **Optional:** Select the values that appear in the filter. Under Data Source, click the Configure icon. Configuring the values is useful if you’re filtering on something like Created by. The Created by field uses the user table which might have thousands of entries. A dynamic filter that only shows the problems created by the direct reports of the manager using the Experience. In this case, you can configure the filter with the condition Manager | is (dynamic) | Me. For more information, see .

10. Click **Save**.

**Results**
The filter you create is available in the workspace in which you created it.
What to do next
For filters to work in workspaces, you must configure an event handler to apply the filters.

Set up supplied landing pages in workspace
Set up pre-configured reports and relevant data for agents on the landing page to help agents quickly find issues to resolve.

Before you begin
Role required: workspace_designer

About this task
The landing page is an agent’s initial view of Workspace. Your instance should have at least one landing page, depending on the features and products you have. Landing pages are configurable and consist of a layout with containers and widgets that appear on the page. You can use any of the supplied landing pages without modifications or you can clone a landing page and make updates for your installation.

Note: Widgets, such as reports, that appear on a landing page must be pre-configured. If you need to configure a widget, see Performance Analytics and Reporting for Agent Workspace.
You can include these components on a landing page:

- Lists—Display a filtered list of records.
- Single Score—Displays the number of records in a filtered list.
- Time Series/Trend By—Displays a graph of record values over time.

To design your own landing page and add custom components to it, see Creating custom landing pages.

**Procedure**

1. Navigate to **Workspace Experience > Landing Pages**.
2. Optional: Click a landing page to modify.
   If the landing page form is read-only, click here in **To edit this record click here**.
3. Optional: Create a new landing page in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new landing page based on an existing page</td>
<td>Select a landing page. If the landing page form is read-only, click here in <strong>To edit this record click here</strong>. You can</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>modify this landing page and save it</td>
<td>under a different name to create a new landing page that is based on this one.</td>
</tr>
<tr>
<td>Create a landing page</td>
<td>Click <strong>New</strong>.</td>
</tr>
</tbody>
</table>

4. On the form, fill in the fields.

**UX Custom Content Extension form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Landing page name.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the page shows. If you set up multiple landing pages, the page with a lower value takes precedence over the pages with higher values.</td>
</tr>
<tr>
<td>Note:</td>
<td>If there are permissions on any active page, an agent sees the page with their group or role set. The permissions takes precedence over a user who sees a page without permissions that is the lowest order.</td>
</tr>
<tr>
<td>Applicability</td>
<td>If applicability is for any page or a specific page.</td>
</tr>
<tr>
<td>Applicable Page</td>
<td>Page in the UX page registry. Select <strong>Agent Workspace</strong>. This field only appears when you set <strong>Applicability</strong> to <strong>Specific Page</strong>.</td>
</tr>
<tr>
<td>Registry</td>
<td>Application Name of the application that this landing page applies to. For example, if this value is <strong>ITSM Landing Pages</strong>, this landing page applies only to ITSM.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you select to determine whether the landing page appears. A page that is not active does not appear.</td>
</tr>
<tr>
<td>Optional Page Title</td>
<td>Title to display on the page.</td>
</tr>
<tr>
<td>Available Child Slots</td>
<td>Pre-defined named location for child elements.</td>
</tr>
<tr>
<td>Layout</td>
<td>Pre-defined list of containers to define the number of slots (columns) that display on a layout.</td>
</tr>
</tbody>
</table>

5. Right-click anywhere on the top banner and click **Save**.
6. Put containers on your landing page.
   Containers hold the components on your landing page. You set up the
   containers on the landing page before putting components into them.

   a. On the **UX Page Elements** tab, click **New Container**.

   b. On the form, fill in the fields.

   **UX Page Element form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the container.</td>
</tr>
<tr>
<td>Component</td>
<td>Name of the container component.</td>
</tr>
<tr>
<td>Parent element</td>
<td>Landing page that this container is on.</td>
</tr>
<tr>
<td>Border</td>
<td>Option to select a border around your container.</td>
</tr>
<tr>
<td>Can Collapse</td>
<td>Toggle to enable agents to collapse this container on the landing page.</td>
</tr>
<tr>
<td>Optional Container Title</td>
<td>Title to display on the container.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of styling for your visualization. You can choose the default styling</td>
</tr>
<tr>
<td></td>
<td>(no background color) or visualization styling (gray background).</td>
</tr>
<tr>
<td>Collapsed</td>
<td>Toggle for the initial state of the container. Select this option to</td>
</tr>
<tr>
<td></td>
<td>collapse the container when the landing page opens.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the container appears in on the landing page. The lower the</td>
</tr>
<tr>
<td></td>
<td>value means the higher it appears on the landing page.</td>
</tr>
<tr>
<td>Available Child Slots</td>
<td>Pre-defined list of containers to define the number of slots (columns) that</td>
</tr>
<tr>
<td></td>
<td>appear in a layout.</td>
</tr>
<tr>
<td>Layout</td>
<td>Column layout on the page. Valid values depend on the value of **Available</td>
</tr>
<tr>
<td></td>
<td>Child Slots**. The total number of columns on a page is 12. For example,</td>
</tr>
<tr>
<td></td>
<td>if you choose <strong>Container - 3 Up</strong> for <strong>Available Child Slots</strong>, the <strong>Layout</strong></td>
</tr>
<tr>
<td></td>
<td>value enables you to specify the width of the three columns.</td>
</tr>
</tbody>
</table>
c. Click **Submit**.

You’ve created a container to put your landing page components in.

7. Add components to the containers on your landing page.

a. On the **UX Page Element Permissions** tab, click **New Visualization**.

b. On the form, fill in the fields.

### UX Page Element form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your component.</td>
</tr>
<tr>
<td>Component</td>
<td>Name of the visualization component.</td>
</tr>
<tr>
<td>Parent element</td>
<td>Container that this component goes into.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the component shows in the container if there's more than one component.</td>
</tr>
<tr>
<td>Report</td>
<td>Report that you want to render in the container, for example, <strong>Open problems older than 30 days</strong> or <strong>Transactions by month for Last 12 months</strong>.</td>
</tr>
<tr>
<td>is_realtime</td>
<td>Toggle to update the Report or PA Widget values in real time.</td>
</tr>
<tr>
<td>PA Widget</td>
<td>PA Widget that you want to render in the container, for example, a single score or a time series.</td>
</tr>
<tr>
<td>Optional Widget Label</td>
<td>Title to display with the PA widget.</td>
</tr>
</tbody>
</table>

<i>Note: You must select either a Report or PA Widget, but you can't display both in a single container. If you define both, only the report displays.</i>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size Variant</td>
<td>Size of the PA Widget. Choosing a size depends on how many containers are on the landing page and what you want to emphasize.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Not all sizes apply to all widgets.</td>
</tr>
<tr>
<td>Border</td>
<td>Toggle to put a border around the report or PA widget.</td>
</tr>
<tr>
<td>Refresh Interval</td>
<td>Number of minutes before the values of this component refresh. The interval begins when an agent navigates away from a landing page and ends when they come back to the landing page.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> There is no auto-refresh, but an agent can click the browser’s refresh button at any time.</td>
</tr>
<tr>
<td>Visualization SysID</td>
<td>Designated ID for the widget.</td>
</tr>
<tr>
<td>Report Type</td>
<td>Type of report that renders.</td>
</tr>
</tbody>
</table>

c. Click Submit.

8. Configure permissions for agents to access the landing page:

a. On the UX Page Element Permissions tab, click New.

b. On the page, fill in the form.

**UX Page Element Permissions form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Value of Optional Page Title.</td>
</tr>
<tr>
<td>Role</td>
<td>Role that an agent must have to see this landing page.</td>
</tr>
<tr>
<td>Group</td>
<td>Group that an agent must belong to in order to see this landing page.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
</tbody>
</table>

Any page element (including subelements) can have a restriction to a given set of roles or groups. If no element permissions are set on roles or groups,
all agents see the element. If some element permissions are set, an agent needs just one role or group assignment to see the element.

c. Click Submit.

9. To see your landing pages:

a. Under your profile picture, click Configure Workspace.

Configure Workspace enables you to set up list categories, list filters, landing pages, the record types that agents can create, and the modules that appear in the pane on the far left of the screen.

b. On the Workspace form, click the Landing Pages tab.

What to do next
Set up lists for your agents so they can find additional issues to work on.

Set up landing page permissions
Set up permissions for landing pages so that people see the landing pages suited to their roles or the groups they belong to.

Before you begin
Role required: workspace_admin or ui_builder_admin

About this task
When you have multiple landing pages associated with a workspace, several factors determine which one shows. One factor is the order of the landing page; the one that shows is the one that has the lowest value for Order.

<table>
<thead>
<tr>
<th>Name</th>
<th>Active</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident Overview (enabled for UI Builder)</td>
<td>true</td>
<td>200</td>
</tr>
<tr>
<td>Default Landing Page (enabled for UI Bui...</td>
<td>true</td>
<td>1,000</td>
</tr>
</tbody>
</table>

The second factor is permissions, which are based on roles and groups. You can set permissions on landing pages so they only appear if the user either has
the required role or belongs to a specified group. For example, you might set permissions for managers to see one landing page and agents to see another. If permissions prevent a landing page from displaying, the next landing page in Order displays.

**Procedure**

1. Navigate to **Workspace Experience > Administration > Landing pages** and click the landing page you want to set permissions on.
2. On the UX Page Element Permissions tab, click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Landing page name.</td>
</tr>
<tr>
<td>Role</td>
<td>Role, if any, a user must have to see the landing page. Click the search icon (🔍) and select a role.</td>
</tr>
<tr>
<td>Group</td>
<td>Group, if any, a user must belong to to see the landing page. Click the search icon (🔍) and select a group.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of these landing page permissions. Global is the default.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Repeat the procedure starting with step 2 to add other roles or groups that restrict who can see the landing page.

Even though multiple landing pages might have the same Order value, users may see different landing pages based on their roles or the groups they belong to.

**Setting up list view in a workspace**

The list view displays filtered lists of records, such as All tasks, Open tasks, and My tasks. By setting up list categories and filtered lists, you help your agents quickly find the records they need to work on.

Agents use the list view to see records that they want to work on. To get to the list view, they click the list icon (📜) in the navigation bar. When an agent clicks a record in list view, the record opens in record view.
Note: In a typical situation, if you click a field in a record in a list of records, that record opens. If the field is clickable (a reference, document ID, or URL), however, clicking it does not open the record. Instead, it opens the record or URL that the clickable field points to.

List types
The list pane in has the following sections:

Lists
Lists created by the system administrator that are visible to all agents. Includes list categories and filtered lists that system administrators can assign to agents by role or assignment group.

To learn what system administrators can configure in the Lists tab, see Set up list categories.

My Lists
Lists that are created by agents that are not visible to other agents.

To learn what agents can configure in My Lists, see Create a filtered list in a workspace.

What to configure in lists

Create list categories
Create categories for lists, such as All cases, My cases, and Open cases. You must create a list category before you can create a list filter. List categories are names only and not clickable. List categories do not appear unless they contain filtered lists.

Create filtered lists
Create a subset of all the records in the database, such as All cases, My cases, and Open cases. Filtered list names are clickable.

**Highlight list fields**
Highlight record fields in list view to call attention to them.

**Speed up loading large lists**
Remove the list pagination to improve the performance when loading large lists.

**Create custom list operations**
Use an action to create a button that performs a function on the records in the list. For example, you can create a button that assigns a selected record to an agent.

**Set up field lengths for exports to Excel**
Set up the maximum number of characters that are exported in condition fields to prevent the truncation of values.

**Next**
Click the component to set up next.

- **List category**—A name for a group of filtered lists. You must create a list category before you create a filtered list. The list category is not clickable.

- **Filtered list**—A subset of the tables in the database. You must create a list category before you create a filtered list. If you don't create a filtered list, the list category will not show in the Lists tab.

- **Highlighted fields**—Calls attention to fields in list view.
Set up list categories in a workspace

Create list categories in a workspace to group records so that agents can find the records they need to work on.

Before you begin

To create list categories, you need the elevated workspace_list_admin role. If you have the workspace_list_admin role, you can elevate your privileges using the Profile Settings menu. For more information on how to get an elevated role, see Elevated privilege.

About this task

List categories group records that your agents need to do their work. Workspace provides many list categories but you might create additional categories to benefit your agents. The categories are associated with database tables, for example, incidents, cases, tasks, and service level agreements (SLAs).

List categories appear in the list pane, as shown in the following image, but they do not retrieve records when you click them. The filtered lists under the categories do retrieve records. When you create a list category, you must add list filters to it or the category doesn't appear.

![List categories in a workspace](image)

Add a list category
Note: The opening of the video shows a user who is accessing list categories through the application navigator. As of Rome, that module is no longer in the application navigator. The rest of the video, however, shows how to create list categories. Next, see the following procedure to learn how to access list categories.

Procedure

1. In your workspace, click your profile image and then on the Settings menu, select **Configure Workspace**.

2. On the **Workspace List Categories** tab, click **New**.

   Note: If you don’t see the **New** button, click the cog icon (⚙️) and then select **Developer > Agent Workspace**.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Category name. The title usually applies to a table of records, for example, <strong>Users</strong>, or <strong>Cases</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the list category appears in the list pane. Lower numbers appear first. For example, a list category with an order of 100 appears above a list category with 200.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the list category appear or disappear in the list pane.</td>
</tr>
<tr>
<td>Description</td>
<td>Rationale for creating the category.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

   A new list category appears in the list pane.
5. See your list categories:

a. Under your profile image, click **Configure Workspace**.

b. On the Workspace form, click the **Workspace List Categories** tab.

**What to do next**
You must set up a **filtered list** in the category that you created in order for the category to appear.

**Set up filtered lists in a workspace**
Set up filtered lists to group records that help agents do their work more efficiently. Example groupings are Active Cases, My Cases, and All cases.

**Before you begin**
Before you can create a filtered list you must **Create a list category** for the filtered list to go under.
About this task
List filters display a subset of the records in a table. For example, in the Incident category, a filtered list might only display the records in the Incident table that have the status open. You might call that filtered list, Open Incidents.

List filters, as shown in the following image, appear as subsections under list categories in the list pane. When clicked, list categories do not display lists of records, but list filters do. Set up list filters that agents need to do their work. For example, you can set up list filters for Open Incidents, High Priority Incidents, and My Incidents.

BeforeQuery business rules that apply additional conditions will not appear in the condition builder.

![List filters example]

Configure filtered lists

⚠️ **Note:** The Role required value in the video says workplace_list_admin but the correct role is workspace_list_admin.
Procedure

1. In your workspace, click your profile image and on the Settings menu, select Configure Workspace.

2. On the Workspace Lists tab, click New.

   Note: If you don't see the New button, click the cog icon (🛠️) and then select Developer > Agent Workspace.

3. On the form, fill in the fields.

List filter form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List name</td>
<td>Name for the list filter that appears in the list pane. Choose one or two words that agents can easily understand, for example, Open incidents.</td>
</tr>
<tr>
<td>Category</td>
<td>Category that a list filter appears under in the list pane. The category must already exist.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you want to retrieve records from. For example, a list filter about open incidents should retrieve records from the incidents table.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that the list filter appears in.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Restrictions that apply to the list of records that appear with this list filter. For example, Active is true means inactive records do not appear. For more information on creating a filter, see Create a filter.</td>
</tr>
<tr>
<td>Columns</td>
<td>Columns that appear in the filtered list.</td>
</tr>
<tr>
<td>Groups</td>
<td>List of users who can view the list. Add any group to limit the list access to just that group. For example, you might add Customer Service Support. You can add more than one group to the list. If you do not add a group, any user who can access Workspace can access the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles that can view this list filter. Remove clutter from agents' workspaces if they don't need this list filter. If you don't add a role, this list filter appears for all agents.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope that the filter applies to. Global means that you can use this filter for all applications.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the list filter appears under the list category in the list pane. Lower numbers appear above list filters with lower numbers. For example, a list filter with an order of 100 appears above a list filter with 200 under a list category.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the list filter appear or disappear in the list pane.</td>
</tr>
</tbody>
</table>

For example, the following filtered list, named Open, displays only active incidents.

4. Click **Submit**.
The list filter appears in the list pane under the category that you specified. Using the example in the previous step, the list filter, **Open**, appears under the **Incidents** list category.
New list filter displays under a category

5. To see your filtered lists:

a. Under your profile picture, click **Configure Workspace**.

b. Click the **Workspace Lists** tab.

**What to do next**

- **Highlight fields that appear in list view** to call agents' attention to them, for example, when priority is critical.
- If you are finished setting up list components, you can now set up the components in the **record view**.

**Highlight list fields in a workspace**

Use colors to highlight list fields so that you can call an agent's attention to them.

**Before you begin**

Role required: workspace_admin

**About this task**

Highlighted list fields appear colored and optionally, have a leading bullet.
The setup involves specifying the field that gets highlighted and the condition that triggers the highlighting.

1. **When you list records from this table**
2. **Highlight this field in each record**

Available colors are:
- Critical
- High
- Warning
- Moderate
- Positive
- Info
- Low

Workspace does not support highlighting the following field types:
- Reference
- URL
- Document IDs
Procedure

1. Navigate to **Workspace Experience > Administration > Highlighted Values** and click **New**.

2. On the form, fill in the fields.

### Highlighted Value form

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table that contains the fields you want to highlight.</td>
</tr>
<tr>
<td>Field</td>
<td>Name of the field that you want to highlight if the triggering conditions are met.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that this highlighting applies to.</td>
</tr>
</tbody>
</table>

The **Field** value can be unrelated to the condition that triggers the highlighting. In the following example, if the **Caller** is Fred Luddy, workspace highlights the **Priority** field, not the **Caller** field.

3. Right-click the header and click **Save**.

You’ve specified the field where the highlights appear. Now, it’s time to specify the conditions that trigger the highlighting.

4. In **Highlighted Value Conditions**, click **New**.

5. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Conditions that trigger the highlighting. The condition can be different from the field that gets highlighted. For example, if the Caller in that record is Fred Luddy, you might highlight the Priority field in the record. A simpler example is highlighting the Priority field if the priority value is critical.</td>
</tr>
<tr>
<td>Status</td>
<td>Highlighting color.</td>
</tr>
<tr>
<td>Show Icon</td>
<td>Toggle to display (selected) or hide the leading bullet when highlighting. 1 - Critical</td>
</tr>
<tr>
<td>Value Override</td>
<td>Text that replaces the field values from the table. If you don't supply a Value Override, your workspace highlights the field value from the table. If you supply a value, your workspace replaces the field value with your text and highlights that. 1 - Deal with this immediately!</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which to evaluate the conditions. When you have multiple conditions for highlighting the same field, they are evaluated in order from the lowest to the highest condition. If any of the conditions are True, your workspace highlights the field.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

In the following example, the highlighting was triggered on the **Priority** field because the priority value was critical.

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
<th>Caller</th>
<th>Priority •</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC00000002</td>
<td>2019-05-29 16:07:12</td>
<td>AGAIN UPDATED</td>
<td>Fred Luddy</td>
<td>1 - Critical</td>
<td>On Hold</td>
</tr>
<tr>
<td>INC00000031</td>
<td>2019-05-09 17:18:03</td>
<td>UPDATED VIA MULTI-EDIT</td>
<td>Joe Employee</td>
<td>1 - Critical</td>
<td>In Progress</td>
</tr>
</tbody>
</table>

7. **Optional:** Click **New** on the Highlighted Value Conditions related list and create another condition for highlighting the same field.

For example, highlight the **Priority** field that is associated with the Incident table when the **Priority** field is "critical," or when the **Caller** value is "Fred Luddy." The conditions are ranked according to the **Order** value. Workspace evaluates the lowest value first.
8. **Optional:** Remove the highlighting from a filtered list that would otherwise have highlighting. When setting up highlighting for a table, all filtered lists that are associated with the table display highlighted fields unless you disable highlighting for specific filtered lists.

   **a.** In your workspace, click your profile image and then on the Settings menu, select **Configure Workspace**.

   ![Configure Workspace](image)

   **b.** Click **Configure List Attributes**.

   **c.** In the Disable Highlighted Values column, either select the check box in the title bar of a list category to remove highlighting from all fields in the associated list category, or select the filtered list in each list category where you want to hide the highlighting.

**What to do next**
Set up the components in record view.

**Speed up how fast lists load in workspace**
Speed up how fast lists load by removing the calculation of the total number of records in a list.

**Before you begin**
Role required: workspace_admin

**About this task**
Calculating the total number of records included in a list that’s filtered from large tables can take a long time. After calculating the number of records, workspace calculates the number of pages those records fill and displays the page count.
To load lists faster, you can remove the page calculation for all or only specified filtered lists. When you remove the calculation, the total record count is not displayed and workspace removes the go-to-end-of-list icon (→).

**Procedure**

1. In your workspace, click your profile image and then, on the Settings menu, click **Configure Workspace**.

2. Click **Configure List Attributes**.

3. To omit the page calculation, in the **Omit Count** column, either:
   - Select the check box in the title bar of a list category to remove the pagination calculation for all filtered lists in the associated list category.
   - Select the filtered lists in each list category where you want to omit the page calculation.

4. Click **Save**.

**Create custom list operations in a workspace**

Create an action that enables agents to perform functions on the records in the list. For example, you can create a button that assigns a selected record to an agent.

**Before you begin**

Role required: workspace_admin

**About this task**

A list action appears as a button in list view.
When clicked, the button dispatches a predefined action in Workspace. You can create list actions to:

- Create a new record (client action)
- Assign a record to the user (client side action)
- Group actions, such as selecting multiple records and deleting them (server side action)
- Edit a record. Agents can click a button to open a side panel in list view to edit record details while still in list view.
Procedure

1. Navigate to **Workspace Experience > Actions & Components > List Actions** and click **New**.
2. On the form, fill in the fields.

### Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name of the list action. Typical names are Edit, Create New, and Update.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that describes what you’re adding.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Action type. Select <strong>Client action</strong>. The list action takes place on the client side, such as dialing a phone number, opening a record, or opening a form to edit a record.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Component to add in the UI for this action. Shown only when <strong>Implemented as</strong> is <strong>UI component</strong>. Click the magnifying glass icon (🔍) and select the component to add as a list action.</td>
</tr>
<tr>
<td>Specify client action</td>
<td>Action taken by the client when an agent clicks the action icon. Shown only when <strong>Implemented as</strong> is <strong>Client action</strong>. Click the magnifying glass icon (🔍) and select the client action to add as a related list.</td>
</tr>
<tr>
<td>Button type</td>
<td>Primary green button, such as <strong>New</strong> in the following image. The secondary button is gray.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when an agent points their mouse at the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this component is tied to. When a record from this table is open, this list action appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>View</td>
<td>Set of visual configurations. This value is typically <strong>Workspace</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the icon for this list action appear.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that governs the placement of this icon in the list of list actions. A lower number means that it is higher in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future.</td>
</tr>
</tbody>
</table>

3. Under **Related Links**, click **Advanced view**.

4. In the value field, specify the action that the button takes.

5. **Optional:** On the **Conditions** tab, use the condition builder to create filters that prevent the list actions from appearing in workspace. For example, you may hide a button to create a new record for specific tables or if the user has the wrong permissions.

6. **Optional:** On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop-up window that asks the agent to confirm the use of this list action.

7. **Optional:** On the **Action Exclusion** tab, click **New** to exclude child tables from inheriting this list action, or this table from inheriting components from a parent table.

   a. On the form, fill in the fields.

### Action Exclusion form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Function the action performs, such as, <strong>create new</strong> or <strong>agent assist</strong>. Click the magnifying glass icon (🔍) and select an action assignment.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that is associated with this component. Every time <strong>Workspace</strong> opens a record from this table, this component's icon appears in the Related Items menu.</td>
</tr>
<tr>
<td>Exclude this table</td>
<td>Toggle to prevent this <strong>Table</strong> from inheriting this component from its parent table.</td>
</tr>
</tbody>
</table>
### Field Description

| Exclude all child tables | Toggle to prevent child tables of **Table** from inheriting this component in Related Items menu. |

b. Click **Submit**.

8. Click **Update**.

### Set up the condition field length in exports

Set up the maximum number of characters that can be exported in condition fields to prevent truncated values.

**Before you begin**

Role required: admin

**About this task**

This setup only pertains to exporting condition field types, for example, **SLA definition**.

The default number of characters in the condition field types that you can export to Microsoft Excel spreadsheets is 80. If your data contains longer values, you can use the `glide.ui.export.choice_list_max_characters` system property to increase the number of characters exported. This property has no effect on the length of condition field values in tables.

**Procedure**

1. In the navigation filter, enter **sys_properties.list**.
2. In the **Name** field, search for and click `glide.ui.export.choice_list_max_characters` in the list of system properties.
3. In the System Property form, in the **Value** field, set the maximum number of characters to export in condition fields.
What to do next
Set up the components in record view.

Enable the list refresh prompt
Receive a prompt to refresh a list when a list item has changed. A prompt indicates when to refresh the list, and after refreshing, you see a visual indication showing which records changed.

Before you begin
Role required: admin

About this task
Lists are prompted to refresh when the following changes are made.

• Creation of a record or when a record meets query conditions
• Deletion or when a record no longer meets query conditions
• When a column on the list has been updated

List refresh prompt functionality works on lists that meet the following criteria.

• The list does not exceed 500 records (or the number set in glide.lists.live_list_threshold).
• The list is not a database view.
• At least one condition has been applied to the list.
• The list does not contain any dot-walked columns.
• Omit count is not enabled.
• The list is a sys_aw_list or a sys_aw_my_list. Related lists are not supported.

Procedure
1. Enable the list refresh prompt system property.
   a. Enter sys_properties.list in the Workspace filter navigator.
   b. Search for glide.lists.live_list_enabled in the System Properties list search bar.
   c. Click the Value column field and change the value to true.
Note: The live list system property is set to **false** by default.

**d.** Click the checkmark icon (✔️) to save the selection.

2. (Optional) Change the maximum number of records that the list can contain with the list refresh prompt enabled.

a. Enter `sys_properties.list` in the Workspace filter navigator.

b. Click **New**.

c. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the system property. Enter <code>glide.lists.live_list_threshold</code>.</td>
</tr>
<tr>
<td>Description</td>
<td>Description that is displayed in the System Properties list.</td>
</tr>
<tr>
<td>Choices</td>
<td>Choices for your system property. Leave this field empty.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of system property. Select <strong>Integer</strong>.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the integer. This value controls the maximum number of records that the list can contain while enabling the list refresh prompt. By default, the value is set to <strong>500</strong>.</td>
</tr>
</tbody>
</table>

Note: Although the value can be increased, be aware of the impact on your nodes.

<p>| Ignore cache | Option to ignore the cache.                                                                                                                    |
| Private      | Option to keep the system property private.                                                                                                |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read roles</td>
<td>Roles that can read the system property.</td>
</tr>
<tr>
<td>Write roles</td>
<td>Roles that can write the system property.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for the system property. <strong>Global</strong> applies the system property to all applications when the system property is set to <strong>true</strong>.</td>
</tr>
</tbody>
</table>

d. Click **Submit**.

Results

Before you refresh the list, the refresh icon (🔍) displays an indicator with the number of records changed and the list header prompts you to check the refresh icon for updates.

After you refresh the list, the affected rows are displayed in bold text with an indicator badge.

⚠️ **Note:** The most recently added or updated record may not be at the top of your list. Records that are removed from the list are not displayed.
Disable list export
Create an action to disable the export button so that the button doesn't display in the Workspace UI.

Before you begin
Role required: admin

About this task
The export button is a default list action. You can control who sees this action and when based on the role of an agent, or by following any rule configured with Actions & Components. To configure list Actions & Components, see Create custom list operations in a workspace.

Procedure
1. Navigate to Workspace Experience > Actions & Components > List Actions.
2. From the Action Assignments list, select Export.
3. On the form, toggle Active.
4. Click the menu icon (≡) and select Save.

Results
The export button no longer appears in the Workspace UI and the function is disabled.
Enable inline editing in lists

Enable inline editing for Workspace lists so that you can inline edit one or multiple cells in a list column.

Before you begin

Inline editing enables you to change a field in a list instead of opening the record and changing it on the form.

After starting inline editing, rights to edit the field are verified. If the field has a dependency relationship, for example Category or Subcategory, then the popover displays all the dependent fields. Buttons appears with complex interactions to confirm or cancel the inline edit.

Inline editing is supported in most common field types. These field types include: boolean, string, choice, reference, integer, date, and date/time.

Role required: admin

Procedure

1. In the Filter navigator enter sys_properties.list.
2. Select glide.lists.inline_editing_enabled.
3. Set the value to true.

Setting up Record View in workspace

Set up the components in the Workspace Record View to optimize the user interface where agents do most of their work.

After agents select a record to work on in list view or on a Landing Page, the record displays in record view.
In this view, agents get record details, can assign records to themselves, get information about resolving the issue, and communicate resolutions with the requester. As system administrator, your job is to optimize the information presented in Record View so the agents can complete their work easily.

Adding custom components
Each component area in Record View comes with standard components that you configure. In the following component areas, you can also add custom components using the Now component library:

- Ribbon
- Contextual Side panel
- Related lists
- Related items
- List action
- Field decorator
-Modal

Now component are the building blocks of Workspace, such as lists, PAR scores, and containers.

For more information about custom components, see Custom components.

Configuring Record View components
Click a component to set it up.
Select the records agents can create in Workspace

Enable agents to create the records they need so they can do their work in Workspace.

**Before you begin**
Role required: workspace_admin

**About this task**
Agents access open records by clicking tabs above the Form Header. Agents create new records by clicking the plus (+) icon. You set up the tables agents can insert new records into.
Create a record

By default, agents only create records in the Interaction table. These records store information about interactions, such as phone or chat conversations between agents and customers. Agents typically create incidents or problems out of those conversations. As the previous image shows, the agent can only create records in the Interaction and Incident tables.

The new record appears in a new tab. In this way, agents can jump between open records just by clicking tabs. The tabs in this image show two incident records are already open. Your job is to set up the correct list of tables agents can insert records into. Agents must have create permissions on those tables.

**Procedure**

1. Navigate to Agent Workspace > New Record Menu.
2. In the New Record Menu Items form, click New.
3. In the New Record form, fill in the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the records you want to give agents access to, for example, Incident or Case.</td>
</tr>
<tr>
<td>Workspace settings</td>
<td>Workspace the agents are working in.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this setting’s applicability. Global means that all workspaces can use this setting.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement of this table in the list of tables in the list under the plus (+) icon. Lower numbers appear higher in the list. The list appears when you hover over the plus (+) icon.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the table appear (selected) or not in the list of tables under the plus (+) icon.</td>
</tr>
</tbody>
</table>

4. Click Submit.
5. To see the records your agents can open:
a. Under your profile picture, click **Configure Workspace**.

![Configure Workspace](image)

b. On the Workspace form, click the **New Record Menu Items** tab.

**Example:**
If you added the Incident table and made the **Order** value for the Incident table lower than the **Order** value for the Interaction table, Incident appears above Interaction in the list of records an agent can create.

![Workspace Form](image)

**What to do next**
Click a component to set it up.

- **Tabs**
- **Notifications**
- **Form Header**
- **UI Actions**
- **Ribbon**
- **Related Items**
- **Form pane**
- **Actions & Components**
- **Activity Stream**
- **Contextual Side Panel**
Set up forms in Workspace

Select the fields that appear in form pane to help agents do their work.

**Before you begin**

Role required: workspace_admin

**About this task**

The form pane in Workspace displays detailed information stored in the selected record.
Each record contains more fields than can reasonably fit on the screen. Your job is to display only the fields the agents need. You perform this task for each table the agent can access. For example, form panes show the same fields for all incident records, which is likely different from the fields displayed for all case records. You can tell which tables the agents have access to by looking at the list under the plus (+) icon.

The fields displayed in forms can vary by the agent's role.

ℹ️ **Note:** Workspace does not support the display of all fields that might be in a record. For more information about supported fields, see [Supported fields in Workspace form panes](#).

### Configuring the form layout

**Procedure**

1. Navigate to **Workspace > New Record Menu**.
2. Click your avatar.
3. Select **Configure Page > Form Layout**.
4. In the configuration form, move fields into or out of the **Selected** column using the arrows between the **Available** and **Selected** columns.

The fields in the **Selected** column appear in the form pane. For a description of some of the fields, see [Supported fields in Workspace form panes](#).

Available items that appear in green followed by a plus (+) sign represent related tables. To access the fields on these tables, use dot-walking.
5. Use the up and down arrows to the right of the **Selected** column to move highlighted fields up or down in the column.

6. In the **View name** list, select the workspace you're configuring, for example, **Workspace_itil**. These views correspond to **agent roles**.

7. **Optional**: Add a field to the **Selected** column that's not in the **Available** column.

   a. Under **Create new field**, fill in the fields.

   
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the new field.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the values in the field.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field length</td>
<td>Maximum length of the string value, if you select String as the <strong>Type</strong>. This field does not display for other types.</td>
</tr>
</tbody>
</table>

b. Click **Add**.

8. Click **Save**.

**Note:** Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

**Example:**
The following image shows the addition of the **Category** and **Subcategory** fields in the form pane.

**New fields in form pane**

---

**What to do next**

- **Hide some of the fields displayed in forms** based on an agent's permissions or set up a different component.
- Click a component to set it up.

- Tabs
- Notifications
- Ribbon
- Related Items
- Activity Stream
- Contextual Side Panel
Hide fields from agents in Workspace

Specify the fields that display in the form pane depending on the agent’s role. Only display the fields in the form pane agents need to do their work.

Before you begin
Role required: workspace_admin

About this task
By default, agents see all of the record fields configured to display in the form pane. You can hide fields from agents according to their role. Hiding field values de-clutters the form pane for them.

Procedure
1. Navigate to Workspace Experience > Forms > Workspace View Rules.
2. Click New.
3. In the Workspace View Rule form, fill in the fields.
## Workspace View Rule

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the rule. Typically, the name expresses what agents are affected by the rule and what privileged information they are allowed to see.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this rule applies to. You can define view rules only at the table level and only once per table.</td>
</tr>
<tr>
<td>View</td>
<td>Select the form view to render for the conditions set. A view defines the elements that appear when an agent opens a form or list. The view corresponds to an agent's role.</td>
</tr>
<tr>
<td>Application</td>
<td>Application this rule applies to. Global means the rule applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace affected.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this rule active (selected) or not.</td>
</tr>
</tbody>
</table>

**4. Optional:** On the **Conditions** tab, select the roles people must have in order to see the field.  
Use the role selection picker:
In the following example, only an admin or agent_admin will see the **State** field in the form pane if the **State** is **New**. Everyone will see the **State** field in the form pane if the **State** field has a different value.

**View rule condition**

Roles: admin, agent_admin

Conditions:
- Add Filter Condition
- Add "OR" Clause

All of these conditions must be met

<table>
<thead>
<tr>
<th>State</th>
<th>is</th>
<th>New</th>
</tr>
</thead>
</table>

5. Click **Submit**.

**Results**

Users with the specified roles can see the fields for the specified table.

If there are multiple Workspace View Rules in place, the rule with the lower execution order applies. If the execution order is the same for multiple rules, the first rule created applies.

**What to do next**

Set up form annotations to highlight form fields, or set up a different component.

Click a component to set it up.

- Tabs
- Notifications
- Form Header
- UI Actions
- Ribbon
- Related Items
- Form pane
- Actions & Components
- Activity Stream
- Contextual Side Panel
Set up form views based on Agent roles

Set different form views for different agent roles to display on the fields the agent needs to see.

Agent roles can be based on permission levels or products, for example, CSM (for cases) or ITSM (for incidents). A workspace view is configured for each type of agent. Views use the following role-based hierarchy to determine which form the agent sees in Workspace.

Any view/role combination that results in the **Default** form view is read-only.

<table>
<thead>
<tr>
<th>Role</th>
<th>Form view</th>
</tr>
</thead>
<tbody>
<tr>
<td>itil</td>
<td>1. workspace_itil</td>
</tr>
<tr>
<td></td>
<td>2. workspace</td>
</tr>
<tr>
<td></td>
<td>3. default</td>
</tr>
<tr>
<td>sn_esm_agent</td>
<td>1. workspace_csm</td>
</tr>
<tr>
<td></td>
<td>2. workspace</td>
</tr>
<tr>
<td></td>
<td>3. default</td>
</tr>
</tbody>
</table>
### Supported fields in Workspace form panes

Check which fields Workspace supports so that you can plan which fields to display in the form pane.

Workspace can display in the **form pane** all of the following fields found in records.

<table>
<thead>
<tr>
<th>Field type</th>
<th>Description</th>
<th>Supported properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice</td>
<td>List of configurable choices.</td>
<td>N/A</td>
</tr>
<tr>
<td>Conditions</td>
<td>Field that adds the condition builder to a form. You must specify a dependent field that references the table name.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
| Currency     | Decimal field with four digits after the decimal point. When displayed on a form, a currency field also includes an additional choice list for selecting the currency type. If there is no default value for the field, empty currency fields use the reference currency. Adding a value causes the field to update. | • glide.currency_price.use_all_fraction_digits  
• glide.system.locale  
• glide.i18n.single_currency  
• glide.i18n.single_currency.code  
• glide.currency_price.use_all_fraction_digits |
<table>
<thead>
<tr>
<th>Field type</th>

<td></td>
<td>• Multi</td>
<td></td>
</tr>
<tr>
<td>Field type</td>
<td>Description</td>
<td>Supported properties</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Radio Button Choice</td>
<td>Multiple choice button used to select one option amongst two or more choices.</td>
<td>N/A</td>
</tr>
</tbody>
</table>
| Reference           | Query that displays records from another table.                             | • glide.ui.max_ref_dropdown  
                      |                                                | • glide.ui.reference.readonly.clickthrough        |
| Single File Attachment | Attachment reference that enables you to reference a single file attached to the menu item or section record. | N/A                                                 |
| String              | For 255 characters or less, the string field is a single-line text field. Anything 256 characters or over appears as a multi-line text box. | glide.ui.textarea.character_counter             |

**Note:** The database may translate the value that you provide in the **Max length** field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100).

For Oracle instances, users are not able to increase the max length of a string field to a value greater than 4000 through the application UI. Changes greater than 4000 require the CLOB data type in Oracle. If you require a field to be larger than 4000 characters, log an incident to request the change.

<p>| Suggestion          | String field that provides suggested values but accepts free-form text. Available when | N/A                                                 |</p>

Add help to a field label

Create field-level help in forms by placing help icons in individual fields and converting the field labels to links to external or internal URLs.

Before you begin
Role required: personalize_dictionary

About this task
You can link to any type of file, document, or wiki, and open it in a separate browser window. The following is an example of a form with field label help enabled.

Field label help enabled

Procedure
1. Open the form.
2. Right-click the label for the field and select **Configure Label**.
   The Field Label form appears. The fields in the top portion of the form are pre-populated. The Help field is not currently used.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint</td>
<td>Type text to use as a tooltip that appears when a user places the cursor on the field label.</td>
</tr>
<tr>
<td>URL</td>
<td>Enter the URL of the target file to open when the field label or icon is clicked. This can be a complete URL to a file outside the instance, or a relative URL to a target on the instance.</td>
</tr>
</tbody>
</table>

**Note:** Links aren't supported in Workspace.

| URL target | Not used. The help file opens in a new tab regardless of the URL target value. |

4. Click **Update**.

**Results**

Help appears when you select or hover over the field.

Set up form annotations
Highlight form elements by displaying blocks of colored text or separators between form elements.

Before you begin
Role required: admin

About this task
Form annotations are colored lines or colored lines of text that you can insert between fields in the form pane.

Procedure
1. Navigate to a form.

2. Click the context menu icon ( ) and select **Configure > Form Layout**.

3. Under **Form view and section**, select a section.

4. In the Available list, double-click *Annotation* to move it to the **Selected** list. The Annotation Details section appears.
5. Place it above the field to annotate.

6. In Annotation Details, select the type of annotation. The available types of annotations include **Info Box Blue**, **Info Box Red**, **Line Separator** (any text you add appears beneath the line), **Section Details**, **Section Separator**, and **Text**.
## Incident

<table>
<thead>
<tr>
<th>Field</th>

Configure change and problem task records in Workspace
Configure the record types that are available when you create a change or problem task from a related list in Workspace. This configuration enables you to categorize your change and problem task records according to your preferred categorization.
Before you begin
Role required: admin

About this task
• Types can be changed in the **Type** field on the Workspace form.
• Display values appear in Workspace lists.

Change and problem task example types include the following.
• Change: Normal, Standard, Emergency
• Problem: General, Root Cause Analysis

Procedure
1. Navigate to **Change > Workspace Record Type Selectors**.
2. Select a Workspace record types selector, or click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target table</td>
<td>Table associated with the change or problem request. For example, Change Request or Problem Task.</td>
</tr>
<tr>
<td>Target field</td>
<td>Field type for the record. This field determines the selections in the <strong>Type</strong> field on the Workspace form.</td>
</tr>
<tr>
<td>Value</td>
<td>Specific value from the target field that is displayed on the Workspace form. Change the value on the Workspace form by selecting another value from the list.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this Workspace record types selector applies to. Global means that the Workspace record types selector applies to all Workspace applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the Workspace record types selector.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the placement of this Workspace record types selector in the Workspace Record Types Selectors list. The lower the number, the earlier it appears in the list. Typically, these numbers are in the hundreds. For example, 100, 200, 300, and 400.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Disable Document Viewer in Workspace**

Disable Document Viewer at the instance level in Workspace to disable it or at table level to disable it for specific tables within the instance.

**Before you begin**

Ensure the system property `(com.snc.documentviewer.enable_document_viewer)` exists in your instance.

Role required: admin

**About this task**

The legacy form attachment preview is displayed when document viewer is disabled.

**Procedure**

Disable Document Viewer at the instance level or for specific tables.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Document Viewer at the instance level</td>
<td>a. Search for <code>sys_properties.list</code> in the navigation filter.</td>
</tr>
<tr>
<td></td>
<td>b. Set the system property <code>com.snc.documentviewer.enable_document_viewer</code> value to <code>false</code>.</td>
</tr>
<tr>
<td></td>
<td>c. Click <strong>Update</strong>.</td>
</tr>
<tr>
<td>Disable Document Viewer at the table level</td>
<td>a. Navigate to <strong>System Definition → Dictionary</strong>.</td>
</tr>
<tr>
<td></td>
<td>b. Open the table and click <strong>New</strong> under the <strong>Attributes</strong> tab.</td>
</tr>
</tbody>
</table>
Option | Description
---|---
c. Search for **Use Document Viewer** in the **Attribute** field.
d. Enter **false** in the **Value** field.
e. Click **Submit**.

**Change the default form section navigation in Workspace**

Change the default form section navigation of your Workspace Experience. By changing the form section navigation, you can simplify forms that are less complex and don’t need form section navigation or section collapsing.

Configure form section navigation.

- Auto-collapse form sections on load.
- Hide section navigation.
- Disable section collapsing.

**Set up form section auto-collapse on load**

Set up auto-collapsing of one or more form sections using client scripts.

**Before you begin**

The collapsed sections can be expanded by using the section collapse or expand control on the form.

Role required: admin

**Procedure**

1. Navigate to **System Definition > Client Scripts**.
2. Click **New**.
3. On the form, fill in the fields.

   ✓ **Note**: See the example configuration to configure section auto-collapse.

**Client Script form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the client script.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to associate with the client script. For example, <strong>Incident</strong>.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
UI Type | UI type for the client script. Choose Desktop, Mobile/Service Portal, or All.
Type | Type of client script. Select the event that triggers the script to run from the Type list.
Application | Scope of the client script applicability. Global means that all workspaces can use this setting.
Active | Option to activate the client script.
Inherited | Option to enable inherited client script.
Global | Global means all workspaces can use this setting.
Description | Description of the client script that also displays in the Client Scripts list.
Messages | Additional information about the client script.

4. Input `input g_aw.setSectionExpanded('section_name', false);` in the scripting field and modify the section name you want to auto-collapse. For example, `g_aw.setSectionExpand('related_records', false);`.

Note: Enter all the forms sections on separate lines to enable auto-collapse on load for all the form sections.

5. Click Submit.

Example:
Example Client Script form

<table>
<thead>
<tr>
<th>Field</th>

**Hide form section navigation**

Hide the default form section navigation to disable jump-to section navigation on forms. Simplify forms that are less complex and don't benefit from form section navigation.

**Before you begin**

Role required: admin

**About this task**

The form section control displays at the of a form.
Procedure

1. Navigate to **Workspace Experience > Forms > Workspace View Rules**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for your Workspace view rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to apply your Workspace view rule. For example, <strong>Incident</strong>.</td>
</tr>
<tr>
<td>View</td>
<td>View for your Workspace view rule.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for your Workspace view rule.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace for your Workspace view rule. Associate workspace view rule to a specific workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the Workspace view rule.</td>
</tr>
</tbody>
</table>

4. In related lists, click the **Form Settings** tab.
5. Select **Hide section navigation**.
6. Click **Submit**.

Results

The form section control is removed from the form.

</tbody>
</table>

**Set up form headers in workspace**

Configure the primary field and secondary values in form headers so that agents can quickly orient themselves to an issue.
Before you begin
Role required: workspace_admin

About this task
Form headers provide an overview of the record. They have two lines:

• Primary field—The top line that serves as the title for the page, such as Laptop won't boot, as shown in the following image. Typically, this is the value of the Short Description field in the record.

• Secondary value—The line below the primary field consists of read-only, name-value pairs of important record information, such as Priority: 5 - Planning. Workspace displays up to the first seven, non-null secondary fields. You can highlight these fields and make them appear conditionally. If you do not have the required role, you would not see the associated secondary value. You can set conditions that have to be met for a secondary value to appear, for example, Active=true.

Your job is to set up what appears in the primary and secondary fields for your agents.

Child tables inherit form header configurations from their parent tables. Form header configurations on a child table take precedence over parent table configurations. For example, if the Incident table does not have a form header configuration, the table inherits all form header configurations from its parent, the Task table.

Procedure
1. Navigate to Forms > Form Headers and click New.
2. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that is associated with this form header. Whenever an agent selects a record from this table, this form header appears.</td>
</tr>
<tr>
<td>Primary field</td>
<td>Field that appears on the top of the form header and acts like the title of the record. Normally, the field is unique and descriptive, such as short_description. This field helps the agent understand what the record is about.</td>
</tr>
<tr>
<td>Subheading</td>
<td>Value displayed on the form header that is dependent on the Table selection.</td>
</tr>
<tr>
<td>Header Image</td>
<td>Image to display on the form header from an image field. Header images give context to records. They can be set to show agent avatars, differentiate between domains, etc.</td>
</tr>
</tbody>
</table>

*Note:* Header images can only be selected from user image files.

<table>
<thead>
<tr>
<th>Hide Tags</th>
<th>Toggle to hide tags.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore Highlight</td>
<td>Toggle to turn off (selected) highlighting in the form header for fields configured to be highlighted.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this setting's applicability. Global means that all workspaces can use this setting.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that is associated with this form header.</td>
</tr>
</tbody>
</table>

3. In the Secondary Values related list, select a field.

4. On the form, fill in the fields.

### Secondary values form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Secondary fields that appear in the form header whenever records from this table are open.</td>

Highlight values in the form header

Highlight secondary field values in the form header in Workspace to alert agents to important information.

Before you begin
Role required: admin

About this task
Highlighted secondary-field values appear with a background color in the form header.

To configure highlights, you specify the fields in tables that should appear highlighted when displayed in the secondary fields of a form header. In that way, whenever any agent accesses a record from the specified table, the configured secondary fields appear highlighted.
Procedure
1. Navigate to **Workspace Experience > Administration > Highlighted Values** and click **New**.
2. On the form, fill in the fields.

### Highlighted Value form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the field that you want to highlight in the form header.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that you want to highlight.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

4. In the Highlighted Values list, click the record you just created.

5. In the Highlighted Value Conditions related list, and click **New**.

6. On the form, fill in the fields.

### Highlighted Value Condition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Condition builder where you can set the conditions for your highlighted value to display.</td>
</tr>
<tr>
<td>Status</td>
<td>Background color. Each status has its own color, for example, Critical displays a red background, Moderate displays a purple background, and Info displays a blue background.</td>
</tr>
<tr>
<td>Show icon</td>
<td>Toggle that makes a small circle display in addition to the background coloring.</td>
</tr>
<tr>
<td>Value Override</td>
<td>Text that renders instead of the Status value. For example, instead of &quot;Critical,&quot; you can display, &quot;Address this immediately.&quot; You can reference a text value using {{value}}.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains the record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the highlighted values are evaluated.</td>
</tr>
</tbody>
</table>
**Example: Configure a highlighted value**

Configure a highlighted value for the **Priority** field in problem records when the priority is **1 - Critical**. Select the Incident table and the **Priority** field when creating this highlighted value.

In the **Highlighted Value Conditions**, set the conditions to be **Priority is 1 - Critical** and **Status Critical** and check **Show icon**.

The highlighted value renders for this configuration:

---

**Employee payroll application server is down.**

<table>
<thead>
<tr>
<th>Priority</th>
<th>State</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - Critical</td>
<td>New</td>
<td>Hardware</td>
</tr>
</tbody>
</table>

---

**What to do next**

Prevent agents from tagging records or set up a different component.

Click a component to set it up.

Disable tagging
Prevent agents from tagging records in Workspace.

Before you begin
Role required: admin

About this task
Tags are text labels that agents add to records to organize them. The Tag icon (🏷️) appears in the Form Header.

Tag in form header

Unable to completely uninds…

Priority State Category

Yay! In Progress System Applicati…

After tagging a record, an agent can search for it by entering the tag name in the global search field. Agents add tags by clicking the Tag icon, which displays the Add Tag field.
For more information about using tags, see Tag records in Workspace.

**Procedure**

To prevent agents from tagging records on an entire instance, in the `glide.ui.show_form_tags_bar` system property, set `Type = true | false` and `Value = false`. The Tag icon doesn’t appear on records stored in the instance.

**What to do next**

Click a component to set it up.

Set up ribbons in workspace

Set up ribbons in Workspace to help agents quickly scan relevant information about a record, such as the record's time line, a customer summary, and record SLAs.

Before you begin
Role required: workspace_admin

Ribbons provide contextual information about the record displayed in the form. Ribbons do not display by default. Each ribbon can have multiple components and each can occupy a configured amount of screen space. You cannot configure what is in each ribbon component. Ribbon components include:

- **Customer360**—Provides contact information about the account, contact, or consumer in the record.

- **Timeline**—Shows an at-a-glance overview of the activities associated with the record, for example, was there a lot of activity early on and then things went quiet for a while? Were there long delays in communications between the agent and the customer's response? On the right side, the timeline shows how long the agent spent working on the case (**With Agent**) and how long
the agent has waited for info from the customer (With Customer). A case is considered to be with the agent when it is in the New, Open, or Closed state. A case is considered to be with the customer when it is in the Awaiting Info or Resolved state.

- Active SLA—Provides a countdown to the time when the record violates SLA standards.

You associate ribbons with tables. Only one ribbon can be associated with a table. Whenever an agent selects a record from a table associated with a ribbon, the ribbon appears. If the agent then selects a record from a table not associated with a ribbon, the ribbon disappears.

You add components to ribbons one at a time. To add multiple components to a ribbon, repeat the following procedure multiple times, each time adding a different component. You must also repeat the following procedure for each table you want to associate with a ribbon.

Configure ribbon.

**Procedure**

1. Navigate to **Workspace Experience > Forms > Ribbon Settings.**
2. Click **New.**
3. On the New record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Label that describes this ribbon setting. It often includes the table associated with this ribbon.</td>
</tr>
<tr>
<td>Ribbon component</td>
<td>Component to add to the ribbon, including Customer360, Timeline, Active SLA or a custom ribbon component. You can only add one component at a time. To make a second component appear in the ribbon, repeat this procedure and add a different component.</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this ribbon. Any time an agent selects a record from this table, the ribbon appears with this component.</td>
</tr>
<tr>
<td>Width</td>
<td>Number of columns the component occupies in the ribbon. The width of the page is 12 columns. When using multiple components, the total combined width of all the components must equal 12 or less.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this ribbon. Global means the ribbon works with all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>The workspace that uses this ribbon configuration. If this field is empty, the ribbon configuration applies to all workspaces. The <strong>Workspace</strong> field is empty by default.</td>
</tr>
<tr>
<td>Order</td>
<td>Location of this component in the ribbon. Ordering the components goes from left to right. For example, if you associated three components with a table, the component with the lowest order would be on the left and the component with the highest order would be on the right.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn this component on/off in the ribbon for this table.</td>
</tr>
<tr>
<td>Inherit</td>
<td>If set to true, the ribbon configuration can be inherited by child tables. For this to be effective, a child table should not have any configured ribbon settings. The <strong>Inherit</strong> field is false by default.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select **Save**.

If the **Ribbon component** is either Customer360 or Timeline, the **Ribbon Component Attributes** form appears so you can specify the values that
go into the component. Other ribbon component type attributes are not configurable.

5. Optional: Add a custom component to the ribbon.

a. Click the magnifying glass icon (🔍) next to **Ribbon component**.

b. In the Ribbon Components form, click **New**.

c. In the form, fill in the fields.

<table>
<thead>
<tr>
<th><strong>Ribbon Component</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Name</td>
<td>Name of the Now component.</td>
</tr>
<tr>
<td>UX Component</td>
<td>Click the magnifying glass icon (🔍), in the Application column, find components associated with Agent Workspace and select one. Alternative, click <strong>New</strong> to associate a script with a new component you’ve written and then add that in the UX Component field.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the Now component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
</tbody>
</table>

d. Click **Submit** on the Ribbon Components form.

e. Click **Submit** on the New record form to add the Now component to the ribbon.

6. In the **Ribbon Component Attributes** form, fill in the values. The form depends on the **Ribbon component**.

a. If your **Ribbon component** is **Customer360**, fill in the form.

The values specify the source and the kind of the information displayed in this component.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary user</td>
<td>Table column in the <strong>Primary reference table</strong> to use when retrieving name and contact information for this component, for example, <strong>Assigned to</strong> or <strong>Caller</strong>. If this value is missing in the table, Workspace inserts the values specified in <strong>Secondary user</strong>.</td>
</tr>
<tr>
<td>Primary reference table</td>
<td>The table that stores information for the <strong>Primary user</strong> field.</td>
</tr>
<tr>
<td>Primary fields</td>
<td>Table column values in the <strong>Primary reference table</strong> displayed in this component, for example, name, email, phone number, etc.</td>
</tr>
<tr>
<td>Secondary user</td>
<td>Table column in the <strong>Secondary reference table</strong> to use when retrieving name and contact information for this component if the value is missing for the <strong>Primary user</strong>. For example, <strong>Assigned to</strong>. If this value is missing in the table, Workspace inserts the values specified in <strong>Tertiary user</strong>.</td>
</tr>
<tr>
<td>Secondary reference table</td>
<td>The table that stores information for the <strong>Secondary user</strong> field.</td>
</tr>
<tr>
<td>Secondary fields</td>
<td>Table column values in the <strong>Secondary reference table</strong> displayed in this component, for example, name, email, phone number, etc. when Workspace uses the <strong>Secondary user</strong>.</td>
</tr>
<tr>
<td>Tertiary user</td>
<td>Table column in the <strong>Tertiary reference table</strong> to use when retrieving name and contact information for this component if the value is missing for the <strong>Secondary user</strong>. For example, <strong>Assigned to</strong>. If this value is missing, no information displays in this component.</td>
</tr>
<tr>
<td>Tertiary reference table</td>
<td>The table that stores information for the <strong>Tertiary user</strong> field.</td>
</tr>
<tr>
<td>Tertiary fields</td>
<td>Table column values in the <strong>Secondary reference table</strong> displayed in this component, for example, name, email, phone number, etc. when Workspace uses the <strong>Tertiary user</strong>.</td>
</tr>
</tbody>
</table>
b. If your Ribbon component is **Timeline**, specify the role of the person who works on the task summarized in the record.

Generally, the fulfiller is the agent, for example, `sn_esm_agent`. The fulfiller role is different for different versions of Workspace, for example, ITSM and CSM. The timeline shows activities performed by the fulfiller and requester. You can configure the fulfiller and requester labels in the time line using the Resolution Shaper. The **Fulfiller Label** in the Resolution Shaper Config form should match the **Fulfiller role** attribute. For example, if the **Fulfiller role** is set to `sn_esm_agent`, which is an agent role, the **Fulfiller Label** should refer to an agent. For more information about the resolution shaper configuration, see [Customer service case timeline](#).

7. Click **Submit**.

The ribbon appears when an agent selects a record from the specified table. Each component is filled with the information specified in the ribbon component attributes.

**Form ribbon**

![Form ribbon image]

8. **Optional:** Repeat this procedure if you want to add a different component to the same ribbon, or if you want to add a ribbon to a different table.

**What to do next**

Click a component to set it up.

Set up Related Items in workspace

Set up the items that are related to the open record so that agents can get a better understanding of the record and its impact.

Before you begin

Role required: admin

About this task

Related items appear like tabs above the form pane. There are three types of items:

- Details—Fields from the open record. You can specify which fields appear.
- Related items—Components other than lists that are related to the open record. Typically, this tab shows Now components. For example, you might create cards with record fields to appear in the form pane.
- Related lists—Lists that are related to the open record. These lists are tables of records.
The following example shows an incident record. The Impacted Services related list shows a list of services that are impacted by this incident. The Child Incidents related list show incidents that are related to this one.

The highlighted section in this image is called the Related Items.

You set up related lists for each table. For example, the related lists that are displayed are the same for all incident records. The related lists that are displayed are the same for all case records but are likely different from those displayed for incident records.

**Procedure**

1. Navigate to the table that you want to create a related list for. For example, in the navigation filter, enter Incident to set up related lists for all incident records.

2. Click any of the records to open it.

3. Right-click the menu icon (Ξ) and navigate to **Configure > Related List**.

4. On the Configuring related lists form, move the fields that you want in the related lists section from the Available column to the Selected column.

5. **Optional:** Select a field in the Selected column and use the vertical arrow heads on the right to move the field in the list order.

6. Click **Save**.
Optional: Change the order of the items in the Related Items. By default, Details appears on the left.

b. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the order of lists in the Related Lists for all records in Table.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this order of lists pertains to. Whenever a record from this table opens, this form defines the order of the lists in related lists.</td>
</tr>
<tr>
<td>View</td>
<td>View that is shown when the conditions are met. Use Workspace.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that this rule applies to.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) and off this rule.</td>
</tr>
</tbody>
</table>

c. On the Conditions tab, specify the role users must have and the record field conditions that must be met for this reordering to appear. For example, you can select the condition State is resolved.

d. To order the items in the Related Items, on the Form Tabs tab, clear the Default Tab Order check box, click the lock icon (🔒) next to Tab Order. You can then reorder the items in the Related Items by selecting the lists that you want to move. Then, use the up and down arrow to move them.

e. Click Submit unless you want to select which item in the Related Items appears in the form pane when record view opens.

(Optional) If you do want to choose what appears in the form pane when record view opens, right-click the top banner, click Save, and proceed to the next step.
The following example shows that **Details** is no longer on the left.

![Image](created_for_offering-offering2-s2-l1-sp1-4created_for_c)

<table>
<thead>
<tr>
<th>Configuration Item</th>
<th>Managed by</th>
<th>Owned by</th>
<th>Approval group</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offering2-S2-L1-SP1</td>
<td>Davis Heideman</td>
<td>SP1SO Layer1-SP1</td>
<td>(empty)</td>
<td>(empty)</td>
</tr>
</tbody>
</table>

8. **Optional:** Specify which item in the Related Items appears in the form pane when record view opens.
By default, the left-most item is in focus when a record opens. You can, however, put a different item in focus.

a. Navigate to **Workspace Experience > Forms > Workspace View Rules** and click the workspace view rule that you want to edit.

b. On the **Form Tabs** tab, open the **Default Tab Focus** list and select the item that should be in focus when an agent opens a record in the table that is specified in this rule.

c. Click **Submit**.

(Optional) The following image shows that **Impacted Services/CIs** rather than the **Affected CIs** is in focus when the record opens.

![Image](created_for_offering-offering2-s2-l1-sp1-4created_for_c)

<table>
<thead>
<tr>
<th>Configuration Item</th>
<th>Managed by</th>
<th>Owned by</th>
<th>Approval group</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Offering2-S2-L1-SP1</td>
<td>Davis Heideman</td>
<td>SP1SO Layer1-SP1</td>
<td>(empty)</td>
<td>(empty)</td>
</tr>
</tbody>
</table>

9. **Optional:** Automatically jump to a section in the form pane when conditions are met.

(Optional) By default, when **Details** is in focus in the Related Items, the first section opens. You can, however, set conditions for the **Details** to open on
a different section. **Details** usually displays many sections in the form pane that require scrolling to reach. If there is a typical work pattern for agents, you can save agents’ time by automatically scrolling to the relevant section when conditions are met. For example, when the condition, **State is On hold**, is true, automatically scroll to the tenth section in **Details** because that is a section that agents need for their resolution notes.

**a.** Navigate to **Workspace Experience > Forms > Workspace View Rules** and click the workspace view rule that you want to edit.

**b.** On the **Form Settings** tab, click **New**.

**c.** On the form, fill in the fields.

```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this configuration where a specified section in <strong>Details</strong> automatically appears instead of the first section.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequential order this rule is evaluated in when there are multiple rules. The lower the <strong>Order</strong> value means that it’s evaluated in the sequence sooner.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle that turns on this customization.</td>
</tr>
<tr>
<td>Form Section</td>
<td>Section of <strong>Details</strong> that opens in the form pane instead of the first section.</td>
</tr>
</tbody>
</table>
```

**d. Optional:** In **Conditions**, add conditions that limit when the specified section in **Form Section** opens first.

**e.** Click **Submit**.

10. **Optional:** Create an **Add** button so agents can add records to the related lists.

**What to do next**

Click a component to set it up.

- Notifications
- Ribbon
- Related Items
- Activity Stream
- Contextual Side Panel
Set up adding records to a related list

Create an **Add** button so agents can add records to a Related List.

**Before you begin**
Role required: workspace_admin

**About this task**
You can create an **Add** button that enables agents to add records to lists. This functionality supports one-to-many (o2m) and many-to-many (m2m) tables. In the following example, we use the task_location tables and create the **Add** button for incidents. So, when you open an incident, you can click the new related list, **Affected Locations**, to see incidents (tasks) that occurred at the same location. Many incidents might occur at one location, and one incident might involve many locations.

The general procedure is to add the Related List, **Affected Locations** that is associated with the many-to-many table, task_location, and then create a Workspace Action to create the **Add** button that adds, in our example, locations to an incident.
When an agent clicks **Add**, a modal opens showing the agent locations he or she can add to the incident.

To understand the following example, enter `task_location.list` in the **Filter Navigator** to show the task_location table.

The table shows the associations between the location (cmn_location) and task (task) tables. In the example, there are none.
Procedure

1. Add a new Related List, **Affected Locations**, which opens with incident records.
   
a. Open an incident by navigating to **Incident > Open** and click an incident.

   b. Confirm that you’re in the Workspace View by clicking your profile icon (≡), selecting **Configure Page**, and then selecting **Form Layout**.

   c. Set up a related list for the Incident table by clicking your profile icon (≡), selecting **Configure Page**, and then selecting **Related Lists**.

   d. On the Configuring related lists on Incident form, in **View name**, select **Workspace**.

   e. Select **Affected Locations** and use the arrows to move it into the **Selected** column.
      The task_location value is called **Affected Locations**.

   f. Click **Save**.
      You’ve added **Affected Locations** as a related list for all incident records.

2. Use a Workspace Action to create an **Add** button that enables agents to add locations to an incident.

   a. Navigate to **Workspace Experience > Actions & Components > Related List Actions** and click **New**.

   b. On the form, fill in the fields.
### Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Label that appears on the button in the Related Lists area. Make this <strong>Add</strong>. In the previous image, the <strong>Add</strong> button will appear next to the <strong>New</strong> button.</td>
</tr>
<tr>
<td>Action name</td>
<td>The name for this record that appears in the list of related list actions. <strong>Workspace Experience</strong> &gt; <strong>Actions &amp; Components</strong> &gt; <strong>Related List Actions</strong>.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Select <strong>UI Component</strong> because you are creating a button.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Select <strong>sn-multi-record-associator</strong>.</td>
</tr>
<tr>
<td>Button type</td>
<td>Select <strong>Primary</strong>. Primary buttons are green. Secondary buttons are gray.</td>
</tr>
<tr>
<td>Record Selection Required</td>
<td>Checkbox to make record selection required.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that appears when agents hover a mouse over the UI component.</td>
</tr>
<tr>
<td>Description</td>
<td>Verbose description of this Workspace Action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this UI component appears in.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this related list action shows up on.</td>
</tr>
<tr>
<td></td>
<td>• For an o2m relationship, make sure the table is your o2m related list table. For example, incident.</td>
</tr>
<tr>
<td></td>
<td>• For an m2m relationship, make sure the table is your m2m table. For example, task_location. In our example, select task_location.</td>
</tr>
<tr>
<td>View</td>
<td>Select <strong>workspace</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) and off this UI component.</td>
</tr>
</tbody>
</table>
c. Under Related Links, click Advanced view to give the component the properties it needs to function.

d. On the Component Attributes tab, fill in the fields.

### Component Attributes form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Name that appears on the top of the modal when you click the Add button.</td>
</tr>
<tr>
<td>extensionPoint</td>
<td>In our example, leave this blank. This field filters the list in the modal. When an agent clicks Add, every possible association is shown between the cmn_location and task tables. This field prevents some of those associations. To learn how to create an extension point, see Using extension points to extend application functionality.</td>
</tr>
</tbody>
</table>
| userGivenTable      | Table that appears in the modal. In our example, we want to open the locations agents can add, so select cmn_location.  
  - Select task_location for m2m relationships.  
  - For o2m relationships, select the table associated with the many portion of your o2m. For example, Incident. |
<p>| hideSelectAll       | Field that enables you to hide Select All. Select True to hide Select All. |
| referencedfieldName | Field displayed in the modal from the userGivenTable. In our example, enter location (lowercase). To find the |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>field name</td>
<td>right-click the <strong>Location</strong> field title on the many-to-many table form.</td>
</tr>
<tr>
<td>type</td>
<td>Record relationship type. Select an <strong>o2m</strong> or <strong>m2m</strong> relationship for the records.</td>
</tr>
<tr>
<td>parentFieldName</td>
<td>The name of the field you’re making the reference from, in this example, it’s <strong>task</strong>. To find the field name, right-click the field title.</td>
</tr>
<tr>
<td>columns</td>
<td>Comma-separated list of columns you want displayed in the modal. For example, in the cmn_location table, you might want name and city. So, enter <strong>name,city</strong>.</td>
</tr>
<tr>
<td>view</td>
<td>The view of the list. Do not add a value; the default view is fine.</td>
</tr>
</tbody>
</table>
e. Click **Update**.
   You've created an **Add** button that shows up in the Related Lists area when an incident record opens.

3. Make sure the **Add** button appears and works.
   a. Open an incident by navigating to **Incident > Open** and clicking an incident.

   b. Click the **Affected Locations** Related List.
      You should see the **Add** button in Related Lists.

   c. Click **Add**.
      A modal appears.

   ![Add location modal](attachment:image.png)

   d. Select several check boxes to add those addresses to the incident record and then click **Add**.
      The addresses you selected appear in **Affected Locations**.
e. Enter `task_location.list` in the Filter Navigator to show the task_location table. The new locations should appear in the table.

4. Add a remove action.

You can create a remove button that enables agents to remove records from a related list and disassociate that record from the parent table. This functionality supports o2m and m2m tables.

a. Navigate to Workspace Experience > Actions & Components > Related List Actions and click New.

b. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Label that appears on the button in the Related Lists area. Make sure the action label includes <code>{{count}}</code>.</td>
</tr>
<tr>
<td>Action name</td>
<td>The name for this record that appears in the list of related list actions, Workspace Experience &gt; Actions &amp; Components &gt; Related List Actions.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Select Server Script.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Select <code>sn-multi-record-associator</code>.</td>
</tr>
<tr>
<td>Button type</td>
<td>Select Primary. Primary buttons are green. Secondary buttons are gray.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Record Selection Required</td>
<td>Checkbox to make record selection required. Toggle the checkbox.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that appears when agents hover a mouse over the UI component.</td>
</tr>
<tr>
<td>Description</td>
<td>Verbose description of this Workspace Action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this UI component appears in.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this related list action shows up on.</td>
</tr>
<tr>
<td></td>
<td>• For an o2m relationship, make sure the table is your o2m related list table. For example, incident.</td>
</tr>
<tr>
<td></td>
<td>• For an m2m relationship, make sure the table is your m2m table. For example, task_location. In our example, select task_location.</td>
</tr>
<tr>
<td>View</td>
<td>Select workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) and off this UI component.</td>
</tr>
<tr>
<td>Order</td>
<td>The sequence order in which this UI component appears in a horizontal list of UI components. The lower the value, the further left the location.</td>
</tr>
</tbody>
</table>

c. Click the menu icon (≡) and click Save.

d. Under Related Links click Advanced view.

e. Click the Server Script tab.

f. Enter a server script in the scripting field. `current.deleteRecord();` into the server script field.
   • For m2m relationships, enter `current.deleteRecord();`.
   • For o2m relationships, enter `current.[field_name] = ''; current.update();`.
g. Under Related Links click Advanced view, and click the Confirmation Settings tab.

h. Toggle Confirmation required.

i. Click Update.

What to do next

About this task
Declutter the Related Items menu by removing the Details tab from the form pane and all UI actions for users who are not interested in looking at record details or taking actions on records, such as assigning a record to themselves.

Procedure
1. Navigate to Workspace Experience > Forms > Workspace View Rules.
2. Click the rule that you want to modify.
3. On the Form Settings tab, select the Hide Details & UI Actions check box to hide UI actions and the Details tab in the Related Items menu.

What to do next
Click a component to set it up.

Create a related item in Related Items
Create a custom related item that appears in the Form panel to help agents.
Before you begin
Role required: workspace_admin

About this task
You might want to add a related item to display important information related to the open record. The related item in the following image is AAAAAA.

Procedure
1. Navigate to Workspace Experience > Actions & Components > Related Items and click New
2. On the form, fill in the fields.

Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name of the component you’re adding to the contextual sidebar.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that describes what you’re adding.</td>
</tr>
</tbody>
</table>
| Implemented as      | • UI component—Displays an icon in a field, form, list, or related list to perform a function, such as adding an attachment to a record, adding a component in the contextual side panel, displaying a form for users to fill out, or searching for a record.  
  • Client action—Takes action on the client side, such as dialing a phone number, opening a record, or opening a form to edit a record. There are a preset number of client actions, such as call number, remove notification, and show notifications. You cannot create new ones. Use this option, for example, with a phone number field to enable the
agent to dial a phone number by clicking the icon. The client actions that come with Agent Workspace have handlers in the browser that carry out the actions.

- Server script—Executes a script on the server, for example, to assign a record to someone, or delete a record. Use this option whenever your action involves changing the database.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify UI component</td>
<td>Click the magnifying glass icon (🔍) and select the component to add to the contextual side panel.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon to use on the right side of the contextual side bar that agents click to use this component.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when and agent hovers a mouse over the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>

**Set up a notification in workspace**
Send notifications to an agent or a small group of agents when there are updates to important records.
Before you begin
Role required: workspace_admin or notification_provider_admin

Before you begin
Role required: workspace_admin or notification_provider_admin

About this task
When you configure a workspace notification, you determine the following:
• Who receives the notification
• When users receive the notification

The information that is displayed in each notification follows a default format that you can't configure. For more information on the default formats, see Default notification formats.

You can configure up to five workspace notifications per table.

Important: Workspace notifications can be sent to a maximum of five users. They are intended to direct an individual agent or small group of agents to a record rather than notify a broad distribution list.

Procedure
1. Navigate to System Notification > Provider > Notifications, and then click New.
2. On the form, fill in the fields.

Notifications form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

<td><strong>Note:</strong> You can select only an event that shares the same table as the notification.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filter to specify the table records that users receive notifications about. For example, to send notifications about top-priority incidents, you would select <strong>Incident</strong> [incident] in the <strong>Table</strong> field and set the conditions to <strong>[Priority] [is] [1 - Critical]</strong>.</td>
</tr>
<tr>
<td>Users</td>
<td>Users who receive the notification.</td>
</tr>
<tr>
<td>Users in fields</td>
<td>Record fields that include users who receive the notification. For example, to send the notification to the record assignee, select <strong>Assigned to</strong>.</td>
</tr>
<tr>
<td>Is originating user included?</td>
<td>Option to include the user who changed the record or triggered the event.</td>
</tr>
</tbody>
</table>

3. Click **Submit and Add Common Content**.  
4. Select **Workspace** as the content type for your notification.  

5. On the form, fill in the fields to define the notification content.
### Notification form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification.</td>
</tr>
<tr>
<td>Notification</td>
<td>Notification that is associated with the content. This field is populated automatically with the notification that you created.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to receive notifications about. This field is populated automatically with the table defined in the notification.</td>
</tr>
<tr>
<td>Route</td>
<td>Route through which the notification is sent to the recipient. This field is automatically populated with <strong>Agent Workspace</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the notification content.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification content.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Results**

After the notification is triggered, it is sent to recipients who aren’t currently looking at the target record. A user clicks the notification to link directly to the record.

The notification tray can contain up to one notification per record. If the same record is updated twice in one day, the first notification is removed with the arrival of the second notification.

Users can customize their notifications using the workspace settings. These options appear only after you've configured an active notification.
If a user isn’t receiving notifications as expected, check that notifications are enabled in the workspace settings.

**What to do next**
Click a component to set it up.

</tbody>
</table>
Default notification formats

After you configure a workspace notification, the information that is displayed in the notification follows a default format that you can’t configure. Learn about the default notification formats so that you can know what information is being sent to notification recipients.

There are notification formats for three different use cases in workspace:

• Someone assigns a record to an agent
• Someone updates a field in a record
• Someone updates multiple fields

Each format uses the display value of the target record. A display value is a field value that the system displays to represent the record that was updated. For example, in Incident [incident] records, the display value is the incident number by default.

To set a new display value for a record, follow the steps in Select a field as the table display value.

Newly assigned record

When someone assigns a record to an agent, the notification contains the following information:
• Display value of the assigned record
• Priority of the record
• Short description of the record

The notification displays up to two lines of the short description. If the short description doesn't fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

**Single field update**
When someone updates a field in a record, the notification contains the following information:

• Name of the user who updated the field
• Name of the field that the user updated
• Display value of the updated record
• Priority of the updated record
• Short description of the updated record

The notification displays up to two lines of the short description. If the short description doesn't fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

**Multiple field updates**
When someone updates multiple fields in a record, the notification contains the following information:
• Name of the user who updated the fields
• Display value of the updated record
• Priority of the updated record
• Short description of the updated record

The notification displays up to two lines of the short description. If the short description doesn't fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

Setting up the workspace email client

Set up Workspace to include an email client that enables agents to email callers directly from the record view.

To set up the workspace email client, do the following:
• Designate someone to set up the workspace email client by assigning them the email_client_admin role.

• Allow agents to use the workspace email client by assigning them the email_composer role.

• Allow business managers to create quick messages for their agents by assigning them the email_client_quick_message_author role.

• Enable workspace email client for a table
  Enable the email client for a table so that users can send emails directly from the table record.

• Define recipient qualifiers for the workspace email client
  Create a configuration that controls the auto-complete list of recipients displayed in the email client.

• Define from addresses for the workspace email client
  Set an allowable email address that is displayed in the From address of a message sent from the email client.

• Create a workspace email client configuration
  Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table.

• Create a workspace email client template
  You can create a different template for each table that uses the email client.

• Define a quick message for the workspace email client
  Create predefined content to add in the email client so that users can write emails consistently and efficiently.

Enable workspace email client for a table
Enable the email client for a table so that users can send emails directly from the table record.

Before you begin
Role required: admin
About this task
The email client is enabled by default on the Incident [incident] table. You can enable the email client for another table by adding the email_client dictionary attribute to the table.

iad: This capability is not inherited by tables that extend the current table. For example, enabling the email client on the Task table does not enable it for the Incident or Problem tables.

Procedure
1. Open a record in the table that you want to enable the email client for. For example, to enable the email client for the Problem [problem] table, navigate to Problem > Open, and then open any problem record.
2. On the form, click the menu icon ( ) and then click Configure > Dictionary.
3. On the Dictionary Entries list, open the first record. The first record has the record type Collection and does not have any entry for Column name.
4. On the form, in the Related Links section, click Advanced view.
5. In the Attributes field, enter email_client=true. If there are other values in the field, separate the attribute with a comma.
6. Click Update.

Define recipient qualifiers for the workspace email client
Create a configuration that controls the auto-complete list of recipients displayed in the email client.

Before you begin
Role required: email_client_admin or admin

About this task
You can specify recipient qualifiers that display additional fields (from a selected ServiceNow table) in the auto-complete list. These fields differentiate email recipients who have the same first and last names. Use the following tabs in the Email Client Recipient Qualifier form to define a recipient configuration.
• **Display Configuration** – Set up the email recipient auto-complete behavior and optionally select additional fields to differentiate recipients who have the same name. The additional fields ensure that users select the proper recipient for an email.

• **Query Configuration** – Specify a condition or script that queries the selected table and filters the recipient results returned.

You can define different recipient configurations, which can be used in an email client configuration.

**Procedure**

1. Navigate to **Email Client > Email Client Recipient Qualifier** and click **New**.
2. Fill in the fields at the top of the Recipient Qualifier form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for this email client recipient configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Table</td>
<td>The ServiceNow table to be queried for recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of this recipient configuration.</td>
</tr>
</tbody>
</table>

3. Fill in the fields in the **Display Configuration** tab to control the auto-complete display in the email client.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Address</td>
<td>The field on the table that contains the recipient email address.</td>
</tr>
<tr>
<td>Display Name</td>
<td>The field on the table used for the recipient name displayed.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of results returned relative to other recipient qualifiers defined.</td>
</tr>
<tr>
<td>Additional Display Fields</td>
<td>A content list for choosing additional fields from the table to be displayed in the auto-complete list.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Differentiates recipients who share the same name.</td>
<td>A check box for enabling additional fields to be searched. Expands the recipients returned in the autocomplete list by querying (searching) the Additional Display Fields.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the Query Configuration tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefix Search</td>
<td>Option to find the desired recipient using prefix.</td>
</tr>
</tbody>
</table>

Note: Selecting the Prefix Search option displays the Last Name Field drop-down menu with options to filter the recipient's name.

<table>
<thead>
<tr>
<th>Type</th>
<th>Select the method for filtering the recipients returned in the autocomplete list:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Condition</td>
</tr>
<tr>
<td></td>
<td>• Script</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Conditions</th>
<th>If you selected Condition for the Type, use the condition builder to specify the conditions that must be met to return the appropriate recipients.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Script</th>
<th>If you selected Script for the Type, enter a script that uses these variables to return the appropriate recipients:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• recipientQuery: GlideRecord for the table being queried.</td>
</tr>
<tr>
<td></td>
<td>• targetRecord: GlideRecord for the target record from which the email client was opened.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>For example, this recipientQuery is a GlideRecord that represents the Customer Contact table. The targetRecord variable is a Customer Service case from which the email client was opened. This query limits the email client auto-complete results to contacts who belong to the same account as the Customer Service case.</td>
</tr>
</tbody>
</table>

```javascript
(function (recipientQuery, targetRecord) {

    // Limit results to contacts belonging to the account for the case.
    var account = targetRecord.getValue('account');
    recipientQuery.addQuery('account', account);
})
```

5. Click **Submit**.
   The recipient qualifier configuration is added to the Recipient Qualifier [sys_recipient_qualifier] table and is available for use in an email client configuration.

**Define from addresses for the workspace email client**

Set an allowable email address that is displayed in the From address of a message sent from the email client.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to Email Client > Email Client From Address and click **New**.
2. In the **Display name**, enter the name to be displayed in the From field of the email client message.
3. Enter a valid **Email address** for the From address in the email client.
4. Click **Submit**.  
The From address is added to the Email Client From Address [sys_email_client_from_address] table.

**Create a workspace email client configuration**

Define a configuration that controls the display and behavior of the email client that is based on a selected ServiceNow table.

**Before you begin**
Role required: email_client_admin or admin

**About this task**

The configuration determines the recipient auto-complete results that are displayed, email addresses that can be entered, and a set of allowable From addresses to be used when sending a message with the client.

You can create one email client configuration per ServiceNow table.

**Procedure**

1. Navigate to **Email Client > Email Client Configuration** and click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this email client configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that the configuration is active. The configuration is active by default.</td>
</tr>
<tr>
<td>Table</td>
<td>ServiceNow table that this client configuration applies to. Select a table from the list.</td>
</tr>
</tbody>
</table>

3. In the Recipient Configuration section, select **Recipient Qualifiers** to be used for this client configuration.

   a. Click the lock icon (🔒). By default, two types of recipients are available: Active Users with email accounts and Active Groups with email accounts.

   b. Click the search icon (🔍) and select a recipient configuration from the list of available recipient configurations.

   c. Click the lock icon (🔒) to lock it.

4. In the Display Configuration section:
a. Select the **Display From** option to display the From email address in the email client. To hide the From email address in the email client, clear the check box.

b. Select the **Display Reply-To** option to display the Reply To address in the email client. To hide the Reply To email address in the email client, clear the check box.

5. In the Attachment Handling section, select from one of three choices for the **Attachment Send Action** field:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach to Email Record</td>
<td>Keep email client attachments on the Email [sys_email] record when you send an email.</td>
</tr>
<tr>
<td>Attach to Target Record</td>
<td>Attach email client attachments to the target record when you send an email. This option is the default value.</td>
</tr>
<tr>
<td>Conditionally Attach to Target Record</td>
<td>Set conditions that define which email client attachments are moved to the target record when you send an email. Attachments that do not meet the conditions remain on the email record when you send an email.</td>
</tr>
</tbody>
</table>

6. In the Filter Configuration section, select **Email Address Filters** to be applied to the email client.

   a. Unlock the lock icon (🔒).

   b. Click the search icon (🔍) and select one or more Email Address Filters.

   c. Click the lock icon (🔒) to lock **Email Address Filters**.

   Each filter that you select evaluates a given email address and determines whether or not the given address is valid to apply to an outbound email.

7. Click **Submit**.
   The configuration is added to the Email Client Configuration [sys_email_client_configuration] table.

**Create a workspace email client template**

You can create a different template for each table that uses the email client.
Before you begin
Role required: admin

About this task
The email client uses its own email templates to define default values for fields. Use the following sections in the Email Client Template form to build a client template:

- **Content**: The message body.
- **Recipients**: The email addresses of users receiving the email message. The email addresses are displayed in the To, Cc, and Bcc fields of the message.
- **Sender Configuration**: The method used to generate the email sender (From email address) of the message.

Procedure
1. Navigate to Email Client > Email Client Templates.
2. Click New.
3. Fill in the fields at the top of the Email Client Template form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique template name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the template applies to. Enable the email client for the same table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>The conditions that determine when this client template is used. Use the condition builder to identify the target record that must match before this template is applied to the email client.</td>
</tr>
<tr>
<td>Application</td>
<td>The type of scoped application.</td>
</tr>
<tr>
<td>Execution Order</td>
<td>A number that indicates the order in which template conditions are evaluated.</td>
</tr>
</tbody>
</table>

4. Fill in the fields in the Content tab.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subject</td>
<td>Enter a description of the email.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The <strong>Subject</strong> field on the email client allows a larger character count than the default setting for the <strong>Subject</strong> field on the Email [sys_email] table. If the subject text from the client is being truncated, increase the <strong>Max length</strong> value for the <strong>Subject</strong> field on the Email table.</td>
</tr>
<tr>
<td>Content Type</td>
<td>Select the format of the message body content: HTML or plain text.</td>
</tr>
<tr>
<td>Body HTML</td>
<td>If you selected HTML for the <strong>Content type</strong>, enter the content of the message body using the HTML editor toolbar to format the HTML.</td>
</tr>
<tr>
<td></td>
<td>To reference field values, select variables from the variables list or manually type variable references using the syntax ${table_name.variable_name}. To reference the user who launches the email client, enter the variable ${current_user}.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Line breaks don’t appear for multi-line fields such as ${description} and ${comments} in the email client template.</td>
</tr>
<tr>
<td></td>
<td>You can call a mail script by using ${mail_script:script name} in the <strong>Body HTML</strong> field.</td>
</tr>
<tr>
<td>Body text</td>
<td>If you selected plain text for the <strong>Content type</strong>, enter any text or mail script that you want to appear in the message body.</td>
</tr>
</tbody>
</table>
You can insert a mail script in the **Body text** field by using the following syntax:

```html
<mail_script> [code] </mail_script>
```

5. Fill in the fields in the **Recipients** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>To</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string.</td>
</tr>
<tr>
<td>Cc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Cc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> field.</td>
</tr>
<tr>
<td>Bcc</td>
<td>Enter a comma-separated list of either field names that contain user email addresses or specific email addresses. To reference an email address using a script, create a script include and then call the script include in the <strong>Bcc</strong> field. Your script must start with the <code>javascript:</code> prefix. The script must return email addresses in a comma-separated string. This field cannot have the same addresses as the <strong>To</strong> or <strong>Cc</strong> fields.</td>
</tr>
</tbody>
</table>

6. In the **Sender Configuration** tab, select the **From Generation Type** to determine how the sender (From address) in the email client message is generated.
Use this field only if you want a different From address than the one defined in your SMTP email account.

- None: The From address is not generated in the email client message.
- SMTP Email Account: Use the From address of the SMTP email account for the instance as the sender.
- Select From List: Choose from a list of allowable From addresses defined in the Email Client From Address [sys_email_client_from_address] table.
- Script: Run a GlideRecord query on the Email Client From Address [sys_email_client_from_address] table.
  For example, the following script sets the From address based on the location of the incident caller:

```javascript
(function (fromAddressQuery, targetRecord) {
    // targetRecord is incident for this template
    var location = targetRecord.caller_id.country;

    if (location == 'us')
        fromAddressQuery.addQuery('email_address', 'servicedesk.us@example.com');
    else if (location == 'japan')
        fromAddressQuery.addQuery('email_address', 'servicedesk.jp@example.com');
    else if (location == 'uk')
        fromAddressQuery.addQuery('email_address', 'servicedesk.uk@example.com');
})(fromAddressQuery, targetRecord);

- Text: Enter the email From address to be used in the client.

⚠️ **Note:** The From email address does not appear in the email client unless you configure email client to display the From address. For more information on managing the behavior of email client, see **Email client configurations**.

⚠️ **Note:** If the domain for the From address is not the domain of the SMTP email account server, the owner of the From domain must configure the SPF record for the domain. The owner changes the domain settings to allow the instance to send email as if from that domain. For details on using SPF records, see ServiceNow KB0535456.

7. Click **Submit**.
   The template is added to the Email Client Templates [sys_email_client_template] table.
Define a quick message for the workspace email client

Create predefined content to add in the email client so that users can write emails consistently and efficiently.

Before you begin
Role required: email_client_quick_message_author or admin

About this task
Agents can insert quick messages into emails that they draft in workspace. By default, the quick message content is inserted at the place of the cursor. To instead have quick message content replace all existing content in an email draft, set the `glide.email_client.quick_message.insert` property to `false`.

Procedure

1. Navigate to Email Client > Quick Messages.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name that appears in the Quick Message selector.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick message. When selected, the quick message is available for selection in the Quick Message selector.</td>
</tr>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>User</td>
<td>User who has access to this quick message. Selecting a user restricts access to that user only. Leave the field blank to have no user-based restrictions.</td>
</tr>
<tr>
<td>Group</td>
<td>Group whose members have access to this quick message. Selecting a group restricts access to members of that group only. Leave the field blank to have no group-based restrictions.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to which the quick message applies. To make the quick message available for all tables, leave blank.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Target record that must match the conditions before the quick message appears for selection in the email client.</td>
</tr>
<tr>
<td>Body</td>
<td>Content to insert in the Message Text field in the email client. By default, the field supports HTML format.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>To reference field values, select variables from the variables list or manually type variable references using the syntax <code>${table_name.variable_name}</code>. To reference the user who launches the email client, enter the variable <code>${current_user}</code>.</td>
</tr>
</tbody>
</table>

**Note:** Line breaks don't appear for multi-line fields such as `${description}` and `${comments}` in the email client template.

4. Click **Submit**.

**Setting up the Contextual Side panel in workspace**

The Contextual Side panel provides agents with tools to research and resolve problems. The different components provide the agents with different types of help.

The Contextual Side panel is where agents research and resolve issues. Agents click the icons to open the following tools:
• **Agent Assist** ( )—Automatically displays search results based on the short description. Also displays similar, resolved issues so the agent can determine if the solution applies in this case. Agent Assist takes advantage of artificial intelligence.

• **Attach** ( )—Enables the agent to attach content found in the Knowledge Base in a response to the requester in the Activity Stream. This feature does not require configuration.

• **Playbook** ( )— Enables the agent to work on records with consistent a workflow, moving the record from on state to another.

• **Template** ( )—Populates the Activity Stream with standard content related to resolving the issue. Good templates save the agent time by eliminating repetitive work.

• **Now components**—The building blocks of Workspace, for example, lists, PAR scores, and so forth.

• **Components you design**—You can create your own Workspace components.

Workspace comes preconfigured with components in the Contextual Side panel but you can add more. Each component can appear for all tables or you can set up a component to display only when an agent opens records from specific tables.

Side panel components are responsive, so you can widen the side panel to, for example, make it easier to read a Knowledge Base article.
Next

• Add a custom component to the Contextual Side panel
• Set up templates that fill in form fields for agents
• Set up Agent Assist that provides recommended solutions to issues presented in the open record.

Add custom components to the Contextual Side panel

You can add or remove components in the Contextual Side panel. These components help agents resolve customer issues they’re working on.

Before you begin
Role required: admin
About this task
Workspace comes preconfigured with components in the Contextual Side panel but you can add more. Each component can appear for all tables or you can set up a component to display only when an agent opens records from specific tables. The following image shows Agent Assist in the Contextual Side panel.

Components already available to put in the Contextual Side panel are:

- Agent Assist
- Attachments
- Templates

In the following procedure, you create a Workspace Action that displays an icon in the Contextual Side panel, which opens a component in the panel.
Procedure

1. Navigate to **Workspace Experience > Actions & Components > Contextual Side panel Items** and click **New**.
   The Action Assignments form lists the components that appear in the form side panel depending on the table the open record belongs to. For example, you can set up Agent Assist differently for every table.

2. On the form, fill in the fields.

### Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name that appears on the component you're adding to the Contextual Side panel.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that appears for this record in the list of action assignments: <strong>Workspace Experience &gt; Actions &amp; Components &gt; Contextual Side panel Items</strong></td>
</tr>
<tr>
<td>Implemented as</td>
<td><strong>UI component</strong> is the only valid selection. A UI component displays an icon in a field, form, list, or related list to perform a function, such as adding an attachment to a record, adding a component in the form side panel, displaying a form for users to fill out, or searching for a record.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Click the magnifying glass icon (🔍) and select the component to add to the form side panel. For example, to add an additional Agent Assist, select <strong>now-agent-assist</strong>.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon to add to the right side of the form side bar that agents click to use this component.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when and agent hovers a mouse over the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Table** | Table this component is tied to. When a record from this table is open, this component can appear in the form side panel.

**View** | A set of visual configurations. This value is typically Workspace.

**Active** | Toggle to make this component active in the form side panel.

**Order** | An integer that governs the placement of this icon in the list of Contextual Side panel icons. The lower the number, the higher in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future.

---

3. Right-click the top banner and select **Save**.

4. In the related lists, click **Advanced view**.

5. **Optional:** On the **Conditions** tab, use the condition builder to create filters that prevent the component's icon from appearing in the form side panel.

6. **Optional:** On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the use of this component.

7. **Optional:** On the **Action Exclusion** tab, click **New** to exclude children tables from inheriting this component in the Contextual Side panel, or this table inheriting components from a parent table.

   (Optional) Components in the Contextual Side panel appear according to the records open in Agent Workspace. Child tables inherit these components by default. You can prevent that from happening.

   **a.** On the form, fill in the fields.

   **Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this component. Every time Workspace opens a record from this table, this</td>
</tr>
</tbody>
</table>
### Field Description

Component's icon appears in the Contextual Side panel.

#### Exclude this table
Toggle to prevent this **Table** from inheriting this component from its parent table.

#### Exclude all child tables
Toggle to prevent child tables of **Table** from inheriting this component in the Contextual Side panel.

---

**b. Click Submit.**

**8. Click Update.**

**What to do next**

Click a component to set it up.

---

- **Tabs**
- **Notifications**
- **Form Header**
- **UI Actions**
- **Ribbon**
- **Related Items**
- **Form pane**
- **Actions & Components**
- **Activity Stream**
- **Contextual Side Panel**
Set up templates in the Contextual Side panel

Reduce an agent's time responding to requesters by automatically filling in record fields using a template.

About this task
Role required: admin

You associate templates with tables. Whenever an agent works on a record from that table, the agent can click a template to fill fields in the form. For example, you might create a High Priority template for the problem table. Whenever agents work on a problem, if they click the template, it sets the Urgency field in the problem record to High.

Configure templates.

Procedure
1. Navigate to System Definition > Templates.
2. Click New.
3. On the form, fill in the fields.

Template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this template.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this template applies to. Select Global to make the template available for use with all tables.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The table list shows only the tables and database views that are in the same scope as the template.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for making the template available for use. A template must be active to be used.</td>
</tr>
<tr>
<td>User</td>
<td>User who can configure and apply the template. If you define a user, no other users can see the template unless you select the Global option.</td>
</tr>
<tr>
<td>Group</td>
<td>Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the Global option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Global</td>
<td>Option for allowing any user who can access the templates to view and apply this template.</td>
</tr>
</tbody>
</table>
| Short description | Description of the template.  
   \n   **Note:** Adding content to this field does not add that content to the Short description field of the forms that use this template. |
| Template      | Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to automatically populate in the right column.  
   \n   **Note:** Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form. |
| Link element  | Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table.  
   \n   **Note:** This field does not appear by default. Configure the template form to add the field. |

4. Click **Submit**.

**Results**
You can also create a template by saving a form. For more information, see .

**What to do next**
Set up Agent Assist so agents receive recommendation for issues presented in the open record. Or, set up a different component.

Click a component to set it up.

Set up Agent assist

Set up Agent assist to give agents automatic search results that show possible solutions for records they open. Agent assist is pre-configured to search Incident, Problem, Change, Outages, Knowledge, and Case tables for solutions. You can set up Agent assist to search additional information sources.

Before you begin

- Role required: workspace_admin
- The ITSM plugin, com.snc.agent_workspace.itsm, must be activated on your instance.

About this task

Clicking the graduation cap icon (🎓) in the Contextual Side panel makes Agent assist appear. Agent assist uses contextual search and, optionally, machine learning to surface recommendations based on Knowledge base articles, catalog items, as well as related incidents, cases, problems, and questions relevant to a record an agent is working on.

When an agent opens a record, Agent assist does an automatic search based on a field in the record, typically the short description field. Each search result appears in a card.
Search results typically return multiple cards. You configure the card content, which might be record fields or a custom message. You also configure the card’s heading. To improve recommendations, set up Predictive Intelligence, which has a separate subscription fee.

You set up Agent Assist for every table your agents can access. You can even set up more than one Agent assist for each table. Each of those Agent assists would search a different repository of information.

For each Agent assist, you specify the source of the information to search. A typical implementation just searches Knowledge Base articles, which includes community articles (once called Social Q&A). You can also search a service
catalog if your agents order items to fulfill requests, for example, sending a keyboard to a requester. You can also use Additional Resources, which are tables your agents need to access, for example a table of incidents.

Agent assist, represented by the graduation cap icon (🎓) in the Contextual Side panel, is the workspace version of Contextual Search. So, the set up for Agent assist is almost identical to Contextual Search. To get set up information in addition to that provided in this topic, see Contextual search.

**Procedure**

1. **Optional:** Modify the information sources Agent assist can search. Agent Assist has default information sources it searches. You can modify those sources by defining new search contexts.

2. Navigate to Contextual Search > Table Configuration and click New.

3. In the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table name associated with this Agent assist, for example, Incident [incident].</td>
</tr>
<tr>
<td>UI type</td>
<td>Select Workspace.</td>
</tr>
<tr>
<td>Search context</td>
<td>Click the Lookup icon (🔍) and select a search context. Search contexts are the groups of Searchers used as information sources for Agent assist searches. Searchers are information sources, such as Knowledge, Catalog, and Pinned. If you associate more than one Agent assist to one table, the search contexts must be different. For more information, see Contextual Search &gt; Search Contexts, or Define a search context.</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears at the top of Agent Assist. The default is Agent Assist.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Enable related search box</td>
<td>Toggle that shows or hides the search box in Agent assist. Agents use this box to enter new search terms to find solutions. Otherwise, the agent would have to change the text in the field Agent assist bases its search on, for example, Short Description. This field is read-only when the UI type is <strong>Workspace</strong>.</td>
</tr>
<tr>
<td>Show searcher first</td>
<td>Toggle to display searcher resources before additional resources in the search context. In general, select this check box. Searcher resources are information sources, such as Knowledge Base articles and catalog items. Additional resources are tables that you give agents access to in order to resolve problems, such as closed incidents, resolved problems, and employee records.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications. This field is read-only.</td>
</tr>
<tr>
<td>Limit</td>
<td>Maximum number of search results returned.</td>
</tr>
<tr>
<td>Results per page</td>
<td>Number of results to display per page.</td>
</tr>
<tr>
<td>Allow search with empty search text</td>
<td>Toggle to specify whether the search runs when there is no search text. There is no search text when there is no <strong>Search Field</strong> specified or there is a <strong>Search Field</strong> specified but it is empty. You might, for example, want the search field in Agent assist to be empty so that an agent can enter an employee's name to display their records. To look up employee records, it wouldn't make sense to run a sample search on an arbitrary employee. <strong>Search Field</strong> is the field in the open record Agent assist uses as search</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>criteria. The default is <strong>Short description</strong>. You configure this value in the following steps.</td>
</tr>
<tr>
<td>When to display</td>
<td>Conditions that must be satisfied for Agent assist to appear. For example, set <code>[Active] [is] [true]</code> to make Agent assist appear only when the open record is active.</td>
</tr>
<tr>
<td>Search as</td>
<td>Enables agent to search based on the value of a field in the open record, for example, <strong>Caller</strong>. Use this when an agent fills out forms on behalf of a customer. On the tab, select <strong>Enable search as</strong>. In the <strong>Search as field</strong> list, select the field in the open record to use as the person doing the search.</td>
</tr>
</tbody>
</table>

4. Right-click the top banner and click **Save**. The **Search Fields**, **Filter Configurations**, **Email Configurations**, and **Search Action Configurations** related lists appear.

5. **Optional:** On the **Search Fields** tab, click **New** to make Agent assist search on a field different from the default, **Short description**.

6. **Optional:** On the **Filter Configurations** tab, click **New** to create conditions that statically or dynamically change the search results that appear in Agent assist. An example of a static condition is setting the condition for the **Category** field to equal **Software**. In this case, for all search results returned, Agent assist only shows the ones where the **Category** field is **Software**.

You can also create dynamic filters, which are filters based on fields in the form pane. For example, only show knowledge articles that have the same category as the current incident. If an agent changes the value of a dynamic field in the form pane, Agent assist automatically does another search based on the updated value. Click the following link to create a dynamic filter.

7. **Optional:** On the **Email Configurations** tab, select **New** to send a pre-written email notification, such as incident closed, to a user named in a record field, such as **Assigned to**.
8. **Optional:** On the **Search Action Configurations** tab, you can see the actions an agent can take with the search result, for example, **Attach**, **Flag**, **Full View**, and **Helpful**.

9. Click **Update**.

10. **Optional:** **Set up Predictive Intelligence.** Predictive Intelligence is an add-on subscription that provides highly accurate solution recommendations automatically.

11. **(Optional) Set up Agent assist cards.**

12. **Optional:** **Set up more than one Agent assist for a table.**

**What to do next**

Click a component to set it up.
Set up Agent assist information sources

Set up the information sources Agent assist searches to provide your agents with recommended solutions.

Before you begin
Role required: workspace_admin

About this task
Agent assist comes with default information sources it searches. You might change the information sources to provide more relevant information. Some of the resources Agent assist can search include:

- Knowledge base
- Service catalogs
- Tables
- Record producers

These information sources are grouped as follows:

- Searchers—Catalog, Knowledge base, Pinned, and discussions. You cannot add to these. You can see the full list by navigating to Contextual Search > Searchers.
- Additional Resources—Tables that can be queried. You cannot add to these. You can see the full list by navigating to Contextual Search > Additional Resources.
- Search contexts—Combines Searchers and Additional Resources as a single information source to search.

Procedure
1. Navigate to Contextual Search > Search Contexts and click New.
2. In the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Search Context name.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes this Search Context.</td>
</tr>
<tr>
<td>Searcher</td>
<td>The group of Searchers to use as sources material for searches.</td>
</tr>
<tr>
<td>Searcher text</td>
<td>Label for search results</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Application | Application that this component applies to. Global means that the component applies to all applications.
Active | Toggle to make this Search Context active.
Enable wildcard searches | Toggle to make the regex asterisk (*) valid. * can represent any alphanumeric character in a search term. The recommendation is to enable this option.
Search on tab | This field is not used by Agent assist in workspace.

3. Right-click the top banner and select **Save**.

4. On the **Additional Resource Configurations** tab, click **Edit**.

5. In the slushbucket, select items in the **Collection** column and use the arrowheads to move them to the **Additional Resource Configurations List** column to add the items as source of information for Agent assist to search.

6. Click **Save**.

7. **Optional:** On the **Record Producer Configurations** tab, click **New** to add Record Producers to the resources Agent assist searches.

   (Optional) A Record Producer is a type of catalog item that enables end users to request a task, such as Reboot Windows Server, Password reset, or Replace printer toner. A Record Producer produces a record, for example, a case that embodies the task.

   a. On the **Record Producer Configuration** form, select the Record Producer to add to the search resources and click **Submit**. For information about creating a Record Producer, see [Create a record producer](#).

8. **Optional:** On the **Table Configurations** tab, click **New** to add tables for Agent assist to search.

   (Optional) On the Table Configuration form, select the table to add as a search resource, and optionally, conditions that prevent using this additional resource. For help filling out the form, see this step in [Set up Agent assist](#).

**What to do next**
Set up Agent assist.
Set up Predictive Intelligence in Agent assist

Set up Predictive Intelligence to use machine language to research and create recommendations for issue resolutions automatically. Agent assist works without Predictive Intelligence, which is an upgrade.

Before you begin

- Plugins required: com.snc.contextual_search, com.glide.platform_ml, com.snc.contextual_search_ml - Enables customers to leverage machine-learning algorithms for searching with Contextual Search.
- Implement the initial setup and configuration for Predictive Intelligence on your instance.
- Prediction Intelligence subscription.
- Role required: admin

About this task

Agents use Agent assist to manually look up similar issues, related Knowledge Base articles, and related solutions. The pro version of Agent assist, powered by Predictive Intelligence, does all of that automatically.

When an agent opens a record, Agent assist with Predictive Intelligence:

1. Looks for similar records.
2. Finds what is common among those records, such as a recommendation code of all the records point to the same Knowledge base article.
3. Displays the solutions as recommendations in Agent assist.
The top line beside the magnifying glass icon (🔍) shows the text researched, which is configurable but typically it's the short description field in the open record. Agent assist presents one or more recommendations. Agents can click the article to read more. To use the recommendation, agents click a link, which, in this example is **Link to Problem**. Links include:

- **Attach**—Attach the Knowledge Base article to the record and include the attachment in the Activity Stream.

- **Propose major incident**—Because many records report the same incident, the recommendation is to escalate the priority of fixing the issue.

- **Link to change**—Because many records appear to report the same problem because of a recent change, such as a software release, associate this record with the change, and propose the solution the similar records used.

- **Link to problem**—Associate this record with a common problem and propose the solution similar records used.

The following modules work together to configure predictions:
• Predictive intelligence and similarity (Predictive intelligence > Similarity > Solution Definitions)—A solution definition specifies what commonalities you’re looking for in records, for example, all point to the same Knowledge Base article, or all incidents are related to the same software upgrade.

• Trend definitions (Similarity Analyzer > Trend definitions)—Defines how many records that have something in common constitute a trend, for example, six or more records pointing to the same Knowledge Base article constitutes a trend.

Procedure
1. Define the commonalities you’re looking for.
   
a. Navigate to Predictive intelligence > Similarity > Solution Definitions) and click New.

b. On the Solution Definition form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solution template</td>
<td>Template for this form. Select the option that describes your commonality. Similarity template is the most generic template. Similar Incidents Template looks for incident records with similar short descriptions. Major Incident Template looks for incident records with similar short descriptions in the past 15 minutes.</td>
</tr>
<tr>
<td>Word Corpus</td>
<td>Text that displays in Agent assist that relates to the commonality defined in this form.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to look in for records.</td>
</tr>
<tr>
<td>Fields</td>
<td>One or more fields in the records to examine for common values.</td>
</tr>
<tr>
<td>Filters</td>
<td>Conditions that specify the commonality, for example, State is not Resolved + Severity is High + Short description contains build.</td>
</tr>
<tr>
<td>Processing Language</td>
<td>Agent’s language.</td>
</tr>
</tbody>
</table>
## Field Description

<table>
<thead>
<tr>
<th>Training Frequency</th>
<th>Suggestion how often to retrain the model so it doesn’t go stale. This value is not enforced and does not automatically retrain the model.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh Frequency</td>
<td>Frequency used to run the model on the records to find commonalities.</td>
</tr>
<tr>
<td>Label</td>
<td>Solution template name.</td>
</tr>
<tr>
<td>Name</td>
<td>Read only</td>
</tr>
<tr>
<td>Table to compare</td>
<td>Table to look in for similar records.</td>
</tr>
<tr>
<td>Fields to compare</td>
<td>Fields in records to look in for similar values.</td>
</tr>
</tbody>
</table>

### 2. Specify what constitutes a trend.

**a.** Navigate to **Contextual Search > Agent assist > Trend Definitions** and click **New**.

**b.** On the form, fill in the fields.

#### Trend Definition

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Trend name, for example, Common Change because you're looking for a similar change among records.</td>
</tr>
<tr>
<td>Table</td>
<td>Table the records come from that have been defined as having values in common.</td>
</tr>
<tr>
<td>Trend type</td>
<td>Commonality the trend is defined by. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Common value—If more than the threshold number of records in the Table have the same value, it's a trend. For example, if six or more records have the same resolution code, it's a trend.</td>
</tr>
<tr>
<td></td>
<td>• Common reference—If more than the threshold number of records in the Table have the same reference to another table, it's a trend. For example, if at least the threshold number of records refer to the same Knowledge Base article, it's a trend.</td>
</tr>
<tr>
<td></td>
<td>• Common condition—If records have at least the threshold number of matching conditions, it's a trend. You might define six conditions for records. <strong>Threshold</strong></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>is the number of those conditions that should match to be considered a trend. For example, to detect major incidents, the conditions might be impact is high, creation date is within the past six hours, plus four more conditions. If records have at least the threshold number of matching conditions, there’s a trend, for example, at least four of the six conditions must match for there to be a trend.</td>
</tr>
<tr>
<td>Common field</td>
<td>Field in the table record to examine for common values.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Trend ID</td>
<td>Read only</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence order in which Agent assist evaluates this trend. Trends are evaluated in order from the lowest to highest <em>Order</em> value.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Minimum number of records having this commonality. For example, if the value is 10, then 10 or more records must have the commonality to be considered a trend.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specifies when to show the notification, for example, <em>State is not Resolved + Severity is High + Short description contains build</em>. This field only appears when the <em>Trend Type</em> is <em>Common Condition</em>. You can create a condition that if this record was linked to a problem, you don’t want to link it back to that problem.</td>
</tr>
<tr>
<td>Reference type</td>
<td>Many-to-many (M2M) reference or one-to-one reference. An M2M reference is that many incidents can relate to a single record, and many records can relate to a single incident. Simple reference means there’s a direct relationship between cause and change.</td>
</tr>
<tr>
<td>M2M table</td>
<td>The many-to-many join of two tables. The table name must begin with m2m, for example, m2m_kb_task. This field only appears when the <em>Trend type</em> is <em>Common reference</em>.</td>
</tr>
<tr>
<td>M2M from field</td>
<td>Specifies which field is referring to another table. This field only appears when the <em>Trend type</em> is <em>Common reference</em>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>M2M to field</td>
<td>Specifies which field is being referred to from another table. This field only appears when the Trend type is Common reference.</td>
</tr>
</tbody>
</table>

The following example says that a trend is defined by 6 or more (Threshold) resolution codes (Common field) having the same value (Trend type) in the incident table (Table).

At this point, you've defined what a trend is. You haven't yet defined what action to take when there is a trend.

c. Click Submit.

3. Match solution definitions with trends.
In other words, if Trend A happens, recommend Solution A.

a. Navigate to Agent assist Recommendations and click New to connect solution definitions with a trend definitions.

b. On the form, fill in the fields.

**Agent assist Recommendation**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recommendation name.</td>
</tr>
<tr>
<td>Table Configuration</td>
<td>Table to look for trends in.</td>
</tr>
<tr>
<td>Source type</td>
<td>Select Predictive Intelligence unless you're writing a script that joins the trends with solutions.</td>
</tr>
<tr>
<td>Solution Definition</td>
<td>Specify the solution definition to match with the trends you will subsequently list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the recommendation active.</td>
</tr>
<tr>
<td>Order</td>
<td>If there are multiple, possible recommendation, this value establishes the priority of this recommendation; the lower the value, the higher the recommendation.</td>
</tr>
</tbody>
</table>

c. Right-click the form and click Save.

d. On the Trend Recommendations related list, click New to associate a trend with the Solution Definition.

e. On the form, fill in the fields.

**Trend Recommendation**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Trend name.</td>
</tr>
<tr>
<td>Agent assist Recommendation</td>
<td>Prefills with the value you specified for the recommendation name.</td>
</tr>
<tr>
<td>Trend definition</td>
<td>Select the trend definition you want to associate with this Solution Definition.</td>
</tr>
<tr>
<td>Order</td>
<td>If you have multiple trends associated with this Solution Definition, the priority of this trend in that list. The lower the number, the higher it appears in the Related list.</td>
</tr>
<tr>
<td>Recommendation title</td>
<td>Recommendation title that appears in Agent assist.</td>
</tr>
<tr>
<td>UI type</td>
<td>In the recommendation that displays in Agent assist, display the record or a message, which you will enter.</td>
</tr>
<tr>
<td>Primary Action</td>
<td>Select the Workspace Action to take, for example, Link to Problem.</td>
</tr>
<tr>
<td>Additional Actions</td>
<td>Additional Workspace Actions to take. Click the lock icon (🔒) and then the Workspace Action icon (🔧) and use the slushbucket to select the actions</td>
</tr>
</tbody>
</table>
### Field Description

- **Field**
  - to take. This field only displays with **UI type is Record display**.

  **Recommendation message**
  - Enter the message you want displayed in the Primary Action area of Agent assist. This field only appears when **UI type is Message display**.

- **Display Condition**
  - Optionally specify conditions when this trend should use this **Solution Definition**.

The following examples show when **UI type is Message display** and **Record display**.

<table>
<thead>
<tr>
<th>Message display</th>
<th>Record display</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Message display" /></td>
<td><img src="image" alt="Record display" /></td>
</tr>
</tbody>
</table>

f. Click **Submit**.

**Example:**

- **Common change (Name)**
- **Across similar records (found in step 1) in the Incident table (Table)**
- **Looking for a common reference (Trend Type), meaning the Analyzer is looking at a reference field to another record**
- **Looking for a simple style reference (Reference type) meaning the Analyzer is looking for a direct relationship between the incident and the change (Change is a parent of Incident)**

Configure Agent assist cards

Configure Agent assist cards to customize information agents view at a glance.

Before you begin
Role required: admin

Procedure
1. Navigate to Contextual Search > Search Result Display Configuration.
2. Filter the list by UI type and enter Workspace in the query field.
3. Open a card display configuration record.
4. On the form, fill in the Card View fields.

**Search Result Display Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI Type</td>
<td>UI type for your configuration. Workspace displays as this is a card for Agent assist.</td>

</tr>
<tr>
<td>Details show latest work note</td>
</tr>
</tbody>
</table>

6. Click Update.
Set up multiple Agent assist

Set up multiple Agent assists per table so that your agents can use Agent assist to search through different sources of information to find solutions related to records in the same table. For example, for records from the problem table, one Agent assist might search through employee records, another Agent assist might only search through Knowledge and the Service Catalog.

Before you begin
Role required: workspace_admin

About this task
You can combine multiple information sources that get searched in one Agent assist. If you want to restrict access to some of the information sources, you can set up multiple Agent assists for each information source, and grant permissions accordingly. For example, if you want to restrict some agents from seeing employee records, create an Agent assist that uses employee records as an information source but restrict the permissions of who can use that Agent assist.

Agent Assist appears as an icon in the Contextual side panel. The following example shows two Agent assists that are represented by two graduation cap icons (=edge). You get to choose the icon for the second Agent assist.

Procedure

1. Create an action that adds an additional Agent assist to the Contextual side panel for a table that is already set up for Agent assist.
   To see how, go to Add custom components to the Contextual Side panel. After completing these steps, you should have an icon for your new Agent assist in the Contextual side panel, as shown in the previous image, but when
you click it, nothing appears. The next steps make the icon bring up the second Agent assist in the Contextual side panel.

1. Note: Make sure that the **Action name** of the second Agent assist is different from the **Action name** of the first Agent assist. If the **Action name** is the same, the second Agent assist gets overwritten.

2. Navigate to **Contextual Search > Table Configuration** and click **New** to create a new table configuration for the same database table that you created an action for in the previous step.
   To see how to set up and save a table configuration, see [Set up Agent assist](#).

3. With the table configuration for the second Agent assist displaying, copy the `sys_id` by right-clicking the heading bar and clicking **Copy sys_id**. You will use this value in the following steps.
   Alternately, you can copy the `sys_id` in the URL.

4. Navigate to **Workspace Experience > Actions & Components > Contextual Side panel** and click the action that you created to display the second Agent assist.

5. On the Action Assignment page, under the related links, click **Advanced View**.

6. On the **Component Attributes** tab for `cxTableConfig`, enter the `sys_id` value of the table configuration that you copied in the previous steps.

7. If you add an Agent assist, you must add model fields.
   
   a. Right-click the top banner and navigate to **Configure > Form Layout**.
   
   The Configuring Action Assignment form appears.
   
   b. In the form, move Model Fields Required from the Available column to the **Selected** column and click **Save**.
   
   c. Click the lock icon (_UNLOCKED_LOCKED).
   
   d. Add these model fields: `isNewRecord`, `sysid`, `table`, `fields`.

8. Click **Update**.

9. To check the functioning of the second Agent assist:
a. Navigate to **Workspace Experience > Workspaces > Agent Workspace Home**.

b. Open a record from the table that you associated with two Agent assists.

c. In the Contextual side panel, click the two Agent assist icons that you created.

**What to do next**
Click a component to set it up.

**Personalize Agent assist search results**

Base Agent assist search results on a field in a record to return results for someone other than the agent.

**Before you begin**
Role required: admin
About this task
You can specify a field in a record as the person doing an Agent assist search. When you identify that field, Agent assist watches it and automatically changes the search results if the value of that field changes. You might watch such a field, for example, if agents create cases on behalf of customers or employees. Entering a customer's identity in that field in the form pane returns Agent assist search results that match the customer instead of the agent. Common fields that Agent assist watches are **caller** and **Assigned to**.

Procedure
1. Navigate to **Contextual Search > Table Configuration**.
2. Open any record where the **UI type** is **Workspace**.
3. Select the **Enable search as** check box to make Agent assist use the value of a field for the searcher's identity.
4. In the **Search as field** list, select the field in the record to use as the person doing the search.
   Search results for the user that you defined in the **Search as field** appear in a separate tab next to the search results for the current user.
5. Click **Submit**.
   This option appears in Agent assist as a slider that an agent can use to search while impersonating the user configured in the previous step. For example, the following image shows the value for **Caller** in the record used as the person doing the search.

What to do next
Click a component to set it up.
Set default source for search context

Choose an additional resource to be the default source or the searcher.

**Before you begin**
Role required: admin

**About this task**

- If you set an additional resource as the default source that source is considered the default search source.

- If you do not mark any additional resource as the default source, then the searcher source is considered the default search source.

- If you do not have a searcher and you have not marked any additional resource as the default source, the default is the additional resource with the lowest value in the **Order** field.
Procedure
1. Navigate to Contextual Search > Search Contexts.
2. Open the search context record to change its default source.
3. To set an additional resource as the default search source:
   a. Click the Additional Resource Configuration related list.
   b. Right-click the search resource configuration record and click Set as Default Search.
4. To set a searcher source as the default search source:
   a. Click the Set Searcher as the Default Search related link to set Searcher as the default search source.
   
   Note: The Set Searcher as the Default Search related link appears only if an additional resource is the default search source.
   
   b. To search all searcher sources or a specific searcher source from the list, select All.
   
   Note: The Searcher default search field appears only when the Searcher field contains more than one source.

Set catalog item request method in Agent assist
Set the request method for catalog items to match the catalog order experience.

Before you begin
Role required: admin

Procedure
1. Navigate to Service Catalog > Catalog Definitions > My Items.
2. Select a catalog item from the list.
3. In the related lists, select the Portal Settings tab.
4. In the Request method field, select Order, Request, or Submit.

Results
The request method displays your selection when ordering the catalog item.
Set up a dynamic filter for Agent assist

Use values from a Workspace form to dynamically filter results from Agent assist. If you change the value of a dynamic field in the form pane, Agent assist automatically searches based on the updated value. You can set up a dynamic filter in Agent assist for catalog results, knowledge articles, and open incidents.

Before you begin
Role required: admin

Procedure
1. Navigate to Contextual Search > Table Configuration.
2. Select Incident, Problem, or Change from the list.
3. In related lists, click Filter Configurations.
4. Click New.
5. On the form, fill in the fields.
Filter Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource configuration</td>
<td>Resource data is retrieved from. For example, <strong>Open Incidents</strong>.</td>
</tr>
<tr>
<td>Table configuration</td>
<td>Table configuration for Agent assist. <strong>Note:</strong> This field is automatically populated with the table you selected.</td>
</tr>
<tr>
<td>Scripted filter</td>
<td>Toggle to expand a scripting field.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for your filter configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to activate the form.</td>
</tr>
</tbody>
</table>

6. Enter a script corresponding to the resource configuration.

**Note:** Use one of these **dynamic filter scripts** to set up your dynamic filter.

7. Click **Submit**.

What to do next
Continue setting up Agent assist from step 7.

Scripting for dynamic filters
Enter the following scripts with the corresponding resource configuration in the Table Configuration form to set up a dynamic filter in Agent assist.

**Catalog Items**
Filter for catalog items with the user-selected category.

**Note:** **Catalog** must be selected in the Resource configuration field of the Table Configuration form.

```javascript
(function(current, query_table){

    // Active results only.
    query_table.addActiveQuery();

    // Results matching the form selected category.
    // Note: Dot-walk from the category (ref) to the category title (category.title).
    query_table.addQuery("category.title", ",=",", current.getValue('category')");

```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Knowledge Articles
Filters for knowledge articles with the user-selected category.

<i>Note: Knowledge Articles</i> must be selected in the Resource configuration field of the Table Configuration form.

```javascript
(function(current, query_table) {
  // Active results only.
  query_table.addActiveQuery();

  // Results matching the form selected category.
  // Note: Dot-walk from the kb_category (ref) to the category label (kb_category.label).
  query_table.addQuery("kb_category.label", "," , current.getValue('category'));

  // Return the encoded query
  return query_table.getEncodedQuery();
})(current, query_table);
```

Open Incidents
Filters for incidents with the user-selected category.

<i>Note: Open Incidents</i> must be selected in the Resource configuration field of the Table Configuration form.

```javascript
(function(current, query_table) {
  // Filter based on the selected category in the form.
  query_table.addQuery('category', current.getValue('category'));

  // Return the encoded query
  return query_table.getEncodedQuery();
})(current, query_table);
```

Set up lookup and verify in Workspace
Configure a <b>Consumer lookup</b> or <b>Contact lookup</b> so that agents can easily verify the consumer or contact information.
Before you begin

- Requires the com.snc.sn_lookup_and_verify_config plugin
- Role required: workspace_admin

About this task

When talking with a customer, agents often want to verify who they're talking to. Lookup and verify pulls up customer information so the agent can ask the customer for personal data, such as a home address, to verify the identity of the person on the phone.

Two lookup and verify configurations are provided: one for contacts and one for consumers. You can configure settings in these configurations to control the type-ahead search and the information displayed in the search results and the verification card.

Procedure

1. Navigate to Workspace Experience > Lookup and Verify > Configuration.
2. Select a configuration from the list.
3. Select the Active option.
   A configuration must be active for the related UI action to appear on the interaction record.
4. Optional: In the Minimum characters to start typeahead search field, enter the minimum number of characters that you want for your search. For example, if the minimum number is 1, type ahead starts searching after the first character an agent enters. If the minimum number is 4, the search starts after the agent enters a fourth character. Too few characters might delay character entry as a search happens. Too many characters reduces the benefits of type-ahead searches.
5. In the Max result count list, set the maximum number of search results up to a maximum of 10.
6. Configure the Search results tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary field</td>
<td>Select the name of the field that you want an agent to see in the search results list.</td>
</tr>
<tr>
<td>Secondary fields</td>
<td>Unlock to access the Secondary fields and move a secondary field from the Available list to the Selected list. Lock when done.</td>
</tr>
</tbody>
</table>
7. Configure the Verification card tab. Unlock to access the Display fields and move a field from the Available list to the Selected list. Lock when done.

8. Click Update to save the configuration.

What to do next
Click a component to set it up.

Verify Contact and Verify Consumer UI action client script
The lookup and verify feature uses a client script for the Verify Contact and Verify Consumer UI actions.

The main function that calls the lookup and verify modal has been changed in the Orlando release. The g_csm.lookupAndVerify function call was replaced by g_modal.sn_lookup_verify.lookupVerify. The call back handling has also changed.
If you modified the lookup and verify UI action script in the Madrid or New York releases, you need to modify the script for the Orlando release. It is not updated automatically during the upgrade to Orlando. You can use the examples below to make the necessary changes.

**Client script for the Verify Contact UI action (Orlando)**

```javascript
function onClick(g_form) {
    if (!g_form.isVisible("contact")) {
        var msg = "You do not have permissions to verify the contact."
        getMessages([msg], function(messages)
            (g_form.addErrorMessage(messages[msg])));
        return;
    }

    var title = "Verify Contact";
    var confirm_title = "Done";
    var cancel_title = "Cancel";
    getMessages([title, confirm_title, cancel_title], function(messages) {
        var lookupConfig = {
            configID: '0a20d0c9b360230001f34d43c6a8dc0a',
            selectedEntityTableName: 'customer_contact',
            selectedEntitySysID: g_form.getValue('contact'),
            selectedEntityDisplayVal: g_form.getDisplayValue('contact'),
            modalTitle: messages[title]
        };

        g_modal.sn_lookup_verify.lookupVerify({
            title: messages[title],
            confirmTitle: messages[confirm_title],
            cancelTitle: messages[cancel_title],
            params: lookupConfig,
            disabledPrimaryButtonOnLoad: true,
            size: 'lg'
        }).then(
            function(confirm) {
                var data = confirm.data;
                var verifiedSysId = data.sysId;
                g_form.setValue('account', '');
                g_form.setValue('contact', verifiedSysId);
                g_form.setValue('verified', 'true');

                var ga = new GlideAjax('global.CSManagementUtils');
                ga.addParam('sysparm_name', 'getGlideRecordData');
                ga.addParam('sysparm_table_name', "customer_contact");
            }
        );
    });
}
```
ga.addParam('sysparm_sys_id', verifiedSysId);
ga.addParam('sysparm_fields', "account");
ga.getXML(function (serverResponse) {
    var items = serverResponse.responseXML.getElementsByTagName("item");
    for (var i = 0; i < items.length; i++) {
        var field = items[i].getAttribute("field");
        if (field == "account") {
            g_scratchpad.csaccountset = true;
            g_form.setValue("account", items[i].getAttribute("value"), items[i].getAttribute("display_value"));
            break;
        }
    }
    var info = "This contact has been verified."
    getMessages([info], function(messages)
        g_form.addInfoMessage(messages[info], 'info', '');
    });
    if (data.stringForLookup) {
        var interactionId = g_form.getUniqueValue();
        var ga = new GlideAjax('sn_lookup_verify.LookupVerifyUtil');
        ga.addParam('sysparm_name', 'associateRecordToInteraction');
        ga.addParam('sysparm_term', data.stringForLookup);
        ga.addParam('sysparm_interaction_id', interactionId);
        ga.getXMLAnswer(function (answer) {
            var result = JSON.parse(answer);
            if (result != null && result.table != null && result.sysId != null) {
                var params = {};
                params.sysparm_parent_table = "interaction";
                params.sysparm_parent_sys_id = g_form.getSysId();
                g_service_catalog.openCatalogItem(result.table, result.sysId, params);
            }
        });
    }
});
});
function (error) {
    console.log('cancel:'+error);
function onClick(g_form) {
    if (!g_form.isVisible("contact")) {
        var msg = "You do not have permissions to verify the contact.";
        getMessages([msg], function(messages)
            (g_form.addErrorMessage(messages[msg]));
        return;
    }

    var title = "Verify Contact";
    getMessages([title], function(messages) {
        var lookupConfig = {
            configID: '0a20d0c9b360230001f34d43c6a8dc0a',
            selectedEntityTableName: 'customer_contact',
            selectedEntitySysID: g_form.getValue('contact'),
            selectedEntityDisplayVal: g_form.getDisplayValue('contact'),
            modalTitle: messages[title]
        };

        var onConfirm = function(data) {
            var verifiedSysId = data.sys_id;
            g_form.setValue('account', '');
            g_form.setValue('contact', verifiedSysId);
            g_form.setValue('verified', true);

            var ga = new GlideAjax('global.CSManagementUtils');
            ga.addParam('sysparm_name', 'getGlideRecordData');
            ga.addParam('sysparm_table_name', "customer_contact");
            ga.addParam('sysparm_sys_id', verifiedSysId);
            ga.addParam('sysparm_fields', "account");
            ga.getXML(function(serverResponse){
                var items =
                    serverResponse.responseXML.getElementsByTagName("item");
                for(var i = 0; i < items.length; i++) {

      params.sysparm_parent_sys_id =
g_form.getSysId();

g_service_catalog.openCatalogItem(result.table, result.sysId, params);
    }
  });
});
}
};
g_csm.lookupAndVerify(lookupConfig, onConfirm);

Set up Activity Stream in Workspace
Set up the options of how agents can interact with Activity Stream to make their
job easier.

Before you begin
Role required: workspace_admin
About this task
Activity Stream enables agents to communicate with requesters and make internal notes about the work done on a record. Internal notes are only visible to fellow agents. External comments are visible to agents and requesters.

In Activity Stream, agents can embed knowledge articles, import solutions from Agent Assist, and ask requesters for more information.

You can set system properties that give agents the option of using a:

- Rich text editor.
  The rich text editor includes the formatting icons for bold, italics, underlining, font, and so forth, as shown in the following image.
- Single box or separate text boxes to enter internal and external comments
  The following image shows the single-box option.
The following image shows separate, stacked boxes for internal and external communication.

Once you use system properties to enable these options, the sliders in the configuration menu appear.

**Procedure**

1. In the Filter Navigator, enter `sys_properties.list`. The list of system properties displays.
2. To give agents the option of having separate boxes for internal and external communications, search for and set the `glide.ui.activity.journal.stacked` property to `true`.

3. To give agents the option of using a rich text editor instead of a plain text editor in Activity Stream, search for and set the `glide.ui.journal.use_html` property to `true`. The default is `false`.

What to do next
Click a component to set it up.

---

Disable the Post Comments button from disappearing in Activity Stream

Disable the Post Comments button from disappearing in Activity Stream when mandatory fields aren’t filled in. The Post Comments button is functional even when mandatory fields aren’t filled in.
Before you begin

The **Post Comments** button disappears by default when the Comments or Work Notes fields are made mandatory by a UI Policy on the incident_task table. This task enables you to disable that functionality so that the button is visible and useable even when mandatory fields aren’t filled in.

Role required: admin

**Procedure**

1. Enter `sys_properties.list` in the Filter navigator.
2. Select `glide.activity.compose.can_post_mandatory_fields` from the list.
3. In the Value field, set the value to **true**.

**Display avatars on Activity Stream tiles**

Configure Activity Stream tiles to display avatars instead of icons, or both avatars and icons.

**Before you begin**

Role required: admin

**Procedure**

1. Display avatars on Activity Stream tiles.

   a. In the Filter navigator, enter `glide.activity.show_tile_avatars`.

   b. Select the property and in the value field enter **true**.

   c. Set the property to **true**.
      This property is set to **false** by default.

   d. Select **Update**.

2. Disable icons on Activity Stream tiles.
The SAP Human Resources application is not accessible

a. In the Filter navigator, enter `glide.asys`.

b. Select the property and in the value field enter `false`. This property is set to `true` by default. Leaving this field `true` displays both avatars and icons.

c. Select **Update**.

Set up Playbook Experiences

ServiceNow® Playbook experiences enable you to customize the default Playbook user experience to interact with your desired business process workflow.

Overview

Playbook provides fulfillers with a way to visualize business process workflows in a simple, task-oriented view. This workflow ensures consistent responses to commonly encountered situations. These business process workflows are designed with Process Automation Designer.

*Note:* The following documentation is for use with playbooks built using Process Automation Designer. If you are looking for information related to Security Incident Response Playbooks, see Security Incident Response Playbook Resources.

Installation

Playbook is available from the ServiceNow Store. For more information, see Install Playbook Experience.

Customize Playbook experiences

Playbook comes with a Global Playbook Experience record that defines a default Playbook configuration. You can use this record without any additional configurations. By default, this record defines a set of overrides for controlling how individual activities appear within Playbook. Activity overrides enable you to override the Playbook UI.
You can customize any of this behavior by creating a custom Playbook experience with your own configurations and activity overrides. These records will extend or, optionally, override the global Playbook experience.

**Start here**

**Install Playbook Experience**
You can install the Playbook Experience application (com.snc:playbook-experience) if you have the admin role.

**Before you begin**
- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

**About this task**
The following items are installed with Playbook Experience:
- Plugins
- Store applications
- Roles
- Tables

For more information, see Components installed with Playbook.

**Procedure**
1. Navigate to System Applications > All Available Applications > All.
2. Find the Playbook Experience application (com.snc:playbook-experience) using the filter criteria and search bar.
   - You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.
   - Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.
Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Playbook Experience.

4. Click **Install**.

**What to do next**
You have the option to install the Process Automation Experience Demo which contains example Process Definitions, Activity Definitions, Flows, and context records for showing a Playbook within Agent Workspace. For more information, see **Install Process Automation Experience Demo**.

**Components installed with Playbook**
Several types of components are installed with activation of the Playbook application, including tables and user roles.

ℹ️ **Note**: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see **Find components installed with an application**.

Demo data is available for this feature.

**Roles installed with Playbook**
Roles are added with activation of the Playbook application.

<table>

| Playbook Experience Status To Activity State Map
[sys_playbook_experience_status_to_state]    | List of activity state mapping records used in the Playbook Experience Activity State To Experience Status Map. |

**Note:** All additional tables installed by the dependent plugins are also needed for Playbook.

**Install Process Automation Experience Demo**

You can install the Process Automation Experience Demo application (sn_pad_demo) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.
Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

About this task
The following items are installed with Process Automation Experience Demo:
- Plugins
- Store applications
- Roles
- Tables

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the Process Automation Experience Demo application (sn_pad_demo) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Process Automation Experience Demo.

4. Click Install.

Configure a Playbook user experience
Create a container for your Playbook experience. Your custom Playbook experience acts as a container for your configurations and activity overrides.

Before you begin
Role required: playbook_experience.admin
The sys_id of the Playbook Experience record is used when integrating Playbook into Workspace or a page built with UI Builder.

**About this task**
Enter a name and select the application and domain that you want to associate with the Playbook experience.

**Procedure**
1. Navigate to **Playbook Experience > Playbook Experiences**.
2. Click **New**.
3. On the form, fill in the fields.

### Playbook Experience form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for your Playbook experience.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this Playbook experience applies to. Global means that the Playbook experience applies to all applications.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the playbook, if other than Global. A domain associates records with specific callers and companies. Select a domain that the Playbook experience is associated with.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**What to do next**
Create a **playbook configuration** for your Playbook experience.

**Create Playbook experience configurations**
Define a custom configuration for this Playbook experience. Customize the Playbook user experience including activity filters, assignment badges, embedded forms, and SLA timers in each activity.

**Before you begin**
Role required: playbook_experience.admin
About this task
This task is optional. If you don’t define a custom configuration for your Playbook experience, the global Playbook experience configuration is used instead.

Procedure
1. Navigate to Playbook Experience > Playbook Experiences.
2. Select a Playbook experience.
3. Click the Configurations related list.
4. Select a playbook configuration or click New.
5. On the form, fill in the fields.

Playbook Configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Activity State</td>
<td>Option to display the state of the activity within the activity card to orient the user.</td>
</tr>
<tr>
<td>Filter fields</td>
<td>List of field names that appear in a drop-down filter at the top of the Playbook. For example: assigned_to or state. Separate each field name with a comma. Field values come from an activity's associated record.</td>
</tr>
<tr>
<td>Filter on playbook card status</td>
<td>Option to include activity states in the drop-down filter.</td>
</tr>
<tr>
<td>Assigned to field</td>
<td>Field used to populate an Assigned to badge and avatar that shows up on each Playbook card. The field value comes from the activity's associated record.</td>
</tr>
<tr>
<td>Max form fields on card</td>
<td>Maximum number of form fields in a Playbook card. Forms that exceed this size instead render in a modal.</td>
</tr>
</tbody>
</table>

Note: An activity's state is not the same as the state of its associated record.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expand first prioritized card</td>
<td>Expand the first prioritized card in each stage of the playbook.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the precedence of this configuration in relation to other matching configurations in this Playbook experience. The lower the number, the more likely it will be selected over another configuration. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate your playbook configuration.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this playbook configuration applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Playbook experience</td>
<td>Playbook experience associated with this configuration. This field is automatically populated when you configure the Playbook Experience form.</td>
</tr>
<tr>
<td>Playbook table</td>
<td>Table to limit this configuration to a specific Playbook. Specify the table that contains the Playbook. If the Playbook was built with Process Automation Designer, select Process Definition &lt;sys_pd_process_definition&gt;.</td>
</tr>
<tr>
<td>Playbook record</td>
<td>Playbook record to limit this configuration to a specific Playbook. Choose a record from the table that appears in the Playbook table field. For example, select a specific Process Definition.</td>
</tr>
<tr>
<td>SLA configuration</td>
<td>Activities can be configured to show an SLA timer for the task record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
|                               | associated with activities. Specify an SLA configuration record used to select the correct SLA to display in this case. If no SLA configuration is selected, the SLA that breaches first is used. SLA configurations include:  
• Do not show SLA timer  
• Incident Response and Resolution Team  
• Show SLA that will breach first |
| Inaccessible Data Visibility  | Option to hide data or activities that the logged-in user cannot access.                                                                      |
| Pending Item Visibility       | Option to hide the activities or stages that are not yet triggered.                                                                           |

6. Click Submit.

**What to do next**
Set up additional **playbook activity overrides**.

**Set up playbook activity overrides**
Create additional activity overrides that extend or replace overrides defined by the global Playbook experience. Playbook activity overrides enable you to override the default display behavior of individual activities within your playbook.

**Before you begin**
Role required: playbook_experience admin

**About this task**
After specifying a set of conditions, you can override the UI. This override enables you to change the default prioritized state, required roles, and the UI component used to display matching activities in a playbook for a specific playbook experience. By default, all activity overrides defined for the global Playbook experience are used. You can extend or override these records with your own records for your Playbook experience.
Procedure

1. Navigate to **Playbook Experience > Playbook Experiences**.
2. Select a Playbook experience.
3. Click the **Activity Overrides** related list.
4. Click **New**.
5. On the form, fill in the fields.

### Playbook Activity Override form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for your activity override.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the precedence of this activity override over other matching overrides in this Playbook experience. The lower the number, the more likely it will be selected over other overrides. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for the activity override.</td>
</tr>
<tr>
<td>Playbook experience</td>
<td>Playbook experience associated with this activity override. This field is automatically populated when you create the configuration from the Playbook Experience form.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the activity override. This description is displayed in the Playbook Activity Overrides list and provides context on the form.</td>
</tr>
</tbody>
</table>

6. Click the **When to apply** tab.
7. On the form, fill in the fields.
   This form enables you to specify which activities this override applies to.
### When to apply form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Experience Type</td>
<td>Experience type that you want to match.</td>
</tr>
<tr>
<td></td>
<td>Click the search icon (🔍) to select an activity type, or click <strong>New</strong> on the Activity Type form to create a new activity type.</td>
</tr>
<tr>
<td>Parent Table</td>
<td>Parent table for the record. Match the table for the input record that triggered the playbook.</td>
</tr>
<tr>
<td>Parent Table Conditions</td>
<td>Conditions evaluated against the parent record that triggered the playbook.</td>
</tr>
<tr>
<td>Activity State</td>
<td>Match against a specific Activity State such as &quot;In Progress&quot;.</td>
</tr>
<tr>
<td>Associated Table</td>
<td>Table associated with an activity.</td>
</tr>
<tr>
<td>Associated Record Conditions</td>
<td>Conditions evaluated against the activity’s associated record.</td>
</tr>
<tr>
<td>Experience Property Conditions</td>
<td>Conditions evaluated against the activity properties and defined by the <strong>Type</strong> field selection.</td>
</tr>
</tbody>
</table>

8. Click the **What to override** tab.

   This form enables you to specify what behavior you want to override in matching activities.

### What to override form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Renderer</td>
<td>UI component used to render matching activities in Playbook. If no UI component is selected, the default renderer is used.</td>
</tr>
<tr>
<td>Prioritized</td>
<td>Option to prioritize matching activities. Select <strong>None</strong>, <strong>Yes</strong>, or <strong>No</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>None</td>
<td>If None is selected, activities are prioritized while they're in progress. The first prioritized activity within a stage is expanded by default. All other prioritized activities in the same stage have a blue dot when collapsed. A badge in the stage navigation displays how many prioritized activities are in each stage.</td>
</tr>
</tbody>
</table>

Roles Required

<table>
<thead>
<tr>
<th>Roles Required</th>
<th>Roles required to view matching activities. Unless specified, users can view all activities within a playbook.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note</td>
<td>Users can only view a playbook if they have read access on the input record that triggered the playbook.</td>
</tr>
</tbody>
</table>

10. Click **Submit**.

What to do next

Define **Playbook actions**.

**Playbook record generator**

Use the playbook record generator to guide a user through the record creation process using a playbook experience.

Process Automation Designer requires a record to be created or updated before a process can start. However, you can use the playbook record generator to allow users to create a new record using the playbook experience. You can then configure your workspace or UI Builder page to display the record generator playbook experience component in place of the standard new record form when a user opens a new record tab.

Playbook record generator inserts a record generator activity as the first step within a specified process definition created with Process Automation Designer. This record generator activity contains a new record form. Once a user submits the form, the user is redirected to the newly created record, which now contains a running process. The running process guides the user through the rest of the record creation. If no process definition is running after the new record form is submitted, then the playbook will manually trigger whichever process definition was shown to user before record creation. The user stays within the playbook.
experience before and after the record is created for a seamless and guided record creation experience.

Admins can specify the name of the record generator activity, the form view, and the process definition shown to the user before the record is created. Admins can also optionally configure the declarative action used to submit the form.

**Setup playbook record generators**

Use the playbook record generator to display a process before a record is created.

**Before you begin**

Role required: playbook admin

**About this task**

Use playbook record generators to create records using a playbook. Agents no longer need to create records before viewing a playbook.

**Procedure**

1. Navigate to **Playbook Experience > Record Generators**
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table for which the new record page should use the record generator entry.</td>
</tr>
<tr>
<td>Process Definition</td>
<td>Select the process definition you want to display before a record is created. All activities will be marked pending. If no process is running after the record is created, playbook will then manually trigger this process definition.</td>
</tr>
<tr>
<td>Create Record Activity Name</td>
<td>Enter a name to display on the record generator activity inserted as the first step within the specified process definition.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to activate the record generator.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the precedence of this configuration in relation to other activities in a Playbook experience. The lower the number, the more likely it will be selected over another configuration. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.</td>
</tr>
<tr>
<td>Create Record Form View</td>
<td>Select the form view to use for the new record form embedded within the inserted activity.</td>
</tr>
<tr>
<td>Template Fields</td>
<td>Optional field values that can be pre-filled in the new record form.</td>
</tr>
</tbody>
</table>

4. **Click Submit.**

**What to do next**

If you are adding a record generator to a playbook configured in Paris or Quebec, you need to update your workspace integration to include the isNewParentRecord attribute. For more information, see [Integrate Playbook with Workspace](#).

You can override the **Continue** button associated with playbook record generator with your own custom conditions, label, and coloring by creating a new declarative action. Use the same name as the declarative action associated with the global playbook experience and associate it with your custom playbook experience. For more information, see [Custom Playbook actions](#).

**Preview a playbook**

Preview playbooks in real time within a non-production environment.

**Before you begin**

Role required: `pd_author`, `pd_operator`, `pd_trigger_author`, `pd_content_author`, `pd_shared.admin`, `pd_admin`, `pd_shared.user`, or `playbook_experience.admin`
About this task
Use playbook preview to test processes created in Process Automation Designer or HR Lifecycle Events including the following:

• Activity definitions
• Declarative actions
• Record Generator configurations
• Playbook experience configurations
• Activity overrides

Procedure
1. Navigate to Playbook Experience > Playbook Preview.
3. Select a **Parent table**.
4. Select a **Parent record**. You can select an existing record or **New Record** to preview the playbook record generator process in the currently selected table.
5. Select a **Playbook experience**.
6. Click **Done**.
7. A preview of your playbook appears.

The Playbook Preview Configuration Details side panel is where you can change the playbook preview. You can select from the following options:

- **Parent Table**—Select the parent table containing the record you want to see a playbook for.
- **Parent Record**—Select a parent record or **New Record**
- **Playbook Experience**—Select the playbook experience
- **Activity View**—Select stacked or focused view
- **View Compact Mode**—Option to preview your playbook in compact mode.
The playbook preview configuration details sidebar is automatically exposed when previewing a playbook. You can hide the sidebar by clicking the arrow in the top right of the sidebar. If the sidebar is not exposed, click the gear icon to open the configuration details sidebar.

The playbook preview URL updates as changes are made in the configuration details side panel. You can bookmark playbook previews to easily access specific configurations in the future.

**Custom Playbook actions**

Customize Playbook interactions by setting up conditions that add buttons, drop-downs, list items, and clickable icons. This customization enables you to submit forms, open records, and complete and skip activities across all Playbook experiences.

**Overview**

Playbook actions can run server scripts, dispatch client actions, or render UI components when triggered. When running server scripts, the current variable is tied to the activity’s associated record. If you want client actions to trigger events within UI Builder, see Configure UXF client actions for playbook.

Flow Data records (sys_flow_data) are often used as associated records to control the configuration of a flow through an action server script. These server scripts can set the state of the flows to complete or skipped, enabling an agent to directly affect logic within a flow.

Flow Data records can also collect user data from an agent to use within a flow. An associated record can be tied to any table. You can define your own actions beyond these default actions to accomplish the business process workflow logic that you want.

**Default actions**

The following default actions are supported in Playbook.

<table>
<thead>
<tr>
<th>Action Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip</td>
<td>Skips an instructional process step</td>
</tr>
<tr>
<td>skip_instructional</td>
<td>Skips an instructional process step</td>
</tr>
<tr>
<td>Skip</td>
<td>Skips sending an email</td>
</tr>
<tr>
<td>skip_email</td>
<td>Skips sending an email</td>
</tr>
<tr>
<td>Skip</td>
<td>Skips a knowledge process step</td>
</tr>
<tr>
<td>skip_knowledge</td>
<td>Skips a knowledge process step</td>
</tr>
<tr>
<td>Action Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Skip skip_update</td>
<td>Skips an update record process step</td>
</tr>
<tr>
<td>Skip skip_list</td>
<td>Skips a list process step</td>
</tr>
<tr>
<td>Skip skip_create</td>
<td>Skips a create record process step</td>
</tr>
<tr>
<td>Mark Completed</td>
<td>Mark an activity as complete</td>
</tr>
<tr>
<td>complete_activity</td>
<td></td>
</tr>
<tr>
<td>Create Record</td>
<td>Create a new record from a new record form</td>
</tr>
<tr>
<td>create_record</td>
<td></td>
</tr>
<tr>
<td>Send Email send_email</td>
<td>Informs process automation to send email</td>
</tr>
<tr>
<td>Restart restart_activity</td>
<td>Restarts the activity</td>
</tr>
<tr>
<td>Skip skip_activity</td>
<td>Mark activities using an experience status record as skipped.</td>
</tr>
<tr>
<td>View Record View Record</td>
<td>View the current record</td>
</tr>
<tr>
<td>Save save_record</td>
<td>Save the current record</td>
</tr>
<tr>
<td>View Approvers Playbook View Approvers</td>
<td>View approvers for this record</td>
</tr>
<tr>
<td>Mark Complete mark_complete_knowledge</td>
<td>Marks a knowledge process step complete</td>
</tr>
<tr>
<td>Mark Complete mark_complete_instruction</td>
<td>Marks an instructional process step complete</td>
</tr>
<tr>
<td>Mark Complete mark_complete_list</td>
<td>Marks a list process step complete</td>
</tr>
<tr>
<td>Mark Complete</td>
<td>Marks the current process complete</td>
</tr>
<tr>
<td>Action Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>mark_complete</td>
<td></td>
</tr>
</tbody>
</table>

**Customize Playbook actions**

Customize Playbook actions using forms, conditions, and scripts, components, or client actions. This customization enables users to submit forms, open records, and complete and skip activities.

**Before you begin**

Role required: playbook_experience.admin

**About this task**

- Default actions can't be edited. These actions are displayed as read only.
- Actions can only operate against one record.

**Procedure**

1. Create the action and specify details.

   a. Navigate to Playbook Experience > Actions Playbook Actions, Stage Actions, or Activity Actions.

   b. Select an action assignment or click New to create a new one.

   i. **Note:** For a list of default actions, see Playbook actions.

   c. On the form, fill in the fields.

---

**Action Assignment form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Label</td>
<td>Label that appears on the button created through the action.</td>
</tr>
<tr>
<td>Action Name</td>
<td>Name for your action that appears in the action assignment list. An action assignment overrides others with the same name.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Type of action that is implemented. For example, UI Component.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Specify UI Component</td>
<td>When the <strong>Implemented as</strong> field is set to UI Component, this field specifies a UI component that is displayed when the action is triggered.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when an agent points their cursor over a button or icon.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon that displays in the activity card.</td>
</tr>
<tr>
<td>Render Mode</td>
<td>Render mode on a Playbook card. Specify how the action renders on the Playbook card. <strong>Select Button, Header Dropdown, or Header Icon.</strong></td>
</tr>
<tr>
<td>Button Type</td>
<td>Button type that's displayed in the Playbook UI. Select <strong>Primary</strong>, <strong>Secondary</strong>, or <strong>Tertiary</strong>.</td>
</tr>
<tr>
<td>Form fields required</td>
<td>Option that communicates that the action requires data from the user to proceed. This field is consumed in the Playbook experience UI in the following ways.</td>
</tr>
<tr>
<td></td>
<td><strong>i.</strong> When an activity contains a form that's too large to fit on a card, the form is hidden in a modal.</td>
</tr>
<tr>
<td></td>
<td><strong>ii.</strong> When an Activity contains a form but doesn't have actions that require form fields, the form is not rendered. Instead, the fields on the form are rendered as a stacked collection of label-value pairs.</td>
</tr>
<tr>
<td></td>
<td>This field can be overridden by creating a custom activity renderer.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the action that's displayed in the Action Assignments list.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Application | Application for the action assignment.
Workspace | Workspace that the playbook action is associated with. For example, ServiceNow® ITSM or HR. **Note:** This field is not required.
Table | Field to limit this action to activities with this associated table.
View | Field to limit this action to activities with this Form View.
Active | Option to activate the action.
Order | Integer that determines the precedence of this action in relation to matching actions with the same name. The lower the number, the more likely it is to be selected against other actions. This ordering enables you to override other actions with your own. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.

2. Set up conditions for the action.

   **a.** Click the **Conditions** tab.

   **b.** On the form, fill in the fields.

   **Conditions form**

   | Field | Description |
   --- | --- |
   Script Condition | Script condition for the action assignment. Enter `sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(current)`. This script enables you to show a Playbook only when the record has triggered a process execution.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Adding queries involving multiple joins can impair performance.</td>
<td></td>
</tr>
<tr>
<td>Client Conditions</td>
<td>Choose conditions to limit collisions based on your use case.</td>
</tr>
<tr>
<td>Record Conditions</td>
<td>Choose conditions to limit collisions based on your use case.</td>
</tr>
<tr>
<td>Required Roles</td>
<td>Roles to limit Playbook access.</td>
</tr>
<tr>
<td>Requires create access</td>
<td>Options to require create access.</td>
</tr>
<tr>
<td>Requires read access</td>
<td>Option to require read access.</td>
</tr>
<tr>
<td>Requires write access</td>
<td>Options to require write access.</td>
</tr>
<tr>
<td>Requires delete access</td>
<td>Options to require delete access.</td>
</tr>
</tbody>
</table>

3. If **Server Script** is selected in the **Implemented as** field, provide a script for the action.
   - Server scripts can reference the associated record of an activity using the `Current` variable.
   - Calling `current.update()` updates the associated record with values that the user provides from embedded forms on Playbook cards.

4. If **Client Action** is selected in the **Implemented as** field, optionally specify the payload mapping on the **Action Attributes** tab.
   - Payload mapping enables you to override portions of the payload dispatched by the client action. For example, the Preview Record client action enables you to open a record on a new Workspace tab. Using payload mapping, you can specify a related item tab that displays when the form opens. Set the `defaultTab` to do this.

5. If **UI Component** is selected in the **Implemented as** field, optionally specify the component’s attributes on the **Component Attributes** tab.

6. Click **Submit**.

**Apply playbook actions to playbook experiences**

Apply default or custom playbook actions to playbook experiences.

**Before you begin**

Role required: playbook_experience_admin
Procedure
1. Navigate to **Playbook Experience > Playbook Experiences**.
2. Select a Playbook experience.
3. Click the Action Mapping related list.
4. Click **New**.
5. On the form, fill in the fields.

### Playbook Experience Action Assignment Map

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Assignment</td>
<td>Select the declarative action assignment</td>
</tr>
<tr>
<td>Playbook Experience</td>
<td>Choose which Playbook Experience to apply the action</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the action is applied</td>
</tr>
<tr>
<td>Activity Definition</td>
<td>Select the activity definition to apply the action</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. In the related links section, select the **Playbook Experience Mapping** tab.
8. Verify that the playbook experience has been added to the table.

**What to do next**

**Integrate your Playbook experience** with **Workspace**.

**Configure UXF client actions for playbook**

Create playbook UXF client actions for use within **UI Builder**.

**Before you begin**

Role required: **admin**

Use UXF client actions to trigger events within **UI Builder**. UXF Client Actions can be used in the **Playbook**, **Stage**, and **Activity Actions**.

**Procedure**

1. Navigate to **Playbook Experience > Actions Playbook Actions, Stage Actions, or Activity Actions**.
2. Select an action assignment or click **New** to create a new one.
3. On the form, fill in the fields.

### Action Assignment form

Field | Description
--- | ---
View | Field to only display a Playbook when this Form View is selected on the parent record.
Active | Option to activate the action assignment.
Order | Integer that determines the precedence of this action in relation to matching actions with the same name. The lower the number, the more likely it is to be selected against other actions. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.
Tooltip | Message that’s displayed when your mouse points to the Related Item tab or Contextual Side Panel icon.
Description | Description for the action assignment. This description is displayed in the Action Assignment list and provides context on the form.

4. Click the **Advanced View** related link.

5. Click the **Component Attributes** tab.

6. On the form, fill in the fields.

### Component Attributes form

<table>
<thead>
<tr>
<th>Attribute name</th>
<th>Description</th>
</tr>
</thead>
</table>
| playbookExperienceId | Associated Playbook experience ID. Copy and paste the sys_id of a Playbook Experience record. **Note:** If no Playbook experience ID is provided, the global Playbook experience is used by default.
<p>| parentSysId | Associated parent sys_id. Enter <code>{{sysId}}</code> to automatically take... |</p>
<table>
<thead>
<tr>
<th>Attribute name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parentTable</td>
<td>Associated parent table. Enter {{table}} to automatically take the parentSysId of the record that you're viewing.</td>
</tr>
<tr>
<td>compactMode</td>
<td>Option to display a Playbook in compact mode. Typically set to true for Contextual Side Panel and false for Related Item.</td>
</tr>
<tr>
<td>recordGeneratorQuery</td>
<td>Not currently supported in Agent Workspace.</td>
</tr>
<tr>
<td>isNewParentRecord</td>
<td>Set to {{isNewRecord}}.</td>
</tr>
</tbody>
</table>

**Note:** Select a different **UI Component** if the attributes are missing from your form. Change the **UI Component** back to **now-playbook-experience** and the attributes will appear.

7. Click the additional actions icon (≡) and select **Save**.
8. Click the **Conditions** tab.

### Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script Condition</td>
<td>Script condition for the action assignment. Enter <code>sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(current)</code> to show a Playbook only when the record has triggered a process execution.</td>
</tr>
<tr>
<td>Client Conditions</td>
<td>Choose conditions to limit collisions based on your use case.</td>
</tr>
<tr>
<td>Record Conditions</td>
<td>Choose conditions to limit collisions based on your use case.</td>
</tr>
<tr>
<td>Required Roles</td>
<td>Roles to limit Playbook access.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>Requires create access</td>
<td>Option to require create access.</td>
</tr>
<tr>
<td>Requires read access</td>
<td>Option to require read access.</td>
</tr>
<tr>
<td>Requires write access</td>
<td>Option to require write access.</td>
</tr>
<tr>
<td>Requires delete access</td>
<td>Option to require delete access.</td>
</tr>
</tbody>
</table>

10. Click the additional actions icon (Ξ) and click Save.

Playbook activity state mapping

Use playbook activity state mapping to override the status of a playbook card.

Overview

A playbook card's state comes from the Activity State by default. Activity states come from the Sub Flow or Flow Action powering the activity.

Activity Definition authors can specify a record to provide the status shown in playbook cards. This record is referred to as an Experience Status Record. It is specified within an Activity Definition's experience properties.

Any record from any table can be used as an Experience Status Record. Default activity definitions use sys_flow_data records as their Experience Status Record.
Activity States displayed in card view

Default Activity States

Out-of-the-box Default Activity States in sys_flow_data record.

<table>
<thead>
<tr>
<th>Status</th>
<th>Flow State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>Flow has not started</td>
</tr>
<tr>
<td>In Progress</td>
<td>Flow is running</td>
</tr>
<tr>
<td>Complete</td>
<td>Flow has finished</td>
</tr>
<tr>
<td>Skipped</td>
<td>Flow was skipped due to conditions</td>
</tr>
<tr>
<td>Error</td>
<td>Flow encountered an error</td>
</tr>
</tbody>
</table>

Activity states are used in the following:

- Declarative Action conditions
- Activity Override conditions
- Animations
- Card visual experience
Exceptions
Business logic doesn’t always align one-to-one with the flow. The following are examples of exceptions:

- An agent clicks **Skip** on an instructional card. The flow displays as complete, but the business logic is skipped.

- An agent clicks **Restart** on a completed instructional card. The flow does not restart the flow, just update the **Flow Data** record.

- A flow may never complete if a task is waiting for input from an agent to restart a loop. The associated task is effectively complete in this state.

Playbook activity state-mapping rules
Use activity state-mapping rules to control which activity state is shown in a card for a given experience status record.

Activity state-mapping rules are required for each Experience Status Table. These rules determine how to update the experience status record when a playbook user updates an activity state, such as completing an activity.

Out-of-the-box Global Playbook Experience includes a default rule set for the **sys_flow_data** table. This rule set is enough for most playbook activities, but additional rules can be created for custom tables if needed.

Activity state-mapping rules for a given Experience Status Table are unique for each Playbook Experience and can be accessed in the related tabs by clicking **Status Mapping**.

### Status Mapping tab

![Status Mapping tab](image)
Experience status mapping records
Each Experience Status Mapping record specifies which field on the Experience Status Tables contains the Experience Status value. Experience Status Mapping records also have the following related lists.

- Experience Status to Activity State rules
- Activity State to Experience Status rules

Experience Status Mapping record related lists

The Experience Status to Activity State form controls which activity state is shown in a card for a given experience status record value. The form populates the Experience Status Record Value list with the choice values of the Experience Status Field.

Activity State to Experience Status form controls how the experience status record is updated when a playbook user updates an activity state, such as skipping an activity. The form populates Experience Status Record Value list with the choice value of the Experience Status Field.
Playbook activity state-mapping permissions

User permissions must be assigned to allow agents to complete, skip, or restart activities in playbook using activity state mapping.

**Can Complete, Can Skip, and Can Restart** permissions are determined whenever an activity is fetched based on the following conditions:

- **Experience Status Record** must be defined
- Users must have write access on **Experience Status Record**
- Activity State Mapping rule set must exist for **Experience Status Table**
- User must have write access on **Experience Status Field** for that table
- **Activity State to Experience Status** mapping rule must exist for that corresponding operation:

<table>
<thead>
<tr>
<th>Playbook Activities</th>
<th>Activity State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Complete</td>
<td>Complete</td>
</tr>
<tr>
<td>Skip</td>
<td>Skipped</td>
</tr>
<tr>
<td>Restart</td>
<td>In Progress</td>
</tr>
</tbody>
</table>

If the permissions are not valid, users cannot perform that operation. The corresponding declarative actions that use the **Can Complete, Can Skip, and Can Restart** client conditions will not display.

**Note:** If a user does not have read access on the **Experience Status Field** of the **Experience Status Record**, the default activity state will be used instead. The default activity state is the state of the flow powering the activity.

Configure experience status mapping

Configure experience status mapping for playbook status mapping.
Before you begin
Role required: playbook_experience.admin

Procedure
1. Navigate to Playbook Experience > Playbook Experiences and select a playbook experience.
2. Select Status Mapping.
3. Click New.
4. On the form, fill in the fields.

Playbook Experience Status Mapping form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Experience Status Table</td>
<td>Which Experience Status Table this mapping is for</td>
</tr>
<tr>
<td>Experience Status Field</td>
<td>Which choice field on the table contains the Experience Status value</td>
</tr>
<tr>
<td>Order</td>
<td>Order of precedence for multiple mapping records on the same table</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that activates or deactivates the status-mapping table.</td>
</tr>
</tbody>
</table>

5. Click Submit.

6. Select the Experience Status to Activity State tab.
7. Click New.
8. On the form, fill in the fields.

Playbook Experience Status to Activity State Map

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Experience Status Record Value</td>
<td>Choose an Experience Status to map to a Playbook Activity State</td>
</tr>
<tr>
<td>Activity Card Value</td>
<td>Choose a corresponding Playbook Activity State to display in a card for the given Experience Status</td>
</tr>
</tbody>
</table>

9. Click Submit.
10. Repeat steps 7 through 9 until all values have been added for every possible Experience Status.

11. Select the Activity State to Experience Status tab.

12. Click New.

13. One the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Card Value</td>
<td>Choose a Playbook Activity State to map to an Experience Status</td>
</tr>
<tr>
<td>Experience Status Record Value</td>
<td>Choose which value should be set on the Experience Status Record when a Playbook user assigns that Activity State to an activity</td>
</tr>
</tbody>
</table>

14. Click Submit.

15. Repeat steps 12 through 14 until all values have been added for every possible Activity State.

Manually trigger a Playbook
Use a server script to manually trigger a playbook.

Trigger Playbook function
Manually trigger a Playbook using a server script function with the following code:

```javascript
sn_playbook.PlaybookExperience.triggerPlaybook('<scoped name>',parentRecord);
```

Replace `<scoped name>` with the scoped name of your playbook. You can find the scoped name by locating the process definition in the `sys_pd_process_definition` table and copying the name and application scope fields. Replace `parentRecord` with the input/parent record you want to run the process on.

The server script throws an exception on failure. You can add an info message when successful and an error message on failure.

Helper functions
Use the following scriptable function to determine if a Playbook is already running on a record before displaying a UI action or declarative action to trigger it.
To view every playbook running on a given parent record use the following code:

```python
sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(parentRecord, '<scoped name>')
```

This information can be used to control when to show a trigger playbook action such as a UI action.

The following section is an example of how to use the trigger playbook function to create an Add Playbook button.

**Create an Add Playbook UI Action**

Create an Add Playbook UI Action in workspace.

**Before you begin**

Role required: workspace_admin

**Procedure**

1. Navigate to **System Definitions > UI Actions**.
2. Click **New**.
3. In the form, fill in the fields.

**Note:** Other fields than those in the following table appear in the form but they do not function in workspaces. For more information on each field on the UI actions form, see **Set up custom UI actions in Workspace**.

**UI Action Form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>UI action name. This appears in the workspace UI, for example, Add Onboarding Playbook.</td>
</tr>
<tr>
<td>Table</td>
<td>Table the UI action applies to. Every time an agent displays a record from this table, this UI action appears.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement in the horizontal list of UI actions. From left to right, the Order numbers go from small to large.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action Name</strong></td>
<td>Equivalent of <strong>Name</strong> that appears in logs and table columns, for example, interaction_add_onboarding</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Toggle to make the UI action appear.</td>
</tr>
<tr>
<td><strong>Show update</strong></td>
<td>Toggle to show the update in the <strong>Table</strong>.</td>
</tr>
<tr>
<td><strong>Condition</strong></td>
<td>Conditions that must be satisfied for the UI Action to appear, for example, current.canWrite() &amp;&amp; ! sn_playbook.PlaybookExperience.parentRecordContainsPlaybook(current, 'sn_pad_demo.playbook_onboarding_demo').</td>
</tr>
<tr>
<td><strong>Script</strong></td>
<td>Server-side script that implements the UI action.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
</tbody>
</table>

4. To create a server-side script that implements the add playbook action, enter the script in the **Script** field.

```java
try{
    current.update();
    sn_playbook.PlaybookExperience.triggerPlaybook('sn_pad_demo.playbook_onboarding_demo', current);
    gs.addInfoMessage(gs.getMessage("Onboarding Playbook added to Interaction."));
} catch(e){
    gs.addErrorMessage(e.getMessage());
}
```

The system ignores any client scripts that are included in this field. You can only use the workspace client script field for client scripts. Replace `sn_pad_demo.playbook_onboarding_demo` with the scoped name of your playbook. You can find the scoped name by locating the process definition in the `sys_pd_process_definition` table and copying the name and application scope fields.

5. In the **Workspace** tab, select: **Workspace Form Button** to make the add playbook button appear on the line of UI actions, or **Workspace Form Menu** to make it appear as a list in the menu list.

6. In the **Workspace Client Script** field, create a workspace-specific client script.
Workspace has similar client scripting limitations as Service Portal. For example, to open a form by clicking it, you could add the following client script:

```javascript
function onClick(g_form) {
}
```

Add a cancel playbook action

Add a cancel playbook action to the playbook actions menu.

**Before you begin**

Role required: playbook_experience.admin

**Procedure**

1. Create the cancel action and specify details.

   a. Navigate to **Playbook Experience > Actions Playbook Actions**.

   b. Click **New**.

   c. On the form, fill in the fields.

   **Action Assignment form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Label</td>
<td>Label that appears on the button created through the action. For example, Cancel Playbook.</td>
</tr>
<tr>
<td>Action Name</td>
<td>Name for your action that appears in the action assignment list. For example, cancel_student_playbook. An action assignment overrides others with the same name.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Select <strong>Client Action</strong>.</td>
</tr>
<tr>
<td>Specify Client Action</td>
<td>Select <strong>Cancel Playbook</strong>.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when an agent points their cursor over a button or icon.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the action that's displayed in the Action Assignments list.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for the action assignment.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that the playbook action is associated with. For example, ServiceNow® ITSM or HR.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is not required.</td>
</tr>
<tr>
<td>Table</td>
<td>Field to limit this action to activities with this associated table.</td>
</tr>
<tr>
<td>View</td>
<td>Field to limit this action to activities with this Form View.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the action.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the precedence of this action in relation to matching actions with the same name. The lower the number, the more likely it is to be selected against other actions. This ordering enables you to override other actions with your own. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.</td>
</tr>
</tbody>
</table>

2. Set up action attributes.
   a. Select the **Action Attributes** tab.
   b. Select **playbookContextId** in the **Payload Map** drop down.
   c. Enter `{{playbook_context_id}}` into the value field.

3. Set up conditions for the action.
   a. Click the **Conditions** tab.
   b. Select **Playbook Status is In Progress** in the **Client Conditions** drop down.
   c. Select **Requires write access**.

4. Click **Submit**.
Embedding a form in playbook

Use the User Form activity definition when creating a form in which an agent can decide when an activity is complete.

The User Form activity definition lets the process owner specify a table, record, form view, form fields, display fields, SLA Timer, checklist, and attachments and automatically display the corresponding form.

The form automatically renders the following:

- An **Update** button that saves the agent's progress.
- A **Mark Complete** button that will allow the agent to specify when they are done updating the record and ready to move to the next step.
- A **Skip** button to move to the next activity without completing the form.
- A **Restart** button appears once the activity is marked complete or skipped by the agent. The agent can restart the activity if necessary.

Create your own custom activity definition based on the user form activity definition if you want to customize the logic. The process owner can optionally specify the **Assigned To** or **Assignment Group** fields to control which users can mark the activity as complete.

**Declarative Actions that require form fields**

A form without a submit button is rendered as read-only to allow the process owner to control when an agent can complete a form. For example, you could configure a form that can only be submit if the agent is a member of the ITIL user role, the activity is progress, and the incident is high priority. All conditions must be met, otherwise the form remains read only.

**Create a user form for Playbook**

Create an editable user form within a playbook.

**Before you begin**
Role required: process_automation.admin

**Procedure**

1. Navigate to **Process Automation > Process Automation Designer**.
2. Select a process from the list or create a new process.
3. Select **Add an activity**.
4. Select **Global**.
5. Select **User Form**.
6. Select **Configure activity** under **Activity properties**.

7. In the form, fill in the fields.

---

### Configure your activity

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>Name of the activity to display to users in Process Automation Designer.</td>
</tr>
<tr>
<td><strong>Start Rule</strong></td>
<td>Select the when to the activity should start running.</td>
</tr>
<tr>
<td><strong>Lane</strong></td>
<td>Select the lane in which the activity runs.</td>
</tr>
<tr>
<td><strong>Activity Definition</strong></td>
<td>Select the activity definition.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Optional description for the activity.</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Name of the table whose records the activity can access as inputs. Typically, this table is either the Task [task] or Global [global] table.</td>
</tr>
<tr>
<td><strong>Record</strong></td>
<td>Reference to the record associated with the activity.</td>
</tr>
<tr>
<td><strong>Assignment Group</strong></td>
<td>Group responsible for completing the task associated with the activity.</td>
</tr>
<tr>
<td><strong>Assign To</strong></td>
<td>User responsible for completing the task associated with the activity.</td>
</tr>
<tr>
<td><strong>Form View</strong></td>
<td>A UI View used to render a form for editing the associated record via Declarative Actions.</td>
</tr>
<tr>
<td><strong>Form Fields</strong></td>
<td>Follows the same rules as Form View but only displays the fields specified in a comma-separated list. Specified form fields must be in the corresponding Form View for access control list purposes. If no Form View is specified, then the Form View view is used. Fields render without a client scripting environment which means that UI Policies, Client</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Scripts and Field Decorators will not work. As such, this should only be</td>
</tr>
<tr>
<td></td>
<td>used if creating a UI View for every combination of fields needed is too</td>
</tr>
<tr>
<td></td>
<td>onerous for your use case.</td>
</tr>
<tr>
<td>Display Fields</td>
<td>Select additional record fields to display in the user form.</td>
</tr>
<tr>
<td>Footer</td>
<td>Text displayed in the card footer.</td>
</tr>
<tr>
<td>Show Attachments</td>
<td>Drop down displaying attachments attached to the parent record, associated</td>
</tr>
<tr>
<td></td>
<td>record, or none.</td>
</tr>
<tr>
<td>Show SLA</td>
<td>Option to render an SLA timer in the header of the card for the associated</td>
</tr>
<tr>
<td></td>
<td>record. The SLA is chosen according to the SLA configuration record specified</td>
</tr>
<tr>
<td></td>
<td>in the playbook configuration.</td>
</tr>
<tr>
<td>Show Checklist</td>
<td>Option to display a checklist that is attached to the associated record.</td>
</tr>
<tr>
<td></td>
<td>Checklists are editable and changes are saved without requiring a declarative action.</td>
</tr>
</tbody>
</table>

8. Select **Update**.

**Configure activity stream for playbook**

Provide agents a way to view the history for a parent record or associated record in playbook.

**About this task**

Role required: process_automation.admin

Activity streams at the playbook and stage level only display history for the parent record. Activity actions display history from associated records.

**Procedure**

1. Navigate to **Playbook Experience > Actions** and select **Playbook Actions**, **Stage Actions**, or **Activity Actions**.

2. On the form fill, in the fields.
# Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Label</td>
<td>Label that appears on the button created through the action.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name for your action that appears in the action assignment list. An action assignment overrides others with the same name.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Select <strong>UI Component</strong> from the list.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Enter <code>now-playbook-activity-stream-modal-connected</code>.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon that displays in the activity card.</td>
</tr>
<tr>
<td>Render Mode</td>
<td>Render mode on a Playbook card. Specify how the action renders on the Playbook card. Select Button, Header Dropdown, or Header Icon.</td>
</tr>
<tr>
<td>Button type</td>
<td>Button type that's displayed in the Playbook UI. Select <strong>Primary</strong>, <strong>Secondary</strong>, or <strong>Tertiary</strong>.</td>
</tr>
<tr>
<td>Form Fields Required</td>
<td>Option that communicates that the action requires data from the user to proceed. This field is consumed in the Playbook experience UI in the following ways.</td>
</tr>
<tr>
<td></td>
<td><strong>a.</strong> When an activity contains a form that's too large to fit on a card, the form is hidden in a modal.</td>
</tr>
<tr>
<td></td>
<td><strong>b.</strong> When an Activity contains a form but doesn’t have actions that require form fields, the form is not rendered. Instead, the fields on the form are rendered as a stacked collection of label-value pairs. This field can be overridden by creating a custom activity renderer.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application for the action assignment.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that the playbook action is associated with. For example, ServiceNow® ITSM or HR.</td>
</tr>
<tr>
<td>Table</td>
<td>Field to limit this action to activities with this associated table.</td>
</tr>
<tr>
<td>View</td>
<td>Field to limit this action to activities with this Form View.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the action.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that determines the precedence of this action in relation to matching actions with the same name. The lower the number, the more likely it is to be selected against other actions. This ordering enables you to override other actions with your own. The typical practice is to use numbers that are in the hundreds. For example, 100, 200, 300, or 400.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the action that's displayed in the Action Assignments list.</td>
</tr>
</tbody>
</table>

**Note:** This field is not required.

---

3. Select the **Component Attributes** tab.

4. On the form, fill in the fields.

### Component Attributes form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table</td>
<td>Select the table you want to display an activity stream for.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>• For playbook and stage level, {{table}} shows an activity stream for the parent table.</td>
</tr>
<tr>
<td></td>
<td>• For activity level, {{table}} shows an activity stream for an associated table.</td>
</tr>
<tr>
<td>sysId</td>
<td>Select the record you want to display an activity stream for.</td>
</tr>
<tr>
<td></td>
<td>• For playbook and stage level, {{sysId}} shows an activity stream for the parent record.</td>
</tr>
<tr>
<td></td>
<td>• For activity level, {{sysId}} shows an activity stream for an associated record.</td>
</tr>
<tr>
<td>modalTitle</td>
<td>Provide a title for the activity stream modal.</td>
</tr>
</tbody>
</table>

5. Select the **Conditions** tab.

6. Set the conditions for when you would like the activity stream to display.

7. Click **Submit**.

**Configure wait for condition form**

Configure the wait for condition form for use in playbook.

**Before you begin**

**Role required**: admin

Use the Wait for Condition activity definition to update records with a form in playbook. The following instructions specify when an activity is complete. For example, you want an agent to set an incident's Assigned to Field and provide a Short Description. You would use the Wait for Condition's condition builder to specify:

• Short description is not empty
• Assigned to not empty (or changed)

The moment an agent fills in the short description and assigned to fields in playbook, workspace, legacy UI, or mobile, the activity completes. The activity is not tied to any user experience.
Procedure

2. Switch to the activity’s advanced view in Process Automation Designer.

3. Select the Activity Experience tab.

4. Choose the corresponding table for Associated Table.

5. Use the pill picker to map the Associated Record to the same record being used in the Wait for Condition:
   • VL > Wait for Condition > Inputs > Record

6. Provide a title and description (optional).
   a. Map the Title to the activity’s Label and Description to the activity’s Description so the process owner can easily change these properties without switching to the advanced view in the future.

7. Specify a Form View that you’d like to show and / or a comma-separated list of Form Fields.

   Note: If you specify a comma-separated list of form fields, those fields must be in the selected form view. If you only specify from fields without specifying a form view, then those fields must be in the default view.

   a. The default view is typically not supported in workspace. This results in "this form is not configured for workspace" error when the form is rendered. Perform the following to resolve the issues.
      • Specify workspace as a form view.
      • Add the table name to the system property sn_agent_workspace.default_view_editable_tables.
      • Create a custom view.

8. Optionally provide a footer, SLA timer, attachments, or checklist.

Upgrading playbooks for Quebec

Upgrade playbooks created in Paris for the Quebec release.

Several new platform features were added to Playbook Experience in Quebec. These features are backward compatible with Playbooks built in the Paris release so that they will not break existing behavior.

Some features require manual upgrade steps to take advantage of them on existing playbooks, activity definitions, and declarative actions.
Playbooks need to be upgraded to render Complete and Skip buttons correctly. Use the following instructions to update your existing playbooks for Quebec.

Upgrade playbooks for Quebec

Before you begin
Role required: process automation admin

Procedure
2. Select the process you want to upgrade from the list.
3. Select an instructional activity.
4. Select Configure activity.
5. Select Advanced View.
6. Use the pill picker for Experience Status Record to choose the record output by the first Collect Flow Data step.
7. Select Update.
8. Select Activate.

Upgrade existing activity definitions for playbook in Quebec

Activity definitions are backwards compatible with Playbook in Quebec, but they require a slight modification to display properly.

Before you begin
Role required: process automation admin

Procedure
2. Select the process you want to upgrade from the list.
3. Select an activity.
4. Make any change to the activity.
5. Select Save.
6. Click Activate.

Results
The activity definition is now updated to work with Quebec.
Set up custom UI actions in Workspace

Set up UI actions to customize Workspace for your organization. UI actions include custom buttons, menu items and limiting access to forms based on a user's role.

Before you begin
Role required: workspace_admin

About this task
UI actions appear either as form buttons or list items in the UI action menu.

Each workspace comes preconfigured with UI actions. You can, however add to or remove preconfigured UI actions.

Custom UI actions.
You can hide UI Actions for people who do not need to take action on records. For more information, see Hide the Details tab and UI Actions.

Procedure
1. Navigate to System Definition > UI Actions and click New.
2. In the form, fill in the fields.

Note: Other fields than those in the following table appear in the form but they do not function in workspaces. For more information on each field on the UI actions form, see UI actions.

<table>
<thead>
<tr>
<th>Name</th>
<th>UI action name. This appears in the workspace UI, for example, Assign incident to me.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table the UI action applies to. Every time an agent displays a record from this table, this UI action appears.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement in the horizontal list of UI actions. From left to right, the Order numbers go from small to large.</td>
</tr>
<tr>
<td>Action name</td>

<td>Toggle to show the UI Action as a link in the form pane.</td>
</tr>
</tbody>
</table>
| Form style      | • Primary—Colors the UI Action blue.  
• Destructive—Colors the UI Action red.  
• Unstyled—Does not color the UI Action.                                                                                                          |
<p>| List banner button | Toggle to show the UI Action as a button in the list banner.                                                                                                                                                |
| List bottom button | Toggle to show the UI Action as a button at the bottom of the list of records.                                                                                                                               |
| List context menu | Toggle to show the UI Action as an entry in the context menu of the list.                                                                                                                                     |</p>
<table>
<thead>
<tr>
<th>List choice</th>
<th>Toggle to show the UI Action as a drop-down list of choices in list view.</th>
</tr>
</thead>
<tbody>
<tr>
<td>List link</td>
<td>Toggle to show the UI Action as a link in list view.</td>
</tr>
<tr>
<td>List style</td>
<td>• Primary—Color the UI Action blue.</td>
</tr>
<tr>
<td></td>
<td>• Destructive—Color the UI Action red.</td>
</tr>
<tr>
<td></td>
<td>• Unstyled—Does not color the UI Action.</td>
</tr>
</tbody>
</table>

3. **Optional:** To create a server-side script that implements the UI action, enter the script in the **Script** field.

For example, if you want to include the caller name and the short description in an incident that is created from an interaction record, you could use the following script that uses **GlideRecord**

```javascript
if(current.update()){
    var inc = new GlideRecord("incident");
    inc.newRecord();
    inc.caller_id = current.opened_for;
    inc.short_description = current.short_description;
    action.openGlideRecord(inc);
}
```

The system ignores any client scripts that are included in this field. You can only use the workspace client script field for client scripts.

4. **Optional:** To create a client-side script that implements the UI action, see **Supported client script types and APIs** and also, **Service Portal and client scripts**
5. In the **Workspace** tab, select: **Workspace Form Button** to make the UI action appear on the line of UI actions, or **Workspace Form Menu** to make it appears as a list item in the menu list.

- **Workspace Form Button** to make the UI action appear on the list of UI actions.
- **Workspace Form Menu** to make the UI action appear as a list item in the menu associated with UI actions.

6. **Optional:** In the **Workspace Client Script** field, create a workspace-specific client script. Workspace has similar client scripting limitations as Service Portal. For example, to open a form by clicking it, you could add the following client script:

   ```javascript
   function onClick(g_form) {
   }
   ```

7. In the **Requires role** tab of the workspace section, add any roles that you want to limit access to the UI action to.

8. Click **Submit** or **Update**.

**What to do next**

Click a component to set it up.

<table>
<thead>
<tr>
<th>Tabs</th>
<th>Ribbon</th>
<th>Activity Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notifications</td>
<td>Related Items</td>
<td>Contextual Side Panel</td>
</tr>
<tr>
<td>Form Header</td>
<td>Form pane</td>
<td></td>
</tr>
<tr>

<td>Actions &amp; Components</td>
<td></td>
</tr>
</tbody>
</table>
Render a Now component in a modal

Use a UI Action to launch a custom Now component in a modal so an agent doesn't have to navigate to a different screen to accomplish a task.

Before you begin
Role required: workspace_admin

About this task
Launch a custom component in a modal so an agent doesn't have to leave the current screen. For example, you can launch a modal that contains contact information about the customer named in an open record so an agent can ask callers to confirm their identity. The following example shows a list in a modal.
Procedure

1. Develop and deploy a custom component to your instance. For more information, see Custom components.

2. Create an entry in the Registered Scripting Modal.
   a. In the Filter Navigator, enter `sys_aw_registered_scripting_modal.list` to open that table.
   b. Click New.
   c. Use the search icon (🔍) to select a component, in this case, use `sn-workspace-header`.
   d. Enter the name of the API, in this case `showHeader`.
   e. Public API gets auto-populated:
f. Click **Save**.

3. Author your UI Action to render your component in a modal.

a. Create a new UI Action for the appropriate table and on the **Workspace** tab, select either **Workspace Form Button** or **Workspace Menu Button** depending on how and where you want the UI Action to appear. For information on creating a UI Action, see Set up UI Actions in **Workspace**.

When you select one of the check boxes, the **Workspace Client Script** text box appears.

b. Enter the following code in the **Workspace Client Script** text box:

```javascript
function onClick(g_form) {
  g_modal.global.showHeader({
    title: 'Test custom modal',
    confirmTitle:'YES',
    params: {
      primaryValue: 'THIS IS A PRIMARY VALUE',
      secondaryItems:{},
    }
  }).then(function(result){
    alert('confirm:'+result);
  }, function(error) {
    alert('cancel:'+error);
  });
}
```
4. Now test the UI Action by opening a record in Workspace from the table you selected when creating this UI Action. The UI Action should appear in the Form pane.

**Close tab and save-and-close tab UI Actions**

Use the `closeRecord()` method to close a tab, or save and close a tab.

**Before you begin**
Role required: admin

**About this task**
You can use the `closeRecord()` method to author a UI Action that closes a tab.

**Procedure**

1. Follow the instructions on Set up custom UI actions in Workspace to set up a client-side UI Action.

2. In the **Workspace Client Script** field, add the following client script UI Action to close a tab.

```javascript
function onClick(g_form) {
    g_aw.closeRecord();
}
```

3. In the **Workspace Client Script** field, add the following client script UI Action to save the contents of the tab and close it.

```javascript
function onClick(g_form) {
    g_form.save().then(function()
    {
        g_aw.closeRecord();
    });
}
```

**Group UI actions in Workspace**

Define a group of one or more UI actions to customize the actions in the form header menu.

The group of UI actions is displayed on the form header under a single menu button or split button. To group your UI actions, first create a layout, then group the UI actions.
Create a layout for your table view

Create a layout for your table view to group your UI actions.

Before you begin
Role required: admin

About this task
Layouts create a place where your UI action groups are placed. You can create layouts specific to a form view. Select a table specific to the form view.

Procedure
1. Navigate to **Workspace Experience > Forms > UI Action Layouts**.
2. Click **New**.
3. On the form, fill in the fields.

**UI Action Layouts form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layout name</td>
<td>Name for your UI action layout.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for your UI action layout.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Application scope matches the scope you're in and is read-only.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace for your UI action layout.</td>
</tr>
<tr>
<td></td>
<td>Associate UI actions layout to a specific workspace.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Workspace is by default Global when left empty.</td>

</table>

4. Click **Submit**.

### Group UI actions in Workspace

Create a UI action group. Define the table, view, and the workspace that displays the UI action layout and the UI action groups. Set the display color of the menu or split button to primary, secondary, or unstyled.

**Before you begin**
Create a layout for your table view before performing this task.
Role required: admin

**About this task**
- Your UI action renders as a standalone UI action when only one UI action from the group renders.
- To reorder your UI actions, open the group record and click the lock icon. Reorder your UI actions then press the lock icon again to lock it.
- To order your split button, change the Order field on the group form.

**Procedure**
1. Navigate to **Workspace Experience > Forms > UI Action Groups**.
2. In the UI Action Groups related list, click **New**.
3. On the form, fill in the fields.

### UI Action Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for your UI action group.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of UI action group. Choose between <strong>Menu</strong> and <strong>Split Button</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Overflow</td>
<td>Option to place the UI action group in the overflow menu by default.</td>
</tr>
<tr>
<td>Color</td>
<td>Color for your UI action group. Select <strong>Primary</strong> (green), <strong>Secondary</strong> (red), or <strong>Unstyled</strong> (gray).</td>
</tr>
<tr>
<td>Order</td>
<td>Order for your UI action group.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for your UI action group.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Application matches the scope you're in and is read-only.</td>
</tr>
<tr>
<td>UI Action layout</td>
<td>UI action layout that your UI group is applied to. Select the UI action layout you previously configured.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>UI action to group.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> UI actions evaluate according to individual conditions.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the form.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for your UI action group.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Customizing workspace**

Customize your workspace forms, fields, lists, and related lists without writing custom scripts or learning APIs.

You can create actions and components in workspace that perform an action, such as dialing a phone number, adding a Now component to the Contextual side panel, deleting a related list, or adding a record to the database. Adding actions and components as icons in workspace enables your agents to perform actions while remaining in workspace rather than opening new browser windows. For example, you can create an action that pops up a modal with a caller's personal information so an agent can verify the caller's identity instead of making the agent open a new window with the caller's information to accomplish the same task. You can create all of these actions with little or no scripting.
Action types

There are three action types:

• UI component—Places a Now component in workspace, for example, an Agent assist component in the Contextual side panel.

• Client action—Dispatches an action that the browser carries out. Workspace supplies a limited number of client actions, including dialing a phone number, opening a record, opening a form to modify record content, and opening a URL.

• Server script—Executes a script on the server to change the database, for example, to assign a record to someone, to delete a record, or to add a record.

Action locations

Actions can only appear in a limited number of locations in workspace. For example, list view has only one action, called a list action, that can only appear above the list.

The actions in record view can only appear in the following locations:

• Field decorator—Displays an icon in one or more fields in an open record. An agent can click these icons, for example, to call a phone number or display additional information.

• Related list action—Displays a button in the Related Items menu. Examples include adding or removing a related list.

• Contextual side panel items—Appears as an icon in the Contextual side panel. By clicking the panel, an agent can make a Now component appear in the Contextual side panel. For example, an agent can display additional Agent Assists in the Contextual side panel.

• Related items—Appear as an entry in the Related Items menu. The entry works like a tab and sits, by default, between Details and related lists. Related lists act like tabs that display information from tables that are related to the open record. Related items make any Now component appear in the form pane.
This figure shows the only places where actions can appear in record view.

**Creating actions**
To learn how to create actions in all of the workspace locations, see the following links:

- List action
- Contextual side panel
- Related lists
- Related items
- Field decorator
Using supplied Actions & Components

The workspace interface incorporates the following Actions & Components.

### Actions & Components supplied with your instance

<table>
<thead>
<tr>
<th>Action</th>
<th>Action is available on</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Assist</td>
<td>Form</td>
<td>Adds the information in the form to Agent Assist.</td>
</tr>
<tr>
<td>Assign to Me</td>
<td>List, Related List</td>
<td>Assigns a record to the user.</td>
</tr>
<tr>
<td>Attachments</td>
<td>Form</td>
<td>Adds an attachment to a record in a form.</td>
</tr>
<tr>
<td>Call Number</td>
<td>Field</td>
<td>Calls the phone number in the field.</td>
</tr>
<tr>
<td>Create New</td>
<td>List</td>
<td>Creates a new record in the list.</td>
</tr>

<td>Field</td>
<td>Opens a record in a new sub-tab.</td>
</tr>
<tr>
<td>Reference Search</td>
<td>Field</td>
<td>Opens a modal to enable users to search a reference table.</td>
</tr>
<tr>
<td>Templates</td>
<td>Form</td>
<td>Opens a template on a form.</td>
</tr>
</tbody>
</table>

### Action & Component tables

**Note:** Declarative Action is the previous name for Actions & Components.

<table>
<thead>
<tr>
<th>Name</th>
<th>Permissions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Declarative Action Model Definition</td>
<td>Read-only for Admin</td>
<td>Defines the section in the workspace that a declarative action can exist and displays available data. Models</td>
</tr>
</tbody>
</table>
### Action & Component tables (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Permissions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Declarative Action Model Field</td>
<td>Read-only for Admin</td>
<td>Represents a field in a specific model. A model can have multiple fields.</td>
</tr>
<tr>
<td>[sys_declarative_action_model_field]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Definition</td>
<td>Read-only for Admin</td>
<td>Accumulates all the declarative actions.</td>
</tr>
<tr>
<td>[sys_declarative_action_definition]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Assignment</td>
<td>Admin only</td>
<td>Defines where and when a declarative action runs.</td>
</tr>
<tr>
<td>[sys_declarative_action_assignment]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Group</td>
<td>Admin only</td>
<td>Allows associating multiple declarative actions into a group. This action is only supported for the list model.</td>
</tr>
<tr>
<td>[sys_declarative_action_group]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Set up custom actions on record fields in Workspace

Set up using a value in a reference field to take action. For example, add an icon in a field with a phone number to dial that phone number. Or, add an icon in a reference field that opens a user record in a tab.

**Before you begin**

Role required: admin

A field decorator is an icon that’s added to a reference field in the Form pane that an agent can click to perform some action. Workspace supports up to three decorators per field.

The objective in setting up Workspace Action field decorators is to enable agents to do things on one page that otherwise would require opening additional pages. For example, instead of opening another page to display the record of the user named in an incident, the agent just clicks the Workspace Action field decorator in the **Caller** field to open the user record in a tab.
The field action, Open Record, must exist as a Workspace Action definition before you create a new action assignment. The icon, icon-user, must be an icon available in your instance.

**Procedure**

1. **Navigate to** Workspace Experience > Actions & Components > Field Decorators.  
   A list of existing field decorators appears.
2. **Click** New.
3. **On the form, fill in the fields.**  
   The following table adds a field decorator icon to URL fields. When agents click the icon, the URL opens.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name of the field decorator, for example, Open a URL. You can use double</td>
</tr>
<tr>
<td></td>
<td>braces, {{}}, to insert values in the text at runtime, for example, {{count}}.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that appears for this record in the list of action assignments: <strong>Workspace Experience &gt; Actions &amp; Components &gt; Field Decorators</strong>, for example, open_a_url.</td>
</tr>
<tr>
<td>Implemented as</td>
<td><strong>Client Action</strong> is the only valid selection for field decorators. The field decorator appears as an icon in a field, form, list, or related list. When clicked, the decorator performs an action, such as calling a phone number, opening a record, updating content, or opening a URL. <strong>UI component</strong> is a UI element that you can place in many areas in Workspace. <strong>Client Action</strong> dispatches an action specified in <strong>Specify client action</strong>. <strong>Server Script</strong> take actions on the server changing database records, such as adding, removing, or modifying them.</td>
</tr>
<tr>
<td>Specify client action</td>
<td>Click the magnifying glass icon (🔍) and select the action to take. To open a URL, select <strong>Open URL</strong>. This field only appears when Implemented as is <strong>Client Action</strong>. You cannot add custom actions to this list.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Click the magnifying glass icon (🔍) and select the component to add. This field only appears when Implemented as is <strong>UI Component</strong>.</td>
</tr>
<tr>
<td>Decorator applies to</td>
<td><strong>Field type</strong> means the decorator appears for all fields of this type. <strong>Specific field</strong> means the decorator appears only when the field you specify opens. Many specific fields are of the same field type. For example, select <strong>Field type</strong> to apply this field decorator icon to all URL fields.</td>
</tr>
<tr>
<td>Field type</td>
<td>Select the field type where you want the field decorator to appear, for example, <strong>Reference</strong>. Many fields are of type <strong>Reference</strong>. As another example, to dial a phone number, select <strong>Phone Number</strong>. This field, <strong>Field type</strong> only appears when <strong>Decorator applies to</strong> is <strong>Field type</strong>.</td>
</tr>
<tr>
<td>Field name</td>
<td>Select the field where you want the field decorator to appear. The choices of fields depends on the value of <strong>Table</strong>. For example, select <strong>Date</strong>. This field only appears when <strong>Decorator applies to</strong> is <strong>Specific field</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Icon</td>
<td>Clickable icon that appears in the field specified by <strong>Field type</strong> or <strong>Field name</strong> that initiates the action.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when and agent hovers a mouse over the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this component is tied to. When a record from this table opens, the field decorator appears in the field(s) specified by <strong>Field type</strong> or <strong>Field Name</strong>. The default is Global. You can leave the default value so that the field decorator icon appears for any open record that has the field specified by <strong>Field type</strong>. If you specify a table, then only when records from that table are open can the field decorator icon appear.</td>
</tr>
<tr>
<td>View</td>
<td>A set of visual configurations. This value is typically Workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this field decorator appear (selected) or not.</td>
</tr>
<tr>
<td>Order</td>
<td>An integer that governs the placement of this icon in the list of field decorators in a field. The lower the number, the further left in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future.</td>
</tr>
</tbody>
</table>

4. Right-click the top banner and select **Save**. Related links appear.

5. **Optional:** On the **Action Exclusion** tab, click **New** to exclude children tables from inheriting this component in the Contextual Side panel, or this table inheriting components from a parent table. Components in the Contextual Side panel appear according to the records open in Agent Workspace. Child tables inherit these components by default. You can prevent that from happening.
a. On the form, fill in the fields.

**Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the action assignment.</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this component. Every time Workspace opens a record from this table, this component’s icon appears in the Contextual Side panel.</td>
</tr>
<tr>
<td>Exclude this table</td>
<td>Toggle to prevent this Table from inheriting this component from its parent tables.</td>
</tr>
<tr>
<td>Exclude all child tables</td>
<td>Toggle to prevent child tables of Table from inheriting this field decorator.</td>
</tr>
</tbody>
</table>

b. Click **Submit**.

6. Under **Related Links**, click **Advanced view**.
   Up to this point, you have not specified the URL you want to open when an agent clicks the field decorator icon. This is the task you perform in Advanced view.

7. On the **Action Attributes** tab, in **Payload Map**, select the action attribute you want to define. In this example, select **url**.

8. In the value field, enter the URL to open.

9. **Optional:** On the **Conditions** tab, in **Script Condition**, enter a script that can hide the field decorator.

10. **Optional:** On the **Conditions** tab, in **Client Conditions**, specify conditions on the client that would hide the field decorator.
   (Optional) Client conditions are reevaluated whenever an agent makes a change in a list of records. For example, you might hide the button for a list action until an agent selects one or more records in a list. The client condition, then, is "count is greater than zero," where count is the number of records selected.

11. **Optional:** On the **Conditions** tab, in **Record Conditions**, specify a field and a value such that if an open record has a field with that value, the field decorator icon would not appear.
12. **Optional:** On the **Conditions** tab, in **Required Roles**, specify roles an agent must have to see the field decorator.

13. **Optional:** On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the action to be taken by the field decorator.

14. Click **Update**.

**Results**
The field decorator icon appears in all record fields of type reference for all of the tables you specified in **Table**. Clicking an icon would open the URL specified in the **Payload Map**.

---

**Setting up Advanced Work Assignment (AWA)**

Advanced Work Assignment (AWA) automatically routes work items to agents when you set the criteria for the agent’s availability, capacity, and skills. With AWA, agents can access their work item assignments from their Agent Workspace inboxes.

AWA uses service channels to organize incoming work items, such as chats, cases, and incidents. AWA routes these work items to specific work item queues, such as the product chat, billing chat, VIP chat, critical cases, and IT support.
queues. You can set the capacity for an agent, which is the number of work items on a particular service channel that an agent may actively work on. You can set assignment rules to determine how AWA routes work items to a group of agents. If an agent rejects a work item, the item is rerouted to another agent.

Note:
The Advanced Work Assignment plugin is required for Workspace.

**AWA work flow**

**Service Channels**
- Chats
- Cases
- Incidents

**Work Item Queues**
- Product Chat
- Billing Chat
- VIP Chat
- Critical Chat
- Critical Cases
- IT Support

**Groups**

**Agent Options**
- Agent Presence
- Reject Reasons

**AWA Configuration Components**

**Service channels**
Agents receive work items through service channels, which are preconfigured work channels. You can customize the channel conditions, define the inbox layout for agents, create additional queues, and set the capacity for specific agents. Workspace includes two preconfigured service channels, Chat and Case.

**Work items**
Each work item is a single piece of work that is handled by an agent, such as an incoming chat or case. Work items come through a work item queue, which has definable schedules, target wait times, and routing conditions.

**Assign Groups**
You can use assignment groups to group agents and provide details regarding the name and description, manager, and group email. You can use the related lists to set up roles, groups and group
members, queues, and agent capacity overrides for the agent pool.

**Assignment Rules**

Assignment rules determine how work items, such as cases, chats, or incidents, are routed to an assignment group. You can set the criteria to assign work items to agents and create custom assignment rules to determine work item assignment and handling. You can define agent skills by using the Skills Management feature.

**Agent Presence States**

An agent presence state indicates if an agent is online and available to receive incoming work items or whether the agent is away or offline. You can create or modify these availability states for agents.

**Reject Reasons**

You can define the reasons that agents use to reject a work item, such as out to lunch or on a break.

**Setting up Agent Chat**

Configure Workspace Agent Chat to enable live agent chat with customers. Through Agent Chat, agents interact with customers, create incident or case records, or transfer chats to another agent or queue.

**Before you begin**

Configure the following before starting this task:

- Install the Agent Chat plugin (com.glide.interaction.awa).
- In Advanced Work Assignment:
  - Configure service channels.
  - Define work item queues.
  - Set up work assignments.
- Update agent Live Feed profiles to display agent names and avatars in the chat client.

Watch this video to get started with Workspace Agent Chat:

Role required: workspace_admin

**About this task**

Use Chat Setup to configure these features:
• Activate or disable live chat (enabled by default).
• Activate or disable transcript download.
• Activate the display of the estimated wait time for live chat support (transfer from the virtual agent to a live agent).
• Control the display of agent names and avatars in the chat window.
• Activate notifications to be sent via the Virtual Agent chatbot in the web and mobile chat client.
• Activate Agent Whisper to enable supervisors to message agents privately when agents are interacting with a requester. For new instances, Agent Whisper is enabled by default. If you’re upgrading from a previous release, you must activate Agent Whisper.
• Set the system messages that are displayed when a live agent transfer occurs.

Chat Setup also includes the Context related list for defining chat context variables that can be used in Virtual Agent topic scripts or in chat-related features. For example, you can use chat context variables to pass certain information from the topic to share with the live agent or control how bot conversations are routed to live agents. For details on using Live Agent and context variables, see .

Procedure
1. Navigate to Conversational Interfaces > Chat Setup.

      Note: The Conversational Interfaces module is unrelated to the Collaboration plugin.

2. On the form, fill in the fields, which differ depending on whether you’re a new customer or upgrading from a previous release.

Chat Setup form for new customers in the Rome release

<table>
<thead>

**Fields related to Connect Support plugin**

If you're currently using Connect Support and upgraded to the Rome release, complete the UI, queue, and transfer message fields. These fields appear only if the Connect Support plugin is installed.

- **CSM Fulfiller UI**
  - Chat support interface: Connect Support or Workspace.
  - **Note:** If you're migrating to Agent Chat, select **Agent Workspace** as the fulfiller UI.

- **CSM Queue**
  - Live Agent chat queue is used for Customer Service Management (CSM) if not specified in the chat interface or changed by a Virtual Agent topic.
  - **Note:** If you're using Workspace, a CSM queue is not required.

- **HR Fulfiller UI**
  - Chat support interface: Connect Support or Workspace.
  - **Note:** If you're migrating to Agent Chat, select **Agent Workspace** as the fulfiller UI.

- **HR Queue**
  - Live Agent chat queue is used for HR if not specified in the chat interface or changed by a Virtual Agent topic.
  - **Note:** If you're migrating to Workspace, an HR queue is not required.

- **ITSM Fulfiller UI**
  - Chat support interface: Connect Support or Workspace.
  - **Note:** If you're migrating to Agent Chat, select **Agent Workspace** as the fulfiller UI.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ITSM Queue</td>
<td>Live Agent chat support queue is used for IT Service Management (ITSM) if not specified through the chat interface or specified by a Virtual Agent topic.</td>
</tr>
<tr>
<td>Global Fulfiller UI</td>
<td>Chat support interface for the platform: Connect Support or Workspace.</td>
</tr>
<tr>
<td></td>
<td>Note: If you’re migrating to Agent Chat, select <strong>Agent Workspace</strong> as the Global Fulfiller UI.</td>
</tr>
<tr>
<td>Global Queue</td>
<td>Queue used if Virtual Agent doesn’t have information about the queue from the chat interface or a Virtual Agent topic.</td>
</tr>
<tr>
<td></td>
<td>Note: If you’re migrating to Workspace, a Global Queue is not required.</td>
</tr>
<tr>
<td>Transfer message</td>
<td>Message users see when they are transferred to a live agent or another queue. For example: &quot;Please stand by while I connect you to a live agent.&quot;</td>
</tr>
<tr>
<td></td>
<td>Note: You can define only one transfer message, which is displayed for all queues in your instance.</td>
</tr>
<tr>
<td>No Agents Available message</td>
<td>Message that users see when a live agent is not available. For example: &quot;No agents are available at the moment. Please try again later.&quot;</td>
</tr>
<tr>
<td></td>
<td>Note: You can define only one agent availability message, which is displayed for all queues in your instance.</td>
</tr>
<tr>
<td>Enable Autopilot Client Notifications</td>
<td>Option to receive notifications related to Conversation Autopilot. Conversation Autopilot allows agents to use autopilot quick actions to invoke Virtual Agent topics.</td>
</tr>
</tbody>
</table>

3. Select **Update**.
What to do next
You’re almost done with Agent Chat configuration. From here, you can define and publish chat context variables to capture information that can be used in other chat-related features.

Your final step is to enable the chat client on your end-user portal, which is commonly called the Service Portal. After completing this step, you’re done configuring Agent Chat.

Two options are available for setting the Service Portal chat client for Virtual Agent and Live Agent:

• **Service Portal Agent Chat Configuration**: Define a configuration that enables the chat client to persist across all portal pages for selected portals. End users can engage in chat on any portal page in specified portals.

• **Configure the legacy Service Portal widget for Virtual Agent**: Add the Legacy Virtual Agent Service Portal widget to a single, selected portal page, from which your end users run the chat client.

Setting up Agent Whisper
The Agent Chat plugin [com.glide.interaction.awa] must be installed and configured before using Agent Whisper.

Before you begin
Role required: admin

Procedure
1. New customers or existing customers who do not have the Agent Chat plugin [com.glide.interaction.awa] installed must install the Agent Chat plugin. For instructions on installing the plugin, see Activate a Plugin. Agent Whisper is enabled by default.

2. Existing customers who have the Agent Chat plugin already installed:
a. Navigate to **Conversational Interfaces > Chat Setup**.

b. On the form, select the Agent Whisper check box.

---

**Build a report to track the number of help requests**

Create a report that tracks the number of help requests.

**Before you begin**

Role required: admin

**Procedure**

1. **Activate the Interaction Events business rule.**
   a. Navigate to **Interaction > All**.
   b. Right-click the **Number** heading.
c. Click **Configure > Business Rules**. The Business Rules screen appears.

d. Under the **Name** column, click **Interaction Events**. The Business Rules - Interaction Events screen appears.
e. Select the Active check box if it is not already selected.

f. Click Update.

2. Create a new metric definition for Interaction "help requested." For detailed steps on creating metric definitions, see Create a metric. On the Metric Definition - New record screen, enter Interaction in the Table field and select Help Requested from the Field list.

3. Create a new chat as a requester.

4. Accept the same chat as an agent.

5. While still logged in as that agent, enter the quick action /help.

6. Navigate to Metrics > Instances and observe that there is one instance record created for help_requested=true.
Record the ID of the instance record created.

7. Navigate to the Admin window and open the interaction from the previous step.

8. Join the conversation (either privately or publicly).
9. Navigate to **Metrics > Instances** and observe that one instance record was created for 

```
<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>2020-05-15</td>
<td>Help Requested</td>
<td>Interaction: IMS0000011</td>
</tr>
<tr>
<td>11:59:25</td>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>
```

help_requested=true.

10. To learn more about using the Metric Instance Table, see [https://docs.servicenow.com/bundle/rome-platform-administration/page/use/reporting/concept/c_MetricInstance.html](https://docs.servicenow.com/bundle/rome-platform-administration/page/use/reporting/concept/c_MetricInstance.html).

**Idle live chats**
You can configure how the system handles live chats if an active chat becomes idle.

By default, the system automatically checks live chat sessions every two minutes through the Idle Chat Time Task scheduled job to ensure that chat sessions are still active. If the requester does not respond within 180 seconds (three minutes) during an active chat session, the session becomes idle. The user receives a reminder message that the conversation is timing out and asks if they are still there. If they don’t respond, the system automatically cancels (times out) the chat session 360 seconds (six minutes) after the requester’s last response.

You can change the idle chat reminder message and the default time after which the system displays the reminder message and closes an idle chat.

**Change the idle chat reminder message**
The default idle chat reminder message displayed to requesters is: *The conversation is timing out, are you still there?* Agents receive the message and user response will indicate if they want to continue the chat.

You can modify the default message sent to requesters by updating the `com.glide.cs.idle_chat_reminder_message` property.
1. In the navigation filter, enter `sys_properties.list`.

2. Open the `com.glide.cs.idle_chat_reminder_message` property.

3. In the **Value** field, enter the new reminder message to be displayed.

4. Select **Update**.

**Change the idle chat timeout values**

To change the default idle chat timeout values, see `add system properties`. Add the `com.glide.cs.idle_chat_reminder_timeout` and the `com.glide.cs.idle_chat_cancel_timeout` properties to the System Property [sys_properties] table to set the chat reminder message timeout and the idle chat cancel timeout values. Create both properties at the same time.

1. In the Filter navigator, enter `sys_properties.list`.

2. Select **New** to add the `com.glide.cs.idle_chat_reminder_timeout` property.

   a. Complete these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the system property name: <code>com.glide.cs.idle_chat_reminder_timeout</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter an explanation for this property: <em>Idle chat reminder timeout (in seconds)</em></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select <em>integer.</em></td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>Enter the number of seconds before the idle chat reminder message is displayed, after the requester's last response. This value must be equal to or greater than 120 seconds, since the Idle Chat Time Task job runs every 120 seconds to check active chat sessions. For example, if the idle chat reminder message is to be displayed 5 minutes after the requester's last response, enter 300 seconds.</td>
</tr>
</tbody>
</table>
If you want to set an idle chat message reminder timeout that is under 120 seconds, you must also change the time at which the Idle Chat Time Task job runs. The job must check for idle chats within a shorter timeframe. For example, if the reminder message timeout is 60 seconds after the requester's last response, set the Idle Chat Time Task job to run every 60 seconds. For more information on base system scheduled jobs, see System scheduler.

b. Select Submit.

3. In the System Properties table, select New to add the com.glide.cs.idle_chat_cancel_timeout property.

a. Complete these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the system property name: com.glide.cs.idle_chat_cancel_timeout</td>
</tr>
<tr>
<td>Description</td>
<td>Enter an explanation for this property: Idle chat cancel timeout (in seconds)</td>
</tr>
<tr>
<td>Type</td>
<td>Select integer.</td>
</tr>
</tbody>
</table>
| Value       | Enter the number of seconds before an idle chat is canceled (times out). This value must be larger than com.glide.cs.idle_chat_reminder_timeout, where the difference between this value and com.glide.cs.idle_chat_reminder_timeout is larger than or equal to 120 seconds (2 minutes, which is when the Idle Chat Time Task job runs).

For example, if the reminder message timeout value is 300 seconds (5 minutes), the idle chat cancel timeout value must be 420 seconds or greater.
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>If you changed the Idle Chat Time Task job, the difference between the chat cancel timeout value and the idle chat reminder timeout must be larger or equal to the Idle Chat Time Task job time. For example, if the reminder timeout is 60 seconds and the Idle Chat Time Task job is also 60 seconds, the idle chat cancel timeout value must be 120 seconds or greater.</td>
</tr>
</tbody>
</table>

### b. Select Submit.

#### Set the inactivity timeout behavior

The `com.glide.cs.start_idle_timeout_after_agent_response` property determines the timeout behavior when inactivity is triggered. When this property is `true`, then the inactivity timer does not start until the agent sends a non-automated response to the requester. To add this property to the System Property [sys_properties] table, see [add system properties](#).

1. In the Filter navigator, enter `sys_properties.list`.
2. Select **New** to add the `com.glide.cs.start_idle_timeout_after_agent_response` property.
   
   a. Complete these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Enter the system property name: <code>com.glide.cs.start_idle_timeout_after_agent_response</code></td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Enter an explanation for this property: <strong>Timeout behavior when inactivity should be triggered.</strong></td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Select <code>true/false</code>.</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td><code>true</code> or <code>false</code>.</td>
</tr>
</tbody>
</table>

   b. Select **Submit**.

#### Examples

These examples show how the `com.glide.cs.start_idle_timeout_after_agent_response` system setting may affect
how the system handles idle chats. In the following examples, the inactivity timeout is set to 60 seconds and the inactivity reminder is set to 30 seconds.

Example 1: In this example, com.glide.cs.start_idle_timeout_after_agent_response does not affect how the system handles an idle chat.

1. Agent enters the chat.
2. System sends automated message Thank you for contacting support. I am looking into your question now and will be with you shortly.
3. Agent sends the message What can I help you with today?
4. If the requester does not respond after 30 seconds, then the system sends the message The conversation is timing out, are you still there?
5. If the requester does not respond within 60 seconds after the agent’s message, then the system sends the message It seems you have left the conversation and ends the chat.

Example 2: In this example, com.glide.cs.start_idle_timeout_after_agent_response affects how the system handles an idle chat.

1. Agent enters the chat.
2. System sends automated message Thank you for contacting support. I am looking into your question now and will be with you shortly.
3. If the agent does NOT send a message, one of the following occurs:
   - If com.glide.cs.start_idle_timeout_after_agent_response is not set or is set to false, then
     a. The system starts the inactivity timer.
     b. If the requester does not respond after 30 seconds, then the system sends the message The conversation is timing out, are you still there?
     c. If the requester does not respond within 60 seconds after the automated message, then the system sends the message It seems you have left the conversation and ends the chat.
   - If com.glide.cs.start_idle_timeout_after_agent_response is set to true, the system does not start the inactivity timer and the chat will not time out.

**Associating user profiles on messaging interactions**

Use extension points to call custom scripts.

**Before you begin**

Role required: admin
About this task
When a requester sends a message, the system checks if there is an existing user profile that has a matching identifier (such as a phone number) and channel details. If there is a matching user, then the system will populate the interaction record with the identifier, channel details, and the user profile in the Opened for field. If there is no user profile that matches the identifier and channel, then the system creates a channel user profile.

Procedure
1. Navigate to System Extension Points > Scripted Extension Points.
2. Click the desired extension point to view the record details. You can create multiple implementations for each extension point and assign an order number for each implementation. The implementation that has the lowest ordered applicable implementation is executed first.

<table>
<thead>
<tr>
<th>Extension point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global.ChannelUserProfileExtPoint</td>
<td>Use channel_user_id to find record to channel_user_profile user_table/user_document</td>
</tr>
<tr>
<td>global.InteractionChannelUserProfileExtPoint</td>
<td>Defines how users are synchronized between the interaction and channel_user_profile tables</td>
</tr>
<tr>
<td>global.AgentInitiatedConversationUtil</td>
<td>Get From and To options to show in UI for agent initiated conversations</td>
</tr>
</tbody>
</table>

Anonymous user chat sessions
Anonymous users (unauthenticated guests) can chat with support agents in the web chat client, without logging in to a service portal. Admins can control certain aspects of the conversational experience for guest users, such as enabling resumable chat sessions after a browser refresh.

When guest users refresh the browser window while chatting with an agent, the refresh automatically starts a new conversation and chat session. By default, the ongoing conversation and chat session history are not retained.

You can change the default guest session behavior to let your guest users resume an ongoing conversation and see the chat session history after a browser refresh. You can also set the duration of the guest chat session user cookie, to let guest users resume chat sessions after they close and reopen their browser.
Enable resumable guest sessions

Use the `com.glide.cs.guest_session_resumable` system property to change the default chat guest session behavior for guest users.

1. In the navigation filter, enter `sys_properties.list`.
2. Open the `com.glide.cs.guest_session_resumable` property.
3. In the Value field, enter `true` to enable resumable guest chat sessions and retain the chat session history.
4. Click Update.

After a browser refresh, your guest users can continue their conversations with agents and see the chat session history in the chat panel.

Change the guest chat session cookie time

The guest chat session cookie time is the length of time (duration), in seconds, of the guest session user cookie. Use the `com.glide.cs.guest_session_cookie_max_age` property to change the guest session cookie time, in case your guest users want to resume a chat after closing and reopening their browser.

For security reasons, the default property value is `-1`, which means the guest session cookie is immediately deleted when the browser is closed. But you can specify a maximum time length that sets the duration of the guest session cookie, for example 900 seconds (15 minutes).

1. In the navigation filter, enter `sys_properties.list`.
2. Open the `com.glide.cs.guest_session_cookie_max_age` property.
3. In the Value field, enter the maximum length of time (seconds) for the guest session cookie.
   - For example, the value `900` is the duration of the guest session cookie in seconds (15 minutes), to give your guest users time to resume a chat session after closing and reopening the browser.
4. Click Update.

Create conversational chat surveys

Use Survey Designer to build conversational questionnaires for gathering pre-chat information and post-chat feedback from end users. These questionnaires run in the chat client for Virtual Agent and Agent Chat.
Before you begin

- Identify the information that you want from your requesters, such as their name or email address. If you’re collecting pre-chat information, determine whether certain survey responses should be stored as chat context variables so that you can use that information for topic discovery or routing chats to certain work item queues. Before you build your survey, define and publish chat context variables for storing responses to certain survey questions. You’ll map these chat context variables to the appropriate questions in your survey.

- Role required: survey_admin or admin

About this task

You define, configure, and publish conversational questionnaires (surveys) using Survey Designer. You can use various survey controls to define the content of your questionnaires. For details on the survey controls available, see Survey designer elements to see how the controls are rendered in the survey. For example, the Choice control provides a multiple choice selection to your users.

The survey controls map to corresponding Virtual Agent Designer input controls that render the survey as a conversation in the chat client. For examples on how Virtual Agent Designer input controls are rendered in run-time conversations, see Virtual Agent Designer user input controls. The following table identifies the survey controls supported in Virtual Agent Designer.

<table>
<thead>
<tr>
<th>Survey Designer controls</th>

<td>Not supported</td>
</tr>
</tbody>
</table>

**Procedure**

1. Navigate to **Survey > Survey Designer**.

2. Click the **Configuration** tab and configure the survey. For details on survey configuration, see **Configure a survey in the survey designer**.
   As you configure your survey:
   - If you want an introduction note and end note to begin and end your survey, enter your content in the **Introduction** and **End note** fields.
   - Select the **Chat Survey** option to enable conversational questionnaires. This option also enables the display of the **Context** option in the Properties form for each survey control.
   - Click **Save**.

3. Click the **Design** tab and give your survey a **Name**. In this step, you’ll define your survey questions. For more information, see **Create a question in the survey**.
   As you design your survey questions:
   - To create a question, drag a data type icon from the Controls palette and drop it into the category container. Give each question a **Name** and click the gear icon to open the Properties form for the control.
   - In the Properties form, complete the fields as needed to define the control.
     - If you enable the **Mandatory** option, users are required to answer the survey question. If you leave this field blank, users can skip the question in the survey.
     - If you want to store the user response to this question, enter the chat context variable in the **Context** field.
   - Click **Save**.

4. After you finish defining the questions in your survey, click **Preview** to review your survey.
5. When you are satisfied with the Survey, click **Save and Publish**. Your survey is listed in the Assessment Metric Types [asmt_metric_type] table.

**What to do next**
Define the pre-chat and post-chat survey configurations that control the surveys to be presented to your requesters.

**Using emojis in Agent Chat**
Use emojis in Agent Chat conversations to convey emotions to requesters. This helps requesters feel like they are having a conversation with a friend and builds customer brand loyalty.

**Before you begin**
Emojis must be enabled before you can use them in Agent Chat and can be used by both requesters and agents. See [Setting up Agent Chat](#) for instructions on enabling emojis.

Role required: admin
Procedure

1. While in an active chat, there are several ways to include an emoji:

   • Select the Insert emoji icon 😊 to display the emoji palette. Then select an emoji from the palette or search for an emoji by entering a name in the search bar of the emoji palette.

   • Enter a colon followed by the first few characters of the emoji name. When the pop-up menu of emojis displays, select one.
• Enter a special character combination or short name which is automatically converted into an emoji after entering a space or enter.

2. If you position the cursor over an emoji, a tooltip displays the short name for the emoji.

Define pre-chat survey configurations
Determine the pre-chat questionnaire to be presented to your requesters based on conditions that you apply.
Before you begin

- Create your pre-chat surveys in Survey Designer.
- Role required: admin

About this task

You can apply different questionnaires to collect pre-chat information from your requesters. You can use the survey information to route chats to the appropriate live agent (if using Advanced Work Assignment), or to the virtual agent.

Procedure

1. Navigate to Conversational Interfaces > Pre-Chat Survey.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this pre-chat survey configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that activates this pre-chat survey.</td>
</tr>
<tr>
<td>Order</td>
<td>Number that indicates the order in which survey configurations run.</td>
</tr>
<tr>
<td></td>
<td>If there are multiple pre-chat survey configurations, the system runs the</td>
</tr>
<tr>
<td></td>
<td>first survey found, from lowest to highest order.</td>
</tr>
<tr>
<td>Show Summary</td>
<td>Option that asks requesters of they want to see a summary of the survey</td>
</tr>
<tr>
<td></td>
<td>responses they entered.</td>
</tr>
<tr>
<td>Condition mode</td>
<td>Type of condition to be used to control the conversational survey presented</td>
</tr>
<tr>
<td></td>
<td>to requesters.</td>
</tr>
<tr>
<td></td>
<td>• Simple: Specify a condition using the condition builder.</td>
</tr>
<tr>
<td></td>
<td>• Advanced: Specify a JavaScript scripted condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that controls when the survey configuration is used.</td>
</tr>
<tr>
<td></td>
<td>Use the condition builder to select the conditions to be applied.</td>
</tr>
<tr>
<td>Script</td>
<td>JavaScript condition statement that specifies the condition for using this</td>
</tr>
<tr>
<td></td>
<td>pre-chat survey. The condition must evaluate to true.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Survey</td>
<td>List of the pre-chat surveys available. Choose the survey to be presented to the requester.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Results**

When a requester completes the pre-chat survey, the user is transferred either to a live agent if Agent Chat is set as the fulfiller interface or a virtual agent if Virtual Agent is set as the fulfiller. The user’s pre-chat responses are stored as context in the chat interaction record.

**What to do next**

Define the post-chat survey configurations that determine the post-chat survey to be applied to the appropriate queue in Advanced Work Assignment.

**Define post-chat survey configurations**

Control the post-chat questionnaire displayed to your requesters to gather feedback on their experience with live agents. You configure the post-chat surveys to be used for chat queues defined in Advanced Work Assignment.

**Before you begin**

- Activate the Agent Chat plugin (com.glide.interaction.awa) if Advanced Work Assignment is not already installed. In AWA, configure the Chat service channel and work item queues.
- Determine the post-chat survey to be displayed to your requesters.
  - Review the existing chat surveys available in the Assessment Metric Types [asmt_metric_type] table by navigating to **Survey View > View Surveys**. You can use a predefined feedback survey, such as the survey for Virtual Agent feedback (a predefined Virtual Agent setup topic).
  - Or, you can create a new post-chat survey using Survey Designer. For details, see **Create conversational chat surveys**.
- Role required: awa_admin or admin

**Procedure**

1. Navigate to **Advanced Work Assignment > Settings > Queues**.
2. Select the queue (in the Chat service channel) to which the post-chat survey configuration applies.
3. Go to the **Post Chat Survey** related link and click **New**.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this post-chat survey configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that enables this post-chat survey configuration.</td>
</tr>
<tr>
<td>Show Summary</td>
<td>Survey option that asks requesters if they want to see a summary of the survey responses they entered.</td>
</tr>
<tr>
<td>Order</td>
<td>Number that indicates the order in which survey configurations run. If there are multiple chat survey configurations, the system runs the first survey found, from lowest to highest order.</td>
</tr>
</tbody>
</table>
| Requester ended| Option that specifies if the post chat survey should always run regardless of who ends the chat.  
  - True: survey should run when either the requester or the agent ends the chat.  
  - False: survey should run only when the agent ends the chat. |
| Condition mode | Type of condition that determines the conversational survey presented to requesters.  
  - Simple: Specify a condition using the condition builder.  
  - Advanced: Specify a JavaScript scripted condition. |
| Condition      | Condition that determines the conversational survey displayed to requesters.  
  Use the condition builder to select the conditions to be applied. The fields available for selection are based on the Chat service channel. |
| Script         | JavaScript condition statement that specifies the condition for using this chat survey. The condition must evaluate to true. |
| Survey         | List of the chat surveys available. Choose the post-chat survey to be presented to your requesters. |

5. Click Submit.
Results
When a live agent ends the chat session, the post-chat survey (configured for the chat queue) is presented to the requester. When the requester submits the post-chat survey, the chat session ends for the requester. The Interaction Related Records list stores the post-survey chat survey results and creates a related record that links the assessment to the live agent (fulfiller).

Create a quick action for Workspace chat

Create a quick action so that agents can use shortcuts for performing actions in Workspace chat.

Before you begin
Role required: admin

Procedure
1. Navigate to Quick Actions > Actions, and then select New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the quick action.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the quick action.</td>
</tr>
<tr>
<td>Command Name</td>
<td>Text that triggers the quick action when entered after the forward slash (/) in a conversation.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Work item that the quick action is available for. Filter the table that you select in the Table field to qualify a certain kind of work item. For example, to make the quick action available only for conversations that are assigned to Beth Anglin, you would first select the Interaction [interaction] table in the Table. Then, in the Applies to field, you would create the following filter: [Assigned to] [is] [Beth Anglin].</td>
</tr>
</tbody>
</table>
| Table          | Work item table that the quick action is available for.  

Note: Quick actions are supported only in the Interaction [interaction] table. |
| Apply to all groups | Option for making the quick action available to all user groups. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to groups</td>
<td>List of which groups can use the quick action. This field appears only if you clear the <strong>Apply to all groups</strong> option.</td>
</tr>
<tr>
<td>Script</td>
<td>JavaScript code to control what the quick action does.</td>
</tr>
<tr>
<td></td>
<td>In this script, you have access to:</td>
</tr>
<tr>
<td></td>
<td>• The <strong>record</strong> variable, which for Workspace chat is the Interaction [interaction] record</td>
</tr>
<tr>
<td></td>
<td>• The <strong>params</strong> array, if you defined quick action parameters</td>
</tr>
<tr>
<td></td>
<td>If provided, all free-form text entered after all the other parameters are captured as the last item in the <strong>params</strong> array.</td>
</tr>
</tbody>
</table>

**Set the value of answer as follows:**

```javascript
answer = {
    success: <Boolean>,
    message: <success_or_error_message>
};
```

> **Note:** If you do not script a message, the agent receives a default message instead.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope of the quick action.</td>
</tr>
<tr>
<td>Accepts string parameter</td>
<td>Option to indicate that the script accepts text input after any defined parameters.</td>
</tr>
<tr>
<td>Parameter label</td>
<td>Parameter name that displays next to the quick action.</td>
</tr>
<tr>
<td>Parameter hint text</td>
<td>Text that displays as a hint when the agent enters a quick action.</td>
</tr>
</tbody>
</table>

### What to do next

If your quick action requires a secondary menu, define a quick action parameter so that agents can further control the quick action. For more information, see [Define a quick action parameter for Workspace chat](#).

Optionally, you can make the quick action available in Workspace chat as a button. For more information, see [Configure a quick action button for Workspace chat](#).
Define a quick action parameter for Workspace chat

Define a quick action parameter to allow agents to further control a quick action in Workspace chat.

Before you begin
Role required: admin

Procedure
1. Navigate to Quick Actions > Parameters, and then click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the parameter.</td>
</tr>
<tr>
<td>Action</td>
<td>Quick action that uses the parameter.</td>
</tr>
<tr>
<td>No Matching Results Message</td>
<td>Message to agents if no records match the record query. If you do not create a No Matching Results Message, a default message is provided.</td>
</tr>
<tr>
<td>Display value field</td>
<td>Field from the parameter record that appears in Workspace chat. This field appears when you select Basic in the Query mode field.</td>
</tr>
<tr>
<td>Query mode</td>
<td>Type of query. You can select Scripted or Basic. To query records with a script, select Scripted. To query records by whichever table that you specify in the Table name field, select Basic.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table to query for parameters. This field appears when you select Basic in the Query mode field.</td>
</tr>
<tr>
<td>No Results Message</td>
<td>Message to agents if there are no available records to query. If you do not create a No Results Message, a default message is provided.</td>
</tr>
<tr>
<td>Value field</td>
<td>Field from the parameter record that agents can enter in Workspace chat to invoke the parameter item. For example, to transfer a conversation to Beth Anglin, an agent would enter /ta &quot;beth.anglin&quot;. In this case, the User ID field in the User [sys_user] record is the Value field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Query Script | JavaScript code to determine which records qualify for your parameter. You are given a query variable that represents the search query that the agent provided. Set the value of the answer variable as follows:  

```javascript
answer = {
  items: [ { value: <value>, displayValue: <displayValue>} ]
};
```

The array of items should contain objects with a value and a displayValue.  

**Note:** This field shows only if you select Scripted in the Query mode field. |

<table>
<thead>
<tr>
<th>Application</th>
<th>Application scope of the parameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order that the parameter is available for the quick action.</td>
</tr>
</tbody>
</table>

3. Click Submit.

**Configure a quick action button for Workspace chat**

Configure a quick action button so that agents can perform actions in Workspace chat with a single click.

**Before you begin**

Role required: admin

**About this task**

The toolbar of the Workspace chat window contains three buttons. By default, clicking the left button (_attach_file_icon_) attaches a file in a conversation, clicking the center button (_queue_icon_) initiates a queue transfer, and clicking the right button (_agent_icon_) initiates an agent transfer. You can’t configure the left button, but you can assign different quick actions to the center and right buttons. However, you can’t change the button icons.
Toolbar in the Workspace chat window

1. Navigate to Conversational Interfaces > Chat Setup.
2. Go to the Quick Actions for Workspace Actions related list and select a button to configure.
   • To configure the arrow button (→), open arrow-right-outline.
   • To configure the add user button (➕), open user-plus-outline.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Action</td>
<td>Quick action that is inserted when you click the button.</td>
</tr>
<tr>
<td>Icon</td>
<td>Button icon that appears on the toolbar of the Workspace chat window. You can't change the button icon.</td>
</tr>
</tbody>
</table>
Setting up quick action toolbar controls

Customize the quick actions that appear on the chat toolbar.

Before you begin
Role required: admin

Procedure

1. Navigate to Conversational Interfaces > Chat Setup. Navigate to the Quick Action Toolbar Controls related list at the bottom of the screen.
   - To create a quick action workspace action, select New.
   - To modify a quick action workspace action, select the quick action workspace action record you want to update.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Action</td>
<td>Quick action performed.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the quick actions workspace action.</td>
</tr>
<tr>
<td>Use custom icon</td>
<td>Option to display a custom, downloaded icon in the toolbar.</td>
</tr>
<tr>
<td>Icon</td>
<td>Image to display on the toolbar when Use custom icon is selected. Select Click to add... and on the Choose an image screen, select an image file.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the quick action.</td>
</tr>
</tbody>
</table>

4. Click Update.
<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Value of this quick action. Quick actions are executed from lowest order to highest order, so a quick action with an order of 100 is considered before a quick action of 200.</td>
</tr>
<tr>
<td>Available on private chat tab</td>
<td>Option that defines whether the quick action is available on the private chat tab.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Condition which determines when the quick action is available. * Add Filter Condition- Filter the table that you select in the <strong>Table</strong> field to qualify a certain type of work item. * Add “OR” Clause- Add an “or” clause to the condition. For example, to make the quick action available only for conversations assigned to Beth Anglin, you select the Interaction [interaction] table in the <strong>Table</strong>. Then, in the <strong>Applies to</strong> field, you create the following filter: <em>[Assigned to] [is] [Beth Anglin]</em>.</td>
</tr>
<tr>
<td>Apply to all groups</td>
<td>Option for making the quick action available to all user groups.</td>
</tr>
<tr>
<td>Apply to groups</td>
<td>Option for making the quick action available to only specified user groups.</td>
</tr>
<tr>
<td>Parameter value(s)</td>
<td>Parameters needed for the quick action.</td>
</tr>
<tr>
<td>Auto-submit</td>
<td>Option for the agent to select a button and have the quick action and parameter post to the chat.</td>
</tr>
</tbody>
</table>

3. Select **Submit** or **Update**.
Display chat context variables

Activate context quick actions to enable agents to view context relevant to a chat interaction. When launched in a chat display cards show: sysparm_portal, sysparm_page, table, sys_id, or sysparm_language.

Before you begin
Role required: admin

About this task
Context quick actions are a default quick action, but require activation.

Procedure
1. Navigate to Quick Actions > Actions.
2. Set the Active field to true under Get Chat Context Variables, or use the list editor to set the quick action to active.

Using Dynamic Translation for Agent Chat
Use Dynamic Translation for Agent Chat (DTAC) to translate chat conversations into both the requester's and agent's preferred languages.

Transferring from Virtual Agent to a live agent
Once an agent accepts a chat, they can see the chat history between the Virtual Agent and requester in their preferred language for more context.

Virtual Agent topics must be set up in the desired languages prior to using DTAC. To learn more about how to set up topics, see Virtual Agent Designer.
Translation indicators for agents and requesters

When DTAC is enabled, requesters see a banner at the top of the chat conversation that informs them that the conversation is being translated. The banner helps the requesters understand to be clear and conscious with their messages.

A banner also appears at the top of the agent’s active chats informing them that translation is being used as well as the requester’s source language. Bilingual agents can determine if they’re fluent enough in the requester’s language to temporarily turn off DTAC for individual chat sessions as needed.

Translation support in chat conversations

When DTAC is enabled, these items are translated in chat conversations:

• Users’ messages
• System messages
• Virtual Agent chat history
• Record card field values
• Rich controls

<table>
<thead>
<tr>
<th>Type</th>
<th>Rich Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>User input</td>
<td>String</td>
</tr>
<tr>
<td>User input</td>
<td>Static choice list</td>
</tr>
<tr>
<td>User input</td>
<td>Reference choice</td>
</tr>
<tr>
<td>User input</td>
<td>Boolean</td>
</tr>
<tr>
<td>User input</td>
<td>Date time</td>
</tr>
<tr>
<td>User input</td>
<td>File picker</td>
</tr>
<tr>
<td>User input</td>
<td>Carousel</td>
</tr>
<tr>
<td>Bot response</td>
<td>Text</td>
</tr>
<tr>
<td>Bot response</td>
<td>Single link</td>
</tr>
<tr>
<td>Bot response</td>
<td>Multiple links</td>
</tr>
<tr>
<td>Bot response</td>
<td>Multi-flow output</td>
</tr>
<tr>
<td>Bot response</td>
<td>Script output</td>
</tr>
<tr>
<td>Bot response</td>
<td>Record card</td>
</tr>
</tbody>
</table>

DTAC does not support record card labels. For this functionality to operate, system localization properties must be configured. Navigate to **System Properties > System Localization**. For more information, see ServiceNow® product documentation on Localization settings.
How agents can troubleshoot translated messages

If the translation doesn’t make sense because of idioms or jargon, then the agent can use this to see the requesters original message.

Translation services do not understand idioms or jargon and it is possible that some user messages are lost in translation. Agents can use the translation-indicator icon to view the requester’s original message and look up its meaning as needed.

Agents can navigate to the individual chat message and select the translation-indicator icon (🌐) to see the requester’s original, untranslated message.

Dynamic translations control for bilingual agents

When a bilingual agent accepts a chat conversation to which they’re fluent in the requester’s language, DTAC is not necessary. With the Dynamic translations chat session control, agents can turn off DTAC for individual chat sessions.

Agents can select the ellipsis (…) at the bottom of the chat window then select the Dynamic translations control to the off position.

When DTAC is switched off, a notification displays at the top of the agent’s and the requester’s chat windows, highlighting the change in status, for this chat session.

The translation capability is switched off for both the requester and the agent, for this specific chat session. The selection in one chat session does not affect the selection in other chat sessions and the agent can turn DTAC off and back on within one chat session.
Translated chat transcripts
Two chat transcripts are generated at the end of each DTAC chat session. One for the requester to download and save in the requester’s language. The other is the agent’s transcript which contains the text as seen in the agent’s chat window. If an agent used DTAC in part of the chat, the transcript contains both the translated and non-translated text. For more information, see Download chat transcript.

Analytical reports for DTAC
You can generate a report that counts the number of DTAC chats, to assess how many conversations use the DTAC option.

Monitor the number of true values in the Translated column in the Interaction table. For more information, see the ServiceNow® product documentation on Interaction records in Workspace Interaction records in Agent Workspace.

Mobile clients
DTAC is available for requesters on Agent Chat in mobile for iOS and Android.

Agent-Initiated Messaging Interface
Enable agents to initiate conversations with customers on a messaging app of customers’ choice by using the ServiceNow® Agent-Initiated Messaging Interface application.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Overview
The Agent-Initiated Messaging Interface application supports agent-initiated conversations for any type of messaging channels such as SMS.

Note: The messaging channels are available based on the application associated with the service channel you install. For more information, see Service channels.

By default, the application is configured for the Conversational SMS service channel in the CSM Configurable Workspace. For more information, see Conversational SMS service channel and Initiate messaging conversations from the CSM Configurable Workspace.
Configuring Agent-Initiated Messaging Interface
Set up the Agent-Initiated Messaging Interface application to enable agents to send messages to customers through different messaging channels.

Agent-Initiated Messaging Interface configuration tasks

<table>
<thead>
<tr>
<th>Task</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Install Agent-Initiated Messaging Interface.</td>
<td>Install the Agent-Initiated Messaging Interface application to integrate a messaging channel with your ServiceNow instance.</td>
</tr>
<tr>
<td>2. Set up Agent-Initiated Messaging Interface for a messaging channel.</td>
<td>Set up the Agent-Initiated Messaging Interface application to send messages from a messaging channel.</td>
</tr>
<tr>
<td>3. (Optional) Associate user profiles with agent-initiated messages.</td>
<td>Use scripted extension points to call custom scripts for associating user profiles with agent-initiated messages.</td>
</tr>
<tr>
<td>4. (Optional) Validate recipient IDs for agent-initiated messages.</td>
<td>Use scripted extension points to call custom scripts for validating the format of a recipient ID associated with a messaging channel.</td>
</tr>
<tr>
<td>5. (Optional) Determine whether messaging channels are available for agent-initiated messages.</td>
<td>Use scripted extension points to call custom scripts for determining whether a messaging channel is applicable to a user profile in an agent-initiated message.</td>
</tr>
</tbody>
</table>

Install Agent-Initiated Messaging Interface
You can install the Agent-Initiated Messaging Interface application (sn_agent_initiated) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin
- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

About this task
The following items are installed with Agent-Initiated Messaging Interface:
• Plugins
• Store applications
• Tables

For more information, see Components installed with Agent-Initiated Messaging Interface.

Procedure
1. Navigate to System Applications > All Available Applications > All.

2. Find the Agent-Initiated Messaging Interface application (sn_agent_initiated) using the filter criteria and search bar.
   
   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Agent-Initiated Messaging Interface.

4. Optional: If demo data is available and you want to install it, click Load demo data.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   **Important:** If you don’t load the demo data during installation, it’s unavailable to load later.

5. Click Install.

Set up Agent-Initiated Messaging Interface for a messaging channel

Set up the Agent-Initiated Messaging Interface application to send messages from a messaging channel.
Before you begin

• Install Agent-Initiated Messaging Interface.

• Review the list of messaging channels available for the Agent-Initiated Messaging Interface application.

• Set the application scope to the application associated with the messaging channel using the application picker. For more information, see Application picker.

  For example, for using the SMS messaging channel, set the application scope to the Conversational SMS service channel application.

Role required: admin

About this task

A messaging channel is available when you install the application associated with a service channel.

For example, use the SMS messaging channel to send an SMS message to a customer. The SMS messaging channel is available when you have installed the Conversational SMS service channel application.

Procedure

1. In the navigation filter, enter **sn_agent_initiated_msg_config.list**.

2. In the Agent initiated messaging configurations list, modify an existing configuration or create another configuration for a messaging channel.

   • To modify an existing configuration, in the **Active** column, click the value link corresponding to the messaging channel displayed in the **Channel** column.

     For example, to send messages by using the SMS messaging channel, click the link in the **Active** column corresponding to the **SMS** channel.

   • To create another configuration for a messaging channel, click **New** in the Agent initiated messaging configurations list.

3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Messaging channel using which agents can initiate messages to connect with requesters.</td>
</tr>
<tr>
<td>Check if active recipient</td>
<td>Option to ensure that an active channel user profile exists when sending messages to the user from the channel.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>profile exists</td>
<td>If there are no active channel user profiles, the associated channel is not available for agent-initiated messages. In this case, the channel does not appear in the <strong>Channel</strong> field of the Compose Message form. For information on the Compose Message form available in CSM Configurable Workspace, see <em>Initiate messaging conversations from CSM Configurable Workspace</em>.</td>
</tr>
<tr>
<td>Show option to enter recipient ID manually</td>
<td>Option to display the field to manually enter recipient ID. For example, select this check box to enable agents to enter a phone number manually for sending an SMS message to a consumer.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the application that contains the channel. This field is automatically set based on the application scope selected in the application picker.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the use of the channel for agent-initiated messages.</td>
</tr>
<tr>
<td>Order</td>
<td>Order number for each channel in which they appear for agent on the Compose Message form when composing messages. The channel that has the lowest order number is displayed first. For information on the Compose Message form available in CSM Configurable Workspace, see <em>Initiate messaging conversations from CSM Configurable Workspace</em>.</td>
</tr>
</tbody>
</table>

4. Save the configuration setting.
   - If you created a new configuration setting, click **Submit**.
   - If you modified an existing configuration setting, click **Update**.

**Associate user profiles with agent-initiated messages**

Use scripted extension points to call custom scripts for associating user profiles with agent-initiated messages.

**Before you begin**

Install the Agent-Initiated Messaging Interface application. For more information, see *Install Agent-Initiated Messaging Interface*.

Role required: admin
About this task
An agent can compose messages from an interaction of type other than Message in the CSM Configurable Workspace. By default, the AgentMessagingInteractionUserDocument script include is available for retrieving user profiles associated with consumers and customer contacts in an interaction record.

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

Procedure
1. Navigate to System Extension Points > Scripted Extension Points.
2. In the API Name column, search for and select sn_agent_initiated.AgentInitiatedMessagingUserDocument.
3. On the Extension Point form, either modify a script include to use the sn_agent_initiated.AgentInitiatedMessagingUserDocument extension point or create and register a custom script include.
   - Create and register a custom script include.
     For more information, see Register a custom script include.
   - Modify the existing script include by going to the Implementations related list and selecting a script include in the Class column.

   **Note:** By default, the AgentMessagingInteractionUserDocument script include that use the sn_agent_initiated.AgentInitiatedMessagingUserDocument extension point is available for the Agent-Initiated Messaging Interface application. This script include is configured to retrieve user profiles associated with consumers and customer contacts from the Interaction [interaction] table record.

4. Associate user profiles for an agent-initiated messages by adding the sn_agent_initiated.AgentInitiatedMessagingUserDocument extension point to the script include.
   You can create multiple implementations for an extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.
<table>
<thead>
<tr>
<th>Customization</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associate a table record from which the message was initiated</td>
<td>Include the <code>isValidForTableRecord</code> method in the <code>sn_agent_initiated.AgentInitiatedMessagingUserDocument</code> extension point.</td>
</tr>
<tr>
<td>Retrieve the user details associated with the table record from which the message was initiated</td>
<td>Include the <code>getUserDocument</code> method in the <code>sn_agent_initiated.AgentInitiatedMessagingUserDocument</code> extension point.</td>
</tr>
</tbody>
</table>

**Note:** Based on the table record set in the `isValidForTableRecord` method, the user details are retrieved for sending agent-initiated messages in the `getUserDocument` method.

5. On the Extension Point form, click **Update**.

**Validate recipient IDs for agent-initiated messages**

Use scripted extension points to call custom scripts for validating the format of a recipient ID associated with a messaging channel.

**Before you begin**

Install the Agent-Initiated Messaging Interface application. For more information, see Install Agent-Initiated Messaging Interface.

Role required: admin

**About this task**

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

**Procedure**

1. Navigate to System Extension Points > Scripted Extension Points.
2. In the API Name column, search for and select `global.ChannelSendToValidation`.
3. On the Extension Point form, either modify a script include to use the `global.ChannelSendToValidation` extension point or create and register a custom script include.
Create and register a custom script include.
For more information, see Register a custom script include.

Modify the existing script include by going to the Implementations related list and selecting a script include in the Class column.

**Note:** The `PhoneNumberValidationExtPointImpl` script include that use the `global.ChannelSendToValidation` extension point is available for validating recipient IDs profiles associated with the Conversational SMS service channel application.

4. Associate user profiles for an agent-initiated messages by adding the `global.ChannelSendToValidation` extension point to the script include. You can create multiple implementations for an extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.

<table>
<thead>
<tr>
<th>Customization</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associate a channel ID for which the message was initiated</td>
<td>Include the <code>isValid</code> method in the <code>global.ChannelSendToValidation</code> extension point.</td>
</tr>
<tr>
<td>Retrieve the recipient ID associated with the channel for which the message was initiated</td>
<td>Include the <code>channelSendToValidation</code> method in the <code>sn_agent_initiated.AgentInitiatedMessagingUserDocument</code> extension point.</td>
</tr>
</tbody>
</table>

**Note:** Based on the channel ID set in the `isValid` method, the recipient details are retrieved for validating a recipient ID in the `channelSendToValidation` method.

5. On the Extension Point form, click **Update**.

**Determine whether messaging channels are available for agent-initiated messages**

Use scripted extension points to call custom scripts for determining whether a messaging channel is applicable to a user profile in an agent-initiated message.

**Before you begin**

Install the Agent-Initiated Messaging Interface application. For more information, see Install Agent-Initiated Messaging Interface.
Role required: admin

About this task
By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

Procedure
1. Navigate to System Extension Points > Scripted Extension Points.
2. In the API Name column, search for and select sn_agent_initiated.ChannelsQualifyingForAgentMessaging.
3. On the Extension Point form, create and register a custom script include. For more information, see Register a custom script include.
4. Determine whether a messaging channel is applicable to a user profile in an agent-initiated message by adding the sn_agent_initiated.ChannelsQualifyingForAgentMessaging extension point to the script include.
   You can create multiple implementations for an extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.

<table>
<thead>
<tr>
<th>Customization</th>
<th>Implementation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associate a messaging channel ID for agent-initiated messages with the custom script</td>
<td>Include the isValidForChannel method in the sn_agent_initiated.ChannelsQualifyingForAgentMessaging extension point.</td>
</tr>
<tr>
<td>Check whether a user qualifies for the messaging channel for agent-initiated messages</td>
<td>Include the isChannelValidForAgentInitiatedMessaging method in the sn_agent_initiated.ChannelsQualifyingForAgentMessaging extension point.</td>
</tr>
</tbody>
</table>

**Note:** Based on the messaging channel ID set in the isValidForChannel method, the users are evaluated for sending agent-initiated messages in the isChannelValidForAgentInitiatedMessaging method.

5. On the Extension Point form, click Update.
Components installed with Agent-Initiated Messaging Interface

Several types of components are installed with installation of the Agent-Initiated Messaging Interface application, including tables, plugins, and ServiceNow Store applications.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Setting up phones in workspace
Enable agents to receive and make phone calls with requesters.

When you connect workspace to your telephony system, agents can make and receive calls with requesters. When receiving calls, workspace automatically creates an interaction record, which an agent uses to enter the details of the phone call request.

Workspace displays a phone icon (📞) that agents use to accept and make phone calls. The icon displays a number when phone calls are waiting to be answered. Agents set their status to Available or Away to allow or prevent phone calls from being routed to them.

The phone interface is integrated into workspace so agents can talk while working onscreen with all of other features provided by workspace.
Next

Set up Phone integration.

Workspace phone integration with OpenFrame and computer telephony integration (CTI)

OpenFrame and CTI enable third-party phone integrations for phone use for agents in Agent Workspace.

- OpenFrame enables CTI with third-party telephony service providers (TSPs) such as Twilio.
- CTI integrates with the Now Platform and the TSPs to support incoming and outgoing calls.

When you integrate OpenFrame and CTI with a TSP, agents in Workspace can use:
• An embedded softphone to place and receive customer calls.
• Click-to-call capability from phone number fields on forms and the Customer 360 ribbon component.
• Contextual identification for incoming calls.
• An additional window that contains contextual links in the softphone window and open related records.

OpenFrame and CTI can also integrate with the Interaction Management System (IMS), which enables you to manage the life cycle of the phone interaction. With this integration, incoming and outgoing calls create phone interaction records.

Related information

OpenFrame overview
Create an OpenFrame configuration

Use embedded softphones with Workspace

Configure Workspace to support embedded softphones so that agents can receive incoming calls and place outgoing calls.

Incoming calls

Agents receive incoming calls in the OpenFrame window. Contextual information, such as the account, contact, consumer, and case number, is displayed in the window.

Agents click links from the contextual information in the OpenFrame window to open the corresponding records in Workspace. Agents can open the forms in primary or child tabs depending on the workspace tab configuration.

• With Interaction Management System (IMS) integration, these records open as sub-tabs to the interaction record.
• Without IMS integration, these records open as primary tabs.

For more information, see the OpenFrame overview.

Outgoing calls

Agents can place outgoing calls from phone number fields on a form or from the ribbon on the Case form.

By clicking these phone fields, agents see the OpenFrame window, where they can place a call to the number which shows on-screen.
Integration with Interaction Management System (IMS)

With OpenFrame, computer telephony integration (CTI), and IMS integration, incoming and outgoing calls create interaction records.

Receive incoming calls through Workspace

When an agent answers an incoming call from the OpenFrame window, an interaction record opens in a parent tab in the New state with the Channel field set to Phone.

If available for your installation, the account information, the contact information, or the consumer information, is added to the interaction record. The case number is also added to the record if the caller provides it to the agent. If an agent clicks a link in the OpenFrame window, such as the account, contact, consumer, or case number, the corresponding record opens in a sub-tab under the interaction record.

The call forwards to an agent. The interaction record is assigned to the agent and the state is set to Pending Acceptance. The interaction record is displayed in the agent’s workspace and includes any details that are provided by the customer.

The agent can accept or reject the call:

• If accepted, the interaction record state is set to Work in Progress.
• If rejected, the interaction record state is set to Closed Complete.
• If the call is not picked up or the caller hangs up before the agent can pick up, the interaction state is set to Closed Complete.

When a call is ended, a phone log record is created for the interaction and the interaction record state is set to Closed Complete.

Make outgoing calls through Workspace

For outgoing calls, the sn_openframe.create_interaction property determines whether or not an interaction record is created.

When an agent places an outgoing call using a click-to-call enabled phone field, the system gathers contextual information about the call, including the account, contact, or consumer details.

If the sn_openframe.create_interaction property is set to true:

• An interaction record is created in the Work in Progress state. The record is populated with the contextual information and is assigned to the agent.
• The interaction record and relevant information is passed to OpenFrame.
• CTI receives the interaction, initiates the call, and manages the interaction life cycle.
• If the outgoing call is unanswered, the interaction record is set to Closed Complete.

If the `sn_openframe.create_interaction` property is set to false:
• The contextual information is passed to OpenFrame.
• CTI receives the contextual information and initiates the call.

Transferring calls to other agents
If an agent transfers a call to another agent, the interaction record is also transferred and a transfer record is created. The call is shown in the OpenFrame window in the new agent's workspace. The interaction record is assigned to the new agent in the Pending Acceptance state and is displayed in the agent's workspace. The state changes to Work in Progress when the agent accepts the call.

Integration with Interactive Voice Response (IVR)
With IVR integration, an interaction record is created as soon as the caller connects and receives an IVR message. The selections made by the caller are captured and added to the interaction record. If the caller enters a case number, the case is added as a related record on the interaction.

Limiting conversation data growth
As operations are performed, conversation-related tables increase in size and can end up affecting system performance. To improve performance while still retaining sufficient records, set up a process to archive past data and clean up the tables that are used for ongoing conversations.

Recommended activations
To limit the data growth associated with heavy use of Virtual Agent and Agent Chat, activate the cleaner jobs in the following table:

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Cleaner Job Summary</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA agent channel availability [awa_agent_channel_availability]</td>
<td>Removes AWA agent channel availability logs older than 90 days.</td>
<td>Activation recommended.</td>
</tr>
<tr>
<td>Table Name</td>
<td>Cleaner Job Summary</td>
<td>Recommendation</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------</td>

<td>Removes conversation logs that are older than 60 days.</td>
<td>No action needed, already activated.</td>
</tr>
<tr>
<td>[sys_cs_conversation]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Which tables should be cleaned**

These tables should be cleaned because they can grow into the millions of records in long-running instances:

- Agent Presence History [awa_agent_presence_history]
- AWA Document Size [awa_document_size]
- AWA Work Item [awa_work_item]
- Consumer [sys_cs_consumer]
- Consumer Device Context [sys_cs_consumer_device_context]
- Conversation [sys_cs_conversation]
- Interaction [interaction]
- Interaction JSON Blob [interaction_json_blob]
- Live Group Profile [live_group_profile]

There are other related tables, such as the Conversation Message [sys_cs_message] and Live Feed Message [live_message] tables, that can also become large. These tables have `reference_cascade_rule_delete` attributes that cause them to be cleaned as a side effect of cleaning the tables in the preceding list.

**Which records in the tables should be deleted**

The Auto Flush configuration lets you select the **Matchfield** and **Age in seconds** fields. The **Matchfield** field corresponds to a date column in the table and the **Age in seconds** field indicates when the deletions are triggered. When a record...
reaches a point where the **Matchfield** field has a date that is farther in the past than the **Age in seconds** field, the cleaner deletes the record when it runs.

Ideally, the **Matchfield** field should indicate how long the record has been active. The columns in the following table work well as the **Matchfield** field for the tables in question, with the additional condition in the **Conditions** field where indicated.

<table>
<thead>
<tr>
<th>Table</th>
<th>Column</th>
<th>Is column indexed?</th>
<th>Additional condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA agent channel availability [awa_agent_channel_availability]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td>agent.active=false</td>
</tr>
<tr>
<td>AWA agent presence [awa_agent_presence]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>AWA agent presence history [awa_agent_presence_history]</td>
<td>Updated (sys_updated_on)</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>AWA document size [awa_document_size]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>AWA work item [awa_work_item]</td>
<td>Updated (sys_updated_on)</td>
<td>Yes</td>
<td>state!=accepted,cancelled</td>
</tr>
<tr>
<td>Interaction [interaction]</td>
<td>Updated (sys_updated_on)</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Interaction JSON blob [interaction_json_blob]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>Live group profile [live_group_profile]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td></td>
</tr>
<tr>
<td>Consumer [sys_cs_consumer]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td>name=Guest User</td>
</tr>
<tr>
<td>Conversation [sys_cs_conversation]</td>
<td>Updated (sys_updated_on)</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**interaction.closed_at and sys_cs_conversation.conversation.completed** are not good options for the **Matchfield** field because they do not have values for
faulted conversations and some closed interactions. The gaps can be closed with business rules that set this date if it is empty when an appropriate state change occurs, but for simplicity, use the sys_updated_on field for these tables. Other tables can be limited by conditions on the state field that ensure only closed chats are deleted. Since interactions should never be left open for more than a few days in general, these conditions can be left out to make the queries simpler and run faster after the last update. The state on the awa_work_item table may be more important because longer running tasks like cases are also represented.

The issue with the sys_cs_consumer table is that while normally you may want to keep these records to match new conversations to existing users, in the case of guest users, a different record is created for every conversation. For the sys_cs_consumer_device_context table, there is a reference to the CS Consumer Account [sys_cs_consumer_account] table (which itself has a reference to the sys_cs_consumer table), but the reference is not marked with reference_cascade_rule=delete. The recommendation is to add this rule to the consumer account reference. That way, when the cleaner deletes the records in the sys_cs_consumer and sys_cs_consumer_account tables, it also deletes these.

The awa_agent_presence and awa_agent_channel_availability tables do not grow per chat in the same way as other tables, but are regularly accessed by the assignment engine and can end up with stale entries from users who are no longer active. Long unused entries should be cleaned up here as well. Extra care must be taken with the awa_agent_channel_availability column because it may not be updated often. For this reason, an extra condition should be added to that cleaner so only records associated with inactive users can be removed.

When can the records be safely deleted

There are several considerations in determining when the records can be safely deleted:

• Do not delete records for ongoing conversations.
  For session-based chat conversations, the age threshold is just a couple days. If SMS/messaging conversations are included, the age threshold may extend to a few weeks or longer. One way to evaluate this is to look through all the properties of the form com.glide.cs._idle_timeout and locate the one with the highest value.
• Do not delete records that contribute to dashboards/reports on recent activity.
The AWA for Interactions-Advanced Analytics dashboard includes a Weekly Trends indicator that looks back three months. To fully support this, you must keep interaction and awa_work_item records for at least 90 days.

- Do not delete records if any of their data needs to be archived for later reference.

The timing of this depends on the timing of any custom logic that is added to do the needed archiving. You should be able to set this up so that it runs early enough to not be the deciding factor.

Considering the above, the following ages in seconds thresholds are recommended:

- interaction, awa_work_item: 7776000 (90 days - but this can be reduced if you do not use the Weekly Trends indicator or you are willing to set the lookback for it to a shorter amount of time).

- sys_cs_conversation, live_group_profile, interaction_json_blob, sys_cs_consumer: 2592000 (30 days) or 5184000 (60 days).

**Performance considerations**

Are sys_updated_on indexes needed for the tables missing them?

Tests were run on an instance that had 12,000,000+ interactions, with a table cleanup configured for one table having an index on sys_updated_on field (interaction) and one that does not (interaction_json_blob). In both cases, for initial and subsequent executions, the time spent doing deletions (potentially many minutes) far outweighed the time spent on querying the records (2 seconds or less). Given this result, no additional indices need to be added to the tables as the performance impact would be minimal.

When should the initial and repeated table cleaner job run?

Normally table cleaner sys_trigger runs once per hour. If one or more cleaners are set on tables with many outdated records, the number of deletes done during that first run can be very high and place an additional load on the system. Before adjusting and activating the table cleanup configuration, temporarily change this table cleaner schedule so that its next run occurs during off-hours (a time when the system is usually under a lighter load).

If there are no off hours, there are some properties governing the table cleaners that may help. In particular, glide.db.tablecleaner.chunk_delete_max_time_spent limits how long the cleaner spends trying to batch-delete records during a single run. The value is given in seconds and defaults to 1200 (20 minutes). This means that in the base system setup, the table cleaner runs hourly for a maximum of 20 minutes (for reference, during one test, about 400,000 interactions could be deleted in 20
minutes, including cascaded deletes). If 20 minutes every hour is too aggressive, the property value can be reduced.

**Agents using Workspace**

Use workspace to find and resolve internal or external requester issues.

The following video shows an example of how to resolve an incident using workspace.

Using Agent Workspace

Your general workflow using workspace is:

1. Find an issue to work on.
2. Work on the issue to find a solution.
3. Communicate the resolution to the requester.
Agent task flow

01 Click to start
02 Find a record to work on
03 Work on the record

Landing page

List view

Record view

Next
Get started using workspace by working through some tutorials.

Getting started using workspace
Use the tutorials to walk through many parts of workspace that you’ll use on a regular basis.
The following tutorials are included for you to get a sense of how workspace works:

- Work on issues that are already in the database.
- Work on issues that come in through phone calls or chats.

⚠️ Note: UI may vary between classic Workspace and UIB Workspace, but the functionality of the features is the same.

Once you complete both tutorials, you should have a feeling for what workspace does. The topics after the tutorials provide detailed instructions about how to use all of the functionality in workspace.

**Workspace tutorial for agents starting with a record**

Perform the steps in this tutorial to get an idea how you can use workspace when you begin with a task already stored in the database.

**Before you begin**

Role required: agent

**About this task**

This tutorial starts with finding a task to work on that is already in a record in the database. The other tutorial starts with answering a phone call or chatting with a requester.

You use workspace to:

1. Find a task to work on.
2. Do research to resolve the task.
3. Communicate the solution to the requester or enter notes for yourself and other agents that document your progress in finding a solution.

The following graphic provides a very quick overview of finding and solving an issue.
This tutorial starts with you working on a record that's in the database. Other ways you might start include receiving phone calls or chatting with requesters. The next tutorial shows how to begin work in those cases.
Procedure

1. Open your workspace by navigating to **Workspace Experience > Administration > All Workspaces**.

   ![Workspace Experience screenshot]

   **Note:** In the previous image, you can see **Agent Workspace Home** in the application modules. You can click that to open Workspace. The following steps are for you if you're using a different workspace.

2. Click the name of your workspace and then under Related Links, click **Open workspace**.
   Your workspace opens.

3. Log into your workspace.
The first thing to do is find out what to work on. You can do that by looking at what's on the landing page, as shown in this image. Or, you can go directly to the list of open issues to solve. Let's see how to do both.

4. On the landing page, let's say you want to look at the P1 incidents that haven't been solved. Click the box, **Open P1 Incidents**.

A list of P1 incidents open.

</table>

This display is called List view. It’s a list of records, in this case, incident records. Normally, you'd click one of the records to open it. Before you do, let's see how else you can start from a list to find a task to work on.

5. Click the list icon ( ) in the left, edge menu.
   In the Lists tab, you see the groups of records you can open as lists. For example, you could open **All problems** or **All change requests**.

6. In the Lists tab, under **Incidents**, click **Open**.
   A list of open incidents appears. Let's find out what the problem is and solve it.

7. Click an incident.
   The record opens in what is called Record view.
From top to bottom, here's what to notice:

• This record is on a tab labeled INC000905. You can open other incidents without closing this one. How? Click the list icon ( ) and click another incident. You can always jump from record to record by clicking the tabs.

• The form header shows the record's short description, "Email server is down." The form header is like the title of the incident record.
• Underneath that title in the form header is high-level information, including the importance of the task (Priority), whether it's been worked on (State), and the kind of incident this is (Category).

• On the bottom-left, the Details tab shows a lot of details in the record. This section is called the form pane. Notice that you can scroll this section. You can enter information in this section, for example when you get additional information from the requester.

We'll get to the other things you see in the next steps. But basically, the Activity pane is where you communicate with the requester or make notes to yourself or other agents about your progress in dealing with this incident. On the far right, the Contextual Side panel is where you do your research to find solutions for the task at hand.

8. Click through the tabs to the right of the Details tab to get information related to the open record, such as the service level agreement (Task SLAs) for this task, continuous integrations (Affected CIs) that might be affected, services impacted by the incident, related incidents, outages, and so on. These items that work like tabs are called the Related items menu.

9. Let's say you want to work on this incident. Click Assign to me.

10. Let's solve the issue. Scroll down the stack of cards in Agent assist, which is on the right side. If you don't see a card that suggests a solution, you could enter a search term beside the search icon (🔍). Notice that workspace automatically entered the value of the Short Description field from the record in the search field and used that to search.

11. It looks like the card, Reboot Windows Server, might be the solution you want. Click the card.

Agent assist gives you the opportunity to order a reboot.
12. Click **Helpful** to provide guidance to the predictive intelligence software that this was a good solution for this incident.

13. Click **Order** to issue a change request to reboot the Windows server. Notice a new tab appears as a child tab of the same incident tab. These child tabs enable you to accomplish multiple tasks on one screen. All of the child tabs relate to the same incident, which is shown on the tab at the top.

14. If you were really solving this issue, you’d click **Submit** and then click the option to save the change request. The system would then create the change request, which someone would then perform.

15. Document what you’ve done. In **Activity**, in the **Compose** field, click **Comments** and enter a note to the requester explaining what you did.
16. Click **Post Comments**.

Workspace sends your comment to the requester and also adds it to the **Activity Stream**, which is the history of communications and actions you've taken.
17. Click **Work notes (Private)**, enter a comment, and click **Post Comments** to save information that’s only seen by fellow agents. You might use this internal commenting feature if you’ve not completely resolved an issue but want to document what you’ve done for other agents or yourself when you come back to the issue later.

18. In the form pane, scroll to the section, **Resolution Information**, and do the following.

   a. In **Resolution code**, click on one of the choices from the menu, for example, **Solved (Permanently)**.

   b. In **Resolution notes**, enter a description of your resolution.

   c. In **Resolved by**, select your name.

   d. In **Resolved**, select the date and time of the resolution.
19. If you haven’t resolved the issue but want to save your progress, click Save.

20. If you’ve resolve the issue, click Resolved.
   The incident no longer appears in the list of open records.

What to do next
You’ve walked through finding and solving an incident that was in the database. Next, walk through solving an issue that comes in through a phone call or a chat.

Workspace tutorial for agents starting with a chat
Walk through this tutorial to get an idea how you can use workspace when you receive a task by phone or chat.

Before you begin
Role required: agent
About this task
This tutorial starts with an agent working on a request that started with a chat. The workflow would be almost identical if the issue started with a phone call.

Procedure
1. Open your workspace by navigating to Workspace Experience > Administration > All Workspaces and clicking the name of your workspace.
2. Click the name of your workspace and then under Related Links, click Open workspace.
3. Log into your workspace.
4. Click the inbox icon and set your status to Available.

The green circle at the top left of the icon shows your status is Available. A number appears at the top, right of the icon when there are one or more chats available to answer.

5. Click the inbox to open a chat.
You're given the opportunity to accept the chat.

Chat - CH0001081
How to set up a broadband
Wallace Thompson

Time to accept: 1:30

Reject  Accept
The **Time to accept** counter shows how much time you have to accept the chat. When the counter reaches zero, the chat opportunity disappears from your inbox.

6. Click **Accept**. 
   The chat pane appears and workspace automatically creates an interaction record, assigns it to you, and enters it in the database.

7. Chat with the requester to find out what the issue is.
8. Add information about the customer and issue to the interaction record.
9. Optional: You can verify the customer’s information by clicking the **Verify contact** or **Verify customer** UI action button.

- **Note:** Not all workspaces have these buttons.

A modal appears that displays personal information about the contact or customer. You can ask the requester for this information to confirm their identity.
10. **Optional:** You can transfer the chat to another agent who has more experience with the issue.

   a. From the Action toolbar in the Active chat panel, click the Transfer Agent icon (`).

   b. In the Transfer to Agent window, select the agent to receive the chat and enter a message to that agent.

   ⚠ **Note:** Only the current owner of a chat may transfer the chat to another agent. The transfer button is otherwise disabled.
The transferred chat is listed in the Queues panel for the receiving agent. The receiving agent can accept or decline the transfer request. When the agent accepts the request, you get a confirmation.

Chat - CH0001081
Transfer to: Lisa Gray
Transfer initiated

11. After chatting, you might decide to create an incident out of this interaction record. Click **Create incident** to create an incident and transfer the information from the interaction to the incident record.
The incident is automatically assigned to you.

12. Click **Save** to save the incident.
13. Look at the information in the ribbon to get information about the requester and the record.

14. Click several of the items in the related items menu to see what other records might be linked to the one that's open.

For example, clicking Outages shows related system failures, and Child incidents shows incidents related to this one.

15. Use Agent assist to research the incident.

If the suggestions in Agent assist don't provide answers for the incident, enter a search term.
16. Document what you’ve done. In **Activity**, in the **Compose** field, click **Comments** and enter a note to the requester explaining what you did.

17. Click **Post Comments**.
   Workspace sends your comment to the requester and also adds it to the **Activity Stream**, which is the history of communications and actions you’ve taken.
18. Click **Work notes (Private)**, enter a comment, and click **Post Comments** to save information that’s only seen by fellow agents. You might use this internal commenting feature if you’ve not completely resolved an issue but want to document what you’ve done for other agents or yourself when you come back to the issue later.

19. Click **Save** or **Resolve**, depending on whether or not you’ve completed your work on this incident.

**What to do next**
You’ve walked through answering and solving an incident reported in a chat. Before you tackle your first, real task, you can customize your workspace.

**Customize workspace**
Customize Workspace to display the components you want to see.

**Before you begin**
Role required: agent

**About this task**
You can hide some workspace components if you don’t intend to use them. You can always un-hide them in the future. The following image gives you the layout
of the Record view, which is where you do most of your work and can customize the most features.

Procedure

1. Click your profile image and expand the **Settings** menu.

   Pushing the sliders to the right displays the component. Pushing the sliders left hides the component. The following steps explain each slider.
a. Push the **Show Ribbon** slider to the right to display the ribbon.

The ribbon provides high-level information related to the open record, including the requester's contact information, timeline of agent-requester interactions, issue SLA, and, potentially, custom components created by your system administrator. Your system administrator configures which ribbon elements appear.

![Ribbon Image]

b. Push the **Show Sidebar** slider to the right to display the Contextual side panel.

The Contextual side panel automatically provides suggestions for resolving issues, enables you to search for additional solutions, attaches solutions to your comments in the Activity Stream, and saves you time by using templates to fill out record fields with standard values. Make sure this slider is turned on.
c. Push the **Wrap list text** slider to the right to wrap text onto the next line for record fields in List view.

Wrapped text makes the columns narrower in List view. The following image displays wrapped text:

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
<th>Caller</th>
<th>Priority</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0010112</td>
<td>2019-07-29 11:48:43</td>
<td>Assessment : ATF Assessor</td>
<td>survey user</td>
<td>5 - Planning</td>
<td>New</td>
</tr>
<tr>
<td>INC0010111</td>
<td>2019-07-22 14:04:57</td>
<td>ATF : Test1</td>

<td>5 - Planning</td>
<td>New</td>
</tr>
<tr>
<td>INC0009009</td>
<td>2018-08-30 01:06:16</td>
<td>Unable to access the shared folder.</td>
<td>David Miller</td>
<td>4 - Low</td>
<td>New</td>
</tr>
<tr>
<td>INC0009005</td>
<td>2018-08-31 21:35:01</td>
<td>Email server is down.</td>
<td>David Miller</td>
<td>1 - Critical</td>
<td>New</td>
</tr>
</tbody>
</table>
The following image displays unwrapped text:

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
<th>Caller</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0010111</td>
<td>2019-07-22 14:04:57</td>
<td>ATF : Test1</td>
<td>System Administrator</td>
</tr>
<tr>
<td>INC0009009</td>
<td>2018-08-30 01:06:16</td>
<td>Unable to access the shared folder.</td>
<td>David Miller</td>
</tr>
<tr>
<td>INC0009005</td>
<td>2018-08-31 21:35:21</td>
<td>Email server is down.</td>
<td>David Miller</td>
</tr>
<tr>
<td>INC0009001</td>
<td>2018-09-11 20:56:26</td>
<td>Unable to post content on a Wiki page.</td>
<td>David Miller</td>
</tr>
</tbody>
</table>

d. Push the **Show Banners** slider to the right to display notifications. Notifications display when updates occur to records you’re working on.

Regardless of whether you display notification banners, you can access your notifications by clicking the notification icon () in the top, right of workspace.

e. Push the **Show badge count** slider to the right to display the number of unread notifications you have beside the notification icon ().

2. Set up the **Compose** editor, which is what you use to communicate with requesters and to enter internal notes for fellow agents about work you’ve done on a record.
a. Configure the composition editor in Activity Stream by clicking the configuration icon (⋮).

![Composition Editor Configuration](image)

Note: Your system administrator controls whether these sliders appear. If one or both sliders don’t appear, talk to your system administrator.

b. Push the Rich Text Editor slider to the right to use the rich text editor.

The rich text editor includes formatting icons for bold, italics, underlining, font, and so forth, as shown in the previous image at the top of each text field.

c. Push the Stacked View slider to the right to display two text-entry boxes, one to enter comments for external requesters and one to enter internal notes for yourself and fellow agents, as shown in the previous image.

Internal notes are only visible to you and fellow agents. External comments are visible to agents and sent to requesters. The following image shows the unstacked view, which is a single, text entry box with tabs to enter external comments and internal, work notes.
The pros and cons of these views:

- The stacked view might make it clearer whether you’re entering comments for fellow agents or external requesters.
- The unstacked view consumes less space in Activity Stream.
- The stacked view enables you to copy and paste a message and send it to internal and external audiences.

3. Click one of the icons (≡ □) at the bottom of workspace to select whether you want to display only the Form pane, only the Activity Stream, or both (the default).

- Form pane only icon (≡)—Workspace displays the Form pane but not the Activity Stream to create a wider view of the Form pane. The Form pane displays details of the open record.
- Form pane and Activity Stream icon (≡□)—Workspace displays both the Form pane and Activity Stream in equally-sized panes. You can drag the boundaries of the panes to resize them. This setting is the default.
- Activity Stream only icon (□)—Workspace displays the Activity Stream but not the Form pane to create a wider view for the Activity Stream. The Activity Stream enables you to communicate with requesters and to make internal notes about the work done on the open record.

You can click these icons at any time to change the display.
4. Set up chat notifications.

   a. Click the inbox icon (ぁ). The Inbox pane appears.

   b. Click the gear icon (🔧). The configuration sliders appear.
Desktop Notifications are text boxes that temporarily appear on the screen. Regardless of the settings, when something is in the inbox, a circle appears to the top, left of the inbox icon ( ), and the number of items in the inbox to the top right. The color of the circle matches the agent's status. For example, when an agent is Available, the circle is green.

c. Set the sliders accordingly for audio alerts and desktop notifications.

What to do next
Now that you’ve done the tutorials and customized workspace, learn the different ways to find issues to work on.

Finding issues to work on
Use workspace to find the issues to work on.

The first step in your workflow is finding issues to solve. You can find issues to work on in the following ways:
• Landing page—Provides a high-level overview of tasks that need to get done.

Clicking a link takes you either to list view or a specific record. You get to the landing page by clicking the home icon ( ). For more information, see Use the landing page to find issues to work on.

• List view—Displays lists of records to work on. Records are grouped by the table they’re in, for example, Task, SLA, Incident.

Clicking a link takes you to the record so you can work on it. You get to list view by clicking the list icon ( ). For more information about list view, see Use lists to find work to do.

• Chat inbox—Interact in real time with requesters using chat.
Accepting a chat request automatically creates a record for you to record the work you do to solve the issue. You get to chats by clicking the agent inbox icon ( mingle ). For more information about chatting with requesters, see Getting work from chats.

- Phone inbox—Interact in real time with requesters by phone.
  Accepting a phone call automatically creates a record for you to record the work you do to solve the issue. You answer and make phone calls by clicking the phone icon ( 📞 ). For more information about using phones in workspace, see Get work by phone in workspace.

- Share a record—See a record another agent is working on so you can help.
  You can share the current state of your workspace by sharing its URL. For more information, see Sharing workspace views.

Next
Learn how to use the landing page to find work to do.

Use the landing page to find issues to work on
Use the landing page to get an overall view of work that needs to get done.

Before you begin
Role required: agent

About this task
The landing page is the first page you land on when opening a workspace. It can contain high-level information, such as unassigned, high-priority tasks, or tasks assigned to you. For example, the following landing page shows unassigned, high priority cases, such as open P1 incidents. The page also shows tasks assigned to you under My Work.
Landing pages are configurable by your system administrator so yours might look different.

**Procedure**

1. Navigate to **Workspace Experience > Workspaces** and click your workspace. Your landing page opens.

2. Click any of the links on the landing page to select an issue to work on.

   If you click a group of records, such as, open P1 incidents, list view opens and you see a list of P1 incidents that you can choose to work on. If you click the link to a specific record, such as INC0018313, that record opens in record view.

**What to do next**

Learn how to find work do to in list view. Once you click a record in a list, it opens in record view.

**Using lists to find work to do**

Use lists in workspace to see high-priority issues and which issues are assigned to you.

To get to list view, click the list icon ( ).
You see two tabs of lists: **Lists** and **My Lists**. The system administrator creates the list categories in **Lists**. You create the list categories in **My Lists**.

**List categories**

List categories in the previous image are **Tasks**, **SLAs**, and **Incidents**. List categories are not clickable and therefore serve mainly as headings for the list filters beneath them. For example, under the list category, **Tasks**, are the list filters, **My Work** and **My Group's Work**.

Your system administrator sets up the list categories, which typically correspond with the tables in the database. For example, all incidents are stored in the incident table. All interactions are stored in the interaction table.
categories your system administrator chooses to display in list view correspond to the kinds of issues you work on. If you work on incidents, your system administrator shows incidents in the **Lists** column. If you work on cases, the **Lists** column shows cases.

You can use the up arrowhead icon (▲) to display the list filters under each list category. Clicking the down arrowhead icon (▼) collapses the list categories to make it easier to scroll through the list categories.

You cannot have a list category without list filters.

**List filters**

*List filters* are the subsections under list categories. In the previous image, under **Tasks**, you see **My Work** and **My Group's Work**. Each list filter provides a helpful grouping of records typically from one table. For example, **My Cases** enables you to quickly find cases assigned to you. Your system administrator creates the list filters.

Clicking a list filter opens the corresponding list of records in list view. A list filter must belong to a list category in the **Lists** tab.

**My Lists**

Any lists that you create appear in this section. Lists in this section are only visible to you. For more information about creating your own list categories and list filters, see [Create My Lists in workspace](#).

**Next**

Learn how to [work with lists in list view](#).

**Work with lists in workspace**

Open a list of records in workspace so you can choose one to work on.

**Before you begin**

Role required: workspace_user

**About this task**

List view enables you to see high-level information for all records in a list filter. Normally, clicking a field in a record in a list opens that record. If the field is clickable (a reference, document ID, or URL), clicking it does not open the record; it opens the record or URL that the clickable field points to.
Last refreshed indicates how long ago the values in the list were last refreshed. To refresh the values, refresh the page.

Each list has an associated URL. You can bookmark a list to enable quick access to it.

Here’s how to open a list to find records you want to work on.

Procedure

1. Click the list icon (≡).
2. Find a list category that contains the records you want to work on, for example, Tasks.
3. Click one of the list filters under it.
   For example, under Tasks, you might click on a list filter called My Work. That would open up a list of task records assigned to you. The list filter title and the number of records in the list appear at the top of the list. In the previous image, the All list contains 8383 records.
4. Optional: To preview a record before opening it, move your mouse over a record and click the information icon (ⓘ).

   A side panel opens that shows the record.
5. Optional: To move to a different page of records, click a page number or one of the arrows to move forward or backwards a page, or to the first or last page of records.
6. **Optional:** To change the number of records displayed on a page, click the number beside rows per page and select a number from the menu.

7. Click a record number to open it.

8. **Optional:** To export the records in a list in one of the following formats: CSV, XLSX, JSON, or PDF, click the gear icon and select **Export**.

**What to do next**
Now that you know how to open a list and the records in it, find out how to **edit records in list view**.

**Edit records in list view**
Make updates to a record directly from a list, without leaving the list.

**Before you begin**
Role required: agent_workspace_user

**About this task**
You can revise one or more records while in list view. To learn more about a record before editing it, view and revise it in **record view**.

**Procedure**
1. Revise a single record from a list.

   a. Click the Open Preview icon.
      The record opens.
b. Revise the values in the fields and click **Update**.

2. **Optional:** Revise multiple records at once.

   a. In list view, click the boxes to the left of all the records you want to revise.

   ![Table](image)

   b. Click **Edit**.

   A preview pane opens and shows you the fields you can edit in the selected records.
c. Revise the values in the fields and click Update.

What to do next
Now that you know how to edit a record in list view, find out how to sort and filter the records displayed in a list.

Sort records in lists
Sort the records displayed in list view to more easily find the records you want to work on.

Before you begin
Role required: agent_workspace_user

About this task
Filtered lists can contain thousands of records. Sorting them by field values can help you find the records you want to work on. You can sort the entire list based on any of the columns in the list.

Procedure
1. To change the field the records are sorted by, double click a column heading. An arrowhead icon (↑) appears to the right of the column heading you clicked and workspace sorts the list of records based on the values in that
column. An arrowhead pointed down means the values are sorted from highest to lowest values.

| Number |

2. **Optional:** To reverse the sorting order, click the arrowhead icon so the arrowhead reverses direction.

**What to do next**
Instead of sorting records, you might want to filter records in lists to reduce the number of records displayed in list view.

**Filter records in lists**
Filter the records to reduce the number of records displayed in list view so you can find the records you want to work on.

**Before you begin**
Role required: agent_workspace_user

**About this task**
Filtering removes records from a list so you can view only those records you're interested in working on.

Workspace provides the following ways of filtering records displayed in a list:

- Use the filter icon (🔍).
- Filter directly in the list using the column heading.
- Filter directly in the list using the values in the columns.

**Procedure**

1. To filter out records using the filter icon (🔍):
   a. Click the filter icon (🔍).
   b. Click **Advanced View**.
   c. Use the condition builder to specify the conditions one or more field values must meet for a record to appear in the list.
      For example, [Active][is][true], and [Urgency][is][1 - High].
d. Optional: To add more conditions, click **New condition set** and supply a condition.

e. Optional: Select **Save Filter**, enter a filter name, and choose permissions to determine who can use the filter. Retrieve the filter by selecting **Use existing filter** and select the filter.

f. Click **Update**.

The list filter icon shows the number of conditions that apply to the current list.

2. Filter records based on field values displayed.
   You can work directly with list columns to filter out records.

   a. Click the **More UI Actions** icon to the right of a column heading.

   b. Click the downward pointing arrowhead icon (▼) and select a filter condition, such as **is not, starts with, or contains**.

   c. Enter the field value to filter the list on the bottom line and click **Apply**.
   In the following example, the only records that appear have **Caller** values that start with **David**.
Note: Not all field types support column filtering. You can use the Advanced Filter panel and condition builder to create a filter for those field types.

d. If the values come from the sys_choice table, the possible values (choices) appear with boxes beside them.
If there are more than ten fields, workspace displays a **Filter**, as shown here, so you don’t have to scroll to find a field value. If there are less than ten choices, there’s no entry filter under **Filter**.

You can click **All** to select all of the fields or **None** to uncheck all of the fields. **All** selects all of the field values that meet the filter conditions, not just those shown in the pop up. Likewise, **None** unchecks all of the fields that meet the filter conditions, not just those shown in the pop up. You can combine these functions. For example, you can filter on **Windows** and select **All**, and then filter on **2000** and select **None** and wind up with rows that contain Windows but not Windows 2000.
You cannot configure the number of fields (10) that makes the Filter entry field appear.

**e. Optional:** To remove the filter and restore all of the records, click the More UI Actions icon (⋮) and click Clear.

3. Filter out records based on field values.
   This feature is similar to the one in the previous step but you can't enter a term to filter the records.

   a. Click a field in the record.

   b. Click the More UI Actions icon (⋮).

   c. To remove all records that don't have the same field value, click Show Matching.

   d. To remove all records in the list that have the same field value, click Filter Out.
      By default, a column sorts in an ascending order unless the column data type is a date. Dates sort in a descending order.

**What to do next**
Instead of filtering records, you might like to group records in list view.

**Group records in lists**
Group the records displayed in list view to more easily find the records you want to work on.

**Before you begin**
Role required: agent_workspace_user
About this task
You can group records that have the same values in a column so you can see similar records.

Procedure
1. Move the mouse over a column heading and click the More Options icon (⋮).
2. Click the first option, **Group by <column-heading-name>** where <column-heading-name> is the name of the column you’re clicking in.

The records are grouped based on the values in the selected column.

The display shows the number of records in each group.
3. Open a group by clicking its arrowhead icon (↑).

4. **Optional:** To ungroup the records, mouse over the same column heading, click the More Options icon (⋮) and click `Ungroup by <column-heading-name>`.

**What to do next**

Instead of grouping records, you might like to Filter records in lists.

---

**Create My Lists in workspace**

Create your own filtered lists in workspace to monitor your issues, tasks, or problems, under **My Lists**.

**Before you begin**

Role required: agent_workspace_user

**About this task**

Create different groupings of records than those provided by your system administrator under the **Lists** tab. For example, you might like to group all records that pertain to incidents associated with a specific company. You can create another version of an existing list, or create an entirely new one. Those lists are only visible to you. To access your lists, select **My Lists**.

As you can see, **My Lists** doesn’t have list categories, only list filters.

**Procedure**

1. Navigate to **Workspace Experience > Workspaces** and select your workspace.
   Your workspace opens.

2. Select **My Lists**.

3. Select **+New list**.

4. On the form, fill in the fields.
### New List

<table>
<thead>
<tr>
<th>Type</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start from existing</td>
<td>List</td>
<td>Existing list that you want to modify. The menu displays all available admin defined lists for selection.</td>
</tr>
<tr>
<td></td>
<td>List Name</td>
<td>Name for your list. By default this field appends &quot;_Copy&quot; to the list selected in the previous menu.</td>
</tr>
<tr>
<td></td>
<td>Select columns</td>
<td>Record fields to include in list view. Columns from the list you selected appear. Add or remove columns to create the list you like as needed.</td>
</tr>
<tr>
<td></td>
<td>Add Filters</td>
<td>Condition builder to create filters that appear in your My Lists tab. By default the conditions applied to the list selected appear.</td>
</tr>
<tr>
<td>Create your own</td>
<td>List Name</td>
<td>Name for your list.</td>
</tr>
<tr>
<td></td>
<td>Select Source</td>
<td>Table the records come from.</td>
</tr>
<tr>
<td></td>
<td>Select columns</td>
<td>Record fields to include in list view. Select the columns that display in the list. By default this field populates with columns from a Workspace list view if one exists. If a Workspace list doesn't exist, the columns are</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>populated with the Default list view of the table selected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Add filters</td>
<td>Condition builder that is applied to the list.</td>
</tr>
</tbody>
</table>

5. Select **Create**.  
The list appears on the **My Lists** tab.

6. **Optional:** To change the order of your lists, select **Reorder**, then drag each list into the order that you want and select **Done**.

7. **Optional:** To modify or delete any of your lists, select the gear icon (⚙️) and select one of the following:

   - **Rename**
     Enables you to rename a list.
   
   - **Personalize Columns**
     Enables you to alter the columns that are displayed in the list.
   
   - **Save**
     Saves the current list and underlying filters.

   - **Save as**
     Saves and renames the current list and underlying filters under **My List**.

   - **Export**
     Export **My List** in a variety of formats.

   - **Delete**
     Removes a list from **My List**.

**Inline edit one or multiple cells in a list**

Inline edit one or multiple cells from the same column of a list to simultaneously change the value of the selected cells.

Inline editing enables you to change a field in a list instead of opening the record and changing it on the form.

- Edited cells must be in the same column when editing multiple cells.
- Most **common field types** are supported.
Inline edit using a mouse

Inline edit one or multiple cells from the same column using a mouse.

Before you begin
Role required: none

Procedure
1. Edit a single cell.
   a. Double click a cell.
   b. Enter the value you want and press Enter.
      To cancel the inline edit, press esc or Cancel on the keyboard, or click outside the cell.

2. Select consecutive cells.
   a. Place focus on a cell.
   b. Hold shift on the keyboard and select the final cell you want to change.
   c. Double click the cell.
   d. Enter the value you want.
      To cancel the inline edit, press esc or Cancel on the keyboard, or click outside the cell.
   e. Press Enter.

Short description

<table>

Get work by phone in Workspace

Use workspace to make inbound and outbound telephone calls if your instance is integrated with your telephony system.

Before you begin
Role required: workspace_user

About this task
You can do the following with the Workspace phone:

• Make an outgoing call
• Receive an incoming call
• Transfer a call to another user within the system
• Place a call on hold or on mute
• Set your availability status

Procedure
1. Do one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the phone icon in the main navigation bar.</td>
<td>Enter the phone number in the <strong>Number</strong> field and click <strong>Call</strong>.</td>
</tr>
<tr>
<td><strong>Click the phone icon next to the Contact or Consumer fields on the form.</strong></td>
<td>For your contacts who may have multiple phone numbers:</td>
</tr>
<tr>
<td></td>
<td>• If only one phone field is populated, a call is placed to that number.</td>
</tr>
<tr>
<td></td>
<td>• If you see a dialog box that displays more than one number, click the</td>
</tr>
<tr>
<td></td>
<td>number that you want and then close the dialog box.</td>
</tr>
</tbody>
</table>

2. Click **End** to end the call.

Getting work from chats

Use the agent inbox to manage your incoming work items, such as chats, cases, and incidents.
To open the agent inbox, select the Inbox icon in the navigation bar. When you accept a chat, an interaction record is automatically created and captures the work done in that session.

### Inbox responsibilities

<table>
<thead>
<tr>
<th>Agent responsibilities</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitor your inbox</td>
<td>Use designated service channels to route work items to available agents, such as incoming chat requests, case assignments, and incidents.</td>
</tr>
<tr>
<td>Start a chat session</td>
<td>Accept a chat from your inbox. You have a time limit to accept a chat before it reroutes to another agent. The chat associates to an interaction record that captures the conversation and work done during the session. During a chat session, you can:</td>
</tr>
<tr>
<td></td>
<td>• Add attachments using the Action toolbar.</td>
</tr>
<tr>
<td></td>
<td>• Transfer the chat to another agent.</td>
</tr>
<tr>
<td></td>
<td>• Add another agent to the chat.</td>
</tr>
<tr>
<td></td>
<td>• Perform other support tasks, such as create an incident or case.</td>
</tr>
<tr>
<td></td>
<td>• Use workspace tools, such as the ribbon to glance at information or the activity stream to review related work.</td>
</tr>
</tbody>
</table>

### Agent inbox features
<table>
<thead>
<tr>
<th>Feature</th>

</tr>
</tbody>
</table>

**Ongoing messages**

The Ongoing messages tab displays when you have access to at least one presence state which includes a messaging-based service channel.
Select the clock icon to display cards for ongoing messages. If the clock icon has a number in the upper right-hand corner, this number indicates the number of messaging conversations with unread messages. If a card has a green dot, there is a new message for that messaging conversation. The card also displays the interaction number and when the last update was made on the conversation.

Accept a chat session

Begin a conversation with a customer by selecting a chat queue in the chat session. You can work on multiple chats in different queues simultaneously.

Before you begin
Role required: workspace_user

Procedure
1. Navigate to Workspace Home > Inbox.
2. From your inbox, accept or reject a chat.

Chat - CH0001081

How to set up a broadband
Wallace Thompson

Time to accept: 1:30

Reject  Accept

You are automatically connected to the first customer in the chat queue, which is the oldest request in the queue. The Active Chat panel displays a pre-
chat message acknowledging the customer chat request. You can review the customer information before you enter a response in the Active Chat panel.

In the chat workspace, an interaction parent tab with a details child tab open for the session. The details child tab offers more information on the chat request and provides contextual options for performing related operations during the chat session.

### 3. Use chat tools for managing the chat and contextual options to perform related tasks.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Manage your chat</strong></td>
<td>Do the following actions from the Actions toolbar:</td>
</tr>
<tr>
<td></td>
<td>• Add an attachment.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another queue.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another agent.</td>
</tr>
<tr>
<td><strong>Perform additional support tasks</strong></td>
<td>Engage in other support work during the chat session by using the contextual options in the Details tab. For example, you can:</td>
</tr>
<tr>
<td></td>
<td>• Update chat information.</td>
</tr>
<tr>
<td></td>
<td>• Create a new case or incident.</td>
</tr>
<tr>
<td></td>
<td>From the sub-tab, you can select other contextual options to work on a resolution for the case or incident. For example, you might need to escalate the issue.</td>
</tr>
<tr>
<td></td>
<td>• Choose a related task in the More options (….), such as send email.</td>
</tr>
<tr>
<td></td>
<td>• Search for relevant information in the knowledge base using Agent Assist.</td>
</tr>
</tbody>
</table>

### 4. In the Details tab of the interaction, end the chat session by clicking Close.

Ending the chat saves the conversation history and closes out the interaction. You can also end a chat by closing the tab. If you end the chat this way, you lose all of the conversation history and you cannot save the information in the interaction record.
Transfer a chat to another queue

Route a chat to another queue. Any agent who belongs to the associated queue can accept the chat.

Before you begin
Role required: workspace_user

Procedure

1. From the Action toolbar, click the Transfer to Queue icon ( ),
2. In the Transfer to Queue panel, select the queue to transfer the chat to. When you transfer a chat, the current work item associated with the interaction is marked as closed complete. A new work item is associated with the new queue and the chat is added to the selected queue. When a receiving agent accepts the transfer, that agent sees the conversation and the chat history in the Active Chat panel.

Transfer a chat to another agent

Route a chat to another agent in the same service channel.

Before you begin
Role required: workspace_user

Procedure

1. From the Action toolbar in the Active chat panel, click the Transfer Agent icon ( ).
2. In the Transfer to Agent window, select the agent to receive the chat.

Note: Only the current owner of a chat may transfer the chat to another agent. The transfer button is otherwise disabled.
The transferred chat is listed in the Queues panel for the receiving agent. The receiving agent can accept or decline the transfer request.

Add an attachment to a chat
Chat agents can add attachments, such as documents and image files, to the conversation.

Before you begin
Role required: agent_workspace_user

Procedure
From the Action toolbar, click the Attachment icon (_attach_file_ to upload an attachment to the case.

Change your status in the chat panel
Change your status while you are on a break or offline so no new chats are assigned to you. When you return, you can update your status to let everyone know you are back.

Before you begin
Role required: agent_workspace_user

Procedure
1. Navigate to Agent Workspace Home > Chat.
2. In the chat panel, from the status list, select your current status.
• Available: You are available to receive new chats.
• Away: You are not available to receive new chats.
• Offline: You are not available to receive new chats.

What to do next
Adjust your status depending on your availability.

Set up a new chat or work item alert
Set up an audible alert to notify you when a new chat or work item arrives in your Agent Workspace inbox.

Before you begin
• Install the Agent Chat plugin (com.glide.interaction.awa).
• Enable Desktop Notifications for browser.

Role required: agent

About this task
Only agents who are subscribed to the corresponding service channel can change the settings.

Procedure
1. In your Agent Workspace inbox, select the settings (⚙️) icon.
2. To receive desktop notifications for new items in your inbox, turn on Inbox Desktop Notifications.
   These notifications are delivered if the Agent Workspace browser tab is open but not currently in focus.
3. To receive audible alerts for new items in your inbox, turn on Inbox Audio Alerts.
   These alerts are delivered if the Agent Workspace browser tab open, it doesn’t matter whether the tab is in focus or in the background.
4. To receive desktop notifications for new conversations in your inbox, turn on Conversation Desktop Notifications.
   These notifications are delivered if the Agent Workspace browser tab is open but not currently in focus.
5. To receive audible alerts for new chats in your inbox, turn on Conversation Audio Alerts.
   These notifications are delivered if the Agent Workspace browser tab is open, it doesn’t matter whether the tab is in focus or in the background.
6. To receive browser notifications, you must have this set-up:
   a. Chrome as your browser.
   b. Configured to receive Conversation Desktop Notifications.
   c. Workspace browser tab is not in focus.
   d. There is a new message on a conversation assigned to you.

Monitor chat conversations
Chat supervisors can view ongoing chat conversations and join them to assist agents and requesters in Workspace Agent Chat.

Before you begin
Role required: awa_manager

Procedure
1. Navigate to Lists > Interactions > Active Chat Interactions.
2. Select an active chat interaction from the list.
3. If Agent Whisper is installed, an agent can ask for help by typing /help in the Active Chat window. A message is sent only to the chat supervisor, the requester does not see this message.
4. In the Active Chat panel, click Join.
   A notification lets the agent and requester know that you’ve entered the chat. Messages that you submit are visible to the agent and requester.

   Note: Your presence is not known until you join a chat.
5. If Agent Whisper is installed, click Send Private Message to send a message to the agent. The requester does not see this message, only the agent sees the message.

Interaction records in Workspace
Using an interaction record, agents can create or reference customer information from a customer contact. Agents can then decide if the conversation is an incident, case, or request.

An interaction represents a request for assistance made through a chat, phone call, or walk-up. Interactions can be routed to queues for assignment or assigned to agents directly. Support agents can create cases, requests, or incidents from the interaction. Interactions can also be used to capture one-and-done type requests where an agent might not want to create associated tasks.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details, Related Tasks, User's Interactions forms</td>
<td>Details tab that shows detailed information from the interaction record. Related Tasks show tasks related to the interaction in the form pane, for example, a new incident. User's Interactions tab shows all interactions related to specific users.</td>
</tr>
<tr>
<td>Number</td>
<td>Number is associated to each customer interaction.</td>
</tr>
<tr>
<td>Type</td>
<td>Logs the type of channel communication, such as chat, phone, walk-up, or messaging.</td>
</tr>
</tbody>
</table>
### Feature | Description
--- | ---
| 🔄 **Note:** Phone is an available type of channel communication when the OpenFrame plugin (com.sn_openframe) is activated and **Messaging** is an available type when the Conversational Messaging plugin (com.glide.messaging.awa) is activated. |  

### State | State of the interaction record:
- Queued
- Pending Accept
- New
- Work in Progress
- Closed Complete
- Closed Abandoned

### State reason | Reason for the current state of the interaction record:
- Waiting on customer
- Waiting internal
- null

This field appears only for messaging type interactions.

### Opened for | Customer who initiates or receives the communication.

### Duration | Tracks the amount of time an agent spends working on an interaction.

### Assigned to | Agent the interaction record is assigned to.

### Wait time | Time it takes to initially respond to the customer.

### Short Description | Short description of the interaction.
### Feature

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> The short description field is empty by default, but it cannot be empty when the record is closed, saved, or associated to a related task. Populate the short description and then close, save, or associate the record, or you cannot archive the record.</td>
</tr>
</tbody>
</table>

While you are on an interaction, tasks that are viewed or created under the interaction are automatically logged on the Interaction Related tasks.

### Associating user profiles on messaging interactions

When a requester sends a message, the system checks whether the identifier matches an existing channel user profile. Channel user profiles are used to track the identities of conversation participants using an identifier associated with the source of the message. For SMS messages, the identifier is the phone number from which the message was sent.

If there is a matching channel user profile

- A new interaction is started.
- Or the message is associated with an ongoing interaction for the matching channel user profile.

If there is no matching channel user profile

- A new channel user profile is created.
- A new interaction referencing the new channel user profile is created.
- If the identifier matches a user, it populates the User document field of the channel user profile and the Opened for field of the interaction with a reference to that user.

### Create a problem from an interaction

You can create a problem record directly from an Interaction when the customer makes contact regarding an issue and you need to investigate.
Before you begin

- Role required: workspace_user or admin
- Activate the Problem Management Best Practice — com.snc.best_practice.problem plugin
- Select the **Allow Problem creation from Interaction** (glide.problem.interaction.allow_create) problem property

![](danger) **Note:** The Interaction feature is a more efficient way to create a problem from an interaction than the New Call feature from Service Desk Call (com.snc.service_desk_call) plugin that you might have used previously.

Procedure

1. Navigate to **Workspace Experience > Workspaces > Workspace Home**.
2. Click the list icon ( ) and click the Interaction list.
3. Click the interaction record from which you want to create a problem.
4. On the interaction page, click the more actions icon ( ) and select **Create Problem**.
5. On the form, fill in the fields.

**Problem form**

<table>
<thead>
<tr>

<tr>
<td>Confirmed</td>
<td>Auto-generated. Date and time when the issue was confirmed as a problem.</td>
</tr>
<tr>
<td>Confirmed by</td>
<td>Auto-generated. User who accessed the issue and confirmed that it was a problem.</td>
</tr>
</tbody>
</table>

6. Click **Save**.  
A problem record is created and the record appears in the Related tasks related list on the Interaction form.

**Create a standard change from an Interaction**

Create a standard change record directly from an Interaction Management to implement a pre-approved, low-risk change without having to go through the Change Management module to implement it.

**Before you begin**

Role required: workspace_user or admin

**Procedure**

1. Navigate to **Workspace > Workspace Home**.
2. Open the interaction record from which you want to create a standard change.
3. On the Interaction form, click the more actions icon [•••] and then click **Create Standard Change**.
4. On the New Catalog Item page, select the standard change and click Submit.
   A standard change is created and the record appears in the Related tasks related list on the Interaction Management form.

Getting notifications in workspace

You can receive workspace notifications to get immediate updates about records you're working on without leaving workspace.

Notifications present updates about records you’re working on or being assigned to regardless of whether or not the record is open in workspace. For example, a notification might show that you've been assigned in incident.

You can click the notification to open the record.

You can open all of your notifications by clicking on the notifications tray icon (져). The badge number indicates the number of unread notifications.

Workspace deletes notifications after seven days.

Performance Analytics and Reporting for Workspace

Integrate data visualization and reporting functionality into the workspace experience. Get notified about behavioral process changes. Explore KPIs, and
get answers and insights on analytics with these Performance Analytics and Reporting Workspace integrations.

These features enable users to see pre-configured dashboard views. The features also show cases via trend line, column, comparison, proportional, and score visualizations within workspaces. Users can view and drill down into reports that show key performance indicators over time. They also see the current state of instance data, such as how many open incidents of each priority there are.

For more information, see Performance Analytics and Reporting for Workspace.

Working on issues in workspace

Use the following sections to discover answers to the issues you're dealing with in an open record.
Depending on the issue at hand, you might be ordering a hardware component for a requester, issuing a server restart to solve an issue, or creating and assigning an incident record to remedy a software issue.

When you use the landing page or list view to open a record, workspace provides a lot of information about the record. Here’s how you might look at the different parts of workspace to understand and resolve an issue.
1. In the Form Header, read the record’s short description, priority, status, and issue category.

2. In the Ribbon, read about the requester, how long the issue has been open, and what the SLA is in solving the issue.

3. In the Form pane, on the Details tab, scroll through detailed information about the issue.

4. In the Related Items menu, click the tabs to see information related to the open record, such as related incidents. The information appears in the Form pane.

5. In the Contextual side panel, read the search results automatically pulled up by Agent assist that might help solve the issue.

6. In the Activity Stream, read about the history of actions you or other agents have taken in solving this issue.

7. In the Compose section of the Activity Stream pane, write a comment to the requester or make notes to yourself and other agents about your progress in resolving the issue.

Next

Now that you understand how to look through the parts of workspace to get contextual information about an issue, let’s see how to find a solution.

Finding solutions using Agent assist

Agent assist is a search engine that helps you find the information you need to resolve issues.

Agent assist appears in the Contextual side panel by default and when you click the graduation cap icon (🎓). It’s possible for you to have icons for more than one Agent assist. If so, each one would search a different set of information sources.

When you open a record, Agent assist automatically does a search based on a field in the open record. The field value used for the search term is configurable by your system administrator but it’s typically the value for the record’s short description field. The following figure shows the search results for the short description, “HDMI port is not working.” Search results return as cards. In the following example, the card returned links to an article with the title, HDMI port is not working on my PC, and that was updated 14 days ago. The following figure also shows there are two different Agent assists available using the differently-colored graduation caps.
The default number of search results is 10. If there are more than 10 results, the number appears as 10+.

Agent assist is pre-configured to search the Incident, Problem, Change, Knowledge, and Case tables for solutions. Your system administrator can configure Agent assist to search additional information sources, such as the service catalog.

You can use Agent assist in the following ways to find solutions to the record you opened:

• Click a card to go to the search result.
  The search result might provide the answer you need, which you can then send to the requester using the Compose editor in Activity Stream.

• Enter a new search term in the search field next to the search icon (🔍) to get different search results.
  If the search results automatically displayed don't show appropriate results, enter a new search term to get better search results.

• Filter the search results.
  By default, Agent assist returns search results from all of its information sources. You may get too many results. To see the search results from a subset of those information sources, click the configuration icon (🌐) and then click an information source.
• Send a solution to the requester by clicking a link in the card.

The following example shows a link, **Link to Problem**, that, when clicked, adds the link to a similar problem in the **Compose editor** that you can then send to the requester.

• If the card is an article, click the card and then the **Attach** link to send the article to the requester.

For more information, see **Send an article to a requester**.

• If the card links to an item in the service catalog, click the card to order the item.
For more information, see Order a catalog item for a requester.

- Click a different Agent assist icon and repeat the search.

If you have more than one Agent assist in the Contextual side panel, each one searches through a different set of information resources. Your system administrator configures the icon to click for additional Agent assists.

- If your system administrator enables Search as on your instance, you can change search results by changing field values in the form pane.

On the Details tab, you may be able to replace the value for Caller, for example, to change the search results based on that value. For example, if you create cases on behalf of customers or employees, entering a customer’s identity in the Caller field in the form pane returns Agent assist search results, for example 401k information, that match the customer instead of the you.

- Place a catalog order by clicking a catalog item shown on a card.

- Add a knowledge article to the Compose editor by clicking the Attach icon in Agent assist.

No search term

Your system administrator can configure Agent assist to conduct a search without using a search term. The search result is all records from a particular information source, such as employee records. You then can get the record of a particular employee by entering the employee’s name in the search field.

Interact with Playbook

Interact with a business workflow in real time from within Workspace. Agents can use Playbook to update records, upload attachments, and complete tasks across multiple workflow activities in line.

Playbook overview

The Playbook experience provides fulfillers with visibility into cross-business workflows and the actionable tasks used to complete these workflows.

1. Playbooks may appear in the Contextual side panel or in the related items of records configured with Playbook.

2. Activities that you must perform to complete the business workflow are displayed. You’re able to see what you’ve done and what you must do to complete the playbook. You can collapse activities to display relevant activities, and expand them again.
3. Activities are typically performed sequentially. You can go back to those activities to complete them later, if necessary. Complete an activity and go to the next activity, or complete the playbook.

4. Playbook automatically updates playbook tasks if completed outside of a playbook.

Playbook anatomy
Playbooks contain the following UI.

Playbook header
Shows the title of a Playbook. A header exists for each playbook attached to a record. Selecting a Playbook header expands the stages nested under it.
Playbook stages

Click a stage title to view its activities. By default, all activity cards are collapsed, except for the first card in a stage.

The stage progress updates as activities are completed. A check mark inside the playbook header indicates that the stage is complete.

- **Create**
  1 of 1 complete

- **Review and Update**
  1 of 3 complete

Use the stage filter (チョーク) to filter a playbook.
Use the ellipses action menu icon ( ⋮ ) to perform select actions at the playbook and stage level.

Activity cards

See details about an activity in the playbook activity card which may include the status, SLA timer, form data, and attachments. Use playbook activity cards to complete tasks by filling in forms,
completing checklists, adding attachments, and clicking buttons.

Add a playbook
Add a playbook to a record in agent workspace.

About this task
A playbook can be added to a record with no playbook or a record with existing playbooks. The example below shows how a playbook can be added to a record using an Add Playbook button.
Procedure

1. Open a record.
2. Select the **Add Playbook** drop down.
3. Select the playbook you would like to add to the record.

Results

The **Playbook** tab displays when the playbook was successfully added.
Cancel a playbook

Cancel a playbook to stop a business workflow when no longer valid.

Before you begin
Role required: agent

If your playbook admin has added a cancel action to your playbook experience, you can typically find the cancel action under the playbook actions menu. If you are an admin and would like to add a cancel action to a playbook experience, see Add a cancel playbook action.

Note: Certain activities within a playbook cannot be canceled once they have started.

Procedure
1. Open a playbook in workspace.
2. Click the ellipses action menu icon ( ⋮ ) in the playbook header.
3. Click Cancel Playbook.
4. Provide a reason for canceling the playbook.

5. Click Cancel Playbook.
A canceled banner appears below the playbook header confirming that the playbook has been canceled.

**Playbook Experience D... ▼ ▲**

⚠️ Canceled View Reason

- **Assign**
  - 0 of 2 complete

- **Create**
  - 0 of 2 complete

- **Review and Update**
  - 0 of 3 complete

**Open full lists within playbook**

Open a full list within playbook cards to view and update list items.

To open a full list within playbook, click the **Open List** icon (Open List).

**Card view**

- **Interactions**

A new tab opens to show a full list.

Using activity stream within playbook

Use activity stream within playbook to add comments or notes, and view communication and task history for the parent or associated record.

Activities may contain a button, icon, or dropdown item to view a record’s activity stream.

Playbook activity stream examples

To open the activity stream within playbook, click the View activity button or select View History from the dropdown list.
Activity stream modal

You can see tabs for comments and work notes related to a parent or associated record. You can use the Compose text box to post new comments or work notes.

![Employee Payroll Setup Request](image)

You can view previous activity by scrolling down to the Activity section.

Create a record in workspace

Create a record in workspace from the Record tab menu or from a list.

Before you begin

Role required: workspace_user

About this task

You might create a record to capture work you're doing. For example, after a phone call, you might create an interaction or incident record. In the record, you capture the information you obtained in the phone call.
The kinds of records you can create is configured by your system administrator. The default is an interaction record. If you place your mouse over the plus sign icon (➕), the list of records you can create appears.

**Procedure**

1. Click the plus sign icon (➕).

Notice that the record type appears when you place your mouse over the icon.

If you can only create one type of record, a blank form of the record appears. If your system administrator configured workspace so you can create multiple record types, workspace displays a list of those record types. You then select the type you want to create and that blank record type appears.

**Note:** If you have access to more than one domain, filling in a caller or company on the record form associates the record with the domain of the caller or company.

2. On the form, fill in the fields and click **Save**.

**Global search in Workspace**

Search across all cases, incidents, problems, knowledge articles, community questions, customers, users, and change requests to find answers.

**Global search feature**

Search results include all the items the search term appears in, for example, in the short description, content, or attached files. By default, global search results can include:

- Cases
- Customers or Users
- Now Community Questions
- Incidents
- Change Requests
- Problems
- Knowledge Articles
To enter search terms, click the search icon (🔍) and enter the search term in the search field.

Search results appear in a separate tab. Links lead to a record or a list of records.

Searching for a customer or user
You can search for a requester by name, for example, Beth:

Global search results show the number of search results by category:
Clicking **Users** shows the search results for users that have the name *Beth*:

**Users (1 of 1)**

*Beth Anglin*

beth.anglin@example.com

ACME North America

**Searching for a case or incident**

You can use case or incident numbers to search for specific cases or incidents. Or, you can search using other values related to the cases or incidents. In the previous example, if you click **Incidents**, Workspace displays all the incidents that have the name *Beth* in one or more record fields.

<table>

Getting or adding information to a record

Use the form pane to discover detailed information about a record, information related to the open record, and to make entries in the record.

Getting detailed record information

To get detailed record information about a record, click the Details tab. The contents, which appear in the form pane, are many of the fields in a record. Your administrator configures which fields you see.

You can vary the width of the form pane by dragging the right side of it. You can scroll through all the fields or jump to a section in the Detail tab. To jump to a section, click the menu icon (≡) to the left of the record type to display the sections in the form pane. Click the section title you want to jump to. For example, in the following image, if you click Notes, the record fields scroll up to the Notes section.
Getting information related to the open record

The Related items menu provides tabs that display information related to the open record.

Click these tabs to understand what this record might be affecting. For example, clicking **Impacted Services** displays the services affected by the incident in the open record. For more information, see Get information related to the open record.

Adding information to a record

When working on a record, you might add or revise some of the fields in the record. You can do that on the **Details** tab. For example, on the **Details** tab, you might change the **Urgency** value of the record to **1 - late**, or, after solving an issue, enter a resolution summary in the **Resolution notes** section. After entering or changing information in the form pane, click **Save**.
Additional record functionality

- Template value field: For more information, see Configure a template value field.
- Field name field type
- Doc ID field type

Updating records using templated information

Select one of the templates to add standard information to open records to save yourself some work.

Before you begin
Role required: workspace_user

About this task
Templates set field values in the open record to the values specified in the template. For example, the major incident template might set the Impact field in the open record to 1 - High, and the Urgency field to 1 - High. Templates reduce the work you have to do and make actions taken more consistent.
Procedure

1. In Workspace, open an existing record.

2. In the Contextual side panel, click the template icon ( ).

   The available templates appear.

3. From the list of templates, select a template to apply to the open record.

   Field values included in the template automatically populate the record in the Details tab of the form pane. Workspace provides a pop up of the updated fields.

4. Optional: To undo the changes that were made in the open record when you selected the template, navigate away from the form without saving.

5. Fill in the remaining fields in the Details tab of the Form pane.

6. Click Save to save your progress or Resolve to mark the issue as resolved.

What to do next

Communicate your progress or the solution with the requester.

Manage custom form templates

Manage custom form templates by creating, editing, and deleting templates.
**Before you begin**
Create a custom form template that fits the workflow of a customer or activity. Custom form templates enable you to retrieve a form with the fields you want to save time resolving the workflow. They can also be edited to adapt to new demands or similar cases.
Role required: agent

**About this task**
Custom form templates are controlled by group assignments.

**Procedure**
1. In Workspace, select a record.

2. Select the Template icon ( ) in the contextual side panel. Two lists display in the contextual side panel. All displays all available templates, and My Templates displays your custom form templates.

3. Create a custom form template.
   a. On the Templates pane in the contextual side panel, select the plus icon (+).
   b. Enter a name for your custom form template.
   c. Select the fields you want for your template and delete the ones you don’t want.
   d. Select Save.

4. Select the option icon ( ) to Edit or Delete a template. Templates that are deleted can’t be retrieved.

**Configure a template value field**
Select desired fields to create a form template in the Template section of a form.

**Before you begin**
Role required: user

**About this task**
Template value field selections sync with live updates.
Procedure
1. Open a record.
2. In the Template section of the form, select the associated table. For example, Incident.
3. In the Template field, select a field and a value for your template.
   
   **Note:** The table you selected determines which template value fields are available.
4. Select Save.

Results
The template value fields are visible on the form in the Template section.

Example:
Selecting field template values.
1. In the Template section of the form, select the Incident from the Table field.
2. In the Template field, select Description and enter Test text. A description is added to the template.
3. Select Approval from the Template field. A list displays with approval values.
4. Select Caller from the Template field. A list displays to select a caller.
5. Select Active from the Template field. The option appears to activate or deactivate the record.
6. Select Save.

Getting information related to the open record
Use related items to gather information about and to enter information into the open record.
The items in the Related items menu behave like tabs. When you click one, the corresponding content appears in the form pane. Workspace underlines the item that’s active in the form pane. What items appear in the menu, what order they’re in, and which one opens automatically are configurable by your system administrator.

The items contain information related to the record open in the form pane. You click the different items to get contextual information. For example, if the open incident is about a failed service, you might click **Impacted Services/CIs** to see if other services are also down. If the incident is a power outage, you might click **Outages** to see if there are outages in other locations.

The **Details** item usually displays first by default. It is the only item that contains details of the open record. It also provides text fields that you can edit. For example, when you solve an issue, you should enter the resolution description in the section, **Resolution notes**. Your system administrator determines which fields from a record appear in the form pane.

Your configuration of workspace might include the following related items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Detailed information about the open record and text fields for you to enter information. The system administrator specifies the record fields that appear in the form pane. You use this</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Task SLAs</td>
<td>Service level agreements (SLAs) for a task. Expected deadlines for resolving a task of this type.</td>
</tr>
<tr>
<td>Affected CIs</td>
<td>Configuration items (CIs) related to an incident. Often, an incident is related to one or more specific configuration items (CIs). If the configuration management database (CMDB) is populated, the CI records hold valuable information to help resolve incidents. You can associate configuration items to an incident to see how the incident affects dependent CIs.</td>
</tr>
<tr>
<td>Impacted Services/CIs</td>
<td>Services and configuration items (CIs) affected by this incident.</td>
</tr>
<tr>
<td>Child incidents</td>
<td>Child incidents are incidents related to the parent incident, the incident open in record view. All work notes or comments in a parent incident are copied into a child incident. When a parent incident is resolved, the child incidents are resolved.</td>
</tr>
<tr>
<td>Outages</td>
<td>Service outages related to the incident open in record view.</td>
</tr>
<tr>
<td>User's Calls</td>
<td>The <strong>User's Calls</strong> related list displays historical calls between a requester and Service Desk agents. This feature is available to the users who has the Service Desk Call plugin (com.snc.service_desk_call) already activated.</td>
</tr>
</tbody>
</table>
  **Note:** The customer name in the **Opened for** field in Interaction is matched with the **Caller** field in Service Desk calls and records are retrieved based on the number of days mentioned in the interaction property **Number of days (integer) for which past user call records are retrieved. The default value is seven (7). A setting of zero (0) disables this feature. (glide.new_call.interaction.records_age). |
| User's Task        | When a requester contacts an agent through chat, phone call, request, or walk-in, the **User's Task** related list shows the agent all of the other tasks (incident, problem, change request, request, and so on) that have been created for the requester. For example, if a requester calls about the status of a request that was made the previous day, the **User's Task** |

**Domain separation for Workspace records**

Workspace supports standard domain separation. In a record, you can safely create another record in the correct domain, change the domain that the record associates with, and temporarily expand the domain scope of a record to a domain outside the record session.

Workspace uses Cross-Tenant Intelligence to automatically handle the data, metadata, business logic, and processing context for tenants that have access to additional tenant data. Cross-tenant intelligence enables the following behavior when you create a record.

- Records created from another record inherit the domain of the originating record.
- Records created with a UI action from a record carry over the domain of the originating record.
- Records created from a parent record, for example a related list, carry over the domain of the parent record.

For more information on Cross-Tenant Intelligence in Domain Separation, see [What is Domain Separation?](#).

Set form header images to provide domain context to a record.

**Toggle domain scope of a record**

Expand the domain scope of a record temporarily to a domain outside the record session. The record expands to include related lists and reference field queries. This enables you to create a master record that applies to issues for more than one domain.
Before you begin
You must first have permission to access the domain that you want to toggle.
Role required: domain_expand_scope user role

Procedure
1. Navigate to Workspace.
2. Select a record.
3. Click the overflow UI action icon (*** in the record and select **Toggle Domain Scope**.
   You can now access related lists and reference field queries.
   
   Note: Domain scope doesn’t toggle when the record is in the global domain or when your domain and the record domain match.

4. Click the overflow UI action icon (*** in the record and select **Toggle Domain Scope** to return the domain scope to the domain associated with the record.

Create a record in a domain without a parent
Create a new record when the domain of the record is unknown and you have access to multiple domains.

Before you begin
Change a domain by modifying the selection of the caller or company on the form of the record.
Role required: user

Procedure
1. Navigate to Workspace > New record menu.
2. On the form, fill in the fields.
   The company or caller selected associates the record with the corresponding domain.
   
   Note: Data available for auto-population is limited to the domains you have access to.

3. Click Next.

Results
The new record includes data and rules specific to the domain.
Sharing workspace views
Send a workspace view to another agent so he or she can look at the same information in workspace.

There may be times when you’re working on a record and want to share what you’re looking at with your manager or a fellow agent. To do that, copy the workspace URL in your browser and send it. The person can open the URL and see exactly what you’re seeing in workspace.

Add records to related lists
Add records to a related list to provide information related to an incident.

Before you begin
Role required: agent

About this task
If there is an Add button on your Related Items menu, your system administrator has made it possible for you to add records to related lists. You’d do this when you find a record that’s related to the one that’s open. For example, if the open record is about a power outage in one location, if there’s a power outage in a second location, you might add it to the related list of the first record.

Note: Not all workspaces have the Add button. It’s added by your system administrator.

When you open an incident, you can add locations that are associated with the incident. For example, let’s say that a power outage occurred in a location. You might find additional locations with the same power outage that you can add to the original incident report.

Procedure
1. Navigate to Incident > Open and click an incident to open it.
2. In the Affected Locations related list, click Add to associate records with the incident you selected.
3. In the pop-up modal, select the records that you want to add to the open incident.
The record data is read-only. Selecting the check box in the table heading selects all of the records in the modal and gives you an option of selecting all of the records in the list. Records that are selected on one page remain selected as you move onto another page.

4. In the modal, click **Add**.
   The addresses that you selected appear in the Affected Locations related list. They are added to the cmn_location table and are associated with this incident.

**Group and find records using tags in workspace**
Add tags to records to group and organize them.

**Before you begin**
Role required: agent
About this task

Tags are labels you can add to records. The tag icon (إنشاء) appears next to the primary value in the form header.

Tags enable you to group and organize records. You create the tag name, which should name the reason for the tag. You can make the tags visible to everyone, some people, or just yourself. The visibility setting specifies who can use the tags to search for records.

An unfilled tag icon (إنشاء) means that no tags have been assigned to the record. When tags are assigned and they're visible to you, the tag icon is filled (إنشاء).

After tagging records, you can use the tags to search for records in the global search field or using the filter icon (إنشاء) in List view.

Procedure

1. Navigate to any open record in a workspace.

   For example, click the list icon (إنشاء)، click a list filter, such as Open incidents، and click a record.

2. Click the Tag icon (إنشاء) next to the primary value in the form header.

3. In Add Tag، enter a tag name.

   The tag name should reveal the organization principal of the tag, for example, all records stemming from a particular incident.

4. Click Enter to save the tag with the record.

   You can add more tags.

   The tag visibility setting defaults to private, which means the tag is only visible to the person who created the tag. So, only that person can use the tag to search for records labeled with that tag.
5. To change the visibility setting of the tag, click the tag and change the **Viewable by** setting:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Me</strong></td>
<td>Tag is visible only to the person who created the tag. Only that person can use the tag to search for records. This setting is the default.</td>
</tr>
<tr>
<td><strong>Groups and Users</strong></td>
<td>Tag is visible to specific groups or users. You can specify the groups and users who can view this tag.</td>
</tr>
<tr>
<td><strong>Everyone</strong></td>
<td>Tag is visible to everyone.</td>
</tr>
</tbody>
</table>

Note: This visibility setting is only available to an admin or tags-admin role.

A record can have multiple tags and each can have a different visibility setting.
6. **Optional:** To remove a tag from a record, click a filled tag icon (✓) to open the list of tags, then click the X next to the tag you want to remove.

7. **Optional:** Search for your tag using the global search field.

**Communicating via email in workspace**

Email requesters and agents while working on issues in workspace.

With the workspace email client, you can email callers or fellow agents directly from the record view.
Compose an email
Compose an email to send to requesters and agents.

Before you begin
Role required: email_composer

Procedure
1. Open a record.
2. On the record view, click the menu icon (・・・) and then click Compose Email.
3. If available, complete the Reply To field.
   This field specifies who the recipient can reply to after receiving your email.
   You may choose to specify an entity apart from yourself (for example, the IT service desk).
4. In the To field, add an email recipient.
   Optionally, you can also add Cc and Bcc recipients by clicking Cc/Bcc.
5. In the Subject field, enter a subject line.
6. Create the email body.
   Optionally, you can insert a quick message in the email body. For more information, see Insert a quick message.
7. Optional: Attach a file to the email.
   For more information, see Attach a file to an email.
8. Click Send.
   Optionally, you can save the email as a draft by clicking Save. For more information on finding email drafts, see Review email drafts.
Results
You can find the sent email in the Emails list. For more information, see Review emails.

Insert a quick message
Insert predefined content into email messages.

Before you begin
Role required: email_composer

Procedure
1. Open an email draft.
2. Click the quick message icon (+).
3. From the quick messages list, select a quick message by clicking the insert icon (+).

Example:
In the following GIF, an agent creates an email requesting more information from the caller Beth Anglin. The agent opens the Quick Messages panel and then inserts several quick messages.
Attach a file to an email

Send a file to a requester or agent by attaching it to an email.

**Before you begin**
Role required: email_composer

**Procedure**

1. Open an email draft.
2. Attach a file using one of the following methods.

<table>
<thead>
<tr>
<th>Method</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach a file from your computer</td>
<td>a. Click + Attach File, and then click From Computer.</td>
</tr>
<tr>
<td></td>
<td>b. Select a file from your computer.</td>
</tr>
<tr>
<td></td>
<td>You can select multiple files at a time. The system uploads the files si-</td>
</tr>
<tr>
<td></td>
<td>multaneously.</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can drag files from your computer onto workspace. You</td>
</tr>
<tr>
<td></td>
<td>can’t attach a folder.</td>
</tr>
<tr>
<td>Attach a file from the associated record</td>
<td>a. Click + Attach File, and then click From Record.</td>
</tr>
<tr>
<td></td>
<td>b. On the window, select the files to attach.</td>
</tr>
<tr>
<td></td>
<td>c. Click Add.</td>
</tr>
</tbody>
</table>

**What to do next**

Optionally, you can perform additional actions by clicking the menu icon ( disclosing) next to each attached file:

- **Download**: Download the file to your computer.
- **Rename**: Rename the attached file. Only the first 100 characters of a file name are displayed.
- **Remove**: Remove the attachment from the email.

**Flag an email as important**

Inform recipients that your email is high priority.
Before you begin
Role required: email_composer

Procedure
On an email draft, click the flag icon (.FLAG).

Results
After you send the email, the email is flagged in the recipient's inbox. In workspace, this flag appears as a tag on the email.

Review emails
Review emails that you have sent and received.

Before you begin
Create a workspace list for the Email [sys_email] table. For more information on creating workspace lists, see Create My Lists in workspace.
Role required: workspace_user

Procedure
1. Open the list view by clicking the list icon (LIST).
2. Click My Lists, and then open your emails list.
3. Find an email by filtering the list or sorting columns.
4. Open an email to review.

For more information on using workspace lists, see Work with lists in workspace.

INC0000601 - The USB port …

Hi Beth Anglin,

Thank you for reaching out to IT Support. We are working on your issue now.

Thanks,

IT Service Desk

Ref: MSG0000068_TMEUbli0j3wcP8nwEMr

You can reply to or forward the email by clicking Reply, Reply All, or Forward.
Note: The UI behavior is different when you select Compose Email in the header. For more information, see Communicating with requesters and agents using Compose.

if you reply/reply all/forward from the activity stream, just because that email behavior is different than if you just click Compose Email in the header.

Review email drafts
Continue working on the emails that you saved for later.

Before you begin
Create a workspace list for the Email Draft [sys_email_draft] table. For more information on creating workspace lists, see Create My Lists in workspace.

Role required: workspace_user

Procedure

1. Open the list view by clicking the list icon ( ).
2. Click My Lists, and then open your email drafts list.
3. Find an email draft by filtering the list or sorting columns.

For more information on using workspace lists, see Work with lists in workspace.

4. Open an email draft to continue working on it.

Communicating with requesters and agents using Compose
You use Compose to communicate with requesters and to enter comments about the work that you do on issues that only fellow agents can read.

Composing comments
After researching an issue, you might want to get more information from a requester, communicate a solution, or write an internal note to yourself or
other agents to record your progress in solving an issue. To do that, you use the **Compose** feature. How you enter comments or work notes depends on the configuration.

- If you use a single text field, you select **Comments** or **Work Notes**, enter your comment in the text field, and select **Post Comments**.

Use the **Comments** text field to communicate with external requesters. Use the **Work Notes** field to document your progress on an issue. Work notes are not sent to external requesters and are visible only to you and other internal personnel, such as fellow agents who might also work on the issue.

- In stacked view, where there are two text fields, enter text in the appropriate field and select **Post Comments** or **Post Work notes (Private)**.

You can view emails in the Activity Stream. The **Email** tab appears in **Compose** when you reply, reply all, or forward an email from an existing email in the Activity Stream.
If you configured **Compose** to use the rich text editor, you can use the icons at the top of the field to stylize the text.

**Activity**

**Response via Additional comments (Customer visible)**

With the rich text editor, you can paste an image directly into the text field.
When you post your comment in **Compose**, the comment moves into the Activity Stream, which preserves the entire communication history. Only emails that are user-generated appear, for example existing emails that you write or reply to.

**Activity Stream**

**Service-now:**
2019-12-04 13:23:01 • Additional comments

I entered a change request to restart the Windows server.

**Service-now:**
2019-12-04 13:19:11 • Field changes

- **Impact**: 3 - Low was Empty
- **Opened by**: Empty was Empty
- **Priority**: 4 - Low was Empty
- **State**: New was Empty

**Other communications**

In addition to sending comments to requesters, you can also:
• Use the attachment feature (_attachment) in the Contextual side panel, for example, to add a knowledge article to a comment.

• Select the links in some of the cards in Agent assist that, for example, add a knowledge article to a comment.

**Configuring Compose**

You can configure **Compose** to appear as a single text field or two text fields.

You configure **Compose** by selecting the configuration icon (Configuration).

You can also view **Compose** and the Activity Stream side by side to enable you to write work notes and comments while scrolling the activity stream. The Compose UI displays next to the Activity Stream when column space is adjusted to accommodate the side by side UI. You can enable or disable this feature by selecting the configuration icon (Configuration) and then selecting **Side by side**. This option appears in the UI when column spacing is wide enough to support side by side (700 pixels or more). This feature may not be supported in older versions of Safari.
For more information, see Customize workspace.

Writing Knowledge articles to share solutions

To share a solution you’ve found with the community of workspace users, you can create and publish a knowledge article. The Knowledge Management Service Portal enables users to view knowledge base articles. It is available by default. For more information about creating, editing, and viewing articles, see Knowledge article authoring in Workspace.

Attach a document for a requester

Attach documents to a record to help requesters resolve issues. The attachment icon displays a badge enabling you to see with a quick glance that a document is attached.

Before you begin
Role required: agent_workspace_user

About this task
  • There are two ways to attach documents to a record.
    1. Browse for the document from the Agent Assist panel.
    2. Drag and drop the document on the record and press browse in the pop-up window.
  • Attachments support PDFs and most image files.
Procedure

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Open an incident record.
3. In the Agent Assist panel, click the attachment icon (🔗).
4. Select the document for your local computer.
5. Click **Upload**.

Results

The document appears in the Activity Pane and the Attachments icon displays a small dot indicating the record has an attachment.

Send an article to a requester

Use Agent Assist to send articles to requesters to solve their issues.

**Before you begin**

Role required: agent_workspace_user

**About this task**

Agent Assist search results can include links to knowledge articles that you can send to a requester.

Procedure

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Open an incident record in list view.
3. In the Agent Assist panel, click a search result that is an article.
4. Click the **Attach** link to send the article to the requester.
5. In the pop-up, enter a message to the requester and click **Attach Article**.

**Attach Article**

Create And Edit A Contact Group

Additional comments (Customer visible)  
I think this article might provide the info you need.
You comment and a link to the attachment appears in the activity stream.

Order a catalog item for a requester
Order a catalog item for a requester from Agent Assist search results.

Before you begin
Role required: agent_workspace_user

Procedure
1. Navigate to Agent Workspace > Agent Workspace Home.
2. Open an incident record in list view.
3. In the Agent Assist panel, click a search result that is a catalog item.
4. Click the catalog item, and then click Order.
The form for the catalog item opens in a new sub-tab.
5. Specify the details of the catalog item in the form, such as the number of gigabytes a laptop should have.

Results
Ordering the catalog item creates a service catalog request.

Performance Analytics and Reporting for Workspace
Integrate data visualization and reporting functionality into the workspace experience. Get notified about behavioral process changes. Explore KPIs, and get answers and insights on analytics with these Performance Analytics and Reporting Workspace integrations.

These features enable users to see pre-configured dashboard views. The features also show cases via trend line, column, comparison, proportional, and score visualizations within workspaces. Users can view and drill down into reports that show key performance indicators over time. They also see the current state of instance data, such as how many open incidents of each priority there are.

For more information, see Performance Analytics and Reporting for Workspace
Cloud Call Center

Integrate a third-party phone system with your ServiceNow® instance to drive the efficiency of your call center without having to navigate through multiple systems while attending a call. Help managers analyze the calls and view call metrics at one place.

Amazon Connect - Setup Instructions

Home

This guide helps you set up your Amazon Connect instance and integrate it with your ServiceNow instance.

Prerequisites:

1. Ensure an Amazon Web Services (AWS) account with administrative access to complete the setup.
2. Review the pricing guidelines for the services provisioned during this setup. Required services, resources, and roles are set up in your AWS account.
3. Since not all Amazon Services are available in all AWS regions, review the AWS documentation to ensure all resources are deployed to one region.
4. Create a service account in your ServiceNow instance to allow communication from your AWS account to your ServiceNow instance. If you do not have the permissions to create new user accounts on your instance, contact your ServiceNow administrator for creating this service account.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Display relevant data for an agent at the right time

Display relevant data in an interaction for an agent to help a customer during a call.

Route calls to agents

Analyze recording and call metrics of interactions

Within your ServiceNow instance, access recordings, call metrics, and call transcripts of agents to analyze interactions.

Review and analyze call transcripts

As an admin, you can:

• Use pre-built instructions and templates to integrate your ServiceNow instance with a third-party phone system such as Amazon Connect.

• Use pre-built operation handlers that invoke interactions to fulfill requests between a third-party phone system and Cloud Call Center.
As a manager, you can:
• View the call transcript and recording for coaching.
• View call metrics (for example, agent call time) for reporting.
• Analyze agent conversations and provide feedback for quality assurance.

As an agent, you can:
• Get calls routed to your assigned queues and accept or reject the calls via the integrated softphone from within the ServiceNow instance.
• Get the context of caller information before accepting a call.
• Collaborate with managers who can analyze your conversations and provide feedback for quality assurance.
• Manage presence states within the ServiceNow instance. For information about the presence states of an agent, see Agent Inbox controls.
• Access and use your softphone directly from within the ServiceNow interface using the OpenFrame integration. For information about OpenFrame, see OpenFrame overview.

As a caller, you can:
• Create a task using voice-based interactions. For example, create an incident or a case, unlock your account, or get a callback.
• Get your requests fulfilled within the integrated ServiceNow instance through bot interactions using the voice or dual-tone multi frequency (DTMF) inputs. These bot interactions are defined in contact flows in the third-party phone system.
• Get your call transferred to an agent who can help fulfill a request.

Inbound call workflow for the integration of Cloud Call Center with Amazon Connect
When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from a caller, a contact flow is invoked in the Amazon Connect instance based on the caller context such as language. An interaction record is created for this call.
• The caller request can be forwarded to an operation handler in the ServiceNow instance.
• The request can be resolved by an automated interaction with bot. If the caller request is not resolved by an automated interaction with bot, then the request is forwarded to a queue. An agent then receives the call and interaction, and resolves the request.
Here is an example workflow.
Amazon Connect Integration

Zeke calls Support

Amazon Connect → AWS Lambda

Interaction record created

Let’s try and deflect the call
Cloud Call Center recognizes this is Zeke and identifies that there is a wifi issue in his office location

There is a wifi issue in San Diego. Is this why you are calling?

“No, can you please tell me the status of my request?”

Zeke

I will look up the status of your request.
Setting up Cloud Call Center

Enable Cloud Call Center and integrate it with a third-party phone system such as Amazon Connect.

When you set up a third-party phone system and integrate it with the ServiceNow instance, an agent can accept an incoming call or make an outbound call from the ServiceNow instance using the integrated softphone. This experience is based on the configurations made within the third-party phone system.

Get started with Cloud Call Center

1. Procure the Professional license for a ServiceNow application, such as ITSM Pro or CSM Pro, which includes the Cloud Call Center SKU.
2. Install the Cloud Call Center applications in ServiceNow® Store. For information about this installation, see Install Cloud Call Center applications.
3. Sign up and create an account with a third-party phone system. By default, Amazon Connect is supported. For information about creating an Amazon Web Services (AWS) account, see the Amazon documentation.
4. Configure the framework for the third-party phone system within the ServiceNow instance. By default, the framework is supported for Amazon Connect. For information about this configuration, see Integrate Cloud Call Center with Amazon Connect.

Install Cloud Call Center applications

You can install the Cloud Call Center applications if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

• Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
• Your organization must have purchased the Professional license for a ServiceNow application, such as ITSM Pro or CSM Pro, which includes the Cloud Call Center SKU.
• You should install at least one content pack, for example, CSM or ITSM.

Role required: admin

About this task

The following Cloud Call Center applications should be installed.
# Cloud Call Center applications

<table>
<thead>
<tr>
<th>Application</th>
<th>Description</th>
<th>Components installed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Call Center Core [sn_cti_core]</td>
<td>Provides the framework that supports the integration with your third-party phone system.</td>
<td>For information about the components installed with this application, see <a href="#">Components installed with Cloud Call Center Core</a>.</td>
</tr>
<tr>
<td>Amazon Connect Integration with Cloud Call Center [sn_cti_amzn_cct]</td>
<td>Integrates Amazon Connect with the Cloud Call Center Core.</td>
<td>For information about the components installed with this application, see <a href="#">Components installed with Amazon Connect Integration with Cloud Call Center</a>.</td>
</tr>
<tr>
<td>Cloud Call Center UX Components [sn_cti_ux]</td>
<td>Enables call recording, transcription, and sentiment analysis for Cloud Call Center with Workspace experience.</td>
<td>None</td>
</tr>
</tbody>
</table>

## Procedure

1. Navigate to **System Applications > All Available Applications > All**.
2. Find these applications using the filter criteria and search bar.
   - Cloud Call Center Core (sn_cti_core)
   - Amazon Connect Integration with Cloud Call Center (sn_cti_amzn_cct)
   - Cloud Call Center UX Components (sn_cti_ux)

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the [ServiceNow Store version history release notes](#).

3. In the Application installation dialog box, review the application dependencies.
Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install the Cloud Call Center applications.

- Cloud Call Center Core (sn_cti_core)
- Amazon Connect Integration with Cloud Call Center (sn_cti_amzn_cct)
- Cloud Call Center UX Components (sn_cti_ux)

For the complete Cloud Call Center experience, install Cloud Call Center for ITSM or Cloud Call Center for CSM applications. For information about these installations, see Install Cloud Call Center for ITSM and Install Cloud Call Center for CSM.

4. Optional: If demo data is available and you want to install it, click Load demo data.

(Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

**Important:** If you don’t load the demo data during installation, it’s unavailable to load later.

5. Click Install.

Integrate Cloud Call Center with Amazon Connect

Connect Cloud Call Center of your ServiceNow instance with the Amazon Connect instance to provide a seamless inbound and outbound voice call experience for your callers and agents.

Before you begin

- Procure an Amazon Web Services (AWS) account with the administrative access to complete the integration setup between Amazon Connect and ServiceNow. For information about creating the AWS account, see the Amazon documentation.

- Create a service account in your ServiceNow instance to allow communication from your AWS account to your ServiceNow instance. If you do not have the permissions to create service accounts on your instance, contact your ServiceNow administrator for creating this service account.

Role required: sn_cti_amzn_cct.admin

Watch this 10-minute video to learn more about integrating an Amazon Connect instance. This video covers: Deploying Amazon resources and the
Lex Bot, setting up the Amazon Connect instance and the contact flow, authentication and roles, and User ID and password parameters

Procedure

1. Log in to your Amazon Web Services (AWS) account and setup an Amazon Connect instance. For instructions on setting up this instance, see the Amazon Connect documentation.

2. Integrate the Amazon Connect with your ServiceNow instance.
   a. Log in to your ServiceNow instance.
   b. Navigate to Amazon Connect Integration > Setup Instance.
   c. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Amazon Connect instance.</td>
</tr>
<tr>
<td>AWS ARN</td>
<td>Amazon resource name of the Amazon Connect instance. For information on AWS ARN, see the Amazon Connect documentation.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates if the record is active.</td>
</tr>
<tr>
<td>Override Params</td>
<td>Option to edit the domain for Amazon Connect instance parameters. You should select this option only when you want to integrate the ServiceNow instance with an Amazon Connect instance created before introducing the new domain for the Amazon Connect console. For information about this new domain, see the Amazon Connect documentation.</td>
</tr>
<tr>
<td>Instance Params</td>
<td>Auto-generated parameters based on the name of the Amazon Connect instance. For example, here are the Amazon Connect instance parameters before and after introducing the new domain for the Amazon Connect console.</td>
</tr>
</tbody>
</table>
3. Configure the Amazon Connect components in your ServiceNow instance.

   a. Navigate to Amazon Connect Integration > View Instances.

   b. Select the instance you want to configure.

   c. Click the Setup Guide related link.

   d. Complete the instructions for components specified in each section.

### Steps to configure Amazon Connect components

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Application</td>
<td>Select an application for which you want to configure the Amazon Connect components.</td>

</tbody>
</table>
|              | • Use AWS Cloud Formation template to describe AWS resources and properties  
|              | • Use AWS Cloud Formation stack to provision the resources described in the template                                                      |
| Deploy Lex Bot | Build voice-based conversational interfaces for your users. For more information on Lex Bot, see the Amazon documentation                     |
| Connect Setup | Integrate with your ServiceNow instance with AWS services                                                                                  |
| Import Contact Flows | Define a call tree for inbound and outbound calls between Amazon Connect and your ServiceNow instance. For more information on contact flows, see the Amazon documentation.  
|              | Based on your subscription, you have default inbound and outbound contact flows. For example, for the integration of Cloud Call Center with ITSM applications, see Components installed with Cloud Call Center for ITSM.  
|              | For an inbound contact flow, create queues to route contacts from AWS queues to ServiceNow queues. For information on creating queues in AWS, see the Amazon documentation.  
|              | Amazon Connect (Phone) is a placeholder phone channel for Amazon Connect integration. For queues that you implement in your Amazon Connect instance, you can use this channel to create corresponding Advanced Work Assignment queues. For an example implementation, see Associate Amazon Connect queues for ITSM to a ServiceNow instance or Associate Amazon Connect queues for CSM to a ServiceNow instance. |
| Call Recording Events | Send recording events to the ServiceNow instance by enabling call recording on your Amazon Connect instance. For more information on recording behavior, see the Amazon documentation |
| Setup Authentication | Integrate your Amazon Connect instance with your ServiceNow account by creating a service account                                              |
| Additional Configuration | Launch the Amazon Connect softphone interface within ServiceNow UI by configuring Openframe.                                                  |
Configure a contact flow for an automated caller interaction

Invoke an automated caller interaction with bots to fulfill the caller's request within the ServiceNow instance.

Before you begin
Role required: sn_cti_core.admin

About this task
When a caller contacts the call center, using the voice or dual-tone multi frequency (DTMF) inputs from caller, a contact flow is invoked in the Amazon Connect instance based on the caller context. The contact flow contains nodes that act as integration points between Amazon services and the ServiceNow instance. Based on the nodes defined in the contact flow, the corresponding operation handlers are triggered in the ServiceNow instance. The caller then gets the response that is defined in the operation handler. For information about contact flows, see the Amazon documentation.

In the ServiceNow base system, a few operation handlers are available by default. For information on operation handlers, see Cloud Call Center reference.

Procedure
1. **Optional:** If you do not want to use a default operation handler, create and configure an operation handler in the ServiceNow instance.
   
   a. Navigate to Cloud Call Center - Core > Operation Handlers.
   
   b. Click New.
   
   c. On the form, fill in the fields.
### Operation Handler form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operation Name</strong></td>
<td>Name of the operation that you want to automate.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Type that specifies how the operation is implemented.</td>
</tr>
<tr>
<td></td>
<td>• Script: Implementation is included in a script.</td>
</tr>
<tr>
<td></td>
<td>• Forward to Handler: Request is forwarded to an operation handler, which is invoked by lookup on the sys_id of that handler. This scenario is possible when you have different intents for similar operations, for example, Create an HR incident and Create incident.</td>
</tr>
<tr>
<td></td>
<td>• Forward to Operation: Request is forwarded to an operation handler, which is invoked by lookup on the name of the handler and then name resolution to find the handler.</td>
</tr>
<tr>
<td></td>
<td>• Integration Hub - Action: Calls an IntegrationHub action.</td>
</tr>
<tr>
<td></td>
<td>• Integration Hub - Subflow: Calls an IntegrationHub flow or subflow.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Application associated with the operation handler.</td>
</tr>
<tr>
<td><strong>Domain</strong></td>
<td>Domain associated with the operation handler.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option to activate the operation handler.</td>
</tr>
<tr>
<td><strong>Require Authentication</strong></td>
<td>Option to enable authentication for the operation handler.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this option is selected, the corresponding operation is invoked only when a valid authentication token is passed in the request. It is supported by an authentication operation handler that supports pin-based authentication, which can be leveraged in your contact flows. For information about configuring the PIN, see Configuring a phone PIN.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Summary about the operation handler.</td>
</tr>
</tbody>
</table>
### Nodes in contact flows

<table>
<thead>
<tr>
<th>Node</th>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
</table>
| Get Customer Input   | Invokes a Lex Bot. The operation handler that is triggered is based on the name of the intent associated with the Lex Bot. For information about this node, see the Amazon documentation. | a. Create an intent for the required Lex Bot in your Amazon Connect instance. For information about creating an intent, see the Amazon documentation.  
   
b. Specify the following information in the intent.  
   • Intent name: Name of the intent.  
   
   Note: This intent name should match an operation handler in the ServiceNow instance with the same name, or name + ‘_<suffix>’ where suffix can contain any five uppercase alpha characters. |
<table>
<thead>
<tr>
<th>Node</th>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
</table>
| Note:                                            | This node can be used when the integration is between Amazon Lex and the ServiceNow instance. | • Sample utterances: Caller utterances that trigger the operation handler.  
• Lambda initialization and validation: If the operation handler being invoked requires authentication, select the **Initialization and validation code hook** check box and select the deployed AWS Lambda function.  
• Lambda function: Deployed AWS Lambda function that is invoked.                                                                 |
| c. Save, build, and publish the intent.          |                                                                             |                                                                                                                                           |
| d. Open the required contact flow in the contact flow designer in your Amazon Connect instance. |                                                                             |                                                                                                                                           |
| e. Click the Get Customer Input node and specify the Lex Bot details in the **Amazon Lex** section. |                                                                             |                                                                                                                                           |
| f. Click **Save**.                               |                                                                             |                                                                                                                                           |
| a. Open the required contact flow in the contact flow designer in your Amazon Connect instance. | Invokes an AWS Lambda function. The operation handler that is triggered is based on the **sn_operation** parameter set on the node in the contact flow. For information about this node, see the Amazon documentation. |                                                                                                                                              |
| b. Click the **Invoke AWS Lambda Function** node and specify the following input parameters. | Invokes an AWS Lambda function. The operation handler that is triggered is based on the **sn_operation** parameter set on the node in the contact flow. For information about this node, see the Amazon documentation. | • Destination key: **sn_component**, Value: Component from where the Lambda function is invoked. For example, **sn_aws_connect_lambda_proxy_component**.  
• Destination key: **sn_operation**, Value: Name of the operation handler that you want to invoke. For example, **interactionEvent**. |
| a. Open the required contact flow in the contact flow designer in your Amazon Connect instance. | Invokes an AWS Lambda function. The operation handler that is triggered is based on the **sn_operation** parameter set on the node in the contact flow. For information about this node, see the Amazon documentation. |                                                                                                                                              |
| b. Click the **Invoke AWS Lambda Function** node and specify the following input parameters. | Invokes an AWS Lambda function. The operation handler that is triggered is based on the **sn_operation** parameter set on the node in the contact flow. For information about this node, see the Amazon documentation. | • Destination key: **sn_component**, Value: Component from where the Lambda function is invoked. For example, **sn_aws_connect_lambda_proxy_component**.  
• Destination key: **sn_operation**, Value: Name of the operation handler that you want to invoke. For example, **interactionEvent**. |

<table>
<thead>
<tr>
<th>Node</th>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
</table>
|      | **Note:** This node can be used to for data dips (for example, authorizing a caller) where the integration is between the call center and the ServiceNow instance. The data dip configuration allows a caller to enter information, such as an account number, to route calls to a particular queue. Using this number, you can look up the first name of the caller and create an interaction record after the call is initiated. Also, you can customize the greeting with the caller name later in the flow. | • (optional) Destination key: queueName, Value: Name of the queue that you want to transfer the flow to.  
  **Note:** This parameter is used to invoke the workItemEvent operation handler.  
  • (optional) Destination key: queueId, Value: ARN of the queue that you want to transfer the flow to.  
  **Note:** This parameter is used to invoke the workItemEvent operation handler.  
  • (optional) Destination key: authToken, Value: AuthToken received via authentication call. This parameter is required for invoking an operation handler that requires authentication.  
  • (optional) Destination key: interactionId, Value: Interaction ID received via interactionEvent call.  |
|      |             | c. Click **Save**. |
3. Ensure that a caller’s phone number is associated with the contact flow after it is created and published. This process ensures that each time the caller calls, the corresponding contact flow is invoked. For information about associating a phone number with a contact flow, see the Amazon documentation.

Note: For a sample implementation of invoking operation handlers in a contact flow, you can refer to the default contact flows. For information on default contact flows, see Components installed with Cloud Call Center for ITSM and Components installed with Cloud Call Center for CSM.

Configuring a phone PIN

You can set up or reset a phone PIN that can be used for caller authentication during a call with an agent.

If the Require authentication field is set to true for an operation handler, the corresponding operation is invoked only after the caller enters the PIN.

Important: It is applicable for both Cloud Call Center for CSM and Cloud Call Center for ITSM applications.

Reset the phone PIN for a caller

Reset the phone PIN for a caller if the caller's account is locked.

Before you begin
Role required: sn_cti_core.user_manager

About this task

Procedure

1. Navigate to Cloud Call Center - Core > User Pin Reset.
2. For the required CTI user, Click the preview icon and open the record to reset the PIN.
   a. In the PIN field, enter the new PIN.
   b. Clear the Disabled check box.
   c. Click Update.
Set or reset the phone PIN

Set up or reset your phone PIN that can be used for caller authentication when you call an agent.

Before you begin
Role required: none

Procedure

1. Navigate to **Cloud Call Center - Core > My Phone PIN**.
2. On the Request Phone PIN form, enter the PIN and re-enter it.
3. Click **Submit**.

Scripting for operation handlers

You can use the APIs in the Cloud Call Center framework to create a seamless voice call experience for your callers and agents.

The **CTIOperationRequest** API provides methods to set and get data on the current CTIOperationRequest object. For information on this API, see **CTIOperationRequest - Scoped, Global**.

The **CTIOperationResponse** API provides methods to set and get data on the current CTIOperationResponse object. For information on this API, see **CTIOperationResponse - Scoped, Global**.

The **CTI API** provides REST resources that enable Computer Telephony Integration (CTI) providers to interact with the Cloud Call Center framework. For information about this API, see **CTI API**.

Provider configuration in Cloud Call Center

For both inbound and outbound calls, a provider configuration contains settings about the involved components and message transformers for a specific third-party phone system provider. Any request from that phone system provider is handled within ServiceNow based on these settings.

To view the available provider configurations, navigate to **Cloud Call Center - Core > Provider Configurations**.

Any request from a third-party phone system is passed into a ServiceNow instance through the **CTI Operation** endpoint of the **CTI API**. For information about this API, see **CTI API**. Based on the provider and the component specified in the endpoint, the corresponding message transformers are invoked to perform the following:
• Transform the request from the third-party phone system before passing the request to an operation handler.
• Transform the response from the operation handler before passing it on to the third-party phone system.

Provider component
For each component or node available in the third-party phone system, a provider configuration contains a provider component. It contains a mapping between the component and a message transformer.

To view the available provider components, navigate to Cloud Call Center - Core > Provider Components > .

Message transformer
A message transformer defines how a request and response can be transformed between a third-party phone system and the ServiceNow instance.

• The Input Transformer field has a script that defines how a request from a third-party phone system should be transformed within the ServiceNow instance before passing the request to an operation handler.

• The Output Transformer field has a script that defines how the response from the operation handler should be transformed before passing it on to the third-party phone system.

To view the available message transformers, navigate to Cloud Call Center - Core > Provider Message Transformers > .

Provider configuration for the integration of Cloud Call Center with Amazon Connect
For the Cloud Call Center integration with Amazon Connect, the AWS Connect Default Handler provider component is available by default.

⚠ Note: The Amazon Connect Integration with Cloud Call Center application [sn_ctl_amzn_cct] should be installed in ServiceNow® Store. For information on installing this application, see Install Cloud Call Center applications.

For each node that can be used as an integration point between Amazon services and the ServiceNow instance, the following provider components and the corresponding message transformers are available.
When a customer dials using a phone number, a call is placed through the Amazon Connect's phone system. Using one of its components, Amazon Connect provides the request to the ServiceNow instance through the CTI Operation endpoint of the CTI API. For information about this API, see CTI API. Based on the provider and the component specified here, the corresponding message transformers are invoked to perform the following:

- Transform the request from Amazon Connect before passing the request to an operation handler.
- Transform the response from the operation handler before passing it on to Amazon Connect.

**Extension points in Cloud Call Center**

Using extension points, you can call the custom scripts to extend the functionality of Cloud Call Center. While integrating a third-party phone system with Cloud Call Center, you can invoke extension points using the CTI API to handle events in Cloud Call Center.

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

To view the extension points that are available by default, navigate to System Extension Points > Scripted Extension Points and group by the Cloud Call Center Core application.
Note: You should install the Cloud Call Center Core, Cloud Call Center for ITSM, Cloud Call Center for CSM, and Amazon Connect Integration with Cloud Call Center applications in ServiceNow® Store. For information about these installations, see Install Cloud Call Center applications, Install Cloud Call Center for ITSM, and Install Cloud Call Center for CSM.

Extension points in Cloud Call Center

<table>
<thead>
<tr>
<th>Extension point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_cti_core.clickToCallContextMap</td>
<td>Enables the copying of application-specific field values to interaction records for Cloud Call Center outbound calls.</td>
</tr>
<tr>

Configure the E.164 format for a consumer phone number

Ensure that all the necessary information for a phone number is included and properly formatted to successfully route an international call over a territory’s public telephone network. Provide the E.164-compliant formatting and validation for phone number.

Before you begin
Role required: admin

About this task
An E.164 phone number field displays the following field types:

- A list for the phone number territory
- An input box for entering phone numbers

The E.164 format that does not contain any dashes or spaces and must include the + sign. For example, +14152223456.
Procedure

1. Navigate to Customer Service > Consumers.
2. Select the required consumer record.
3. On the Consumer form, right-click any phone field and select Configure Dictionary.
4. On the Dictionary Entry form, for the Type field, select Phone Number (E164).
5. Click Update.

Results
After this configuration, when entering the consumer phone number in the phone field, select the territory and enter the corresponding phone number. The same format is reflected in Agent Workspace.

Using Cloud Call Center

Agents can use Cloud Call Center to receive inbound calls and make outbound calls with a seamless voice call experience. Managers can use this application to monitor and analyze calls.

Receiving inbound calls in Cloud Call Center

An agent can receive inbound calls using the Agent Softphone interface to handle a caller's request.

As an agent, you should have any of the following roles to receive an inbound call:

- sn_openframe.user and interaction_agent
- If the Advanced Work Assignment plugin (com.glide.awa) is installed, awa_agent & awa_integration_user.

After a customer dials in, the corresponding contact flow is invoked in Amazon Connect. Through the configured nodes, the request is forwarded to an operation handler in the ServiceNow instance.

If an agent is available, the agent can receive the call and handle the request using Agent Softphone interface. For information about the presence states of an agent, see Agent Inbox controls.
Interaction record states

<table>
<thead>
<tr>
<th>If</th>
<th>Then the interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>The interaction has just been created, is currently in a call tree</td>
<td>Is in <strong>New</strong> state.</td>
</tr>
<tr>
<td>being deflected by an IVR flow, or has not yet been routed and</td>
<td></td>
</tr>
<tr>
<td>assigned to an agent</td>
<td></td>
</tr>
<tr>
<td>The Lex Bot deflects the call or the user disconnects the call any</td>
<td>Moves to <strong>Closed Complete</strong> state.</td>
</tr>
<tr>
<td>time before the call enters the queue</td>
<td></td>
</tr>
<tr>
<td>The interaction gets assigned to an agent</td>
<td>Moves to <strong>Work in Progress</strong> state.</td>
</tr>
<tr>
<td>The user disconnects the call while waiting in the queue</td>
<td>Moves to <strong>Closed Abandoned</strong> state.</td>
</tr>
</tbody>
</table>

**Initiating outbound calls with Cloud Call Center**

Improve your productivity as an agent by initiating outbound calls to connect with customers using the click-to-call feature in the Cloud Call Center application.

As an agent, you can initiate outbound calls using the click-to-call feature when accessing the phone number of a user. The phone number of a user, if available, is displayed on the ServiceNow application UIs. Example application UIs include the contact details on a Case form, the user record on an Incident form, the Consumer form, the Contact form, and other application UIs.

**Note:**

- If not available, you can add the **Caller** field to an incident form.
- The phone number of a user should be in the E.164 format. For information about configuring a phone number in this format, see [Configure the E.164 format for a consumer phone number](#).

You should have any of the following roles to initiate an outbound call:

- **sn_openframe.user** and **interaction_agent**
- If the Advanced Work Assignment plugin (com.glide.awa) is installed, **awa_agent & awa_integration_user**.

You can click the link to the user's phone number displayed on the application UI. The user record must have the mobile phone, business phone, or both.
Agent Softphone pop-up window is displayed letting you know that the call will be recorded, and then the user's number is connected. An interaction record of type Phone is created for the call and is in the **Work in Progress** state.

The following agent presence states are configured by default for the Cloud Call Center application and are displayed in your Agent Workspace Inbox.

### Agent Workspace Inbox statuses

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallingCustomer</td>
<td>Indicates that you are in the process of connecting with a customer. After the call is connected, the status appears as <strong>Busy</strong>.</td>
</tr>
<tr>
<td>Busy</td>
<td>Indicates that you are on the call.</td>
</tr>
<tr>
<td>AfterCallWork</td>
<td>Indicates that you ended the call and right now working on updating the task such as case details. The status is displayed after you click <strong>End call</strong> in the Agent Softphone pop-up window.</td>
</tr>
<tr>
<td>Available</td>
<td>Indicates that you are available to accept another task such as a case. The status is displayed after you click <strong>Clear contact</strong> in the Agent Softphone pop-up window.</td>
</tr>
<tr>
<td>FailedConnectAgent</td>
<td>Indicates that you were unable to connect with the customer. After the call doesn’t go through, the status appears as <strong>Available</strong>.</td>
</tr>
</tbody>
</table>

**Note:** The Agent Workspace Inbox statuses are synchronized with your Advanced Work Assignment (AWA) activity.

The activity stream of the associated interaction record is populated with your status details, the URL to the call recording, contact trace record, and call transcript.

**Monitoring calls in Cloud Call Center**

A manager can monitor analyze calls to provide feedback and coach agents. As a manager, you can:
• View the call transcript and recording for coaching.
• View call metrics (for example, agent call time) for reporting.
• Analyse agent conversations and provide feedback for quality assurance.

In Agent Workspace, ITSM Manager Workspace, and CSM Manager Workspace, you can use the **Call Analysis** tab in an interaction to analyze transcripts, recordings, and sentiments.

**Integrating Cloud Call Center with other applications**
You can extend the capabilities of Cloud Call Center for inbound and outbound calls by integrating with other applications.

**Integrating Cloud Call Center with ITSM**
Route calls coming through the Cloud Call Center to specific phone queues based on user preference, utterances, or any other ServiceNow data to optimize incident resolution.

**Sample ITSM contact flow**
Use the inbound ([ServiceNow ITSM Inbound Demo Flow](#)) and outbound ([ServiceNow ITSM Outbound Demo Flow](#)) Amazon Connect ITSM sample contact flows that come with the Cloud Call Center integration to get you up and running quickly. The sample flow allows you to deflect voice calls or route them based on the caller context to different queues. When a call comes through the Cloud Call Center, the Amazon Connect application uses data dips to identify the caller and then deflect the call or route it to the right agent. For more information on integrating Cloud Call Center with Amazon Connect see, [Integrate Cloud Call Center with Amazon Connect](#).

Callers can access status updates or make updates to their records when they are authenticated.

**PIN-based authentication**
Callers can use PIN-based authentication to access the phone channel. Managers can set or reset the PIN for the users who can also set or reset their phone PIN. For more information, see [Configure a phone PIN](#).

**Workforce Optimization for ITSM**
Integrate Cloud Call Center with Workforce Optimization for ITSM to visualize call metrics from Amazon Connect. The Cloud Call Center uses **Advanced Work Assignment** to display the call metrics and active calls along with all other...
Channel metrics in the Manager Workspace. For more information, see Using Cloud Call Center with Workforce Optimization for ITSM.

Install Cloud Call Center for ITSM

You can install the Cloud Call Center for ITSM application (sn_cti_itms_cnt) if you have the admin role. This plugin installs the ITSM content for integration between Cloud Call Center and a third-party phone system.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Your organization must have purchased ITSM Pro subscription, which includes the Cloud Call Center SKU.
- Cloud Call Center for ITSM requires the following ServiceNow Store application. Ensure that this application is installed before you install Cloud Call Center for ITSM.

**Required ServiceNow Store applications**

Amazon Connect Integration with Cloud Call Center (sn_cti_amzn_cct)

Integrates the ServiceNow instance with the Amazon Connect server.
Role required: admin

About this task
The following items are installed with Cloud Call Center for ITSM application (sn_cti_itsm_cnt):

- Contact flows
- Operation handlers

For more information, see Components installed with Cloud Call Center for ITSM.

Procedure
1. Navigate to System Applications > All Available Applications > All.

2. Find the Cloud Call Center for ITSM application (sn_cti_core) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Cloud Call Center for ITSM application (sn_cti_itsm_cnt).

4. Optional: If demo data is available and you want to install it, click Load demo data.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   **Important:** If you don’t load the demo data during installation, it’s unavailable to load later.

5. Click Install.
Integrating Cloud Call Center with CSM

Access the CSM-specific contact flows and operation handlers when you integrate the Cloud Call Center application with the Customer Service Management application.

The Cloud Call Center for CSM application provides seamless interactive voice response (IVR) and calling experiences for your customers and agents by integrating a cloud contact center provider with the robust capabilities of the Customer Service Management application.

Overview
The Cloud Call Center for CSM application provides the following Customer Service capabilities for the integration with a cloud call center provider such as the Amazon Connect service:

• A bot building framework to automate interactions with consumers and customer contacts.
• An inbound contact flow to define the customer experience in an IVR.
• An outbound contact flow to connect with consumers and customer contacts from the phone number field displayed in any of the ServiceNow application UIs.
• Operation handlers to configure automated interactions for customer service cases.
• A phone PIN setup option for consumers and customer contacts.
• Amazon Connect phone queues for the Workforce Optimization for Customer Service application.

To get started with the Cloud Call Center for CSM application, see Install Cloud Call Center for CSM.

Key features

Customer experience
Engage via voice-based interactions using a natural language process to create a case, update and check case status, and speak with an agent.

Agent experience
• Preview caller information displayed in Agent Workspace before accepting an inbound call.

• Indicate your presence in the Agent Workspace Inbox with voice as a service channel when the Agent Workspace Inbox is integrated with the Agent softphone.

• Make outbound calls to connect with a customer and automatically capture interaction details to simplify data entry.

Manager experience

• Review call transcripts, sentiments, and recordings to explore coaching opportunities for agents.

• Use call metrics, such as the agent call time, to report on agents.

• Monitor real-time phone metrics captured in a unified dashboard by using the Workforce Optimization for Customer Service application.

Note: This feature is available when the Workforce Optimization for Customer Service application is enabled for the Customer Service Management application.

Cloud Call Center for CSM user roles

The users with the roles listed in the following table can use the Cloud Call Center for CSM application.

<table>
<thead>
<tr>
<th>Roles</th>
<th>Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_workspace_user</td>
<td>Initiate or accept voice calls to understand customer issues and resolve issues.</td>
</tr>
<tr>
<td>sn_customerservice_manager</td>
<td>View details of voice calls using the interaction record of the Phone type.</td>
</tr>
<tr>
<td>sn_customerservice.consumer,</td>
<td>Initiate or accept voice calls to create and track one’s own customer service cases.</td>
</tr>
<tr>
<td>sn_customerservice.customer</td>
<td></td>
</tr>
</tbody>
</table>
Example workflow

The following example workflow shows the use of the Cloud Call Center for CSM application in resolving a customer issue:

1. A customer is in an IVR call using the Cloud Call Center for CSM application.
2. The Cloud Call Center for CSM application identifies the customer and starts an interaction.
3. A welcome message is read out to the customer including announcements, if any.
4. Based on customer identification, the Cloud Call Center for CSM application addresses the call.
   - If the caller is identified as an existing customer who has a customer contact or consumer record with the phone number details available in the Customer Service Management application, a personal greeting is read to the caller and the automated interactions are made available.
   - If the caller is not identified, the call is routed to a live agent.
5. The Cloud Call Center for CSM application identifies the customer intent using automated interactions, and then based on the interaction responses, either creates or updates a case.

⚠️ Note: This step in the flow applies only when the caller is an existing customer.

Workforce Optimization for Customer Service

Integrate the Cloud Call Center application with the Workforce Optimization for Customer Service application to visualize call metrics from the Amazon Connect service. The Cloud Call Center application uses the Advanced Work Assignment feature to display the call metrics and active calls along with all other Channel metrics in the Manager Workspace. For more information, see Cloud Call Center in Workforce Optimization for Customer Service.
Install Cloud Call Center for CSM

You can install the Cloud Call Center for CSM application (sn_cti_csm_cnt) if you have the admin role. The application installs related ServiceNow® Store applications if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Your organization must have purchased CSM Pro subscription, which includes the Cloud Call Center SKU.
- Cloud Call Center for CSM requires the following ServiceNow Store applications. Ensure that this application is installed before you install Cloud Call Center for CSM.

Required ServiceNow Store applications
Amazon Connect Integration with Cloud Call Center
(sn_cti_amzn_cct)

Integrates the ServiceNow instance with the Amazon
Connect server.

Role required: admin

About this task
The following items are installed with Cloud Call Center for CSM:
• Contact flows
• Operation handlers

For more information, see Components installed with Cloud Call Center for CSM.

Procedure
1. Navigate to System Applications > All Available Applications > All.
2. Find the Cloud Call Center for CSM application (sn_cti_csm_cnt) using the filter
criteria and search bar.
   You can search for the application by its name or ID. If you cannot find the
   application, you may have to request it from the ServiceNow Store.
   Visit the ServiceNow Store website to view all the available apps and for
   information about submitting requests to the store. For cumulative release
   notes information for all released apps, see the ServiceNow Store version
   history release notes.
3. In the Application installation dialog box, review the application
dependencies.
   Dependent plugins and applications are listed if they will be installed,
   are currently installed, or need to be installed. If there are any plugins or
   applications that need to be installed, you must install them before you can
   install Cloud Call Center for CSM.
4. Optional: If demo data is available and you want to install it, click Load demo
data.
   (Optional) Demo data comprises sample records that describe application
   features for common use cases. Load demo data when you first install the
   application on a development or test instance.
   **Important:** If you don't load the demo data during installation, it's
   unavailable to load later.
5. Click Install.

Configuring the phone PIN settings for Cloud Call Center for CSM

Use a PIN-based authentication mechanism for enabling a customer contact or consumer to connect with the Cloud Call Center for CSM application.

An authentication mechanism for inbound dialing enables protecting the details of customer contacts and consumers from unauthorized users. When using the Cloud Call Center for CSM application, you as an administrator can configure the PIN-based authentication mechanism available within the Cloud Call Center for CSM application or set up a custom authentication mechanism.

The PIN-based authentication mechanism available within the Cloud Call Center for CSM application enables customer contacts and consumers to use a custom phone PIN for accessing details related to their customer service cases during inbound dialing.

By default, the My Phone PIN link in the Additional Configuration section of the setup guide for configuring the Amazon Connect components enables the PIN-based authentication mechanism. For more information about the setup guide, see Integrate Cloud Call Center with Amazon Connect.

Note: The My Phone PIN link for customer contacts and consumers is available only with the sample CSM-specific contact flows.

To enable a PIN-based authentication mechanism, the My Phone PIN link in the setup guide uses the predefined Setup PIN record producer that is configured by default for consumers and customer contacts. As an administrator, you can edit the Setup PIN record producer to add any additional ServiceNow roles, include the record producer in a service catalog, and display the service catalog as a module on a customer-facing portal. Customers can then use the module to configure and reset their phone PIN. For more information, see Record Producer and Set up a service catalog.

Cloud Call Center reference

Reference topics provide additional information about components installed with Cloud Call Center.

Components installed with Cloud Call Center Core

Several types of components are installed with activation of the Cloud Call Center Core application (sn_cti_core), including user roles, plugins, and operation handlers.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.
Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI service account [sn_cti_core.service]</td>
<td>Allows communication between the third-party phone system instance and the ServiceNow instance.</td>
<td>sn_openframe_api_user</td>
</tr>
<tr>
<td>CTI admin [sn_cti_core.admin]</td>
<td>Creates the framework for integration with a third-party phone system.</td>
<td>None</td>
</tr>
<tr>
<td>CTI user manager [sn_cti_core.user_manager]</td>
<td>Manages the CTI-enabled user PIN.</td>
<td>None</td>
</tr>
</tbody>
</table>

Plugins installed

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interaction Management (com.glide.interaction)</td>
<td>Enables interaction logging, routing, and queueing</td>
</tr>
<tr>
<td>Openframe (com.sn_openframe)</td>
<td>Provides an interface to integrate a communication frame to place and receive calls.</td>
</tr>
</tbody>
</table>

Operation handlers installed

Operation handlers are defined in the ServiceNow instance to run a script based on the intent of the caller and provide response to the caller.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$transcript</td>
<td>Saves the call transcript</td>
</tr>
<tr>
<td>$query2ssml</td>
<td>Securely queries tables and returns the response as ssml</td>
</tr>
<tr>
<td>workItemEvent</td>
<td>If the Advanced Work Assignment plugin (com.glide.awa) is installed, creates a work item on Advanced Work Assignment table before routing the call to agent, and associates an interaction with the work item.</td>
</tr>
</tbody>
</table>
### Components installed with Amazon Connect Integration with Cloud Call Center

Several types of components are installed with installation of the Amazon Connect Integration with Cloud Call Center application (sn_cti_amzn_cct), including user roles, plugins, and operation handlers.

⚠️ **Note**: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

#### Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Connect administrator</td>
<td>Configures the integration with the Amazon Connect instance.</td>
<td>sn_cti_core.admin</td>

Common Service Data Model

The Common Service Data Model (CSDM) is a standard and consistent set of terms and definitions that span and can be used with all ServiceNow® products on the Now Platform®. These terms and definitions form the basis for the CSDM framework.

About the CSDM

The CSDM terms and definitions enable service reporting, and provide prescriptive guidelines for service modeling within the ServiceNow® Configuration Management Database (CMDB).

The CSDM data model is a CMDB framework that supports multiple configuration strategies. The data model includes guidelines for using base system tables and relationships. Many ServiceNow products depend on data within this data model.

Benefits of using the CSDM

You can use the CSDM as a blueprint to map your IT services to the ServiceNow platform. The CSDM is a CMDB-based framework that identifies where to place data for the products that you're using. Also, the CSDM is the standard for all ServiceNow products that use the CMDB. Following the CSDM framework ensures that the data your ServiceNow application requires maps correctly to the appropriate CMDB tables.
If you don't follow this standard, you may not receive the full benefit of the ServiceNow products on the Now Platform®.

**CSDM and reports**

You can use the CMDB query builder to create reports showing CMDB configuration items (CIs) and their relationships.

Most of the CSDM follows the CMDB data model, which includes the following components:

- Business capability
- Business application
- Information object
- Application service
- Service
- Service offering

**Additional information about CSDM**

You can find additional information about the CSDM on the Community Forum.

**Common Service Data Model conceptual model**

The Common Service Data Model (CSDM) is a framework or blueprint that you can follow when you set up your ServiceNow® application. Following this model ensures that the data for that application maps correctly to the appropriate tables.

The following figure illustrates the CSDM conceptual model. The figure also defines each of the domains in the CSDM framework, and shows how each domain works together to manage your ServiceNow applications and services.
Domains in the CSDM conceptual model

The CSDM conceptual model contains these domains: Foundation domain, Design domain, Manage Technical Services domain, Sell/Consume domain, and the Manage Portfolio domain.

Each domain in the CSDM conceptual model is associated with one or more products, services, or service types, which you can extend as needed.

Services and service types

A service enables you to achieve the outcomes that you want with minimal risks and without incurring costs. This definition is consistent with the base definition of "service" in ITIL v3 and IT4IT. Services typically have three components: the interaction, the offering, and the service system.

Base system service types

ServiceNow includes these base system service types which you can extend to align with the service types in your organization.

- Technical services

Technical services are associated with service owners. Technical services are typically lower-level leaf nodes of one or more business or application services in a structured hierarchy.
• Application services

  Application services are logical representations of a deployed application stack.

  **Note:** For more information about leaf nodes and structured hierarchies, see **Design domain**.

### Set up the CSDM environment

Set up the Common Service Data Model (CSDM) framework to use standard fields and values to track the life cycle of a CI.

**Procedure**

1. Before you can use the CSDM framework, you must first migrate your life cycle data. This step includes mapping and migrating the legacy life cycle values to the CSDM standard values. For more information, see **Migrate to CSDM life cycle standards**.

2. **Activate the CSDM Activation plugin** `com.snc.cmdb.csdm.activation`. For more information, see **Activate a plugin**.

**Results**

You have successfully set up your CSDM environment. You can use standard values to track assets effectively through their life cycle transitions with the **CMDB Data Manager**.

### Common Service Data Model life cycle states

The CSDM framework provides standard fields and values that you can use to track the life cycle of an asset or a CI.

The life cycle state is a combination of an asset or CI's stage and status in the entire life cycle. You can manage and track the life cycle state for a product model, a specific version, or a product configuration.

A hardware (physical) or software (logical) asset can go through several phases from concept to design until it reaches end of life. A hardware asset includes physical items that are stocked like servers, monitors, keyboards. A software asset includes items like applications, services, licenses.

The following diagrams show the life-cycle phases of physical and logical assets.
If you activate the CSDM framework, you can start using the two new fields, **Life Cycle Stage** and **Life Cycle Stage Status** to track an asset’s life cycle. The following legacy statuses are automatically mapped to these two new fields:

- Product Model Status
- Asset State
• Asset Substate
• Contract Status
• CI Install Status
• CI Operational Status
• CI Hardware Status
• CI Hardware Substatus

To activate the CSDM framework and use the new fields, follow the procedure described in Set up the CSDM environment.

**Synchronize group assignment attributes**

Synchronize group assignment attributes across a large number of CIs or entire CI classes.

If you want a specific user group to manage a collection of CIs or CI classes, you can set group assignment attributes through the CI Class Manager or the technical service offering. This will automatically synchronize the group assignment attribute data across all CIs belonging to a specific class or groups of CIs.

- **Synchronize data using CI Class Manager**: Set the Managed by group attribute for a specific class in the CI Class Manager. This setting is automatically applied to all CIs of this class.

  **Note**: The Managed by group setting is applied only to the CIs that are not associated with a technical service offering.

- **Synchronize data using a technical service offering**: Directly set the Support group, Change group, or Managed by group attributes in a technical service offering. These settings are automatically applied to those CIs that are associated with the Technical service offering.

**Related information**

- CI Class Manager

**Synchronize data using CI Class Manager**

Synchronize group assignment attributes on entire CI classes and individual CIs using the CI Class Manager.

**Before you begin**

- Role: itil and itil_admin
Procedure

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list, select a class to display details for and click Basic Info.
3. Change the value in the Managed by Group attribute and click Save.
4. To verify this change, click CI List.
   You can see that the change has been applied to the Managed by Group attribute of all CIs of this class unless they are associated with a Technical Service Offering.

   Note: This change is applied only to the CIs in the class and not to the sub classes under a CI.

Example:
As an itil_admin, you can define a user group that can manage all CIs belonging to a specific class by following these steps:

• 1. Navigate to the CI Class Manager and select the Linux Server class from the tree
2. Click Basic Info and in the Managed By Group attribute, select sys_user_group and click Save.
3. To verify that this attribute has been updated, click CI List and navigate to a specific Linux Server class. You will see that the Managed By Group attribute has been updated to sys_user_group.

Synchronize data using a technical service offering

Synchronize group assignment attributes on entire CI classes and individual CIs using a Technical Service Offering

Before you begin
Role required: itil and itil_admin

Procedure

1. Navigate to Configuration > CMDB Groups and create a new CMDB group. See CMDB groups for details.
2. Navigate to Configuration > Dynamic CI Groups.
3. Create a new Dynamic CI group and associate it with the CMDB group you have created.
See Manage Technical Services domain for more information on Dynamic CI groups.

4. Navigate to CSDM > Technical Service Offering and create a new technical service offering. See Manage Technical Services domain for more information on Technical Service Offerings.

5. Navigate to the CI Relationships table and click New and enter the following:
   - Parent: Select the technical service offering you have created.
   - Child: Select the Dynamic CI group you have created.

6. Click Submit. You have now created a relationship between the technical service offering and the Dynamic CI group.

7. Navigate back CSDM > Technical Service Offering and open the technical service offering you have created.

8. Enter values in the following fields:
• Support group
• Change group
• Managed by group

Note the Dynamic CI group associated with the technical service offering.

9. Click Save. You will see a message indicating that data synchronization has been enabled for these fields.

10. The values you have specified are applied to the related Dynamic CI group and all the associated CIs.

ℹ️ Note:

• If a new CI is added to the class, the data will be synchronized only after the scheduled CSDM Data Sync job is completed. If you need to synchronize the data immediately, navigate to Scheduled Jobs > CSDM Data Sync and click Execute.

• The Managed by Group field may be populated both in the CI Class Manager and the Technical service offering. In this case, the value specified in Managed by Group field in the Technical service offering takes precedence.
Common Service Data Model (CSDM) navigation pane

The CSDM navigation pane is the starting point for accessing the CSDM domains. The domains include the Foundation domain, the Design domain, the Manage Portfolio domain, the Manage Technical Services domain, and the Sell/Consume domain. Each domain is associated with one or more products or services.

The CSDM includes a navigation pane used to access the CSDM domains and their components. For more information about the CSDM domains, see Common Service Data Model domains.
Note: If you are using Service Portfolio Management (SPM), the CSDM navigation pane includes a Technology Request Catalog module in the Manage Technical Services domain and a Business Request Catalog module in the Sell/Consume domain. For more information about how SPM integrates with the CSDM framework, see Service Owner Workspace integrations.

CSDM and application services
The Manage Technical Services domain contains an Application Service component. You use this component to create an application service, and choose the population method you want to use. You can also set a relationship between the application services and the components of other CSDM domains. For more information about automatically creating and populating application services, see Service Mapping.

CSDM and the Application Service Dashboard
The CSDM navigation pane also includes an Application Service Dashboard you can use to monitor and manage your application services. For more information about using the Application Service Dashboard, see Monitor the health of application services in the Application Service Dashboard.

The CMDB and CSDM Data Foundations Dashboard
The CMDB and CSDM Data Foundations Dashboards store app contains dashboards which provide insights into the key foundational indicators of your Configuration Management Database (CMDB) and Common Service Data Model (CSDM). This app provides recommendations to ensure that the CMDB and CSDM are properly configured for optimal usage and to mitigate any potential risks. For an introduction, watch the ServiceNow® Data Foundations Dashboards for CSDM and CMDB video. For more information about this store app, see Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards (Version 1.0.2).

Common Service Data Model domains
The Common Service Data Model (CSDM) contains the Foundation, Design, Manage Technical Services, Sell/Consume, and Manage Portfolio domains. Each domain is associated with one or more products or services.
**Foundation domain**

The Foundation domain is one of the domains in the Common Service Data Model (CSDM). The Foundation domain represents tables that contain base data referenced from or to objects in the other CSDM domains.

The tables in the Foundation Domain aren't used in Configuration Management Database (CMDB) relationships. Instead, these tables contain critical referential data. For example, Foundation data is required before you use ServiceNow® products or add data to the CMDB.

The typical users of this domain are process owners, data stewards, and product owners, and contract managers.

**CMDB group**

A CMDB group is a collection of CIs based on the results of saved Query Builder queries, encoded queries, or manual entries. The CMDB group isn't a CI.

The CMDB group provides a grouping of CIs which you can then use throughout the Now Platform.

For the CSDM, the Dynamic CI Group references a CMDB group to provide a list of CIs based on a common criteria.

CMDB groups are stored in the table `cmdb_group`.

The CMDB group can potentially replace the spreadsheets that you may be using to group your CIs.
**Contracts**

A contract is a binding agreement between two parties. In the Now Platform®, contracts contain detailed information, such as the contract number, start and end dates, active status, terms and conditions statements, documents, renewal information, and financial terms.

Contracts are stored in the table [ast_contract].

A contract isn't a CI. Contracts use contract model types from the Product Models.

Service contracts may support hardware CIs as part of an SLA and used by vendor management. Additionally, Service contracts may be used by Customer Service Management.

**Common data**

Common data are shared data that is used throughout the Now Platform. Common data include the organizational structure (Company, Business Unit, Department), locations, groups, and users. Many ServiceNow products depend on common data to provide business value. Planning your common data is core to the effective implementation of ServiceNow products and features.

Consider your answers to these questions:

- Do you have a trusted source for this data?
- Do you have multiple data sources?
- How often does this data change?
- Do you have the depth of data that the CIs require?
- Who maintains this data?

These are only some of the issues you need to consider. Carefully planning your common data helps ensure that you have the data you need.

Common data are stored in the following tables:

- Company: [core_company]
- Business unit: [business_unit]
- Department: [cmn_department]
- Location: [cmn_location]
- Groups: [sys_user_group]
- Users: [sys_user]

Common data are not CIs.
**Design domain**

The Design domain is one of the domains in the Common Service Data Model (CSDM). The Design domain represents the tables currently used by ServiceNow® Application Portfolio Management (APM).

While the Design domain represents the tables currently used by APM, these tables are not operational. Because these tables are not operational, you can’t select them for Incident Management and Change Management.

The Design domain includes the following tables:

- Business capability table [cmdb_ci_business_capability]
- Business application table [cmdb_ci_business_app]
- Information object table [cmdb_ci_information_object]

While you’re not required to use APM to use these tables, you can use APM to rationalize and manage your business applications.

The typical users are enterprise architects and application owners.

**Information object**

An Information object is part of the information portfolio and the business application references the information object.

The information object is a CI that displays information in an organized form. An information object describes the type of data (or the information) that the application receives from the database.

Information objects are mapped to the information object table [cmdb_ci_information_object] in the CMDB.
You can use the information object table to identify the types of data a business application uses including highly sensitive data such as:

- Personally Identifiable Information (PII)
- Payment Card Industry Data Security Standard (PCI DSS) data
- Health Insurance Portability and Accountability Act (HIPAA) data

**Business capability**

A business capability is a high-level capability that your organization must do to complete a business model or fulfill a mission. A business capability is typically associated with performing specific tasks needed to achieve one or more business outcomes. Business capabilities are often listed as verbs (for example, manage financials or provide IT support services).

Business capabilities are recorded in the table [cmdb_ci_business_capability].

**Create relationships between CIs**

Establish a relationship between the following configuration items (CIs):

- The business capability and the business application (for visualization and reporting purposes).
- The business application and the application services.

These relationships enable you to:

- Determine the risks involved in using these business capabilities.
- Assess services based on their relationships to business capabilities and business applications.

An accurate service model that includes these relationships can serve as the foundation for strategically aligned architectural decisions.

**Business capabilities represented in a hierarchy**

You can represent business capabilities in a hierarchy that includes a parent business capability and one or more lower-level (child) capabilities.

These lower-level capabilities are called “leaf nodes.” Leaf nodes are represented by numeric values, such as 1.0 for the parent and 2.0 through 6.0 for the leaf nodes.

ℹ️ **Note:** If a business capability hierarchy requires more than six levels, consider using multiple business capabilities.
Use the Business Capability form to create, modify, and extend business capabilities.

**Business capability form**

If you add, update, or delete a capability at a leaf node, update the levels of all the capabilities for the leaf nodes in that hierarchy, as applicable.

To update the capabilities, click the **Update Capability Level** and **HierarchyID** related link in the Business Capability form. Updating the capabilities ensures that the capability map reflects the change. When you're updating business capabilities, note the following guidelines:

- When adding a capability, the hierarchy level is automatically assigned based on the parent capability level.
- If the parent capability is updated in the hierarchy, the levels of all its leaf node capabilities are recalculated.
- The total number of leaf node levels can't exceed six in the hierarchy.
- Only leaf node-level capabilities or capabilities without leaf node levels can be deleted.
- Don’t create circular relationships. For instance, when creating a parent capability, a leaf node capability can’t be its parent.

**Business application**

A business application represents the software and infrastructure (for example, the titles catalog) used to provide a business function.

Business applications increase productivity and perform other business functions, such as accounts payables, accounts receivables, and general ledger.

A business application can:

- Span multiple environments (for example, Development, Test, or Production).
- Span geographies (for example, Americas, the Asia Pacific Japan (APJ), or regions (for example, Europe, the Middle East, and Africa [EMEA] )

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Use the Business Application form to add the applications that your organization uses.

You can enter the details of a business application by using the Business Application form. Alternatively, you can import the list of applications from a spreadsheet or a third-party tool. To import data, define a data source and a transform map, and run or schedule an import. Although not required, you should use a business application.

Create relationships between the business application and other CIs

A business application is a manually managed CMDB CI class. Because the business application is a manually managed CI class, you must manually create the required relationships. For example, you must create relationships between the business application and other CIs, such as the instances of the application services in use.

Note: If needed, you can integrate or connect two or more applications to establish their relationship.

Creating relationships also enables you to relate business applications to infrastructure CIs, such as databases and web servers.

Using APM, you can add any business application for which you must track costs, usage, business value, functionality, and risks.

Manage Technical Services domain

The Manage Technical Services domain is one of the domains in the Common Service Data Model (CSDM). This domain represents the tables currently used by
ServiceNow® IT Operations Management (ITOM), such as Service Mapping and Discovery.

While you aren’t required to use Service Mapping and Discovery to use the tables, these two ServiceNow products let you manage configuration items (CIs) and their relationships. The CIs in this domain are the discovered items, such as installed applications, servers, and network components.

The Manage Technical Services domain also represents the portfolio of technical services in use. These services are operational, which means that you can select them for Incident Management and Change Management.

The typical users are application service owners (for the application and platform) and technology service owners (for the infrastructure and delivery).

**Note:** Beginning with the New York release, technology consumers can request technical services through the Request Catalog.

The tables in the Manage Technical Services domain represent the technology that your business sells or consumes in the provider view. The domain includes the following tables:

- Technical service table [cmdb_ci_service_technical]
  (Event Management uses the [cmdb_ci_query_based_service] table.)
**Note:** Starting with the Paris release, the [cmdb_ci_query_based_service] table has been relabeled to Dynamic CI group.

- Request catalog
- Technical service offering table [service_offering]
- Dynamic CI group table [cmdb_ci_query_based_service]
- Application Service table [cmdb_ci_service_discovered]

Starting with the London release, this table is included in the base system.

**Technical services**

Technical services are associated with service owners and are typically layered beneath one or more business or application services.

When you use technical services, you can view and manage the technology that you provide to the business. If you’re using Event Management, you can monitor service performance. You can also use Event Management to identify health issues for related infrastructure CIs and application services.

Previously, technical services were mapped to the [cmdb_ci_service] table and were classified as “technical services.” Starting with the Paris release, technical services are now mapped to the [cmdb_ci_service_technical] table.

The table for Event Management-enabled technical services has also changed. Previously, these technical services were mapped to the [cmdb_ci_query_based_service] table. The new name for the [cmdb_ci_query_based_service] table is Dynamic CI Group.

A technical service may have one or more technical service offerings.

**Technical service offerings**

Technical service offerings (SO) divide technical services into these options:

- Location or geography
- Environment
- Pricing
- Availability
- Capability
- Support group (for incident)
- Technical approval group (for change)
- Packaging options (commitments)
You can use the technical service offering to set different levels of performance and select features for a given technical service.

Technical service offerings typically have the following components:

- One or more service commitments:
  
  A service commitment defines the service delivery obligations agreed to between the consumer and the provider.

  Service commitments uniquely define the level of service in terms of availability, criticality, scope, pricing, and other factors. For example, an organization may offer two levels of support for an application service, as described below:

  - Support for a production-related offering: Provides a high level of availability and criticality for production instances. Includes a 5-minute response time guarantee of 24-hours, seven days per-week.

  - Support for a non-production-related offering: Provides limited availability and criticality for non-production instances. Includes a 60-minute response time guarantee between 8:00 a.m. and 5:00 p.m., Monday through Friday.

- A service offering subscription that records which users have access to an offering.

The technical service offerings are mapped to the [service_offering] table, are classified as “technical service,” and are derived from the service. The technical service offering is based on how the parent serves a specific technical need. Every operational technical service should have at least one technical service offering.

Beginning with the New York release, technology consumers can request technical service offerings through the Request Catalog.

**Dynamic CI group**

A Dynamic CI group is a CI that contains a dynamic grouping of CIs, based on the results of CMDB Groups queries. For example, you can create a Dynamic CI group based on the location of all web servers in Detroit or all Oracle databases in Boston.

ℹ️ **Note:** Dynamic CI groups contain CIs. Dynamic CI groups can’t contain other groups.

A Dynamic CI group is mapped to the [cmdb_ci_query_based_service] table and is classified as either an “Application Service” or “Technical Service,” as applicable.

You might want to use Dynamic CI groups in the following situations:
• As a query-based application service
  You don’t have Service Mapping enabled yet, but you have 12 servers and 3 database instances in MyAppServiceProd. You can delete your spreadsheets and use a Dynamic CI group as an application service.

• As a managed group of Infrastructure CIs
  The web servers in Detroit are managed by the DetroitRockCity Technical Service Offering. You don’t need to manually create relationships from Technical Service Offerings to Infrastructure CIs. You can use a Dynamic CI group. A single relationship from your Technical Service Offering CI (DetroitRockCity) to your Dynamic CI Group (web servers in Detroit) gives you the visibility you need.

• As a way to manage patches for your CIs
  In Change Management, you can select the Dynamic CI group for the CIs you need to update and use a business rule to auto populate the Affected CI field.

See Create a Dynamic CI Group for instructions on how to create a dynamic group.

Application service

An application service is a logical representation of an application stack in use. Using application services, you can view maps and change history for services. If you’re using Event Management, you can monitor service performance and identify health issues for application services.

Application services can be internal, like an organization email system or customer-facing, like an organization website. For example, creating financial reports through a web-based application requires a computer, web server, application server, databases, middleware, and network infrastructure. These applications and hosts are configured to offer the service of financial reporting. In development environments, application services represent instances of a business application or system in different types of environments, such as development, test, or production.

Application services are the entry points for Service Mapping. Application services are mapped to the Configuration Management Database (CMDB) [cmdb_ci_service_auto] table for common reporting and they underpin a business or technical service.

Starting with the Paris release, you can use additional methods you to create application services. Each method maps to a different table as listed below:
Method used to create the application service | Mapped to table
--- | ---
Top Down Discovery | cmdb_ci_service_discovered
Dynamic CI Group | cmdb_ci_query_based_service
Tags | cmdb_ci_service_tags
Manual | cmdb_ci_service_discovered

To create the application service, use the Create an Application Service form.

For more information about application services and the methods you can use to create them, see Application services.

Application services are key relationship entities for IT Service Management (ITSM), IT Operations Management (ITOM), IT Business Management (ITBM), and Customer Service Management (CSM).

Application services include relationships between business applications, business services, technical services, applications, and infrastructure CIs. You can expose an application service by using the related business or technical service offering.

- **Application**

  An application is any program or module used to complete a specific function. An application defines behavior and is associated with a specific function. Applications are typically discoverable instances and provide a specific set of functions for one or more services.
ServiceNow limits applications to those applications on a single host. This limitation ensures that the applications are uniquely identified during discovery.

Also, there's a one-to-many (and not a one-to-one) relationship between the application and the application service. A single installed application, such as a database instance, may support multiple application services.

The application table [cmdb_ci_appl] isn't an inventory or portfolio of your applications. Inventory or application portfolio objects belong in the business application table (as documented in Design domain).

The application table and extended tables contain those uniquely discovered instances of code in use on the host.

Applications are considered infrastructure CIs.

- **Infrastructure CIs**

  Infrastructure CIs are managed physical and logical components.

  A CI may be a single module, such as a server, database, or a router. A CI may also be a complete system (for example, a web server, database, or infrastructure.)

  The underlying infrastructure components or CIs can be complicated. The complexity increases as data structures are layered on top of those physical CIs. For that reason, you should work with a business relationship manager or enterprise architect to define the various business capabilities and business applications.

### Sell/Consume domain

The Sell/Consume domain is one of the domains in the Common Service Data Model (CSDM). The Sell/Consume domain represents the tables currently used by ServiceNow® Service Portfolio Management (SPM) and Customer Service Management.

You're not required to use SPM or CSM to use the referenced tables. However, using these ServiceNow products enables you to manage workflows and report service-related data.
The Sell/Consume domain also represents the portfolio of business services that may sell or consume elements of the Manage Technical Services domain.

**Note:** Beginning with the New York release, business consumers can request business services through the Request Catalog.

The Sell/Consume domain includes the following tables:

- Business service offering table [service_offering]
- Service portfolio table [service_portfolio]
  
  The Service portfolio table is not a Configuration Management Database (CMDB) table.
- Business service table [cmdb_ci_service]

You can select the tables in the Sell/Consume domain to use with Incident Management and Change Management.

The typical users are the business relationship manager and the customer service manager.

**Business service offerings**

Business service offerings are the starting point for configuring SPM. Business service offerings consist of one or more service commitments. These service commitments define the level of service in terms of availability, scope, pricing, and other factors. For example, an organization may offer two levels of desktop support:
• A “standard” offering of upgrades and virus protection.

• An “executive” offering with the standard commitments plus a response time guarantee. For example, this offering could be a response time of 30 minutes between the hours of 8:00 a.m. and 5:00 p.m., Monday through Friday.

Business service offerings have the following characteristics:

• Business service offerings divide the service into capability, availability, pricing, and packaging options. You can use the service offering to set different levels of performance and features for a given service.

• Business service offering commitments define the agreed-upon service delivery obligations. Service offering subscriptions record which users have access to an offering.

• Business service offerings are the specific ServiceNow records that identify the specific business area and the entity where the service is delivered. Some business services and service offerings depend on the application service.

• Business service offerings are derived from the service and are refined depending on how the parent serves a specific business need.

Note: You should have at least one service offering for each operational business or technical service.

You can view your business service offerings from the Service Owner Workspace.

Service Offering view from the Service Owner Workspace
Business service offerings typically have different Service-Level Agreements (SLAs). Without a business service offering, your SLAs remain at a process level only. For example, the SLA stays at a P1 incident or a minor change, and doesn’t refer to the service offering affected.

You can represent business services and offerings in the service catalog (by catalog items) and make them available for consumers.

**Service portfolio**

At the highest level, a portfolio is a collection of services, products, projects, or applications. You can use it to group and manage items for a business. You can group items by:

- Objective
- Capability
- Organization (for example, enterprise resource planning [ERP] or financial management)
- Geography

A service portfolio is a hierarchical collection of business services. The service portfolio contains products and services. You can use these products and services to define strategic business objectives and manage the life cycle of those services.

**Business service**

A business service is associated with business users and is typically layered beneath one or more business capabilities.

Business consumers can use the Request Catalog to order business services, service offerings, and service commitment levels. The business services are mapped to the [cmdb_ci_service] table and are classified as “business services.”

A business service may contain one or more business service offerings.

**Manage Portfolio domain**

The Manage Portfolio domain is one of the domains in the Common Service Data Model (CSDM). This domain represents portions of the other CSDM domains: Foundation, Design, Manage Technical Services, and Sell/Consume.

Think of the Manage Portfolio domain as a layer on top of the CSDM conceptual model. This domain incorporates portions of the other CSDM domains.
The typical user for this domain is the service owner. The service owner may be responsible for services in more than one domain. For example, in the Sell/Consume domain, the service owner for Human Resources (HR) may be financially responsible for the business application that provides HR services.

Request Catalog

A Request Catalog is a list of business and technical products, services, service commitment options, and offerings that you can order. Catalogs enable you to order and manage your available products and services.

Catalogs (such as the Human Resources [HR] service catalog) help manage services that a user can access. Catalogs are the starting point for accessing available services, and contain catalog items.

Catalog Items

A catalog item is an item or a service that you can request from the catalog. A service can contain multiple catalog items (for example, the employee onboarding catalog). Catalog items are listed on the service portal and are
available to the users who need them (either through subscription or job responsibility). Each catalog item is linked to one service offering.

### Common Service Data Model-to-Configuration Management Database (CMDB) mapping

The objects in the Common Service Data Model (CSDM) must map to the tables in the physical model, configuration items (CIs), and classes in the ServiceNow® Configuration Management Database (CMDB).

The following figure shows how objects in the conceptual CSDM framework map to the physical model objects (tables and CI classes) in the CMDB.

#### Conceptual-to-physical object mapping

<table>
<thead>
<tr>
<th>Conceptual Model</th>
<th>Physical Model</th>

</table>

#### Configuration Item relationships in the Common Service Data Model

For configuration management to be the most effective, establish relationships between the objects and configuration items (CIs) in the conceptual Common Service Data Model (CSDM).
Not all objects in the CSDM conceptual model are Configuration Management Database (CMDB) tables, and not all the objects have relationships. You may need to create the required relationships.

The following figure illustrates the required relationships between the objects in the CSDM conceptual model:

Several ServiceNow® products, such as Application Portfolio Management (APM), depend on the preceding relationships. For example, business application “consumes” application service.

These relationships are critical. Without them, some features, such as the Technology Portfolio Management risk assessment, don’t work.

Also, the relationships commonly created as part of Service Mapping and Discovery are the standard for infrastructure CIs. If you map the elements manually, think about the way Discovery would treat the discovered CIs as you continue.
Common Service Data Model framework implementation stages

When you implement the Common Service Data Model (CSDM) framework, use a phased approach. Implement CSDM in stages that ServiceNow® calls foundation, crawl, walk, run, and fly. Each stage builds on the previous one.

Key CSDM implementation principles

The CSDM is designed for reporting and analytics, with the primary goal of supporting consistent analysis. The key CSDM implementation principles help you achieve that goal. As you implement CSDM on your ServiceNow platform, be sure to adhere to these principles. They help you decide how to proceed and help you to effectively manage your shared information.

Note: If you don’t follow these principles, you could cause implementation errors and get results you don’t want.

- Use simple and unique concepts to avoid duplicates and to clearly identify the correct concept to use.
- Use the prescriptive relationships when linking CSDM tables.
- Collaborate on the shared data model with the other product teams.
  Also, when you’re extending the CSDM and related functionality, be sure to follow the provided guidance. Following the guidance and collaborating with other product teams helps you achieve the best design.
- Use agreed-upon CSDM definitions whenever you’re using a table, reference, or attribute.
- Use the CSDM base tables that are available by default on zBoot.
- Use prescribed technologies when you’re integrating external data sources. Doing so ensures data integrity and integration consistency.
- Use data governance and process to make sure that data in the model is accurate. Otherwise, the data is of little value.
- Follow the provided guidance for using the ServiceNow product.

Implementation Stages

Each implementation stage focuses on specific areas and information types, and provides specific benefits. The stages are:

- Foundation
- Crawl
- Walk
Start with the foundation stage and then proceed to the next stage.

**Stage: Foundation**

This stage focuses on making sure you have the foundational information (that is, the required referential data) you need to get accurate reports. Many of the Configuration Management Database (CMDB) reports need this referential data along with information about the configuration items (CIs). You need accurate reports to make the right business decisions.

The foundation stage focuses on the following referential tables in the ServiceNow® base system:

- **Organizational structure** — The organization structure base system tables include tables that identify internal business structures, and external customers, manufacturers, and vendors. Organization structure tables include the following tables:
  - **Company** — The legal entities of either internal or external companies are populated in the Company table. A hierarchy is permitted using the Parent attribute. Consider the legal entities you need for your reports when the CMDB is populated. Entities can be either internal (your company) or external.

  **Internal**
Entries should focus on a hierarchy of legal entities rather than a hierarchy of business units within a legal entity.

**External**

External entries are identified by the True or False flags. The Customer flag identifies your external customers. The Manufacturer flag identifies those companies that the create products that you consume.

**Note:** Your internal company may also be a manufacturer.

The Vendor flag identifies those companies that provide products that you purchase.

**Note:** Your internal company may also be a vendor.

- **Business Unit** — The hierarchy of your business is populated in the Business Unit table with a reference to the parent company. Business units are parts of your organization that are responsible for specific operations, such as Finance, Human Resources (HR), or IT. A hierarchy within business unit is common. For large multinational companies, you may have business units that identify independent regional operations, and the specific operations within that region.

- **Department** — The Department table contains a finer level of detail about your business unit. The Department table gives you another way to categorize users, groups, assets, and CIs.

- **Location** — Identifies a geographic location. You can create a hierarchy of location data by using the Parent attribute. The hierarchy could include entries that match your reporting requirements. For example, you could populate the location table as follows

  **Location reporting workflow**

  ![Location Reporting Workflow Diagram](image)

  If you need to include more details in your reports, you could extend the Location table to include floors, rooms, and even datacenters.

- **Groups** — Identifies a set of users who share a common purpose. Groups may perform tasks such as approving change requests, resolving incidents, receiving email notifications, or performing work order tasks. Groups also use the referential data in the CMDB to identify how the CIs are managed (for example, the Managed by group) and supported (for example, the Support
group). Any business rules, assignment rules, system roles, or attributes that refer to the group automatically apply to all group members.

- **Users** — Identifies the people who have access to the ServiceNow® instance. You can then organize these people into groups associated with the Company, Business Unit, and Department tables.

- **CMDB Group** — Identifies a collection of CIs based on the results of saved Query Builder queries, encoded queries, or manual entries. CMDB groups are critical elements of Dynamic CI groups and the strategic management of CIs. Decide early how you want to report CI information and how you want to monitor your CIs. These decisions affect how you create the CMDB groups you need.

- **Product models** — Identifies the unique types of products your organization develops or consumes. You can group assets and CIs by these product models. Grouping assets and CIs by product models can help you plan projects, monitor costs, and rationalize your data. Discovery can populate hardware product models once they are operational, but other types of product models require planning from product owners.

- **Contracts** — Identifies a binding agreement between two parties. When you are populating services provided by vendors into the CMDB, consider the role that contracts play when evaluating service level agreements (SLAs).

**Benefit of stage: Foundation**

Using the base system tables when you begin implementing the CSDM provides the following benefits:

- These base system tables act as the foundation for many ServiceNow products and the Now Platform®.

- These tables helps your company align with reporting requirements earlier rather than later.

  Early alignment expedites the value you get from the CSDM. For example, you can reduce or eliminate any costly rework tasks needed to align with reporting requirements.
This stage focuses on goals you can achieve with IT Service Management (ITSM).

Start by focusing on applications and the application-related data in these areas and tables:

- **Business application table [cmdb_ci_business_app]**
  
  A business application is a base system Configuration Management Database (CMDB) table that stores your inventory, application portfolio, and their metadata.

  This table is not an operational configuration item (CI), which means you can’t use it in Incident Management and Change Management.

- **Application Service [cmdb_ci_service_auto] table**

  **Note:** The Paris release includes additional methods you can use to create application services. Each method maps to a different table. For details, see Manage Technical Services domain.

  A mapped application service is a base system CMDB table that identifies the related business application in use.

  You may have several application services representing each deployment based on the environment (development, QA, production) and location or geography (North America, Asia Pacific).
The application service is typically what the caller identifies when they report an issue with an application.

The application service ties all the elements of the CSDM together where applications are present.

- **Application table [cmdb_ci_appl]**
  
  An application is a base system CMDB table that represents the discoverable instance of an application: code related to a process in use on a host. This table isn't an inventory of your applications. Discovery creates and maintains this table.

  The application may be identified as the root cause of an incident. However, if you’re not using Event Management, the application may not be the initial cause.

  If you’re using Discovery, applications are automatically related to their host, which provides an impact hierarchy from server-to-host applications.

  Because of the high level of complexity involved, don’t try to manually populate the application table.

Future products and product enhancements depend on the data populated in each of these tables.

**Benefits of stage: crawl**

The crawl stage focuses on these base system CMDB tables:

- Business application table [cmdb_ci_business_app]
- Mapped Application Service table [cmdb_ci_service_discovered]
- Application table [cmdb_ci_appl] (discoverable)
- Server/host (discoverable)

The crawl stage has the following benefits:

- Provides the minimum CMDB requirements required to provide Incident Management and Change Management.

- Serves as a foundation for using Application Portfolio Management (APM).

  When you use APM, your business application data is in the right place in the CMDB, which makes setting up APM faster.

- Serves as a foundation for using Service Mapping.
When you use Service Mapping, your application service data is populated and ready to use for mapping the entry points.

• Lets you manage the life cycles and versions of the technologies that underlie the business applications you’re using.

When you use APM, Service Mapping and Software Asset Management (SAM) Professional, you can identify outdated or at-risk software.

Stage: Walk

Applications that you’re using, and the network infrastructure, need someone to manage and support them. This stage focuses on doing that management. The following ServiceNow tables identify the technology provider:

• Technical service [cmdb_ci_service] table, or [cmdb_query_based_services] table for Event Management.

This base system CMDB table identifies the provider of the technology that your business consumes.

• Technology service offering [service_offering] table

Technical service offerings may be further divided as follows:

◦ Location and geography
◦ Environment (production or non-production)
◦ Pricing
◦ Availability
◦ Support group (for Incident Management)
◦ Technical approval group (for Change Management)
◦ Packaging options (commitments)

The technical service offering comes from the service. It is based on how the parent serves a specific technical need. Every operational technical service you have needs at least one technical service offering.

⚠ Note: Not all technical service offerings have to be related to applications or infrastructure CIs. Managed Service Providers may provide technical service offerings.

• Dynamic CI group [cmdb_ci_query_based_service] table

A Dynamic CI group is a collection of CIs based on the results of saved Query Builder queries, encoded queries, or manual entries.
For more information about Dynamic CI groups and how you can use them, see Manage Technical Services domain.

Benefits of stage: walk

The walk stage focuses on these additional base system CMDB tables:

- Technical service (service table with a service classification of "technical service")
- Technical service offering (service offering with a service classification of "technical service")
- Dynamic CI group

The walk stage provides the following benefits:

- Facilitates managing the discovered infrastructure CIs. Manually managing the metadata on these CIs, such as support group and technical approval group, can be involved. By identifying the technical service offering that manages these CIs, you can:
  - Configure ServiceNow to populate and synchronize this metadata onto the related child objects.
  - Eliminate the manual effort of maintaining the metadata on thousands of CIs.
- Establishes a view of those CIs, applications, and technology owners.
The technology owners are the users your technical team members support. You can see the specific support assignments, which you can change as needed based on your support structure, operational-level agreements (OLAs), and commitments.

Also, this view enables you to formalize for your process for supporting applications and technology owners.

• Serves as a foundation for using Service Portfolio Management (SPM).

When you use SPM, your service data are in the right place, which lets you start using SPM more quickly.

• Enables you to order technology service offerings through the Request Catalog. You can also automate ordering these offerings as needed to enhance the request workflow and update or create related CIs.

Note: The Request Catalog is not a CMDB table.

• Serves as a foundation for Information Technology Operations Management (ITOM) products, such as Service Mapping and Discovery.

Stage: Run
When you use ITSM, you must understand the impact that a technology can have on your business. For example, your business may:

• Consume the technology provided
• Sell the technology (as is the case with Customer Service Management (CSM)]
• Sell and consume the technology

This stage focuses on the relationship between the technology and the business that sells or consumes (or does both) for that specific technology. ServiceNow has these components that identify that relationship:

• Business service portfolio table [service_portfolio]
  A business service portfolio is a hierarchical collection (not a CMDB table) of business services (products and services) that define a business objective.
• Business service table [cmdb_ci_service]
  The business service table is a base system CMDB table. This table identifies a business objective that uses (and depends on) the infrastructure that technology uses.
This dependency means that the business service must sell or consume that infrastructure.

- **Business service offering table [service_offering]**

Business service offerings are the starting point for configuring SPM. Business service offerings consist of one or more service commitments. These service commitments uniquely define the level of service in terms of availability, scope, pricing, and other factors.

The business service offering comes from the service. The business service offering is fine-tuned based on how the parent serves a specific technical need.
Every business service should have at least one business service offering.

**Benefits of stage: run**

The run stage focuses on these components:

- Business service portfolio table [service_portfolio]
- Business service table [cmdb_ci_service]; (service classified as a "business service")
- Business service offering table [service_offering]; (service offering classified as a "business service")
The run stage provides the following benefits:

- **Impact assessment for Incident Management and Change Management.**
  Within an incident or change, you can identify the impacted business, assuming relationships exist between the selected CI and the impacted businesses.

- **A foundation for using SPM in the Service Owner Workspace.**
  Service owners can monitor service portfolios and understand service-related information including:
  - Service trends
  - Improvement initiatives
  - Service performance
  - Outage monitoring

- **A foundation for ITSM capabilities.**
  This foundation populates the related “Subscribe by” table on a service offering to identify the business and subscribers affected.

Business service offerings can identify subscribers by:
- User
- Company
- Location
- Department
- Group

**Stage: Fly**
Reaching this stage means that you’ve accomplished all or most of the earlier stages. The fly stage completes the remaining elements of CSDM:

- **Request catalog**
  Beginning with the New York release, you can request services through the Request Catalog.

  **Note:** The Request Catalog is not a CMDB table.

- **Business capability table [cmdb_ci_business_capability]**
  A business capability is a high-level capability that your organization must complete for its business model. Or a capability your organization must complete it to fulfill its mission. You can use these capabilities to rationalize and prioritize the cost of business applications and business services.
• Information object table [cmdb_ci_information_object]

An information object is part of the information portfolio. The business application references the information object. You can use the information object table to identify the types of data that a business application uses, including highly sensitive data such as:

◦ Personally Identifiable Information (PII)
◦ Payment Card Industry Data Security Standard (PCI DSS) data
◦ Health Insurance Portability and Accountability Act (HIPAA) data

You may need to implement the information object table as part of an earlier stage and not wait until the fly stage. Your business requirements determine the right stage for implementing this table.
Benefits of stage: fly

The fly stage focuses on these components:

- Business service portfolio table [service_portfolio]
- Business service table [cmdb_ci_service]: (service classified as a "business service")
- Business service offering table [service_offering]: (service offering classified as a "business service")

The fly stage provides the following benefits:
• A foundation for using APM capabilities.
  You can use the APM capabilities to rationalize your business applications. Ask questions such as the following:
  ◦ Are you spending too much on your business capabilities?
  ◦ Are you spending too little on your business capabilities?
  ◦ Should you increase the amount you spend on emerging business capabilities?

• A foundation for using APM with SPM capabilities.
  You can use APM with SPM capabilities to rationalize your business services and related offerings. Ask questions such as the following:
  ◦ Are you spending too much or too little on services?
  ◦ Are you spending too little or too little on services?
  ◦ Are the right services compared to emerging capabilities?

• A foundation for using ITSM capabilities.
  Starting with the New York release, you can use the Request Catalog to relate a service offering to a catalog item. You can also enhance the request workflow to automatically populate the “Subscribe by” table.

  Note: The Request Catalog is not a CMDB table.

• If your environment has a combination of CIs from each of the CSDM domains, this stage provides away to manage business services.

• A way to identify the types of data that may be contained in or used by your business applications. The information object table helps you see what’s in your information portfolio.

Migrate to the Common Service Data Model framework

When you begin using the Common Service Data Model (CSDM) framework, you must complete several tasks to ensure that your application migrates successfully to the new framework. These tasks ensure that your data is in the required locations in the ServiceNow® Configuration Management Database (CMDB).

Before you begin
Role required: admin
About this task
To reduce the risk of making mistakes, migrate your applications carefully, and keep the following points in mind:

• Many of the CSDM-related tables for your ServiceNow products have only been available for a short time, and you may not be familiar with them. See the documentation for your ServiceNow product to learn about any of the tables that are unfamiliar to you.

• You may be using customized or non-conforming CMDB tables.
  You can keep using these tables. However, if you do, you may not get the full benefit of the ServiceNow products.

Manage the attributes you are using
Rationalize your custom attributes. Decide if you must keep all customizations.
Delete the attributes that you don’t use or use only rarely. If there’s a better way to address a use case rather than using an attribute, consider deleting those attributes as well.
Organize your custom attributes into the following categories:
• Best Practice: Doesn’t have a related base system attribute but you want to use it.
• Keep: Doesn’t have a related base system attribute but it’s required for a unique use case.
• Refactor: Does have a base system attribute or a capability that can be migrated.
• Do Not Need (DNN): This customization is no longer needed.

Consider the related dependencies
Moving the configuration items (CIs) to a new table doesn’t automatically move the related dependencies. Identify the related dependencies. To identify the related dependencies, use the script called Migrating into CSDM identifying table dependencies available on the ServiceNow Community.

After running the dependency script and evaluating the data, you have a better idea of the effort required for migrating your data. Decide if you need all referenced reports, rules, and scripts. Then decide what you want to migrate and make a migration plan.

The script doesn’t move your data or their dependencies. It simply identifies the dependencies. Refactor them as part of the migration.

The following figure illustrates the migration workflow.
Migration workflow

To migrate your data from one table or class to another, complete the following steps:

**Procedure**

1. **Back up your data.**
   Export your data (with all attributes) to Excel and keep the file in a secure location.

   ✉ **Note:** Have a contingency plan in case issues arise.

2. **Map the attributes.**
   Identify the table where you want your data to go. Make sure that destination table has the required base system attributes. Rationalize your custom attributes. Decide if you must keep all customizations.

3. **Move the configuration item (CI) from one class to another.**

   ✉ **Note:** Don’t forget about your non-conforming tables and their dependencies. You could have hundreds of reports, business rules, scripts, table references, and more that need the data in your non-conforming tables.

4. **Refactor the attributes.**
   Solidify the data model and get the data ready for migration. Make sure you have completed the attribute mapping-related tasks in step 2. Remember to categorize your attributes (Best Practice, Keep, Refactor, DNN) and refactor your data as needed.

5. **Migrate the data.**

   ✉ **Note:** Make sure that you have a valid and recent backup. Do another backup, if necessary. You lose any customized or base system attributes not in the same table hierarchy.

Keep these points in mind as you proceed:
• Migrate your CIs to the new class. Migrating your CIs to the new class moves the CI and all its related objects, incidents, and changes to the new table.

• Start with a few CIs and increase the number when you feel comfortable.

6. Remediate your table dependencies:

   a. Modify reports to use the new table.
   b. Migrate business rules and scripts, if needed.
   c. Update table references, as needed.

7. Reload data into the new attributes using the backup that you made earlier.

8. Validate all data and dependencies.

Results
You’ve successfully migrated your application to the CSDM framework, and your data is in the required locations in the CMDB.

Common Service Data Model product views
Product views and use cases for using your ServiceNow® product with the Common Service Data Model (CSDM) framework.

Starting with the Orlando release, the CSDM documentation includes product views and use cases for a number of ServiceNow products. Each product included has a separate product view.

Each product view includes the following topics:

• The CSDM tables managed by the ServiceNow product.
• The CSDM tables used by the ServiceNow product.
• Other ServiceNow products that add value to the one you are using.
• Other ServiceNow products that benefit from the one you are using.
• Overview of the ServiceNow product you are using.
• Use case for ServiceNow product you are using.

⚠️ Note: A CSDM use case may have 1 or more data types. Other ServiceNow products may also manage these data types. The use case doesn’t describe all the possible product dependencies.

The product views don’t address:

• Implementing the ServiceNow product.
• Configuring non-base systems.
Non-base systems may be referred to in this product view, but they are out-of-scope.

• Using other ServiceNow products, such as IT Service Management (ITSM), IT Business Management (ITBM), and IT Operations Management (ITOM).

**Common Service Data Model product view: Application Portfolio Management**

Product view and use cases for using ServiceNow® Application Portfolio Management (APM) with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see [Common Service Data Model](#).

**CSDM tables managed by APM**

1. Business Capability table [cmdb_ci_business_capability]
2. Business Application table [cmdb_ci_business_app]
3. Information Object table [cmdb_ci_information_object]

The following figure highlights the CSDM tables managed by APM. The numbers correspond to the specific table.

**CSDM tables used by APM**

1. Application Service table [cmdb_ci_discovered_service]
2. Configuration Item tables [cmdb_ci*]
3. Product Model (software and hardware models) tables for Technology Portfolio Management (TPM)

4. Business Unit table [business_unit] and Department table [cmn_department]

5. IT Owner and Business Owner user table [sys_user]

Products that add value to APM

When you use APM with other ServiceNow products, you increase the value you get from APM. These other ServiceNow products include:

- **Discovery**
  
  Discovery provides details about the hardware and software CIs you are using.

- **Service Mapping**
  
  Service Mapping provides details about the application instance service in the [cmdb_ci_service_discovered] table, relating infrastructure and application [cmdb_ci_appl] CIs.

- **Asset Management**
  
  Provides the related product model. Software Asset Management (SAM) Foundation and Hardware Asset Management (HAM) provide lifecycle data for Technology Portfolio Management (TPM).

- **Financial Management**
  
  Total Cost of Ownership (TCO) calculation based on general ledger data and allocation rules.

- **Project Portfolio Management**
Views the business application roadmaps. Includes demands, projects, sprints and epics.

- Agile Development
  Views the backlog stories and epics of each business application in the application roadmap.

**Products that benefit from APM**
The ServiceNow products that gain value from APM include:

- **IT Service Management (ITSM)**
  Services have the context of the business and applications, along with the information and technologies layered beneath them.

- **Information Technology Operations Management (ITOM)**
  Understands the business context for the application services along with the hardware and software being managed.

- **Governance, Risk, and Compliance (GRC)**
  Auditors can leverage the business applications and related Information Objects. This helps auditors understand the design-time data sensitivity for scoping audits, measuring risks, and managing audit activities.

- **Asset Management**
  Manages the software and hardware lifecycles for business applications and business services.

**APM product overview**

Use APM to gain a comprehensive understanding of the applications used in your organization so you can identify redundancies, and decrease budgetary costs.

The APM home screen organizes many of the CSDM tables used by APM.
With the APM home screen, you can see the following information.

1. Business portfolio

View the number of defined business capabilities that have been or will be assessed, and the number of business applications that support the capabilities but are at-risk.

2. Information portfolio

Capture the asset information as information objects. You can connect the information object to your business applications. Connecting the information object to your business applications creates an application portfolio that you can use at any time.

The information portfolio links to the following data:

- Data Domains: Total number of records in the Data Domain table [sn_apm_data_domain].
- Information Objects: Total number of records in the Information Object table [cmdb_ci_information_object].
- Database Instances: Total number of records in the Database Instance table [cmdb_ci_db_instance].
- Database Catalogs: Total number of records in the Database Catalog table [cmdb_ci_db_catalog].

3. Application Portfolio
Track the applications that support your business capabilities and effectively manage them to meet the goals of your organization. The portfolio provides a list of applications with information such as their category, manufacturer, and type. Click Applications to navigate to the list view of business applications in your organization.

APM use case

APM lets you define a single, version-agnostic entity that represents all instances, technologies, and data used for planning and reporting.

You can use a business application for planning and governance activities, such as funding, road mapping, and risk reporting. Rationalizing business applications is a continuous process, and is critically important to reducing costs, and planning technology transformations. Rationalizing business applications is also critical for completing mergers, divestitures, or other broad-impact business-led changes.

Key features of the APM use case

The CMDB, when used by the CSDM framework, provides value to APM in the following ways:

• Application Lifecycle Management. This includes:
  ◦ Registering a new business application.

    Note: Starting with the Paris release this is now included in the base system.
  ◦ Updating a business application
  ◦ Decommissioning a business application, including all the related application services and infrastructure.

• Business application portfolio assessments based on metrics or related impacts.

• Roadmap planning and creating new ideas, demands and projects.

• TCO calculations (using the Financial Management module)

• Manage the following related entities:
  ◦ Information objects table [cmdb_ci_information_object]
  ◦ Business capabilities table [cmdb_ci_business_capability]
Results of the APM use case
With this use case, CSDM provides APM a consistent way to model business applications and relate critical data. The use case ensures that the application services (instances) are defined as required for automating the technology risk scores, costs, and other metrics used for analysis.

TPM use case
TPM gives you a better understanding of the risks associated with using software and hardware that is at the end-of-life (EOL) date. You can use the details provided by the CSDM framework to determine the risk of using software and hardware that is at the EOL date. Each product lifecycle EOL date is calculated, then combined following the CSDM framework to provide a score at the Business Application level.

Results of the TPM use case
The CSDM framework provides a consistent data structure. This consistent data structure makes it easier for you to manage the lifecycles of your technology and analyze the combined technology risks.

Because of the way the CSDM framework is structured, you can leverage many of the ServiceNow products from ITOM, Service Management (SPM), and IT Application Management (ITAM).

The risks of using EOL technologies are calculated based on the lifecycle of each software and hardware product model identified in the CMDB, and matched with a software and hardware product model.

You can enter the lifecycle data manually, import it from an external source, or use the data provided with your Software Asset / Hardware Asset Management license.

The risks are calculated and displayed in a hierarchy. Business application are at the top level, Application Services indicate each deployment (instance), and software and product models are at the lowest level. Risks are calculated in the order shown below, and are based on the time span between the current date and the EOL date.

1. Hardware and software product model — Displays the current lifecycle phases, sources, and indicates the specific models at-risk
2. Application Service level — Displays the combined risk status of all underlying hardware and software product models used in the Application Service (Instance).
3. Business Application level — Combines all the underlying Application Service (Instances) to determine the overall risk rating at a portfolio level.
The following information is used to determine the EOL impact to business applications and their installed application services (instances):

- The business applications used in your organization are all linked to one or more application services. Each of the application services run on one or more technologies or software models.

  The name of the Application Service Software model table is [sn_apm_tpm_service_software_model]

- The software model has a sequence of lifecycle stages. These lifecycle stages range from the installation date to the retirement date.

  Some business organizations set an internal date based on the lifecycle phase of the software models. These software model phases can be Early Adopter, Mainstream, Declining use, and Retired.

  Similarly, the software vendors may also set a date for the software based on the vendor lifecycle phases, such as Pre-release, General Availability, End of Life, and Obsolete. Vendor support may vary depending on the phase of the technology. For example, when the software model reaches the Obsolete phase, the vendor may stop supporting the technology.

  The name of the Software Model Lifecycle table is [sam_sw_model_lifecycle].

**Frequently asked questions (FAQs)**

- What is the difference between a business capability and a business service?

  Business Services are what IT provides to the customer, while Business Capabilities describe what the business does.
• Is purchasing Software Asset Management Foundation plugin required to receive the benefit of Technology Portfolio Management?

No. Software Asset Management Foundation plugin provides life-cycle data that Technology Portfolio Management uses.

However, you can manage that data manually or get it from another source. Both products share the underlying tables, but are independent. You can use them separately.

• How is an application portfolio managed?

For information about managing your application portfolio, see Application Portfolio Management - Inventory Best Practices.

• What's the difference between a business application and an application?

Each uses a different table, and each represents different elements.

  ◦ Business application:
    ▪ Uses the Business Application table [cmdb_ci_Business_App].
    ▪ Represents the single, logical, construct of the application that comprises application service, environment, software, and hardware in use.

  ◦ Application:
    ▪ Uses the Application table [cmdb_ci_appl].
    ▪ Represents the specific version of software in use on a server (often populated by Discovery or System Center Configuration Manager (SCCM).

• Are there other FAQs about APM?

Yes. For other FAQs about APM, see APM: Application Inventory - Most common questions.

For more information
The CSDM provides additional value to APM in the following areas:

• Application assessment

For more information about measuring the usability, cost, quality, performance, and risk of applications, see Application Assessment.

• Business capability management

For more information about using capability mapping to establish a configuration item (CI) relationship between the business capability and the business applications, see Management of business capability.

• Information portfolio

For more information about the information portfolio and the information portfolio model, see Information portfolio.
Technology portfolio management

For more information about technology portfolio management and how it relates to business applications, see Technology Portfolio Management.

Common Service Data Model product view: Incident Management

Product view and use case for using ServiceNow® Incident Management with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by Incident Management

The Incident form references the following attributes and related lists:

1. Configuration items (CIs) table [ci_*].
   - Application table [cmdb_ci_appl]
   - Server table [cmdb_ci_server]
   - Virtual machines table [cmdb_ci_vm_instance]
   - Load balancer table [cmdb_ci_lb]
   - Network gear table [cmdb_ci_netgear]

   The following figure highlights the CSDM tables managed by Incident Management. The numbers correspond to the specific table.

CSDM tables used by Incident Management

The Incident form references the following CSDM tables

1. Application Service [cmdb_ci_discovered_service] table or any infrastructure CI.
2. Configuration Item tables [cmdb_ci*]
3. Service [cmdb_ci_service] table: Uses the service classification attribute to identify business services, technical services, and application services as types of services.
4. Service Offering [service_offering] table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.
Products that add value to Incident Management

When you use Incident Management with other ServiceNow products, you increase the value you get from Incident Management. These other ServiceNow products include:

- Discovery
  Discovery provides details about the hardware and software CIs you are using.
- Service Portfolio Management (SPM)

Products that benefit from Incident Management

The ServiceNow products that gain value from Incident Management include:

- IT Service Management (ITSM)
  Services have the context of the business and applications, along with the information and technologies layered beneath them.
- Information Technology Operations Management (ITOM)
  Understands the business context for the application services along with the hardware and software being managed.
- Governance, Risk, and Compliance (GRC)
  Auditors can leverage the business applications and related Information Objects. This helps auditors understand the design-time data sensitivity for scoping audits, measuring risks, and managing audit activities.
- Asset Management
Manages the software and hardware lifecycles for business applications and business services.

• Customer Service Management (CSM)

**Incident Management product overview**

Incident Management lets you report and track issues. You can contact ServiceNow IT over the internet or on your mobile device. Features of Incident Management that get the most benefit from the CSDM include:

• Agent Workspace gives agents the information they need to quickly prioritize and resolve incidents.

• The major incident workbench includes a single-pane view you can use to identify, track, and resolve high-impact incidents.

• The native mobile app allows agents to quickly view and respond to tasks on-the-go, and can approve the requests with a single swipe.

• Incident deflection encourage self-help by suggesting related knowledge base articles.

• Improves collaboration on incident tasks by using drag-and-drop functionality on visual task boards.

• Performance analytics provide detailed insights into performance trends.

Incident Management includes a form you can use to report incidents.
The incident form references the following attributes and related lists.

   **Note:** Earlier ServiceNow releases labeled this attribute Business Service.

2. Service Offering (attribute) — References the [service_offering] table. Displays the service offerings affected by the incident in the Service Offerings related list.

3. Configuration Items — References the [cmdb_ci] table

4. Affected/Causal CIs — Related list [task_ci] table

5. Impacted Services — Related list [task_cmdb_ci_service] table

6. Service Offering — Related list [task_service_offering] table

### Incident Management Use Case

Incident Management restores normal service operation, while also minimizing impact to your business and maintaining the quality of your data.

Use it to create an incident that captures information about the asset-related CIs. An incident keeps a record of the updated, repaired, swapped, or retired CIs.

By keeping track of the assets, you can tell where the assets are located, how they are used, and when changes were made to them. This information helps you systematically monitor and manage the assets in your company.

A CI can result in an incident. Use a dependency view to identify other CIs that are affected by the incident. Associate the affected CIs with an incident record to find out how the incident affects other dependent CIs.

### Key features of the Incident Management use case

The CMDB, when used by the CSDM framework, provides value to Incident Management in the following ways:

- Understands the impact of the Incident on services and service offerings.
- Dynamically routes incidents
- Identifies all of the affected services

### Results of use case

The CSDM framework provides context for the incidents. The context includes the CIs involved in the incident and the services affected.

Use the Incident form to see the impact of the incident and restore the affected services. Complete the following steps:
1. Populate the Configuration Item attribute [configuration_item] with the CI or the service affected. You can then use this CI to identify details for incident routing. For example, you can use the CI data, such as “Support Group” and provide information about the service impact by using dependency relationships.

2. Populate the Impacted Services related list [task_cmdb_ci_service] with the services that are related to the populated CI. These may include services and service offerings.

3. (Optional) Use the Service and Service Offering attributes to help narrow the list of available CIs.

   **Note:** Narrowing the list of available CIs is not a feature of the base system. To narrow the list, you need to configure the Incident form.

4. (Optional) Use the Affected CI related list [task_ci] to identify the CIs that may have caused the incident.

5. (Optional) Use the Impacted Services related list [task_cmdb_ci_service] to see the services and CIs affected by the incident.
Frequently asked questions (FAQs)

• Why doesn’t this use case reference business application?

Business applications are portfolio objects used for designing and planning your enterprise architecture. Business applications don’t contain attribute-level details such as version, environment, and localization (for any deployments using one or more applications).

• Is the application service an application or a service? Where should it be used on an Incident form?

Application service is a service type that is a logical representation of an application. You can use the application service CI on the Incident form in few scenarios such as:

◦ Scenario 1: The incident is for an application-related issue — On the Incident form, you can enter “Application Service” in the Configuration Item field to represent the application. For example, you can report the Application Service called MyApp 3.0 Production as unavailable.

◦ Scenario 2: The incident is for an infrastructure CI that is affecting one or more services — On the Incident form, the Impacted Services/CI related list identifies the Application Service affecting services. For example, the Server OMG124 CI may be identified as affecting the MyApp 3.0 Production and other related services.

For more information

For more details about Incident Management, see Incident Management.

Common Service Data Model product view: Change Management

Product view and use case for using ServiceNow® Change Management with the (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by Change Management

1. Configuration items (CIs) table [ci_*].
   • Application table [cmdb_ci_appl]
   • Server table [cmdb_ci_server]
   • Virtual machines table [cmdb_ci_vm_instance]
- Load balancer table [cmdb_ci_lb]
- Network gear table [cmdb_ci_lb]

The following figure highlights the CSDM tables managed by Change Management. The numbers correspond to the specific table.

CSDM tables managed by Change Management

1. Application Service table [cmdb_ci_discovered_service] or any infrastructure CI.
2. Configuration Item tables [cmdb_ci*]
3. Service [cmdb_ci_service] table: Uses the service classification attribute to identify business services, technical services, and application services as types of services.
4. Service Offering [service_offering] table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.
Products that add value to Change Management
When you use Change Management with other ServiceNow products, you increase the value you get from Change Management. These other ServiceNow products include:

- Discovery
  Discovery provides details about the hardware and software CIs you are using.
- Service Mapping
  Service Mapping provides details about the application instance service in the [cmdb_ci_service_discovered] table, relating infrastructure and application [cmdb_ci_appl] CIs.

Products that benefit from Change Management
The ServiceNow products that gain value from Change Management include:

- Service Portfolio Management (SPM)
  Services have the context of the business and applications, along with the information and technologies that underpin them.
- IT Service Management (ITSM)
  Incidents caused by, impacted by, or fixed by Change Management.
- Asset Management
  Updates assets.
- Information Technology Operations Management
  Updates CIs using a controlled process.
• DevOps
  Provides Change Management governance for pipeline tool chains.

Change Management product overview
Change Management lets you control every aspect of the IT change process from creation to approval. When you have accurate information you can minimize risks to your business and avoid conflicts with scheduling. Change Management also includes the following features:

• You can manage changes more quickly by using the Change Advisory Board (CAB) Workbench to schedule, plan, and manage CAB meetings from one interface.

• The Change Management backlog analysis dashboard provides increased visibility into any changes.

• Service Maps let you see the change impacts at-a-glance.

• The change approval policies increase DevOps velocity and remove IT friction.

The Change Request form references the following attributes and related lists.

   Note: Earlier ServiceNow releases labeled this attribute Business Service.

2. Service Offering — References the [service_offering] table where the offering has a parent service.

3. Configuration Items — References the [cmdb_ci] table

4. Affected/Causal CIs — Related list [task_ci] table

5. Impacted Services — Related list [task_cmdb_ci_service] table
6. Assignment Group — References the Group attribute

**Note:** You can populate the Group attribute by using the Assignment Group for the relevant CI.

**Change Request form**

---

**Change Management use case**

Know where to find your critical data. This essential knowledge helps reduce mean-time-to-repair (MTTR) and eliminates change-related outages.

**Key features of the Change Management use case**

The CMDB, when used by the CSDM framework, provides value to Change Management in the following ways:

- Understands the impact of the change on services and service offerings.
- Dynamically routes changes
- Identifies and notifies all of the affected services so that the change can be approved.
Tables for the Change Management use case

Results of the Change Management use case

The CSDM framework provides context for the changes. The context includes the CIs involved in the change and the services affected.

Use the Change Request form to see the impact of the change. Complete the following steps:

1. Populate the Configuration Item attribute [configuration_item] with the target CI for the change activity. You can then use this CI to identify details for change routing. For example, you can use the CI data, such as “Assignment Group” or “Approval Group,” and provide information about the service impact by using dependency relationships.

2. Populate the Impacted Services related list [task_cmdb_ci_service] with the services that are related to the populated CI. These may include services and service offerings.

3. (Optional) Use the Service and Service Offering attributes to identify the provider services responsible for managing the selected CIs.

4. (Optional) Use the Affected CI related list [task_ci] to identify the CIs that may have caused the change. These CIs are in addition to the CIs previously populated. The [task_ci] table can be populated dynamically or manually.

**Note:** Dynamic population is not part of the base system. To use dynamic population, you need to configure the Change Request form.
Frequently asked questions (FAQs)

• Why aren’t business applications referenced in the change use case?
  Business applications are portfolio objects you can use for designing and planning an Enterprise Architecture. Business application portfolio objects don’t contain version, environment, and localization details for deployments using one or more applications.

• Who approves a change?
  It depends on how you implement Change Management. Once you populate the CIs on the Change form (if there’s a relationship between the CI and the impacted services and service offerings), the Approval group approves the change.

• What CI attributes should I use for routing a change?
  If you are initiating the change or the change task, use the Assignment Group attribute CI. If you are using build run teams, you could use the Support Group attribute CI for the team assignments.

For more information
For more details about Change Management, see Change Management.

Common Service Data Model product view: Service Portfolio Management

Product view and use case for using Service Portfolio Management with the CSDM framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by SPM
1. Service portfolio table [spm_service_portfolio]
  Provides groups of services that share a common budget and management focus. The Service Portfolio table isn’t a configuration item (CI) but is available in the base system.

  Service portfolios consist of:
• Taxonomy Layers table [spm_taxonomy_layer_definition]
• Taxonomy Nodes table [spm_taxonomy_node]

ℹ️ **Note:** Neither of these tables are CIs but both are included in the base system.

2. Service table [cmdb_ci_service]
   Defines the outcomes available from the service provider. Uses a service classification attribute to classify services as one of the following:
   • Business Service – This service is for the business consumer in your organization
   • Technical Service – This service is for a technical consumer (back-end, network, compute)
   • Application Service – This service represents the application consumed by users

3. Service Offering table [service_offering]
   Classifies a service based on consumable units such as performance and consumer. While this table doesn’t follow the CMDB naming schema, it is still considered a CI and is available in the base system.

### CSDM tables managed by SPM

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2. Request Catalog table [sc_cat_item]</td>
<td>Service offerings connect to catalog items to see how offerings are consumed.</td>
</tr>
<tr>
<td>2. Application Service table [cmdb_ci_service_discovered]</td>
<td></td>
</tr>
</tbody>
</table>

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
SPM manages dependencies on Application Services by Business Services.

3. Technical Service table [cmdb_ci_service]

Technical services are classified as "Technical." SPM manages dependencies on the Technical Services and their offerings by Business Services.

Products that add value to SPM

When you use SPM with other ServiceNow products, you increase the value you get from SPM. These other ServiceNow products include:

- **Service Catalog**
  Provides the Catalog Items [sc_cat_item] to see how the service is being consumed.

- **Vendor Manager Workspace**
  Provides vendor-related information for services.

- **Financial Management**
  Provides an estimated-spend calculation for each service offering.

- **Continual Improvement Management (CIM)**
  Provides visibility into CIM records that are impacting services or offerings.

- **ITOM Visibility**
  Defines the application services and CIs related to service offerings and business services. These definitions help to better understand the footprint of a service from the CMDB perspective.
Products that benefit from SPM
The ServiceNow products that gain value SPM include:

• Application Portfolio Management (APM)
  Understands the service-to-business capability relationships.

• IT Service Management (ITSM): Incident, Problem, and Change
  Gains insight from access to service and offering information. Uses agreed-upon definitions, Service-Level Agreements (SLAs), and commitments. Uses service and service offering relationships to determine service impacts.

SPM product overview
Service Owner Workspace uses the CSDM framework to let you navigate the service portfolio. Navigating the service portfolio lets you locate the services and their related service offerings, dependents, dependencies, combined metrics, costs, and initiatives. Using the CSDM framework, the associated metrics are aggregated with the related tables.

SPM provides the following features:

1. Overview
   Displays who owns and manages the service and service offerings. Also displays the following service offering health and performance metrics:
   • Performance score
   • Customer score
   • Total subscribers
   • Estimated average spend
   • Outages
   • Service offerings

2. Trends
   Displays the performance trends over a specified time frame, as well as SLA compliance.

3. Related offerings
   Displays the up-stream and down-stream service and offering dependencies for all service types.

4. Info
   Displays the service description, performance weight, and scope. Most of this information comes directly from the service and offering tables.

5. Improvement initiatives
Displays all related CI initiatives associated with the service or offering.

6. Impact stream

Shows the service owner outages, changes, and critical incidents related to their service or offering using three time scales: recent, current, and upcoming.

**SPM service form**

![SPM service form](image)

**SPM use case**

Service owners can define and manage their services, and see where the services are in the portfolio. Knowing where their services are in the portfolio helps prevent service duplication, and helps identify the low-value services in the Service Owner Workspace. Service owners can then decide whether to outsource or redeploy critical resources.

**Key features of the SPM use case**

The CMDB, when used by the CSDM framework, provides value to SPM in the following ways:

- Consolidates service information.
- Provides a framework for defining and viewing both service-to-service and service-to-CI relationships.
• Uses the Service Owner Workspace to complete activities such as connecting the service offerings to the service catalog items.

**Service catalog items**

Results of the SPM use case

SPM uses the CSDM framework to define the service and related items. These definitions are required for you to receive the full benefit of the CSDM framework. The base system of SPM includes well-defined services and provides a way for you to manage a service portfolio. SPM also includes the following:

• Activities related to services or offerings (for example, change requests and incidents)

• Service metrics and data used for reporting, such as:
  ◦ Customer satisfaction (CSAT) scores
  ◦ Stability
  ◦ Breached SLAs
  ◦ Availability
  ◦ Activity (consumption)

Frequently asked questions (FAQs)

• What is the difference between a business capability and a business service?

  A business capability is the ability to complete an activity and deliver an outcome. A business service is how value is added, delivered, and consumed, along with performance and cost considerations.
For more information

- Service Offering Subscriptions
  For more information on how service owners can subscribe users to service offerings, see Service Portfolio Management service offering subscriptions.

- Service Level Management
  For more information about managing your Service Level Agreements (SLAs), see Service Level Management for Service Portfolio Management.

- Service Owner Workspace premium experience
  For more information about the premium experience the Service Owner Workspace provides, see Service Owner Workspace.

Common Service Data Model product view: ITOM Health

Product view and use cases for using ServiceNow® ITOM Health with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by ITOM Health

- Dynamic CI Group table [cmdb_ci_query_based_service]
CSDM tables used by ITOM Health

- Application Service table [cmdb_ci_service_discovered]
- Configuration Item table [ci_*]
- Dynamic CI Group table [cmdb_ci_query_based_service]

Products that add value to ITOM Health

When you use ITOM Health with other ServiceNow products, you increase the value you get from ITOM Health. These other ServiceNow products include:

- Discovery
  
  Discovery provides details about the hardware and software CIs you are using.

- Service Mapping
  
  Service Mapping provides details about the application instance service in the [cmdb_ci_service_discovered] table, relating infrastructure and application [cmdb_ci_appl] CIs.

- Service Portfolio Management (SPM)
  
  Provides the related product model. Software Asset Management (SAM) and Hardware Asset Management (HAM) provide lifecycle data for Technology Portfolio Management (TPM).

Products that benefit from ITOM Health

The ServiceNow products that gain value from ITOM Health include:
• Incident Management
  Incidents are created using the downstream information from Event Management.

• Customer Service Management (CSM)
  ITOM Health provides the application service impact which, in turn, is used to identify the affected users.

**ITOM Health product overview**
ITOM Health consists of 2 main capabilities that use the CSDM framework.

• Event Management
  Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to CIs. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

• Metric Anomaly Detection
  Proactively analyzes your IT infrastructure to spot issues and prevent service outages. Using advanced machine learning to analyze information about your IT infrastructure, the application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

**ITOM Health use case**
Modern organizations increasingly rely on artificial intelligence (AI) technologies in IT operations (AIOps) to help address rapid growth in data volumes and variety. Modern organizations need to analyze this data and find ways to automate and predict issues before they occur. AIOps platforms have emerged as a solution to many of these challenges.

**Key features of the ITOM Health use case**
Key features of the ITOM Health include the following:

• Event and metrics ingestion using the base system integration to selected monitoring systems

• Event and metric processing and alert creation

• Alert correlation and root cause analysis

• Anomaly detection

• Application service impact calculation
- Operator workspace and alert intelligence user interface
- Alert remediation automation

**Event Management process**

**Results of the ITOM Health use case**

Application service maps help Network Operations Center (NOC) operators at central locations to accurately predict root cause alerts and correlate the alerts with the discovered topology data. Correlating the alerts with the discovered topology data lets NOC operators accurately predict the impact to services. Impact analysis helps you to determine the impact on the application services and visualize it in the application service map.

**Frequently asked questions (FAQs)**

- **What CIs do I need to get the most benefit from Event Management?**
  
  Event Management uses the CIs that are monitored by the operations team to bind an Alert to the correct CI and analyze the impact on the monitored service.

- **Why don't I see Technical Services in Event Management?**
  
  Technical Services are now labeled as Dynamic CI group service. Dynamic CI group services use the CMDBCI Group capability to query the CMDB.

- **What is a common use case for Dynamic CI Group service?**
  
  Dynamic CI Group service is used in Event Management as a logical grouping of CIs. Dynamic CI Group service provides the health status of the group to the technology or service owner.

**For more information**

For more information about the features ITOM Health, see [ITOM Health](#).
Common Service Data Model product view: ITOM Visibility

Product view and use cases for using ServiceNow® ITOM Visibility with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by ITOM Visibility

1. Application Service tables
   Tables managed vary by the method used to create the application service.
   • Manually created service maps table [cmdb_ci_service_manual]
   • Tag-based maps table [cmdb_ci_service_by_tags]
   • Automated using Service Mapping table [cmdb_ci_service_discovered]
   • There are multiple Application Service types, and different tables used for each type. The specific types and tables managed Service Mapping are as follows: manual service maps: table = cmdb_ci_service_manual tag based maps: table = cmdb_ci_service_by_tags Automated using Service Mapping: table = cmdb_ci_service_discovered

2. Configuration items (CIs) table [ci_*].
   Approximately CMDB tables are available.
   • Application table [cmdb_ci_appl]
   • Server table [cmdb_ci_server]
   • Virtual machines table [cmdb_ci_vm_instance]
   • Load balancer table [cmdb_ci_lb]
   • Network gear table [cmdb_ci_netgear]
CSDM tables managed by ITOM Visibility

The following diagram illustrates the typical ITOM Visibility table structure.

Typical ITOM Visibility table structure
CSDM tables used by ITOM Visibility

1. Dynamic CI Group table [cmdb_ci_query_based_service]
2. Product model tables (for Technology Portfolio Management [TPM]) software and hardware models

Products that benefit from ITOM Visibility

The ServiceNow products that gain value from ITOM Visibility include:

- Service Management
- Customer Service Management (CSM)
- Event Management
- Cloud Management
- Asset Management (Hardware Asset Management and Software Asset Management)
- IT Business Management (Financial Management — Showback statements, Application Portfolio Management [APM])
- Security Operations (Incident Response, software vulnerability management)

ITOM Visibility product overview

ITOM Visibility consists of two ServiceNow products: Discovery and Service Mapping.
• **Discovery**

  Discovery finds computers, servers, printers, a variety of IP-enabled devices, and the applications that run on them. It can then update the CIs in your CMDB with the data it collects.

• **Service Mapping**

  Service Mapping discovers all application services in your organization and builds a comprehensive map of all devices, applications, and configuration profiles used in these business services.

  Service Mapping maps dependencies based on a connection between devices and applications. This method is referred to as top-down mapping. The top-down mapping helps you immediately see the impact of a problematic object on the rest of the application services.

**Discovery use case**

With this use case you can:

• Get increased visibility into your on-premise and cloud resources.

• Keep track of changes in your on-premise, cloud, and serverless infrastructure in the Configuration Management Database (CMDB).

• Set a strong foundation with accurate data and relationship views for ServiceNow products, including Change Management, Software Asset Management, Customer Service Management (CSM), and Security Operations.

**Key features of the Discovery use case**

• Setup and manage Discovery jobs.

• See IT resources and dependencies at-a-glance.

• Build queries to validate the discovered IT resources.

• Manage your Public Key Infrastructure (PKI) certificates in one dashboard.

**Results of the Discovery use case**

The CSDM framework gives Discovery a prescribed model for how infrastructure and software CIs relate to other areas, such as application services, business applications, and assets.

**Service Mapping use case**

You can create application services:
• Manually
• By using an API
• By having Service Mapping discover them.

Regardless of the method, all the application services are stored in the Application Service table [cmdb_ci_service_discovered].

**Results of the Service Mapping use case**

Service Mapping automates a critical aspect of CSDM with a consistent, automated approach to connect the logical layer of the CSDM model to the physical model CIs in the CMDB. This automated approach lets you more effectively manage your business applications. This approach also allows you to automate the modeling of your business applications for impact assessment and analysis. For impact assessments and analysis, you can use a number of ServiceNow products including Change Management, Incident Management, or the CMDB Query Builder.

**Application Services flow**

You can specify a lifecycle status for an application service. Application services with an Operational lifecycle status can be used on service maps for the relevant workflows, such as Artificial Intelligence for IT Operations (AIOPs) workflows.
Lifecycle status for application services

- Operational
- Non-Operational
- Repair in Progress
- DR Standby
- Ready
- Retired

You can view information about the services, such as the criticality, in the Operator Workspace.

Operator Workspace

The Service Map tab lets you see a visual representation of the service.
Frequently asked questions (FAQs)

• Can I define application services without using Service Mapping?

Yes. Service Mapping is just one of the ways you can define application services. You can also:

◦ Define application services manually.
◦ Use a Dynamic CI group, based on a query.
◦ Use a tag-based approach (commonly used for Cloud integrations).

For more information about creating application services, see Create an application service.

For more information

For more information about Discovery, see Discovery basics.
For more information about Service Mapping, see Service Mapping.
Common Service Data Model product view: Service Catalog

Product view and use cases for using the Service Catalog with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

CSDM tables managed by the Service Catalog

The Service Catalog manages the business services in the Sell/Consume domain primarily. Technical Services are also viewed from the Operate domain of Event Management.

The following CSDM table is managed by the Service Catalog:

1. Catalog Item table [sc_cat_item]: Creates requests in Request Management. These requests usually have an automated, semi-automated or business workflow for fulfilling the request, which can consist of approvals and tasks. When part of Service Portfolio Management, these CIs are associated with service offerings. The CIs can include:
   - PC Hardware Item (pc_hardware_cat_item): Submits hardware asset requests included in Asset Management workflows.
   - PC Software Item (pc_Software_cat_item): Submits software asset requests included in Asset Management workflows
   - Record Producer (sc_cat_item_producer): Submits requests or generates records other than Request Management tables for services that aren’t serviced by Request Management (for example, HR Cases, Facilities Requests, or Legal Requests).
CSDM tables managed by the Service Catalog

1. Configuration Item tables [cmdb_ci*]
2. Service Offering table [sc_cat_item_subscribe]
3. Application Service table [cmdb_ci_discovered_service]
4. Product Model tables [cmdb_model]

Note: The following legacy CMDB relationships provide access to catalog items. However, these legacy relationships are no longer supported. To provide access to the catalog item, instead use the relationships listed in the following table.

Relationship tables

<table>
<thead>
<tr>
<th>CMDB table</th>
<th>Catalog item relationship table</th>
<th>New relationship to use instead</th>
</tr>
</thead>
<tbody>
<tr>
<td>User (sys_user)</td>
<td>sc_cat_item_user_mtom, sc_cat_item_user_no_mtom</td>
<td>User criteria</td>
</tr>
<tr>
<td>Group (sys_user_group)</td>
<td>sc_cat_item_group_mtom, sc_cat_item_group_no_mtom</td>
<td>User criteria</td>
</tr>
<tr>
<td>Department (cmn_department)</td>
<td>sc_cat_item_dept_mtom, sc_cat_item_dept_no_mtom</td>
<td>User criteria</td>
</tr>
<tr>
<td>Location (smn_location)</td>
<td>sc_cat_item_location_mtom, sc_cat_item_location_no_mtom</td>
<td>User criteria</td>
</tr>
<tr>
<td>Company (core_company)</td>
<td>sc_cat_item_company_mtom, sc_cat_item_company_no_mtom</td>
<td>User criteria</td>
</tr>
</tbody>
</table>
Products that benefit from the Service Catalog

The ServiceNow products that gain value from the Service Catalog include:

- **Service Portfolio Management (SPM)**
  Ties catalog items to service offerings. Lets service owners create and maintain catalog items more easily, and gives more visibility into the service offerings.

- **Hardware Asset Management and Software Asset Management**
  Self-service catalog lets you order an asset and track the service delivery.

- **Human Resources (HR)**
  Exposes the creator (Record Producer) of the HR cases and displays the Record Producer in the relevant self-service catalogs (for example, Portal, Mobile, and Virtual Agent).

- **Customer Service Management (CSM)**
  Exposes the creator (Record Producer) of the customer service cases and displays the Record Producer in the relevant self-service catalogs (for example, Self-service Portal, Mobile, and Virtual Agent).

Service Catalog overview

The Service Catalog lets you create other catalogs (such as the Request Catalog and the Product Catalog) that provide self-service opportunities in the channel you want to use, such as the Self-service portal, the Mobile App, or the Virtual Agent (conventional interface).

In addition to offerings that are fulfilled using Request Management application for IT, you can use Service Catalog Record Producers to submit requests or
tickets in non-IT applications such as HR, Legal, Facilities and any record in any custom application.

**Service Catalog use case**

You can create customized catalogs where you can request items such as a specific service or product. With this use case, CSDM provides Service Catalog connection to the service offerings and services.

Request Catalogs and Product Catalogs are two of the customized catalogs you can create from the Service Catalog.

- **Request catalog**
  
  A request catalog is a list of business and technical products, services, service commitment options, and offerings that you can order.

- **Product Catalog**
  
  A Product Catalog is a set of information about individual models. Models are specific versions or various configurations of an asset. Asset managers use the Product Catalog as a centralized repository for model information.

Catalogs are the starting points for accessing available services, and contain catalog items.

**Key features of the Service Catalog use case**

Service Owner Workspace uses the CSDM framework to navigate the Service Portfolio. You can then use the Service Portfolio to locate the services and their related service offerings, catalog items, dependents, dependencies, metric roll-ups, costs and initiatives. The associated metrics are aggregated using the CSDM framework with the related tables.

**Catalog items**

A catalog item is an item or a service that you can request from the catalog. A service can contain multiple catalog items. Catalog items are listed on the catalog portal and are available to the users who need them (either through subscription or job responsibility). Each catalog item is linked to one service offering.

The Catalog Item form lets you specify the following details.

1. **Item Details**: Description of the catalog item.
2. **Process Engine**: The defined process used to fulfill the catalog item request.
3. **Picture**: Picture used to represent the catalog item when it appears in the catalog.
5. Portal Settings: Provides specific settings on how you interact with the catalog item in the catalog portal.

Catalog Item form

Product Catalog use case

Use the Product Catalog to specify information about a product model. Product models are specific versions or various configurations of an asset. Asset managers use the Product Catalog as a centralized repository for model information.

A detailed and well-maintained Product Catalog can coordinate with the Service Catalog, asset, procurement, request, contract, and vendor information. Models published to the Product Catalog are automatically published to the Service Catalog. The Service Catalog includes information about goods (models) and services. If the model is available from multiple vendors, a model can be listed more than once. Models are included with Asset Management.

Key features of the Product Catalog use case

This use case lets you include hardware and software product information as items in the Product Catalog.
Results of Product Catalog use case

The CSDM framework ensures that product models are available in the catalog and that there are processes defined to consume the models.

Frequently asked questions (FAQs)

• What is the difference between the Service Catalog and the Product Catalog?

The Product Catalog builds on the Service Catalog. The Product Catalogs specify the product models that are available for you to use. Product-specific attributes are captured in each catalog Item. You can create Product Catalogs for the types of products you have in your portfolio.

• Can I create other types of catalogs?

Yes. You can create the types of catalogs you need for the types of products and services you have.

For more information

For more information about using the Service Catalog, see Service Catalog.

Common Service Data Model product view: Customer Service Management

Product view and use cases for using Customer Service Management (CSM) with the Common Service Data Model (CSDM) framework.

The CSDM is a framework or blueprint that you can follow when you set up your ServiceNow application. Following this model ensures that the data for that
application maps correctly to the appropriate tables. For more information about the CSDM, see Common Service Data Model.

**CSDM tables managed by CSM**

The CSM references the following CSDM tables.

1. **Sold Product table** [sn_install_base_sold_product in CSM].
   
   Represents the product purchased by an Account or Consumer, and references the Product Model table [cmdb_model] or Service Model table [cmdb_service_product_model] for a Customer (Account or Consumer).

2. **Install Base Item table** [sn_install_base_item] in CSM.
   
   Represents the products installed or in use by an account or consumer. Install Base Items are Configuration Items (CIs) consumed by the customer and generally reference the Application Services table [cmdb_ci_discovered_service] for SaaS products.
   
   Multiple sold products can be used on a given Install Base Item by using the Installed Products table [sn_install_base_m2m_installed_product].

3. **A Service Model references the Service Offerings table** [service_offering].
   
   Multiple Service Offerings can be associated with a single Service Model.

4. **Once the product is sold to a customer, the Sold Product table references the Service Offering table** [service_offering]. This reference helps to identify the customers subscribed to an offering.

5. **Customers can request services related to the products they have purchased by linking the Catalog Items table** [sc_cat_item] to the Product Model or Service Model by using the Product-to-Catalog Items Relationships table [sn_prod_cat_rel_m2m_product_catalog_item].

6. **Account table** [customer_account] in CSM.
   
   Extends the Company table. The Account table can be a customer account, a partner account, or both.

7. **Contact table** [customer_contact] in CSM.
   
   Extends the User table. A user is an employee of an account. A contact record stores information about a contact, such as the name, phone number, and email address. A contact can also have a user ID and can log in to the customer portal.

8. **Consumer table** [csm_consumer] in CSM.
   
   A consumer is a customer in the business-to-consumer (B2C) business model.
CSDM tables used by CSM

1. Company, Business Unit, Department, Location, Groups, Users tables
   [core_company], [business_unit], [cmn_department], [cmn_location],
   [sys_user_group], [sys_user], respectively.

2. Product Model tables [cmdb_model], and [cmdb_service_product_model]

3. Contract table [ast_contract]

4. Application Service table [cmdb_ci_service_discovered]

5. Configuration Item table [cmdb_ci_*]

6. Business Service table [cmdb_ci_service]

7. Business Service Offering table [service_offering]

8. Request Catalog table [sc_cat_item]
CSM-specific data model
CSM uses the following key entities to resolve complex end-to-end issues.

- A case is the primary entity of CSM and is used to track and resolve customer questions or issues.
- Customer information is linked to a case using associated entities such as Accounts, Contacts, Consumers, Household, Products, and Service Contracts. This information provides the customer service agent the information necessary to resolve customer issues.
- An account can be a customer account, a partner account, or both.
- The contact is an employee of an account. A contact record stores information about a contact, such as the name, phone number, and email address. A contact can also have a user ID and can log in to the customer portal.
- A consumer is a customer in the business-to-consumer (B2C) business model.
- Household defines the consumers who constitute a household, and the relationships between household members.
- Sold Product tracks the products or services sold to an account or consumer.
- Install Base Items represent the instance of the product that has been configured for a customer.
- Service Contract defines the type of support that customers receive. A contract can include an account and contact or a consumer and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs.
- Entitlement specifies the type of support that a customer receives as well as the supported communication channels.

Products that add value to CSM
When you use CSM with other ServiceNow products, you increase the value you get from CSM. These other ServiceNow products include:

- IT Service Management (ITSM)
  Services have the context of the business, applications, information, and technologies layered beneath them.
- Event Management
  Enables organizations to identify service health-related issues on a single management console. Event Management provides alert aggregation and root cause analysis (RCA) for discovered services, application services, and automated alert groups.
• Service Portfolio Management (SPM)
  Enables organizations to document and manage services using a standardized, structured format.

Products that benefit from CSM
• IT Service Management (ITSM)
  Enables organizations to link incidents, problems, changes, and requests to cases, and have the context of the customer (consumer or account) reporting the issue.
• IT Operations Management (ITOM)
  Enables organizations to identify the Install Base Items and the customers affected by service issues. Helps organizations to provide proactive customer service.
• Service Portfolio Management (SPM)
  Enables customers, who have subscribed to the Service Offering, see who owns the service.

CSM product overview
The CSM enables you to provide service and support for your external customers through communication channels such as the web, email, chat, telephone, and social media. You can create cases as needed and route cases to the appropriate customer service agents.

CSM use case
The goal of this use case is to understand how CSM key entities work with core CSDM framework to provide proactive customer service, decrease cost of service, and provide end-to-end visibility to both customer service and service delivery groups.

Results of the CSM use case
Understand the tables within the CSDM framework that are needed to support the following CSM functionality:
• Service-aware Install Base
• Proactive Customer Service Operations
• Real Time Service Health and Outage Tracking
• Integration with Service Portfolio Management
• Contextual Service Catalog
The following sections include details of the activities needed for the use case.

**Example scenario: key personas and how they benefit**

This section includes an example of how a fictitious technology company called ACME manages the network monitoring services for their customers.

ACME offers a network monitoring service to its enterprise customers who can purchase either the Platinum, Gold, or Silver offering. A customer, Boxeo, has purchased the network monitoring platinum offering (Sold Product) and is using it in development and production environments (Install Base Item).

**CSM data model example**

The key personas (customer service agents, Network Operations Center (NOC) engineers, service owners, and customers) can complete the relevant tasks listed below:

**Customer service agents can:**
• View the products and services that the customer has purchased (Sold Product) and installed (Install Base).

• View the service offering associated with the sold product. The sold product references the service offering.
• View the health status of Install Base Items

NOC engineers can:

• View customers affected by a service issue and inform customer service. Specifically, they can:

  ◦ View the affected Install Base Items and add it to or remove it from an Account. The Install Base item references the application service (CI). The CI it depends on should be one of the CIs affected. The CI should also be
referenced in the Alert to show that Install Base Item (and therefore the Account or Consumer) as affected.

- Create a proactive case from an alert and inform the customer service team of the service issue or outage.

Service owners can:

- View the customers who are subscribed to a service offering.

Customers can:

- View the install base items and details.
- View outages and service issues.
• View products they have purchased.
• Request services related to the products they have purchased.

Example CSM and CSDM use cases
The following diagrams are examples of typical CSM and CSDM use cases. These examples refer to the fictitious technology company, ACME, used in the earlier examples.

• Service with multiple packages
  Example: ACME offers a Credit Check Service to its enterprise customers who can purchase either the Platinum, Gold, or Silver offering.
• **Service with optional components**

Example: ACME offers a Billing Service to its enterprise customers who can purchase the bundle, or one or more of the component offerings (for example, invoices, payments, or discounts).

• **Service with a physical product**

Example: ACME offers a Digital Printing Solution to its customers who can purchase either the bundle or the printer along with one more service offerings (for example, Scan and Email, Monitoring)
• Service sold to multiple customers

Example: ACME sells a Pharmacy Manager Service to two customers: Boxeo and Avid Inc.

• Service used by multiple customers

Example: ACME deploys both Boxeo and Avid on the same production instance (multi-tenant model)
• Service used on-premise

Example: ACME offers an Order Management service. This purchase is tracked in ServiceNow but is used on-premise

Frequently asked questions (FAQs)

• What is a Service-aware Install Base?

A Service-aware Install Base enables companies to track the digital products and services in use. A Service-aware Install Base also tracks the relationships of the products and services to dependent services and CIs that affect their health.

• What are Proactive Customer Service Operations?

Proactive Customer Service Operations bring CSM and Event Management together to enable companies to proactively trigger case workflows and notify the affected customers.
• **Do I need to purchase CSM Professional package to use the Service-aware Install Base?**

No. The Service-aware Install Base is include in the CSM base system.

• **Can multiple sold products reference the same service offering?**

Yes. Multiple sold products (that is, Service Models) purchased by different companies can reference the same service offering. For example, multiple customers can purchase the same SaaS offering with same service commitments.

• **Can multiple Install Base Items reference the same application service?**

Yes. Multiple Install Base Items (either for the same account or for different accounts) can reference the same application service. For example, a multi-tenant SaaS offering where multiple customers (each with their own Install Base Item) are used on the same production instance (application service).

• **When do I create an incident rather than a proactive case from an alert?**

Typically, some companies create an incident so that their NOC engineers can resolving the issue. Once they determine that the issue impacts multiple customers, they also proactively create a major case and related child cases (one for each impacted customer) to notify the affected customers. Thus, the alert, incident, and case are all linked.

Updates made by the resolving teams to the incident status or additional comments are reflected in the case. The customer service teams use these updates to keep customers informed.

To meet the customer notification time requirements of the SLAs, companies may also automate creating incidents and cases from the alert. In addition, companies can also create a proactive case from the alert while the issue is being resolved.

• **What is the difference between entitlements managed at the CSDM Service Offering and the CSM Contracts and Entitlements?**

Service Commitments in CSDM define the expected level of a service. A service offering consists of a set of service commitments which uniquely define the service offerings. For example, a service offering may include a service commitment to perform a data backup each night.

Service contracts in CSM store information about the type of support that is provided to a customer. A contract can include an account or consumer, a contact, and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. An entitlement defines the type of support that a customer receives, as well as the supported communication
channels. For example, a customer may sign a service contract to receive support from 6:00 a.m. to 9:00 p.m. on weekdays.

- How can I request additional services based on the product that I've purchased?

The relationship between the product model and the catalog items enables you to use the customer portal to request additional services for the products you've purchased. Multiple catalog items can be associated with a product model.

- Do I need elements from all the CSDM domains to set up CSM?

No. The approach mentioned in this use case is based on the recommended guidelines and assumes you are in the Run or Fly stage of the CSDM implementation.

When you are implementing CSM, start with the tables in the CSDM Foundation domain and the CSM Customer Service domain. Using these domains enables you to leverage the capabilities included in CSM.

To enable the proactive customer service operations, use tables from the CSDM Manage Technical Services domain for monitoring the application services tied to the customers' install base. Using this domain enables you to leverage the CSM and ITOM integration.

Service-centric organizations can leverage the tables from the CSDM Sell/Consume domain to connect the product model to the service offerings and then to sold product. These connections so enable you to track the service portfolio and see a complete view of how customers are consuming these services.

**For more information**

For more information about the relevant CSM features and tasks, see the following links:

- Configure form views for Service Portfolio Management integration
- View product information from the Customer Service Portal
- Create a proactive case from an alert

- Configure install base
- Outage tracking for install base
- View install base information from the Customer Service Portal
View install base information in Agent Workspace
View product information from the Customer Service Portal
View sold product information in Agent Workspace

Configuration Management Database

With the ServiceNow® Configuration Management Database (CMDB) application, build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB CI Lifecycle Management to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

Note: CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, Query Builder, or Duplicate CI Remediator. Or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CI Lifecycle Management, baseline CMDB, and proposed changes.

### Configuration Management and the CMDB

The Configuration Management data base (CMDB) creates and maintains the logical configurations your network infrastructure needs to support a ServiceNow service.

These logical service configurations are mapped to the physical layout data of the supporting network and application infrastructure in each of your respective domains. They track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CIs have dependencies and relationship with other CIs. For example, the loss of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs
can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items differ from environment to environment because each customer has unique needs. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The NOW Platform provides a mechanism to easily define new classes of configuration items and new relationships that may exist between CIs. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

You can for example, set the `Used for` attribute in the `cmdb_ci_server` table to a value such as ‘development’, ‘test’, or ‘production’. These values indicate the environment that the CI is supporting, and serve as a way of tracking a CI through its lifecycle in a changing environment.

**CI Class Manager**

Use the CI Class Manager to manage CMDB classes, CMDB Health, and other class-related definitions. For example, in the CI Class Manager you can view class attributes, class identification rules, and the list of CIs for a specific class. To view the list of CIs in the CMDB, you can also enter `cmdb_ci_list.do` in the filter navigator.

**Architecture**
Roles required
Reading CMDB tables directly requires the cmdb_read role, however accessing the Configuration module requires the asset, itil, or itil_admin roles. For viewing CMDB-related records in the user interface, the itil role is usually sufficient. For updating records and for other manipulation of records, roles with higher credentials are usually required, as noted in each procedure throughout the documentation set.

Related information
CMDB schema model

Domain separation and Configuration Management Database (CMDB)
Domain separation is supported in the Configuration Management Database (CMDB). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard
- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview
The following topics provide details about domain separation in Configuration Management (CMDB) modules:
- Domain separation in CMDB Health
- Domain separation and CMDB Query Builder
- Domain separation and CMDB Identification and Reconciliation
• Domain separation and the relations formatter and the CI relationship editor
• CMDB APIs (CMDB SDK)

Related information

Domain separation and Configuration Management Database (CMDB)

ITIL and Configuration Management

The CMDB has relationships with IT service management processes in the following areas: ITIL incident management, ITIL problem management, ITIL change management, ITIL service catalog management, and financial management.

ITIL Incident Management

Configuration management assists Incident Management by providing the Service Desk with immediate information on the CIs affected, and more timely resolution of faults by understanding what CIs have been affected and changed.

ITIL Problem Management

Configuration Management assists Problem Management by linking the CIs affected by problems to the Incident / Problem / Change Management processes, and ensuring the CI status is properly maintained.

ITIL Change Management

Configuration Management assists Change Management by recording which CIs have been changed and controlling the status of CIs throughout the entire CI lifecycle. Configuration Management ensures that any changes made to CIs are recorded and kept accurate. Configuration Management is also used in the integration of Change Management with the DiscoverNow Discovery feature.

ITIL Service Catalog Management

With Service Portfolio Management, business services in the CMDB can also be managed by the Service Catalog team, and exposed to end users who can then request items from them.

Financial Management

With Cost Management, costs can be associated with configuration items, so that the cost associated with Configuration Management can be tracked and bundled into expense lines, budgets, or cost centers.
**IT4IT**

IT4IT provides reference architecture about the implementation of ITIL strategy. For more information, see the Now Community blog *Running IT as a Business using IT4IT and ServiceNow*.

- Configuration Management Database

**ITIL**

The IT Infrastructure Library (ITIL) is an integrated, process-based framework for managing IT services.

It provides guidance for creating and operating a Service Desk that provides efficient communication between the user community and the IT provider. Originally initiated to improve IT service management for the UK central government, it has become a standard for many organizations; public or private sector, large or small, centralized, or distributed.

ITIL provides processes for three service concepts: design, transition, and operation.

Watch this 11-minute video for an overview of the ITIL role including the ITSM process, capabilities of ITIL users, working on incidents and problems, change requests, and the Incident Overview dashboard. Overview of incident management, problem management, and change management components of the information technology service management (ITSM) process.

**Service design**
This guide provides a general overview of ITIL service design concepts.

**Service level management**
The service level management process is designed to ensure customer satisfaction within IT service processes. Service level agreements are made between the IT staff and the customers, and the IT desk must monitor their performance as compared to the agreements. In addition, underpinning contracts with external vendors and operational level agreements with internal vendors ensures that these service level agreements are feasible.

**Availability management**
The availability management process ensures that availability within a system is kept as close to 100% as possible. By both reacting to past service failures, and planning to avoid future service failures, availability management can greatly increase end-user satisfaction with services.

**Capacity management**
The capacity management process is designed to ensure that business services are not made unavailable by over-capacity. By analyzing past failures and planning for growth of demand of services, capacity management can increase end-user satisfaction with services.

**Supplier management**
Supplier management is a process that defines and monitors agreements between an IT department and an external supplier.
Service catalog management
The service catalog provides a front end for customers to request items and services. Service catalog management ensures that this service catalog provides accurate and useful information on the items and services.

Related information
- Service Catalog Management
- Service Level Management

Service transition
This guide provides a general overview of ITIL service transition concepts and how the Now Platform can enable these processes.

Change management
The change management process ensures that standardized methods and procedures are used for efficient and prompt handling of all changes to minimize the impact of change related incidents on service quality. Consequently, change management aims to improve the day-to-day operation of the organization. IT-related changes that may affect one or many customers are tracked with change management. Adding memory to one machine, getting a new server, and installing the latest Windows OS on all PCs are all examples. To find out how the ServiceNow platform implements change management, see Change Management.

Knowledge management
The knowledge management process ensures that important information flows freely throughout the IT organization. Knowledge management keeps the CMDB and knowledge base of an organization up-to-date, and uses a knowledge-centered support approach to reduce repeat incidents and problems. For more information on how the ServiceNow platform implements knowledge management, see Knowledge Management.

Asset management
Asset management enables a process of monitoring processes, organizations, people, information, applications, infrastructure, and financial capital within an organization. This allows the organization to collect accurate records of these business components, making them available for both internal and external auditing processes. To find out how the Now Platform implements asset management, see Asset Management.
Configuration management

Configuration management provides a logical model of the infrastructure or a service by identifying, controlling, maintaining and verifying the Configuration Items in existence. To find out how the Now Platform implements configuration management, see Configuration Management Database.

Release management

This discipline of IT service management is the management of all software configuration items within the organization. It is responsible for the management of software development, installation and support of an organization’s software products. Software Control & Distribution procedures include the management of the software Configuration Items and their distribution and implementation into a production environment. This involves the definition of a release program suitable for the organization, the definition of how version control is implemented, and the procedures surrounding how software is built, released and audited. To find out how the Now Platform implements release management, visit Release Management.

CMDB schema model

The Configuration Management Database (CMDB) schema model is a series of connected tables that contain all the assets and business services controlled by a company and its configurations.

Related ServiceNow® Store apps and reference information:

- **CMDB tables descriptions**: Descriptions of key CMDB tables in the base system.
- **CMDB CI Class Models**: A ServiceNow Store app that adds class models that extend the base CMDB class hierarchy. This includes class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can then use the added classes as any other CMDB base class.
- **Populating the CMDB**: Information about the various options for populating the CMDB.
- **Discovery patterns**: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.
- **Service Graph connectors**: ServiceNow Store apps that provide pre-defined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.
CMDB tables contain information about computers and devices on the network, software contracts and licenses, business services, and so on. The IT desk can use the CMDB to better understand their network users' equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

Applications such as Asset Management and Contract Management, operate in conjunction with the CMDB. Asset Management and Software Asset Management link to CMDB all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Contract Management application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration Management Database (CMDB) application has a focus on operation.

For more background information about the CMDB, see the Now Community post) at CMDB 101- What is a configuration management database and why do you need one?.

**Key CMDB tables**

Key tables in the configuration management database (CMDB):

- The Base Configuration Item [cmdb] table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item [cmdb_ci] table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (descending classes are IT CIs).
- The CI Relationship [cmdb_rel_ci] table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database [cmdb_ci_database] and Computer [cmdb_ci_computer]. The Computer table is extended to the Server [cmdb_ci_server] table, which is extended to the UNIX Server [cmdb_ci_unix_server] table, and so on.

**Note:** The Base Configuration Item [cmdb] table uses the table per partition extension model, which has different behaviors for replicating and deriving information than other extended tables. See Table extension and classes.

You can use the schema map to view more details of tables and their relationships:

1. Navigate to **System Definition > Tables & Columns**.
2. Select a table and click **Schema Map**.
Note: CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formaters.

CI attributes
Attributes apply to all the CIs in a classification. To change attribute values for a CI, edit the appropriate CI. To add a unique attribute to a class, extend the class table and create a new classification for that CI.

The position of a CI in a classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.

For example, servers have different attributes from computers, which include workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

CMDB tables descriptions
List of all the tables in the CMDB in a base system, and for each table, its name, label, and a description of the type of information that is stored in the table.
You can extend tables in a base system by installing a CMDB CI Class Models store app which adds class models that support specific technologies. These extensions include class definitions, identification rules, identifier entries, and dependent relationships if applicable. For more information, see CMDB CI Class Models store app.

<td>Directory Server</td>
<td>Server running LDAP software.</td>
</tr>
<tr>
<td>cmdb_ci_disk</td>
<td>Disk</td>
<td>General category of data storage mechanisms.</td>
</tr>
<tr>
<td>cmdb_ci_disk_partition</td>
<td>Disk Partition</td>
<td>Sections of a disk separated so that information in each section can be managed separately.</td>
</tr>
<tr>
<td>cmdb_ci_display_hardware</td>
<td>Display Hardware</td>
<td>Hardware used to display information in visual form.</td>
</tr>
<tr>
<td>cmdb_ci_dns_alias</td>
<td>DNS Alias</td>
<td>Synonym for the host used to resolve DNS addresses.</td>
</tr>
<tr>
<td>cmdb_ci_dns_name</td>
<td>DNS Name</td>
<td>Primary DNS names.</td>
</tr>
<tr>
<td>cmdb_ci_docker</td>
<td>Docker Container</td>
<td>Docker containers (a runtime instance of a docker image).</td>
</tr>
<tr>
<td>cmdb_ci_docker_engine</td>
<td>Docker Engine</td>
<td>Docker software for running and managing Docker containers.</td>
</tr>
<tr>
<td>cmdb_ci_docker_image</td>
<td>Docker Image</td>
<td>Docker images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.</td>
</tr>
<tr>
<td>cmdb_ci_docker_image_tag</td>
<td>Docker Image Tag</td>
<td>Docker tag, which is a label applied to a</td>

<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_docker_local_image</td>
<td>Docker Local Image</td>
<td>Docker image in a repository.</td>
</tr>
<tr>
<td>cmdb_ci_drs_vm_config</td>
<td>DRS VM Config</td>
<td>Distributed Resource Scheduler (DRS) behavior for the VMs in the vCenter that override the cluster behavior.</td>
</tr>
<tr>
<td>cmdb_ci_ec2_instance</td>
<td>EC2 Virtual Machine Instance</td>
<td>Virtual machine running in the Amazon Elastic Compute Cloud (EC2) platform.</td>
</tr>
<tr>
<td>cmdb_ci_email_server</td>
<td>Email Server</td>
<td>Server running email software.</td>
</tr>
<tr>
<td>cmdb_ci_email_server_jes</td>
<td>JES</td>
<td>Server running JES software (multi-featured hybrid MTA/MDA server).</td>
</tr>
<tr>
<td>cmdb_ci_endpoint</td>
<td>Endpoint</td>
<td>Endpoint, which represents the entry point to a service, a process, or a queue or topic destination in service-oriented architecture.</td>
</tr>
<tr>
<td>cmdb_ci_environment</td>
<td>Environment</td>
<td>Logical grouping of hardware and software used to develop, test, and deliver computing services. For example: development, test, quality assurance, and production.</td>
</tr>
<tr>
<td>cmdb_ci_esx_resource_pool</td>
<td>ESX Resource Pool</td>
<td>VMware set of physical resources.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------------</td>

<tr>
<td>cmdb_ci_esx_server</td>
<td>ESX Server</td>
<td>Physical ESX server running the VMware ESXi operating system.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_cas</td>
<td>Exchange Client Access Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_edge</td>
<td>Exchange Edge Transport Server</td>
<td>Server running Exchange Edge Transport software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_front</td>
<td>ExchangeFrontEndServer</td>
<td>Server running Exchange software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_hub</td>
<td>ExchangeHub</td>
<td>Server running Exchange Hub software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox</td>
<td>Exchange MailBox</td>
<td>Exchange email account.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox_server</td>
<td>Exchange Mailbox Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_service</td>
<td>Exchange Service Component</td>
<td>Exchange Service Component software.</td>
</tr>
<tr>
<td>cmdb_ci_facility_hardware</td>
<td>Facility Hardware</td>
<td>Base class for hardware used to facilities services such as electric, water, sewer, air, and security.</td>
</tr>
<tr>
<td>cmdb_ci_fc_disk</td>
<td>Fibre Channel Disk</td>
<td>Base table for fibre channel disk.</td>
</tr>
<tr>
<td>cmdb_ci_fc_export</td>
<td>Fibre Channel Export</td>
<td>Storage volume exported by a storage server via Fibre Channel protocol.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_fc_port</td>
<td>Fibre Channel Port</td>
<td>Fibre Channel port on a storage server, FC switch, or on a host's HBA.</td>
</tr>
<tr>
<td>cmdb_ci_fddi_network</td>
<td>FDDI Cards</td>
<td>Fiber Distributed Data Interface cards.</td>
</tr>
<tr>
<td>cmdb_ci_file_system</td>
<td>File System</td>
<td>File system information for a server, capturing details such as mount point, capacity, and type of file system.</td>
</tr>
<tr>
<td>cmdb_ci_file_system_nfs</td>
<td>NFS File system</td>
<td>Extension of File System, which provides NFS file system information.</td>
</tr>
<tr>
<td>cmdb_ci_file_system_smb</td>
<td>SMB File system</td>
<td>Extension of File System, which provides SMB file system information.</td>
</tr>

**Hardware [cmdb_ci_hardware] class**

Attributes, identification rule, and other important schema structures for the CMDB Hardware [cmdb_ci_hardware] class.
Attributes
The Hardware class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hardware_status</td>
<td>Status of hardware such as <strong>In Maintenance</strong> or <strong>Retired</strong>. Used to sync status to the Asset class.</td>
</tr>
<tr>
<td>hardware_substatus</td>
<td>Secondary hardware status. Each setting in <code>hardware_status</code> results in a different set of choices available for this field.</td>
</tr>
<tr>
<td>default_gateway</td>
<td>Default gateway that the computer is connected through.</td>
</tr>
</tbody>
</table>

Key relationship structures
Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- **Serial number**: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardeware] table.
- Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).

- If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number \([\text{cmdb\_serial\_number}]\) table:

- **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).

- **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.

- **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.

- **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.

- **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

**Network adapter:**

- Use the Network Adapter \([\text{cmdb\_ci\_network\_adapter}]\) class to store network adapters.

- Set the **Name** attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).

- Set the **MAC Address** attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

For example: ‘f8:f2:1e:00:d4:66’
In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

**IP address:**

- Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
- Store an IP address value in the **IP Address** attribute, and in the **Name** attribute (to avoid empty **Name** attributes).
- Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
- Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
- Set the **Netmask** attribute to the IP address.
- In the CI Relationship [cmdb_rel_ci] table, create an **Owned By::Owns** relationship to the associated Hardware CI.
- Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
- To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

**Network adapter and IP address:**

- Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
- Store the IP address in the IP Address [cmdb_ci_ip_address] class.
- Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

**Key reference structures**

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- **Software and processes running on a server:** The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
One to one reference back to the Server [cmdb_ci_server] class

Many to one reference back to the Software class

These references are stored in the Installed on and the Product Name reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_sw_instance table.

- The Manufacturer and Model ID are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
- The Owned By, Assigned To, Managed By, and Supported By are reference attributes to the User [sys_user] table. The Assignment Group and Support Group are reference attributes to the Group [sys_user_group] table.

Identification rule
The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the MAC Address/IP Address attributes in the Network Adapter table. However, do not rely only on the MAC Address/IP Address.

   If both Serial Number and Name are not available, and only MAC Address/IP Address are available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don’t create an empty CI.

For more information, see CMDB Identification and Reconciliation.

Computer [cmdb_ci_computer] class

Attributes, identification rule, and other important schema structures for the CMDB Computer [cmdb_ci_computer] class.
Attributes
The Computer class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD_ROM</td>
<td>Denotes whether a CD ROM exists.</td>
</tr>
<tr>
<td>CD Speed</td>
<td>Speed of CD_ROM.</td>

</tr>
</tbody>
</table>

### Schema description

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named **IsVirtual**. If a computer or server is a virtual instance, set this **IsVirtual** attribute to **true**.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the **IsVirtual** attribute in the Computer or Server CI to **true**. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the BIOS UUID attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set **IsVirtual** to **true**.

### Key relationship structures

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- **Serial number**: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number
[cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.

- Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
- If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:

- **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
- **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
- **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

- **Network adapter**:
  - Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  - Set the Name attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the MAC Address attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

    For example: 'f8:f2:1e:00:d4:66'
In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

• IP address:
  - Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  - Store an IP address value in the IP Address attribute, and in the Name attribute (to avoid empty Name attributes).
  - Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  - Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  - Set the Netmask attribute to the IP address.
  - In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI.
  - Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  - To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

• Network adapter and IP address:
  - Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
  - Store the IP address in the IP Address [cmdb_ci_ip_address] class.
  - Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.

Key reference structures
Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

• Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
• One to one reference back to the Server [cmdb_ci_server] class.
• Many to one reference back to the Software class.
These references are stored in the Installed on and the Product Name
reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or
the Software Asset Management [com.snc.software_asset_management]
plugin is installed, then store software details in the Software Installation
[cmdb_sw_instance] table instead of the cmdb_sw_instance table.

• The Manufacturer and Model ID are reference attributes to the Company
[core_company] and Product Model [cmdb_model] tables respectively.

• The Owned By, Assigned To, Managed By, and Supported By are reference
attributes to the User [sys_user] table. The Assignment Group and Support Group
are reference attributes to the Group [sys_user_group] table.

**Identification rule**
The base system contains pre-defined identification rules for the Hardware,
Computer, and Server classes, which are identical. That identification rule has
the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial
   Number [cmdb_serial_number] as the lookup table. The Serial Number table is
   a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number Attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the
   Name (which is the hostname) attribute is used. If both the Serial Number and
   the Name attributes are provided, then Identification and Reconciliation Engine
   (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE
   falls back to using Name.

4. Identifier entry specified for the MAC Address/IP Address attributes in the
   Network Adapter table. However, do not rely only on the MAC Address/IP
   Address.

   If both Serial Number and Name are not available, and only MAC Address/IP
   Address are available, use MAC Address as the name of the CI. Using the MAC
   Address as the name of the CI ensures that you don't create an empty CI.

For more information, see CMDB Identification and Reconciliation.

**Server [cmdb_ci_server] class**
Attributes, identification rule, and other important schema structures for the
CMDB Server [cmdb_ci_server] class.
Attributes
The Server class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>Type of server, such as production, development, disaster recovery, or user acceptance testing (UAT).</td>
</tr>
<tr>
<td>Firewall status</td>
<td>Internet or intranet facing server.</td>
</tr>
<tr>
<td>Host name</td>
<td>Use the Name attribute to store the host name of the server instead of the Host name attribute.</td>
</tr>
<tr>
<td>Used for</td>
<td>Business service supported by the server, such as production, staging, or quality assurance (QA). This attribute uses the <strong>Used for</strong> choice list field from the Service [cmdb_ci_service] table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reference attribute</th>
<th>Reference to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disaster backup</td>
<td>Server [cmdb_ci_server] table. Reference to another server that is the backup server for this server.</td>
</tr>
</tbody>
</table>
# Reference classes

The following reference classes extend the Server class. They do not add any new attributes.

<table>
<thead>
<tr>
<th>Reference class</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_ci_solaris_server</td>
<td>Solaris Server</td>
<td>Server running Oracle Solaris operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_csm</td>
<td>Cisco CSM</td>
<td>Cisco Security Manager (CSM) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_win_server</td>
<td>Windows Server</td>
<td>Server running Microsoft Windows Server operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lb_ace</td>
<td>ACE</td>
<td>Cisco Application Control Engine load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_netscaler</td>
<td>Citrix Netscaler</td>
<td>Citrix Netscaler load balancer.</td>
</tr>

**Schema description**

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named `IsVirtual`. If a computer or server is a virtual instance, set this `IsVirtual` attribute to `true`. As described in the Virtual Machine schema section, to fully model a virtual machine, set the `IsVirtual` attribute in the Computer or Server CI to `true`. Create a Virtual Machine Instance [cmdb_ci_vm_instance] record using the `BIOS UUID` attribute as the key identifier. Then create a `Hosted_On` relationship between the Virtual Machine Instance record and the Computer or Server instance and set `IsVirtual` to `true`.

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:
• Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number [cmdb_serial_number] table, with reference back to the Hardware [cmdb_ci_hardware] table.
  ◦ Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  ◦ If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number [cmdb_serial_number] table:
  ◦ **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
  ◦ **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
  ◦ **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
  ◦ **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
  ◦ **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

• Network adapter:
  ◦ Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.
  ◦ Set the **Name** attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
Set the MAC Address attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.
For example: 'f8:f2:1e:00:d4:66'

In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI. Specify a reference from the Network Adapter [cmdb_ci_network_adapter] table using the CI with a reference to the associated Hardware CI.

• IP address:

  ◦ Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.
  ◦ Store an IP address value in the IP Address attribute, and in the Name attribute (to avoid empty Name attributes).
  ◦ Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  ◦ Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  ◦ Set the Netmask attribute to the IP address.
  ◦ In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI.
  ◦ Specify for the IP address a reference to the Network Adapter [cmdb_ci_network_adapter] table using the Configuration Item with a reference to the associated Hardware CI.
  ◦ To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

• Network adapter and IP address:

  ◦ Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.
  ◦ Store the IP address in the IP Address [cmdb_ci_ip_address] class.
  ◦ Do not store the MAC address or the IP address in the Server [cmdb_ci_server] class.
Key reference structures
Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

• Software and processes running on a server: The Software [cmdb_ci_spkg] class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  ◦ One to one reference back to the Server [cmdb_ci_server] class
  ◦ Many to one reference back to the Software class

These references are stored in the Installed on and the Product Name reference attributes respectively.

If either the Software Asset Management Foundation [com.snc.sams] or the Software Asset Management [com.snc.software_asset_management] plugin is installed, then store software details in the Software Installation [cmdb_sam_sw_install] table instead of the cmdb_sw_instance table.

• The Manufacturer and Model ID are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.

• The Owned By, Assigned To, Managed By, and Supported By are reference attributes to the User [sys_user] table. The Assignment Group and Support Group are reference attributes to the Group [sys_user_group] table.

Identification rule
The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.
4. Identifier entry specified for the **MAC Address/IP Address** attributes in the Network Adapter table. However, do not rely only on the **MAC Address/IP Address**.

If both **Serial Number** and **Name** are not available, and only **MAC Address/IP Address** are available, use **MAC Address** as the name of the CI. Using the **MAC Address** as the name of the CI ensures that you don't create an empty CI.

For more information, see **CMDB Identification and Reconciliation**.

**VMware vCenter Object [cmdb_ci_vcenter_object] class**

Attributes, identification rule, and other important schema structures for Virtual Machine related classes.

**Schema description**

ServiceNow® has an extensive modeling of virtual machines (VMs) environment, with classes such as:

- VMware vCenter Cluster [cmdb_ci_vcenter_cluster]
- VMware vCenter datacenter [cmdb_ci_vcenter_datacenter]
- VMware Virtual Machine Instance [cmdb_ci_vmware_instance]

Virtual machines are modeled just like any other server, but with the **IsVirtual** attribute set to **true**.
In the diagram above, the 'Discovered' virtual server is referred to as the 'Guest' (VM object). Follow the preceding diagram for any further modeling of VMWare components.

**Key reference structures**

The Guest has the following important key reference structures:

- An Instantiates::InstantiatedBy relationship with the cmdb_ci_vmware_instance (which is the VM instance reported by Center).
- A Virtualizes::Virtualized by relationship with ESXi Server (the hardware with the ESXi virtualization software installed).
- Guest (Discovered, VMObject) also has a HasRegistered::RegisteredOn relationship to ESXi Server.

**Identification rules**

- Guest operating system: Guest operating system is modeled as Server (with **IsVirtual** set to **true**) and therefore identification rules follow the rules for the Server class. In most operating systems, BIOS UUID is reported as serial number. It is essential that you follow proper VMware guidelines to ensure that BIOS UUID is not being reused. Having a cloned BIOS UUID causes issues with identification rules.
- VM Instances: IRE uses instance MosRef ID as key identifier.
- ESX Server: Server is modeled as bare metal Server (with **IsVirtual** set to **false**) and therefore applies the Server class identification rules.

**Cloud class**

Description, identification rule, and other important schema structures for the CMDB cloud classes.

**AWS/Azure/OpenStack class model**

![AWS/Azure/OpenStack class model diagram](image-url)
Cloud schema description

ServiceNow has extensive models of cloud environments including Amazon Web Services (AWS), Microsoft Azure service, Google Cloud Platform (GCP), and IBM Cloud. Focusing on the compute side, the models for cloud environments and for Virtual Servers are similar. For example, instances of Amazon Elastic Compute Cloud (EC2) and Microsoft® Azure Cloud Compute, are an extension of Virtual Machine instances, where CIs are typically created by connecting directly to
cloud inventory. However, Virtual Machine instances do not represent actual usage of the cloud instance.

For example, you can represent a Linux guest host running on Amazon EC2 by the Server [cmdb_ci_server] class, with the `IsVirtual` attribute set to `true` and with the relationship Runs on:Runs to the EC2 instance. Integrating the AWS Config Service or the Amazon CloudWatch application, provides information on the EC2 object ID. Running Discovery or another discovery program on the guest Linux host, provides the `hostname`.

Ensure the following:

- Getting the correct UUID which gets stored in the Serial Number [cmdb_serial_number] table.
- Connecting/creating the cloud instance to Host OS, matching on the UUID/Object ID and creating the Runs On:Runs relationship.

Also, there is a complete model of Storage, Networking, Lamda/Functions in addition to modeling of different regions using the concept of the table Logical Datacenter [cmdb_ci_logical_datacenter] with Hosts:HostedOn relationship with Compute, Storage, and such.

**Identification rule**

The base system contains pre-defined identification rules for cloud schema classes. A cloud object requires the following identification items:

- **Object ID**: Which is synonymous with the IDs that cloud vendors use for each type of cloud resource, such as Azure Compute, EC2, and Amazon Simple Storage Service (S3).

- **Object ID** is unique per region and therefore has dependent relationship requiring information from the Logical Datacenter [cmdb_ci_logical_data_center] table, about the region where the cloud resource is being hosted. For example, AWS Datacenter [cmdb_ci_aws_datacenter], Azure Datacenter [cmdb_ci_azure_datacenter], Google Datacenter [cmdb_ci_google_datacenter] that are extended from Logical Datacenter.

Logical Datacenter itself, has two identifier entries:

- **Object ID**: Unique ID of the logical datacenter where applicable
  
  Or

- **Region**: The region of the cloud resource

- **Logical Datacenter** has a dependency on cloud service accounts, which has two identifier entries:
Object ID: Unique ID of the account where applicable.

Or

Account ID: The unique Account ID that encompasses the different cloud resources. Account ID is generally more applicable than Object ID.

For more information, see CMDB Identification and Reconciliation.

CMDB CI Class Models store app

The ServiceNow Configuration Management Database (CMDB) contains out-of-the-box classes that store data about Configuration Items (CIs). The CMDB CI Class Models store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable.

You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping can use these class extensions to populate CIs and discover various technologies and software.

Related ServiceNow® Store apps and reference information:

• **CMDB schema model**: A collection of class diagrams and class attributes for key CMDB classes.

• **CMDB tables descriptions**: Descriptions of key CMDB tables in the base system.

• **Populating the CMDB**: Information about the various options for populating the CMDB.

• **Discovery patterns**: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.

• **Service Graph connectors**: ServiceNow Store apps that provide pre-defined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.

Add class models

The app adds classes, columns, and the associated metadata as related records in the following tables:

• **CMDB Class Information [cmdb_class_info]**: Class descriptions

• **Identifier [cmdb_identifier]**: Identification rules
Discover using extension classes

The table lists the software and technologies that applications can discover using the extension classes. It provides links to documentation for CMDB CI Class Models and the corresponding ServiceNow Store discovery patterns.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Verify successful installation
After installing the CMDB CI Class Models store app, make sure the classes were added successfully:

1. Navigate to Configuration and then click CI Class Manager.
2. Click Hierarchy to display the CI Classes list.
   - This list contains the added classes, such as the Nutanix classes.
3. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships, if applicable.

Note: Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Avi load balancer extension classes
The CMDB CI Class Models store app adds or updates classes for the Avi load balancer.

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Avi load balancer
The Avi Vantage platform is built on software-defined principles, enabling a next generation architecture to deliver the flexibility and simplicity expected by IT and lines of business. The Avi Vantage platform architecture separates the data and control planes to deliver application services beyond load balancing, such as application analytics, predictive autoscaling, micro-segmentation, and
self-service, for app owners in on-premises or cloud environments. The platform provides a centrally managed, dynamic pool of load balancing resources on commodity x86 servers, virtual machines, or containers, to deliver granular services close to individual applications. Providing these services allows network services to scale near infinitely without the added complexity of managing hundreds of disparate appliances.

ServiceNow Discovery uses the Avi Vantage load balancer discovery pattern to find Avi load balancer resources.

### Related information

**CMDB schema model**

**BYOL model of RDS for Oracle extension classes**

The CMDB CI Class Models store app adds or updates classes for the BYOL Model of RDS for Oracle.

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use...
these class extensions to populate CIs and discover various technologies and software.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**BYOL Model of RDS for Oracle**

The Amazon RDS for Oracle is a fully managed commercial database that makes it easy to set up, operate, and scale Oracle deployments in the cloud. You can run Amazon RDS for Oracle under two different licensing models – “License Included” and “Bring-Your-Own-License (BYOL)“. In the “License Included” service model, you do not need separately purchased Oracle licenses; the Oracle Database software has been licensed by AWS.

We support discovery of the RDS Databases and their licenses.

**Classes**

This section lists the classes that the CMDB CI Class Models store app adds or updates. CMDB CI Class Models: Release 1.23.0 adds the following classes for the BYOL Model of RDS for Oracle. For the list of classes in a base system, including classes that this store app might be extending, see CMDB tables descriptions.

Firewalls

A firewall is a network security system that monitors and controls incoming and outgoing network traffic, based on security policies. Firewalls typically form a barrier between an internal network and an untrusted external network, such as the internet. It usually consists of security policies that help secure an organization from external threats and cyber attacks. Firewall vendors may provide a centralized firewall manager to manage many firewall devices and the security policies residing on them. For example, Panorama™ is the centralized management system for Palo Alto Networks firewalls.

Related information

**CMDB schema model**

**Internet of Things (IoT) extension classes**

The CMDB CI Class Models store app adds or updates classes for the Internet of Things (IoT).

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
Internet of Things (IoT)

IoT is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction. The classes added in this release, extend the Data Model to provide a foundation for the representation of IoT CI classes. This foundation underpins workflows for Enterprise Asset Management (EAM), Governance Risk Compliance (GRC), Component Supply Management (CSM), and Field Service Management (FSM) surrounding the management of IoT devices and the transport vehicles that some reside in.

IoT extension classes integrated with the CMDB class hierarchy

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.

CMDB CI Class Models: Release 1.6.0 adds the following classes for IoT. For the list of CMDB classes in a base system, including ones that this store app might be extending, see CMDB tables descriptions.

**CMDB schema model**

**Kubernetes extension classes**

The CMDB CI Class Models store app adds or updates classes for the Kubernetes pattern.

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Kubernetes pattern

The Kubernetes pattern main flow helps with discovering Kubernetes core elements. The classes in this release, extend the support to discover Kubernetes workload controller components like deployments, daemonsets, and statefulsets. The Workload Share library captures information about deployments, daemonsets, and statefulsets and stores them in the respective tables. Other extensions include a YAML and service mesh extension that generates a YAML file to track configuration files and creating service to service relations by discovering service mesh information.

#### CMDB schema model

#### Nutanix extension classes

The CMDB CI Class Models store app adds or updates classes for Nutanix. The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

#### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

#### Nutanix Enterprise Cloud platform

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

</tbody>
</table>
Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class. (continued)

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>

Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

The following classes have no added columns:

- Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]
- Nutanix Host [cmdb_ci_nutanix_host]
- Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]

CMDB CI Class Models: Release 1.1.4 adds the following columns to the respective classes.

Nutanix Cluster [cmdb_ci_nutanix_cluster] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block Serial Numbers</td>
<td>Serial numbers of blocks that are connected to the cluster.</td>
</tr>
</tbody>
</table>
### Nutanix Cluster [cmdb_ci_nutanix_cluster] class (continued)

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster ID</td>
<td>UUID (Universal Unique Identifier) of the cluster.</td>
</tr>
<tr>
<td>External Subnet</td>
<td>Subnet of the external IP address of the cluster.</td>
</tr>
<tr>
<td>Full Version</td>
<td>Full version of the cluster. For example: el7.3-release-euphrates-5.10.3.1-stable-655d4def34bf18785782f2adb8cdd5f8457d1</td>
</tr>
<tr>
<td>Hypervisor Types</td>
<td>Types of hypervisors that are related to this cluster.</td>
</tr>
<tr>
<td>Internal Subnet</td>
<td>Subnet of internal IP addresses.</td>
</tr>
<tr>
<td>NCC Version</td>
<td>Nutanix cluster check version.</td>
</tr>
<tr>
<td>NTP Servers</td>
<td>NTP servers that are related to this cluster.</td>
</tr>
<tr>
<td>Number of Nodes</td>
<td>Number of nodes that are connected to the cluster.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Timezone of the cluster.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the cluster. For example: 5.10.3.1</td>
</tr>
</tbody>
</table>

### Nutanix Controller VM [cmdb_ci_nutanix_controller_vm] class.

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypervisor Type</td>
<td>Type of hypervisor.</td>
</tr>
<tr>
<td>Memory</td>
<td>Amount of memory (in MB) available to the virtual machine.</td>
</tr>
<tr>
<td>State</td>
<td>On/off state of power.</td>
</tr>
<tr>
<td>VM ID</td>
<td>UUID of the controller virtual machine.</td>
</tr>
<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>
Nutanix Storage Container [cmdb_ci_nutanix_storage_container] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>

OpenStack extension classes

The CMDB CI Class Models store app adds or updates classes for OpenStack.

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

OpenStack

OpenStack is a cloud operating system that controls large pools of compute, storage, and networking resources throughout a datacenter. All of these resources are managed and provisioned through APIs with common authentication mechanisms. Other components provide services such as orchestration, fault management, and service management to ensure high availability of user applications. OpenStack is broken up into services to enable you to plug and play components depending on your needs. These components are designed for horizontal scalability, so you can easily add new resources to grow your cloud over time.

OpenStack classes integrated with the CMDB class hierarchy

Classes

This section lists the relevant classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.8.0 adds the following classes for OpenStack. For the list of CMDB classes in a base system, including ones that this store app might be extending, see CMDB tables descriptions.
<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenStack Services (<a href="#">cmdb_ci_cloud_openstack_service</a>)</td>
<td>Virtual Machine Object (<a href="#">cmdb_ci_vm_object</a>)</td>
<td>An OpenStack web service that can be accessed via a URL.</td>
</tr>
<tr>
<td>OpenStack Endpoint (<a href="#">cmdb_ci_cloud_openstack_endpoint</a>)</td>
<td>Virtual Machine Object (<a href="#">cmdb_ci_vm_object</a>)</td>
<td>The access point of a Service.</td>
</tr>
<tr>
<td>OpenStack Domain (<a href="#">cmdb_ci_cloud_openstack_domain</a>)</td>
<td>Virtual Machine Object (<a href="#">cmdb_ci_vm_object</a>)</td>
<td>A collection of users, groups, and projects.</td>

</tbody>
</table>

**Class columns**

CMDB CI Class Models: Release 1.8.0 adds the following columns to the respective classes.

**OpenStack Services ([cmdb_ci_cloud_openstack_service](#)) class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>The Service type, which describes the API implemented by the Service. Possible values: Compute, ec2, identity, image, network, or volume.</td>
</tr>
<tr>
<td>enabled</td>
<td>Defines if the service and its endpoints appear in the Service catalog (true/false).</td>
</tr>
</tbody>
</table>

**OpenStack Endpoint ([cmdb_ci_cloud_openstack_endpoint](#)) class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>The interface type, which describes the visibility of the endpoint. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• public - Visible by end users on a publicly available network interface.</td>
</tr>
<tr>
<td></td>
<td>• internal - Visible by end users on an unmetered internal network interface.</td>
</tr>
<tr>
<td></td>
<td>• admin - Visible by administrative users on a secure network interface.</td>
</tr>
</tbody>
</table>
OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint] class (continued)

Related information

CMDB schema model

Operational Technology (OT) extension classes

The CMDB CI Class Models store app adds or updates classes for Operational Technology (OT).

The store app adds class models that extend the CMDB class hierarchy, including:

- Class descriptions
- Identification rules
- Identifier entries
- Dependent relationships, if applicable.

You can use the added classes as any other CMDB class. Applications such as Discovery for Operational Technology, and Service Graph Connector for Operational Technology (Excel) use these class extensions to populate CIs and discover various technologies and software. To learn more, see:

- Service Graph Connector for Operational Technology (Excel)
- Discovery for Operational Technology

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
**Note:** In Operational Technology, CIs in the OT class structure are often referred to as OT Assets. This term shouldn’t be confused with an asset record commonly used in the practice of Asset Management in the IT domain.

### Operational Technology (OT) schema structure

### Classes

This section lists the relevant classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.23 adds the following classes for Operational Technology (OT). For the list of CMDB classes in a base system, including ones that this store app might be extending, see **CMDB tables descriptions**.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operations Technology</td>
<td>cmdb_ci_hardware</td>
<td>Base class for Operational Technology, used for industrial control. For instance, in manufacturing.</td>
</tr>
<tr>
<td>[cmdb_ci_ot]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Class</td>
<td>Extends</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OT Supervisory System</td>
<td>cmdb_ci_ot</td>
<td>Base class for supervisory systems, usually at Purdue Model Level 2 or 3</td>
</tr>
<tr>
<td>EWS [cmdb_ci_ot_ews]</td>
<td>cmdb_ci_ot_supervisory</td>
<td>Engineering Workstation. A computing platform for configuration, maintenance, and diagnostics of ICS applications and other control system equipment.</td>
</tr>
<tr>
<td>Historian</td>
<td>cmdb_ci_ot_supervisory</td>
<td>Data Historian. A centralized database supporting data analysis for industrial processes.</td>
</tr>
<tr>
<td>HMI [cmdb_ci_ot_hmi]</td>
<td>cmdb_ci_ot_supervisory</td>
<td>Human-Machine Interface. Hardware or software through which an operator interacts with a controller.</td>
</tr>
<tr>
<td>SCADA Client</td>
<td>cmdb_ci_ot_supervisory</td>
<td>Supervisory Control and Data Acquisition. Client that enables an operator to manage a SCADA server.</td>
</tr>
<tr>
<td>OT Control System</td>
<td>cmdb_ci_ot</td>
<td>Base Class for industrial control systems (ICS), usually at Purdue Model Level 1 or 2</td>
</tr>
<tr>
<td>CNC [cmdb_ci_ot_cnc]</td>
<td>cmdb_ci_ot_control</td>
<td>Computer Numerical Control, used for automated control of machining tools such as drills, lathes, mills, and for 3D printers.</td>
</tr>
<tr>
<td>Class</td>
<td>Extends</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DCS [cmdb_ci_ot_dcs]</td>
<td>cmdb_ci_ot_control</td>
<td>Distributed Control System. Achieves control using intelligence distributed about the controlled process, rather than by a centrally located single unit.</td>
</tr>
<tr>
<td>DPU [cmdb_ci_ot_dpu]</td>
<td>cmdb_ci_ot_control</td>
<td>Distributed Processing Units. ICS on a dedicated network, with each DPU handling thousands of points of I/O.</td>
</tr>
<tr>
<td>IED [cmdb_ci_ot_ied]</td>
<td>cmdb_ci_ot_control</td>
<td>Intelligent Electronic Device. Receives or sends data/control from or to an external source for power grids.</td>
</tr>
<tr>
<td>OT Control Module [cmdb_ci_ot_control_module]</td>
<td>cmdb_ci_ot_control</td>
<td>Module such as a PLC or DCS connected to an OT Control System.</td>
</tr>
<tr>
<td>PLC [cmdb_ci_ot_plc]</td>
<td>cmdb_ci_ot_control</td>
<td>Programmable Logic Controller. Used to control OT devices.</td>
</tr>
<tr>
<td>RTU [cmdb_ci_ot_rtu]</td>
<td>cmdb_ci_ot_control</td>
<td>Remote Terminal Unit. Special purpose data acquisition and control unit designed to support DCS and SCADA remote stations</td>
</tr>
<tr>
<td>SCADA Server [cmdb_ci_ot_scada_server]</td>
<td>cmdb_ci_ot_control</td>
<td>Supervisory Control and Data Acquisition. System capable of gathering and processing data and applying operational controls over long distance.</td>
</tr>
</tbody>
</table>
### Class columns
CMDB CI Class Models: Release 1.23 adds the following columns to the respective classes.

<table>
<thead>
<tr>
<th>Operational Technology (OT) [cmdb_ci_ot] class</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Added columns</strong></td>
</tr>
<tr>
<td>firmware_version</td>
</tr>
<tr>
<td>hardware_version</td>
</tr>
</tbody>
</table>
**OT Control System [cmdb_ci_ot_control_system] class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>has_module</td>
<td>true/false value describing if the system has modules, such as chassis / blade architecture.</td>
</tr>
<tr>
<td>backplane_name</td>
<td>System-reported string name or number for the backplane.</td>
</tr>
<tr>
<td>backplane_id</td>
<td>System-reported unique ID for the backplane</td>
</tr>
</tbody>
</table>

**OT Control Module [cmdb_ci_ot_control_module] class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot_number</td>
<td>Reported slot in the control system this module is using.</td>
</tr>
<tr>
<td>module_type</td>
<td>Module type reported by the discovery source.</td>
</tr>
</tbody>
</table>

**OT Field Device [cmdb_ci_ot_field_device] class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>device_type</td>
<td>List that describes if the device provides input, output, or both to the parent control system.</td>
</tr>
</tbody>
</table>

**Roles**

Three new roles have been introduced with the Operational Technology (OT) [cmdb_ci_ot] classes and associated tables that follow:

**Editor (cmdb_ot_editor)**

Can view and edit OT asset records.

**Viewer (cmdb_ot_viewer)**

Can only view OT asset records.

**Admin (cmdb_ot_admin)**

Can edit and manage specific configurations on the OT entity tables.
Key relationship structures

Use the following key relationships as important guidelines when creating Operational Technology (OT) CIs:

**OT Entity**
Since any CI class may be found on an OT network, the OT Entity table [cmdb_ot_entity] captures additional attributes required in an OT Environment:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business criticality</td>
<td>Business criticality assigned in the discovery source.</td>
</tr>
<tr>
<td>OT Asset</td>
<td>Reference to the CI that is on the OT network.</td>
</tr>
<tr>
<td>OT Class</td>
<td>Class that the OT asset is functioning as.</td>
</tr>
<tr>
<td></td>
<td>• For a dedicated HMI appliance, the CI is in the cmdb_ci_ot_hmi class, and the OT class should be HMI.</td>
</tr>
<tr>
<td></td>
<td>• For a computer performing the function of an HMI, the CI is in the cmdb_ci_computer class and the OT class should be HMI</td>
</tr>
<tr>
<td>Purdue level</td>
<td>Purdue level of the OT asset.</td>
</tr>
</tbody>
</table>

The OT Entity is a related list added to the Operational Technology (OT) [cmdb_ci_ot] table and extended tables. If you want to view OT entity metadata on an existing CI class, first add the related list to the form.

**OT Entity Type**
The [cmdb_ot_entity_type] table tracks the type of OT asset that an OT or non-OT CI is performing the function of. It serves as a necessary part of the Purdue level data model, and extends the Application File [sys_metadata] table.

The Now Platform includes a few records representing common types of OT CIs:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Display name of a specific type.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Name</td>
<td>Value used to identify a specific type.</td>
</tr>
<tr>
<td>OT table</td>
<td>Value used for auto-populating the Type field for the OT entity record [cmdb_ot_entity] of an OT CI.</td>
</tr>
<tr>
<td>Parent</td>
<td>Parent type of a specific type, which is a reference to a record in the same table [cmdb_ot_entity].</td>
</tr>
</tbody>
</table>

**Serial number**

During CI identification, the Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the other is the Serial Number [cmdb_serial_number] table, with reference back to the Operational Technology (OT) [cmdb_ci_ot] table.

- It stores any serial number of any type other than system serial number, and only in the Serial Number table (and not in the server CI attribute).
- If the system serial number is available, it stores it in both the Serial Number attribute of the CI and in the Serial Number table.
- The Serial Number table is a many-to-one relationship, linking back to the Operational Technology (OT) CI. This table has a Type field for specifying the type of the serial number.
- For Operational Technology (OT), use the string value `system` for the serial number type to ensure proper reconciliation across various sources.

**Network adapter**

Use the Network Adapter [cmdb_ci_network_adapter] class to store network adapters.

1. Set the MAC Address attribute to be the MAC address value.
   - Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.
   - For example, ‘f8:f2:1e:00:d4:66’.
2. Set the Name attribute in the Network Adapter class to be the same as the MAC Address.
3. In the CI Relationship [cmdb_rel_ci] table, create an Owned By:Owns relationship to the associated Hardware CI.
4. Using the CI with a reference to the associated Hardware CI, specify a reference from the Network Adapter [cmdb_ci_network_adapter] table.
IP Address
Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.

1. Store an IP address value in the IP Address attribute, and in the Name attribute to avoid empty Name attributes.
   • Store an IPv4 IP address value using the format ‘NNN.NNN.NNN.NNN’, with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
   • Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.

2. Set the Netmask attribute to the IP address.

3. Set the Name attribute in the Network Adapter class to be the same as the MAC Address.

4. In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI.

5. In the CI Relationship [cmdb_rel_ci] table, create an Owned By::Owns relationship to the associated Hardware CI.

6. For the IP address, specify a reference to the Network Adapter [cmdb_ci_network_adapter] table, using the Configuration Item with a reference to the associated Hardware CI.

7. To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

Network adapter and IP address
Use the IP Address [cmdb_ci_ip_address] class to store IP addresses.

1. Store the MAC address of the network adapter installed on a server, in the Network Adapter [cmdb_ci_network_adapter] class.

2. Store the IP address in the IP Address [cmdb_ci_ip_address] class.

   Note: Do not store the MAC address or the IP address in the Operational Technology (OT) [cmdb_ci.ot] table. The default Operational Technology (OT) form is configured to display the IP address from the Network Adapter table.

Key reference structures
Use the following key references are important guidelines when creating Operational Technology (OT) records:
• When creating computer or server records for OT assets that are running on computers or servers, see the following topics:
  ◦ Computer [cmdb_ci_computer] class
  ◦ Server [cmdb_ci_server] class
• The Manufacturer and Model ID attributes are reference attributes to the Company [core_company] and Product Model [cmdb_model] tables respectively.
• The Owned By, Assigned To, Managed By, and Supported By attributes are reference attributes to the User [sys_user] table. The Assignment Group and Support Group attributes are reference attributes to the Group [sys_user_group] table.

Identification rules
The Now Platform contains a pre-defined identification rule for the Operational Technology (OT) classes. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry that uses the identification specified in Serial Number [cmdb_serial_number] as the lookup table. The Serial Number table is a many-to-one reference from the serial number back to the server CI.
2. Identifier entry specified in the Serial Number attribute in the CI.
3. Identifier entry specified in the Mac Address attribute in the Network Adapter table.
4. Identifier entry for the Name attribute.
   • If Serial Number and MAC Address are not available, then the Name (which is usually the system reported hostname) attribute is used.
   • If both Serial Number and Name are not available, and only MAC Address is available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don’t create an empty CI.

  Note: To learn more, see CMDB Identification and Reconciliation.

Deprecated classes
CMDB CI Class Models: Release 1.23 soft deprecated (not removed, but marked as follows) with the release of the OT class model:
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Human Machine Interface [cmdb_ci_hmi]</td>
<td>OT assets moved to cmdb_ci_ot to support broader use cases. Use cmdb_ci_ot_hmi instead.</td>
</tr>
<tr>
<td>Manufacturing Device [cmdb_ci_manufacturing]</td>
<td>OT assets moved to cmdb_ci_ot to support broader use cases. Use cmdb_ci_ot as the base class or other generic child classes as appropriate.</td>
</tr>
<tr>
<td>Programmable Logic Controller [cmdb_ci_plc]</td>
<td>OT assets moved to cmdb_ci_ot to support broader use cases. Use cmdb_ci_ot_plc instead.</td>
</tr>
</tbody>
</table>

A script has been provided to migrate records from these classes to the new class tables. The admin role is required to perform the following tasks:

1. Navigate to **System Definition > Script Includes**
2. Find the record named **OTAssetsMigrationUtils**.
3. Navigate to **Definition > Script Includes**.
4. In the background window, copy and paste the provided script.
5. Select the appropriate scope and run the script.

**Troubleshooting**
The following are some troubleshooting tips:

<table>
<thead>
<tr>
<th>Problem</th>
<th>Suggested resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unable to see OT Asset menu items</td>
<td>Ensure that the logged in user has been assigned the appropriate roles. To learn more, see the preceding Roles section.</td>
</tr>
<tr>
<td>Error creating or updating an OT Asset record</td>
<td>Allow only one OT Asset record (cmdb_ot_entity) per CI.</td>
</tr>
</tbody>
</table>

CMDB schema model
Red Hat Virtualization (RHV) extension classes

The CMDB CI Class Models store app adds or updates classes for Red Hat Virtualization (RHV).

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Red Hat Virtualization (RHV)

Red Hat Virtualization (RHV) is a virtualization product which is based on the Kernel-based Virtual Machine (KVM) hypervisor. RHV uses the SPICE protocol and Virtual Desktop Server Manager (VDSM) with a RHEL-based centralized management server. RHV solution is based on two primary software components: Red Hat Virtualization Manager (RHV-M) and Red Hat Virtualization Hypervisors or hosts: Red Hat Enterprise Linux or RHV Host (RHV-H).
Classes

This section lists the relevant classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

CMDB CI Class Models: Release 1.8.0 adds the following classes for RHV. For the list of CMDB classes in a base system, including ones that this store app might be extending, see CMDB tables descriptions.

<table>
<thead>
<tr>
<th>Class</th>

Transport Layer Security (TLS) extension classes

The CMDB CI Class Models store app adds or updates a class for TLS certificates.

The app adds class models that extend the CMDB class hierarchy. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Transport Layer Security (TLS)

TLS is a cryptographic protocol designed to provide communications security over a computer network. The TLS protocol provides privacy and data integrity between communicating computer applications. Once the client and the server have agreed to use TLS, they negotiate a stateful connection by using a handshaking procedure. The server usually provides identification in the form
of a digital certificate. The certificate contains the server name, the trusted certificate authority (CA) that vouches for the authenticity of the certificate, and the server's public encryption key. The client confirms the validity of the certificate before proceeding. When the handshake is completed, a secured connection is established.

**TLS certificate classes integrated with the CMDB class hierarchy**

**Scoped apps certification class**

The scoped apps certification class supports TLS certificates. With this class you can proactively manage certificates by keeping stakeholders informed about any impending expiries. Use this extension class to ensure that certificates are monitored and renewed before they expire, to prevent severe outage of production systems.

**Classes**

This section lists the relevant classes that the CMDB CI Class Models store app adds or updates. See the class columns table for further details about the columns added for each class.

The CMDB CI Class Models: Release 1.4.0 updates the following class:

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
</table>
The CMDB CI Class Models store app changes the Unique Certificate [cmdb_ci_certificate] class as follows:

- The `assigned_to` attribute now depends on the `assignment_group` attribute so that users in the `assigned_to` attribute are filtered based on the specified `assignment_group`.

- The Certificate Inventory and Management store app populates the Unique Certificate [cmdb_ci_certificate] table. The list view for that class does not have a New button and you can no longer add new records to the table. This is because there are certain fields that are extracted from binary encoded parameters in the certificate which users may not be able to provide. Also, certificates have to be discovered rather than uploaded.

- You can no longer add or delete attachments in the Certificate file attribute.

The CMDB CI Class Models: Release 1.3.0 adds the following classes. For the list of CMDB classes in a base system, including ones that this store app might be extending, see CMDB tables descriptions.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Certificate [cmdb_ci_certificate]</td>
<td>Configuration Item [cmdb_ci]</td>
<td>N/A</td>
</tr>
<tr>
<td>Certificate Domain [certificate_domain]</td>
<td>N/A</td>
<td>Fully qualified domain name.</td>
</tr>
</tbody>
</table>

**Class columns**

CMDB CI Class Models: Release 1.4.0 adds the following columns to the respective classes.

<table>

</tbody>
</table>

### Certificate Domain [certificate_domain] class

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Fully qualified domain name.</td>
</tr>
</tbody>
</table>

CMDB CI Class Models: Release 1.3.0 adds no columns.

**Related information**

CMDB schema model
VMware NSX load balancer extension classes

The CMDB CI Class Models store app adds or updates classes for VMware NSX load balancers.

The app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

VMware NSX load balancer

NSX is a network virtualization solution offered by VMware. Among the virtual resources included in the NSX solution are virtual LANs (VLANs), virtual load balancers, virtual routers, switches, and firewalls.

ServiceNow Discovery uses the VMware NSX load balancer discovery pattern to find VMware NSX load balancers and their components: Listeners, pools, pool members, and health services.

Classes

This section lists the classes that the CMDB CI Class Models store app adds or updates.
CMDB CI Class Models: Release 1.10.0 adds the following classes for the VMware NSX load balancer. For the list of CMDB classes in a base system, including ones that this store app is extending, see CMDB tables descriptions.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSX Load Balancer</td>
<td>[cmdb_ci_nsx_lb]</td>
<td>The table containing the NSX Load Balancer resources.</td>
</tr>
<tr>
<td>[cmdb_ci_lb]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Class columns**

The VMware NSX load balancer discovery pattern introduces one new table with one identification rule and entry. The table uses only the columns inherited from its parent.

**Related information**

- CMDB schema model

**Extend classes and rules**

Extend and update CMDB CI Class Models store app classes and rules when using third-party integration tools.

When using a third-party tool to integrate with ServiceNow apps, gaps can occur between the integration and different CIs. Some of the integrated tables and classes may be missing classes and rules not included with the CMDB CI Class Models store app.

The classes and rules in the following table enable you to add and extend the CMDB CI Class Models store app for integrations:

<table>
<thead>
<tr>
<th>Table</th>
<th>Extends</th>
<th>Rules and related entries</th>
</tr>

For the list of CMDB classes in a base system, including ones that this store app is extending, see **CMDB tables descriptions**.

**Related information**

**CMDB schema model**

**Populating the CMDB**

You can populate the CMDB by using Discovery, by using the IntegrationHub ETL or Import Sets to import and integrate data from a third-party source, by integrating with an external CMDB, or by manually creating CIs.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

**Related ServiceNow® Store apps and reference information:**

- **CMDB schema model**: A collection of class diagrams and class attributes for key CMDB classes.
- **CMDB tables descriptions**: Descriptions of key CMDB tables in the base system.
- **CMDB CI Class Models**: A ServiceNow Store app that adds class models that extend the base CMDB class hierarchy. This includes class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can then use the added classes as any other CMDB base class.
- **Discovery patterns**: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.
- **Service Graph connectors**: ServiceNow Store apps that provide pre-defined integrations for importing and integrating common third-party data into CMDB classes. Also includes the IntegrationHub ETL wizard for creating new ETL transform maps.
ITIL configuration management auto-discovery
The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. The ServiceNow platform provides three options for auto-discovery:

- The separate and highly robust Discovery product.
- For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, and so on), the ServiceNow platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see the CMDB Design & Configuration white paper.

Discovery
The Discovery product automatically populates the CMDB. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device's configuration, provisioning, and current status. Discovery uses probes, sensors, and patterns, to collect and process data about computers, servers, printers, a variety of IP-enabled devices, and the relationships between all the items found. Discovery also reports on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships. This information is sent back to the instance and is used to populate the CMDB.

For more information about Discovery see:
- ITOM Visibility
- Discovery basics

Integrate third-party data using IntegrationHub ETL
Use the IntegrationHub ETL to import and integrate data from a third party into the CMDB. Using IntegrationHub ETL, create ETL transform maps which are used for integrating data from specific data sources. IntegrationHub ETL guides you through importing source data, transforming any data if needed, and selecting target CMDB classes and attributes to map the data to. You then preview the integration results and adjust any configurations before scheduling recurring integrations.

Visit the ServiceNow Store website to view and download common integrations.

Import data from another source using Import Sets
You can import data to the CMDB using Import Sets. Import sets find files of information (in formats such as XML, Excel, or CSV), import them, and transform
them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table [cmdb_rel_ci] with information on the parent, the child, and the nature of the relationship. The [cmdb_rel_ci] table displays a list of all CI relationships and is useful when importing CI data.

**CMDB instance API**

Use the CMDB instance API to populate the CMDB by creating or updating CMDB tables.

**Manually create a CI**

Create a single CI for a specific class. The role required is based on the selected table settings.

1. Use the CI Class Manager:
   a. Navigate to **Configuration > CI Class Manager**.
   b. Click **Hierarchy** to display the list of CI Classes. Select the class to use for the CI.
c. In the class navigation bar, select CI List and then on the CI list view, click New.

d. Fill out the CI form and then click Submit.

2. Or, directly use a table:

a. Navigate to and expand Configuration and then elect the class to use for the CI, such as Business Services.

b. In the navigation filter of the application navigator, enter the table label (such as 'Linux'), or the table name in the format of <table name>.list (such as 'cmdb_ci_linux_server.list'). Then, press Enter.

c. In the list view of the table, click New and fill out the form fields for the table.

d. Click Submit.

Integrating third-party data into the CMDB

Use Service Graph Connectors to import and integrate third-party data into CMDB classes and properties. You can use predefined Service Graph Connectors for common applications from the ServiceNow Store. You can also use IntegrationHub ETL to create new ETL transform maps or edit existing ones.

Related ServiceNow® Store apps and reference information:

- **CMDB schema model**: A collection of class diagrams and class attributes for key CMDB classes.
- **CMDB tables descriptions**: Descriptions of key CMDB tables in the base system.
- **CMDB CI Class Models**: A ServiceNow Store app that adds class models that extend the base CMDB class hierarchy. This includes class descriptions, identification rules, identifier entries, and dependent relationships if applicable. You can then use the added classes as any other CMDB base class.
- **Populating the CMDB**: Information about the various options for populating the CMDB.
- **Discovery patterns**: A ServiceNow Store app that provides a library of Discovery patterns for discovering specific devices and applications in the industry.

IntegrationHub ETL (2.1.0)

Use the IntegrationHub ETL store app to create and manage ETL transform maps, which integrate third-party data into the CMDB without compromising the integrity of the CMDB. IntegrationHub ETL provides a simplified user interface
that guides you through the integration process end-to-end, including a test integration run of sample data.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

When you create an integration, you import source data, transform data if needed, and select target CMDB classes and attributes to map the data to. Eventually, you run an integration test of the sample data, using your settings in the IntegrationHub ETL. You can then preview the integration test results and adjust any settings before scheduling recurring integration runs for large data sets. If you develop and test the ETL transform map on a development instance, then you can test and adjust the configuration before implementation on a production instance.

For example, you can integrate data from SCCM (Microsoft System Center Configuration Manager).

For more information, watch the IntegrationHub ETL | Importing resources into the CMDB video for an introduction and walk through of the IntegrationHub ETL tool.

**Roles required**

Users with the cmdb_inst_admin role can use IntegrationHub ETL to create integrations, or customize a pre-existing integration provided by ServiceNow or a vendor at the ServiceNow Store. A vendor can create a new integration and provide it as an application for anyone to use.

**IntegrationHub ETL and Import Sets**

Using IntegrationHub ETL and ETL transform maps has the following advantages over using Import Sets and transform maps:

- Identification and Reconciliation Engine (IRE) processes are incorporated into the IntegrationHub ETL so all data is automatically processed by IRE as part of the integration. Using Import Sets and transform maps does not provide a simple way to apply IRE processes.
- IntegrationHub ETL uses guided setup which provides guidance and a simple user interface for the entire process of integrating third-party data.
- IntegrationHub ETL includes an integration test for a small data set using the new ETL transform map. This test lets you review the results and adjust configuration settings before scheduling recurring integrations.
Terms
The following terms are associated with the IntegrationHub ETL:

CMDB application
Name of the third-party vendor such as SCCM 2019. A CMDB application has two associated attributes: Name and Discovery Source. When creating a new integration, ensure to configure a discovery source for the CMDB application that you plan to use, before using the IntegrationHub ETL.

Data source
The source feed, such as SCCM 7.0 Computer Identity, where the raw source data is imported from. If you use various REST endpoints for different types of data, then each REST endpoint is associated with its own data source and an ETL transform map.

ETL transform map
The output generated by IntegrationHub ETL. You can integrate third-party data into the CMDB, using an ETL transform map which is configured for the respective integration.

Source data
Original, raw data that have been imported into IntegrationHub ETL. Source data can be used in its original form, or you can transform the data before mapping and integration.

Transform
An operation, that you can apply to a specific data column to transform the data values. For example, to transform the format of the data values. Use transforms to standardize data formats and meet other system requirements.

Transformed data
Some of the source data might not be compliant with the requirements of its target CMDB attributes and classes. In those cases, you can apply various types of transforms to the source data, before mapping the data to the target CMDB classes and attributes. Transforms, can for example convert data format, replace values, and concatenate values from multiple data columns.

Robust Transform Engine
Robust Transform Engine (RTE) is used to transform raw source data that is stored in staging tables, into the data that is mapped and
integrated into the CMDB. RTE uses ETL transform maps that were created for the integration during data transformation.

Each CMDB application can have multiple connections for retrieving raw data. Each connection that is used to retrieve a certain type of data, has its own pair of data source and an ETL transform map. Therefore, one CMDB application can have multiple ETL transform maps, and each of those ETL transform maps is associated with a single Data Source.

For example:

<table>
<thead>
<tr>
<th>CMDB Application</th>
<th>ETL Transform Map</th>
<th>Data Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>SCCM Computer Identify</td>
<td>/sccm/2019/comp</td>
</tr>
<tr>
<td></td>
<td>SCCM Disk</td>
<td>/sccm/2019/disk</td>
</tr>
<tr>
<td></td>
<td>SCCM Application</td>
<td>/sccm/2019/appl</td>
</tr>
</tbody>
</table>

**Nested data payloads**

To process nested data payloads, you must first ensure that the data source that is used for the integration, is set with the Data in single column option. With that setting, you can correctly represent nested data in a JSON payload which IntegrationHub ETL then processes as nested data, rather than as flat data.

Sample of nested data:

```json
{
    "u_computer_fqdn": "computer2-fqdn",
    "u_computer_id": 2,
    "u_computer_ip": "computer2-ip",
    "u_computer_location": "PDX",
    "u_computer_mac": "computer2-mac",
    "u_computer_name": "nested-payload-computer2",
    "u_computer_os": "computer2-os",
    "interfaces": [ {
        "u_interface_ip": "computer2-eth1-ip",
        "u_interface_mac": "computer2-eth1-mac",
        "u_interface_name": "computer2-eth1",
        "ip": "",
    }, {
        "u_interface_ip": "computer2-eth2-ip",
        "u_interface_mac": "computer2-eth2-mac",
        "u_interface_name": "computer2-eth2",
    }
```
You can view the layers of nested data in a separate panel in IntegrationHub ETL, apply transforms, map, and integrate that data into the CMDB.

When creating a nested data JSON payload, the following restrictions apply:

- Column names can't contain special characters such as *, [, ], #, $, spaces, and dot.
- Column names can't be “temp” or “object”, which are reserved for internal use.
- Consistently throughout the payload, you must use an array or an object to represent data in a specific level, regardless of the number of items in the level. If you use an array for multiple items in one object, you must also use an array to represent a single item in other objects.

**Process**

IntegrationHub ETL uses both, RTE and IRE, that work together to process and integrate data. Data is first imported from a data source, and is then stored in temporary staging tables in Import Sets systems. Using the data in the staging tables and the ETL transform map created by IntegrationHub ETL, RTE creates IRE payloads which are then processed by IRE. IRE applies reconciliation processes...
to avoid potential problems such as duplicate CIs, ensuring that the CMDB remains healthy, and then integrates the resulting data into the CMDB.

**Related reference**

- Teams related list

**Create an ETL transform map**

IntegrationHub ETL provides a guided setup which walks you through the completion of all necessary tasks for creating an ETL transform map for a specific integration.

**Guided setup**

Guided setup organizes all the tasks in the correct order, tracks the completion of tasks, and enforces any task dependencies. Tasks that depend on the completion of other tasks, are enabled or disabled as you step through the tool and complete tasks.

Use guided setup to complete the following tasks.

**Import source data and specify basic details**

Provide basic details for the integration, such as the source of the data that you want to integrate into CMDB, and import the source data.

**Before you begin**

The data source that you plan to select for the ETL Transform Map must exist in the same application scope as the one being used in the current session.

Role required: cmdb_inst_admin

**Procedure**

1. **Navigate to Configuration > IntegrationHub ETL.**
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. **Click the Name of an integration to view or modify, or click Create new.**
   IntegrationHub ETL validates the ETL transform map that you are loading and automatically deletes invalid data records. If there are any validation errors then the Invalid Mapping Data dialog box appears, listing all the specific errors that were detected. The system detects errors such as:
• Missing source or target fields in corresponding Robust Transform Engine (RTE) field mappings records
• Missing table columns in an import set
• Missing an Identification and Reconciliation Engine (IRE) lookup rule for a lookup class

3. On the ETL Transform Map Assistant page, in the Specify Basic Details section of the guided setup, select the Import Source Data and Provide Basic Details task.

4. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Application</td>
<td>The CMDB application associated with the ETL transform map. You can select Add new, which adds the CMDB Application and the Discovery Source fields for the new CMDB application.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the ETL transform map.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the integration.</td>
</tr>
<tr>
<td>Data Source</td>
<td>List of all data sources in the system.</td>
</tr>
<tr>
<td>Sample Import Set</td>
<td>An existing Import Set that is associated with the specified Data Source.</td>
</tr>
<tr>
<td></td>
<td>A subset of that Import Set data is used to preview source data.</td>
</tr>
<tr>
<td></td>
<td>If you don't select an Import Set or if the specified Data Source isn't associated with any Import Sets, an Import Set of up to 100 records, is automatically created and selected.</td>
</tr>
<tr>
<td>CMDB Application</td>
<td>Name of a new CMDB Application. Appears if you set CMDB Application to Add new.</td>
</tr>
<tr>
<td>Discovery Source</td>
<td>Discovery source associated with a new CMDB Application. Appears if</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
you set CMDB Application to Add new.

5. Click **Save** to save the current changes or **Mark as Complete**.

A time stamp appears in the header when you click **Save**, which remains for the duration of the Integration Hub ETL session for the ETL transform map. When you re-enter the session or switch between ETL maps, the time stamp disappears.

**Related information**

- Create an Import Set data source

**Preview and prepare data**

Review sample records of raw source data, which will be integrated into the CMDB. Transform and prepare data to align with the target classes and attributes, if needed.

**Before you begin**

The number of records in the sample data is determined by the system property `sn_int_studio.preview.size`, which is set to 100 by default. The maximum number of records in the sample data that IntegrationHub ETL can process is 10,000. If you set that property above the 10,000 limit, then IntegrationHub ETL will only process up to 10,000 records and a message will appear to that effect.

To process nested data from a nested payload, the respective data source must be set with the **Data in single column** option.

**Role required:** cmdb_inst_admin

**About this task**

Review the values in the data columns of the sample data and identify columns that do not align with the requirements of the intended target classes and attributes. You can transform data, for example, by converting the data format, replacing values, and concatenating data columns. You can apply transformations one on top of another, creating a chain of data transformations. You can also set a data column to be ignored in the mapping and integration process.

Columns for nested data appear alongside the rest of the data, with a **Nested Objects** notation in the data column header. The count of nested data items per object appear with a link which lets you drill to deeper levels of the nested data. To show the data structure of nested data in a separate panel, enable the **Show data structure** option.
The Data Structure panel has two options for displaying nested data:

- **Tree**: Nested data grouped by objects, where each object node corresponds to a record entry in the source data. Expand object nodes to show all nested data for the record.

- **Collection**: Nested data grouped by the top-level object (by default) and then by nested data items such as software. Expand a node such as software, to show which software is installed on each computer.

You can navigate through the levels of nested data in the Data Structure panel, the breadcrumbs path, or through number links that appear in the source data itself. Your selections and the data that appears are kept synchronized between all views of the nested data, regardless of navigation.

**Procedure**

1. Navigate to **Configuration > IntegrationHub ETL**, and click the **Name** of an integration.

   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Prepare Source Data for Mapping section of the guided setup, select **Preview and Prepare Data**. Then, on the Preview and Prepare Data page, you can perform any of the following optional steps.

3. **Optional**: Select **Show data structure** to open the Data Structure panel which shows the structure of nested data. In the Data Structure panel, you can drill down through the levels of nested data.

4. **Optional**: Select the action menu for a column and then select a **Sort** operation.

5. Select the action menu for a column and then select **Group by** to group the data by the respective column. Select **Ungroup** to undo the grouping operation.

6. **Optional**: Click **New Transform** and then select **Use Source Column**. Or, select the action menu for a column, and then select **New Transform** to transform the selected column.

   (Optional) You can't create new transforms for nested objects at this top-level view of the data. A nested object column contains number links which indicate the number of nested items for the record. To create a new transform for nested objects, click that number link to drill down to the actual nested...
data. Alternatively, navigate in the Data Structure panel to the nested object for which you want to create a transform.

A transform of nested data can reference parent objects of the nested data being transformed. Using the sample payload for nested data as an example, a transform for an interface object can reference the parent computer object but can't reference a software object.

a. In the New Transform sidebar on the right, select a **Transform Type** and modify the **Transform Description** if appropriate. For more details about transform types, see Transform types in IntegrationHub ETL.

b. (Optional) Select **Hide initial column used for this transform** to hide from the current view all the columns that were used for this transform. This setting is temporary for the current session, and if you refresh the page, the hidden column reappears. To show a hidden column, you can also click the gear icon on the banner frame. Then, move the hidden column from the Available to the Selected list and click **OK**.

c. Select or verify the **Input Column** whose values are being transformed.

d. (Optional) Modify the **Output Column Name** for any of the columns that will be added with the transformed values.

e. Click **Apply**.

A new column with the transformed values appears, placed in alphabetical order based on the output column name. If you used the suggested output column name, then the new column appears to the right of the input column.

f. Review the transformed data and adjust any transforms, if needed.

7. **Optional:** To apply the 'Set Fixed Value Column' transform:

a. Click **New Transform** and then select **Set Fixed Value Column**.

b. In the Set Fixed Value Column sidebar, enter a **Column Name** and a **Column Description** for the new column. Then, set **Assign Column Value** to the value that is fixed for the new column.

c. Click **Apply**.

8. **Optional:** Select the action menu for a column, and then select **Ignore in Mapping** to exclude the column from mapping and integration in the current session.
(Optional) In a subsequent session, the **Ignore in Mapping** setting does not apply, and the column will be included in mapping.

You can click **Include in Mapping** to undo the **Ignore in Mapping** setting for the column.

9. **Optional:** Select the action menu for a column, and then select **Delete This and Downstream Columns**. This delete action deletes the column along with any columns that were added using this column as an input column.

10. **Optional:** Click **New Transform** and then select **Table Lookup** which lets you specify a table to look up and extract additional values from. Fill out the fields in the Table Lookup sidebar on the right.

Values from the specified lookup table are matched with the mapped data. For the records that match, the specified values from the lookup table, are added as a column, to the data that is being prepared for mapping.

<table>
<thead>
<tr>
<th>Table Lookup</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Lookup Table</td>
</tr>
<tr>
<td>Lookup Condition</td>
</tr>
</tbody>
</table>

- **If values of target table column:**
  The column in the target table to match to a column in the mapped data.

- **Match values of source data table:**
  The column in the mapped data to match to a column in the lookup table.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>You can add multiple pairs of columns to match on.</td>
</tr>
<tr>
<td>Lookup Condition</td>
<td>(Optional) Values to extract from the <em>Lookup Table</em> when there is a match</td>
</tr>
<tr>
<td></td>
<td>with the mapped data.</td>
</tr>
<tr>
<td></td>
<td>• <em>Then output values from the following columns:</em> The lookup table</td>
</tr>
<tr>
<td></td>
<td>columns to extract values from, when values from the lookup table and the</td>
</tr>
<tr>
<td></td>
<td>mapped data, satisfy the <em>Lookup Condition</em>.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>An <em>Output Column Name</em> field is automatically added for every column that</td>
</tr>
<tr>
<td></td>
<td>you specify in <em>Then output values from the following columns</em>.</td>
</tr>
</tbody>
</table>

11. Review the data and ensure that the intended set of data to be integrated is transformed, correctly formatted and prepared for import.

12. Click **Mark as Complete**.

**Results**

Data is prepared when the set of source data columns and transformed columns that you want to integrate, meet any formatting and other value requirements of the target CMDB classes and attributes. These columns are then ready to be mapped and integrated to CMDB classes and attributes.
About mapping data columns to CMDB classes and attributes

There are several requirements and guidelines for mapping source data to target CMDB classes and attributes. Also, there is an option of deactivating class mappings while preserving the settings for an easy reactivation. Review these concepts to ensure proper processing by the Identification and Reconciliation Engine (IRE).

Required mappings

You must map data to all required attributes of the target class in addition to mapping to attributes that are not configured as required. Also, the following two fields appear by default and you cannot delete them:

**Source Native Key**

Required by Identification and Reconciliation Engine (IRE) to uniquely identify a record and used for building relationships and references. Also, improves performance of insert and update operations. When processing a payload, IRE generates an error if this field is empty.

**Source Recency Timestamp**

Used by IRE to identify records that are older than the current record and therefore can be ignored, to help resolve conflicting attribute values.

For more information about how IRE uses `source_native_key` and `source_recency_timestamp` for CI identification, see Identification and Reconciliation engine (IRE).

Conditional class

A conditional class lets you map different sets of data records to different target classes according to specific column values, or the status of a specific plugin.

For example, if a display name contains 'Windows', then 'Windows Server' is selected as the target class. But if the display name contains 'Linux', then 'Linux Server' is selected as the target class. For records that do not meet any of these conditions (display name does not contain 'Windows' nor 'Linux'), 'Server' is selected as the target class.

Associated class

An associated class lets you select the CMDB class to be associated with a target non-CMDB class, which is required for IRE processing.

If the target class for mapping is a non-CMDB class with a reference to a CMDB class, you must select the CMDB class to associate the non-CMDB target class with. A non-CMDB class refers to a class, such Serial Number
[cmdb_serial_number], that does not extend the Configuration Item [cmdb_ci] class. The Related Entry [cmdb_related_entry] class might contain multiple CMDB class associations for the same non-CMDB class. Therefore, select the appropriate association to allow IRE processes to update the target non-CMDB class.

For example, the Related Entry [cmdb_related_entry] class has a record which associates the non-CMDB Software Instance [cmdb_software_instance] class with the CMDB Software Package [cmdb_ci_spkg] class. If you select Software Instance as a target class, you must associate the Software Instance class with the Software Package [cmdb_ci_spkg] class.

### Deactivating class mappings

When you edit an ETL transform map, provided by a Service Graph connector for example, you can delete a class mapping to prevent the class from being populated when the integration runs. However, if you later decide to populate that class, you must readd that class and reconfigure all the class mappings. Instead, you can deactivate a class mapping to temporarily ignore the class during the integration run, while preserving all of its mapping configuration. A class that you choose to deactivate is grayed out in the user interface but you can continue and edit the class mappings. Later, you can reactivate a class mapping to enable populating the class, without needing to reconfigure the class mappings.

Some classes that you choose to deactivate, trigger an automatic deactivation of additional classes that you did not directly choose to deactivate. Which classes are automatically deactivated, depends on the class that you chose to deactivate. For example, whether the class has dependent relationships or associated classes. Those automatically deactivated classes:

- Appear in light gray in the user interface and you can't reactivate them.
- Are automatically reactivated when you reactivate:
  - The class that you initially deactivated which triggered the automatic deactivation
  - Any class that the deactivated class depends on

All classes that you directly deactivate mappings for and the resulting class mappings that are automatically deactivated, are not populated when the integration runs. Also, any relationships and lookup tables associated with those classes, are not populated when the integration runs.

Class mapping and other deactivation scenarios:
• Deactivate a class which no class depends on and which has no associated classes:
  ◦ Triggers an automatic deactivation of any lookup rules and relationships associated with the deactivated class.
• Deactivate a lookup rule, such as serial number, within a class mapping:
  ◦ Does not trigger any automatic deactivations.
• Deactivate a CMDB class which is associated with a non-CMDB class:
  ◦ Triggers an automatic deactivation of the associated non-CMDB class.
  ◦ Deactivating the non-CMDB class, does not impact the associated CMDB class.
• Deactivate a class with dependent relationships (Applies only if the dependent relationship exists in IntegrationHub ETL):
  ◦ Triggers an automatic deactivation of any class that has a single dependent relationship with the deactivated class.
  ◦ If a class has multiple dependent relationships, then it is automatically deactivated only when you deactivate all of the dependent on classes.
  
  For example, a scenario in which the File System class has dependent relationships with both, the Computer and a Server class. If you deactivate the Computer class, the File System class is not automatically deactivated. Only if you also deactivate the Server class, the File System class is automatically deactivated.
• Deactivate a conditional class or a class mapping within a conditional class:
  ◦ Deactivating or activating a conditional class, triggers an automatic deactivation or activation of all conditional class mappings within the conditional class.
  ◦ Deactivating a class mapping within a conditional class: Prevents the deactivated class from getting populated during integration runs. However, the associated ‘If’, ‘Else if’, or ‘Else’ conditions themselves remain in effect within the condition of the conditional class. For example, if you deactivate the following class mapping:

  \[\text{[If]} \text{[operating\_system]} \text{[contains]} \text{[Linux]} \text{Then \[Class\]} \text{[is]} \text{[Linux Server]}\].

  Then, the Linux Server class is not populated, but the \[\text{[If]} \text{[operating\_system]} \text{[contains]} \text{[Linux]}\] condition is in effect.
Map data columns to CMDB classes and attributes

Choose target classes and attributes in the CMDB to map source data columns to. You can map a data column to a specific target class, or add conditions so that the choice of target class depends on specific data values.

Before you begin
Role required: cmdb_inst_admin

About this task
Data columns that you map can be either source data columns which were not transformed, or transformed data columns. For example, to integrate a data column into the Computer and Software Package classes, select those classes as target classes and then map data columns into specific attributes in those classes.

When you configure mapping for a class, relationship, or a lookup rule, those items are always initially set as activated. For details about the results of deactivating mappings, see Deactivating class mappings.

Procedure
1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow store.

2. In the ETL Transform Map Assistant page, in the Map Data to CMDB and Add Relationships section of the guided setup, select Select CMDB Classes to Map Source Data.
   Attributes that are configured as required in the platform, are noted, and you must map a data column to each of those attributes.

3. Click Add Class to add a target class to map to, or click Edit Class to edit a class.
   a. In the Add Class dialog box, select a CMDB Class.
   b. Click Save.
   c. Optional: Set the Activate/Deactivate Mapping toggle switch for a class, to on or off. If the Affected class mappings dialog box appears, review the list of affected classes, and then click Proceed.

4. Click Add Conditional Class to specify different conditions for selecting different target classes.
a. In the **Add Conditional Class** dialog box, specify the conditions that must be met for data to be mapped to various target classes. In the **choose field** list, select attribute conditions that data values must meet, or enter plugins in the search box and specify a plugin condition. You can then specify that the rest of the records, which did not match any conditions, are mapped to yet a different target class.

When processing nested data, a prefix denotes the first level in the nested hierarchy for attribute items.

Data records are mapped to different target classes according to the conditions met.

b. Click **Save**.

c. **Optional:** Set the Activate/Deactivate Mapping toggle switch for a conditional class, to on or off. If the Affected class mappings dialog box appears, review the list of affected classes, and then click **Proceed**.

d. **Optional:** Click **Edit Class** to edit the settings of a conditional class. In the Edit Conditional Class dialog box, set the Activate/Deactivate Mapping toggle switch for a class mapping, to on or off. Click **Save**, and if the Affected class mappings dialog box appears, review the list of affected classes and then click **Proceed**.

- A deactivated class is not populated during integration runs, however, this doesn't affect the associated condition. The 'If', 'Else if', and 'Else' conditions themselves remain in effect within the condition of the conditional class and matching CIs are filtered accordingly.

- The toggle switch of the conditional class reflects the summary of the states of all the conditional class mappings within the conditional class. If at least one of the conditional class mappings is activated, then the toggle switch of the conditional class appears as activated. Otherwise, the toggle switch of the conditional class appears as deactivated.

5. For a non-CMDB class, click **Add Associated Class** to associate the non-CMDB class with a CMDB class. Or, click **Edit Associated Class** to edit an already associated class.
a. In the Add Associated Class dialog box, select a CMDB class. The list includes all entries in the Related Entry [cmdb_related_entry] class for the specified non-CMDB table.

b. Click Add.

c. Optional: Set the Activate/Deactivate Mapping toggle switch for an associated class, to on or off.

6. Click Set Up Mapping to configure mapping for a newly added class, or click Edit Mapping to edit a mapping.

a. To map, drag data columns from the Data sidebar on the right, to CMDB target attribute on the left side of the mapping page. Or, click the icon to search and select data columns for the mapping.

When mapping nested data:

• Data columns in the Data sidebar appear in a tree format that represents the structure of the nested data. Each attribute is associated with sample data for the attribute.

• Transformed columns are noted by a cyan-shaded dot.

• All mappings to a specific CMDB class must be from the same source branch in the nested data. Only the branch from which you selected the first column to map, is valid for selecting columns in subsequent mappings. This restriction applies differently when mapping to attributes in lookup tables. All mappings to attributes in a lookup table also must be from the same source branch. However, that source branch can be different than the source branch you used with non-lookup tables.

   Note: You can work around this restriction by using the Copy transform in the data preparation step, to copy attributes from a parent level to a child level. Prepare the data so that all the attributes that you want to map, are at the same level.

• When you drag a column to map from the Data sidebar, the fields of CMDB target attributes that are valid for the mapping, are highlighted by a green frame. If you attempt to drop a column in an invalid target attribute, the respective field is highlighted by a red frame and an error appears.

b. Click Add Attribute. Then, in the Add Attribute dialog box, from the Attribute list, select one or more items as target attributes to map data to. Close the Attribute list and click Save.
c. Map any lookup rules such as the ‘Serial Number Lookup 1’ rule. Lookup rules are in a deactivated state until you map them. After mapping a field of a lookup rule, you can set the Activate/Deactivate Lookup rule toggle switch for a rule, to on or off.

d. Optional: Click View Class Details to view the current class in CI Class Manager.

e. Optional: Click the Transform Data tab to navigate to the data preparation page where you can review and further transform data that you want to map.

f. Return to the Select CMDB Classes to Map Source Data page.

7. Click Mark as Complete.

Add Relationships
Add relationships that exist among the target CMDB classes, for an integration.

Before you begin
• A class that you want to add in the relationship, must be in an activated state.
• A base relationship or a relationship within a conditional relationship, that you want to edit, must be in an activated state.
• In a conditional relationship that you want to edit, at least one relationship condition must be in an activated state. Otherwise, the Edit Relationship button is grayed out.

Role required: cmdb_inst_admin

About this task
When creating relationships with nested data, you can’t create a relationship between sibling objects from the nested data. Using the sample payload for nested data as an example, you can’t create a relationship between interfaces and software.

ITOM Visibility, if available, uses enhanced discovery patterns to identify and add CI relationships to the Suggested Relationships table in the base system. When applicable, use the Suggested Relationships table to select relationships that are in compliance with Common Service Data Model (CSDM) standards.
Procedure

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Map Data to CMDB and Add Relationships section of the guided setup, select Add Relationships.

3. To add relationships, select Add Relationship or Add Conditional Relationship if you want to specify attribute conditions that must be met before adding a relationship. Then, complete the following actions as needed.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Relationship</td>
<td>a. Select the Parent, Child, and Relationship Type values.</td>
</tr>
<tr>
<td></td>
<td>b. Click Add.</td>
</tr>
<tr>
<td>Add Conditional Relationship</td>
<td>a. In the choose field list, select attribute conditions that the data values must meet.</td>
</tr>
<tr>
<td></td>
<td>b. Select the Parent, Child, and Relationship Type values.</td>
</tr>
<tr>
<td></td>
<td>c. Click Save. To add a relationship, click Save. When processing nested data, a prefix denotes</td>
</tr>
<tr>
<td></td>
<td>the first level in the nested hierarchy for attribute items.</td>
</tr>
</tbody>
</table>

The Relationship Type list menu changes based on the selected parent and child class:

- If there is a dependent relationship, the list is disabled and the relationship type is automatically populated.
- If there is more than one dependent relationship, the list displays both containment and hosting relationship options and the containment relationship type is automatically populated.
• If there is no dependent relationship, the list displays **Suggested relationships** with the first suggested relationship automatically selected, followed by the base system relationship types.

• If there is no suggested relationship, the list displays **No suggested relationships** followed by the base system relationship types.

4. Click **Save** to save the current changes or **Mark as Complete**.
   
   A time stamp appears in the header when you click **Save**, which remains for the duration of the Integration Hub ETL session for the ETL transform map. When you re-enter the session or switch between ETL maps, the time stamp disappears.

**Preview mapping results**

Preview the results of the sample data integration.

**Before you begin**

Role required: cmdb_inst_admin

**About this task**

Run an integration test and view a summary of the results, for the sample data (by default, up to 100 records). The summary includes total numbers for relationships that were created, mapped classes, partial and incomplete payloads that IRE couldn’t process. You can also view detailed messages from RTE and IRE. After you view the details in the summary page, you can return to any step to make adjustments and then rerun the integration.

**Procedure**

1. Navigate to **Configuration > IntegrationHub ETL**, and click the **Name** of an integration.
   
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Preview Sample Integration Results and Schedule Import section of the guided setup, select **Test and Rollback Integration Results**.

3. On the Test and Rollback Integration Results page, click **Run Integration**.

4. View the summary page and click the various tabs to see the integration run results for the affected CMDB classes. You can click **i** to open CI forms and view information.
Note: The order of the attribute columns follows the default columns list for the class in the platform. First, the default columns for the class appear from left to right, followed by the rest of the attribute columns organized in alphabetical order. For example, to see the default columns list for the Computers class, navigate to Configuration > Computers.

5. Optional: Select any class tab and click Edit Mapping to return to the Select CMDB Classes to Map Source Data page where you can review and change mapping settings.

Note: Clicking Edit Mapping rolls back all the changes that were made to the CMDB as a result of this integration run.

6. Optional: Click the Relationships tab and review any relationships that were created. Click Edit Relationships to return to the Add Relationships page where you can review and change any relationship configurations.

Note: Clicking Edit Relationships rolls back all the changes that were made to the CMDB as a result of this integration run.

7. Click the Error Log and Activity Log tabs for details about the activities and any errors logged by IRE and RTE during the integration.

8. Click the Incomplete Payloads and Partial Payloads tabs for details about IRE payloads for the integration run.

9. Click Mark as Complete. The Rollback options dialog box appears and you can choose either of the following options.

• Retain Data: All the changes to the CMDB resulting from this integration, are retained.

• Perform Rollback: All the changes to the CMDB resulting from this integration, are rolled back and the CMDB is restored to its state before running the integration.

Provide integration schedule

Configure a schedule for importing data to CMDB using this ETL Transform Map.

Before you begin

Role required: cmdb_inst_admin
Procedure

1. Navigate to **Configuration > IntegrationHub ETL**, and click the **Name** of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Preview Sample Integration Results and Schedule Import section of the guided setup, select **Set Import Schedule**.

3. On the Provide Schedule page, click **Set Schedules**.

4. In the Scheduled Data Imports list view (which opens in a new tab), click **New**.

5. Fill out the Scheduled Data Import form and then click **Submit**.
   See **Schedule a data import** for details about the form fields.

6. Click **Mark as Complete**.

Transform types in IntegrationHub ETL

Use various transforms in IntegrationHub ETL to convert and prepare source data for mapping to the CMDB.

Transforms from the **Integration Commons for CMDB** store app, are also available in IntegrationHub ETL.

**Concatenation**

Combines the values from input fields into a single string, joining them on the optional **joining_string** field.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rteEb_concat_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_pb_fields</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_pb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>joining_string (optional)</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“input_1”, “input_2”, “input_3”</td>
<td></td>
</tr>
</tbody>
</table>
Example

<table>
<thead>
<tr>
<th>Additional Fields</th>
<th>joining_string = &quot;, &quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>“input_1, input_2, input_3”</td>
</tr>
</tbody>
</table>

### Convert to Boolean

Converts the incoming value to a boolean. ‘true’ and ‘1’ values convert to ‘true’ (case insensitive), and any other values convert to ‘false’.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_to_boolean_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb_to_boolean_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
</tbody>
</table>

Examples:

- All of the following inputs return ‘true’:
  - true
  - 1
- All of the following inputs return ‘false’:
  - “input_1”
  - “”
  - 0
  - 11

### Convert to Date

Attempts to convert the incoming value to a GlideDateTime value by applying the date_format to the incoming value. Attempts to directly convert using GlideDateTime if the date_format is incorrect.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_to_date_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb_to_date_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>

Details

Returns an empty value if unable to parse at all.

Additional Fields

date_format (Java simple date format)

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>2018/09/20 11:21:00 AM EST</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>date_format = “yyyy/MM/dd hh:mm:ss a z”</td>
</tr>
<tr>
<td>Result</td>
<td>“2018-09-20 16:21:00”</td>
</tr>
</tbody>
</table>

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>2018/09/20 01:21:00 PM EST</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>date_format = “yyyy/MM/dd hh:mm:ss a z”</td>
</tr>
<tr>
<td>Result</td>
<td>“2018-09-20 18:21:00”</td>
</tr>
</tbody>
</table>

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>09/20/18</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>date_format = “yyyy/MM/dd hh:mm:ss a z”</td>
</tr>
<tr>
<td>Result</td>
<td>“0018-09-20 00:00:00”</td>
</tr>
</tbody>
</table>

Convert to Numeric

Converts the incoming value to a number.

Details

Table | sys_rte_eb_to_numeric_operation |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
</tbody>
</table>

If the incoming value is non-numeric, then the output is empty.
### Example

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.23</td>
<td>1.23</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.00</td>
<td>1</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>input_1</td>
<td>null</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>two</td>
<td>null</td>
</tr>
</tbody>
</table>

#### Copy

Copies the source field’s value to all of the target fields.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb_copy_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>overwrite_existing_value (optional, boolean): If true, then the values of target fields are replaced. Otherwise, any non-empty value is not overwritten.</td>
</tr>
</tbody>
</table>

#### Extract Leading Numeric

Sets the target field to be the first numeric value found in the source field.
<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_extract_numeric_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input  fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td></td>
</tr>
</tbody>
</table>
|  | • **decimal_places** (optional, number): Forces the output to have a specified number of decimal places.  
|  | • **remainder_target_field** (optional, reference to a field): Set to the trimmed remainder of the source field, after removing the first numeric value.  

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>
| Input | “100 mb”  
| Result | “100”  

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>
| Input | “100.123 mb”  
| Result | “100.123”  

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>
| Input | “100.123 mb”  
| Additional Fields | **decimal_places** = 2  
| Result | “100.12”  

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
</table>
| Input | “100 mb”  
| Additional Fields | **decimal_places** = 2  
| Result | “100.00”

### Glide Lookup

Performs a lookup in the database on the `target_table`.  

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
</tr>
<tr>
<td><strong>Input fields</strong></td>
</tr>
<tr>
<td><strong>Output field</strong></td>
</tr>
<tr>
<td><strong>Additional Fields</strong></td>
</tr>
<tr>
<td>• <code>target_table</code></td>
</tr>
<tr>
<td>• <code>glide_matching_fields</code> (string): Comma-separated list of column names in the target table. For each input field in <code>source_sys_rte_eb_fields</code>, there must be an equal number of values in <code>glide_matching_fields</code></td>
</tr>
<tr>
<td>• <code>glide_target_fields</code> (string): Comma-separated list of column names in the target table. For each target field in <code>target_sys_rte_eb_fields</code>, there must be an equal number of values in <code>glide_target_fields</code>.</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Input Field 1: 100 South Charles Street, Baltimore</td>
</tr>
<tr>
<td>• Input Field 2: MD</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Additional Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Target Table: Location (cmn_location)</td>
</tr>
<tr>
<td>• Glide Matching Fields: street,state</td>
</tr>
<tr>
<td>• Glide Target Fields: sys_id</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Field 1: 25ab9c4d0a0a0bb300f7dabdc0ca7c1c</td>
</tr>
</tbody>
</table>
Min/Max
Sets the target field to either the maximum or minimum of the values from all input fields.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_min_max_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Input fields</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td></td>
</tr>
<tr>
<td>Additional Fields</td>
<td>data_type (choice list &lt;STRING,NUMERIC,DATE&gt;)</td>
</tr>
<tr>
<td></td>
<td>min_max (choice list &lt;MIN,MAX&gt;)</td>
</tr>
</tbody>
</table>

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;2&quot;, &quot;-1&quot;, &quot;0&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>data_type = NUMERIC</td>
</tr>
<tr>
<td></td>
<td>min_max = MAX</td>
</tr>
<tr>
<td>Result</td>
<td>&quot;2&quot;</td>
</tr>
</tbody>
</table>

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;a&quot;, &quot;b&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>data_type = STRING</td>
</tr>
<tr>
<td></td>
<td>min_max = MAX</td>
</tr>
<tr>
<td>Result</td>
<td>&quot;b&quot;</td>
</tr>
</tbody>
</table>

Example

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;2&quot;, &quot;-1&quot;, &quot;0&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>data_type = NUMERIC</td>
</tr>
<tr>
<td></td>
<td>min_max = MIN</td>
</tr>
<tr>
<td>Result</td>
<td>&quot;-1&quot;</td>
</tr>
</tbody>
</table>
### Example

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;a&quot;, &quot;b&quot;</th>
</tr>
</thead>
</table>
| Additional Fields | • data_type = STRING  
• min_max = MIN |
| Result | "a" |

### Multiple Input Script

Runs a script with multiple inputs, setting the `target_field == output` for that script.

Each source field is available inside of the ‘batch’ variable as JavaScript fields. The name of the JavaScript field is the field attribute of the entity field (looking at `sys_rteEb_field.field`, not `sys_rteEb_field.name`).

### Details

<table>
<thead>
<tr>
<th>Details</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sys_rteEb_multiIn_script_operation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rteEb_fields</code></td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rteEb_field</code></td>
</tr>
</tbody>
</table>
| Additional Fields | • script (script)  
• use_unique_input_sets (boolean): When `true`, only unique input values are included in the data batch for IRE processing. Otherwise, all input object’s field values are included. |

Example for using `use_unique_input_sets`, with a script function that takes `record_type` and `operating_system` as input and returns `record_with_os`:

### Input data

<table>
<thead>
<tr>
<th>Record</th>
<th>record_type</th>
<th>operating_system</th>
<th>record_with_os</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>computer</td>
<td>Windows XP</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>computer</td>
<td>Linux</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>computer</td>
<td>Windows XP</td>
<td></td>
</tr>
</tbody>
</table>
If `use_unique_inputs_sets` is set to `true`, then the script processes only two values (computer + Windows XP and computer + Linux). If `use_unique_inputs_sets` is set to `false`, then each of the three values is individually processed (computer + Windows XP, computer + Linux, and computer + Windows XP).

Sample script:

```javascript
(function(batch, output) {
    for (var i = 0; i < batch.length; i++) {
        // batch[i] is the unique set of inputs/individual record
        // batch[i].<field> gives access to the field value
        var in0 = gs.nil(batch[i].record_type) ? '' : batch[i].record_type;
        var in1 = gs.nil(batch[i].operating_system) ? '' : batch[i].operating_system;

        // output[i] is the output for the specific combination of inputs/individual record
        output[i] = in0 + "_" + in1;
    }
})(batch, output);
```

Sample script:

```javascript
/* Example Script
   // In this example the script input fields are 'input_field_1',
   'input_field_2' - replace these with the fields used as script inputs
   // There is a static field 'input' that has all the input field values concatenated with a '|' (function(batch, output) {

    for (var i = 0; i < batch.length; i++) {

        //step1: access the input variables
        var a = batch[i].input_field_1; //Value of the first source field.
        var b = batch[i].input_field_2; //Value of the second source field.

        //step2: Your script/code goes here.
        var c = a + b;

        //step3: set the output for each elements
        output[i] = b;
    }

})(batch, output);
*/
```
**Rexeg Replace**
Replaces each substring of the incoming string that matches the specified `match_regex`, with the specified `replacement_regex` string value.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_regex_replace_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
</tbody>
</table>
| Additional Fields| • `match_regex` (string, regular expression)  
|                  | • `replacement_regex` (string)       |

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>“String&amp;With(Special)$Characters”</td>
</tr>
</tbody>
</table>
| Additional Fields| • `match_regex` = “[^0-9a-zA-Z]+”    
|                  | • `replacement_regex` = “ “         |
| Result           | “String With Special Characters”    |

**Replace**
Replaces each substring in the incoming string that matches the specified `match_string`, with the `replacement_string` string value.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_replace_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
</tbody>
</table>
| Additional Fields| • `match_string` (string)             
|                  | • `replacement_string` (string)       |

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>“Original String”</td>
</tr>
</tbody>
</table>
**Example**

| Additional Fields | • `match_string` = "Original"
| | • `replacement_string` = "Replacement"
| Result | "Replacement String"

**Round Numeric**

Rounds the number value to the nearest whole number. Non-numbers are truncated.

**Details**

| Table | `sys_rte_eb_round_numeric_operation`
| Input fields | `source_sys_rte_eb_field`
| Output field | `target_sys_rte_eb_field`

**Example**

| Input | "1.5"
| Result | "2"

| Input | "1.4"
| Result | "1"

| Input | "i’m a string"
| Result | ""

**Script**

Runs a script with input, setting the target_field == output for that script.

This transform has been superseded by the Multi Input Script transform and is included for backwards compatibility with existing configurations.
The source field is included in the ‘batch’ variable as the JavaScript field ‘input’.

```javascript
(function(batch, output) {
    for (var i = 0; i < batch.length; i++) {
        // batch[i] is the unique set of inputs/individual record
        // batch[i].input gives access to the field value
        var in0 = gs.nil(batch[i].input) ? '' : batch[i].input;
        // output[i] is the output for the specific combination of
        inputs/individual record
        output[i] = in0 + " modified by script";
    }
})(batch, output);
```

Example:

```javascript
/* Example Script
(function(batch, output) {
    for (var i = 0; i < batch.length; i++) {
        //step1: access the input variables
        var a = batch[i].input; //Value of the source field.
        //step2: Your script/code goes here.
        var b = a + 1;
        //step3: set the output for each elements
        output[i] = b;
    }
})(batch, output);
*/
```
Set
Sets the target field’s value to the string specified in `set_value`.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_set_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td></td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>• <code>set_value</code> (string)</td>
</tr>
<tr>
<td></td>
<td>• <code>overwrite_existing_value</code> (optional, boolean): When true, the current value of the target field is overwritten. Otherwise, a non-empty value isn’t replaced.</td>
</tr>
</tbody>
</table>

Split
Splits the source field’s value on the `splitting_string` and assigns each resulting item from the split to the `target_sys_rte_eb_fields`, in order.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_split_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td></td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Additional Fields</td>
<td><code>splitting_string</code> (string)</td>
</tr>
</tbody>
</table>

Example
```
Input  | “value1 | | value2 | | value3”, with target_sys_rte_eb_fields {target1,target2,target3}
Additional Fields | splitting_string = ” | | ”
Result  | target1 : value1, target2 : value2, target3 : value3
```
Example

| Input                                           | “value1 | | value2 | | value3”, with `target_sys_rte_eb_fields` {target1} |
| Additional Fields                               | `splitting_string = " | | "` |
| Result                                         | `target1 : value1` |

Example

| Input                                           | “value1”, with `target_sys_rte_eb_fields` {target1,target2,target3} |
| Additional Fields                               | `splitting_string = " | | "` |
| Result                                         | `target1 : value1, target2 : <null>, target3 : <null>` |

**Trim**

Trims leading and trailing whitespace from the `source_sys_rte_eb_field` value and assigns the result to the `target_sys_rte_eb_field`. This transform is equivalent to a Java String.trim().

**Details**

| Table                                           | `sys_rte_eb_trim_operation` |
| Input fields                                    | `source_sys_rte_eb_field` |
| Output field                                    | `target_sys_rte_eb_field` |

Example

| Input                                           | “ value 1 " |
| Result                                         | “value 1” |

**Uppercase**

Uppercases the `source_sys_rte_eb_field` value and assigns the result to `target_sys_rte_eb_field`. 
### Uppercase Trim

Combines both the Uppercase and the Trim transforms.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>

<tr>
<td>Input</td>
</tr>
<tr>
<td>Result</td>
</tr>
</tbody>
</table>

### Duplicate an ETL transform map

Use an existing ETL transform map if you need to create a map that is mostly similar to that existing map. Select an existing map, specify a new data source for the new duplicate map, and then change or retain other settings such as data transforms.

**Before you begin**

The data source for the new duplicated ETL transform map must satisfy these requirements:
• The schema of the data source must be identical to the schema of the original ETL transform map. For example, both data sources must have an identical number of columns and identical column labels.

• The data source must preexist.

• The data source must not be used in any other ETL transform map.

Role required: cmdb_inst_admin

Procedure
1. Navigate to Configuration > IntegrationHub ETL.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. Click Duplicate and then fill out the Duplicate ETL Transform Map form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate from</td>
<td>The ETL transform map to duplicate from.</td>
</tr>
<tr>
<td>CMDB application</td>
<td>The CMDB application associated with the ETL transform map.</td>
</tr>
<tr>
<td></td>
<td>You can select Add new, which adds the CMDB Application and the Discovery Source fields for the new CMDB application.</td>
</tr>
<tr>
<td>Discovery Source</td>
<td>Discovery source associated with a new CMDB Application. Appears if you set CMDB Application to Add new.</td>
</tr>
<tr>
<td>CMDB Application Name</td>
<td>Name of a new CMDB Application. Appears if you set CMDB Application to Add new.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the ETL transform map.</td>
</tr>
<tr>
<td>Data Source</td>
<td>The source feed, unique for this ETL transform map, where the raw source data is imported from.</td>
</tr>
</tbody>
</table>

3. Click Create Duplicate.
Results
Data for the new duplicated ETL transform map is imported, and the Import Source Data and Provide Basic Details task, is set as complete.

What to do next
Continue with the next steps on the guided setup steps to review the imported data and complete the integration using the duplicated ETL transform map.

Integration Commons for CMDB (2.5.0)
The Integration Commons for CMDB store app contain a set of RTE (Robust Transform Engine) transforms and script includes. Use these transforms and script includes to standardize the values stored in the CMDB by different data integrations or by changes.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

CMDB Integrations Dashboard
The Integration Commons for CMDB store app provides a dashboard with a central view of status, processing results, and processing errors of all installed Service Graph Connectors. You can see metrics for all Service Graph Connector runs, or filter the view to a specific connector, a specific time duration, or a specific connector run.

To access the CMDB Integrations Dashboard:
1. Navigate to Self-Service > Dashboards.
2. On the Dashboards view, select CMDB Integrations Dashboard and do any of the following actions:
   - Click the CMDB Execution Status tab to see metrics such as the total number of integrations and processed rows, integration runs actively running, daily statistics, and details about the classes that were updated.
   - Click the CMDB Integration Errors tab to see metrics such as number of import and integration errors, and number of erroneous imported records.
   - Point to the score on the various tiles to drill down to the list views for the associated records. Point to charts to show more details for the chart.
   - Narrow down the scope of the integration runs included in the metrics on the dashboard by configuring filters on the right-hand side of the
dashboard. Set any of the following filters and then click **Apply**. The filter settings apply to any metric with a filter icon in its upper left corner.

### Filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Date</td>
<td>Select <strong>All</strong> or a time period, such as <strong>Last 7 days</strong>, from which to include integration runs in metrics.</td>
</tr>
<tr>
<td>CMDB Applications</td>
<td>Select <strong>All</strong>, or a CMDB application, such as <strong>SCCM</strong>, from which to include integration runs in metrics.</td>
</tr>
<tr>
<td>CMDB Import</td>
<td>Select <strong>All</strong>, or a specific integration run to include in metrics.</td>
</tr>
</tbody>
</table>

### Using the transforms and script includes in Integration Commons for CMDB

The attributes that are included in the Integration Commons for CMDB store app are attributes that Identification and Reconciliation Engine (IRE) requires for identification or attributes that could be used to derive classes.

The transforms are templated operations, meaning that there is a script that controls the logic for the transform. The result is that there can be only a single output. When a transform returns multiple values, then those values are concatenated by a triple pipe (|||). You then must use the split transform to retrieve the values that you are interested in. The inputs are either a single field or a list of fields. For all but one transform, the inputs are assumed to be a fixed list of fields as described for each of the following individual transform.

ServiceNow Service Graph Connectors that are available at the ServiceNow Store, have dependencies on the transforms and script includes in the Integration Commons for CMDB store app. Therefore, when you install such CMDB integration, the Integration Commons for CMDB store app is automatically installed too.

The following RTE transforms are included in Integration Commons for CMDB store app, and are available in the **IntegrationHub ETL (2.1.0)** store app.

### Cleanse Company

Use to cleanse hardware manufacturer name and add the record to the Company [core_company] table to populate a reference, when the manufacturer is not linked to a model or software (cpu_manufacturer).
### Details

<table>
<thead>
<tr>
<th>Table</th>
<th>sn_cmdb_int_util_cleanse_company_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input fields</strong></td>
<td></td>
</tr>
<tr>
<td>source_sys_rte_eb_field</td>
<td>Input is a company/manufacturer name.</td>
</tr>
<tr>
<td><strong>Output field</strong></td>
<td></td>
</tr>
<tr>
<td>target_sys_rte_eb_field</td>
<td>Output is the resulting sys_id and name of the company in core_company, concatenated by triple pipe (</td>
</tr>
<tr>
<td><strong>Script include function</strong></td>
<td></td>
</tr>
<tr>
<td>sn_cmdb_int_util.CmdbIntegrationHardwareModelUtil().cleanseCompany(input)</td>
<td></td>
</tr>
</tbody>
</table>

If a matching record does not exist, then a new record is created in core_company so the return always includes a sys_id and name (unless the input is empty or invalid). The name is cleansed and a fuzzy lookup is done via the CmdbIntegrationCompanyModelUtil script include before the MakeAndModelIJS platform API is called.

#### Example:

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICENOW</td>
<td>93d4ecfac0a8000b6294d71b733977fb</td>
</tr>
</tbody>
</table>

### Cleanse Hardware Model

Use to create, cleanse, or lookup a hardware model to create a reference (model_id).

<table>
<thead>
<tr>
<th>Table</th>
<th>sn_cmdb_int_util_cleanse_hardware_model_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Input fields</strong></td>
<td></td>
</tr>
<tr>
<td>source_sys_rte_eb_fields</td>
<td>Input in order is:</td>
</tr>
<tr>
<td>1. The manufacturer name</td>

Details

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Output is the resulting sys_id and name of the company in core_company, and sys_id and name of the model in cmdb_model - all concatenated by triple pipe (</td>
</tr>
</tbody>
</table>

Script include function

| sn_cmdb_int_util.CmdbIntegrationHardwareModelUtil().cleanseModelAndCompany(manufacturer_in, model_in) |

For either the manufacturer or model, if a matching record does not exist then a new record is created so the return always includes sys_ids and names for both records (unless the input is empty or invalid).

The manufacturer name is processed like the Cleanse Company transform and then both the manufacturer name and model name are sent to the MakeAndModelJS platform API.

Example:

<table>
<thead>
<tr>
<th>Manufacturer Name</th>
<th>Model Name</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow Incorporated</td>
<td>SERVICENOW</td>
<td>93d4ecfac0a8000b6294d71b733977f7</td>
</tr>
</tbody>
</table>

**Cleanse IP Address**

Use when a field provides an IP address.

Details

<table>
<thead>
<tr>
<th>Table</th>
<th>sn_cmdb_int_util_cleanse_ip_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is the IP address to cleanse.</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting IP address, which can be empty.</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationNetworkUtil().cleanseIpAddress(input)</td>
</tr>
</tbody>
</table>
The IP address is tested for both IPv4 and IPv6 structures along with some known derivations (an IPv4 with spaces instead of periods). If a result is found, then it is formatted and returned.

Examples:

<table>
<thead>
<tr>
<th>Ip</th>
<th>Ip Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.160.89.1</td>
<td>192.160.89.1</td>
</tr>
<tr>
<td>192.160.89.1,54.21.12.311</td>
<td>192.160.89.1</td>
</tr>
<tr>
<td>192 160 89 1 54 21 12 311</td>
<td>192.160.89.1</td>
</tr>
<tr>
<td>192-160-89-1</td>
<td>192.160.89.1</td>
</tr>
<tr>
<td>2001:0db8:0000:0000:0000:ff00:0042:8329</td>
<td>2001:0db8:0000:0000:0000:ff00:0042:8329</td>
</tr>
<tr>
<td>junk</td>
<td>10.124.54.89</td>
</tr>
<tr>
<td>175912537</td>
<td>10.124.54.89</td>
</tr>
<tr>
<td>-1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Cleanse IP Version

Use when the source of data does not provide an IP version or when the IP version might be unreliable.

<table>
<thead>
<tr>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sn_cmdb_int_util_cleanse_ip_version_operation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rte_eb_field</code>&lt;br&gt;Input is the IP address to cleanse.</td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rte_eb_field</code>&lt;br&gt;Output is the resulting cmdb_ci_ip_address.ip_version lookup key (either 4, 6, or empty).</td>
</tr>
<tr>
<td>Script include function</td>
<td><code>sn_cmdb_int_util.CmdbIntegrationNetworkUtil().deriveIpVersion(input)</code></td>
</tr>
</tbody>
</table>

The input IP address value is checked for either proper IPv4 or IPv6 structure, otherwise the return is empty. This function provides no IP cleansing.
Example:

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.160.89.1</td>
<td>4</td>
</tr>
</tbody>
</table>

**Cleanse MAC Address**

Use when a field provides a MAC address.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_mac_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is the MAC address to cleanse.</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting MAC address which can be empty.</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationNetworkUtil().cleanseMacAddress(input)</td>
</tr>
</tbody>
</table>

The MAC address is tested for proper structure along with some known derivations (for example, a MAC address with spaces instead of colons). If a result is found, then it is formatted and returned.

Example:

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>00 0A 95 9D 68 16</td>
<td>00:0a:95d:68:16</td>
</tr>
</tbody>
</table>

**Cleanse Operating System**

Use to extract, cleanse, and format an operating system name, when the source provides an operating system value.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_os_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is the operating system name to cleanse.</td>
</tr>
</tbody>
</table>
Details

Output field  | target_sys_rte_eb_field
---|---
Output is the resulting operating system name. The resulting operating system name is also written to the cmdb_ci_computer.os list field.

Script include function  | sn_cmdb_int_util.CmdbIntegrationOsUtil().cleanseAndInsertOs(input)

Most of the current cleansing is centered on Microsoft operating system values aside from common cleansing such as fixing casing.

Examples:

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Operating System Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 2003</td>
<td>Windows 2003</td>
</tr>
<tr>
<td>Windows Vista 64 bit Edition</td>
<td>Windows Vista</td>
</tr>
<tr>
<td>Windows XP Service Pack 2-3</td>
<td>Windows XP</td>
</tr>
<tr>
<td>Microsoft Windows 2003</td>
<td>Microsoft Windows 2003</td>
</tr>
<tr>
<td>Microsoft Windows Vista 64 bit Edition</td>
<td>Microsoft Windows Vista</td>
</tr>
<tr>
<td>Microsoft Windows 2000 Professional Service Pack 4</td>
<td>Microsoft Windows 2000 Professional</td>
</tr>
<tr>
<td>Microsoft Windows XP Service Pack 2-3</td>
<td>Microsoft Windows XP</td>
</tr>
<tr>
<td>linux ubuntu</td>
<td>Linux Ubuntu</td>
</tr>
<tr>
<td>Linux Ubuntu Server</td>
<td>Linux Ubuntu Server</td>
</tr>
</tbody>
</table>

Cleanse Serial Number

Use to cleanse and remove invalid serial numbers.
Details | sn_cmdb_int_util_cleanse_serial_number_operation
---|---
Input fields | source_sys_rte_eb_fields
Input is the serial number to cleanse.
Output field | target_sys_rte_eb_field
Output is the resulting serial number.

Examples:

<table>
<thead>
<tr>
<th>Serial Number</th>
<th>Serial Number Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>ec2aa2da-5312-aa3e-804c-c35feabeda5f</td>
<td>ec2aa2da-5312-aa3e-804c-c35feabeda5f</td>
</tr>
</tbody>
</table>

Cleanse Software Model

Use to cleanse and create a software model. Also, to create manufacturer and software model if they do not exist and follow with a split operation.

Details | sn_cmdb_int_util_cleanse_software_model_operation
---|---
Input fields | source_sys_rte_eb_fields
Input in order is:
1. The manufacturer name
2. The software name
3. The software version (not required)
If only manufacturer or name is provided, then only those values are processed and returned.
Output field | target_sys_rte_eb_field
Output is the resulting sys_id and name of the company in core_company, the cleansed software name, and the cleansed software version all concatenated by a triple pipe (|||).
If a matching manufacturer record does not exist, then a new record is created so the return always includes the sys_id and name for the manufacturer (if the manufacturer is not empty or invalid).

The manufacturer name is processed the same as in the Cleanse Company transform and then the manufacturer name is sent to the MakeAndModelJS platform API.

The software name and version are cleansed and formatted and returned. The version is removed from the software name if present.

### Examples:

<table>
<thead>
<tr>
<th>Manufacturer</th>
<th>Software Name</th>
<th>Software Version</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell Inc.</td>
<td>NoManufacturer</td>
<td></td>
<td></td>

Derive CI Class from Model

Use when processing a computer record and a model is provided but the class of the computer is ambiguous otherwise. Can be used along with other Derive CI Class transforms.

Details

<table>
<thead>
<tr>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_derive_class_from_model_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte Eb fields</td>
</tr>
<tr>
<td></td>
<td>Input in order is:</td>
</tr>
<tr>
<td></td>
<td>1. The model name</td>
</tr>
<tr>
<td></td>
<td>2. The current class name</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte Eb field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting class name.</td>
</tr>
<tr>
<td>Script include</td>
<td>function</td>
</tr>
<tr>
<td></td>
<td>sn_cmdb_int_util.CmdbIntegrationClassUtil().deriveClassNameFromModelInput(class_in)</td>
</tr>
</tbody>
</table>

Does not return a value of a class which is higher in the class hierarchy (a parent class) than the provided input class. For example, does not return cmdb_ci_computer if the input is cmdb_ci_server. Looks only at the cmdb_ci_computer hierarchy, going through cmdb_ci_server (cmdb_ci_computer, cmdb_ci_server, children of cmdb_ci_server).

Currently looks for Server, Windows Server, and Linux Server indicators in the model.
### Derive CI Class from Native Class Identifier

Use when processing a computer record and a native class indicator is provided but the class of the computer is ambiguous otherwise. Can be used along with other Derive CI Class transforms.

</tr>
<tr>
<td>Junk</td>
<td>cmdb_ci_server</td>
<td>cmdb_ci_server</td>
</tr>
</tbody>
</table>
| Details | 1. The native class identifier
2. The current class name |
| --- | --- |
| Output field | target_sys_rte_eb_field  
Output is the resulting class name. |
| Script include function | sn_cmdb_int_util.CmdIntegrationClassUtil().deriveClassNameFromNativeValue(native_id_in, class_in) |

Does not return a value of a class which is higher in the class hierarchy (a parent class) than the provided input class. For example, does not return `cmdb_ci_computer` if the input is `cmdb_ci_server`. Looks only at the `cmdb_ci_computer` hierarchy, going through `cmdb_ci_server` (`cmdb_ci_computer, cmdb_ci_server, children of cmdb_ci_server`).

Currently looks for Server, Windows Server, and Linux Server indicators in the native identifier.

| Examples: |
| --- | --- | --- |
| **Model** | **Class** | **Class Results** |
| window server | cmdb_ci_computer | cmdb_ci_win_server |
| Microsoft server | cmdb_ci_computer | cmdb_ci_win_server |
| linux server | cmdb_ci_computer | cmdb_ci_linux_server |
| Microsoft server | cmdb_ci_server | cmdb_ci_win_server |
| linux server | cmdb_ci_server | cmdb_ci_linux_server |
| Red hat server | cmdb_ci_server | cmdb_ci_linux_server |
| Arch server | cmdb_ci_server | cmdb_ci_linux_server |
| Centos server | cmdb_ci_server | cmdb_ci_linux_server |
| Debian server | cmdb_ci_server | cmdb_ci_linux_server |
| Fedora server | cmdb_ci_server | cmdb_ci_linux_server |
| Suse server | cmdb_ci_server | cmdb_ci_linux_server |
| Oracle server | cmdb_ci_server | cmdb_ci_linux_server |
| RHEL server | cmdb_ci_server | cmdb_ci_linux_server |
Examples: (continued)

<table>
<thead>
<tr>
<th>Model</th>

### Details

1. The hardware model name
2. The current virtual flag value

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output</td>
<td>is the resulting virtual flag (true/false). If the current virtual flag is ‘true’, the result is true. Otherwise the result is ‘true’ or ‘false’.</td>
</tr>
</tbody>
</table>

| Script include function | sn_cmdb_int_util.CmdbIntegrationVirtualDetectionUtil().detectVirtualFromModelName(model_in, is_virtual_in) |

Looks for indicators in the model name for a virtual device (VMware).

#### Examples:

<table>
<thead>
<tr>
<th>Model Name</th>
<th>Virtual Flag</th>
<th>Virtual Flag Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>thinkpad</td>
<td>true</td>
<td>true</td>

<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

### Derive Virtual From Native Indicator

Use when processing a computer record that may be virtual, a virtual indicator is provided by the source, and the virtual status is ambiguous. Can be used along with other Derive Virtual From transforms.

<table>
<thead>
<tr>
<th>Details</th>
<th>sn_cmdb_int_util.derive_virtual_from_native_value_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util.derive_virtual_from_native_value_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td></td>
<td>Input in order is:</td>
</tr>
</tbody>
</table>
1. The native indicator
2. The current virtual flag value

Output field: `target_sys_rte_eb_field`
Output is the resulting virtual flag (true/false). If the current virtual flag is ‘true’, the result is true. Otherwise the result is ‘true’ or ‘false’.

Script include function: `sn_cmdb_int_util.CmdIntegrationVirtualDetectionUtil().detectVirtualFromNativeIdentifier(native_in, is_virtual_in)`

Tests native indicator against a list of common values and looks for a ‘true’ boolean indicator.

<table>
<thead>
<tr>

</table>

**Derive Virtual From Serial Number**

Use when processing a computer record that may be virtual, a serial number is provided by the source, and the virtual status is ambiguous. Can be used along with other Derive Virtual From transforms.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_derive_virtual_from_serial_number_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rteEb_fields</td>
</tr>
<tr>
<td></td>
<td>Input in order is:</td>
</tr>
<tr>
<td></td>
<td>1. The serial number</td>
</tr>
<tr>
<td></td>
<td>2. The current virtual flag value</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rteEb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting virtual flag (true/false). If the current virtual flag is ‘true’, the result is true. Otherwise the result is ‘true’ or ‘false’.</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationVirtualDetectionUtil().detectVirtualFromSerialNumber(serial_in, is_virtual_in)</td>
</tr>
</tbody>
</table>

Looks for indicators in the serial number for a virtual device (VMware).
### Examples:

<table>
<thead>
<tr>
<th>Serial Number</th>
<th>Virtual Flag</th>
<th>Virtual Flag Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>123</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>123</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>vmware-123</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

### Extract and Scale by Units

Use when the source has numerical values that need to be scaled and numerical value with an input such as 2048Mb. The source does not always provide the units so it may be required to calculate or guess the units being provided. The target units depend on the target field in the CMDB. If not specified, the decimal units field is set at 2 by default.

<table>
<thead>
<tr>
<th>Details</th>
<th>sn_cmdb_int_util_extract_and_scale_by_units_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_extract_and_scale_by_units_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte Eb Fields</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte Eb Field</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationExtractScaleUtilUtil().extractAndScaleUnits</td>
</tr>
</tbody>
</table>

### Examples:

<table>
<thead>
<tr>
<th>Input Value</th>
<th>Default Unit</th>
<th>Output Unit</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2048Mb</td>
<td>Mb</td>
<td>GB</td>
<td>2GB</td>
</tr>
<tr>
<td>17179869184</td>
<td>B</td>
<td>GB</td>
<td>16GB</td>
</tr>
</tbody>
</table>
First Non Null Value

Use when you have a list of fields providing similar information that must map to a single field and you want to rank the order in which they can provide those values.

For example: Internally in SolarWinds, there is a hierarchy of tables that are join. In one example, a computer’s name could come from the child most table or any of that tables parents but each of those is a separate field in the pull. Starting with the most specific table, the values are searched for the first instance of a name value.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_first_non_null_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td></td>
<td>Input is a list of fields of any length.</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the value from the first field in the list that doesn’t have a null (or empty) value.</td>
</tr>
<tr>
<td>Script include</td>
<td>function</td>
</tr>
<tr>
<td></td>
<td>sn_cmdb_int_util.CmdbIntegrationFirstNonNullValueUtil().firstNonNullValue(batch[i])</td>
</tr>
</tbody>
</table>

Example:

<table>
<thead>
<tr>
<th>Field 1</th>
<th>Field 2</th>
<th>Field 3</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>foo</td>
<td></td>
<td></td>
<td>foo</td>
</tr>
</tbody>
</table>

Process Name, Domain, FQDN, DNS set

Use when the source provides name, domain, FQDN, or DNS information. Can be used for only a subset of these (if for example, the source only provides name and domain). In the case that a source only provides fields that are lower in the input list (FQDN) the CmdbIntegrationHardwareNameUtil script include can be called from a script operation to minimize having to create empty dummy fields.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_process_name_set_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
</tbody>
</table>
### Details

Takes up to four Input fieldss (any additional fields are ignored), in the following order:

1. Name
2. Domain
3. FQDN
4. DNS

You don’t have to provide all four input values, but you must provide those values in the specified order. If for example, you only want to cleanse domain, you must provide a name attribute, even if empty.

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output is a concatenated set of values in the same order, using a triple pipe (</td>
<td></td>
</tr>
</tbody>
</table>

### Script include function

```python
sn_cmdb_int_util.CmdbIntegrationHardwareNameUtil().processNameDomainFqdnDnsSet(name, domain, fqdn, dns)
```

FQDN and DNS are first processed to see if their formats are correct. FQDN has an additional discovery regex it must pass (via properties):

- `glide.discovery.fqdn.regex` - default: `^([^.]\.)\.([^.]\.)+$`

Possible name and domain values are extracted if possible. When name and domain are processed, if there is no FQDN, a value is generated if possible. A resulting name value is also modified using the following discovery flags:

1. `glide.discovery.hostname.case` – default: No change. Can be set to ‘Lower case’, ‘Upper case’, ‘No change’
2. `glide.discovery.hostname.include_domain` – default: false. If ‘true’ the domain is added to the final name value

### Examples:

<table>
<thead>
<tr>
<th>Name</th>
<th>Domain</th>
<th>FQDN</th>
<th>DNS</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>myName</td>
<td>other.net</td>
<td>otherName.other</td>
<td>mycomp.servicenow.com</td>
<td>myName</td>
</tr>
</tbody>
</table>
Examples: (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Domain</th>
<th>FQDN</th>
<th>DNS</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>na</td>
<td>other.net</td>
<td>otherName.other.net</td>
<td></td>
<td>mycomp.servicenow.com</td>
</tr>
<tr>
<td></td>
<td></td>
<td>servicenow.com</td>
<td></td>
<td>name.servicenow.com</td>
</tr>
<tr>
<td></td>
<td></td>
<td>name.servicenow.com</td>
<td></td>
<td>name.servicenow.com</td>
</tr>
<tr>
<td></td>
<td></td>
<td>name.servicenow.com</td>
<td></td>
<td>name.servicenow.com</td>
</tr>
<tr>
<td>name</td>
<td>servicenow.com</td>
<td></td>
<td></td>
<td>name.servicenow.com</td>
</tr>
</tbody>
</table>

**Process FQDN**

Use when the source provides a suspected FQDN value but no other naming fields such as name, domain, or DNS.

<table>
<thead>
<tr>
<th>Details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_process_fqdn_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field&lt;br&gt;Input is a single field containing an FQDN.</td>
</tr>
</tbody>
</table>
| Output field  | target_sys_rte_eb_field<br>Output is a concatenated set of values in the same order using a triple pipe (|||): {name} || {domain} || {fqdn} || {dns}
The processing follows the same logic as the ‘Process Name, Domain, FQDN, DNS set’ transform except that only FQDN is used as an input.

Example:

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycomputer.servicenow.com</td>
<td>mycomputer</td>
</tr>
</tbody>
</table>

**Scale Units**

Use when the source has numerical inputs that must be scaled. The source does not always provide the current units so it may be required to calculate or guess the units being provided. The target units depend on the field being targeted in the CMDB.

<table>
<thead>
<tr>
<th>Details</th>
<th>sn_cmdb_int_util_scale_unit_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_scale_unit_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td></td>
<td>Inputs in order are:</td>
</tr>
<tr>
<td></td>
<td>1. The input value</td>
</tr>
<tr>
<td></td>
<td>2. The current units</td>
</tr>
<tr>
<td></td>
<td>3. The target units</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the input value scaled from the current units to the target units. If no units are found for the current units, then the input value is returned. If no current or target units are found the input is returned as the output.</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util_CmdbIntegrationScaleUnitUtil().scaleUnits(input_value, input_unit, output_unit)</td>
</tr>
</tbody>
</table>
Quick start tests for Integration Commons for CMDB

Validate that integrations for CMDB pass validation still works after you make any configuration changes such as applying an upgrade or developing an application. Copy and customize these quick start tests to pass when using your instance-specific data.

⚠️ **DANGER:** By default, the system property that is used to run automated tests is disabled to prevent you from accidentally running these tests on a production system. To avoid data corruption or an outage, run tests only on development, test, and other non-production instances. See Enable or disable executing Automated Test Framework tests.

**Related information**

Quick start tests
Service Graph connector for ExtraHop (2.0.3)

Use the Service Graph connector for ExtraHop to pull data from the ExtraHop application into your ServiceNow instance.

The Service Graph connector for ExtraHop provides real-time network visibility across your enterprise by implementing stream processing, so that you can transform your network data into structured wire data.

The Service Graph connector for ExtraHop pulls network visibility data into the ServiceNow® Configuration Management Database (CMDB) application. The connector enriches discovered device data and establishes relationships between devices based on network traffic flow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

System requirements and supported versions

Dependencies and requirements:

- MID Server that is installed on Linux or Windows, unless the ExtraHop appliance is publicly accessible.
- ExtraHop Discover appliance with firmware version 7.2 or later with a user account that has unlimited privileges.

Supported versions: ExtraHop v7.9

Supported ServiceNow versions:

- Starting with Orlando Patch 7.
- Starting with Paris Patch 1.
- Starting with Quebec.

Use cases

The following are examples on how you can use the Service Graph connector:

- Identification of network interactions between CIs.
- Discovery of network traffic flow data between computers or other types of hardware.
- Creation of relationships between devices. The relationships are based on network traffic flow.
Guided setup
The guided setup for the Service Graph connector for ExtraHop provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph connector for ExtraHop.

CMDB Integrations Dashboard
The Integration Commons for the CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed Service Graph connectors. You can see metrics for all integration runs. You can also filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring ExtraHop integrations in the CMDB Integrations Dashboard, see CMDB Integrations Dashboard.

Data mappings
Data from data sources in the ExtraHop application is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete the guided setup, you can configure the integration to periodically pull data from the ExtraHop application. The data is loaded into the following staging tables:

- ExtraHop Computer [sn_extrahop_integr_computer]
- ExtraHop Network Activity [sn_extrahop_integr_activity]

The data is then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Hardware [cmdb_ci_hardware]
- IP Address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]

Configure Service Graph connector for ExtraHop
Set up a REST message and scheduled jobs to import ExtraHop data into your CMDB.

Before you begin
To use this Service Graph connector, you need a subscription to a Subscription Unit that is based in the ServiceNow® IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview,
for managed IT resources that are created or modified in the CMDB by this Service Graph connector, but that are not yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app, which is automatically installed.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- MID Server that is installed on Linux or Windows, unless the ExtraHop appliance is publicly accessible.
- ExtraHop Discover appliance with firmware version 7.2 or later, with a user account that has unlimited privileges.
- To connect to the ExtraHop application, configure an API key. For more information, see ExtraHop REST API Guide, specifically, see the "ExtraHop API requirements" section.

Roles required: admin

Procedure

1. Navigate to Service Graph Connector ExtraHop > Setup.
2. On the Getting started page, click Get Started.
3. On the Service Graph connector for the ExtraHop page, in the Configure REST message section, select the task Configure ExtraHop REST message.
4. To configure a REST message to use when sending requests to the ExtraHop API, complete the following steps:

   a. On the next page, in the Configure ExtraHop REST message task section, click Configure.

   b. On the form, fill in the fields.
### REST Message form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this REST Message. This field is automatically set.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>URL to the web service API endpoint. Set the field to a base URL. For example, <a href="https://myextrahop.com">https://myextrahop.com</a>.</td>
</tr>
<tr>
<td><strong>Note:</strong> Updating the Endpoint base URL also updates the base URLs for all HTTP methods that are associated with the ExtraHop REST message. In the HTTP Request tab, update the Authorization header to use your API key in the Value field.</td>
<td></td>
</tr>
<tr>
<td>Description</td>
<td>Description for this REST Message. This field is automatically set.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this message. The field is automatically set.</td>
</tr>
<tr>
<td>Authentication type</td>
<td>Type of authentication to apply to HTTP requests. The field is automatically set.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.</td>
</tr>
</tbody>
</table>

c. Click **Update** if necessary.

d. In the Configure ExtraHop REST message task section, click **Mark as Complete**.

5. To test the connection to the ExtraHop Computer API, complete the following steps:
a. In the Test Computer connection task section, click **Configure**.

b. On the form, fill in the fields.

### HTTP Method form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique identifier for this HTTP method. This field is automatically set.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>URL to the web service API endpoint</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>MID Server that sends this HTTP request. Using a MID Server is not compatible with mutual authentication.</td>
</tr>
<tr>
<td>REST Message</td>
<td>REST message record that this method is based on. This field is automatically set.</td>
</tr>
<tr>
<td>HTTP method</td>
<td>HTTP method that is implemented by this method. This field is automatically set.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this method. This field is automatically set.</td>
</tr>
<tr>
<td>Authentication type</td>
<td>Type of authentication to apply to HTTP requests.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.</td>
</tr>
</tbody>
</table>

c. Select the **HTTP Request** tab and fill out the **Use MID Server** field.

d. Click the **Authentication** tab and then click the **Test** related link.
   Testing the connection takes a few moments. When the test is complete, the page is refreshed and shows the test results.
e. Select **Mark as Complete**.

   **Note:** The connection is successful if the **HTTP Status** field is set to **200**. If there are any errors in the **Error Message** field, then the connection failed and further troubleshooting is required.

f. Click **Update** if necessary.

g. In the Test Computer connection task section, click **Mark as Complete**.

6. To test the connection to the ExtraHop Network Activity Create API, complete the following steps:

a. In the Test Network Activity Create connection task section, click **Configure**.

b. On the form, fill in the fields.

**HTTP Method form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique identifier for this HTTP method.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>URL to the web service API endpoint</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>MID Server that sends this HTTP request. Using a MID Server is not compatible with mutual authentication.</td>
</tr>
<tr>
<td>REST Message</td>
<td>REST message that this method is based on. This field is automatically set.</td>
</tr>
<tr>
<td>HTTP method</td>
<td>HTTP method that is implemented by this method. This field is automatically set.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this record. This field is automatically set.</td>
</tr>
<tr>
<td>Authentication type</td>
<td>Type of authentication to apply to HTTP requests. This field is automatically set.</td>
</tr>
</tbody>
</table>
Use mutual authentication | Option to use multiple authentication by authenticating HTTP requests. Mutual authentication cannot be used with a MID Server.

c. Click the **Authentication** tab and then click the **Test** related link. Testing the connection takes a few moments. When the test is complete, the page is refreshed and shows the test results.

d. **Select Mark as Complete.**

   - **Note:** The connection is successful if the **HTTP Status** field is set to **200**. If there are any errors in the **Error Message** field, then the connection failed and further troubleshooting is required.

e. **Click Update if necessary.**

f. In the Test Network Activity Create connection task section, click **Mark as Complete**.

7. **On the left sidebar, click the **Set up scheduled import jobs** button.**

8. **On the Service Graph Connector for ExtraHop page, in the Set up scheduled import jobs section, select the task **Configure Computer scheduled job**.**

   a. In the Configure Computer scheduled job task section, click **Configure**.

   b. On the form, fill in the fields.

### Scheduled Data Import form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

c. Click **Update** if necessary.

d. In the Configure Network Activity scheduled job task section, click **Mark as Complete**.

**Service Graph connector for Microsoft Intune (2.0.0)**

Use the Service Graph connector for Microsoft Intune to pull data from the Microsoft Intune application into your ServiceNow instance.

The Service Graph connector for Microsoft Intune pulls data from mobile devices and software applications into the ServiceNow® Configuration Management Database (CMDB) application. The integration provides greater visibility into mobile devices, computers and related software applications that run on them.
Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions
Supported versions: Microsoft Intune Graph API v1.0
Supported ServiceNow versions:
• Starting with Orlando Patch 7.
• Starting with Paris Patch 1.
• Starting with Quebec.

Use Cases
The following are examples on how you can use the Service Graph connector for different ServiceNow® applications:

• IT Operations Management (ITOM) Visibility
  ◦ Detailed hardware and application inventory for Android, Apple, and Windows mobile devices. The inventory can be used with or without Software Asset Management (SAM).
  ◦ Compliance tracking for mobile devices. You can build your own device (BYOD) or use corporate-owned devices.

• IT Service Management (ITSM)
  ◦ Incidents, problems, and changes on discovered configuration items (CI).
  ◦ Ownership tracking and assignment for mobile devices.

You can also do the following types of administrative actions:
• Device Management: You can locate, wipe, or retire a device. You can report on various aspects of the device.
• Integration with Azure Monitor: Delta notification.

Guided Setup
The guided setup for the Service Graph connector for Microsoft Intune provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph connector for Microsoft Intune.
CMDB Integration Dashboards

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft Intune integrations in the CMDB Integrations Dashboard, see CMDB Integrations Dashboard.

Data Mappings

Data from data sources in the Microsoft Intune application is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete the guided setup, you can configure the integration to periodically pull data from the Microsoft Intune application. The data is loaded into the following staging tables:

- SG-Intune Computer [sn_intune_integrat_computer]
- SG-Intune Devices [sn_intune_integrat_devices]
- SG-Intune Software [sn_intune_integrat_software]

The data is then inserted into the following target tables:

- Computer [cmdb_ci_computer]
- Hardware [cmdb_ci_handheld_computing]
- Network Adapter [cmdb_ci_network_adapter]
- Serial Number [cmdb_serial number]
- Software [cmdb_ci_spkg]
- Software Installation [cmdb_sam_sw_install]
- Software Instance [cmdb_software_instance]

⚠️ Note: To view any additional information about a handheld device or computer, you can add the SG-Intune Device Related and SG-Intune Computer Related related lists by configuring the Related lists view.

Configure Service Graph connector for Microsoft Intune

Set up authentication credentials and a scheduled job to import Microsoft Intune data into your CMDB.
Before you begin
To use this Service Graph connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled “Managed IT Resource Types” in ServiceNow Subscription Unit Overview, for managed IT resources that are created or modified in the CMDB by this Service Graph connector, but that are not yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Before you start the configuration, ensure that the Microsoft Intune administrator is registered with the DeviceManagementManagedDevices.Read.All. permission. For more information about how to register the Microsoft Intune application, see the How to use Azure AD to access the Intune APIs in Microsoft Graph article on the Microsoft documentation site.

Dependencies and requirements:
• The Integration Commons for CMDB store app, which is automatically installed.
• The CMDB CI Class Models store app store app, which is automatically installed.
• Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.
• ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
• ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.

Role required: admin

Procedure
1. Navigate to Service Graph Connector for Microsoft Intune > Setup.
2. On the Getting Started page, select Get started.
3. On the Service Graph connector for Microsoft Intune page, in the Configure the connection section, select the task Configure credentials.
4. To configure your credentials, complete the following steps:
   a. On the next page, in the Configure credentials task section, click Configure.
   b. On the form, fill in the fields.
### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>The client id of the OAuth app.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>The client secret of the OAuth app.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth token end-point to retrieve access and refresh tokens.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Update the <code>tenantId</code> in the URL.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the OAuth app. This field is automatically set.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>The script used to customize request and response to external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>Optional OAuth app logo URL.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>The Default Grant Type used to establish the OAuth token.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>The number of seconds a refresh token issued will be good for. This field is automatically set.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable for Public Clients to require PKCE during the authorization flow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application containing this record. This field is automatically set.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Where the OAuth is accessible from. This field is automatically set.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the OAuth app. Select this option.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code end-point.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth access token revocation end-point.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The OAuth’s app end-point to receive authorization code.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. Requires Mutual Auth Profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>OAuth Client will populate client credentials in the request per the choice selected. This field is automatically set.</td>
</tr>
<tr>
<td>Comments</td>
<td>Comments about the OAuth app.</td>
</tr>
</tbody>
</table>

c. Click **Update** if necessary,

d. In the Configure credentials task section, click **Mark as Complete**

5. In the Configure MID Server section, select **Configure** and complete the following steps:

   a. Select the **Use MID server** check box.
   
   b. Click **Update** to save the record.

   ! **Note:** You do not need to update the other fields.

6. To test the connection to the Intune API, complete the following steps:

   a. In the Test the connection section, select **Configure**.
   
   b. On the form, review the fields.

---

**Data Source form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Label of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Name of the table that will be created for this data source.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data in single column</td>
<td>Option to set to data in single column.</td>
</tr>
<tr>
<td>Type</td>
<td>Data storage type of the data to be imported.</td>
</tr>
<tr>
<td>Application</td>
<td>Application containing this record.</td>
</tr>
</tbody>
</table>

c. Click the **Test Load 20 Records** related link to start the process. Testing the connection takes a few moments, after which the page refreshes to show the test results.

**Note:** The connection is successful if the **HTTP Status** is **200**. If there is an **Error Code** and **Error Message**, the connection failed and further troubleshooting is required.

**Note:** Do not click **Load All Records** during this step.

d. In the Test the connection task section, click **Mark as Complete**.

7. On the left sidebar, click the **Set up scheduled import jobs** button.

8. On the Service Graph Connector for Microsoft Intune page, in the Set up scheduled import jobs section, select the task **Configure the scheduled job**.

a. In the Configure the scheduled import jobs task section, click **Configure**.

b. On the form, fill in the fields.

### Scheduled Data Import form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the scheduled job.</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source record that defines the data to import.</td>
</tr>
<tr>
<td>Run as</td>
<td>Option to run the scheduled job with the credentials of the specified user.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the scheduled job. Select this option.</td>
</tr>
<tr>
<td>Concurrent Import</td>
<td>Function that loads the data from multiple import sets. The function</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>then processes and transforms the data concurrently.</td>
<td></td>
</tr>
<tr>
<td>Partition Method</td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Option to specify a script to run before the import is performed.</td>
</tr>
<tr>
<td>Execute post-import script</td>
<td>Option to specify a script to run after the import is performed.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this scheduled job.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency of running the import.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>

c. Click **Execute Now**.

d. In the Configure the scheduled job task section, click **Mark as Complete**.

**Service Graph connector for Jamf (2.5.0)**

Use the Service Graph connector for Jamf to pull data from Jamf into your ServiceNow instance.

The Service Graph connector for Jamf pulls data from computers, disks, networks, and software into the ServiceNow® Configuration Management Database (CMDB) application.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**Supported versions**

Supported versions: Jamf API v2.1.0 and Jamf Pro API 10.28.0

Supported ServiceNow versions:
Starting with Orlando Patch 7.
Starting with Paris Patch 1.
Starting with Quebec.

**Use Cases**
The following are examples on how you can use the Service Graph connector for different ServiceNow® applications:

- **IT Operations Management (ITOM) Visibility**
  - Detailed hardware and software inventory tracking for Mac hardware and apps. The tracking can be done with or without Software Asset Management (SAM).
  - Detailed hardware and software inventory tracking for hardware and apps for both iPhones and iPads. The tracking can be done with or without Software Asset Management (SAM).
  - Compliance tracking for mobile devices and end-user computers.
  - Duplicate data detection on imports to improve performance of nightly imports.

- **Software Asset Management (SAM) and IT Asset Management (ITAM)**
  - Software package and installation tracking.
  - License reclamation by detecting removed software.
  - Software Usage tracking.

- **IT Service Management (ITSM)**
  - Incidents, problems, and changes on discovered configuration items (CI).
  - Automatic ownership assignment based on top users.

**Guided Setup**
The guided setup for the Service Graph connector for Jamf provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see [Configure Service Graph connector for Jamf](#).

**CMDB Integrations Dashboard**
The Integration Commons for the CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Jamf integrations in the CMDB Integrations Dashboard, see [CMDB Integrations Dashboard](#).
Data mapping

Data from the Jamf data source is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete the guided setup, you can configure the integration to periodically pull data from Jamf. The data is loaded into the following tables:

- Jamf Computer [sn_jamf_integrate_jamf_computers] staging table
- Jamf mobile devices [sn_jamf_integrate_jamf_mobile] table

The data is then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Computer [cmdb_ci_computer]
- Disk [cmdb_ci_disk]
- Handheld Computing device [cmdb_ci_handheld_computing]
- IP Address [cmdb_ci_ip_address]
- Network Adapter [cmdb_ci_network_adapter]
- Printer [cmdb_ci_printer]
- Serial Number [cmdb_serial_number]
- Software [cmdb_ci_spkg]
- Software Installation [cmdb_sam_sw_install]
- Software Instance [cmdb_software_instance]
- Software Usage [samp_sw_usage]

Configure Service Graph connector for Jamf

Set up authentication credentials and scheduled jobs to import Jamf data into your CMDB.

Before you begin

To use this Service Graph connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview, for managed IT resources that are created or modified in the CMDB by this Service Graph connector, but that are not yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that
application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app store app, which is automatically installed.
- ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- Jamf Classic API version 10.x.
- To access Jamf data: API user with read-only access to Jamf database.

Roles required: admin

Procedure

1. Navigate to Service Graph Connector for Jamf > Setup.
2. On the Getting Started page, select Get started.
3. (Optional) On the Service Graph Connector for Jamf page, in the Configure the connection section, select the task Enable Jamf proAPI property.
4. To enable the use of Jamf proAPI property, set the proAPI property to true for the computer data source, and complete the following steps:
   a. In the Enable Jamf proAPI property task section, click Configure.
   b. Set the Value field to true.
   c. Click Update.

   Note: When you configure the Jamf HTTP connection, ensure that the Base Path field is empty so that you can set up the endpoint URL for the Jamf proAPI property.
5. In the Configure the connection section, select the task Configure Jamf authentication credentials.
6. To configure your Jamf authentication credentials, complete the following steps:
a. On the next page, in the Configure Jamf authentication credentials task section, click **Configure**.

b. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of this authentication configuration.</td>
</tr>
<tr>
<td>User name</td>
<td>User name that is used to authenticate the HTTP request when this Basic authentication profile is enabled.</td>
</tr>
<tr>
<td>Password</td>
<td>Password that is used to authenticate the HTTP request when this Basic authentication profile is enabled.</td>
</tr>
</tbody>
</table>

> **Note:** The Jamf user must have a role with read privileges for Computers so that the integration can pull computer data.

> **Note:** The Jamf user must have a role with read privileges for Mobile Devices so that the integration can pull mobile device data.

c. Click **Update** if necessary.

d. In the Configure Jamf authentication credentials, click **Mark as Complete**.

7. In the Configure Jamf HTTP Connection task section, click **Configure** and complete the following steps:

a. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to select a MID Server that sends this HTTP connection. Using a MID Server is not compatible with mutual authentication.</td>
</tr>
</tbody>
</table>
| Host                     | Target host value used by the connection. The Connection URL will automatically fill in the hostname.  

⚠️ **Note:** Update the Host field with a Jamf base URL or IP address. For example, demojamfhost.com or 127.0.0.1. |
| Credential               | Credential value used by this connection. |
| Connection alias         | Connection value that is used to refer to the connection. |
| URL builder              | URL builder that is used to build the connection URL. |
| Connection URL           | Connection URL for the connection. You can either manually enter a URL or use the URL builder to build the connection string. |
| Mutual authentication    | Option to set the connection with mutual authentication. |
| Protocol                 | Underlying protocol used by the connection.  

⚠️ **Note:** Update the Protocol field if you are using anything other than https. |
| Active                   | Option to activate the HTTP connection. |
| Domain                   | Domain that contains the connection. |
| Override default port    | Target value port that is used by the connection. |
**Field** | **Description**  
---|---  
Base path | Base path for HTTP(s) connection.  

> **Note:** You do not need to update this field. This field is automatically set to `/JSSResource`. If you are upgrading the Service Graph connector for Jamf and want to use the Jamf proAPI property, you must clear this field.

**b.** Click **Update** if necessary.

**c.** In the Configure Jamf HTTP Connection task section, click **Mark as Complete**.

**8.** To test the connection to the Jamf API, complete the following steps:

**a.** In the Test the connection task section, click **Configure**.

**b.** Review the fields on the form.

---

**Data Source form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Label of the import set table that this data source will produce.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Name of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Type</td>
<td>Data storage type of the data to be imported.</td>
</tr>
<tr>
<td>Data in single column</td>
<td>Option to set to data in single column.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this record.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Data Loader | Script that loads data in the import set table.

c. Click the **Test Load 20 Records** related link to test the connection. Testing the connection takes a few moments, after which the page refreshes to show the test results.

**Note:** The connection is successful if the **HTTP Status** is **200**. If there is anything displayed in the **Error Code** and **Error Message** fields, then the connection failed and further troubleshooting is required.

**Note:** Do not click **Load All Records** during this setup.

d. In the Test the connection task section, click **Mark as Complete**.

9. On the left sidebar, click the **Duplicate detection rules** button.

10. On the Service Graph Connector for Jamf page, in the Duplicate detection rules section, select the task **Configure duplicate detection rules**.

   a. In the Configure duplicate detection rules section, click **Configure**.

   b. On the CMDB Duplicate Row Rules form, update the **Active** column value to **true** to activate the duplicate detection rule.

   c. When you're finished, in the Help side bar, select **Mark as Complete**.

11. On the left side bar, click the **Set up scheduled import jobs** button.

12. On the Service Graph Connector for Jamf page, in the Set up scheduled import jobs section, select the task **Configure the scheduled job**.

   a. In the Configure the scheduled job task section, click **Configure**.

   b. Select the name of the scheduled job that you want to activate.

   c. Review the pre-populated fields on the Scheduled Data Import form.

   **Note:** By default, the **SG-Jamf Mobile Devices** scheduled job is automatically set as **Active** and runs SG-Jamf Computer as a parent.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Source</td>
<td>Data source record that defines the data to import.</td>
</tr>
<tr>
<td>Run as</td>
<td>Option to run the scheduled job with the credentials of the specified user.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the scheduled job. Select this option.</td>
</tr>
<tr>
<td>Concurrent Import</td>
<td>Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.</td>
</tr>
<tr>
<td>Partition Method</td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Option to specify a script to run before the import is performed.</td>
</tr>
<tr>
<td>Pre-script</td>
<td>Optional processing before import.</td>
</tr>
</tbody>
</table>

**Note:** For the SG-Jamf Remove Software scheduled job, you can import information about deleted software instances or software installs onto your ServiceNow instance. To run the import from the beginning, set the code as:

```javascript
var resetLastRunDateTime = true;
```

<table>
<thead>
<tr>
<th>Execute post-import script</th>
<th>Option to specify a script to run after the import is performed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application that contains this scheduled job.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency of running the import.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>
d. Click **Execute Now** and repeat the previous steps for the other imports if needed.

e. In the Configure the scheduled job task section, click **Mark as Complete**.

Create multi-instance support for Jamf

If you need to connect multiple instances for Jamf, you can create connection aliases, HTTP connections, and scheduled data imports to pull in data from multiple data servers.

**Before you begin**

Confirm you are in the Service Graph connector for Jamf application scope.

Role required: admin

**Procedure**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. On the Connection & Credentials Aliases list, select **Jamf_CMDB_Connection**, then the **Child Aliases** tab and **New**, to create a new child alias.
3. On the Connection & Credential Aliases form, enter a name for the alias and click **Submit**.
4. Click the **Connections** tab and select **New**, to create a new connection.
5. On the HTTP(s) Connection form, complete the following steps:

   a. Review the HTTP(s) Connection form and fill in fields as needed.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential used by this connection.</td>
</tr>
</tbody>
</table>

**Note:** Create a new Basic Auth credential by selecting **Get** > **New** > **Basic Auth Credentials**. When you create a new Basic Auth credential, enter a new Jamf user name and password.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL builder</td>
<td>Check box to build a URL. The connection URL will be automatically generated based on the Host and Base path.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Update the <strong>Host</strong> field with a Jamf host name or IP address and the <strong>Base path</strong> field with <code>/JSSResource</code>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>(Optional) For more information on how to configure a MID Server, see the Configuring a MID Server for the Service Graph Connector for Jamf [KB0853427] KB article on the HI Knowledge Base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you create more than one instance, it will only use one MID Server.</td>
</tr>
</tbody>
</table>

The URL builder builds a URL in the Connection URL which is based on values in the Host and Base path fields.

---

**Fields that are automatically set on the HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to activate the HTTP connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Connection value with which the connection can be referred to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Use to enter connection URL for the new connection.</td>
</tr>
</tbody>
</table>

b. **Click Submit.**

6. Select the alias you created and right-click the form context menu icon ☰️, then select **Copy sys_id**.

⚠️ **Note:** You will need the system ID for an upcoming step.

7. Navigate to **Service Graph Connector for Jamf > Import Schedules**.
8. Select **New** to create a new import schedule for the new instance.
9. On the Scheduled Data Import form, complete the following steps:

a. **Fill out the Scheduled Data Import form.**

<table>
<thead>
<tr>
<th>Scheduled Data Import</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of the scheduled data import.</td>
</tr>
<tr>
<td><strong>Data Source</strong></td>
<td>Data source record that defines the data to import. By default, select <strong>SG-Jamf Computer</strong>.</td>
</tr>
<tr>
<td><strong>Run as</strong></td>
<td>Name of a user whose credentials the import job uses. By default, select <strong>System Administrator</strong>.</td>
</tr>
<tr>
<td><strong>Concurrent Import</strong></td>
<td>Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.</td>
</tr>
<tr>
<td><strong>Partition Method</strong></td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td><strong>Partition Size</strong></td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td><strong>Execute pre-import script</strong></td>
<td>Option to specify script to run before the import is performed.</td>
</tr>
<tr>
<td><strong>Run</strong></td>
<td>Frequency at which you want to run the import.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>

b. Select the Concurrent Import box to set the Partition Method to **Custom size** and Partition Size to **15,000**.

c. Select the Execute pre-import script box, then paste the sys_id of the new Connection Alias you copied from Step 6 into the following script:

```javascript
var devConnectionAliasSysId = "your_sys_id";

gs.getSession().putClientData("jamf_connection_alias_sys_id", devConnectionAliasSysId);
```

d. In the Run field, select **After Parent Runs** to run the scheduled data imports sequentially then select the parent in the **Parent** field.

**Note:** These scheduled imports shouldn’t run simultaneously since they share the same data source.

e. Click **Submit**.

**What to do next**
Repeat the steps for each additional Jamf instance, as needed.

**Service Graph connector for Microsoft SCCM (2.4.1)**

Use the Service Graph connector for Microsoft System Center Configuration Manager (SCCM) to pull data from SCCM into your ServiceNow instance.

The Service Graph connector for Microsoft SCCM imports SCCM data into the ServiceNow® Configuration Management Database (CMDB) application. The integration does not write to the SCCM database. The integration pulls data from computers, processors, operating systems, disks, networks, and software.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions

Supported ServiceNow versions:

• Starting with Orlando Patch 7.
• Starting with Paris Patch 1.
• Starting with Quebec.

Use Cases

The following are examples on how you can use the Service Graph connector for different ServiceNow applications:

• IT Operations Management (ITOM) Visibility

  ◦ Ability to get visibility into your infrastructure.
  ◦ Detailed hardware and software inventory tracking. The tracking can be done with or without Software Asset Management (SAM).
  ◦ Ability to detect delta changes for efficient incremental imports from SCCM to NOW.

• IT Service Management (ITSM)

  ◦ Incidents, problems, and changes on discovered configuration items (CI).
  ◦ Automatic device ownership assignment.

• Software Asset Management (SAM) and IT Asset Management (ITAM)

  ◦ Tight integration with Software Asset Management Professional and client software distribution workflows.
  ◦ Inventory Software package and installation tracking.
  ◦ Software Usage tracking.
  ◦ License reclamation by detecting removed software.
  ◦ Support for software editions, normalizing publisher information, and normalizing product Information.
  ◦ Support for SCCM Asset Intelligence.
Guided Setup
The guided setup for the Service Graph connector for Microsoft SCCM provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph connector for Microsoft SCCM.

Note: When you install and configure the Service Graph connector for Microsoft SCCM, only active SG-SCCM data sources will be configured with credentials/MID configuration during the guided setup. If a Software Asset Management plugin is enabled after the connector has been installed, any additional SAM-related data sources will not be configured with credentials and will not function correctly. In this scenario, you must go back into guided setup for SG-SCCM and re-enter the credentials and MID configuration, in order for these new SAM-related data sources to function correctly.

CMDB Integrations Dashboard
The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Microsoft SCCM integrations in the CMDB Integrations Dashboard, see CMDB Integrations Dashboard.

Data mapping
Data from the SCCM data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE). The SCCM data sources include the following:

• SG-SCCM Computer Identity
• SG-SCCM Disk
• SG-SCCM Last Discovered Update, this data source will run at the end of the import schedules to update the last_discovered date on the Computer CI. This will conduct a full pull of all the computers and brings in only the ResourceID and the LastHWScan columns to update the CMDB Computer table.
• SG-SCCM Network
• SG-SCCM Operating System
• SG-SCCM Processor
• SG-SCCM Removed Software, ensure the Use last run datetime option is cleared for every run.
• SG-SCCM Removed Software AI, ensure the **Use last run datetime** option is cleared for every run.

• SG-SCCM Software

• SG-SCCM Software AI

**Note:** If you have Asset Intelligence on your instance, you have to run SG-SCCM Removed Software AI and SG-SCCM Software AI. If you do not have Asset Intelligence on your instance, you have to run SG-SCCM Removed Software and SG-SCCM Software.

When you complete the guided setup, you can configure the integration to periodically pull data from SCCM. The data is loaded into staging tables and then inserted into the following target tables:

- CI Relationship [cmdb_rel_ci]
- Computer [cmdb_ci_computer] (required)
- Disk [cmdb_ci_disk]
- Network Adapter [cmdb_ci_network_adapter]
- Serial Number [cmdb_serial_number]
- Software [cmdb_ci_spkg]
- Software Installation [cmdb_sam_sw_install]
- Software Instance [cmdboftware_instance]
- Software Usage [samp_sw_usage]

**Note:** By default, network adapters that are missing an IP address or MAC address are not imported. To include these network adapters in the import, do the following:

1. Navigate to **Service Graph Connector for Microsoft SCCM > Data Sources**.
2. Select **SG-SCCM Network**.
3. Remove the where clause from the **SQL statement** field.

**Configure Service Graph connector for Microsoft SCCM**

Set up and validate data source connection credentials to import Microsoft SCCM data into your CMDB.
Before you begin

**Important:** If you are currently using the SCCM plugin, please refer to the following topic, Update from the Microsoft SCCM 2016 plugin to the Service Graph connector for Microsoft SCCM.

**Note:** If you have the Service Graph connector for Microsoft SCCM version 2.1.6 or lower installed in your production environment, you will need to contact Customer Service and Support for additional steps to remove the ITOM Licensing dependency. The dependency is removed for Service Graph connector for Microsoft SCCM version 2.3.1 and greater.

Confirm that you are in the SCCM application scope instead of a global scope so that you are able to save your information.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app store app, which is automatically installed.
- Integration - JDBC (com.snc.integration.jdbc)
- Windows MID Server required for access to SCCM environment.

To access SCCM data, you must have appropriate access to the SCCM database. You must have sufficient credentials to query the SQL Server that contains the SCCM database. You must do the following:

1. Create a SQL Server account in order to connect to the SCCM database on the MID Server to use the data sources.

2. Connect to your SCCM SQL Server and configure the following:
   - Create a new login user name and password for SQL authentication.
   - Choose the SCCM database that ServiceNow data sources will connect to.
   - Assign the 'db_datareader' role membership to the new user.

Role required: admin

Procedure

1. Navigate to **Service Graph Connector for Microsoft SCCM > Setup**.
2. On the Getting Started page, select **Get Started**.
3. On the Service Graph Connector for Microsoft SCCM page, in the Configure the connection section, select the task **Configure SCCM JDBC Connection**.
4. To enter your configuration details to your Microsoft SCCM data sources, complete the following steps:

a. On the next page, in the Configure SCCM JDBC Connection task section, click **Configure**.

b. On the form, fill in the fields.

### Microsoft SCCM data source configuration form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database name</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>User name</td>
<td>User name for connecting to the database.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for connecting to the database.</td>
</tr>
<tr>
<td>Server</td>
<td>Server name or IP address for the database server.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>MID Server that has access to SCCM environment to access the JDBC server. If you need an integrated authentication, then select the <strong>User Integrated Authentication</strong> check box.</td>
</tr>
<tr>
<td>Instance name</td>
<td>Name of the database instance. If you’re using a default name, then this field should be left empty.</td>
</tr>
<tr>
<td>Database port</td>
<td>Port of the database server. Enter 1433 as a default port.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Number of seconds before the MID server connection cache pool closes the connection and removes it. Zero means no timeout.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Number of seconds the JDBC driver waits for a query to complete. Zero means no timeout. If the timeout runs out, the integration considers</td>
</tr>
</tbody>
</table>
c. Click **Save**.

d. In the Configure SCCM JBDC Configuration task section, click **Mark as Complete**.

5. In the Validate data sources task section, click **Configure** and complete the following steps:

a. Review the fields on the Data Source form, which are automatically set. There is no need to update any values on this page. The data source is pre-configured to use the SCCM JDBC Connection that you set up in the previous step.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Label of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Name of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Type</td>
<td>Data storage type of the data to be imported.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>MID server to use to access the JDBC server.</td>
</tr>
<tr>
<td>Format</td>
<td>Format of the data file.</td>
</tr>
<tr>
<td>Instance name</td>
<td>Named instance for SQLServer.</td>
</tr>
<tr>
<td>Database name</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Database port</td>
<td>Port of the database.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this record.</td>
</tr>
<tr>
<td>Use integrated authentication</td>
<td>Windows JDBC integrated authentication.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User name</td>
<td>User name for connecting to the JDBC server.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the JDBC server.</td>
</tr>
<tr>
<td>Server</td>
<td>Server name for the JDBC connection.</td>
</tr>
<tr>
<td>Query</td>
<td>Query type. Query all data from a table or run a specific SQL statement.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Number of seconds the JDBC driver will wait for a query to complete. Zero means no timeout. If timeout is exceeded, the integration considers the JDBC result inaccessible and places it in an Error state.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Number of seconds before the MID server connection cache pool closes the connection and removes it. Zero means no timeout.</td>
</tr>
<tr>
<td>SQL statement</td>
<td>SQL statement to extract the desired data from the database.</td>
</tr>
<tr>
<td>Use last run datetime</td>
<td>Option to control the amount of data that is retrieved from a database during an import run. If unselected, then all rows in the table specified are imported, every time. You might want to use this setting if this is a one-time import, or if all the data in the target table is new. If selected, two additional fields appear, enabling you to select a <code>datetime</code> value to limit imported data to delta values only.</td>
</tr>
</tbody>
</table>

b. To validate your data sources, click the **Test Load 20 Records** related link.

**Note:** If the displayed completion code is **Success**, mark this step as complete. If the displayed completion code is **Error**, there is an error in the SCCM JDBC Connection that you must fix.
c. In the Help sidebar, click **Back to Guided Setup**.

d. In the Validate data sources task section, click **Mark as Complete**.

6. In the Reset 'Last run datetime' in test load source task section, click **Configure** and complete the following steps:

   a. Select the **Last run datetime** field and delete the value.

   b. Click **Update** to save the change and return to the Configure the connection page.

7. On the left side bar, click the **Set up scheduled import jobs** button.

8. On the Service Graph Connector for Microsoft SCCM page, in the Set up scheduled import jobs section, select the task **Configure scheduled jobs**.

   a. In the Configure scheduled jobs task section, click **Configure**.

   b. On the form, fill in the fields.

   **Scheduled Data Import form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the scheduled job.</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source record that defines the data to import.</td>
</tr>
<tr>
<td>Run as</td>
<td>Option to run the scheduled job with the credentials of the specified user.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the scheduled job. Select this option.</td>
</tr>
<tr>
<td>Concurrent Import</td>
<td>Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.</td>
</tr>
<tr>
<td>Partition Method</td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Option to specify a script to run before the import is performed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Execute post-import script</td>
<td>Option to specify a script to run after the import is performed.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this scheduled job.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency of running the import.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>

c. Click **Execute Now**.

d. In the Configure scheduled jobs task section, click **Mark as Complete**.

**Update from the Microsoft SCCM 2016 plugin to the Service Graph connector for Microsoft SCCM**

Deactivate the scheduled imports and pull records to update from the Microsoft SCCM 2016 plugin to the Service Graph connector for Microsoft SCCM.

**Before you begin**

If you are upgrading to the Service Graph connector for Microsoft SCCM, the following steps are mandatory. The steps must be executed in any instance with an existing install of the Microsoft SCCM 2016 plugin or with an earlier version of the plugin.

**Note:** The Service Graph connector for Microsoft SCCM is an independent implementation that does not reuse any components from the Microsoft SCCM 2016 plugin.

**About this task**

The Service Graph connector for Microsoft SCCM is a successor to the Microsoft SCCM 2016 plugin. If you already have the Microsoft SCCM 2016 plugin or an earlier version installed in your instance, you must follow these steps to enable the successful transition from using the SCCM plugin to using the Service Graph connector. If you brought in data into the Software Package and Software Instance table from other sources, other than SCCM, you have to delete or clean up the software that was brought in only by SCCM and not from any other discovery source. Also, you can run a SG-SCCM cleanup to delete the Network Adapters and Disks created from the older SCCM plugin to make the migration faster.
When the Service Graph connector for Microsoft SCCM is installed in an instance, you must no longer run any components from the Microsoft SCCM 2016 plugin, including Data Sources and Scheduled Data Imports. The SCCM 2016 plugin Scheduled Data Imports must be disabled. The Service Graph connector for Microsoft SCCM installs a new set of SG-SCCM Data Sources and Scheduled Data Imports.

⚠️ **Warning:** This upgrade process should be performed and validated in a non-production or test instance that is based on a recent clone of the customer production instance. Failure to first validate upgrade in a non-production instance may result in unexpected outcomes and possible data loss or corruption.

Any customizations to the SCCM 2016 plugin will not automatically migrate and would have to be reimplemented in the Service Graph connector for Microsoft SCCM, such as by using IntegrationHub-ETL.

**Procedure**

1. Deactivate the scheduled imports from the older SCCM plugin.
   For more information on how to deactivate scheduled imports, see .

2. To delete duplicate OS software records in the older SCCM plugin, complete the following steps:
   
   ✋ **Note:** There is no cleanup required for Computer OS Software records if SAM is enabled.

   a. Navigate to the Software Package or Software Instance table in the older SCCM plugin.

   b. Search for the duplicate OS records, you want to delete. Additionally, you can tell which records are the SG-SCCM software OS records if the version number is included in the Name or Product Name. Complete the following steps to delete the duplicate software OS records on each software table:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Software Package table</td>
<td>a. On the Software Package table, select the duplicate OS record that does not have <strong>SG-SCCM</strong> in the <strong>Discovery Source</strong> column.</td>
</tr>
<tr>
<td></td>
<td>b. Delete the duplicate OS record and repeat with other records as needed.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Software Instance table</strong></td>
<td></td>
</tr>
</tbody>
</table>
  a. On the Software Instance table, select the duplicate OS record that has the **SCCM group ID** column empty.  
  b. Delete the duplicate OS record and repeat with other records as needed. |

3. After you are finished deactivating the scheduled imports and deleting the duplicate OS records from the older SCCM plugin, configure the connector. For instructions, see Configure the Service Graph connector for Microsoft SCCM.

4. If you need to run the SG-SCCM cleanup utility to delete the SCCM Network Adapters and Disks created from the older plugin, complete the following steps:

   a. Confirm that you are in the Service Graph connector for Microsoft SCCM application scope.

   b. Navigate to **Scheduled Job > SG-SCCM CleanupUtil**.

   c. Select the **SG-SCCM CleanupUtil** scheduled job, and then switch to the global application scope.

   d. To make a copy of the scheduled job, right-click the header of the scheduled job and select **Insert and Stay**.

   e. Change the name to **SG-SCCM CleanupUtil Global**.

   f. Click **Update**.

   g. When you need to run the scheduled job, click **Execute Now**.

   h. **Optional:** To check the progress of the run, do the following:
      
      i. Navigate to **System Log > All**.

      ii. Under the **Message** search box, type in **SG-SCCM CleanupUtil** to filter the records for the script run.
The script will have a log message for each batch so that you know the status of the current run and its progress.

ℹ️ Note: The duration of the run depends on the amount of Network Adapter and Disk data in the CMDB from the previous SCCM integration. The data must meet the condition for the cleanup.

What to do next
When you execute the Service Graph connector components, your existing CMDB data created by the SCCM 2016 plugin becomes managed and maintained by Service Graph connector for Microsoft SCCM.

Enable Software Editions in Service Graph connector for Microsoft SCCM
Enable software editions so that you can gather edition information for products such as Adobe Acrobat, Microsoft SQL Server, and Windows Exchange Server into the Service Graph connector for Microsoft SCCM.

Before you begin
ℹ️ Note: There are two types of setup that are required, one on the SCCM Manager and the other on the ServiceNow Instance. For more information on how to set up the SCCM Manager, see the SCCM Manager Setup section of the Custom solution to gather editions in SCCM [KB0721360] article on the HI Knowledge Base. When you’re finished setting up the SCCM Manager, refer back to this task and complete the steps.

Role required: admin

About this task
You can set up the ServiceNow Instance on the Service Graph connector for Microsoft SCCM.

Procedure
1. Navigate to Service Graph Connector Microsoft SCCM > Import Schedules.
2. Select the SG-SCCM Software Edition scheduled import to edit this import record.
3. Select the Active check box.
4. Click Update.
5. Navigate to Service Graph Connector Microsoft SCCM > Data Sources.
8. Edit the data source and select the Active check box.

9. Click Update.

What to do next
You can verify that the edition information has been gathered by doing the following:

1. Navigate to Service Graph Connector Microsoft SCCM > Data Sources > SG-SCCM Software Edition.

2. Select Load All Records.

Note: If the displayed completion code is Success, then the software edition data source was executed successfully. If the displayed completion code is Error, then there is an error that must be fixed.

Service Graph connector for SolarWinds (2.2.1)
Use the Service Graph connector for SolarWinds to pull in data from the SolarWinds software into your ServiceNow instance.

Important:
SolarWinds has publicly disclosed vulnerabilities specific to its SolarWinds Orion Platform software. ServiceNow does not use the SolarWinds Orion Platform software in its cloud.

Work with your internal Security team to verify whether you are affected by reviewing the SolarWinds Security Advisory.

The Service Graph connector for SolarWinds pulls in asset inventory data (hardware and software) from the SolarWinds database into the ServiceNow® Configuration Management Database (CMDB) application.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Supported versions
Supported versions: SolarWinds Orion 2019.4 HF6 or 2020.2.1. HF2
Supported ServiceNow versions:
• Starting with Orlando Patch 7.
• Starting with Paris Patch 1.
• Starting with Quebec.

Use cases
The following are examples on how you can use the Service Graph connector:
• Automatic normalization of asset information for hardware, virtualization and cloud resources, and software.
• Ability to configure and save synchronization schedules.

Guided setup
The guided setup for the Service Graph connector for SolarWinds provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph connector for SolarWinds.

CMDB Integrations Dashboard
The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed Service Graph connectors. You can see metrics for all integration runs. You can filter the view to a specific integration, a specific time duration, or a specific integration run. For more details about monitoring SolarWinds integrations in the CMDB Integrations Dashboard, see CMDB Integrations Dashboard.

Data mappings
Data from data sources in the SolarWinds software is mapped and transformed into ServiceNow CMDB tables using the Robust Transform Engine (RTE). Data is inserted into ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete the guided setup, you can configure the integration to periodically pull data from the SolarWinds software. The data is loaded into staging tables and then inserted into the following CMDB target tables:
• AIX Server [cmdb_ci_aix_server]
• Availability Zone [cmdb_ci_availability_zone]
• CI Relationship [cmdb_rel_ci]
• Cloud Network [cmdb_ci_network]
• Cloud Service Account [cmdb_ci_cloud_service_account]
• Cloud Subnet [cmdb_ci_cloud_subnet]
Configure Service Graph connector for SolarWinds

Set up authentication credentials and scheduled jobs to import SolarWinds data into your CMDB.

Before you begin
To use this Service Graph connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed
IT Resource Types in ServiceNow Subscription Unit Overview, for managed IT resources that are created or modified in the CMDB by this Service Graph connector, but that are not yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Before you start the configuration, navigate to System Definition > Business Rules and deactivate the ValidateServiceAccountID business rule.

Dependencies and requirements:

- The Integration Commons for CMDB store app, which is automatically installed.
- The CMDB CI Class Models store app store app, which is automatically installed.
- Discovery Core plugin (com.snc.discovery.core), which is automatically installed by Discovery.
- ITOM Discovery License plugin (com.snc.itom.discovery.license). You must activate this plugin.
- ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
- SolarWinds Orion Platform.
- SolarWinds Server & Application Monitor and/or Network Performance Monitor.

Roles required:

- To configure the ServiceNow platform: admin
- To access SolarWinds data: User with SWIS (SolarWinds Information Service) access (the same as through the Orion website, not database users).

⚠️ **Attention:** You must agree to the statement that acknowledges you are aware of the recent SolarWinds Security Advisory before navigating the guided setup.

**About this task**

⚠️ **Note:** SolarWinds Integration can work with or without Service & Application Monitor (SAM) and Network Performance Monitor (NPM) being installed.

© 2021 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Procedure

1. Navigate to Service Graph Connector for SolarWinds > Setup.

2. On the Getting started page, click Get Started.

3. On the Service Graph Connector for SolarWinds page, in the Configure the connection section, select the task Configure the authentication credentials used to connect to SolarWinds SWIS API.

4. To configure your authentication credentials used to connect to the SolarWinds SWIS API, complete the following steps:

   a. On the next page, in the Configure the authentication credentials task section, click Configure.

   b. On the form, fill in the fields.

Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This field is automatically set to a human-readable name for this credential. You can optionally change this setting.</td>
</tr>
<tr>
<td>User name</td>
<td>SolarWinds user name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The SolarWinds user must have a role with read privileges to the SolarWinds Information Service API for all SolarWinds data sources that the integration can pull data.</td>
</tr>
<tr>
<td>Password</td>
<td>SolarWinds password, which is stored in the database in encrypted form.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to check if this credential is active.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Advanced selection criteria for this credential.</td>
</tr>
<tr>
<td>Order</td>
<td>Determines the order in which credentials are tried (smaller numbers are tried first)</td>
</tr>
</tbody>
</table>
c. Click **Update** if necessary.

d. In the Configure the authentication credentials used to connect to SolarWinds SWIS API task section, click **Mark as Complete**.

5. In the Configure SolarWinds HTTP connection task section, click **Configure** and complete the following steps:

a. Review the HTTP(s) Connection form and fill in fields as needed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>This field is automatically set to the name of the connection, which you can optionally change.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option denoting if this Connection uses MID server or not.</td>
</tr>
<tr>
<td>Host</td>
<td>Target fully qualified host value used by the connection. The Connection URL will automatically fill in the &lt;hostname&gt;.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential value used by this connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Connection alias value with which the connection can be referred.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Use URL builder to build the connection URL.</td>
</tr>
<tr>
<td>Mutual authentication</td>
<td>Enable if this is Mutual Authentication.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Underlying protocol used by the connection.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the HTTP connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>
b. Click **Update** if necessary.

c. In the Configure SolarWinds HTTP connection task section, click **Mark as Complete**.

6. In the Configure SolarWinds Modules section, click **Configure** and complete the following steps:

   a. On the System Properties page, configure the SolarWinds modules. Update the **Value** for the `sn_solarwinds_inte.npm_installed` and the `sn_solarwinds_inte.sam_installed`or `properties`.

      • Set to **true**: If the respective module is installed on the SolarWinds instance
      • Set to **false**: If the respective module is not installed on the SolarWinds instance

   📘 **Note:** This update changes the API class and the data that is returned from them.

   b. In the Help sidebar, click **Mark as Complete**.

7. In the Test the connection task section, click **Configure** and complete the following steps to test the connection:

   a. Review the fields on the Data Source form, which are automatically set.

   **Data Source form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Label of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Name of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Data storage type of the data to be imported.</td>
</tr>
<tr>
<td>Format</td>
<td>Format of the data file.</td>
</tr>
<tr>
<td>Path for each row</td>
<td>Path expression used to select JSON objects which will become rows in the import set table.</td>
</tr>
<tr>
<td>Discard Arrays</td>
<td>Determines whether to discard or serialize JSON arrays as a value.</td>
</tr>
<tr>
<td>Expand node children</td>
<td>Determines whether to load inner object attributes as new columns for JSON or XML nodes.</td>
</tr>
<tr>
<td>Data in single column</td>
<td>Data in single column.</td>
</tr>
<tr>
<td>Application</td>
<td>Application containing this record.</td>
</tr>
<tr>
<td>Request action</td>
<td>The Data Source request action that will be invoked to get data.</td>
</tr>
<tr>
<td>Support pagination</td>
<td>Enable pagination to request action.</td>
</tr>
<tr>
<td>Limit</td>
<td>Maximum records per page.</td>
</tr>
<tr>
<td>Offset</td>
<td>Initial offset used for pagination.</td>
</tr>
</tbody>
</table>

b. Click the **Test Load 20 Records** related link to test the connection to the SolarWinds API. Testing the connection takes a few moments, after which the page refreshes to show the test results.

This step tests the SG-Solarwinds Hardware data source and ensures that data is loaded into the staging table. A successful connection for SG-Solarwinds Hardware means that all SolarWinds data sources connect successfully, so you do not need to individually test all data source.

The connection is successful if the **HTTP Status** is **200**. If there is an **Error Code** and **Error Message**, the connection failed and further troubleshooting is required.

c. In the Help sidebar, click **Back to Guided Setup**.

d. In the Test the connection task section, click **Mark as Complete**.
8. On the left sidebar, click the **Set-up scheduled import jobs** button.

9. On the Service Graph Connector for SolarWinds page, in the Set up scheduled import jobs section, select the task **Configure the scheduled import jobs**.

a. In the Configure the scheduled import jobs task section, click **Configure**.

b. Review the fields on the Scheduled Data Import form, which are automatically set.

### Scheduled Data Import form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the scheduled job.</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source record that defines the data to import.</td>
</tr>
<tr>
<td>Run as</td>
<td>Option to run the scheduled job with the credentials of the specified user.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the scheduled job. Select this option.</td>
</tr>
<tr>
<td>Concurrent Import</td>
<td>Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.</td>
</tr>
<tr>
<td>Partition Method</td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Option to specify a script to run before the import is performed.</td>
</tr>
<tr>
<td>Execute post-import script</td>
<td>Option to specify a script to run after the import is performed.</td>
</tr>
<tr>
<td>Application</td>
<td>Application containing this record.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency of running the import.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>
Note: All active SolarWinds scheduled jobs will run in their specified order after the SG-Solarwinds Hardware scheduled job runs. You can modify the Active setting for each SolarWinds scheduled job as appropriate for your integration.

c. Click Update if necessary.

d. In the Configure the scheduled import jobs task section, click Mark as Complete.

Service Graph connector for VMware Workspace ONE UEM (1.1.1)

Use the Service Graph connector for VMware Workspace One UEM to pull data from Workspace One into your ServiceNow Instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The integration imports different hardware assets into the ServiceNow® Configuration Management Database (CMDB) application.

Supported versions

Supported versions: VMware Workspace ONE UEM API v.2

Supported ServiceNow versions:
• Starting with Paris Patch 1.
• Starting with Quebec.

Use Cases

The following are examples on how you can use the Service Graph connector for different ServiceNow applications:

• IT Operations Management (ITOM) Visibility
  ◦ Detailed hardware and application inventory for Android, Apple, and Windows mobile devices. The inventory can be used with or without Software Asset Management (SAM).
  ◦ Compliance tracking for mobile devices. You can build your own device (BYOD) or use corporate-owned devices.

• IT Service Management (ITSM)
- Incident, problem, change on discovered configuration items (CI).
- Ownership tracking and assignment for mobile devices.

**Guided Setup**

The guided setup for the Service Graph connector for VMware Workspace ONE UEM provides an organized sequence of tasks to configure the integration on your instance. To access the guided setup, see Configure Service Graph connector for VMware Workspace One UEM.

**CMDB Integrations Dashboard**

The Integration Commons for CMDB store app provides a dashboard with a central view of the status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs. You can filter the view to a specific CMDB integration, a specific time duration, or a specific integration run. For more details about monitoring Workspace ONE integrations in the CMDB Integrations Dashboard, see CMDB Integrations Dashboard.

**Data Mapping**

Data from the VMware Workspace ONE UEM Devices and Apps data sources is mapped and transformed into the ServiceNow CMDB Configuration Item (CI) class definitions using the Robust Transform Engine (RTE). Data is inserted into the ServiceNow CMDB using the Identification and Reconciliation Engine (IRE).

When you complete the guided setup, you configure the integration to periodically pull data from VMware Workspace ONE UEM. The data is loaded into the SG-Workspace ONE UEM Devices and Apps staging [sn_vmwoneuem_integ_devices_and_apps] table.

The data is then inserted into the following target tables:

- Computer [cmdb_ci_computer]
- Handheld Computing Device [cmdb_ci_handheld_computing]
- Media Player [cmdb_ci_media_player]
- Network Adapter [cmdb_ci_network_adapter]
- Printer [cmdb_ci_printer]
- SAM Software Installation [cmdb_sam_sw_install], if com.snc.sams plugin is installed.
- Serial Number [cmdb_serial_number]
• Software Instance [cmdb_software_instance], if com.snc.sams plugin is not installed.
• Software Package [cmdb_ci_spkg], if com.snc.sams plugin is not installed.

Note: To view any additional information such as the device owner, type of ownership, or compliance status, you need to switch to the SG-Workspace ONE UEM view. This view will display a SG-Workspace ONE UEM Device Related tab in the related list tabs with the additional information.

Configure Service Graph connector for VMware Workspace One UEM

Use the Service Graph connector for VMware Workspace One UEM to pull mobile and computing devices data from Workspace One into your ServiceNow instance.

About this task
To use this Service Graph connector, you need a subscription to a Subscription Unit that is based in the IT Operations Management (ITOM) Visibility application or in the ITOM Discovery application. As defined in the section titled "Managed IT Resource Types" in ServiceNow Subscription Unit Overview, for managed IT resources that are created or modified in the CMDB by this Service Graph connector, but that are not yet managed by ITOM Visibility or ITOM Discovery, these resources will increase Subscription Unit consumption from that application. Review your current Subscription Unit consumption within ITOM Visibility or ITOM Discovery to ensure available capacity.

Dependencies and Requirements:
• The Integration Commons for CMDB store app, which is automatically installed.
• The CMDB CI Class Models store app store app, which is automatically installed.
• ITOM Discovery License plugin (com.snc.itom.discovery.license), you must activate this plugin.
• ITOM Licensing plugin (com.snc.itom.license). For more information, see Request Discovery.
• Datastream Action plugin (com.glide.hub.action_type.datastream), which is automatically installed.

Roles required: admin
Procedure

1. Navigate to Service Graph Connector VMware Workspace > Setup.

2. On the Getting started page, select Get Started.

3. On the Service Graph Connector for VMware Workspace ONE UEM, in the Configure the connection section, select the task Configure authentication credentials.

4. To configure your authentication credentials, complete the following steps:

   a. On the next page, in the Configure authentication credentials section, select Configure.

   b. On the form, fill in the following fields.

   Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the VMware Workspace ONE UEM console.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret of the VMware Workspace ONE UEM console.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The Token URL of VMware Workspace ONE UEM console so that you can fetch the access token.</td>
</tr>
</tbody>
</table>

   Note: You can click the lock icon (🔒) to view the client secret.

   Note: For more information about the Token URL, see the VMware knowledge base article on the VMware documentation site.

To get more information about how to get OAuth credentials, see the VMware documentation on the VMware documentation site.

   c. Review the other fields on the Applications Registries form as needed.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the OAuth app.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script that is used to customize requests and responses to the external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>Logo URL for the OAuth app.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>The Default Grant Type that is used to establish the OAuth token.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Number of seconds that a refresh token issued will be good for.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE during the authorization flow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Location where the OAuth is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the OAuth app.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code end-point.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth access token revocation end-point.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The OAuth app end-point to receive authorization code.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token requests and revocations. This option requires that a Mutual Auth Profile is specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Option to enable OAuth Client populate client credentials in the request per the choice selected.</td>
</tr>
<tr>
<td>Comments</td>
<td>Comments about the OAuth app.</td>
</tr>
</tbody>
</table>
d. Click **Update** if necessary.

e. In the Configure authentication credentials task section, click **Mark as Complete**.

5. In the Configure HTTP connection task section, click **Configure** and complete the following steps:

a. On the form, fill in the fields.

**HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>MID Server that sends this HTTP connection. Using a MID Server is not compatible with mutual authentication.</td>
</tr>
<tr>
<td>Host</td>
<td>Target host value that is used by the connection. The Connection URL will automatically fill in the hostname.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential value used by this connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Connection value that is used to refer to the connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>URL builder that is used to build the connection URL.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL of the connection. You can either manually enter your connection URL or use the URL builder to build the connection string.</td>
</tr>
</tbody>
</table>

**Note:** Update the **Host** field with a VMware Workspace ONE UEM base URL. For example, `as4855.awmdm.com`.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mutual authentication</td>
<td>Optional to enable mutual authentication.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Underlying protocol used by the connection.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Update the Protocol field if you are using anything other than https.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the HTTP connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that contains the connection.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target value port that is used by the connection.</td>
</tr>
<tr>
<td>Base path</td>
<td>Base path for HTTP(s) connection.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You do not need to update this field.</td>
</tr>
</tbody>
</table>

**Note:** The HTTP connection will be pre-configured to use the authentication credentials that were configured during the previous setup task.

**b.** Click **Update** if necessary.

**c.** In the Configure HTTP Connection task section, click **Mark as Complete**.

6. In the Validate data sources task section, click **Configure** and complete the following steps:

**a.** Review the fields on the Data Source form, which is automatically set.

### Data Source form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this data source.</td>
</tr>
<tr>
<td>Import set table label</td>
<td>Specify the import set table that is produced by this data source.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Import set table name</td>
<td>Name of the table that will be created for this data source.</td>
</tr>
<tr>
<td>Type</td>
<td>Data storage type of the data to be imported.</td>
</tr>
<tr>
<td>Data in single column</td>
<td>Data in single column.</td>
</tr>
<tr>
<td>Use Batch Import</td>
<td>Option to use batch insert to import set table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this record.</td>
</tr>
<tr>
<td>Data Stream action</td>
<td>Data Stream action that provides complex object streams to load data.</td>
</tr>
<tr>
<td>Data Loader</td>
<td>Script that loads data in import set table.</td>
</tr>
</tbody>
</table>

b. To test the connection, click the **Test Load 20 Records** related link. Testing the connection takes a few moments, after which the page refreshes to show the test results. The connection is successful if the **HTTP Status** is **200**. If there is an **Error Code** and **Error Message**, the connection failed and further troubleshooting is required.

   ✨ **Note:** Do not click **Load All Records** during this setup.

c. In the Help sidebar, click **Back to Guided Setup**.

d. In the Validate data sources task section, click **Mark as Complete**.

7. On the left side bar, click the duplicate detection rules icon.

8. On the Service Graph Connector for VMware Workspace ONE UEM page, in the Duplicate detection rules section, select the task **Configure duplicate detection rules**.

9. In the Configure duplicate detection rules section, click **Configure**.

10. On the CMDB Duplicate Row Rules form, update the **Active** column value to **true** to activate the duplicate detection rule.

   ✨ **Note:** To remove fields from being evaluated, add the field names with a comma in a separated list in the **Ignore Fields** column.
11. In the Help side bar, select **Mark as Complete**.

12. On the left side bar, click the **Set up scheduled import jobs** button.

13. On the Service Graph Connector for VMware Workspace ONE UEM page, in the Set up scheduled import jobs section, select the task **Configure the scheduled job**.

   a. In the Configure the scheduled job task section, click **Configure**.

   b. Select the name of the scheduled import that you want to run.

   c. Review the pre-populated fields on the Scheduled Data Import form.

### Scheduled Data Import form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the scheduled job.</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source record that defines the data to import.</td>
</tr>
<tr>
<td>Run as</td>
<td>Option to run the scheduled job with the credentials of the specified user.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the scheduled job. Select this option.</td>
</tr>
<tr>
<td>Concurrent Import</td>
<td>Function that loads the data from multiple import sets. The function then processes and transforms the data concurrently.</td>
</tr>
<tr>
<td>Partition Method</td>
<td>Partition method for the concurrent import set.</td>
</tr>
<tr>
<td>Partition Size</td>
<td>Import set size for early scheduling.</td>
</tr>
<tr>
<td>Execute pre-import script</td>
<td>Option to specify a script to run before the import is performed.</td>
</tr>
<tr>
<td>Execute post-import script</td>
<td>Option to specify a script to run after the import is performed.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this scheduled job.</td>
</tr>
<tr>
<td>Run</td>
<td>Frequency of running the import.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditional</td>
<td>Conditions under which this job is executed.</td>
</tr>
</tbody>
</table>

d. Click **Execute Now** and repeat the previous steps for the other imports if needed.

e. In the Help task bar, click **Mark as Complete**.

**Create multi-instance support for VMWare Workspace ONE UEM**

If you need to connect to multiple instances of Workspace ONE UEM, you can create multiple connections and scheduled imports to import data from multiple data servers.

**Before you begin**
Confirm that you are in the Service Graph connector for the Workspace ONE UEM application scope.

Role required: admin

**Procedure**

1. Navigate to **Service Graph Connector VMWare Workspace > Setup**.
2. On the left side bar, click the **Create another connection** button.
3. On the Service Graph Connector for VMware Workspace ONE UEM page, in the Create another connection section, select the task **Update Scheduled Data Import access**.
   a. In the Update Scheduled Data Import access task section, select **Configure**.
   b. Select the Scheduled Data Import [scheduled_import_set] table.
   c. To edit the record, select **Global** from the Scope menu.
   d. Under the **Application Access** tab, select the **Can create**, **Can update**, and **Can delete** check boxes.
   e. Save the record.
   f. From the Scope menu, select **Service Graph Connector for VMWare Workspace ONE UEM**.
   g. In the Help task bar, click **Mark as Complete**.
4. On the Service Graph Connector for VMware Workspace ONE UEM page, in the Create another connection section, select the task **Create or Edit connection**.
Note: You need to the following information from your VMWare Workspace ONE UEM administrator:

- Client ID
- Client Secret
- Token URL
- Connection URL

To get more information about how to get OAuth credentials, see the VMware documentation on the VMware documentation site. To get more information about the Token URL, see the Workspace ONE Access Token URL documentation on the VMware documentation site.

a. In the Create or Edit connection, select Configure.

b. Do one of the following:
   - To create a new connection, select Add Connection.
   - To edit an existing connection, select the Edit button.

c. On the form, fill in the fields or edit as needed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Display name for the connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL for the new connection.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Option to select a MID Server that sends this connection. Using a MID Server is not compatible with mutual authentication.</td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server for the connection.</td>
</tr>
<tr>
<td>OAuth Entity Name</td>
<td>Display name for OAuth Entity.</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID for the provider.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret for the provider.</td>
</tr>
<tr>
<td>OAuth Token URL</td>
<td>Callback URL for the provider.</td>
</tr>
</tbody>
</table>
d. Do one of the following:

• To create the new connection, select **Create and Get OAuth Tokens**.

• To save the edits for the existing connection, select **Edit and Get OAuth Token**.

5. On the Service Graph Connector for VMware Workspace ONE UEM page, in the Create another connection section, select the task **Create scheduled import jobs**.

a. In the Create scheduled import jobs, select **Configure**.

b. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduled Data Import name prefix</td>
<td>Contents of this field that will be prepended to the Scheduled Data Import name.</td>
</tr>
<tr>
<td>Connection and Credential Alias</td>
<td>Connection and Credential Alias of the import. Select the connection alias that was created in the previous step.</td>
</tr>
<tr>
<td>Run Scheduled Imports as User</td>
<td>User who will run the scheduled data import.</td>
</tr>
</tbody>
</table>

c. In the Help task bar, click **Mark as Complete**.

**Multisource CMDB**

Multisource CMDB retains complete history about discovery sources and proposed values, involved in updates of CI attributes. Use Multisource CMDB data to track how the CMDB is populated by various discovery sources at the CI attribute level. Also, to revert CI updates from a specific discovery source, or to recompute attribute values using updated reconciliation rules.

When multiple discovery sources attempt to update the same CI attribute, the Identification and Reconciliation Engine (IRE) uses reconciliation rules to select a single discovery source for the update. Without Multisource CMDB, details about the lower-priority discovery sources whose values were rejected, are discarded.
Also, it is difficult to identify the source of an attribute value without Multisource CMDB.

With Multisource CMDB, the raw details for every discovery source and CI combination are retained for both, discovery sources that were selected for an update and all others that were not. Multisource CMDB data, consisting of records for each discovery source and CI combination, is stored in the CMDB MultiSource Data [cmdb_multisource_data] table. You can examine, query, and report on this Multisource CMDB data store.

Use Multisource CMDB to:

• Control CI updates at the discovery source and CI attribute level.
• Visualize discovery sources of attribute values, at the attribute level.
• Modify reconciliation rules and then recompute CMDB data, reflecting the updated reconciliation rules.
• Revert CMDB data integration from a specific discovery source, if, for example, you realize that the discovery source is not reliable. Recompute CI attribute values, while excluding the discovery source that you want to ignore.
• Validate a new discovery source by comparing its data to data from other discovery sources, which are known to be valid.
• Improve data management, data quality, and operational insights, by querying on Multisource CMDB data. Use the Multisource Report Builder to create queries for Multisource CMDB records, discovery sources, and CI records.

Enable Multisource CMDB

• Activate the ITOM Discovery License (com.snc.itom.discovery.license) plugin.
• Add the Multisource CMDB system property `glide.identification_engine.multisource_enabled` and set it to 'true'.

By default, Multisource CMDB tracks discovery source information for CIs from both CMDB and non-CMDB classes. You can independently enable or disable tracking data for CMDB and for non-CMDB classes, using these system properties:

• `glide.identification_engine.multisource_cmdb_ci_enabled`
• `glide.identification_engine.multisource_non_cmdb_ci_enabled`

Report on Multisource CMDB data

Use the Multisource Report Builder to gain insights into the Multisource CMDB data store. Build reports to, for example, do the following:
• Find CIs not reported by any discovery source.
• Find discovery sources populating data in your CMDB.
• Compare attribute values across discovery sources.
• Compare attribute values between CMDB and another discovery source.
• Limit reports for Multisource CMDB data, to a specific application service, technical service, or a CMDB group.

See Sample Multisource CMDB queries for more details.

**Visualize Multisource CMDB data**
Multisource CMDB is highly verbose in the user interface:

• On the Reconciliation Rules page in CI Class Manager, click the Preview Data tab to see per attribute, discovery sources that are authorized to update that attribute, in precedence order.

• On a CI form, click the Multisource Data Preview related link to see per CI attribute, current value in the CMDB and incoming values from other discovery sources.

**Logging**
Enable logging for Multisource CMDB by adding and enabling the system property glide.cmdb.logger.source.cmdb_multisource. In the Log [syslog] table, search for entries in which source="cmdb_multisource".

**Recompute CI attribute values**
Modify reconciliation rules, or exclude a discovery source which is found to be invalid. Then, use the updated reconciliation rules in recomputing CI attribute values, for which those reconciliation rules or discovery source are applicable to.

**Before you begin**
Enable Multisource CMDB.

If you want to recompute to apply updated reconciliation rules, then you must first update the reconciliation rules.

Role required: itil_admin

**About this task**
Multisource CMDB automatically generates a recompute task for each recompute that you submit. If you submit multiple recomputes, a recompute task is generated for each operation, but only one task runs at any given time. To list all recompute tasks, enter cmdb_multisource_recomp_task.list in the left navigation search box.
There is a maximum number of records that can be included in a single recompute operation. This number is specified by the system property `glide.identification_engine.multisource.recompute.max.ci.limit` (100,000 by default).

**Note:** Recompute skips CIs which are reported by multiple discovery sources, but with different class names.

**Procedure**

1. Navigate to **Configuration > CI Class Manager**.
2. Select a class from the CI Classes hierarchy list.
3. In the left-side pane, expand **Class Info**, and select **Reconciliation Rules**.
4. On the Reconciliation Rules page, click **Recompute**.
5. Select the **Recompute Type**.
   
   • **Replace values from the specified discovery source with value from the discovery source next in priority, according to reconciliation rules:** Recompute attribute values for the class CIs, applying priorities specified in reconciliation rules and while excluding the specified Discovery Source. Records for the discovery source you are excluding, are also removed from the Multisource CMDB data store.

   This operation applies to data that exists in the CMDB. If reconciliation rules remain in effect for the discovery source that you have excluded, then future data from that discovery source, can populate the CMDB.

   • **Apply updated reconciliation rules:** Recompute attribute values for the class CIs, applying the updated reconciliation rules which are now in effect.

6. Select the **Recompute Scope**.

   The scopes grow from one option to the next:
   
   • **Recompute only CIs of this class:** Basic scope of CIs to recompute.
   
   • **Recompute CIs of this and derived classes:** Expand the basic scope to include CIs from derived classes.
   
   • **Recompute CIs of this and derived classes, along with selected related items:** Expand the previous scope to also include CIs from specified related items. Select the related items to include in the recompute.

7. Select the **Delete action** for CIs for which the excluded discovery source, is the only discovery source.
• **Delete record**: Delete the CI record from CMDB.

• **Set record attributes to custom value**: Set a specified CI attribute to a custom value to remove the CI from regular operations without deleting the CI. For example, set the *Operational status* attribute to *Retired*.

8. Click **Next** and then, on the Review page, carefully review the counts for the affected CIs. Ensure that all record counts are as you expect. Click **Back** to adjust any settings for the recompute.

9. Click **Recompute**.

**What to do next**

You can do any of the followings:

• In the status message that appears for the recompute operation, click the link to see the CMDB Multisource Recompute Task for more details. The Recompute Task shows the progress and status of the recompute operation.

  You can abort the recompute by setting **Status** to **Closed Incomplete** and selecting **Update**. You can then set **Status** back to **Work in progress** to resume recompute from where it was aborted.

• Enter `cmdb_multisource_recomp_task.list` in the left navigation search box, to see the status and progress of all recompute tasks.

**Create a query in the Multisource Report Builder**

Improve CMDB data management by querying the Multisource CMDB data store. Use the Multisource Report Builder to gain insights about how discovery sources are populating the CMDB and the reliability of the different discovery sources. Then, adjust reconciliation rules to improve the quality of CMDB data.

**Before you begin**

**Enable Multisource CMDB**.

Role required: *itil*

**About this task**

Build reports with a query such as:

• All the discovery sources populating data in your CMDB.

• CIs not reported by any discovery source.

• All CIs discovered by one discovery source, but not by another discovery source.
You can also create queries that show differences in CI attribute values between two discovery sources, or between the CMDB and another discovery source:

- For a given Multisource CMDB record, show how an attribute value is different between a discovery source and the current CMDB record. For example, find Hardware CIs with different location than what SCCM reports.
- For a given Multisource CMDB record, show how an attribute is different between SourceA and SourceB. For example, show all Computer CIs where RAM is different between SCCM and ServiceWatch.

You can show the query results by CI records, Multisource CMDB data records, or Discovery sources. You can also limit the report results to CIs within a specific application service, technical service, or a CMDB group.

Procedure

2. On the Multisource Data Report Builder page, select a query to edit or run, or click New.
3. Enter Name and Description for the report.
4. Select the Result type for the report.
   - **CI Records**: Results show unique CIs from the Multisource CMDB data store.
   - **Multisource Records**: Results show all entries of CI/discovery source combinations from Multisource CMDB data.
   - **Discovery sources**: Results are grouped by discovery sources that match the query criteria.
5. Select Only show difference to show differences in CI attribute values between discovery sources or compared to CMDB data. Select the Type of difference.
   - **Between CMDB record and discovery source**: Show differences in attribute values between the CMDB data and the specified discovery source.
   - **Between discovery sources**: Show differences in attribute values between two specified discovery sources.

a. Set Field to compare to the class attribute for which to show differences for. The list of attributes is a pre-populated subset of the class attributes, to which you cannot add or remove items.
6. Select a **Class** to apply the query to, or multiple classes. For each class, specify a criteria for CIs to be included in the query. Select **All Classes** to apply the query to all classes.

7. Select the **Discovery source** to query on. If **Only show difference** and **Between discovery sources** are selected, select the two discovery sources for the attribute values comparison.

8. Set **Limit results to** to limit the query to CIs that belong to a specific application service, technical service, or a CMDB group.

9. Click **Save**.

10. Click **Run**.

What to do next
On the CMDB Multisource Query Results page:

- If the number of results exceeds the number of results appearing on the page:
  - Click **Load More Results**: To show the next page of results. The number of results that appear on each result page is specified by the `glide.identification_engine.multisource.query.batch.limit` system property (100 items by default).
  - Click **Load All Results**: To show all results, up to the limit specified by the `glide.identification_engine.multisource.query.max.limit` system property (10000 by default).
  - Click a Multisource CMDB value link or a CI value link to access the respective records and see more details.

- In the Configuration Item column, click a CI link to open the CI form. In the Related Links section on the CI form, click the **Multisource Data** tab to show Multisource data, such discovery sources, related to the CI.

</tbody>
</table>
Properties installed

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.multisource_enabled   | Enables Multisource CMDB.  
• Type: true | false  
• Default value: false  
• Location: Add to System Properties [sys_properties] table. |
| glide.identification_engine.multisource_cmdb_ci_enabled | Enables capturing Multisource CMDB data for CIs from CMDB classes (derived from the cmdb_ci class).  
• Type: true | false  
• Default value: false  
• Location: Add to System Properties [sys_properties] table. |
<p>| glide.identification_engine.multisource_non_cmdb_ci_enabled | Enables capturing Multisource CMDB data for CIs from non-CMDB classes (not derived from the cmdb_ci class). For example, the Serial Number [cmdb_serial_number] class, or the Software instance [cmdb_software_instance] class. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.multisource.query.batch.limit | Max number of items to show per query results page, in the Multisource Report Builder. Changing the value of this property might affect performance when running a query.  
• Type: numeric  
• Default value: 100  
• Location: Add to System Properties [sys_properties] table. |
| glide.identification_engine.multisource.query.max.limit | Max number of query results to show when you click **Load All Results** in the Multisource Report Builder. Changing the value of this property might affect performance when running a query.  
• Type: numeric  
• Default value: 10000  
• Location: Add to System Properties [sys_properties] table. |
| glide.identification_engine.multisource.recompute.max.ci.limit | Max number of CIs that can be included in a Multisource CMDB recompute operation. |
### Baseline CMDB

CMDB baseline provides capabilities that help you understand and control the changes that have been made to your configuration items (CIs) in the CMDB.

- You can create a baseline, which is a snapshot of your configuration items in the CMDB. You can review the changes that have been made to that configuration item since a previous baseline. Multiple baselines may be created and the system tracks the changes that have been made per baseline.

Creating a baseline captures the attributes of the CI as well as all first-level relationships for the CI. Any changes to the base CI or to any related CIs are captured and displayed. Newly created CIs are not automatically added to a baseline.

- Associate a configuration item with a task, a change or change task, and to propose changes to the CI after the change is complete. You can record changes, and these changes are not applied to the CI immediately but are delayed until the change is complete.

When the change is complete, you can choose to apply the proposed changes which makes all changes previously proposed and associates the changes with the task.

| | • Location: Add to System Properties [sys_properties] table. |

---
Create a CMDB baseline

You can create a baseline for a CI to track updates to the CI over time.

About this task
Role required: ecmdb_admin and itil

Procedure

1. Navigate to Configuration > Baselines > Baselines.
   If the Baselines module is not visible in the Configuration application, the module is inactive. In that case append /sys_app_module.do?sys_id=f4463879a9fe3dba01b30bc100cbf404 to the instance URL, and in the Module - Baselines form, ensure that the module is Active.

2. Click New.

3. Enter a Name for the baseline.
   By default, the cmdb_ci table is selected so that the record creates the baseline for all configuration items in the system.

4. Optional: To limit the baseline to specific CIs, select a different Table or choose Conditions that a CI must meet for it to have a baseline entry.

   Example
   For example, you might create a baseline for the Database table with the condition [Location] [is] [<configured location>].

5. Click Submit.
   The creation of a baseline is time consuming and occurs in the background. A message at the top of the record list notifies you that your baseline has been scheduled and you will receive an email when the process is complete.

Display baseline differences

You can see the changes that have been made to a CI or any first level related CIs by configuring the CI form layout to display the CMDB Baseline diff field. This field is labeled Baseline differences on the form.

Before you begin
Role required: itil

About this task
Changes are displayed only for the cmdb_ci table and child tables. You can change the com.cmdb.baseline.max_changes system property to limit the number of relationships and changes that appear in a baseline diff section on a CI form (set to 100 by default).
Procedure

1. Open a CI record.

2. Select the baseline you want to see for this CI from the choice list. The field displays the details of any changes that were made to the current record for the selected baseline, or indicates that no changes were made.

   Details of baseline differences

   - **Baseline differences**
     - For: SQL Baseline
   - **Basic attribute changes**
     - **2009-09-14 14:46:49** System Administrator - Changed: RAM (MB), Disk space (GB)
       - RAM (MB): 4 was: -1
       - Disk space (GB): 500 was: 100

3. To add a relationship to the CI, click the green plus icon in the Related Items toolbar. The new relationship appears below the toolbar. For more information about the Related Items toolbar and how to control the display, see CI relations formatter.

4. Update a related CI and see the changes displayed as Basic attribute changes in the current CI record.

   Basic Attribute Changes

   - **Baseline differences**
     - For: SQL Baseline
   - **Basic attribute changes**
     - **2009-09-14 15:17:42** System Administrator - Changed: Sys audit, RAM (MB), Disk space (GB)
       - Storage Area Network 002 was: (relationship added) - CI Relationship Change
       - Application Server PeopleSoft was: (relationship added) - CI Relationship Change
       - RAM (MB): 4 was: -1
       - Disk space (GB): 500 was: 100

Properties for baseline CMDB

Use the baseline CMDB properties to configure how many changes and relationships for a CI can appear in the baseline diff for the CI.

These properties are available for baseline CMDB. To view and edit these properties, the admin role is required.
Properties for Baseline CMDB

<table>
<thead>
<tr>

Managing proposed changes

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.

To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

View CI history

You can view the history of changes to a CI in a list, calendar, or timeline format.
View the proposed changes of a CI

You can view the proposed changes so that you can see what is planned for the CI.

Before you begin
Role required: personalize_form

About this task
To view any proposed changes, configure the CI form layout to display the CMDB Scheduled Changes field. Proposed changes are not displayed in a CI form by default.

Procedure
1. Navigate to Change > Open and open a change request.
2. In the Affected CIs related list, open the Configuration Item. You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select Configure > Form Layout.
5. Move the CMDB Scheduled Changes field to the Selected pane.
6. Click Save. The CI form shows the details of any proposed changes in the Scheduled changes area.

Add a proposed change to a CI

Proposed changes to a CI can be made while viewing a change request or any task-related record.

Before you begin
Role required: itil

Procedure
1. In the Change Request form, go to the Affected CIs related list. If there are no CIs in the Affected CIs list, click Edit to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select Proposed Change.
3. Complete the form to make the proposed changes, and click Save Proposed Change.
Click **Update** to apply the changes immediately. Click **Delete** to delete the CI.

4. To propose an addition or a removal of a CI relationship:
   a. Click the plus icon in the **Related Items** section.
   b. In the Relationships section, add or delete a relationship. For information about using the relationship editor, see [Create or edit a CI relationship](#).
   c. Click **Save Propose Change**.
   d. Confirm saving the proposed change.
   
   Click **Update** or **Delete** to commit the changes immediately.

   **Note:** Use only with CI relationships. Proposing additions or removal of relationships is not valid for user relationships and group relationships.

What to do next

After the proposed changes are saved, the **Apply Proposed Changes** button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

### Apply a proposed change to a CI

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

**Before you begin**

Role required: itil

**About this task**

After you apply the proposed changes, the **Scheduled changes** part of the form displays **No scheduled changes found**. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

**Procedure**

1. Navigate to the **Change Request** form.
2. Click the **Apply Proposed Changes** button.
   
   You may have to right-click the form header and select the **Reload Form** option to see the changes.
Create or edit a proposed change verification rule

Ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Before you begin
Role required: asset or itil

About this task
When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

Procedure
1. Navigate to Configuration > Change Verification > Proposed Change Verification Rules.
2. Click New or select an existing rule to edit.
3. Fill in the fields, as appropriate.

Proposed Change Verification Rules form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>The name of this rule.</td>
</tr>
<tr>
<td>Table name</td>
<td>The table to which the rule applies.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Conditions to apply this rule to specific CIs.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this rule.</td>
</tr>
<tr>
<td>Rule script</td>
<td>A verification Java script that needs to return true or false. For example:</td>
</tr>
</tbody>
</table>

```javascript
validateRule()
{
    var os = current.getValue("os");
    var cpu = current.getValue("cpu_count");
}```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>//Use current.getValue(fieldName) to get the proposed change value, eg. var os = current.getValue(&quot;os&quot;); //Your verification code</td>
</tr>
<tr>
<td></td>
<td>if (os != &quot;SunOS&quot;</td>
</tr>
</tbody>
</table>

4. Click **Submit** or **Update**.

Results
On the Change Request form, you can click **Verify Proposed Changes** to verify proposed changes for the affected CIs.

**Verify proposed changes**
Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

**Before you begin**
Create or edit the rules used to verify proposed changes. For details, see [Create or edit a proposed change verification rule](#).

Role required: none

**About this task**
You can apply proposed changes even if they are unverified or fail a verification test.

**Procedure**
1. Open the Change Request form that affects the CI.
2. Click **Verify Proposed Changes**.
   The proposed changes are verified against any proposed change verification rules in which the CI meets the Filter condition criteria.
3. Review the message that appears at the top of the form after the verification process is finished.
   The message states whether the verification tests passed or failed.
What to do next
To view the details of any verification tests that were performed for the change request in the past two days, click the Proposed Change Verification Log related link.

Create or edit a planned change validation script
Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Before you begin
Role required: admin or itil

About this task
The system attempts to validate each CI change as follows:

• If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.

• If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the Work start and Work end dates of the change request associated with the changed CI.

However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

• The fields that were changed
• The data source that performed the change
• The time stamp of the change

To correctly determine the validity of a change, examine the parameters and apply business logic to evaluate if the validation tests are met. A planned
change validation script can test any of these characteristics and determine when a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

**Procedure**

1. Navigate to **Configuration > Change Verification > Planned Change Validation Script**.
2. Click **New** or select a validation script to edit.
3. Complete the form.

### Planned change validation script form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this script for validating changes.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this script applies to.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.</td>
</tr>
</tbody>
</table>

The script has a template which displays the input variables of the script.

### Template script input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>Current record that is being processed.</td>
</tr>
<tr>
<td>updatedOn</td>
<td>GlideDateTime</td>
<td>Time stamp of the change.</td>
</tr>
<tr>
<td>updatedBy</td>
<td>String</td>
<td>Entity responsible for the change.</td>
</tr>
<tr>
<td>fieldsChanged</td>
<td>String</td>
<td>Comma-separated list of the names of all fields that were changed.</td>
</tr>
</tbody>
</table>

**Example**

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```javascript
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime updatedOn, String updatedBy, String changedFields*/) {
  // Template script input variables
  // current
  // updatedOn
  // updatedBy
  // fieldsChanged

  return admin; // Return true if admin initiated the change, false otherwise.
}
```
//Return true if the user that updated the record has an admin role
return isUserAdmin(updatedBy);
}

function isUserAdmin(userName)
{
    var grUser = new GlideRecord("sys_user");
grUser.addQuery('name', userName);
grUser.query();
if(grUser.next())
{
    var roles = new GlideRecord("sys_user_has_role");
roles.addActiveQuery();
roles.addQuery('user', grUser.sys_id);
roles.query();
while(roles.next())
{
    if(roles.role.name == 'admin')
        return true;
}
return false;
}

4. Click Submit.

CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
- Type of the relationship that links both CIs

For example, in the [Server1] [Managed by] [Server2] relationship:

- Server1 is the child CI
- Server2 is the parent CI
- [Managed by] is the relationship type
For example, a web application might read data from an instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The relationships between CIs can be automatically discovered. If you use Discovery, many relationships can be automatically loaded into the system through the discovery process. If you import your data from another system, you get some form of relationships.

You can add to automatically discovered relationships, create relationships, or edit relationships for a CI by launching the CI relationship editor from the CI form.

**Dependent and non-dependent relationships**

**Dependent relationships**, such as tomcat RunsOn Hardware, are used by the Identification and Reconciliation Engine (IRE) to identify dependent CIs.

Non-dependent relationships are not used for CI identification, and therefore can be deleted if no longer needed. CMDB tracks discovery source and last scanned time for non-dependent relationship in the Relationship Sources [sys_rel_source] table. Dependent relationships are used for CI identification. Therefore they should not be directly deleted and they are not tracked.

Information in the Relationship Sources [sys_rel_source] table can be used to decide if it is safe to delete a non-dependent relationship. For example, a discovery source which is attempting to delete a non-dependent relationship can confirm that:

- There are no other data sources for that relationship.
- The relationship was not updated for some specified length of time and therefore is no longer needed.

When a non-dependent relationship is deleted from the CI Relationship [cmdb_rel_ci] table, all cascading corresponding records in the Relationship Sources [sys_rel_source] table are deleted.

**Related information**

Create a CI relation rollup

**Suggested class relationships**

The system keeps a table (Suggested Relationship [cmdb_rel_type_suggest]) of relationship types that are appropriate for a CI type, based on its class. You can manage suggested relationships by navigating to Configuration > Suggested Relationships, or in the CI Class Manager.
Suggestion model

The relationship editor has a base CI. The base CI designates the CI that a user was on before launching the editor, as the base CI in the new relationship. If you launched the relationship editor from the Linux100 CI, then Linux100 becomes the base CI. Also, every CI in the system has a type (class). For example, bond Linux100 is of the Linux server type.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:

```
cmdb_ci -> cmdb_ci_computer -> cmdb_ci_server -> cmdb_ci_linux_server
```

The suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the current base class of the user or any one of its parent classes. For example, looking at a Linux server, the suggestion model would retrieve any relationships whose base class was:

```
cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, Of cmdb_ci
```

ITOM Visibility, if available, uses enhanced discovery patterns to identify and add CI relationships to the Suggested Relationships table.

Suggested CI relationships in the relationship editor

The CI relationship editor uses the suggestion model to help users select reasonable relationships for configuration items.

For example, consider these relationship types in the system:

- Provides Power for :: Receives Power From
- Runs on :: Hosts

Typically, a user uses these relationships to define the following reasonable relationships between two items as follows:

- a database runs on a server
- a rack provides power for a server

Typically, neither of the following definitions would be appropriate:

- a rack runs on a server
- a server runs on a database

Related information

CI Class Manager
Add a suggested relationship

Add a suggested relationship for a class. The list of suggested relationships for a class is available when you create a new relationship for a CI of that class.

Before you begin
Role required: To view — itil. To create, update, or delete suggested relationships — itil_admin.

Procedure

1. Use the CI Class Manager (Role required: itil_admin):
   a. Navigate to Configuration > CI Class Manager.
   b. Click Hierarchy to expand the CI Classes list. Then select the class to add a suggested relationship to.
   c. In the class navigation bar, click Suggested Relationships.
   d. Click New.
   e. In the Add Suggested Relationship dialog box, select a Relationship and a Target Class for the relationship. This Class and the Target Class become parent or child in the suggested relationship, based on your selection of the Relationship.
   f. Click Save.

2. Or, navigate to Configuration > Relationships > Suggested Relationships (Role required: admin):
   a. Click New.
   b. Complete the form.

Suggested Relationship fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base class</td>
<td>The base class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
<tr>
<td>Relationship</td>
<td>Relationship type.</td>
</tr>
<tr>
<td>Dependent class</td>
<td>The dependent class in the relationship, which depending</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
 | on the relationship type, is either the parent or the child in the relationship.

**Example: Suggested relationship you can add**

<table>
<thead>
<tr>
<th>Base Class</th>
<th>Relationship</th>
<th>Dependent/Target Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Linux Server</td>
</tr>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Solaris Server</td>
</tr>
</tbody>
</table>

⚠️ **Note:** The same parent class and relationship can appear more than once.

**What to do next**

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not affect relationships that are created or updated by Discovery.

**Relationship governance rules**

Relationship governance rules is a set of relationship rules used to ensure consistency and validity in modeling relationships between configuration items (CIs) in the CMDB. Use relationship governance rules to prevent the selection of relationship types or directions that are not allowed between specific CI types.

Different applications such as Discovery and Service Mapping, create relationships between CIs. Each application might use inconsistent relationship type or direction to represent the same entity, resulting in multiple views of the same CIs. Relationship governance rules define what are valid relationship types and valid directions between pairs of CI types resulting in valid and consistent relationships in the CMDB.

Relationship governance rules consist of:

- **CMDB dependent relationship rules:** Rules (hosting and containment rules) that are used for CI identification. You can view and modify dependent relationship rules in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Dependent Relationship**.

- **Suggested relationships:** Rules that are based on existing suggested relationships in the Suggested Relationship [cmdb_rel_type_suggest] table. Suggested relationships are used in the **CI relationship editor**. You can view
and modify suggested relationships in the CI Class Manager, after selecting a class from the class hierarchy and clicking **Suggested Relationships**.

- **Reference rules**: Rules that are used mostly by Cloud Management to represent all the possible valid combinations of pairs of referencing and referenced CIs in the service definition.

- **Built-in valid relationships**: The following relationships are pre-defined in the base system as valid relationships:
  - cmdb_ci_endpoint -> Applicative Flow To::Applicative Flow From -> cmdb_ci_endpoint
  - cmdb_ci_endpoint -> Implement End Point To::Implement End Point From -> cmdb_ci
  - cmdb_ci -> Use End Point To::Use End Point From -> cmdb_ci_endpoint

**General behavior**

- **Relationship governance rules support inheritance**.
  
  For example, suppose that the suggested relationship cmdb_ci_appl Runs On::Runs cmdb_ci_hardware exists. Then a Runs On::Runs relationship between a cmdb_ci_appl_dot_net CI and a cmdb_ci_windows_server CI is valid. That is because .Net Application class inherits from the Application class and the Windows Server class inherits from the Hardware class.

- **Duplicate relationship governance rules are not allowed**.

- **Relationship governance rules are not domain separated**.

- **It is allowed to have more than one relationship type between the same two CI types**.
  
  For example, the following relationships are valid:
  - cmdb_ci_appl Depends On::Used by cmdb_ci_service
  - cmdb_ci_appl Receives data from::Sends data to cmdb_ci_service

**Reports**

A relationship between CIs is considered valid if it conforms to any of the relationship governance rules. Use the CMDB dashboard to view reports about **overall relationships health** including relationships compliance with relationship governance rules. The 'Relationships not compliant with all relationship rules' report shows CI relationships that are not compliant with any of the relationship governance rules.
CI relations formatter

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI.

If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form.
Note:

- If an endpoint is a child in one relationship and the same endpoint is a parent in another relationship, then that endpoint is hidden and does not appear in the relations formatter view. Similarly, relationship qualifier chains are also hidden and do not appear in the relationship formatter view.

  ◦ Example: CI1 > endpoint > CI2

    In this example, CI1 is related to CI2 through relationships with endpoint. A single relationship appears in the relations formatter:

    CI1 > CI2 (These relationships appear as a direct relationship without endpoint, because endpoint is a parent in one relationship and a child in another relationship)

  ◦ Example: CI1 > endpoint1 > CI2 > endpoint2

    Two relationships appear in the relations formatter:

    CI1 > CI2 (endpoint1 is hidden because it is a parent in one relationship and a child in another relationship)

    CI1 > CI2 > endpoint2 (appears as level 2 relationship – endpoint1 is hidden and endpoint2 appears as it a child and not a parent in any other relationship)

- On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.

- CIs not extended from the Configuration Item [cmdb_ci] table, are not displayed in Dependency Views maps and in CI relation formatters.

- The Applicative Flow To::Application Flow From relationship is a special relationship type used only between Service Mapping endpoints. This relationship type is not intended for use in the CMDB as a relationship between CIs and therefore it is not displayed in the relations formatter.

Controls for viewing related CIs

<table>
<thead>
<tr>
<th>Control</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Starts the relationship editor to manually create CI relationships. For more information, see Create or edit a CI relationship.</td>
</tr>
</tbody>

<td>Filter by tables specified in CMDB views, if any relationship filters exist.</td>
</tr>
</tbody>
</table>

The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recently closed changes</td>
<td></td>
</tr>
<tr>
<td>Planned changes</td>
<td></td>
</tr>
<tr>
<td>Currently open changes</td>
<td></td>
</tr>
<tr>
<td>Recently closed outages</td>
<td></td>
</tr>
<tr>
<td>Problems</td>
<td></td>
</tr>
<tr>
<td>Incidents</td>
<td></td>
</tr>
<tr>
<td>Planned outages</td>
<td></td>
</tr>
<tr>
<td>Currently open outages</td>
<td></td>
</tr>
</tbody>
</table>

In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

Properties related to performance

Domain separation and the relations formatter and the CI relationship editor

Domain separation is supported in the relations formatter and the CI relationship editor. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

How domain separation works in the relations formatter and relationship editor

- Relations formatter

  The relations formatter is domain-separation supported. The relations formatter is used to display CMDB relationships in the UI in different views. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, relationships are visible in the relations formatter only if both parent and child CIs (cmdb) are visible in the domain.
The CI Relationship Type (cmdb_rel_type) table is not domain separated. Therefore, in the relations formatter, all the relationship types are available to be selected as a filter.

By default domain separation is supported in the relations formatter.

**Relationship editor**

The relationship editor is domain-separation supported. You can use the relationship editor to add new relationships or delete existing relationships for the current CI.

- The CI relationship editor displays a list of CIs to add or remove from relationships. Since they are domain separated, the CI list view in the relationship editor displays the CIs that are visible to the current domain.
- The CI relationship editor displays a list of relationships to add or remove. Since the CI Relationship [cmdb_rel_ci] table is not domain separated, the relationships list view displays all the relationships of the current CI.

The Suggested Relationship (cmdb_rel_type_suggest) table is not domain separated, which means that all the suggested relationship types in the relationship editor are visible for all domains.

By default domain separation is supported in the relationship editor.

**Related information**

Domain separation and Configuration Management Database (CMDB)

**Create or edit a relationship filter**

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.

**Before you begin**

Role required: ecmdb_admin

**About this task**

The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

**Procedure**

1. Navigate to **Configuration > Relationships > Relationship Filters**.
2. Click **New** or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click **Save**.
5. In the **Configuration Types** section, click **Edit**.
6. On the **Edit Members** form, select the tables of the CIs that you want to show with the filter and then move the tables to the **Configuration Types list**.
7. Click **Save**.

**Results**

On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the **Filter Relations by CMDB View** list.

In the legacy CI relations formatter, you can click **View** and select the newly defined relationship filter.

After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

**Exclude relationships from the relations formatter view**

Create a list of relationships that should not appear in the relations formatter view on CI forms.

**Before you begin**

**Role required:**

- To view the relationship type exclusion list — itil
- To create, update, or delete the relationship type exclusion list — itil_admin

**Procedure**

1. Navigate to **Configuration > Relationships > Relationship Type Exclusion List**.
2. In the CI Relation Filters list view, click **New**.
3. Fill out the CI Relation Filter form to specify the relationship that you want to exclude from view.
4. Click **Submit**.

   Excluded relationships do not appear in Related Items on CI forms.

**Legacy CI relations formatter**

On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.
This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs.

**Related items field**

<table>
<thead>
<tr>
<th>Related Items:</th>
<th>Show 3 Levels</th>
</tr>
</thead>
</table>

**Note:** The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

**Flat layout**

Click the flat layout icon (†) to group the related CIs by relationship.

**Flat layout view**

- **Used by - Business Services**
  - Bond Trading
  - Client Services
  - [Bond Trading → ]IT Services
- **In Rack - Racks**
  - NY-02-02
- **Located in - Computer Rooms**
  - [NY2A → ]NY Floor 2
- **Runs - Web Servers**
  - apache linux den 200
- **Located in Zone - Data Center Zones**
  - [NY-02-02 → ]NY2A

**Tree layout**

Click the tree layout icon (†) to group the related CIs in a hierarchical tree.
CI relationship editor

Use the CI relationship editor to create CI relationships.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.

The relationship editor operates differently, depending on whether you select the **Use suggested relationship** check box.

- With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

  Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of [Suggested].

- Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

  **Note:** The following relationship types are used only for Service Mapping endpoints, and you cannot use them as a relationship type between two CIs:

  - Implement End Point To: Implement End Point From
  - Use End Point To: Use End Point From
  - Applicative Flow To: Applicative Flow From

Suggested relationships

If you select the **Use suggested relationship** check box in the editor, the **Suggested relationship** list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of **(Parent)** or **(Child)** to note the relationship descriptor, and suggested relationship types are displayed in blue and have a "*" prefix.
When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the ‘Feeds’ relationship type, the base CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.

**Downstream relationships**

If you do not select the *Use suggested relationship* check box in the editor, the **Downstream relationships** list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the **Child** column.

**Upstream relationships**

If you do not select the *Use suggested relationship* check box in the editor, the **Upstream relationships** list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the **Parent** column.

**Related information**

- Add a suggested relationship
- Create or edit a CI relationship
- Legacy CI relationship builder

**Supported browsers for the relationship editor**

You must use supported browser versions in order to use the latest CI relationship editor. If you do not use a supported browser version, the instance provides the legacy CI relationship builder.

- Firefox version 20 and up
- Chrome version 25 and up
- Safari version 6 and up
- Internet Explorer version 9 and up

**Create or edit a CI relationship**

Use the relationship editor to view, create or modify CI relationships. You can open the relationship editor from the CI Relations formatter.

**Before you begin**

Role required:
• To create relationships: ITIL or asset
• To view relationships, depending on the state of the Table API ACL:
  ◦ If inactive (default): ITIL or asset
  ◦ If active: ITIL or asset, and snc_platform_rest_api_access

For more information, see REST API and Table API.

About this task
The relationship editor operates differently, depending on whether you check the Use suggested relationship option or not.

Procedure
1. Launch the relationship editor:
   a. Open a CI form.
   b. Locate the Related Items section near the center of the form.
   c. Click the plus (+) icon on the Related items section.
2. To use suggested relationships, first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:
a. Select **Use suggested relationship**.

b. From the **Suggested relationship type** list, select a relationship type. You can filter the list of suggested relationships by using the filter check boxes.

<table>
<thead>
<tr>
<th>Filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide CI relationship</td>
<td>Hides any relationships between the base CI and another CI (such as &quot;Receives data from&quot;). Default filter is stored in the ci_manage_relationships_filter_hint.cmdb_ci user preference.</td>
</tr>
<tr>
<td>Hide user relationship</td>
<td>Hides any relationships between the base CI and a user (such as &quot;Logs reviewed by&quot;). The default filter is stored in the ci_manage_relationships_filter_hint.sys_user preference.</td>
</tr>
<tr>
<td>Hide group relationship</td>
<td>Hides any relationships between the base CI and a group (such as &quot;Backups done by&quot;). Default filter is stored in the ci_manage_relationships_filter_hint.sys_user_group user preference.</td>
</tr>
</tbody>
</table>

The **Configurations Items** list displays all the CIs that are appropriate for the base CI and the selected relationship type. The **Relationships** list at the bottom of the editor, displays all existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

c. From the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** section and clicking **Run filter**. If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.

d. In the **Relationships** section, click the plus icon (+) to add the new relationships. Alternatively, you can drag the selected CIs to the **Relationships** list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.

3. To not use suggested relationships, first select one or more CIs to be the child CIs in the relationship, and then select the relationship type:
a. Clear Use suggested relationship.

b. In the Configuration Items list, select one or more CIs as a second CI for the relationship. You can filter the list of Configuration Items by adding conditions in the Filter area and clicking Run filter. Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.

c. With at least one CI selected in the Configuration Items list, click the ‘+’ sign in the Downstream Relationships section or the Upstream Relationships section to create the relationship.

- Add the relationship to Downstream Relationships to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.
- Add the relationship to Upstream Relationships to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

d. For each newly created relationship in either the Downstream Relationships or the Upstream Relationships lists, click Please select a relationship and select a relationship type.

- The list of available relationship types in the Downstream Relationships list contains parent relationships only, in which the base CI is the parent CI.
- The list of available relationship types in the Upstream Relationships list contains child relationships only, in which the base CI is the child CI.
e. Click **Save** or **Save and Exit**. Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

**Related reference**
- Suggested class relationships

**Related information**
- CI relationships in the CMDB
- CI relationship security

**Legacy CI relationship builder**

Used to define CI relationships manually, this page is a sophisticated version of the standard slushbucket. In the legacy CI relations formatter, click the CI relationship builder icon (⊕) to display the legacy Define Relationships page.

**Select a CI relationship type**

The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate. Click the particular type of relationship you are interested in working with.

**Filter the list of CI relationships**

In the legacy relationship editor, the checkboxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of "Runs on" makes sense, but a relationship of "Provides HVAC for" does not. The default filter is stored in the user preferences `ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user`, and `ci_manage_relationships_filter_hint.sys_user_group`.

- **Hide CI relationship** -- Hides any relationships between this CI and another CI (e.g. "Receives data from").
- **Hide user relationships** -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
- **Hide group relationships** -- Hides any relationships between this CI and a group (e.g. "Backups done by").
Show all relationships -- If you have the appropriate role (out of the box this is itil_admin) you will have an additional checkbox labeled "Show all relationships." If you click that checkbox, the system will let you choose any relationship defined in the system, regardless of where it is on the "suggested" list for this type of CI.

Select CI relationship targets
In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CIs that are appropriate for the relationship you suggested. The left hand select box will contain a list of CIs that might reasonably be linked via this relationship, while the right hand box contains a list of those CIs which are already linked.

1. Link or unlink items.

<table>
<thead>
<tr>
<th>Link new items</th>
<th>Move that CI from the left hand box to the right hand box.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlink existing items</td>
<td>Move them from the right hand box to the left.</td>
</tr>
</tbody>
</table>

Result: When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

<table>
<thead>
<tr>
<th>Click the Save button.</th>
<th>This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the Cancel button.</td>
<td>This causes you to exit without saving your changes.</td>
</tr>
</tbody>
</table>

Related information
CI relationships in the CMDB

Relation qualifier
A relation qualifier, which is a CI of the Qualifier [cmdb_ci_qualifier] type, stores important information about the CI relationships.
In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. But, there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as `cmdb_ci_qualifier_trafficbased`). This results in having two records in the CI Relationship [cmdb_rel_ci] table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type `cmdb_ci_qualifier_trafficbased`.

For information about usage of relation qualifiers in the identification process, see [Identification rules](#).

**CI relationship security**

When applying security to CI relationships, it is important to apply the access controls both to the CI Relationship (cmdb_rel_ci) table and to create an operation `editCIRelations` to the * table as well.

If the current instance has defined security for `editCIRelations`, it will be applied to `edit_ci_relations` automatically in the process of upgrading, and the out-of-date security will be removed.

**Related information**
- CI relationships in the CMDB
- Create a CI relation rollup

**Create a CI relation rollup**

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

**Before you begin**
Role required: ecmdb_admin

**About this task**
CI relation rollup can be useful for tracking and for receiving notifications. For example:
In a sum roll up, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.

If a certain level of power consumption in a rack is exceeded, send a notification.

With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the `cmdb synch event` business rule on the `[cmdb_ci]` table. Although this business rule is active by default, you must modify the rule slightly before it will run.

**Procedure**

1. Navigate to **Configuration > Relationships > CI Relation Rollups**.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>CI Relationship Rollup fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>CI Relationship Type</td>
</tr>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Parent field</td>
</tr>
<tr>
<td>Child field</td>
</tr>
<tr>
<td>Rollup class</td>
</tr>
</tbody>
</table>

4. To run the `cmdb synch event` business rule, navigate to **Business Rules**.
5. Use the search box to find the `[cmdb synch event]` table.
6. Click the `cmdb synch event` business rule to go to the **Business Rule** page.
7. Select the **Update**, **Delete**, and **Query** check boxes.

   Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the **Active** check box on the `cmdb_rel_ci synch event` business rule.

**Related information**

**CI relationships in the CMDB**

**CMDB classifications**

CMDB classifications are groups of configuration items (CIs) that share attributes and are stored in their own table. Classifications allow administrators to define the hierarchy of CIs within the CMDB. A CI class refers to the actual table name in the instance database. In that context, CI Type is a friendly name that a CI is known by, such as computer, router, or printer.

As good practice, keep CI classifications as simple as possible.

**CMDB record types**

The CMDB contains the following major record types.

<table>
<thead>
<tr>
<th>Record types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item (CI)</td>
<td>Any computer, device, or service in the CMDB. A CI's record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.</td>
</tr>
<tr>
<td>Relation Type</td>
<td>A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI's perspective. For example, a parent CI that powers a child CI uses relation type <strong>Powers::Is Powered By</strong>. Example relation types include <strong>In Rack::Rack contains</strong>, <strong>Log Reviewed by::Reviews logs</strong> for, or <strong>Backup done by::Does backups</strong> for. CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form</td>
</tr>
</tbody>
</table>
Related Lists of CI components

Related lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.

By default, the Related Lists only display those components that are associated with that CI in the CMDB that has been discovered by the last scan. Components that are recorded in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: components that are CIs themselves (such as hard disks), and components that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is [Status] [!=] [Absent]. The filter condition for components that are not CIs is [Absent] [=] [false].

For example, a router can have several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.

Teams related list

The Teams related list associates a user group to a CI based on group type, providing flexibility in keeping track of the different types of groups assigned to a CI. Using the Teams related list can be useful if many data sources are used in the organization, and when using the IntegrationHub ETL.

In the base system, the Teams related list contains group types that match the fields:

- Approval Group
- Change Group
• Managed by Group
• Support Group

The Teams related list appears on CI forms for CIs of the Service [cmdb_ci_service] class and its descendent classes such as the Application Service [cmdb_ci_service_auto] class. When you set a group assignment on a CI form of one of those classes, that group assignment is automatically synchronized with the Teams related list. If you set an assignment group for an application service, a relationship record is created to represent the new group assignment for the CI. The Teams related list on such CI forms, always shows the current settings for the various group assignments for the CI.

If there are multiple groups assigned to a CI, then on the Teams related list on a CI form, you can designate one of those groups as primary. When an incident involving that CI is created, the incident is assigned to that primary group. Only one group type can be designated as primary for a CI at any given moment.

As an example, use the Teams related list for an application service with the following characteristics:

• Requires access to a database
• Runs on Linux servers
• Has a group assigned to manage the software portion of the actual application

In that example, you can track all of these group assignments by adding the appropriate group types and setting CIs with the new custom group types. The Teams related list lets you add group types that are needed in your organization, extending the initial list of supported group types. To add a group type, modify the dictionary definition of the group_type column in the cmdb_rel_team table:

1. On a CI form, select the Teams related list.
2. Click the Group type column. Select the Configure menu item and then click Dictionary.
3. Select the dictionary entry for the cmdb_rel_team table and the group_type column.
4. On the Dictionary Entry form, click the Choices tab and then click New. Fill out the form to add a new group type choice, such as DB Group (db_group).
Create a CI class

Create a CI class (table) that is an extension of an existing CI class. Then create identification and reconciliation rules for the new class.

Before you begin
The class that is being extended must have its *Is_Extendable* field checked, indicating that the class is extendable.

Roles:
- Itil_admin and personalize_dictionary: Required for editing the dictionary table
- admin: Full access

About this task
The CI Class Manager is a centralized location for managing CMDB tables and for creating a class that is derived from another CMDB class. Creating a class requires basic details such as a label and a name. Identification and reconciliation rules are also required to ensure that the class can be successfully identified by the identification engine.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list. Then select the class that the new class is extended from.
3. Click Add Child Class.
   The Add Child Class option appears only if the selected class is extendable.
4. On the Provide Basic Info tab, fill out the information and then click Next.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>A unique label for the class (such as Laptops or Thin Clients). The label appears on list and form views for the class. Updating the Label field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables.</td>
</tr>
<tr>
<td>Field</td>

<td><strong>Table name</strong></td>
<td>Automatically populated based on the table label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.</td>
</tr>
<tr>
<td></td>
<td>• For a table in the global application, the name is prefixed with the string 'u_cmdb_ci'. This prefix denotes that the table is created by a user in the CMDB.</td>
</tr>
<tr>
<td></td>
<td>You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).</td>
</tr>
<tr>
<td></td>
<td>Maximum string length is 80 characters.</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Explanation of the use purpose of the class.</td>
</tr>
<tr>
<td><strong>Icon</strong></td>
<td>The icon associated with the class.</td>
</tr>
<tr>
<td><strong>Extensible</strong></td>
<td>Indicator of whether this class can be extended.</td>
</tr>
<tr>
<td><strong>Principal Class</strong></td>
<td>Denotes whether this class is included in the Principal Class filter. If this class is included in the Principal Class filter, then CIs from this class appear in CI list views when the Principal Class filter is applied.</td>
</tr>
</tbody>
</table>

5. On the **Add Attributes** tab, click the + sign and enter details for each new class column. Then click **Next**. For description of the different columns in the
list view, see Dictionary entry form. Set **Identification** to true to designate the column as a CI identifier for class identification.

6. On the **Set Identification Rule** tab, examine the **Derived** identification rule and its **Identifier Entries**. You can click **Replace** to replace the derived rule with a new identification rule and new identifier entries specific to the new class. See **Identification rules** for details about identification rules and identifier entries.

7. On the **Dependencies** tab, click **Add dependency** to add dependent rules. The **Dependencies** tab appears only if there are dependent identification rules for the selected class.

8. On the **Add Reconciliation Rules** tab, click **Add** to create the following rules:
   a. **Reconciliation Rules**
   b. **Data Refresh Rules**

9. On the **Add Suggested Relationships** tab, review the diagram of the class derived suggested relationships. Use the filter to display only inbound, outbound, or specific relationship types. To add a suggested relationship for the class:
   a. Click **New**.
   b. In the Add Suggested Relationship dialog box, select a **Relationship** and a **Target Class** for the relationship. **This Class** and the **Target Class** become parent or child in the suggested relationship, based on your selection of the **Relationship**.
   c. Click **Save**.
      When building relationships for the class in the Query Builder, the list of suggested relationships is updated.

10. Click **Done**.

**Related information**

CMDB Identification and Reconciliation

**Reclassify a CI**

You can upgrade, downgrade, or switch the class of a CI by modifying its **Class** attribute.

**Before you begin**
Role required: itil or asset (In general, the roles required to update a CI)
About this task
Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes defined for the class.

When you reclassify a class, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI's current sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class (the sys_id of the CI is retained).

Depending on the reclassification, the following occurs.

**Downgrade**

The CI class is updated to a class that is higher in the class hierarchy, and the newly assigned class is a parent of the current class. For example, reclassifying a CI from the `cmdb_ci_server` class to the `cmdb_ci_computer` class.

For example, the `cmdb_ci_server` class has attributes that the `cmdb_ci_computer` class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the `cmdb_ci_computer` class.

**Upgrade**

The CI class is updated to a class that is lower in the class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the `cmdb_ci_computer` class to the `cmdb_ci_server` class.

**Switch**

The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the `cmdb_ci_linux_server` class to the `cmdb_ci_win_server` class.

A switch is a combination of a downgrade and an upgrade. For example if the CI is downgraded to the `cmdb_ci_server`, and then upgraded to the `cmdb_ci_win_server` class. Therefore, attributes are lost in the same manner as in a downgrade operation.
Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For information about CI reclassification by the Identification and Reconciliation Engine (IRE) and related system properties that control the behavior of automatic CI reclassification, see CI reclassification during IRE processing.

**Procedure**

1. Locate the CI that you want to reclassify and display it in a list view.
   You can use the application navigator. Or for example, if the CI is a server, then in the navigation search box, type `cmdb_ci_server.list` to display the CI in the **Servers** view.

2. Ensure that the **Class** field is displayed in the list.
   If you do not see this attribute, personalize the list to add the **Class** field.

3. Double-click the **Class** value for the CI, and select a new class.

4. Click the green check box to confirm your selection.

**Delete CIs for a CMDB class**

You can use the CI Class Manager to delete CIs that are no longer needed.

**Before you begin**

Role required: itil_admin

**Procedure**

1. Navigate to **Configuration > CI Class Manager**.

2. Click **Hierarchy** to expand the CI Classes list and then select the class from which you want to delete CI records.

3. In the class navigation bar on the left, click **CI List**.

4. On the CI List form view, select the CIs that you want to delete.
   Select the check box in the header to select all the CIs that are visible.

5. Click **Actions on selected rows** and then click **Delete**.

6. Click **Delete** in the **Confirmation** dialog box.

**View and edit class definitions and metadata**

Use the CI Class Manager as a central location to explore the CMDB class hierarchy, CI table definitions, and class CIs. View the details of each table such as its label and fields, relationships, and all related metadata definitions.
About this task
The CI Class Manager displays the entire CMDB class hierarchy in a tree-view format, consolidating class definitions into a central location. It lets you display metadata information for a class, such as reconciliation rules, mandatory and recommended fields, and audit templates. You can also select a specific class to view, to modify, or to extend its definition to create a derived class. For each class, you can directly access CMDB Health settings, identification and reconciliation rules, orphan scorecard, and certificate template, defined for the class.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list and then select a class to display details for.
3. On the class navigation bar, expand the following items to display further details for the class.
   - Class Info:
     - Basic Info: Displays details for the selected class, such as the display and table name, description, and class icon. Lets you edit some of the class definitions, and prevents editing of some details such as the table name. Role required: itil for reading, and itil_admin and personalize_dictionary for writing.
     - Attributes: Displays table attributes (columns). Lets you edit those attributes and add new ones. For description of the different attributes in the list view, see Dictionary entry form. Role required: personalize_dictionary and itil_admin for editing, and personalize_dictionary and itil for reading

To add an attribute:

a. Click the Added tab and scroll to the bottom of the list.
b. Double-click Insert new column, and enter details for each new class attribute. Set Identification to true to designate an attribute as a CI identifier for class identification.
c. Click Save, and fix any errors that appear.

- Identification and Reconciliation: Displays and lets you edit, create, and delete identification and inclusion rules, reconciliation and data refresh rules for the class.
See CMDB Identification and Reconciliation for more information.
Role required: itil for reading, and itil_admin (on top of itil) for writing.

- **Dependent Relationships**: Displays and lets you edit, create, and delete hosting and containment relationships for the class. See CMDB dependent relationship rules for more information.

  Role required: itil for reading and itil_admin (on top of itil) for writing.

- **Suggested Relationships**: Displays a diagram of all suggested relationships for the class, and lets you delete or add suggested relationships for the class. Use the navigation tools to increase or decrease the diagram, and to move the diagram on the page. Use the filter to display specific relationship types. See Suggested class relationships for more information.

  Role required: itil

- **All Relationship Rules**: Displays a combined diagram of all suggested relationships and all dependent relationships for the class. Use the navigation tools to zoom in or out, and to move or center the diagram on the page. Use the filter to display specific relationship categories.

- **Health**: Lets you review and configure CMDB Health-related system properties, scorecards, and rules and settings for all CMDB health KPI and metrics, at the class level. See CMDB Health for information about enabling and configuring CMDB Health, and displaying health reports.

  Role required: Itil for reading and itill_admin (on top of itil) for writing.

- **CI List**: Displays the CIs of the selected class. Lets you create CIs of the selected class and perform other operations such as delete.

  Role required: Itil for reading. Writing requirements follow the selected table settings.

**Related information**

Create or modify map icons

Update the list of classes in the Principal Class filter

Manage the list of classes that are included in the Principal Class filter to restrict the CIs that appear in CIs list views to only specific classes that you need. You can add or remove CMDB classes from the Principal Class filter.

**Before you begin**

Role required: itil_admin and personalize_dictionary
About this task
Apply the CMDB Principal Class filter in list views of CMDB CIs so that only CIs that belong to the classes in the filter, appear. In a base system, the Principal Class filter doesn’t contain any classes. The principal class setting applies only to the current class and is not derived by child classes.
For more information about list view filters, see Save and use filters in a list view.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list and then select a class to add or remove from the Principal Class filter.
3. On the class navigation bar, navigate to Class Info > Basic Info.
4. On the Basic Info form, select or clear Principal Class.
5. Click Save.

Results
The Principal Class filter is updated with the addition or the removal of the class from the list of classes in the filter. When you apply the Principal Class filter to a Configuration Items list view, only CIs from classes included in the filter, appear.

What to do next
In both of the following scenarios, the list of CIs refreshes to display only CIs whose class is included in the Principal Class filter:

• 1. In the Filter navigator, type cmdb_ci.list and then press the Enter key.
   2. In the Configuration Items list view, click the List controls menu icon, select Filters and then click Principal Class.

• 1. Open a Change Request form.
   2. Scroll down and select the Affected CIs tab. Click Add.
   3. In the Add Affected CIs form, click the List controls menu icon, select Filters and then click Principal Class.

For more information about adding affected CIs to change requests, see Associated CIs on a change request.

Querying the CMDB
The CMDB Query Builder allows you to easily build complex infrastructure and service queries, that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships.
The CMDB Query Builder provides a canvas into which you drag the CI classes that you want to include in a query. Then you add relationships, AND/OR operators between the CI classes, and define the relationship properties to query for. You can use saved queries to populate a CMDB group with CIs, and then use scriptable APIs to retrieve the CI list and apply actions collectively to all the CIs in the group.

There are two query types: CMDB Query and a Service Mapping query, which you can use separately or in combination to create queries such as:

- All hardware in my service offering that has Windows installed.
- All CIs of a certain type in an application service. For example, all Apaches/Web Servers/Linux servers per service.
- All virtual servers and the physical servers that host them.
- All servers that are not mapped to any application service.
- All application services and their associated servers and the cost of each server. This query helps evaluate the cost of technology for each application service.

**Starting node**

The starting point of the query which is labeled as **STARTING NODE** on the Query Builder canvas. The first class that you drag to the canvas becomes automatically the starting node of the query and you cannot select a different starting node. In a complex query, the starting node must always be the only node connected to an AND/OR operator. If you try to connect a second node to an operator that the starting node is connected to, the query fails to run and a prompt to select a different starting node appears.

**CMDB Query**

A query type that queries the infrastructure for CI classes and the relationships and references that connect them. You can optionally add the context of non-CMDB tables to a CMDB query.

You can include **Application services** in a CMDB query, to find, for example:

- All critical application services in your database.
- All infrastructure in a particular application service.
- All incidents for a particular CI in an application service, or all incidents for all the CIs of an application service.
- All application services with a pattern of a service connected to a database, and where the database has incidents.
The list of available non-CMDB tables includes a subset of tables within the system, which have a reference to the Configuration Item [cmdb_ci] class or its children. The list of non-CMDB tables, includes tables such as Asset, Task, and Problem. You can use the system property glide.cmdb.query.non_cmdb.blacklisted_tables to narrow down the list of non-CMDB tables to choose from.

Service Mapping Query

A query type that queries application services. The query is framed within an application service map. You define a pattern, and query for application service maps that have that pattern in their definition. The relationships in Service Mapping queries are matched by single-level direct relationships which is similar to the CMDB queries, and in addition, they are also matched by multi-level indirect relationships if they exist. A query for a relationship between two CI classes is satisfied even if the two CI classes are connected by intermediate CI classes that are not specified in the query.

Combination Query

You can combine the two query types by incorporating a saved Service Mapping query into a CMDB query. For example, create a CMDB query for Windows Servers that are connected to Tomcat WAR. Then connect the Tomcat WAR CI class to a Service Mapping query. The query changes to find Windows Servers that are connected to Tomcat WAR which is included in the services that returned by the Service Mapping query. You can inverse that query by choosing Does Not Belong To Service. This changes the query to find Windows Servers that are connected to Tomcat WAR that is not included in services returned by the Service Mapping query.

Relationship properties

When you connect CI classes on the canvas, the CMDB Query Builder displays the Connection Properties in the right-side bar, where you can configure the properties of the relationship, such as the relationship direction. For Service Mapping queries, you can configure whether to query for related or unrelated CIs.

Connection properties include:

- Relationship type: Query for CIs and descending classes with specific relationship types.
- Relationship direction: Which CI class is the parent and which CI class is the child in the relationship.
- Relationship level: Query only on first-level relationship or also on second-level relationships.
• No relationships: Query for CIs which have no relationship to the set class.
• References fields: A field that the parent and ancestor parent CI classes use to reference the child CI class.

Newly added relationships between CI classes may take up to 30 minutes to appear in the relationship list.

CMDB groups

Domain separation and CMDB Query Builder
Domain separation is supported in the CMDB Query Builder. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

How domain separation works in the CMDB Query Builder
With the CMDB Query Builder you can easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships. Domain separation is set to be on by default.

• Saved Query
The user creates a query by dragging a class node from the class hierarchy and dropping it to the canvas and connecting the nodes with the relationships type.

The user can save the created query as an XML file to the database [qb_saved_query] table in the CMDB for future use. The saved query is domain separated.

• Query results
With a saved query, the user clicks Run and the query result is saved and displays in the platform list view.

In the query results, the domain separation behaves in the same way as the platform list view for the CI relationship [cmdb_rel_ci] table and CMDB CI [cmdb] table. Consequently, since the CI relationship is not domain separated, all relationships of the query result display, regardless of the domains. Conversely, if the query result is CI only, since the CMDB CI is domain separated, the results display only if visible in the current domain.

Domain separation and Configuration Management Database (CMDB)

Build a CMDB query using the CMDB Query Builder

A CMDB query type that queries the infrastructure for CI classes and optionally non-CMDB tables, and the relationships and references that connect them.

Before you begin

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.

About this task

Build the query by dragging the CI classes and non-CMDB tables that you want to include in the query. Then dropping them as nodes on the canvas, and defining relationship properties between them. You can filter on the attributes of any node to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

See Sample queries for a step-by-step walk through of building CMDB queries in the CMDB Query Builder, including queries that integrate application services.

Procedure

1. Navigate to Configuration and click CMDB Query Builder.

2. On the CMDB Query Builder page do either of the following steps:
   - Click Create new. Type in a Name, choose CMDB Query as the Query type, and then click Create.
   - Click a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   - Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The default name of the new query contains the string 'copy'.

3. On the canvas, you can do any of the following operations:
• Add CI classes to the query: On the CMDB Classes tab, select classes from the hierarchy list and drag them to the canvas.

• Add an Application Service CI to the query: On the CMDB Classes tab, select the Application Service class from the hierarchy list and drag it to the canvas.

In Application Service Properties on the right-side bar, you can select Convert attached nodes to pattern to query on patterns between the application service and other CMDB class nodes. When querying on a pattern, the nodes on both ends of the pattern connection, can be any number of levels apart. If Convert attached nodes to pattern is not selected, then the connection between the application service node and other CMDB class nodes, represent direct relationships.

• Add non-CMDB tables to the query: Select a table from the Non-CMDB Tables list and drag it to the canvas.

  Note: A non-CMDB table cannot be the starting node in the query.

• Add connections (relationships or patterns for application services) between two nodes on the canvas:

  a. On the first node in the connection, click the small square at the center of the right side.

  b. On the second node in the connection, click the small square at the center of the left side to create the connection.

### Connection UI Notations

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full line</td>
<td>A relationship in a CMDB query.</td>
</tr>
<tr>
<td>Red asterisk at the center of the connection line</td>
<td>Information such as relationship type is missing, invalidating the query.</td>
</tr>
<tr>
<td>Levels:&lt;n&gt; Types:&lt;n&gt; or a &lt;Reference type&gt; notation on the connection line</td>
<td>As applicable: The number of relationship levels and the number of relationship types included for the connection. Or, a reference type for a relationship that is a reference.</td>
</tr>
<tr>
<td>Dashed line</td>
<td>A pattern connection between an application service node and another node.</td>
</tr>
</tbody>
</table>
• In Connection Properties on the right-side bar, configure relationship settings (click the connection line if necessary):
  a. In the Relationship Direction section, select the **Parent** node (the **Child** node automatically adjusts).
  b. In the Relationship Levels section, set **Level** to **First level relationships** if the CIs are directly connected. Or, **Up to 2nd level relationships** if the CIs are connected either directly or indirectly through another CI.
  c. In the Relationship Types and Related Items section, select either option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Relationships</td>
<td>To query for CIs with no connecting relationships, such as All Tomcat WAR CIs which are not connected to a Windows Server.</td>
</tr>
<tr>
<td>Add Relationship Types</td>
<td>To select specific or any relationship type.</td>
</tr>
<tr>
<td>Add a Related Item</td>
<td>To query for related CIs between the nodes.</td>
</tr>
</tbody>
</table>

• Configure CI reference column for a connection to a non-CMDB table: In the Connection Properties right-side bar, in the CI Reference Column section, select the column with a reference to a CI from the **Use CI reference column** list. If only one option is available, it is automatically selected.

• Configure the pattern between an application service node set with the **Convert attached nodes to pattern** option, and a non-CMDB table node: Select **Apply <table> reference filter to all nodes in the pattern** to apply the query to the application service CI itself and to the CIs within the application service.

• Add filters to a class node: Apply filters to narrow down a class query to a specific set of CIs or to a single specific CI.
  a. Point to the node to add a filter to, and then click the **Apply filters** icon that pops up above the node.
  b. In the Filters section, add attribute and **related list conditions**.
  c. Close the **Filters** section.
  For example: Add a filter for database location to query for databases located in Seattle.

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Click **Applied Filters** in the right-side bar to view all filters for each node on the canvas.

- **Add And/Or operators to the query:**
  - a. Connect one node to two other nodes.
  - b. Click the **And** box that appears on the connection line, to toggle between the **And/Or** operators.
    For example: C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for **All Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server**.

- **Add property columns for a node, to appear in the query results:**
  - Note: For a relationship, the query results include the **parent**, **child**, and **type** columns. You cannot add any other columns from the [cmdb_rel_ci] table.
    
    a. Click **Properties** in the right-side pane.
    b. Click a node once or twice, so that the Report Columns section appears in the right-side bar, and then click **Add Columns**.
    c. Select properties and then click outside the properties list to close it.

- **Create a combination query by integrating a Service Mapping query into a CMDB query:**
  a. When building a CMDB query, click **Saved Service Queries** in the left-side bar.
  b. Select and then drag a Service Mapping query to the canvas.
    This query returns all CIs that satisfy the CMDB query, and that are included in the services returned by the embedded Service Mapping query.

- **Add a search tag that can then be used as a search criteria for saved queries:**
  a. Click the **Add Tags** icon at the top of the canvas.
  b. Click **Add Tag** and in the **Query Tags** dialog box enter one or more tag strings.
  c. Click the **Add Tags** icon again to close the **Query Tags** dialog box.

**4. Click Save.**

On the **Saved Queries** tab, point to a saved query widget and click **Query Information**. Query details such as the query type, last update date, CMDB groups associated with the query, and the query schedules appear.
What to do next

• Click **Run**.

Only the first 100 results of the query appear in the results pane.

  ◦ Click **Load More Results** to view the next set of 100 results.
  ◦ Click **Load All Results** to view the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

Click a CI to open its CI form, and on the CI form click **Dashboard** to view CI health in the CI dashboard.

**Note:**

  ◦ Ensure that the glide.security.use_csrf_token property is set to true, allowing all results to appear.
  ◦ When **Level** is set to **Up to 2nd level relationships**, the relationship type does not appear in the query results.
  ◦ When a query is running, wait for it to complete or to time out before opening or running another query.

• **Modify Query Builder settings:** Click the **(Settings)** icon to open the **Query Builder Settings** dialog box.

• Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.

• **Create reports in CMDB Query Builder.**

• **Create a schedule** to run the query at a future time, and to email the results to interested parties.

• **Export query results:**

    Click the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

• **Export and import a CMDB query** to port a query definition between instances.

• **Populate a CMDB group** using a saved query.

**Related information**

**Sample queries**
Build a Service Mapping query using the CMDB Query Builder

The Service Mapping query type is a pattern consisting of classes and relationships between those classes. After you build the pattern and run the query, the query returns all the Service Mapping services that contain that pattern.

Before you begin

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.

About this task

Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

See Sample queries for a step-by-step walk through of building a Service Mapping query in the CMDB Query Builder.

Procedure

1. Navigate to Configuration and click CMDB Query Builder.

2. On the CMDB Query Builder page do either of the following:
   
a. Click Create new. Type in a Name, choose Service Mapping Query as the Query type, and then click Create.
   
b. Click on a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   
c. Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The new query's default name contains the string 'copy'.

3. On the canvas, you can do any of the following:
• Add CI classes to the query: Select classes from the CMDB Classes hierarchy list and drag them to the canvas.

• Add connections (relationships) between two nodes on the canvas:
  a. On the first node in the relationship, click the small square at the center of the right side.
  b. On the second node in the relationship, click the small square at the center of the left side to create the connection.
  c. In Connection Properties on the right-side bar, configure the following (click the connection line if necessary):
     ◦ In the Relationship Direction section, select the Parent node (the Child node automatically adjusts).
     ◦ In the Service Query Properties section, select Find Related CIs or Find Unrelated CIs to query for a pattern in which the two classes have or do not have relationships with each other, respectively.
     For example, All Tomcat WAR CIs which are not connected to a Windows Server.

<table>
<thead>
<tr>
<th>Relationship UI Notations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Notation</strong></td>
</tr>
<tr>
<td>Dashed line</td>
</tr>
</tbody>
</table>

• Add filters to a class node: Apply filters to narrow down a class to a specific set of CIs or to a single specific CI.
  a. Point to the node to add a filter to, and then click the Apply filters icon that pops up above the node.
  b. In the Filters section, add attribute and related list conditions.
  c. Close the Filters section.
      For example: Add a filter for business criticality to query for businesses that are 'most critical'.
      Click Applied Filters in the right-side bar to view all filters for each node on the canvas.

• Add And/Or operators to the query:
  a. Connect one node to two other nodes.
  b. Click the And box that appears on the connection line, to toggle between the And and the Or operators.
For example C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server.
Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

• Add property columns for a node, to display in the query results:

  Note: For a relationship, the query results display the parent, child, and type columns. You cannot add any other columns from the [cmdb_rel_ci] table.

  a. Click Properties in the right-side pane.
  b. Click a node once or twice, so that the node’s Report Columns section appears in the right-side bar, and then click Add Columns.
  c. Select properties and then click outside the properties list to close it.

• Select columns and add filters that will be applied to the resulting set of services:

  a. Select Properties in the right-side bar, and then click an empty space on the canvas to ensure that nothing is selected.
  b. Click Add Columns at the bottom of the right-side bar and select columns to add. Click outside the columns list to close it.
  c. Click the Apply Service Mapping Query Filters icon at the top of the canvas and add filters.

• Inverse the entire query and search for all Service Mapping services that do not include the query pattern:

  ◦ Click a node once or twice so that Query Properties appear in the right-side bar. In the Metadata section, toggle Services Including This Pattern to enable or disable the option.

• Add a search tag that can then be used as a search criteria for saved queries:

  a. Click the Add Tags icon at the top of the canvas.
  b. Click Add Tag and in the Query Tags dialog box enter one or more tag strings.
  c. Click the Add Tags icon again to close the Query Tags dialog box.

4. Click Save.

On the Saved Queries tab, point to a saved query widget and click Query Information to view query details such as the query type, last update date, and the query schedules.
What to do next

• Click **Run**.

The query results pane displays only the first 100 results of the query.
  ◦ Click **Load More Results** to display the next set of 100 results.
  ◦ Click **Load All Results** to display the rest of the query results, up to the number specified by the `glide.cmdb.query.max_results_limit` system property (10,000 by default).

Click a CI to open its CI form, and on the CI form click **Dashboard** to view CI health in the CI dashboard.

⚠ Note: When a query is running, wait for it to complete or to time out before opening or running another query.

• Modify Query Builder settings: Click the (Settings) icon to open the **Query Builder Settings** dialog box.

• Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.

• Create reports in CMDB Query Builder.

• Create a schedule to run the query at a future time, and to email the results to interested parties.

• Export query results:
  Export query results that are visible: Click the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

• Export and import a CMDB query to port a query definition between instances.

• Populate a CMDB group using the saved query.

Related information

Sample queries

Sample queries

Use the following sample queries to build your own CMDB queries and Service Mapping queries.

Using the CMDB Query Builder requires that the **UI16 plugin** (com.glide.ui.ui16) is activated.
CMDB query sample

Use this example to build a CMDB query to find all servers with a connection to a database.

Example:

1. Navigate to Configuration and click CMDB Query Builder
2. Click Create new. Enter a Name - All servers with a connection to a DB. Choose CMDB Query, and click Create.
3. In the CMDB Classes list, locate the Server class, and drag it to the canvas.
4. Locate the Database class, and place it to the right of the Server class node on the canvas.
5. Click at the center of the right side of Server, and then at the center of the left side of Database to create a connection.
6. Select the Server 1 node on the canvas. In the Relationship Types and Related Items section in the right-side bar, click Add Relationship Types and add all the relationships from the list.
   Note that the added relationships appear in the right-side bar, in the Relationship Types and Related Items section.
7. Click Save, and then click Saved Queries on the left to see the widget for the saved query.
8. Click the query widget to return to the canvas in edit mode.
9. Click Run to execute the query.
   Review the query results. Each row displays the name of a server CI, the name of a database CI, and the relationship type between them.
10. Add columns to the query results:
    a. Click the Server 1 node on the canvas once or twice so that the Server 1 Report Columns section appears in the right-side pane. Click Add Columns.
    b. Select Manufacturer and then click outside the columns list to close it.
    c. Click Run.
       Review the query results which now include the Manufacturer column.
    d. Click Save again to save all your customization for this query.

CMDB query sample - Application service 1

Use this example to build a CMDB query to find all critical application services, and their owner.
Example:

1. Navigate to **Configuration** and then click **CMDB Query Builder**.
2. Click **Create new**.
3. Enter **All critical application services** as the query **Name**. Choose **CMDB Query** and then click **Create**.
4. In the **CMDB Classes** list, locate the **Application Service** class, and then drag it to the canvas.
5. Add a filter to the application service node:
   a. Point to the application service node, and then click the **Apply filters** icon that appear.
   b. In the Filters section, add the condition **[business criticality] [is] [1 - most critical]**.
   c. Close the Filters section.
6. Add columns to the query results:
   a. In the Properties right-side bar, click **Add Columns**.
   b. Select **business criticality** and **owned by**, and then click outside the columns list to close it.
7. Click **Save**.
8. Click **Run** and then review the results. You can for example, locate any of the critical application services without an owner.

**CMDB query sample - Application service 2**

Use this example to build a CMDB query to find all application services, for which there is an incident or a change request, for either, the application service itself, or any CI within the service.

Example:

1. Navigate to **Configuration** and then click **CMDB Query Builder**.
2. Click **Create new**.
3. Enter **Application services with incidents or change requests** as the query **Name**. Choose **CMDB Query** and then click **Create**.
4. In the **CMDB Classes** list, locate the **Application Service** class and then drag it to the canvas.
5. Click **Non-CMDB Tables**.
6. Locate the **Incidents** class in the class hierarchy, and then drag it to the canvas.
7. Locate the **Change Requests** class in the class hierarchy, and then drag it to the canvas.

8. Connect the Application Service and the Incidents nodes, and then, in the Properties right-side bar:
   a. Select **Apply Incidents reference filter to all nodes in the pattern**.
   b. Set **Use CI reference column** to **Configuration item**.

9. Connect the Application Service and the Change Request node, and then, in the Properties right-side bar:
   a. Select **Apply Change Request reference filter to all nodes in the pattern**.
   b. Set **Use CI reference column** to **Configuration item**.

10. Click the **And** operator between the Incidents and the Change Request nodes, and switch it to **Or**.

11. Click **Save**.

12. Click **Run** and then review the results.

**CMDB query sample - Application service 3**

Use this example to build a CMDB query to find all hardware in my service offering that has Windows installed.

**Example:**

1. Navigate to **Configuration** and then click **CMDB Query Builder**.

2. Click **Create new**.

3. Enter **All hardware in my service offering that has Windows installed** as the query **Name**. Choose **CMDB Query** and then click **Create**.

4. In the **CMDB Classes** list, locate the following classes, and then drag them to the canvas.
   - Service
   - Service Offering
   - Application Service
   - Searching for infrastructure, Hardware

5. Connect the Service node to the Service Offering node.

   In the Properties right-side bar, click **Add Relationship Type** and select the **Connect to::Connected by** relationship.

6. Connect the Serviced Offering node to the Application Service node.
In the Properties right-side bar, click **Add Relationship Type** and select the **Connect to::Connected by** relationship.

7. Click the Application Service node.

   In the Properties right-side bar, select **Convert attached nodes to pattern** to include all CIs within the application service, in the query.

8. Connect the Application Service node to the Hardware node.

9. All infrastructure under Service,

10. Click **Save**.

11. Click **Run** and then review the results.

   You can click **Column options** of the Service column header, and select to **Group by Service**. Then expand a service to see all the hardware infrastructure under that service.

12. Return to the CMDB Query Builder window, to expand the query to include only infrastructure CIs on which Windows is installed.

13. Click **Non-CMDB Tables**, locate the **Software Instance** class, and drag it to the canvas.

14. Connect the Hardware node to the Software Instance node.

   In the Properties right-side bar, set **Use CI reference column** to **Installed on**.

15. Point to the Software Instance node, and click on the **Apply filters** icon that appears. In the Filters section, add the condition **[Product Name.Name] [is] [windows]**. Close the Filters section.

16. Click **Save**.

17. Click **Run** and review the new results.

**Service Mapping query sample**

Use this example to build a Service Mapping query to find all Linux servers in services.

**Example:**

1. Navigate to **Configuration** and click **CMDB Query Builder**

2. Click **Create new**. Enter a **Name** - **Linux server in services**. Choose **Service Mapping Query**, and click **Create**.

3. In the **CMDB Classes** hierarchy list, locate **Linux Server** and drag it to the canvas.

4. Click **Run**.
Review the query results. Each row displays the name of a Service Mapping Service and the name of a Linux Server that is a member of that service.

5. On the right-side pane, click **Disable Service Including This Pattern** and then click **Run** again.

Review the query results. Now, each row displays the name of a Service Mapping Service that does not include the specified Linux Server.

**Run a partial CMDB query**

You can run a partial query in the CMDB Query Builder by defining a section of a query, and then running it.

**Before you begin**

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

**About this task**

While building a query or reviewing a saved query, you can run only a section of the query. On the canvas in the CMDB Query Builder, highlight a section of the query which contains the nodes and relationships of the partial query that you want to run. You can then examine the results of the partial query, and update the query if needed.

**Procedure**

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. On the CMDB Query Builder page, click a tile to open an existing query.
3. Click the selection tool under the **navigation tool** to switch to a section selection mode.
4. Border a section of the query:
   a. Click the mouse device on the upper left corner of the section that you want to create.
   b. Drag the mouse device to the bottom right corner of the section that you want to create. As you drag the mouse device, the selected section is highlighted in light blue.
   c. Release the mouse device. The query nodes that are included in the partial query, appear with a blue border.
5. Click **Run**.
6. In the Pick Starting Node dialog box, select the starting node for the partial query, and click **Confirm**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Results
The results of the partial query appear in the Results pane.

Batch size for CMDB Query Builder queries
In a base system, a global batch size of 100 is allocated for every Query Builder query run. If needed, you can use a system property to override the default global batch size, or optimize the batch size value per saved query.

Queries can differ widely as they can be configured to query a wide variety of classes. Therefore, the batch size in the base system might not be optimal for every query, and some queries might time out or take a long time to complete. The optimal batch size for running queries depends on system load such as amount of data and number of relationships in your system. Contact Customer Service and Support for assistance in calculating the batch size for your query.

Batch size is applicable and behaves the same in all query run scenarios, regardless of how the run was initiated:

- Query Builder user interface (ad hoc or saved query)
- Query Builder Scriptable API
- Scheduled jobs
- CMDB groups

The batch size for query runs is allocated in the following priority order:

1. The value in the **Execution Batch Size** field in the Saved Queries table, for a specific saved query. If set, this value applies only to the saved query, and has priority over the global value of 100 and the value of the `glide.cmdb.query.batch_size` system property.

2. The value of the system property `glide.cmdb.query.batch_size`, if exists, determines globally the batch size that is allocated to all query runs. If you add and set this property, the value applies to all queries, other than saved queries with **Execution Batch Size** value set.

3. A global value of 100, if the previous two options are not configured.

Modifying batch size for queries
If you are experiencing performance problems when running queries, you can modify the batch size value:

- Globally for all queries: By adding (if necessary) and setting the value of the system property `glide.cmdb.query.batch_size`.

- Per saved query: Set batch size for a specific saved query
Set batch size for a specific saved query

Configure a custom batch size for a CMDB Query Builder saved query that takes a long time to complete or that times out. A custom batch size overrides the global batch size in the base system and the value of the glide.cmdb.query.batch.size system property.

Before you begin
Role required: admin

About this task
Contact Customer Service and Support for assistance in calculating the batch size for your query. Also, see KB.... for more details.

Procedure
1. In the Filter navigator, enter qb_saved_query.list and press Enter to navigate to the Saved Queries table.
2. In the Saved Queries list view, locate the saved query for which you want to change batch size.
3. Set or modify the value in the Execution Batch Size field. Set the value to be greater than the global value in the glide.cmdb.query.batch.size property, or increase any existing value.

Navigation in CMDB Query Builder
Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

Using the Query Builder requires that the UI16 plugin (com.glide.ui.ui16) is activated.

Use the buttons in the navigation tool as follows:
• Use the plus sign (+) to increase magnification of the query.
• Use the minus sign (-) to decrease magnification of the query.
• Click the center dot to center the query on the canvas.
• Use the direction arrows to move the query in that direction.
• Use the selection tool under the navigation tool to toggle between two states:
Moving the entire query on the canvas.
Bordering a section of the query, which you can then run as a partial query.

Create reports in CMDB Query Builder

Use CMDB Query Builder reports to show the results of a CMDB query or a Service Mapping query. Create a basic report, or a dynamic report that automatically updates when the results of the associated saved query change.

Create a dynamic report

After running a saved query in the CMDB Query Builder, create a dynamic report that continuously updates to show the latest query results. You can use a dynamic report as any other report created using Reporting and you can add it to Performance Analytics dashboards.

Before you begin

Ensure that the query that you want to create a dynamic report for is a saved query, and that there is a specified schedule for the query. Also, run the saved query and ensure that all query results are visible.

Role required:
• To create: cmdb_query_builder and report_user
• To view: Reporting role requirements might apply, see Administering reports for Reporting role requirements.

In a base system, the cmdb_query_builder role is contained in the itil and asset roles.

About this task

The Create Report button in CMDB Query Builder which is used to create a dynamic report, is activated only if:
• The query is saved
• The query has a schedule
• The entire set of query results is present after a query run

The initial dynamic report that you create, is based on the results from the initial run of the saved query. Then, on every subsequent run of the saved query, the associated report automatically updates with the latest query results.

However, if you change the query definition itself, the query and the report are no longer in sync and you must create a new report.
Procedure

1. Navigate to **Configuration > CMDB Query Builder**.

2. In the **Saved Queries** tab, select the saved query for which you want to create a report.
   Ensure that the query has a specified schedule.

3. Click **Run** and ensure that all query results appear. Click **Load All Results** if available, to load all results.
   The **Create Report** button is enabled only if all query results are showing.

4. Click **Create Report**.
   If the CMDB Query Builder displays the query results in a new tab, then after the new tab opens with the query results, return to the CMDB Query Builder window.

5. In the Report Designer, click **Next** or **Back** to view and configure the new report in the **Data**, **Type**, **Configure**, and **Style** tabs.
   The report is pre-populated with the CMDB query results and a few other report details.
   - **Report name** is set to the name of the saved query.
   - **Source type** is set to **Data source**.
   - **Data source** is set to the table in which the query results are stored.
   - **Query Sys ID** is the ID of the latest run of the query.
   For more details about Reporting and about configuring a report in the Report Designer, see **Reporting, Creating reports**.

6. Click **Save** or **Run**.

Results
CMDB Query Builder creates a report source which you can attach to a report and use with dashboards. For more details about report sources, see **Report sources**.

What to do next
Use either of the following steps to view the new report source. The name of the new report source is set to the name of the CMDB query it was created from, and cannot be changed.

- In Query Builder, click **Saved Queries**. In the Saved Queries window, click the **Query Information** icon in the tile of the saved query. Scroll to the bottom of the information list and then click the link under **Report source**.

- Navigate to **Reports > Administration > Report Sources** and locate the new report source.
Create a basic report

After running a query in the CMDB Query Builder, you can create a basic report that is scoped to the query execution.

Before you begin

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required:

• View report: cmdb_query_builder or cmdb_query_builder_read
• Create report: cmdb_query_builder or cmdb_query_builder_read, and report_user

In a base system, the cmdb_query_builder role is contained in the itil and asset roles.

Procedure

1. Navigate to Configuration and click CMDB Query Builder.
2. Build a query.
3. In the query results pane, click the list context menu and select Bar Chart or Pie Chart.

Results

The Reports application creates a basic report, which is scoped to the query execution and is static.

Run a partial CMDB query

Search saved queries

The CMDB Query Builder allows you to search for a specific saved query using any combination of search criteria based on the query’s title, type, custom tags, and who created or updated the query.

Before you begin

To locate a saved query using a Query Tags search criteria, the query must have a query tag associated with it. For more information see Build a CMDB query
using the CMDB Query Builder, or Build a Service Mapping query using the CMDB Query Builder.

The UI16 plugin (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

Procedure
1. Navigate to Configuration > CMDB Query Builder.
2. In the Search Saved Queries box on the Saved Queries tab, enter a string to search for.
   The resulting list displays all search categories that can be applied using the search string.
3. Select an item from the list to add it as a search criteria.
4. Refine the search string or select additional search criteria as needed.

Create a schedule for a CMDB query
Schedule a saved CMDB query to run once at a scheduled time or on a recurring schedule, and to email the query results to specified users.

Before you begin
The UI16 plugin (com.glide.ui.ui16) must be activated and a saved CMDB query that was built in the CMDB Query Builder must exist.

Role required: cmdb_query_builder (contained for itil and asset)

About this task
The query results are attached to the email as a file in the specified format. By default, the maximum result rows that can be attached is 10,000. This is controlled by a system property.

Procedure
1. If need to, navigate to Configuration, click CMDB Query Builder, and then click a saved query.
2. Click Create Schedule and fill out the form.

Export and import a CMDB query

Export a saved CMDB or Service Mapping query definition to an XML file which you can later import and run in the CMDB Query Builder. This process lets you port a saved query between instances, such as from a development environment to a production environment.

Before you begin

• You must save a query before you can export it.
• Domain in an exported query must be visible in both, source and destination instances.

Role required: cmdb_query_builder (contained in itil, itil_admin, and asset).

About this task

When exporting a combination query, the integrated Service Mapping query definition is included in the exported query.

For backward compatibility, you can alternatively Export and import a query as an update set.

Procedure

1. Navigate to Configuration > CMDB Query Builder.
2. Export a saved query:
   a. In the Saved Queries tab, in either list view or card view, select a saved query.
   b. Click the Export query icon at the top of the Query Builder canvas.
   c. Wait for the Query Export Complete message to appear and then click Download.
      You can now access the query XML file.
3. Import a saved query:
   a. In the Saved Queries tab, click the Import query icon at the top of the CMDB Query Builder window.
   b. In Finder, select the saved query XML file and click Open.
      The imported query is available in the Saved Queries tab of the CMDB Query Builder on the instance.
Export and import a query as an update set

Export a saved query definition to an XML file as an update set, which you can later import.

Before you begin
Role required: To export — cmdb_query_builder (contained in itil and asset). To import — user with permission to import an update set.
Domain in the exported query must be visible in both, source and destination instances.

About this task
Export a query definition as an update set which you can later import and commit. This process lets you port a query between instances, such as from a development environment to a production environment. For more information about exporting and then committing update sets using XML files, see Save an update set as a local XML file.

When exporting a combination query, the integrated Service Mapping query definition is included in the exported update set.

Procedure
1. Export a saved query:
   a. In the Filter navigator, enter qb_saved_query.list and hit Enter to navigate to the Saved Queries table.
   b. In the Saved Queries list view, select the query that you want to export.
   c. Click Actions on selected rows and then select Export query.
   d. Wait for the Query Exporter to complete the export.

2. Import the exported saved query:
   b. On the Retrieved Update Sets form, click Import Update Sets from XML.
   c. On the Import XML page, click Choose file and select the exported XML file. Then click Upload.
   d. Open the new record that was added to the Retrieved Update Sets list view.
   e. On the Retrieved Update Set form, click Preview Update Set Batch and then close the Batch Update Set Preview dialog box.
   f. Click Commit Update Set Batch and then close the Commit Update Set Batch dialog box.
Results
The imported query is added to the Query Builder saved queries on the instance.

Settings for CMDB Query Builder
Use settings to control some aspects of the CMDB Query Builder behavior.

Using the Query Builder requires that the UI16 plugin (com.glide.ui.ui16) is activated.

Open the Query Builder Settings dialog box:
1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page, click the (Settings) icon.
3. Click the Settings icon again to close the dialog box.

<table>

Properties for CMDB Query Builder
Use the CMDB Query Builder properties to configure query processing.

These properties are available for CMDB Query Builder. To view and edit these properties, the admin role is required.

Note: To open the System Properties [sys_properties] table, enter sys_properties.list in the navigation filter.
### Properties for CMDB Query Builder

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Limits the number of results for a scheduled query and in the results section in the Query Builder when you click **Load All Results**. glide.cmdb.query.max_results_limit | • Type: integer  
• Default value: 10000  
• Location: Configuration > CMDB Properties > Query Builder Properties |
| Time limit (in seconds) for running one batch to get one batch of query results (100 results). glide.cmdb.query.batch_time_limit_in_sec | • Type: integer  
• Default value: 300  
• Location: Configuration > CMDB Properties > Query Builder Properties |
| Time limit (in seconds) for running an entire query to get all results. glide.cmdb.query.query_time_limit_in_sec | • Type: integer  
• Default value: 1800  
• Location: Configuration > CMDB Properties > Query Builder Properties |
| Blacklist of non-CMDB tables that appear in the CMDB Query Builder when creating a CMDB query. glide.cmdb.query.non_cmdb.blacklisted_tables | • Type: string  
• Default value: empty  
• Other values: Comma separated list of table names (not labels). Can include '*abc' to exclude all tables containing 'abc' in their table name.  
• Location: Configuration > CMDB Properties > Query Builder Properties |
| glide.cmdb.query.batch_size                                      | Batch size allocated globally when saved queries run.  
• Type: integer  
• Default value: 100  
• Location: Add to System Properties [sys_properties] table. |
CMDB Search

Query on CMDB CIs and relationships by entering a search text with configurable synonyms and stop words, which CMDB Search converts into a properly formulated query.

CMDB Search is integrated into global text search, providing enhanced capabilities for searching the CMDB. CMDB Search is designed to search within CMDB tables and relationships, allowing for queries that are more complex than basic text search. For example, you can query for all Tomcat instances that are running on Linux, or for all applications of a specific version that are running on Linux.

CMDB Search parses the search text that you enter, to formulate a properly formatted query that runs on the CMDB. Your search text can include plain words which are then parsed to identify any CMDB table, column, or relationship names. CMDB Search also uses synonyms and stop words to replace any plain text strings within your search text.

Localization is not supported for CMDB Search. In a localized instance, query words such as CI, relationship, or server, must be in English.

Stop Words

A collection of words that are ignored when CMDB Search parses your search text. When CMDB Search finds a stop word in your search text, that word is ignored. CMDB Search provides default stop words such as 'if', 'me', and 'have'. You can delete or add stop words.

To view stop words, navigate to Configuration > CMDB Search > Stop Words.

Relation Synonyms

A collection of synonyms for relationships. CMDB Search searches your search text for strings that match any relationship synonym. For any such string that is found, CMDB Search replaces that string with the relationship type specified in the relation synonym. CMDB Search provides relationship synonyms for common words that stand for any relationship between two tables. For example, the strings "connect", "in", and "on" in your search text, are all treated as a general reference to a relationship, without specifying any relationship in particular. You can modify, delete, or add relationship synonyms.

To view relationship synonyms, navigate to Configuration > CMDB Search > Relation Synonyms.

CI Class Synonyms
A collection of synonyms for CI classes. CMDB Search searches your search text for strings that match any CI class synonym. For any such string that is found, CMDB Search replaces that string with the CI class name specified in the CI class synonym. CMDB Search provides at least one default CI class synonym for each CMDB table. Most default CI class synonyms are the class label. You can modify, delete, or add CI class synonyms.

To view CI class synonyms, navigate to Configuration > CMDB Search > CI Class Synonyms.

Column Synonyms

A collection of synonyms for table columns. CMDB Search searches your search text for strings that match any column synonym. For any such string that is found, CMDB Search replaces that string with the column name specified in the column synonym. CMDB Search provides at least one default column synonym for each table column in the CMDB. Most default column synonyms are similar to the column name itself. You can modify, delete, or add column synonyms.

To view column synonyms, navigate to Configuration > CMDB Search > Column Synonyms.

CMDB Search supports domain separation, searching CIs according to the user domain.

Plugin

To use CMDB Search, activate the CMDB Search (com.snc.cmdb_search) plugin. Activating CMDB Search triggers Zing text search indexing of all CMDB tables, since the Zing search engine is required for some CMDB Searches.

Search text format and examples

The format of the search text is:

```
(<CI class name> (<attribute> "value")* (<relationship>)* )*
```

Consisting of a table name, followed by pairs of '<column> "<value>"', without any separating commas, and with values surrounded by quotation marks. For column, table, and relationship names, you can search by actual names, labels, or synonyms, and column names can be omitted.

Examples:

- application runs on ci name "ciname"
- application name "JBoss Server13" version "1.0.0.0" on tomcat name "Tomcat10" version "2.1"
• tomcat on linux
• tomcat name “My Tomcat” version “2.0” running on linux server name “Linux8”
• tomcat “My Tomcat”
• tomcat name “My Tomcat”
• tomcat name related to Linux server “my server”
• tomcat name related to Linux server ip 1.1.1.1
• services related to tomcat “my tomcat”
• CI impacted by service “EmailService”

Sometimes the search text contains a name, such as Port, which is both a class and a column name. In this situation, the CMDB Search strategy is to first search for a class with the specified name, and then search for a column with the specified name. If this strategy does not yield the expected results, then use the actual class or column name to prevent ambiguity.

Results
Up to 10 query results appear after running the query. To view any additional results, click View all <record> matches. The total number of results that you can view depends on the value of the cmdb.search.rows.limit system property, which is set to 100 by default. You can increase this property value, or you can change the query to return a smaller number of results. Increasing the number of query results might impact performance.

Add synonyms and stop words to CMDB Search
Create, delete, or modify CI class synonyms, column synonyms, relationship types synonyms, and stop words for CMDB Search.

Before you begin
The CMDB Search (com.snc.cmdb_search) plugin must be activated.
Role required: cmdb_read

About this task
You can add any number of synonyms or stop words. There can be multiple synonyms for the same CI class, column, or relationship type.
Procedure

• Add a CI class synonym:

1. Navigate to Configuration > CMDB Search > CI Class Synonyms.

2. Click New and fill out the CMDB Search CI class synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with CI type when parsing the search text.</td>
</tr>
<tr>
<td>CI class</td>
<td>The CMDB class for which the synonym applies.</td>
</tr>
<tr>
<td>Is attribute value</td>
<td>Designates that the synonym is applied only for CIs with an attribute whose value equals the synonym. When checked, the synonym is searched through the columns of the CI class. For example, 'Ubunto' is specified as a synonym for the cmdb_ci_linux_server CI class, but only if one of the CI's attributes (such as operating system) is 'Ubunto'.</td>
</tr>
</tbody>
</table>

3. Click Submit.

• Add a column synonym:

1. Navigate to Configuration > CMDB Search > Column Synonyms.

2. Click New and fill out the CMDB Search column synonyms form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

• Add a relationship type synonym:

1. Navigate to **Configuration > CMDB Search > Relation Synonyms**.

2. Click **New** and fill out the CMDB Search relation synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>The CMDB column for which the synonym applies.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with <strong>Column</strong> when parsing the search text.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

• Add a stop word:

1. Navigate to **Configuration > CMDB Search > Stop Words**.

2. Click **New** and fill out the Stop Words form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String that represents any relationship type.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
Results
When parsing a search text in the global text search box, CMDB Search uses all synonyms and stop words.

Components installed with CMDB search
Several types of components are installed with activation of the CMDB Search (com.snc.cmdb_search) plugin, including tables and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronize CMDB Search synonyms for new CIs and Columns</td>
<td>Synchronizes new CI types and new columns to synonym tables. Runs once a day.</td>
</tr>
</tbody>
</table>

Tables installed

<table>
<thead>
<tr>
<th>Table</th>

<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 45</td>
</tr>
<tr>
<td></td>
<td>• Location: System Properties [sys_properties] table.</td>
</tr>
</tbody>
</table>

CMDB groups

A CMDB group is a collection of CIs that lets you apply CI actions collectively to all the CIs that are members in the group.

For example, a CMDB CI Lifecycle Management API can use a CMDB group scriptable API to retrieve the group's list of CIs, and then apply a CI Lifecycle Management action collectively to all the CIs. You can also use a CMDB group with the Dynamic CI Group service population method, to populate an application service.

Group type

A CMDB group is configured with a group type. If a CMDB group is set with the Health group type, then the CIs in the group can be monitored by CMDB Health, and the aggregated health is reported for the group as a whole in the CMDB group view dashboard. For example, you can monitor health only for CIs in a specific location.

Populate a CMDB group

Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. The resulting CIs from each query are added as members to the group.

Before you begin

Roles required:

• To view CMDB groups - itil
• To use a CMDB queries - cmdb_query_builder on top of itil
• To manually add CIs - itil or asset
Also, to populate a CMDB group using a CMDB query, a saved CMDB query must exist.

Procedure

1. Navigate to **Configuration > CMDB Group**.
2. In the CMDB Groups pane, click **New**.
3. Fill out the form, right-click the title bar and select **Save**.

### CMDB Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>A unique name for the group.</td>
</tr>
</tbody>
</table>
| Group type                 | • **Default**: Basic group type which can be populated by manually adding CIs, saved queries, and encoded queries.  
                             | • **Health**: Sets CMDB Health to monitor the health of the group CIs and aggregate health results for the group as a whole. Can be populated only by encoded queries.  
                             | **Note**: Dynamic filters are not supported when populating this type of CMDB groups. |

4. To use saved CMDB queries:
   a. Click **CMDB Group Contains Saved Queries** and then click **Add Query**.
   b. Select a query from the **Query Builder Saved Query** list.
   c. Click **Submit**.
      The query that is used returns a list of CIs of the class in the starting node of the query.

5. To manually add CIs:
   a. Click **CMDB Group Contains Configuration Items** and then click **Edit Manual CI**.
   b. Optionally, add filters.
   c. Select CIs in the **Configuration Item** list and click the '+' icon at the bottom.
d. In the Group members list, select the CIs to add to the group.

e. Click Save or Save and Exit.

f. In the Save Confirmation dialog box, click OK.

g. Click Submit.

6. To use encoded queries:

a. Click CMDB Group Contains Encoded Queries and then click New.

b. Select a class for which the encoded query applies to and add conditions to build a query. The resulting CIs are included in the group.

Note: Dynamic filters aren’t supported for CMDB health-type groups, even though it’s possible to add them in a condition clause.

c. Click Submit.

What to do next
Click Show All CI to show all CIs from all the result columns of the query. However, only CIs from CMDB tables are shown.

Show CI Lifecycle Management details for CMDB group CIs
Display CI Lifecycle Management operational state and CI actions that apply to the CIs that are members of a CMDB group.

About this task
If the CMDB group is based on a CMDB query, then the query runs in real-time and displays the resulting CIs. If the query does not complete successfully due to timing out or for other reasons, then appropriate error messages are displayed.

Procedure
1. Navigate to Configuration > CMDB Groups.

2. On the CMDB Groups page, click a CMDB group.

3. Click Show All CI.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>CI group member.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of CI group member.</td>
</tr>
</tbody>
</table>
### Application services

Understand application services, learn about different application service types and how multiple ServiceNow® business units and products use them.

#### What application services are

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. For example, creating financial reports through a web-based application requires a computer, web server, application server, databases, middleware, and network infrastructure. These applications and hosts are all configured to offer the service of financial reporting. In development environments, application services represent instances of a business application or system in different types of development environments, like development, test, or production.

ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs). The various CIs and the relationships between them, that comprise an application service, are stored in the Configuration Management Database (CMDB).

Each application service contains an entry point as the top-level CI. An entry point is how clients access an application service. Typically, it is a URL, or a combination of the IP address and port for application services in enterprise deployments. For cloud-based deployments, an entry point can be a URL to a cloud resource like an gateway.
The Common Service Data Model (CSDM) helps you streamline service types and service offerings. You can add relationships between application services and other service-related objects in the CSDM: Business Application, Technical Service Offerings, or Business Service Offerings.

There are the following types of application services:

**Discovered**

Service Mapping discovers application services using patterns and by following traffic connections.

Pattern-based discovery creates precise and complete application services that represent the service-centric view of the IT infrastructure. It creates a high-fidelity map that is well suited to managing mission-critical application services.

In addition, it provides visibility of cloud-native services such as compute, load balancers, and API gateways. You can use service entry points such as S3 buckets, API gateways, Lambda functions, and functions to map services. It can also detect
Lambda to Lambda calls and Lambda to RDS connections to build dynamic service maps.

Top-down method maps VMs on-premises and in public clouds. However, it requires these VMs to be fully discovered for the top-down discovery to determine which applications are running in the VM. If a VM isn’t fully discovered, use the tag-based method to bridge the gap (see later in this document). Tag-based mapping also maps containers, that you cannot map using the top-down discovery.

Discovered application services have the service classification of application service. They are stored in the Mapped Application Service [cmdb_ci_service_discovered] table.

Dynamic CI Group

These application services are dynamic CI group CIs which act as application services. The members of the CMDB group that is associated with the dynamic CI group, populates the application service.

If created from the wizard, the service classification is application service, and if created from the legacy Event Management UI or Service Mapping UI, the classification is technical service. Application services of the Dynamic CI Group type are stored in the Dynamic CI Group [cmdb_ci_query_based_service] table.

Tag-based

A tag is a label that consists of a key-value pair. Your organization may use tags to categorize its assets, to enhance query and reporting capabilities. Discovery and Cloud Provisioning and Governance can discover tags used by all major cloud providers and container ecosystems. Once the tags are discovered, Service Mapping can create application services based on these tags. For example, you can use tags to map all application services your organization uses in the production environment in the EMEA region.

Tag-based application services have the service classification of application service. They are stored in the Tag-based Application Service [cmdb_ci_service_by_tags] table.

Created Manually

With manual mapping, application owners manually document the applications, IT infrastructure, and relationships that support each application service. This methodology is the best fit for configuration items that are not fully discoverable due to security access issues.
For example, IPS devices which support an intrusion prevention service for the security business unit.

Try to avoid manual mapping wherever possible. It’s incredibly time consuming to map services manually, and often the information needed for mapping is not available due to evolving technology and a lack of processes that track and document the infrastructure dependencies needed for application context. And, whenever subsequent changes are made to the application service topology, the service map must be manually updated.

Manually created application services have the service classification of application service. Application services of the created manually type are stored in the Mapped Application Service [cmdb_ci_service_discovered] table.

**Dynamic**

A dynamic application service includes only CIs that are part of CI relationships stored in the CMDB CI Relationship [cmdb_rel_ci] table.

You can’t edit a dynamic application service by directly adding or removing CIs from it. Dynamic application services are updated automatically to reflect any change to CI relationships in the CMDB CI Relationship [cmdb_rel_ci] table. When you add a relationship to a CI that is contained in a dynamic application service, then that service automatically updates to reflect the addition of the relationship and the associated new CI. In a similar manner, a dynamic application service automatically updates upon the removal of a relationship and its associated CI from a CI within the service.

The only way to create dynamic application services, is by converting legacy business services or legacy manual services (created with Event Management, for example) into application services of the dynamic type.

Dynamic application services have the service classification of application service. Dynamic application services are stored in Calculated Application Services [cmdb_ci_service_calculated] table.

**Who uses application services**

Application services provide foundation for operation of the following business units and products of the Now Platform:
- **ITOM Health** gathers alerts from infrastructure events captured by third-party monitoring tools. It then uses IT-related information gathered by Discovery to map alerts to configuration items. Based on the collected information, then provides dashboards showing a consolidated view of all service-impact events.

- **ITOM Optimization** gives you tools to provision private and public cloud infrastructure and services and to achieve consistent management and cost visibility. The **Cloud Insights** application, available in the ServiceNow Store, helps you to analyze the full range of costs associated with cloud assets so you can identify and take action on opportunities to save money and optimize operations.

- **IT Service Management** users rely on the application services reflecting the IT infrastructure to manage and deliver services to their customers.

- **Customer Service Management** users efficiently diagnose and resolve issues related to the IT infrastructure in the context of application services.

- **Software Asset Management** users understand the software running in your IT environment and track configurations that impact software license consumption across your IT environments and datacenters.

- **IT Business Management** users utilize data collected for application services to gain a comprehensive understanding of the applications used in your organization.

- **Security Operations** users view security incidents to find out which application services are at risk. They also use this information to prioritize and resolve threats based on the impact they pose to their organization.

### How to create application services

Depending on the needs of your organization, you can deploy different methods of creating and populating application services.

**Important:** You can use the top-down and manual methods for the same application service. You cannot combine any other methods for creating or populating the same application service.

Analyze the IT infrastructure and service deployment in your organization to pick the optimal method of creating and populating application services.

### Choosing the right method for your deployment

### Choosing the right method for your deployment (continued)

<table>
<thead>
<tr>
<th>Method</th>
<th>When to use</th>
<th>Additional considerations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Convert legacy manual services into dynamic application services</strong></td>
<td>Use this method to transform legacy manual services into application services that other ServiceNow products can utilize. For example, dynamic application services can be used for service monitoring and change management.</td>
<td>You can't edit a dynamic application service by adding or removing CIs from it. The system automatically modifies an application service of the dynamic type when you modify relevant relationships for CIs that are part of that application service.</td>
</tr>
<tr>
<td><strong>From CSV file</strong></td>
<td>If necessary, you can import service candidates from multiple CSV files.</td>
<td>Organize all the collected information in a specific order in a CSV file, precisely as described in the documentation.</td>
</tr>
</tbody>
</table>

Conversion from legacy business services or from legacy manual services, is the only way to create application services of the dynamic type.

Service Mapping extracts information from this file and creates potential application services referred to as service candidates. Use this method, if your organization has performed cross-organization mapping and analysis and collected some information about services.

To comply with CSDM 2.0, convert manual services created using IT Operations Management Event Management and stored in [cmdb_ci_service_manual] as covered in or . Converted services become application services of the manual type stored in the Mapped Application Service [cmdb_ci_service_discovered] table.
Domain separation

Domain separation, if deployed, impacts application services as follows:

• When creating an application service, the application service is assigned to the user’s domain.

• When manually adding a CI to an application service, you can choose only CIs that belong to the service domain.

• When using the `createOrUpdateService - POST` REST API for creating or updating an application service, the process stops if one of the CIs referenced in the API belongs to a different domain than the application service itself.

• When converting business services into application services, the newly created application service belongs to the same domain as the original business service. The application service comprises only CIs belonging to the same domain as the application service itself.

Create an application service

Create an application service to adhere to CSDM standards and to standardize the organization, maintenance, and monitoring of services in your organization.

Before you begin

Role required: app_service_admin

About this task

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

An application service has an entry point, which lets users access the application service. If you are at the planning stage and do not know what the entry points are for an application service, you can create the application service without entry points. Such an application service is referred to as an empty application service, to which you can add entry points at any later time.

All application services created in the wizard, are set with the `application service` service classification.

Service Mapping, if activated, can automatically discover and map application services as described in Application service mapping. A discovered application service contains the CIs and the connections between them that Service Mapping discovered and mapped.

You can also create an application service by using the `createOrUpdateService - POST` REST API.
Procedure

1. Navigate to CSDM > Manage Technical Services > Application Service.
2. In the Application Services list view, click New.
3. In the Provide Basic Details tab:

   a. fill out the fields for Basic Details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Pre-populated unique ID for the application service.</td>
</tr>
<tr>
<td>Name</td>
<td>Application service name which must be unique. Use self-explanatory names such as mailing service or printing service.</td>
</tr>
<tr>
<td>Environment</td>
<td>The environment of the offering such as production, development, or test, as identified by some service offerings. Used by Incident Management and Change Management.</td>
</tr>
<tr>
<td>Version</td>
<td>The application service configuration version.</td>
</tr>
<tr>
<td>Model ID</td>
<td>A product model such as a software model where end of life data is stored.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>Operational status of the application service, such as Ready or Retired.</td>
</tr>
<tr>
<td>Support Group</td>
<td>Used by Incident Management as the group managing the contract covering the asset.</td>
</tr>
<tr>
<td>Assignment Group</td>
<td>Used by ITSM for routing of change and change-related tasks.</td>
</tr>
<tr>
<td>Managed By Group</td>
<td>Group responsible for managing the data.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Owned By</td>
<td>User who is familiar with the infrastructure and applications making up the service. This user is the application service Subject Matter Expert (SME) who provides information necessary for a successful creation of an application service. If the owner name is not listed, create a user with the sm_app_owner role, as the owner. Alternatively, you can choose a user with the sm_admin role.</td>
</tr>
</tbody>
</table>

**Note:** See Teams related list for details about the automatic synchronization between the assignment group fields and the Teams related list.

**b.** In the Set Relationships section, add relationships between the application service and other components in the CSDM domain. Click the **Business Application**, **Technical Service Offering**, **Business Service Offering**, or the **Parent Application Service** tab, and add items to the respective **Selected** list.

- The technical service offering list includes records in the Service Offering [service_offering] table, in which the **Service classification** attribute is **Technical Service**.

- The business service offering list includes records in the Service Offering [service_offering] table, in which the **Service classification** attribute is **Business Service**.

- The parent application service list includes application service records from the Application Service [cmdb_ci_service_auto] table. Adding a parent application service relationship creates hierarchies and dependencies of application services in deployments such as:
○ Platform host and platform application deployments
○ Micro service deployments in which one or more micro services identified as an application service, is part of a larger application service deployment
○ Shared technical service dependencies

c. Click Next.

For information about CSDM relationships, see CI relationships in the Common Service Data Model.

Also, some fields and relationships are noted as required on the page. To change which fields and which relationships are required, see Modify the attributes and relationships required for application services.

4. On the Populate the Application Service tab:

a. Click Choose a Method or click Next to skip selecting a service population method.

b. On the Choose a Method page, select a Service Population Method, and then follow the respective link to complete the specific population method:
   • Top Down Discovery: Populate application services using top-down discovery
   • Dynamic CI Group: Populate an application service using the Dynamic CI Group method.
   • Tags: Populate application services using tags
   • Manual: Populate an application service using the Manual method

   Note: The Top Down Discovery and the Tags options are available only if Service Mapping is installed.

c. On the Service Population Methods page, you can click Add Method to add another method to populate the application service. Or, click Next.

   • You can add any combination of the Top Down Discovery and the Manual methods. However, if you select the Dynamic CI Group or the Tags method, the Add Method button is grayed out and you cannot add additional methods.
   • You can click a card for a Converted Business Service method to see details about the service conversion, such as the conversion type. For more information, see Convert business services to application services.
5. On the **Preview the Service** tab, review and verify the summaries for creating and populating the application service.

   a. Review **Relationships**. You can click **Edit Relationships** to modify the relationships to other CSDM objects.

   b. Review **Population Methods Summary**. You can click **Edit Methods** to modify the selection methods.

   c. Click **Done**.

**Results**

The application service is created, and you can access the new application service by navigating to application services list views:

- **CSDM > Manage Technical Services > Application Service**: Contains application service CIs from any class extending the Application Service [cmdb_ci_service_auto] class, except alert groups. The list view includes the tag-based, discovered, manual, dynamic CI groups, converted, and empty application service types.

- **Configuration > Application Services > Application Services**: Contains application service CIs from any class extending the Application Service [cmdb_ci_service_auto] class, except alert groups. The list view includes the tag-based, discovered, manual, dynamic CI groups, converted, and empty application service types.

- **Service Mapping > Services > Application Services**: Contains application service CIs from the Mapped Application Service [cmdb_ci_service_discovered] class. The list view includes the top-down (discovered) and empty application service types.

**What to do next**

- If the service population method is **Dynamic CI Group**:
  
  - Click **View CMDB Group CI's** to list all the CIs in the CMDB group that is associated with the application service.
  
  - Click **View Service CI's** to list all the CIs in the application service. Both lists of CIs are identical, unless the CMDB group contains more than 10,000 CIs. In this case, **View CMDB Group CI's** shows all the CIs in the CMDB group, and **View Service CI's** shows only the 10,000 CIs that are members of the application service.

- If the service population method is **Tags, Top Down Discovery**, or **Manual**:
Click View Map to view the application service map, where you can:

- Link application services
- View CI attributes in an application service map
- View the change history of application services
- Compare two versions of an application service

Click Advanced, and then on the Advanced Details page, click Additional Info, Questionnaire, Reject Messages, or Worknotes, to add details.

Populate application services using top-down discovery

Use top-down discovery to populate an application service. This discovery method deploys discovery patterns to find configuration items (CIs) belonging to the service and connections between these CIs. Pattern-based discovery creates precise and complete application services that reliably represent the service-aware view of your organization’s IT infrastructure.

Before you begin

- Verify that Service Mapping is set up properly.
- Ensure you know which entry point to use for this application service and which attributes you must be able to define for this entry point. Learn about preconfigured entry points available with Service Mapping.

Role required: sm_admin

About this task

A pattern is a sequence of steps whose purpose is to detect attributes of a CI and its outbound connections. Service Mapping and Discovery share a set of preconfigured patterns that cover most of the commonly used devices and applications.

Service Mapping starts pattern-based top-down discovery process from the entry point you define.

An entry point is how clients access an application service. Usually, it is either a URL or a combination of the IP address and port. Service Mapping starts the mapping process from this point. For example, to map your electronic mailing application service, define an IP address or host name of the email server as an entry point.

Entry points vary depending on the nature of the application service. Service Mapping comes with a wide range of preconfigured entry point types that cover many commonly used applications.
Procedure

1. From the Service Population Method list in the Choose a Method window, select Top-Down Discovery.

2. From the Application Type list, select the CI class of the application that serves as the entry point for this application service. Entry point parameters depend on the type you select.

3. Define attributes for the selected entry point as described in .

4. Optional: Add free-text comment that may provide useful information for handling this application service later.

5. Click Save.

Related information

Populate an application service using the Dynamic CI Group method

The Dynamic CI Group method for populating an application service, automatically generates a dynamic CI group. The members of the CMDB group that the dynamic CI group is based on, populates the application service. The application service continuously synchronizes with the CMDB group to reflect any changes in membership in the CMDB group.

Before you begin

The Dynamic CI Group is one of several methods for populating an application service with CIs. Choosing a method for populating an application service, is only one step of the generic procedure for creating an application service. This procedure complements the generic procedure to Create an application service. By itself, this procedure is incomplete.

Note:
- The number of CIs in an application service that is populated by the Dynamic CI Group method, is limited to 10,000, even if the associated CMDB group has more than 10,000 CIs.
- A CMDB group can be used to populate only a single application service. For more information about populating and using CMDB groups, see CMDB groups.

Role required: app_service_admin
Procedure

1. In the Choose a Method page, select **Dynamic CI Group** as the **Service Population Method**.

2. Fill out the fields that appear, which are specific to the Dynamic CI Group service population method.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Population Method</td>
<td>The method used for populating the application service with CIs. Set to <strong>Dynamic CI Group</strong>.</td>
</tr>
<tr>
<td>CMDB Table</td>
<td>Notes the Dynamic CI Group [cmdb_ci_query_based_service] table, in which application services created by the Dynamic CI Group method, are stored.</td>
</tr>
<tr>
<td>Group Name</td>
<td>The CMDB group whose members become members the application service.</td>
</tr>
</tbody>
</table>

> **Note:** CIs from a class that extends the **cmdb_ci_service** class (Services), are automatically filtered out and are not added to the application service.

3. Click **Save**.

**What to do next**
Complete the generic procedure **Create an application service**.

**Populate application services using tags**

Use tags that help categorize and organize configuration items (CIs) in your organization to populate application services. Tag-based mapping doesn’t require configuring credentials or providing users with elevated rights. Tag-based population method requires the Service Mapping feature of ITOM Visibility.
Before you begin

1. Analyze the tag usage in your organization and make a list of all tags and their purposes. Use the Key Value [cmdb_key_value] table to see the tags in the CMDB.

2. If necessary, assign tags to CIs that you want to include in application services.

3. Create an application service as described in Create an application service.

Role required: sm_admin

About this task

A tag is a label that consists of a key-value pair. Your organization may use tags to categorize its assets, to enhance query and reporting capabilities. Discovery and Cloud Provisioning and Governance can discover tags used by all major cloud providers and container ecosystems. Once the tags are discovered, Service Mapping can create application services based on these tags. For example, you can use tags to map all application services your organization uses in the production environment in the Europe, the Middle East and Africa (EMEA) region.

If you have configured tag-based service families and tag categories, you can use these tag definitions for populating an application service. Part of defining a tag-based service family is defining a tag category, which contains tag keys. If necessary, you can also define tag values to narrow the criteria used for populating application services. Based on the tag definitions for the tag-based service family, Service Mapping creates service candidates - suggested application services. When you use the tag-based service families to populate an application service, you must select the relevant service candidate. Alternatively, you can define tag keys and their values while choosing the tag-based population method for a new application service. Define up to three tag keys and tag values for the population criteria. CIs that have discovered tag keys and tag values, become part of an application service.

Note: Service Mapping includes CIs that are part of CI relationships even if these CIs do not have tags assigned to them. For more information, see.

Procedure

1. From the Service Population Method list in the Choose a Method window, select Tags.

2. To define new tag criteria, perform the following steps:
a. Select **Use a list of tags**.

b. Enter the tag key and its respective tag value.
   Matching tag keys that exist in the system, appear in the auto-fill options.

   **Important:** Tag-based mapping is not case-sensitive; same key names and key values spelled with upper and lower case are identified as the same.

c. **Optional:** Click the plus icon and add another tag key and tag value.

d. Click **Preview Result** to see the list of CIs that match the defined criteria. If necessary, refine the tag definitions.

   **Note:** You can add no more than three tag key-value pairs for one application service.

3. To use tag definitions from a preconfigured tag-based service family, perform the following steps:
a. Select **Use a candidate from a tag-based service family**.

b. **Optional:** To see the tag definitions for this tag-based service family, click the **Preview** button.

c. From the **Tag-Based Service Family** list, select the relevant family.

d. Review the tag categories and values assigned to the service family.

e. From the **Service Candidate** list, select the relevant candidate.

f. **Optional:** To review the service candidate form, click the **Preview** button.

4. **Optional:** Add free-text comment that may provide useful information for handling this application service later.

5. Click **Save**.

**Populate an application service using the Manual method**

The Manual method for populating an application service, is based on selecting an entry point CI, which lets users access the application service. To populate
the application service, you then manually add CIs to the new application service.

**Before you begin**
Role required: app_service_admin

**About this task**
Manual is one of several methods for populating an application service with CIs. Choosing a method for populating an application service, is only one step of the generic procedure for creating an application service. This procedure complements the generic procedure to Create an application service. By itself, this procedure is incomplete.

**Procedure**
1. In the Choose a Method page, select Manual as the Service Population Method.
2. Fill out the fields that appear, which are specific to the Manual service population method.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Population Method</td>
<td>Manual</td>
</tr>
<tr>
<td>CMDB Table</td>
<td>Notes the Mapped Application Service [cmdb_ci_service_discovered] table, in which application services, created by the Manual service population method, are stored.</td>
</tr>
<tr>
<td>Class</td>
<td>The class from which to choose the entry point CI for the application service.</td>
</tr>
<tr>
<td>CI</td>
<td>The CI from the specified Class, to be the entry point for the application service.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

**What to do next**
1. Complete the generic procedure Create an application service.
2. Manually add CIs to populate the application service.
Monitor the health of application services in the Application Service Dashboard

Monitor counts indicating the health state of application services, in the Application Service Dashboard. Then, reduce the number of incomplete application services by populating them and adding any missing details. To use application services effectively, ensure that application services are fully configured and are populated.

**Before you begin**
Role required: itil_admin or app_service_admin

**About this task**
Edit the application services that are showing on the Application Service Dashboard as missing important details. For example, if an application service is not configured with a service population method, edit that application service to set it with a service population method.

The data that appears in the Application Service Dashboard is calculated during night hours, on a 24-hour cycle.

**Procedure**
1. Navigate to **CSDM > Application Service Dashboard**.
2. View counts on the **Application Service Overview** tab, which indicate basic configurations of application services that are incomplete.
   - Count of all application services, complete and incomplete (Total Application Services).
   - Count of application services configured with a service population method (Population method defined).
   - Count of application services missing a service population method (No population method defined). Data for the tags and top down discovery methods appear only if Service Mapping is installed.
   - Breakdown of application services by their missing essential data such as an Owner, an Assignment Group, or a Business Service.
   - Application services without relationships to technical service offerings or to business service offerings.
   - Breakdown of application services by service population methods, including business services that were converted to application services.
3. View counts on the **Related Focus Areas** tab, which indicate other potentially incomplete configurations of application services.
• Total number of application servers, and from those, the number of application servers which are not in any application service. Also, the breakdown of these application servers by class.

• Total number of databases, and from those, the number of databases which are not in any application service. Also, the breakdown of these databases by class.

• Total number of hardware servers, and from those, the number of hardware servers which are not in any application service. Also, the breakdown of these servers by class.

   Note: Application servers, hardware servers, and databases, not included in application services, are counted only up to about 100,000, even if the actual count is greater than this limit. This number limit is determined by the value of the glide.cmdb.csdm.app_service.max_results property.

4. Optional: Filter the count results in either the Application Service Overview or the Related Focus Areas tab, by specific application service properties. You can filter by the Owner, Assignment Group, or the Support Group properties. A filter does not impact counts of application services in which the respective filter property is missing. For example, filtering by Owner, doesn't change the count of Missing Owner.

5. Optional: Select a widget in either the Application Service Overview or the Related Focus Areas tab, to drill down to the respective CI list view. For example, click the No population method defined widget to see the CI list view of application services in which no population method is defined.

6. Optional: Edit the coloring rules that determine the threshold for displaying counts in red. This applies only to the widgets for application services that are not fully configured, such as the No population method defined widget.
   a. Click the Add Widgets (+) icon.
   b. Point to the banner of a widget and click the Edit Content icon.
   c. In the Edit Report window, click the Style tab and then click Edit coloring rules.
   d. See Create coloring rules for multilevel pivot table reports to complete this edit, and for more details.
   Role required for this step is report_admin or admin.

What to do next
After identifying any application services that are missing important details, edit those application services to add those missing details.
1. Navigate to **CSDM > Manage Technical Services > Application Services**.
2. In the Application Services list view, select an application service to edit.
3. Add any missing details.
   
   For details about configuring an application service, see Create application service.

**Modify the attributes and relationships required for application services**

Modify the lists of attributes and relationships that are required when creating application services.

**Before you begin**

Role required: itil_admin

**About this task**

In application service settings, the lists of required attributes and required relationships determine which of those items are required when creating application services. By default, the list of required attributes contains the **Name** and **Number** attributes. Also by default, no relationships are required.

You can change the requirement status of attributes by removing or adding items to the list of required attributes. However, you can't remove the default **Name** and **Number** attributes. You can also add any of Business Application, Technical Service Offering, or Business Service Offering, to the list of required relationships.

**Procedure**

1. Navigate to **CSDM > Application Service Settings**.
2. Add or remove items in the **Required Attributes** and **Required Relationships** lists.
3. Click **Save**.

**Results**

Next time that you create an application service, the required attributes and relationships, are visibly noted in the Basic Details section on the Create an Application Service page.

**Convert business services to application services**

Unify the way you manage services in the organization by converting manually created records in the Service [cmdb_ci_service] table into application services. Conversion lets you streamline the different types of services in your organization,
leverage ITOM Visibility capabilities, and align with the Common Service Data Model (CSDM). The conversion is irreversible: You can’t transform application services back into business services.

Using application services has benefits such as:

• Viewing service maps and change history of services.
• Easily seeing the service context by providing a flat list of all CIs in the application service.
• Monitoring service health. If Event Management is deployed, you can monitor service performance and identify health issues for application services.
• In Change Management, the list of impacted services on a change request form is more accurate because the list includes only application services.
• Applying Customer Service Management tools to open and manage cases at the service level.

Discovery doesn’t run on converted application services, because converted services are manual. However, if after the conversion you add Discoverable by Service Mapping entry points to the application service, then Service Mapping starts discovering such this application service.

**Choosing between application services of the manually created and dynamic type**

You can convert business services into application services of the manually created type or of the dynamic type. You can edit manually created application services by adding or removing CIs at any time. The system does not update manually created services automatically. If there are changes to CIs making up a manually created application service, the service does not automatically reflect it.

Dynamic services are updated automatically to reflect any change to CI relationships stored in the CMDB CI Relationship [cmdb_rel_ci] table. When you add a relationship to a CI that is contained in a dynamic service, then that service automatically updates to reflect the addition of the relationship and the associated new CI. In a similar manner, a dynamic service automatically updates upon the removal of a relationship and its associated CI from a CI within the service.

To learn more about different types of application services, see application services.

**Conversion process**

During conversion, the following changes and processes occur:
• The service record is moved from the Service [cmdb_ci_service] table into the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.

• The application service is set with all the original business service attributes such as name, owner, and operational status.

• The system adds related items from the business service to the converted application service, up to the specified level.

• The system queries the CMDB for the latest CI changes.

• Event Management, if activated, applies CI impact rules to CIs that are associated with alerts and that are part of the application service. Event Management deploys CI impact rules for alert monitoring.

• You can edit a converted application service of the manually created type by navigating to CSDM > Manage Technical Services > Application Service. Then select a converted application service. The service population method for a converted application service, is set to Converted Business Service. For more information about editing application services, see Create an application service.

   Note: You can’t edit a dynamic application service by adding or removing CIs from it. The system automatically modifies an application service of the dynamic type when you modify relevant relationships for CIs that are part of that application service.

Non-compliant CIs
A conversion might involve adding CIs of the following CI types, which cannot be added to an application service:

• cmdb_ci_endpoint
• cmdb_ci_translation_rule
• cmdb_ci_config_file
• cmdb_ci_qualifier
• cmdb_ci_application_cluster

If the original business service contains related items belonging to these CI types, then the system does not add such CIs or connections coming from them. If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.
Domain separation
In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

Convert business services to application services in bulk
Convert a subset or all business services to application services, in bulk and automatically rather than individually. Specify a criteria for a conversion, for the system to convert all business services that match that criteria into application services. The conversion is irreversible: You can't transform application services back into business services.

Before you begin
Role required: app_service_admin, ecmdb_admin, or itil_admin

About this task
Use bulk conversion to convert legacy business services to application services. You can create multiple bulk conversion records, each filtering for a different set of business services. However, do not include a business service in more than one bulk conversion.

Procedure
1. Navigate to Configuration > Services.
2. In the Services list view, click Convert to Application Services.
3. Fill out the Bulk Convert Services form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>Filter that business services must satisfy to participate in the bulk conversion. The number of business services that satisfy the query appear as a link. This number updates as you modify the query. Click the link to see the list of those services.</td>
</tr>
</tbody>
</table>
Levels

The number of levels of related CIs to include in the converted application service.

Update service when CMDB updates

Select this check box to convert the business service into an application service of the dynamic type.

4. Click **Submit**.

**What to do next**

- Check the status of a conversion: On the Bulk Convert Services form, scroll to the Bulk Convert Services Entries section to see the status (such as Ready or Completed) of a conversion.

- Track the progress of a conversion as it runs: In the navigation filter, enter `cmdb_convert_bulk_services.list` and press the Enter key to see the list of conversions, and their progress.

- (Optional) On a change request form, view affected dynamic services. For example, after you add an affected CI that is associated with a dynamic service:

  1. Navigate to **Change > Open**.
  2. Select a new change request to add affected CIs to.
  3. On the Change Request form, scroll to the Related Links section.
  4. Click the **Affected CIs** tab and then click **Add** to add an affected CI to the change request.
  5. Open the form context menu and click **Refresh Impacted Services**.
  6. Click the **Impacted Services/CIs** tab to see any dynamic services that are associated with the affected CI and that are impacted by the change request.

For more information about affected CIs on a change request, see **Associated CIs on a change request**.
Convert an individual business service to an application service
Manually convert a specific business service to an application service.

Before you begin
Review the original business service to evaluate it.

• Make sure that all CIs and CI relations are relevant for the future application service. If necessary, change the CI relations in the CMDB.
• Make sure that the original business service doesn’t contain more than 5000 CI relations. Application services that contain more than 5000 CI relations cause mapping and monitoring performance issues.
• Decide how many levels of CI relations you are going to use during conversion.

⚠️ Attention: The conversion is irreversible: You can't transform application services back into business services.

Role required: app_service_admin

Procedure
1. Navigate to Configuration > Business Services.
2. Select the business service that you want to convert to an application service.
3. Click Convert to Application Service.
   The Converting to Application Service dialog box opens.
4. Select a number from the Up to list, as the number of levels of related CIs to include in the conversion.
   The maximum number of levels is eight.
5. Select Update service when CMDB updates to convert the business service into an application service of the dynamic type.
6. Click OK.

Results
The system adds the CIs from the business service to the converted application service.

What to do next
Open the map for the newly converted application services.
Make sure that the application services aren't too large:
• Service Mapping doesn't offer to view CI list instead of a map for an application service.

• There is no discovery message indicating that the application service is too large: The map does not display the entire service, because it is too large. The number of CI connections exceeded the allowed maximum.

If the service is too large, perform the following actions:

• Review the converted application service to identify CI relations irrelevant or redundant for this service. Remove such CI relations in the CMDB.

• Decide how many levels of related CIs you must include into this application service. If necessary, change the number of levels used in conversion to reduce the service size.

Application services

Convert legacy manual services into dynamic application services
Unify the way you manage services in your organization by converting legacy manual services into dynamic application services. Conversion lets you streamline the different types of services in your organization, leverage ITOM capabilities, and align with the Common Service Data Model (CSDM). The conversion is irreversible: You can't transform application services back into legacy manual services.

Before you begin
Role required: app_service_admin

About this task
You can't edit a dynamic application service directly. Instead, the system automatically updates a dynamic application service to reflect any change to CI relationships in the CMDB CI Relationship [cmdb_rel_ci] table.

During conversion, the following changes and processes occur:

• The service record is moved from the Service [cmdb_ci_service] or the Manual Service [cmdb_ci_service_manual] table into the [cmdb_ci_service_calculated] table by changing the record class.

• The dynamic application service is set with all the original attributes of the legacy manual service such as name, owner, and operational status.
• The system adds related items from the legacy manual service to the converted dynamic application service, up to three levels by default.
• All connections created between CIs in the dynamic application service are endpoint CIs with the relationship uses, implement, or application flow.
• Event Management, if activated, applies CI impact rules to CIs that are associated with alerts and that are part of the application service. Event Management deploys CI impact rules for alert monitoring.

A conversion might involve adding non-compliant CIs, which cannot be added to an application service:
• cmdb_ci_endpoint
• cmdb_ci_translation_rule
• cmdb_ci_config_file
• cmdb_ci_qualifier
• cmdb_ci_application_cluster

If the original manual service contains related items belonging to these CI types, then the system does not add such CIs or connections coming from them. If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.

Procedure
1. Navigate to Configuration > Application Services > Application Services.
2. Open the legacy manual service that you want to convert to a dynamic application service.
3. In the Related Links section on the service form, click Convert to Dynamic Service.

Manually add CIs to an application service
Add configuration items (CIs) to manually created application services or to services discovered by Service Mapping. You can edit discovered and manually created application services.
Before you begin

- Verify that the CI type for the CI that you are planning to add, exists. If necessary, create the CI type as described in Create CI types for Service Mapping and Discovery.

- Add CIs to the CMDB for the device or application that you want to add, if necessary. See Populate the CMDB for more information.

Role required: app_service_admin or sm_admin

About this task

Adding a CI to an application service requires creating a relationship between the new CI and a CI in the application service. You can add CIs to an application service that was created manually, by either:

- Adding a method to populate the application service.
  
  Navigate to CSDM > Manage Technical Services > Application Service. Select an application service and then use the Populate the Application Service tab to choose a method to populate the application service. For more details, see Create an application service.

- Using the application service service map as described in the steps below.

  The default relationship type of the added connection in this case is Depends on: :Used by. You can modify this default relationship type by changing the value of the sa.it_service.manual_ci_rel_type property.

  
  Attention: You cannot fine-tune or edit tag-based and dynamic services from the map.

Information about the CI in application service, to which you are connecting a new CI, is updated in the CMDB. This information includes the type of the relationship between the CIs. If other application services use the same applicative flow, the CMDB recognizes it and adds the CI you added manually to these application services by analogy. For example, you manually added an IBM WebSphere Message Broker to an IBM WebSphere HTTP Listener in the Bank Customer Portal service. The system also adds this IBM WebSphere Message Broker to the same HTTP Listener in the Bank Internal Portal, because it uses this HTTP Listener. The same logic applies when you remove a CI you added manually: The system removes it from all application services where you either manually added it or the system added it by analogy.

You can manually connect a CI only to actual CIs existing in the CMDB, not to a visualization of other items on the map such as clusters or boundaries. Also, it is prohibited to add CIs of these CI types to an application service:
• cmdb_ci_endpoint
• cmdb_ci_translation_rule
• cmdb_ci_config_file
• cmdb_ci_qualifier
• cmdb_ci_application_cluster

If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.

In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

If working with an application service discovered by Service Mapping, manually add a CI:

• To indicate that an application service contains a device or application, which Service Mapping cannot discover. For example, add an A/C unit to the Production Floor service.

• To add a temporary placeholder for a CI, which Service Mapping did not discover. In this case you are planning to perform necessary troubleshooting to ensure that Service Mapping discovers this CI in the future. For example, add an IBM WebSphere Message Broker to the Bank Customer Portal service.

• To create an application service that combines entry points and CIs automatically discovered by Service Mapping with entry points and CIs from the CMDB. After you manually add an entry point, you can update the application service with CIs from the CMDB based on the relationships defined there.

For additional information related to Service Mapping, see Pattern customization and Enable traffic-based discovery for CI types or specific CIs.

**Procedure**

1. Open the application service map.
   a. Navigate to CSDM > Manage Technical Services > Application Service.
   b. Select the needed application service.
   c. On the application service page, select View Map.

2. If needed, click Edit to ensure that the map is in Edit mode.
If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

3. To connect a CI to another CI on the map, right-click the CI to which you want to connect the new CI, and then select Add a CI.

4. In the Add A CI dialog box, specify the CI to add:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the CI from the list of CIs of the selected CI type.</td>
</tr>
</tbody>
</table>

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

5. Click Submit.
The manually added CI appears on the map.

Note: When you manually add a CI, which is an application, as a child to a service that already includes its parent application CI, the newly added child application CI is hidden inside the inclusion. Click the plus (+) symbol next to the parent application CI to see the child application CI.

6. Optional: (If Service Mapping is activated) To add a discoverable outgoing connection for the manually added CI:

a. Right-click the manually added CI.

b. Select Manually add a connection.

Note: If you do not see the Manually add a connection option in the right-click menu, check that you are logged in with the user that belongs to the same domain as the application service.

c. Configure attributes for the entry point as described in Entry points attributes.
d. Click **Submit**.
   Discovery and Service Mapping attempt to discover this CI. If successful, the CI appears on the map. Otherwise, a warning icon (⚠️) appears.

7. **Optional:** (If Service Mapping is activated) If you want Service Mapping to automatically discover a CI, which you previously added manually:

   a. Customize the relevant pattern or fine-tune traffic-based discovery to enable Service Mapping to discover the CI.

   b. Navigate to the relevant application service map.

   c. Click **Run discovery**.

   d. After the discovery process finishes, verify that Service Mapping discovered the CI by checking the connector leading to the CI. If Service Mapping discovered the CI, then two connectors, a manual and automatically discovered, appear for the CI.
e. Right-click the CI you added manually.  
   In the example, it is IBM WebSphere Message Broker.

f. Select Remove manually added CI.  
   The map shows the CI with only one connector leading to it. If this CI had any manually added connections, they are removed together with the manually added CI.

Related information

Link application services

addCI()

Manually update an application service with changes from the CMDB

Ensure that an application service is up-to-date and reflects all the latest changes to its configuration items (CIs). Regularly update application services to reflect any changes to CIs and their relationships in the CMDB.

Before you begin

Role required: app_service_admin

About this task

There is no mechanism or an API that automatically updates application services that were created manually. Also, you may need to manually update application services discovered by Service Mapping, if they contain manually added CIs. You can only update application services which contain manually created entry points and which are not discovered by Service Mapping.

An example of a change is deleting CIs from the CMDB or connecting two CIs one of which is part of an application service. In the first case, your application service may show a CI that no longer exists. In the second case, on the contrary, the application service omits a CI.

An update might involve adding CIs of the following CI types, which cannot be added to an application service:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster
If necessary, you can prevent CIs of other CI types from being added to application services by modifying the `sa.mapping.user.manual.citype.blacklist` property.

Also, the system can connect a CI from the application service only to actual CIs that exist in the CMDB, not a visualization of other items on the map like clusters or boundaries.

The maximum number of CI connections added to application services during this operation is controlled by the `sa.service_max_ci_service_population` property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the `sa.service_max_ci_service_population` property, as described in Add a system property.

In environments with domain separation, only CIs belonging to the same domain as the application service are added into the application service. If there is a domain hierarchy, CIs must belong to the same child domain.

You can also update application services by using APIs.

**Procedure**

1. Navigate to CSDM > Manage Technical Services > Application Service.
2. On the Application Services list view, select the application service that you want to update.
3. Click Advanced and then click Advanced Configurations.
4. On the Additional Info page, click the Update with changes from CMDB related link.
5. Select a number in the Up to list to limit the number of levels of related items to be updated.
   If the specified number is higher than the number of levels of related items that already exist in the application service, then the system adds the missing CIs and their connections.

   **Warning:** Specifying a lower number than the number of levels that already exist in the application service, does not result in the removal of CIs from the application service.

6. Click OK.
Results

• The system updates the application service with the changes from the CMDB and shows them on the map.
• After the update process is complete, the application service form opens.

Link application services

You can manually link two application services by adding a reference to one application service into another application service. The service that contains the reference, becomes a dependent service. The service that you include as a reference is a contained service. You can link application services to create dependencies for impact monitoring in Event Management.

Before you begin

You can edit discovered and manually created application services.

**Important:** You cannot fine-tune or edit tag-based and dynamic services from the map.

Ensure that you know the name and the service type of the application service, to which you want to add a reference.

Role required: app_service_admin or sm_admin

About this task

To create a link, add a reference to the relevant application service as an outgoing connection of the relevant CI inside another application service. For example, you can add the UK Portal application service as a link to the Online Store application service. In this case, the Online Store service becomes dependent on the UK Portal service that it contains. The Online Store service reflects discovery errors for its contained service in the Edit map mode, as well as alerts in Event Management.
When you link an application service to another application service, the information about the CI, to which you linked the service, is updated in the CMDB. The CMDB recognizes other application services that use the same applicative flow, and adds the contained application service to these application services by analogy. The same logic applies when you remove a contained application service: The system removes it from all application services where you either manually linked this service or the system linked this service by analogy.

When using Service Mapping, you may want to link application services to create:
• A dependency between two application services.
• A placeholder for a map branch that Service Mapping failed to discover. If you create or customize a pattern to discover the configuration item (CI) serving as an entry point for the contained application service, Service Mapping can discover this contained service.
• An indication that an application service contains a branch, which Service Mapping cannot discover.

You can add an application service as a contained service to as many application service as necessary.

Procedure
1. Navigate to Service Mapping > Application Services.
2. Click View map next to the relevant application service.
3. If needed, click Edit to ensure that the map is in Edit mode.
4. Right-click the CI to which you want to link an application service as a reference.
5. Select Add A CI.
6. In the Add a CI dialog box, select the application service you want to add as a contained service:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| CI Type    | Select the relevant service type from this list:  
• Tag-Based Application Service  
• Mapped Application Service for discovered or manually created application services  
• Calculated Application Service for dynamic services  
• Dynamic CI Group |
| CI Name    | Select the name of the application service that you want to link as a contained service. |

7. Click Submit.
The icon for the contained service appears on the map.
Related information

Application services

Group application services

Organize application services by groups to perform actions simultaneously on multiple services, and to control user access to services. You can use Event Management to track service health by service groups.

Before you begin

Role required: sm_admin or app_service_admin

About this task

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers.

How you group application services depends on the user and on service provisioning policies in your enterprise. The relation between application services in groups is purely logical and the same application service can belong to multiple groups. For example, the Mobile service can be part of the following service groups: Sales, Beijing, and Telephony.

Example of an application service belonging to different groups
You can embed a service group within another service group to create a hierarchy of service groups. If users have access to a parent service group, they automatically have access to all its child groups. By default, all new services are assigned to the All service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access application services in this service group and in the All service group. To enable users with this role to access other services, assign this role to the respective service group. Do not assign user roles directly to the All service group.

If Service Mapping is activated, service groups can contain a mixture of manually created application services and application services discovered by Service Mapping.

You can use Now Platform Notifications to alert users if the service group severity changes to critical. The overall severity of the group is determined by the highest alert severity within the group.

**Procedure**

1. Navigate to **Configuration > Application Services > Service Groups**.
2. Click **New**.
3. Enter the name of the new application service group in the **Name** field.
4. To embed this group in another group, enter the name of the other group in the **Parent Group** field.
5. Right-click the form header and click **Save**.
6. Add an application service to the newly created service group.
   a. In the Service Group Members section, click **New**.
   b. In the **Name** field, enter the name of the application service. If you are using Event Management, you can also enter an alert group name.
   c. Click **Submit**.
7. Alternatively, add an application service to a group from the application service form.
   a. Navigate to **Configuration > Application Services > Application Services**.
   b. Select the application service you want to add to a service group.
   c. In the **Service Group Members** section, double-click **Insert a new row**.
   d. Enter the name of the service group to which you want to add the selected application service.
Control user access to application services

Assign user roles to service groups to grant users access to application services in your organization. Your organization may restrict access to some services for security or secrecy reasons.

Before you begin
Make sure that you have performed the user provisioning tasks for the users you want to grant access:
1. Add users to user groups.
2. Create new roles.
3. Assign roles to users or user groups.

Also, make sure that you have created service groups as described in Group application services.

Role required: app_service_admin or sm_admin

About this task
In the base system, the following roles provide access to application services:

app_service_admin
Creates and modifies application services, creates service groups, views, and edits application service maps.

app_service_user
Views application service maps. The itil role that serves as the basic helpdesk technician role contains the app_service_user role.

Service Mapping provides these preconfigured roles:

sm_admin
Sets up the Service Mapping application. Maps, fixes, and maintains application services. Also performs advanced configuration and customization of the product. Assign this role to application administrators.

sm_user
Views maps for operational application services to plan change or migration, as well as analyze the continuity and availability of services. Assign this role to application users.

**sm_app_owner**

Provides information necessary for successful mapping of an application service. Once a service is mapped, this user reviews the results and either approves it or suggests changes. Assign the sm_app_owner role to users who own application services and are familiar with the infrastructure and applications that make up the services.

Event Management provides these preconfigured roles:

**evt_mgmt_admin**

Has read and write access to all Event Management features to configure Event Management.

**evt_mgmt_operator**

In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.

**evt_mgmt_user**

Has read access to all Event Management features. Has write access to alerts to manage the alert life. Has the itil role to be able to manage incidents that are created from alerts.

**evt_mgmt_integration**

Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers. In a hierarchy of service groups, access to a parent service group automatically grants access to all the child service groups.

Users inherit permissions from roles that are assigned to them. You can assign some roles directly to service groups to allow all users with this role to access all application services belonging to this group. However, most enterprises choose to organize their roles as a hierarchy. It helps to manage roles across multiple ServiceNow applications. For example, the Service Mapping administrator [sm_admin] can be part of a broader administrator role like administrator...
[admin]. You can add users to user groups and then assign roles to the user groups to give permissions of this role simultaneously to all the group users.

### Assigning a role to an application service group

![Diagram showing role assignment to service group]

By default, all new services are assigned to the **All** service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access application services in this service group and in the **All** service group. To enable users with this role to access other services, assign this role to the respective service group. Do not assign user roles directly to the **All** service group.

**Note:** Some references in the user interface to business services are actually references to application services.

### Procedure

1. Navigate to either of the following:
   - **Configuration** > **Application Services** > **Service Group Responsibilities**.
   - If Service Mapping is activated: **Service Mapping** > **Services** > **Service Group Responsibilities**.
   - If Event Management is activated: **Event Management** > **Services** > **Service Group Responsibilities**.

   **Note:**
   The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

2. Click **New** and fill out the Business Service Group Responsibilities form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Service Group</td>
<td>Service group to which you want to assign a role.</td>
</tr>
<tr>
<td>Role</td>
<td>Role you want to assign to the selected service group.</td>
</tr>
<tr>
<td></td>
<td>For example, financial_services_admin.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Example:**
To manage access to services that contain sensitive financial information in your organization:

1. Organize the services into the Financial Services group.
2. Create a new user role, financial services administrator [financial_services_admin] role, that contains the [app_service_admin] role.
3. Assign the Financial Services administrator role to the Financial Services group.

As a result, only users with the Financial Services administrator role can access application services belonging to the Financial Services group.

**View an application service map in base system**
An application service map provides a visualization of data for the CIs comprising an application service, and the relationships and connections between these CIs.

**Before you begin**
Role required: app_service_user to view the map in View mode, and app_service_admin to modify services in Edit mode.

**About this task**
When you create an application service, the system generates an associated application service map. The system then updates the map to reflect any changes to the application service. This map consists of icons representing CIs and arrows that represent the connections between them.

If Service Mapping is deployed, see Application service maps and View CI connection attributes in an application service map for more details.
To open an application service map, navigate to **CSDM > Manage Technical Services > Application Service**, select an application service, and then click **View map**.

Perform any of the following operations in the application service map.

**Procedure**

- Click \( \downarrow \) on the windows bar to navigate to a different application service.
- Use the navigation tools to increase or decrease the view of the map and to move the map on the page. You can also click anywhere on the map area and drag a segment of the map into the visible area.

- View changes: You can view changes and change records associated with the application service as a whole or with any of its CIs, within a time range. For more information, see **View the change history of application services**. Records under the **Change** tab underneath the map, which are associated with a selected CI or connection, are highlighted. If you select a change record under the **Change** tab, then the associated CI icon appears yellow on the map.

- View attributes: When you select a device, application, or connector on the map, it appears in blue and its attributes appear in the Properties pane on the right of the map. When nothing is selected on the map, the details of the application service itself appear on the Properties pane.
  
  ◦ Open the CI's form for further details by clicking **Detailed Properties** at the bottom of the Properties pane.

- Click **Edit** or **View** to switch the map mode. Edit mode lets you add or remove CIs from the map.

- Click \( \text{Menu} \) for **Additional actions**.
Set **Group CIs on map**: Simplify maps by grouping 10 or more CIs belonging to the same type and hosted on servers sharing prefix and domain name.

Set **Spanning tree view**: Simplify the map by organizing CIs into a tree structure and hiding some connection lines. This option is especially useful for very large maps.

**Map Indicators**: Show additional information for a CI or for the application service itself by displaying related records such as alerts, outages, incidents, and problems. For each indicator that is enabled, the corresponding indicator icon appears next to CIs with associated records, and the corresponding tab appears underneath the map. If a record is associated with the application service itself, the indicator appears next to the application service name.

For information about managing map indicators, see [Create or modify map indicators](#). For more general information, see [Event Management Map Indicators (Video)](#).

**Export to PDF**: Export the map to a .PDF file which you can then share as needed. After the PDF file is ready, click 🖼️ to download the PDF file to your local drive.

- View the details of a connection.
  By default, connection lines for the same CI on an application service map, are merged. This merge reduces clutter on the map and helps to make the map more readable. For a merged connection line, you can view details for all the underlying connection lines.

  ![merged connection lines](merged_connection_lines.png)

- To view the source and target CIs of a connection, right-click a connection line.
  If spanning tree view is enabled:
1. Click the CI whose connections you want to view to show all the concealed connections for the CI.

2. Right-click one of the connection lines.

   ◦ To view properties of a connection, click a connection line. For manually added connections, Endpoint Type is Manual Endpoint.

   ◦ To view properties of a connection within a merged connection:
     1. Right-click the merged connection line.
     2. Select one of the connections.
     3. Select **Select edge**.

**What to do next**
You can change the details that appear in the Properties pane by updating the form view 'Form view and section', as described in Configuring the form layout.

**Related reference**
  - Spanning tree view property

**View CI attributes in an application service map**
An application service map displays attributes for each configuration item (CI) that is part of the application service, as well as for the application service itself. The attributes come from the CMDB.

**Before you begin**
Role required: sm_admin or sm_user

**About this task**
You can view the following information for each CI:

**Name label**
The CI name. This attribute is either preconfigured on the CI or configured during CI installation.

**Basic attributes**
A summary of the most important CI attributes.

**Detailed attributes**
A complete list of all attributes collected for the CI.

Each CI type (CI class) has different attributes. For example, the Linux Server type has different attributes than the SQL Instance type.
If Service Mapping is deployed, the way CIs appear on the map depends on the view you select for the map. Attributes available for viewing also depend on the Service Mapping setup. For more information see description of components installed with Service Mapping.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

**Procedure**

1. Open the application service map.
   a. Navigate to **CSDM > Manage Technical Services > Application Service**.
   b. Select the needed application service.
   c. On the application service page, select **View Map**.

2. If needed, click **Edit** to ensure that the map is in Edit mode.
   If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

3. To see the full name of a CI whose name has been shortened on the map, point to the CI.
   A tooltip displays the full CI name.

4. Click a CI to see its details in the **Properties** pane.
   The attributes of applications and the servers that host them appear separately.
5. To view more detailed attributes for the CI, click **Detailed properties** at the bottom of the Properties pane.

6. **Optional:** (If Service Mapping or Discovery are enabled, and if tracking changes to configuration files is enabled for a CI) To view configuration files associated with a CI:
   - Review the list of files under **Tracked Files** in the **Properties** pane. Click the file name to open the actual file.
   - Click the **Affected CIs** tab and view the list of configuration files. Click the file name to open the actual file.

**View the change history of application services**

You can view the changes made to an application service as a whole and to the individual configuration items (CIs) comprising the service. Change history is useful for maintenance, planning, or troubleshooting procedures.

**Before you begin**
Role required: admin, sm_admin, sm_user, app_service_admin, or app_service_user
About this task
Details about changes to an application service and to its CIs are stored in the CMDB. Typically, these changes reflect adding or removing CIs from an application service, upgrading or updating CIs, or modifying CI configuration files. The system gathers this data by querying CMDB tables and then creating the change history view. In deployments where Service Mapping is activated, the type of change information Service Mapping queries depends on discovery patterns that Service Mapping uses to discover CIs.

Changes to configuration files are associated with CIs to which these files belong. Maps show configuration file changes as changes to related CIs.

While you can see change records for a specific CI in the context of application services, you can also see detailed history of a specific CI separate from its application service as described in History Timeline.

If the Now Platform is configured to validate changes, all changes are evaluated and rendered as valid or not. If a change is valid, its change record on the application service map is marked as approved. For more information about configuring the platform for change validation, see Managing proposed changes.

Changes to the application service appear on the history timeline.

The type of change mark depends on the nature of changes that it represents:

Light gray balloon (📍)
Unapproved change that does not influence the application service behavior. For example, a change in a network path or adding a node to a cluster.

Dark gray balloon (📍)
Unapproved change that changes the application service behavior.

Green balloon (📍)
An approved change in deployments where the Now Platform is configured to validate changes.

**Double balloon (9)**

Multiple separate changes that happened a short time from each other.

You can mark times on the history scale by creating baselines to quickly return to the marked view.

**Procedure**

1. Open the application service map.
   a. Navigate to CSDM > Manage Technical Services > Application Service.
   b. Select the needed application service.
   c. On the application service page, select **View Map**.

2. Review change records created for this application service on the **Changes** tab at the bottom of the page.
   If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

3. On the history timeline, set the time range of changes that you want to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To set the time range of the history timeline</td>
<td>Click the hour, day, week, or month icons.</td>
</tr>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td></td>
<td>The time that serves as the upper limit appears above the history timeline.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the <strong>IT Service Created</strong> event on the history timeline.</td>
</tr>
</tbody>
</table>

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.

4. To mark a time on the time scale, set a baseline:

a. Click the **Compare** icon.

b. Navigate to the time you want to mark as a baseline on the history scale.

c. Click **Set baseline**.
d. Enter the name of the baseline and click **OK**. The new baseline appears as a button above the history scale and as a blue flag on the history scale.

5. View the change history:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a change record on the <strong>Changes</strong> tab.</td>
<td>The related CI is marked yellow in the map.</td>
</tr>
</tbody>
</table>

To see the CI responsible for a change record
<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>To see only change records related to a CI</strong></td>
<td>Select the required CI or the connection on the map. The <strong>Changes</strong> tab displays only change records related to the selected CI or connection.</td>
</tr>
</tbody>
</table>
| **To see the configuration file at the selected moment in the past** | a. Set the time on the history scale.  
   b. In the **Properties** pane, scroll to **Tracked Configuration Files**, and click the file name. The new tab opens displaying the content of the tracked configuration file at the selected time. |
| **To see the network at the selected moment in the past** | a. Set the time on the history scale.  
   b. Right-click the connection and select **Show network path**. The new tab opens displaying the network or storage path map for the time you selected. |

**Note:** You cannot view the network path for connections marked as boundaries to this application service.
6. To exit the history view and see the current status of the application service, click the current icon.

Related information
- View an application service map in base system
- Compare two versions of an application service
- Modify tracking changes in configuration files

Compare two versions of an application service
You can see a summary of application service changes at a glance by comparing two versions of an application service. This feature is useful for checking the application service status before and after a certain change or problem.

Before you begin
Role required: admin, app_service_admin, app_service_user, sm_admin, or sm_user

About this task
Specify two points in time for which to compare the two versions of an application service. You can use the change indicators on the timeline to specify one point in time that is before and another that is after a change for which to see the details. For example, if you know that the application service started to fail at a certain time, you can compare two versions of the application service, one before and one after the problem started. This comparison lets you see the summary of changes that possibly led to the problems.

Service Mapping, if deployed, tracks and shows all changes to a CI including configuration files associated with a CI. When you compare two versions of an application service, you can see changes made to configuration files as changes to CIs. You can also compare two versions of a configuration file to see the actual changes in the files, during the time range specified for the comparison.
The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

Procedure

1. Open the application service map.
   a. Navigate to CSDM > Manage Technical Services > Application Service.
   b. Select the needed application service.
   c. On the application service page, select View Map.

2. If needed, click Edit to ensure that the map is in Edit mode.
   If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

3. On the history timeline, set the time range of changes that you want to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To set the time range of the history timeline</td>
<td>Click the hour, day, week, or month icons.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Hours Days Weeks Months" /></td>
</tr>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Hours Days Weeks Months" /></td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="History Scale" /></td>
</tr>
<tr>
<td></td>
<td>The time that serves as the upper limit appears above the history timeline.</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>--------</td>
<td>--------</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the <strong>IT Service Created</strong> event on the history timeline.</td>
</tr>
</tbody>
</table>

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.

4. Click the **Compare** icon.

5. Set **Compare point 1** and **Compare point 2** as the two points in time for the comparison.
   
   You can drag the pointers on the history scale to set corresponding time points.

   ![Diagram of Compare points](image)

   If the history scale does not include the time set for comparison, then its corresponding pointer appears next to the compare point in yellow:
6. **Note:** If there are no changes to the service during the time interval specified by **Compare point 1** and **Compare point 2**, then no change details are displayed.

7. **Optional:** If Service Mapping is deployed, you can compare two versions of a configuration file that appears on the map as Updated:
   
   a. Select the CI that is associated with the updated configuration file.
   
   b. In the **Properties** pane, click the link to the updated file.
The Tracked Configuration Files Version Compare tab opens showing two versions of the configuration file side by side.

c. Review actual changes.

(Optional) Highlight colors indicate the type of change:

- Purple — Updated line
- Pink — New line
- Gray — Deleted line

d. Navigate between the changes using the arrows in the upper right corner.

e. Close the Tracked Configuration Files Version Compare tab when finished.

9. Close the comparison view when finished.

Use application services APIs

Application services provide APIs that let you perform operations such as creating and updating an application service, populating it with CIs from the CMDB, and retrieving details from an existing application service.

Role required: app_service_admin

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

Create an application service

Using the createOrUpdateService - POST REST API to create an application services suits your organization if the ServiceNow CMDB already contains the CIs making up the service. Typically, it is the case when you have manually added CIs directly into the CMDB, or used the Discovery application to discover CIs and store information about them in the CMDB. You can also use this API to create application services containing CIs discovered using non-ServiceNow applications.

By default, when an application service is created, all CI connections are of the Depends on: :Used by relationship type. You can modify this default type by changing the value of the sa.it_service.manual_ci_rel_type property.

Before creating an application service, ensure that:

• The CMDB contains all the CIs comprising the application service.
• You have the sys_id of each CI comprised in the application service you want to create.
• You understand the hierarchy that the CIs form.

The Mapped Application Service [cmdb_ci_service_discovered] table contains all application services including services you create using APIs.

You can also manually create application services using the user interface as described in Create an application service.

Retrieve content from an application service

Use the getContent - GET REST API to retrieve a list of CIs and the relationships between them, for an application service that was created manually.

Additional APIs

The following JavaScript APIs are also available:
- **addCl()**: Add a CI to a manually created application service.
  
  For restrictions on the CIs being added and other details about adding CIs to application services, see [Manually add CIs to an application service](#).

- **addManualConnection()**: Add a manually created connection to an application service.

- **migrateManualToApplicationService()**: Convert a manual service to an application service.

- **populateApplicationService()**: Populate an application service with CIs and relationships from the designated entry point.

- **removeCI()**: Remove a manually created CI from an application service.

- **removeManualConnection()**: Remove a manually created connection and the connected CI from an application service.

**CMDB Data Manager**

CMDB Data Manager is a policy-driven framework for managing CI life cycle operations such as deletion and archival, in bulk. The CMDB Data Manager is a comprehensive and integrated solution which scales to large CMDBs and copes with rapid changes in a cloud-based world.
Large CMDBs can over time accumulate large amounts of stale CIs which can impact overall performance. Custom mitigating solutions can be difficult to develop and to maintain, and are also prone to errors. The CMDB Data Manager is the tool where you can create, publish, and manage policies. Create policies to automate and govern CI life cycle operations to help maintain the CMDB in a healthy and efficient operational state.

Terms

Policy

A CMDB Data Manager policy captures the overall management plan for a specific life cycle event, such as CI retirement. A policy is associated with a specific subflow (the policy subflow) which creates the tasks (the policy tasks) for the target CIs of the policy. A policy is configured with a policy type and the policy tasks perform operations associated with that policy type, such as archiving or deleting a CI record. Also, you can configure a policy to require an approval.

The policy type, policy subflow, and the policy tasks, are all aligned to a specific life cycle event of CIs. For example, a policy set with the delete policy type, is associated with the delete subflow, and its policy tasks handle the deletion of CIs.

A daily scheduled job processes all published CMDB Data Manager policies.

Policy subflow

The policy subflow contains the underlying logic to process a life cycle event such as retire or delete. If the policy is configured to require approval, then the policy subflow runs only after a policy task is approved.

The base system provides several common subflows, such as delete, archive, and retire, which you can use with policies. You can also create custom subflows that are needed in the organization.

Policy task

A separate task is created and assigned to each unique Managed By Group value within the set of target CIs in a policy. A policy task triggers the policy subflow, tracks the set of target CIs for the task, and handles the approval of the task, if required.

If a policy requires an approval, the policy tasks do not trigger the policy subflow until a member of the group assignment in the Managed by Group attribute of the target CIs, approves the tasks. If a task is rejected or if the Managed by Group attribute is empty, the task
is assigned to an administrator who needs to manually intervene to resolve the task.

If a policy isn’t configured to require an approval, then the policy tasks are always approved, automatically.

**CI exclusion lists**

A set of CIs to which policies of a specific type do not apply.

**CSDM life cycle state definitions**

CMDB Data Manager follows the Common Service Data Model (CSDM) life cycle states and standards, which basically places the CI in an end of life status. Following CSDM standards, a CI progresses from the state of retired, to archived, and then to deleted. For example, a CI must be retired before it can be archived and then deleted.

**Configure the environment for CMDB Data Manager**

To use CMDB Data Manager, you must first configure your environment as follows:

1. **Prerequisite:** Set up the CSDM environment.
2. Populate the **Manage by Group** attribute of CIs that you plan to target in policies. You can use the CI Class Manager to populate that attribute for an entire class, in a single synchronization operation. For more information about this data synchronization, see Synchronize data using CI Class Manager. If the **Managed by Group** attribute is not populated for a CI, then the approval process is directed to the administrator.

**Use CMDB Data Manager**

To open the CMDB Data Manager, navigate to **Configuration > CMDB Data Manager**.

The CMDB Data Manager tool lets you centrally create, edit, review, publish, and track Data Manager policies and the tasks generated by the policies. Use the CMDB Data Manager to **create CMDB Data Manager policies** that represent your organizational policies for managing the life cycle of CIs. You can create policies such as:

- Retire all computers without owners which were created more than a year ago.
- Archive all Linux servers in the Seattle data center which have not been updated for 6 months.
- Delete all containers which have not been discovered in the past week.
The home page of the CMDB Data Manager provides a dashboard view of policies, excluded CIs, and open policy tasks. Access the open policy tasks that need attention from the management group or from the CMDB Data Manager administrator. Preview those tasks, and then approve or reject to continue the process.

</table>
| `glide.cmdb.data_manager.default_archive_time` | Number of days that it is still possible to restore archived CIs from archive tables. After the specified number of days pass, archived CIs are permanently deleted from the archive tables.  
  - **Type:** Integer  
  - **Default value:** 120 |
| `cmdb.data.manager.stale.task.life.in.days`    | Number of days after which a task is considered stale and is set to **Closed Cancelled** by a daily scheduled job. A task becomes stale if:  
  - The task was created at least 90 days ago and it is still open.  
  - The approval requests are older than 90 days and the task is not yet approved.  
  - **Type:** Integer  
  - **Default value:** 90 |

### Migrate to CSDM life cycle standards

Common Service Data Model (CSDM) provides standard fields and values for tracking life cycle stages and stage statuses for CIs. Using these standard values consistently across applications helps to effectively track assets through their life cycle transitions.

Streamline life cycle management by migrating all life cycle fields and field values across the platform, into a CSDM standard set of fields with a standard set of values. Then, to maintain consistency, continue to use only the standard fields and values when updating or creating CIs. Using standard life cycle values is important in scenarios such as:
• Event Management and Operational Intelligence need to know if a CI is in maintenance to be able to handle alerts accordingly.

• Cloud Insights need to know the state of a CI to be able to report cost data effectively.

• Audit and Compliance need to use standard life cycle values to be able to generate consistent tasks and workflows.

You must activate life cycle migration to migrate legacy life cycle values in the system to the CSDM standard fields and values.

**Life Cycle Mapping table**

The base system contains the Life Cycle Mapping [life_cycle_mapping] table, which is pre-populated with different legacy life cycle mappings, that are widely used. Each mapping record specifies how to map a legacy life cycle field’s value, based on which table it’s in, to CSDM life cycle standards. Similar legacy stage and status from different legacy tables might map to different CSDM life cycle values. Life cycle migration stores standard stage and stage status values in the **Life cycle stage** and the **Life cycle status** fields.

The standard values specified in the Life Cycle Mapping [life_cycle_mapping] table limit the values that the **Life cycle stage** and the **Life cycle status** fields can be set to. The standard values are the only valid settings for these fields.

The Life Cycle Mapping [life_cycle_mapping] table typically contains multiple record entries per class, each entry for a specific legacy life cycle and life cycle value pair. When there are multiple record entries for the same class, the entries are prioritized by importance and likelihood for containing meaningful values to use for the mapping process.

**Custom life cycle values**

In an upgrade scenario, life cycle migration checks for custom legacy life cycle values that were added in the system. For each custom value, if any, the system adds a record to the Life Cycle Mapping [life_cycle_mapping] table. However, those mapping records are incomplete and inactive.

Before you activate life cycle migration, you must edit and activate those records to supply the desired life cycle control to use for mapping.

**Activate life cycle migration**

Map any custom and non-standard life cycle settings in the CMDB, to the Common Service Data Model (CSDM) standard life cycle values of stages and stage status values. Activating life cycle migration applies to existing data and to incoming data.
Before you begin
Before activating life cycle migration, navigate to CSDM > Life Cycle Mapping. Review the pre-populated mappings in the Life Cycle Mappings list view:

- Adjust and add any mappings as needed for your environment.
- Review mappings for any custom legacy life cycle values. Those mappings are incomplete and you must provide the desired standard life cycle control to map to.
- Ensure that all mappings are configured with a life cycle control.
- Ensure that all mappings are activated.

Role required: itil_admin or asset_admin

Procedure
2. On the Life Cycle Mappings list view, click Activate. Activation can complete only if all mapping records are set to active and are configured with a life cycle control, and all mapping records for custom legacy values are fully configured.

Results
Activating life cycle migration starts the following processes:

1. One-time bulk mapping of legacy life cycle values to the new Life cycle stage and Life cycle status fields. The mappings are based on the mapping records in the Life Cycle Mapping table, which contain values, source, and target fields.

2. Setting the csdm.lifecycle.migration.activated system property to true (set to false in the base system), which then activates the Update lifecycle from legacy business rule. Future insert or update CI operations will then trigger this business rule to populate the standard Life cycle stage and Life cycle status fields. These processes ensure that the life cycle standards are used continually and consistently.

For example, when creating a Hardware CI, and setting the legacy Status and Operational status fields. After saving, the new life cycle standard fields are automatically populated with the matching life cycle standard values based on the corresponding record entry in the Life Cycle Mapping table. If you modify legacy values, the standard fields are automatically updated based on another matching record in the Life Cycle Mapping table.
Life cycle migration is a one-time process. Therefore, after activation, the **Activate** button is no longer available.

**What to do next**
After the data has migrated successfully, you can start managing data following the CSDM model:

1. **Activate the CSDM Activation** (com.snc.cmdb.csdm.activation) plugin.
2. Use the **CMDB Data Manager** to centrally govern the life cycle of CIs, in bulk, and in a standard and consistent way.

**Create a mapping record for lifecycle migration**
In addition to pre-populated lifecycle mappings in the Life Cycle Mapping table, you can add mappings for any custom lifecycle values used in your environment. Lifecycle mappings are then used to populate the CSDM standard lifecycle fields with standard lifecycle stage and status values.

**Before you begin**
Role required: itil_admin or asset_admin

**Procedure**
1. Navigate to **CSDM > Life Cycle Mapping**.
2. On the Life Cycle Mappings list view, click **New**.
3. Fill out the Life cycle mappings form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mapping for table</td>
<td>Legacy CMDB table and descending tables, that this mapping applies to. Applies to a descending table unless there is a mapping configured specifically to that descending table.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of applying this mapping definition for the table. Priority is used when the Life Cycle Mapping table contains multiple entries for the same class. The highest priority entry is used first when searching for meaningful legacy values. If the first entry can’t be used, the next record in priority is used.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

4. Click **Submit**.

**Create a CMDB Data Manager policy**

Create a CMDB Data Manager policy to automatically process CIs life cycle event such as deletion. Applying consistent and standard life cycle policies to CIs helps maintain the health of the CMDB.

**Before you begin**

- Ensure that any custom subflow that you want to associate with a policy, exist.
- To require a review and an approval for a policy task: Ensure that the **Managed by Policy** attribute is populated in target CIs. Also, ensure that the assigned users have the privilege to approve the policy tasks.
- Life cycle attributes of CIs that you plan to target in an archive or delete policy types, must be set as follows:
  - **Lifecycle Stage** is **End of Life**
  - **Lifecycle Status** is **Retire**
- Life cycle attributes of CIs that you plan to target in a retired policy type, must be set as follows:
  - **Lifecycle Stage** is **not** **End of Life**

**Role required:**

- **Data_manager_admin**: Full access to policies
- **Data_manager_user**: Can read and preview policies
About this task
Specify for each policy a policy type, a life cycle subflow, and a set of CIs to operate on as target CIs.

Set condition filters to specify the initial set of CIs that the policy applies to. You can then further narrow down the initial set of CIs by using a CI exclusion list for the policy type. During the final preview of the policy, or from a policy task, you can select individual CIs to also exclude for the policy type. The policy eventually applies to the resulting set of CIs, after applying all those filters.

If the policy is configured to require an approval for its tasks, then email notifications are sent to members of the assignment group in the Managed by Group attribute of the CI. A policy task triggers the policy subflow only after the task is approved.

Procedure
1. Navigate to Configuration > CMDB Data Manager.
2. On the CMDB Data Manager home page, in the Policies tile, click View Policies.
3. In the CMDB Data Manager Policy and Attributes list view, click New.
4. Fill out the fields on the New Policy tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the policy.</td>
</tr>
<tr>
<td>Needs Review</td>
<td>Check to require a review and an approval of the policy tasks, by the group assignment in CIs' Managed by Group attribute or by an administrator. Otherwise, all policy tasks are approved automatically.</td>
</tr>
<tr>
<td>Policy Type</td>
<td>Life cycle event that this policy manages. Policy type determines the type of actions to perform on target CIs.</td>
</tr>
<tr>
<td>Apply Retention Time</td>
<td>The length of time for retaining archived CIs in the archive table before they are deleted. Applies only when Policy Type is Archive.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition Filter</td>
<td>Criteria that CIs must meet to be included for the policy as target CIs. Further filtering such as a CI exclusion list, can further narrow down the set of target CIs.</td>
</tr>
<tr>
<td>Subflow</td>
<td>A subflow with the actions that will be executed on the target CIs for the policy. The type of subflow typically matches the policy type.</td>
</tr>
</tbody>
</table>

5. **Optional:** Click **Run filter** in the Condition Filter section, to see the resulting list of CIs that match the condition filters.

6. Click **Save**.

7. Click **Preview** and wait for an impact analysis for the policy on the **Preview Policy Impact** page to complete.
   This analysis estimates the number of CIs that the policy applies to based on the policy filters, any CI exclusion lists, and the life cycle stage of CIs. For example:
   - If the policy type is retired, CIs that meet the policy filters but are already in a retired state, are not targeted for the policy.
   - If the policy type is archive or delete, CIs that meet the policy filters but are not retired, are not targeted for the policy.

8. **Optional:** Select CIs in the target CIs list that you want to also exclude for the policy type. Click **Exclude CI** and then click **Recalculate Preview** to recalculate the data on the preview page.

9. Click **Publish** to activate the policy.
   Unpublished tasks are saved as draft policies.

### Results

After you publish a policy:

- A daily scheduled job processes the published policy and policy tasks trigger the policy subflow. Policy execution issues are recorded in an error log with notifications sent to the CMDB Data Manager Administrator.

  If a policy task requires an approval, then the policy subflow is triggered only after the task is approved.
• After a policy task is complete, the policy subflow closes the task. The list of the target CIs is rolled up in a CSV file that is then attached to the task for tracking purposes.

> Note: A CSV file is not created for Retire policy types.

• Stale tasks are set to **Closed Cancelled** by a daily scheduled job. A task becomes stale when it is still open and not approved after at least 90 days. The number of days after which a task is considered stale is determined by the `cmdb.data.manager.stale.task.life.in.days` system property.

**What to do next**

• Track the processing of policy tasks.

• You can open a policy in CMDB Data Manager and click **Deactivate** to temporarily prevent the policy from running.

• Manage CI exclusion lists of CMDB Data Manager.

**Related information**

CMDB Data Manager

**Approve or reject a CMDB Data Manager task**

If you are an authorized approver, you might receive an email notification directing you to review a CMDB Data Manager policy task. Approve the task to continue its processing, or reject the task to send it to the CMDB Data Manager administrator for a more detailed review.

**Before you begin**

Role required:

• **data_manager_admin**: Full access to policy tasks and can set state to 'Work in progress' of an unassigned task.

• **data_manager_user**: Read access to policy tasks and can approve or reject an assigned policy task.

**About this task**

Authorized approvers for a task are all users in the assignment group of the task, with the `data_manager_user` or `data_manager_admin` roles.
Procedure

1. Navigate to **Configuration > CMDB Data Manager**.
2. On the CMDB Data Manager home page, in the Open Policy Tasks tile, click **View Open Tasks**.
3. On the CMDB Data Management Task Control list view, click a task to review.
4. Click the **Approvers** tab in the related lists section.
5. In a record where you are the **Approver**, click the **Requested** value in the **State** column. Then, on the Approval form, set **State** to your approval choice such as **Approved** or **Rejected**.
6. Click **Update**.

Results

1. The **Approval** field of the task is set to **Approved** or **Rejected**.
2. If the task is approved, then the policy subflow is triggered to continue processing the policy tasks for the target CIs.

Manage CI exclusion lists of CMDB Data Manager

Create a CI exclusion list for the various CMDB Data Manager policy types. Policies of a specific policy type will not target CIs in the exclusion list for that policy type.

**Before you begin**

**Role required:**

- data_manager_admin: Full access to CI exclusion lists
- data_manager_user: Read access and can add a CI to a CI exclusion list

**Procedure**

1. Navigate to **Configuration > CMDB Data Manager**.
2. On the CMDB Data Manager home page, in the Excluded CIs tile, click **View Excluded CIs**.
3. On the Excluded CIs list view, click **Edit Exclusion List** and fill out the Specify Excluded CIs form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Type</td>
<td>Type of policy from which to exclude the specified CIs.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition Filter</td>
<td>Conditions that CIs must meet to be excluded for the specified policy type.</td>
</tr>
</tbody>
</table>

4. Click **Run filter**. All the CIs that meet the condition filters, appear in the Results section.

5. In the Results list, select any or all of the CIs that you want to exclude from the policies of the respective policy type. Then, in the Excluded CIs section, click the '+' icon to add the selected CIs to the Excluded CIs list.

6. **Optional:** In the Excluded CIs list, select CIs that you want to remove from the exclusion list. Then, click the trash icon.

7. Click **Save**.

**CMDB CI Lifecycle Management (legacy)**

From the time of its creation to the time that it is no longer needed, a CMDB CI would typically transition through several operational states while undergoing various operations. CI Lifecycle Management provides the mechanism to define states and actions for a CI and lets you apply appropriate actions based on a CI's state to tailor the management of CI lifecycle to business needs.

Terms associated with CI Lifecycle Management:

**Operational states**

A set of states that a CI can be at such as 'Operational' or 'Repair in Progress'. A CI can be associated with only a single operational state at any given time. The choices for operational states are based on the `operational_status` field in the `[cmdb_ci]` table. There are several operational states that are defined in the base system such as 'Retired' and 'Repair in Progress'. You can modify this list to reflect operational states that are relevant in your business.

**Note:** By default, Service Mapping is configured to ignore all host CIs for which the value of Operational status `operational_status` is not 1 (Operational) or the value of status `install_status` is 100 (absent). For additional information about this behavior, see Preparing customized ServiceNow deployments to work with Service Mapping [KB0647574] in the HI Knowledge Base.

CI Lifecycle Management allows multiple operators and automations to simultaneously set different operational states of a CI. Since a CI cannot be associated with multiple operational
states, it is important to configure each operational state with a priority. These priorities are then used in such situation to determine which of the operational states is the cumulative operational state.

**CI actions**

A set of actions that can be applied to a CI during its lifetime. You can define CI actions that are relevant in your business.

**Compatible CI Actions**

CI Lifecycle Management allows a CI to have multiple active CI actions simultaneously, however they must be specifically defined as compatible. By default, there are no two actions for a CI that are compatible with each other. You can change this behavior by specifying pairs of actions that are compatible and thus allowed to be applied simultaneously to a CI. For example, you can specify that the ‘Patching’ and the ‘Provisioning’ CI actions are compatible making it possible to apply both simultaneously to a CI.

**Not Allowed CI Actions**

By default, any CI action can be applied to any CI. You can restrict this behavior by defining a rule that an action is not allowed for a CI when it is in a specific operational state. For example, you can define a Not Allowed CI Action in which it is not allowed to apply the ‘Provisioning’ action to a Linux Server that is in a ‘Non-Operational’ state.

**Not Allowed Operational Transitions**

By default, transitions are allowed from any operational state to another. You can restrict this behavior by defining a rule that for a specified CI, a transition from a certain operational state to another operational state is not allowed. For example, you can define that for a Linux Server it is not allowed to transition from ‘Repair in progress’ to ‘Non-Operational’.

**Requestor**

A requestor can be a workflow or a non-workflow operator that is trying to set operational states and apply CI actions. Each requestor has an associated requestor ID that is a GUID and that can be an active workflow context or a non-workflow registered operator ID.

**Lease time**

A time period that each requestor (especially non-workflow operators) can provide, during which a specified CI action is allowed to be active for a specified CI.
CMDB CI Lifecycle Management provides a set of APIs to manage CI operational states and CI actions. And the UI where you define a set of rules to restrict certain operational state transitions and to restrict actions based on operational states. It also provides a mechanism to audit CI operational state and CI actions during the entire CI lifecycle.

Providers such as automation, workflows, or Change Management can use CI Lifecycle Management as a mechanism to manage CI operational states and apply CI actions. By default, the behavior of CI Lifecycle Management has no restrictions on some operations, and full restrictions on other operations. The CI Lifecycle Management UI lets you modify this default behavior by specifying Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions that restricts some operations and enables for others.

With CI Lifecycle Management you can:

- Manage CI operational states and CI actions throughout the entire CI lifecycle.
- Manage CI operational state transitions.
- Restrict certain operational state transitions.
- Associate certain actions for certain CI types that are in specific operational state.
- Restrict IT Service Management applications based on CI operational state.
- Audit CI operational states and CI actions during the entire CI lifecycle.

**Lifecycle management APIs**

CI Lifecycle Management provides a set of APIs to manage CI operational state and CI actions during the entire CI lifecycle. All restrictions and allowances specified by rules in the UI are enforced when state management APIs run, and if an API attempts to perform a restricted operation, the operation is blocked and an error is logged.

**Registering requestors**

When using the lifecycle management APIs to apply CI actions, requestors are required to be registered and to obtain a requestor ID which is unique within the lifecycle management tables. To register and to obtain a requestor ID, non-workflow users should call the `registerOperator` API. Workflow users can use the active Workflow context as the requestor ID, and they do not need to explicitly call `registerOperator`.

After completing the CI lifecycle operations, the requestor should call the `unregisterOperator` API to unregister. All the state management records associated with that specific requestor ID are then marked as inactive or...
they are removed by the CI Lifecycle Management — Restore Internal State Management Tables scheduled job.

Integration with Incident Management and Problem Management

A base instance includes the pre-defined CI action CreateTask used for creating a task for a CI. New instances have a pre-defined Not Allowed CI Action, specifying that the 'CreateTask' action is not allowed for any CI with a Retired operational state. This restriction is integrated with Incident Management and with Problem Management to prevent the creation of incident or problem tasks for retired CIs. The 'CreateTask' CI action is used as a reference qualifier to the Configuration Item field of the Incident/Problem tables. In a new incident or problem, CIs in which operational Status is 'Retired' — are filtered out from the Configuration Item list on the form. For more information about reference qualifiers, see Reference qualifiers.

Integration with Asset Management

In a base system, a CI's Operational Status field and the Status/Hardware Status (if its hardware) fields are kept synchronized if one of the two fields' values is Retired. When Operational Status of a CI is set to Retired, then the Status/Hardware Status field is automatically set to Retired. In the opposite direction, when the Status/Hardware Status field of a CI is set to Retired, Operational Status is automatically set to Retired too.

- When an Operational Status field changes from Retired to another status, the CI's Status/Hardware Status field is set to Installed.

- When a CI's Status/Hardware Status field changes from Retired to another status, the Operational Status field is automatically set to Non-Operational.

The change of state from 'Retired' to another state is seldom, and by default, the state is changed to 'Non-Operational'. However, this might not be the intended state for the record. Therefore, it important that administrators review and manage the state appropriately in this case.

Whenever CI’s Status/Hardware Status changes, it is synchronized to the CI’s corresponding Asset State field, and vice versa — keeping the CI’s Operational Status and the CI’s corresponding Asset State synchronized.

For more information about mapping Asset State and Substate fields to a CI’s Status/Hardware Status (if its hardware) field, see Map asset state and CI hardware status. And for more information about retiring assets, see Retire assets.
Get started with CI Lifecycle Management

Follow these high level steps to get started and to track activities of the CI Lifecycle Management module of the CMDB application.

Procedure

1. Activate the base system CI Lifecycle Management - Restore Internal State Management Tables scheduled job that continuously checks and maintains data integrity of all internal CI Lifecycle Management tables.
2. Define CI actions.
3. Define compatible CI actions rules.
   Navigate to Configuration > CI Lifecycle Management > CMDB CI Actions to display currently active/inactive CI actions in the CMDB.
4. Define not-allowed CI actions rules.
5. Define not-allowed operational state transitions rules.
6. Define new operational states by modifying the operational_status field in the [cmdb_ci] table in the system dictionary.
   Navigate to Configuration > CI Lifecycle Management > View Internal Operational States to display available operational states set by each requestor.
7. Set priority for operational states.
8. Call APIs to apply CI actions.
   Navigate to Configuration > CI Lifecycle Management > CMDB CI Actions to display which actions were submitted and their active/inactive state in the CMDB.
9. Navigate to Configuration > CI Lifecycle Management > View CI State Registered Users to display currently registered operators that were registered via the registerOperator API.
10. Review Renew Lease tasks and extend leases as needed: Navigate to Configuration > CI Lifecycle Management > Renew Lease Tasks. These tasks are created automatically by the CI Lifecycle Management - Restore Internal State Management Tables scheduled job for CI action records in which the lease for a valid requester has expired. The Requestor should use the lifecycle management API ExtendCIActionLease to extend the lease. Otherwise, if the lease remains expired for a specified grace period, the CI Lifecycle Management - Restore Internal State Management Tables scheduled job marks the respective CI action record as ‘inactive’. 

The grace period for expired lease time is configurable by the system property `glide.cmdb.statemgmt.max_lease_expired_days`.

11. Navigate to **Configuration > CI Lifecycle Management > State Management Logs** to display logs of CI Lifecycle Management operations.

**Lifecycle management APIs**

CI Lifecycle Management provides a set of state management APIs for manipulating CI operational states, and applying CI actions. State management APIs adhere to restrictions and allowances specified by Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions. If an API attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is automatically created if appropriate.

Lifecycle management APIs can set operational states and CI actions to CMDB groups by utilizing lifecycle management bulk APIs.

**Registration APIs**

- `registerOperator()` - Method to register operator with state management for non-workflow user.
- `unregisterOperator(String requestorId)` - Method to unregister operator for non-workflow users.
- `isValidRequestor(String requestorId)` - Method to determine if the specified requestor is a valid active workflow user or a registered user.
- `isLeaseExpired(String requestorId, String ciSysId, String ciActionName)` - Method to check if registered user lease expired.
- `extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime)` - Method to extend CI Action Lease time, for registered users. If previous lease already expired, extend lease from now.

**Operational State APIs**

- `setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld)` - Method to set Operational State for an array of CIs.
- `getOperationalState(String ciSysId)` - Method to get CI Operational State.
CI Actions APIs

- **addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime)** - Method to add CI Action for an array of CIs.
- **removeBulkCIAction(String requestorId, String sysIdList, String ciActionName)** - Method to remove a CI Action for a list of CIs.
- **getCIActions(String ciSysId)** - Method to get CI Actions.

Not Allowed Action Based on Operational State API

- **isNotAllowedAction(String ciType, String opsLabel, String actionName)** - Method to check if a specific CI action is not allowed for specific Operational State on a CI Type.

Not Allowed Operational State Transition API

- **isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel)** - Method to check if specific operational state transition is not allowed on a CI Type.

Compatible Action API

- **isCompatibleCIAction(String actionName, String otherActionName)** - Method to check if two specific actions are compatible with each other.

Example: Using state management APIs

```javascript
// 1. Register Operator with State Mgmt
var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;

// Get list of sys_ids to update
var sys_ids;

// 2. Set list of sys_ids's Operational State to 'Repair in Progress'
output = SNC.StateManagementScriptableApi.setBulkCIOperationalState(requestorId, sys_ids, 'Repair in Progress');
gs.print(output);

// 3. Set list of sys_ids's CI Action State to 'Patching'
output = SNC.StateManagementScriptableApi.addBulkCIAction(requestorId, sys_ids, 'Patching');
gs.print(output);
```
Components installed by CI Lifecycle Management

Several types of components are installed by CI Lifecycle Management (included in the com.snc.cmdb plugin), including tables, scheduled jobs, and properties.

Note: The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

</table>

**Activate the CI Lifecycle Management scheduled job**

When starting to use the CI Lifecycle Management module, ensure to activate the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job which is disabled by default. This scheduled job continuously
checks and maintains the data integrity of all internal CI Lifecycle Management tables.

About this task
When CI Lifecycle Management operations do not complete properly, for example due to a failure of the requestor or a requestor whose lease has expired, the integrity of tables related to CI Lifecycle Management might be compromised. The **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job scans tables related to CI Lifecycle Management, and does the following:

- De-activates or removes all internal lifecycle management records with invalid requestors, and closes any corresponding Renew Lease Tasks if present.
- Detects records associated with a valid requestor whose lease has expired, and automatically creates a Renew Lease Task to notify the user and to provide details for extending the lease. If the requestor takes no action and the lease remains expired for a specified grace period (default 15 days), automatically de-activates the corresponding CI action record, and closes any corresponding Renew Lease Task if present.

Procedure
1. Navigate to **System Definition**, and click **Scheduled Jobs**.
2. Search for the **CI Lifecycle Management - Restore Internal State Management Tables** job.
3. In the respective **Active** column, double-click the value **false**, and select **true**.
4. Click the **Save** icon.

Define a CI action
Define a CI Lifecycle Management CI action that can be later applied to CIs.

About this task
You can view a list of all the actions that are currently applied to CIs by navigating to **Configuration** and clicking **CMDB CI Actions**.

Procedure
1. Navigate to **Configuration > CI Lifecycle Management > CI Actions**.
2. On the **CI Actions** page, click **New**. Fill in **Name** and **Description**, and then click **Submit**.
Define compatible CI actions

Allow a CMDB CI Lifecycle Management operation in which two specified CI actions can be applied simultaneously to a CI.

About this task
By default, it is not allowed to apply more than a single action to a CI. You can change that behavior by defining pairs of CI actions as compatible and therefore these actions can be applied simultaneously to a CI. For example you can specify that Provisioning and Patching are compatible CI actions, which lets you apply both to a CI at the same time.

Procedure
1. Navigate to Configuration, and click Compatible CI Actions.
2. On the Compatible CI Actions page click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>First action in the compatibility actions pair.</td>
</tr>
<tr>
<td>Compatible Action</td>
<td>Second action in the compatibility actions pair.</td>
</tr>
</tbody>
</table>

Results
An API can successfully apply the two specified actions simultaneously to a CI.

Define a not-allowed CI action

Define a restriction for CI Lifecycle Management in which a specified action is not allowed for a CI that is in a specified operational state.

About this task
By default, there are no restrictions in the CMDB CI Lifecycle Management on applying CI actions. You can restrict this behavior by not allowing a specified action to be applied to a CI when it is in a specified operational state. For example, you can define a restriction in which the provisioning action cannot be applied to a Linux Server that is in a non-operational state.
Procedure

1. Navigate to **Configuration > CI Lifecycle Management > Not Allowed CI Actions**.

2. Click **New** on the **Not Allowed CI Actions** page, and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Allowed Action</td>
<td>The action that is being restricted.</td>
</tr>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies to. To apply a rule to all CIs, select Configuration Item.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be at in order to apply the restriction.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Results**
If an API attempts to apply the specified action to the specified CIs, while it is in the specified operational state, the operation fails and an error is logged.

**Set priority for an operational state**
CI Lifecycle Management allows multiple operators or automations to simultaneously set different operational states for a CI. A CI can have only a single operational state, so in this case, the cumulative operational state of the CI is set to the one with the highest priority. It is recommended that you specify a priority for each operational state that you define so that a cumulative state can be correctly calculated.

**About this task**

**Procedure**

1. Navigate to **Configuration > CI Lifecycle Management > Operational State Priority**.

2. On the **Operational State Priority** page, click the operational state for which you want to set or update priority.

3. Enter a **Priority** and click **Update**. Smaller numbers represent higher priority.
Define a non-allowed operational transition

Define a restriction for CI Lifecycle Management in which a specified CI cannot transition from one operational state to another.

About this task

By default, CI Lifecycle Management has no restrictions for transitioning CIs from one operational state to another. You can restrict this behavior by defining transitions that are not allowed for a specified CI. For example, you can define a restriction on transitioning a Linux server from non-operational state to repair in progress state.

Procedure

1. Navigate to Configuration > CI Lifecycle Management > Not Allowed Operational Transitions.

2. On the Not Allowed Operational Transitions page, click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies.</td>
</tr>
<tr>
<td>Not Allowed Transition</td>
<td>The CI state into which transitioning is restricted.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be in for the restriction to apply.</td>
</tr>
</tbody>
</table>

Results

If an API attempts to transition a CI that is in the specified operational state to a state that is not allowed, the operation fails and an error is logged.

CMDB Identification and Reconciliation

The Identification and Reconciliation module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB when multiple data sources are used to create and update CI records.

The use of multiple sources, such as EventManagement, Discovery, ImportSets, CloudInsights, pattern discovery, and ManualEntry, increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity
of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new to the CMDB. Identification and Reconciliation helps you prevent duplication of CI records, reconcile CI attributes, reclassify CIs, and allow only authoritative data sources to update the CMDB.

Domain separation and CMDB Identification and Reconciliation

Domain separation is supported in the CMDB Identification and Reconciliation feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

This topic explains how domain separation is enforced during the CMDB Identification and Reconciliation process. In addition this topic addresses how domain separation is applied to the Identification and Reconciliation rules.

How domain separation works in Identification and Reconciliation

The identification process is domain aware. If the domain separation plugin has been activated, then identification processes only those CIs in which the domain ID is identical to the domain of the currently logged on user. If duplicate CIs exist across domains (including parent and child domains), then those CIs are not considered duplicate CIs because their domain IDs do not match. Domain separation in the identification engine is enforced as soon as users activate the domain separation plugin.

Domain separation during the Identification and Reconciliation Process

• Domain separation during the Identification/Reconciliation process is enforced through the domain ID.
  ◦ Domain IDs do not need to be explicitly sent in the input payload of the identification engine APIs. Internally, the identification engine causes the current domain ID of the user to call the identification engine APIs.
  ◦ Only CIs that have the same domain ID as the currently logged-in user’s domain display during matching.
During matching, if no records are found and a CI needs to be inserted, the CI’s domain ID is the same as the domain ID of the currently logged-in user’s domain.

During matching, if duplicates are found, De-Duplication tasks created in the [reconcile_duplicate_task] table, have the same domain ID as those of the duplicate CIs.

Duplicate CIs that exist across domains (including parent and child domains) are not considered as duplicate CIs by the identification engine.

During matching, if reclassification of the CI is not allowed, reclassification tasks are created in the [reclassification_task] table, with the same domain ID as the CI for which reclassification is needed.

**Domain separation and Identification Rules**

- The identification rules and identification inclusion rules used during the identification process are always defined at the global level. For example, the tables below do not have a sys_domain field:
  - Identifier (cmdb_identifier), Identifier Entries (cmdb_identifier_entry), Related Entries (cmdb_related_entry), and Identification Inclusion Rules (cmdb_ie_active_config).

**Domain separation and Reconciliation Rules**

- The reconciliation definition rules that are used during the reconciliation process can be defined for different domains. For example, the tables below do have sys_domain, sys_overrides, sys_domain_path fields:
  - Reconciliation Definition (cmdb_reconciliation_definition), Datasource Precedence (cmdb_datasource_precedence), and Data Source Staleness Definitions (cmdb_datasource_staleness).

**Components and process of Identification and Reconciliation**

The CMDB Identification and Reconciliation functionality is supported by the Identification and Reconciliation engine (IRE) and rules and tasks. Identification rules, reconciliation rules, IRE data source rules, de-duplication tasks, and reclassification tasks determine how IRE identifies and reconciles CI.

**Concepts and Components of Identification and Reconciliation**

Identification

Process of uniquely identifying CIs, to determine if the CI already exists in the CMDB or if it is a newly discovered CI that must be
added to the CMDB. Identification processes rely on identification rules, or on unique IDs for CIs that data sources can provide.

**Reconciliation**

Process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. Reconciliation processes rely on reconciliation rules and IRE data source rules.

**De-duplication tasks**

If the instance encounters duplicate CIs during the Identification and Reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

**Reclassification tasks**

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

**APIs**

The Identification and Reconciliation APIs are a centralized set of APIs that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce Identification and Reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call APIs first to ensure that the data being written does not introduce inconsistencies.

Identification engine APIs are accessible in scoped apps. The Configuration Management For Scoped Apps (CMDB) plugin (com.snc.cmdb.scoped) allows a scoped app in scripts to use the prefix 'sn_cmdb.IdentificationEngine.<method>' to access identification engine APIs. The Configuration Management For Scoped Apps (CMDB) plugin is activated in base systems.

- **createOrUpdateCI()**: A scriptable API that creates or updates a CI based on Identification and Reconciliation rules.
- **identifyCI()**: Similar to the createOrUpdateCI API, but does not commit the result to the database. Use this API with a given
payload to find out if the identification engine will perform insert or update operations, without committing the operation.

- `CreateOrUpdateCIEnhanced()`: A scriptable API that provides the functionality of enhanced IRE features such as partial payload, partial commit, incomplete payload, and deduplication of payload items. You can select the enhanced features to use. However, if you enable partial payloads, then deduplication of payload items and partial commit are automatically enabled.

- `identifyCIEnhanced`: Similar to the `createOrUpdateCIEnhanced` API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.

- `CMDBTransformUtil`: An API to be used exclusively with Import Sets to apply Identification and Reconciliation processes to data imported by Import Sets.

Predefined Identification and Reconciliation rules are included for tables that are in the base instance. You can customize these rules for your organization. When a new table is created in the CMDB, it derives Identification and Reconciliation rules from its parent table if these rules exist. To apply Identification and Reconciliation rules to a new table, create the rules either at the child level or at its parent level.

### Process flow of Identification and Reconciliation

![Process flow of Identification and Reconciliation](image)

**Identification and Reconciliation Engine (IRE)**

Identification and Reconciliation engine (IRE) is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform
Identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting that data to the CMDB. IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

Identification and Reconciliation engine (IRE)

IRE is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting that data to the CMDB.

IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

ServiceNow® applications such as Service Mapping, horizontal discovery, and pattern discovery, use APIs to apply identification and reconciliation processes. You can also apply IRE processes to data imported by import sets. Other data sources including third-party data sources, can leverage REST or scriptable IRE APIs to perform identification and reconciliation.

Additional information:

- About properties that affect some functions of IRE: See Properties for Identification and Reconciliation.
- About using IRE APIs: See IdentificationEngine - Scoped.

CI identification

The CMDB identification process relies on identification rules to uniquely identify CIs. When possible, CIs can also be uniquely identified using source_name and source_native_key values provided in the sys_object_source_info section of the payload, and the Discovery Source [sys_object_source] table. If identification is successful using that method, then it is not necessary to apply matching algorithms that rely on identification rules, which is a slower identification method.

A unique CI identifier can be provided in the optional sys_object_source_info object in the IRE payload.
Payload items identification
IRE generates identifier keys for all payload items in an incoming payload and then uses those keys when trying to match partial payload and incoming payloads. An identifier key is based either on:

- Combination of the `source_name` and `source_native_key` values from the `sys_object_source_info` object.
- Identification criterion attributes.

IRE stores the identifier keys associated with partial items in the `cmdb_ire_partial_payloads_index` table, and then uses those keys to try to match with identifier keys of incoming payloads.

Enhanced IRE features
The `CreateOrUpdateCIEnhanced()` and `identifyCIEnhanced` scriptable APIs provides the functionality for the following enhanced IRE features, which can be enabled or disabled as needed:

**Partial payloads**
IRE isolates items for which data sources did not provide enough information to uniquely identify the CI and therefore processing cannot continue. Some of these items are identified as partial items, which get stored for potential later processing. Other items are identified as incomplete items, which get stored for logging purposes only.
For example: SCCM has multiple feeds such as a disk feed and a computer feed. The disk feed might have complete information about the disk but insufficient information about the computer CI that it depends on.

API option: `partial_payloads` which is enabled by default. When `partial_payloads` is enabled, `partial_commits` and `deduplicate_payloads` are automatically enabled regardless of their setting in options.

**Partial commits**

Errors in some items do not prevent committing the rest of the items in a payload. Therefore, when a payload contains items with errors, IRE still commits the remaining valid items in the payload.

API option: `partial_commits` which is enabled by default.

**Deduplicate payload items**

IRE deduplicates duplicate items within the payload, merging those duplicates into a single payload item for processing.

API option: `deduplicate_payloads` which is enabled by default.

**Generate summary**

IRE generates summaries in the output payload with processing details such as the number of updates per class.

API option: `generate_summary` which is disabled by default.

**Partial items**

A payload item is determined to be a partial item if it contains the necessary data for unique identification and if it has one of the following errors. Unique identification requires that the payload item has the `sys_object_source_info` section with `source_name` and `source_native_key` values, or the full set of the identification criterion attributes specified for the CI class, or both.

IRE errors for a partial item:

- `MISSING_MATCHING_ATTRIBUTES` — Item does not have identification criterion attributes to use at least one identifier entry for matching.
- `REQUIRED_ATTRIBUTE_EMPTY` — Unable to create a CI because a required attribute is missing.
- `MISSING_DEPENDENCY` — Dependent CI is missing a dependency relation which is specified in the payload.
- `INSERT_NOT_ALLOWED_FOR_SOURCE` — An IRE data source rule prevents the specified data sources from creating CIs of the specified class.
For more details about IRE error messages, see IRE error messages.

If processing fails because payload items are determined to be partial items, then the partial items are saved as partial payloads in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table in JSON format for later potential processing. IRE uses identifier keys to attempt to match incoming payloads with stored partial payloads.

If later, a data source sends the data that was missing in the partial item, IRE matches the incoming payload with the stored partial payloads. IRE then merges any matching partial payloads with the incoming payload. To resolve any conflicting attributes, IRE uses either source_recency_timestamp (when source_native_key and source_name are identical), or reconciliation rules specified for the class. The result is a complete and valid payload which IRE then processes to create or update the respective CIs.

Partial payloads older than 90 days are deleted from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table.

Sample of a partial payload:

```json
Disk feed:
{
  "items": [
    {
      "className": "cmdb_ci_computer",
      "sys_object_source_info": {
        "source_native_key": "Server001",
        "source_name": "SCCM",
        "source_feed": "DISK_FEED",
        "source_recency_timestamp": "2019-08-26 13:00:00"
      }
    },
    {
      "className": "cmdb_ci_disk",
      "values": {
        "name": "disk1"
      }
    }
  ],
  "relations": [{
    "parent": 0,
    "child": 1,
    "type": "Contains::Contained by"
  }]
}
```
The computer item in the above payload does not have any attributes and therefore IRE can’t process it. However, source_name and source_native_key are provided making it a partial item. Because the computer item is partial, the disk item that depends on the computer item, is a partial item too.
Sample of a subsequent payload that completes the previous partial payload by providing the missing details:

Server/Computer feed:
{
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "values": {
        "name": 'linux001',
        "ip_address": "100.126.38.19",
        "mac_address": "DSWER4587"
      },
      "sys_object_source_info": {
        "source_native_key": "Server001",
        "source_name": "SCCM",
        "source_feed": "COMPUTER_IDENTITY",
        "source_recency_timestamp": "2019-08-26 14:00:00"
      }
    }
  ]
}

The computer in the partial payload and the server in the new payload match because they have identical source_name and source_native_key. Therefore, the partial payload and the new payload are merged, the operation is committed, and the partial payload is deleted from the Partial Payloads table.

There is a limit on the number of items per partial payload, which is set by the glide.identification_engine.partial_payload_items_max_size property (1000 by default). Storing associated relationships, references, and dependent items, in one partial payload, can result in reaching that limit, in which case, the payload is split into multiple partial payloads.

For more information about partial payloads, see CreateOrUpdateCIEnhanced().

Incomplete items
A payload item is determined to be an incomplete item if:
• It does not contain all the data necessary for unique identification
• It has an error that is not associated with a partial item
Unique identification is not possible if neither source_name and source_native_key within the sys_object_source_info object, nor the full set of identification criterion attributes specified for the CI class, is provided.

Incomplete items are saved as incomplete payloads in the CMDB IRE Incomplete Payloads [cmdb_ire_incomplete_payloads] table in JSON format. Incomplete items are stored for the purpose of logging payloads with unrecoverable errors, and are never processed again.

**Adding relationships**

Add relationships by using either indices, or the optional JSON internal_id element.

Use the relations object in the payload to add or update relationships by referring to internal_idS of items. Relationships can be created using main items and related items in the payload. For example:

- Relation (parent Index, child Index, Relation Type)
- Relation (parent Internal Id, child Internal Id, Relation Type)

For more information and for code samples, see CreateOrUpdateCIEnhanced().

**Adding references between payload items**

Add references between two payload items by using the optional JSON internal_id element, which uniquely identifies payload items.

Use the referenceItems block to add or update references. You can add references between any two items, including main items, lookup items, and related items, in a single payload.

For more information and for code samples, see CreateOrUpdateCIEnhanced().

**CI reclassification**

Use the updateWithoutUpgrade, updateWithoutDowngrade, and updateWithoutSwitch flags in the settings block in a payload, to prevent unintentional updates to CIs' class. These flags prevent upgrading, downgrading, or switching the class of a CI that multiple data sources unintentionally might attempt while updating the same CI. For more information and for code samples, see CreateOrUpdateCIEnhanced().

Reclassification flags have precedence over any other system settings for CI reclassification during IRE processing.
Adding custom before and after scripts

Use the IntegrationHub ETL to add custom Java scripts for a data source of a CMDB integration application. Those scripts provide access to the IRE input and output payloads, while processing CMDB integrations.

Before scripts provide access to a batch of input payloads that will be sent to IRE. Using a custom before script lets you:

• Skip a payload in the batch by setting the status to SKIPPED. Optionally, provide a reason for skipping the payload which will appear as a comment on the respective import set row table.
• Modify the input payload.
• Write other custom logic inside the script that uses the IRE payload.

After scripts provide access to the IRE input and output payloads. Using a custom after script lets you:

• Easily compare the input and output payloads and identify the different operations that IRE performed on each CI.
• Access the sys_ids of the CIs that IRE created or updated.
• Write other custom logic inside the script that uses the IRE output payload.

Apply CI Identification and Reconciliation to Import Sets

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.

Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

Transform map script

In the onBefore transform map script for an import set, add a call to the CMDBTransformUtil API, similar to the following code sample:

```javascript
(function runTransformScript(source, map, log, target) {
  // Call CMDB API to do Identification and Reconciliation of current row
  var cmdbUtil = new CMDBTransformUtil();
  cmdbUtil.identifyAndReconcile(source, map, log);
  ignore = true;

  if (cmdbUtil.hasError()) {
    var errorMessage = cmdbUtil.getError();
  }
}
```
The `ignore = true` code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

**Process**

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

The CMDBTransformUtil API pre-processes the source data, then passes the input values to the identification engine with import set being the data source by default. The CMDBTransformUtil API supports a target field that is a reference field in the same manner that Import Sets supports it. The CMDBTransformUtil API also supports a source script, evaluating source scripts to determine the target value which is then passed to the identification engine. For more information, see Creating a field map.

**Specify multiple target tables for an import set**

You can configure each record in an import set with its own target table. Then, instead of inserting all the transformed records into a single target table, the records are inserted into the different target tables that are specified per record. For example, you might need to insert some records from the import set to the Computer class and other records to the Server class.

When importing data using Import Sets, incorporate the following steps:

- In the data source file, add a target table column. Use a string such as "MyTable" to label the column header. In each record row, enter the target table for the record, as a valid CMDB class name such as "cmdb_ci_computer".
- After you Auto Map Matching Fields on the Table Transform Map form, add a field map for the added target table column to establish a relationship between classes and the target tables in the CMDB.
1. In the **Field Map** related list on the Table Transform Map form, click **New**.

2. Set **Source field** to the header of the target table column that you added in the data source file, such as **MyTable**.

3. Set **Target field** to **Class**.

4. Click **Submit**.

When you configure an import set with multiple target tables as described in the steps above, the **Target table** that is specified on the Table Transform Map form is not used.

**Restrictions**
The following restrictions apply:

- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.

- The CMDBTransformUtil API does not check if mandatory fields have values when used with Import Sets. Regardless of how **enforce mandatory fields** is set in the transform map, data import fails if a mandatory field does not have a value.

- CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

**Related information**
- Create a transform map

**Identification rules**
The CMDB identification process relies on identification rules to uniquely identify CIs.

An identification rule applies to a CI class and consists of a single **CI identifier** and one or more **identifier entries** and **related entries**, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that are set with the highest priority for the strongest identifier entries and related entries.

The identification process and identification rules use the CIs attributes for identification:

- **Unique attributes**
Designated sets of criterion attribute values of a CI, that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

**Required attributes**

Designated attributes of a CI that cannot be empty.

**Identification rule types**

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules.

**Independent identification rule**

A rule that identifies a CI based on the CI's own attributes, independently of other CIs or relationship.

**Dependent identification rule**

A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To help with the identification process of dependent CIs, create **dependent relationships** that define the dependency chain within CI types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

**Identifier entries**

You can configure an identifier entry to match a CI not only based on the CI's own attributes (field-based identification) but also based on the CI's related list (lookup-based identification) such as **Serial Numbers** or **Network Adapters**. The lookup table that is used for identification, needs to have a reference field that points to `cmdb_ci`.

There are three types of identifier entries:

**Regular identifier entry**

Based on CI's attributes that uniquely identify the CI.

**Lookup identifier entry**
Uses a lookup table (related table) which can be any table that has a reference to the CI that is being identified. After you select a related lookup table, you select identifier attributes from the related table that reference either the cmdb_ci table itself, or one of its descendants.

If the lookup records do not already exist, then they are inserted in the lookup table referenced in the identifier entry.

**Hybrid identifier entry**

A combination of both, a regular identifier entry and a lookup identifier entry.

Example: When discovering virtual machines in a cloud environment which contains two virtual machines with identical serial numbers. A regular identifier entry for the Hardware table such as $[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type]$ cannot uniquely identify these two virtual machines. However, a hybrid identifier entry such as $[Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type + (Name field from main Hardware table)]$ can uniquely identify the two virtual machines.

**Guidelines for lookup tables**

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the cmdb_ci table.

2. It is preferable to enforce exact count match (check box Enforce exact count match (Lookup)) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match. See Create or edit a CI identification rule for more details.

3. Do not create conflicting identification rules especially for lookup-based rule.

Example: In a CI Identifier for the Hardware class, you specify a lookup-based rule for the Network Adapter class and you also define a CI Identifier for the Network Adapter class. Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:

- One rule that looks only at criterion attributes (CI identifier rule)
- Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.
Related entries

You can define related entries which are rules that are based on related CIs. A related entry is based on a related table which can be any table (CMDB or non-CMDB) that has a reference to the CI that is being identified. Related entries let you create or update records on other tables in which the data is associated with the CI being identified by the identifier entries. Related entries are not used to directly identify CIs.

After you select a related table for the rule, the list in **Referenced field** is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

A related entry for a class is derived by child classes for which there no related entries are specified.

**Related information**

**Relation qualifier**

**Create or edit a CI identification rule**

Identification rules are used to uniquely identify CIs in the CMDB, as part of the identification and reconciliation process. Each CMDB class can be associated with a single identification rule.

**Before you begin**

Role required: itil has read access, itil_admin (on top of itil) has full access.

**About this task**

In a CI identification rule, specify a CI identifier, and identifier entries and related entries that uniquely identify the CI.

Review the following before creating identification rules:
• Identification rules
• Effective usage of CMDB Identification

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create an identification rule.
3. In the class navigation bar, expand Class Info and then click Identification Rule.
4. Click Edit to edit an existing rule, or click Add in the Identification Rule section to create one. Fill out the form, and then click Save.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Independent/Dependent</td>
<td>Designation of whether the CI identifier can identify the CI independently of other CIs, or not.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of CI identifier.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the CI identifier.</td>
</tr>
</tbody>
</table>

5. In the Identifier Entries section, click an existing identifier entry to edit, or click Add to create one.
6. In the Identifier Entry dialog box, choose an option and then click Next. Continue with one of the following three steps according to the option you selected.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use attributes from main table &lt;table&gt;</td>
<td>Lets you select attributes from the currently selected table (regular identifier entry).</td>
</tr>
<tr>
<td>Use attributes from another table (Lookup table)</td>
<td>Lets you select attributes from any related table, other than the currently selected table (lookup identifier entry).</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use attributes from main and another table (Hybrid)</td>
<td>Lets you select attributes from both the currently selected table, and from another table (hybrid identifier entry).</td>
</tr>
</tbody>
</table>

7. **Use attributes from main table <table>** option: Set the options on the form and then click **Save**.

**Search On Table** is preset to the currently selected table in the CI Classes list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that specifies the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
<tr>
<td>Criterion Attributes</td>
<td>Set of attributes that uniquely identify the CI. Attributes can belong to the current class, or to a parent class. It is not possible to add reference fields as a criterion attribute. Reference fields store sys_ids that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table.</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>When selected, then if at least one criterion attribute is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null. Otherwise, all criterion attributes must have values to attempt matching with an identifier entry.</td>
</tr>
<tr>
<td>Allow fallback to parent's rules</td>
<td>Allows the identification rules of the CI's parent to be used if a match is not found for this identification rule. Applies only for dependent identification rules.</td>
</tr>
</tbody>
</table>
Note:

- If criterion attributes have only two attributes and `sys_class_name` is one of them (for example `[name, sys_class_name]`, `[ip_address, sys_class_name]`), then the other attribute cannot be NULL, even if Allow null attribute is enabled. This restriction is due to `sys_class_name` being considered a special system matching attribute.

- Optional condition is applicable only for lookup or hybrid identifier entries (and not applicable when using attributes from the main table).

The Optional condition does not apply, although you are able to customize the default Identifier Entry form by adding the Optional condition field. Then navigating to Configuration > Identification/Reconciliation > CI Identifiers to use that customized form (not using the CI Class Manager).

8. Use attributes from another table (Lookup table) option:

   a. Set Search On Table to a table other than the currently selected table in the CI Classes list. The Search On Table must have a reference field to `cmdb_ci`, otherwise the identifier entry is considered invalid.

   b. Set the rest of the fields as described in the previous step.

   c. Optionally, click Advanced options and enter the information for a lookup identifier (scroll down if necessary).

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All of these conditions must be met</td>
<td>A filter to narrow the set of records that will be searched for a matching CI.</td>
</tr>
</tbody>
</table>
| Enforce exact count match            | For lookup identification, match a CI only on exact lookup records count match. When enforced, all lookup items for a CI in the payload must have matching records in the lookup table, that reference the same CI:
  
  i. Only matches CIs that have all the lookup items from the input payload referencing the CI in CMDB.
  
  ii. If there are multiple matches, selects the oldest created CI as the final match. |
When not enforced, one lookup item for a CI in the payload matching a record in the lookup table, is sufficient to consider a match:

i. Matches any CI that has at least one of the lookup items from the input payload referencing the CI in CMDB.

ii. If there are multiple matches, selects the CIs with the max number of lookup items from the input payload referencing the CI in CMDB.

iii. If there are still multiple matches, selects the oldest created CI as the final match.

d. Click Save.

9. Use attributes from main and another table (Hybrid) option:

a. Set the options on the General Settings tab as described in previous steps, and then click Next.

b. On the Main Table Settings tab, select the attributes to use from the currently selected table, and then click Next. Search On Table is preset to the currently selected table in the CI Classes list.

c. On the Lookup Table Settings tab, select a Search On Table and then in Criterion Attributes select attributes from the specified table. Search On Table must have a reference field to cmdb_ci, otherwise the identifier entry is considered invalid.

You can click Advanced options and enter the information for a lookup identifier as described in the previous step (scroll down if necessary).

d. Click Save.

Note: The Allow null attribute option in the hybrid option, is set to 'false'. Therefore, all of the selected criterion attributes from both the currently selected table and the lookup table, must have a value.

10. Optional: On the Related Entries section click an existing related entry to edit, or click Add to create one.
a. Update the Related Entry form and then click **Save**.

### Related Entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that specifies that the related entry is active.</td>
</tr>
<tr>
<td>Related table</td>
<td>A related table that references the CI that is being matched.</td>
</tr>
<tr>
<td>Referenced field</td>
<td>A referenced field in <strong>Related table</strong> that should store the referenced CI. This field always references the <code>cmdb_ci</code> table, or a descendent of the <code>cmdb_ci</code> table.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the related entry for the specified <strong>Related table</strong>. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
<tr>
<td>Criterion attributes</td>
<td>The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. (Optional) Click the lock icon to view, add, or remove attributes from the identification rule.</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.</td>
</tr>
<tr>
<td>Optional condition</td>
<td>Use the <strong>Add Filter Condition</strong> and the <strong>Add &quot;OR&quot; Clause</strong> buttons to construct a filter to narrow the set of records that will be searched for a matching related item.</td>
</tr>
</tbody>
</table>
Note: If criterion attributes have only two attributes and `sys_class_name` is one of them (for example `[name, sys_class_name]`, `[ip_address, sys_class_name]`), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This restriction is due to `sys_class_name` being considered a special system matching attribute.

A related entry for a class is derived by child classes for which there no related entries are specified.

Example:
For example, the pre-defined **Hardware Rule** applies to the Hardware [cmdb_ci_hardware] table. It has an identifier entry with the criterion attribute **Serial Number, Serial Number Type** and its **Search on table** field is set to **Serial Number**.

The following payload snippet adds a CI to the `cmdb_ci_linux_server` class, that is a child of the Hardware class. It also shows how you can add related items in the payload for which you should create **Related Entries** on the CI Identifier page for the Hardware [cmdb_ci_hardware] table:

```
{
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "lookup": [
        {
          "className": "cmdb_serial_number",
          "values": {
            "serial_number": "VMware-42 21 e3 da 44 14 5a a6-56 48 2b 0a 28 53 42 4c",
            "serial_number_type": "system",
            "valid": "true"
          }
        },
        {
          "className": "cmdb_serial_number",
          "values": {
            "serial_number": "4221E3DA-4414-5AA6-5648-2B0A2853424C",
            "serial_number_type": "uuid",
            "valid": "true"
          }
        }
      ]
    }
  ]
}
```
When the **Hardware Rule** is applied, the Serial Number [cmdb_serial_number] table is searched for a match with the values specified within the lookup key. Unless **Enforce exact count match (Lookup)** is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found, then the identification search continues to the next rule entry. If after all the rules are exhausted without finding a match, a new CI record is created in the database.
What to do next
You can optionally **create an inclusion rule** to narrow the scope of CIs that are included in identification.

Create an identification inclusion rule
Narrow the scope of CIs that are included in the identification process by creating an identification inclusion rule.

Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task
During duplication detection of independent CIs, the identification and reconciliation engine (IRE) processes only the CIs that satisfy the identification inclusion rules. For example, you can set a filter to include only CIs whose state is operational. When no identification inclusion rules exist, all CIs are included in the identification process and in the CMDB Health duplicate metric calculations. In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs, in addition to any health inclusion rules.

**Note:** Identification inclusion rules impact any script that calls IRE, therefore create them carefully. Identification inclusion rules can prevent the identification of certain types of CIs, affecting some features of Discovery and Service Mapping.

Procedure

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an identification inclusion rule.
3. In the class navigation bar, expand **Class Info** and then click **Identification**.
4. In the Inclusion Rule (Advanced) section, click **Add** to create a rule or click **Edit** to edit an existing rule. In the Create Inclusion Rules dialog box, specify a criteria in the **Active record condition** field. CIs must meet this criteria to be included in the identification process and in the duplicate CMDB Health metric.
5. Click **Save**.
What to do next
Navigate to Configuration > Identification/Reconciliation > Identification Inclusion Rules > to see the list of all identification inclusion rules.

Related information
Create health inclusion rule

Reconciliation rules
Reconciliation rules specify which discovery sources can update class attributes, and the precedence order among these discovery sources. Ensure that there is a reconciliation rule for each discovery source that is authorized to update an attribute. Reconciliation rules can be defined at the parent and the child class level.

Discovery sources, such as EventManagement, ImportSet, ManualEntry, and Tivoli, are used with the createOrUpdateCI() API to simulate manual updates to CIs. Without reconciliation rules, discovery sources are allowed to overwrite each other's updates to attribute values.

As you create reconciliation rules, keep the following principles and guidelines in mind. These principles are designed for flexibility and the refinement of rules at the attributes level.

Example reconciliation rules
For example, you might have the following reconciliation rules. The rules are created for the cmdb_ci_computer class and one of its child classes, the cmdb_ci_linux_server class. The rules specify the following:

1. Discovery is exclusively authorized to update the name attribute in the cmdb_ci_computer class.
   
   Because reconciliation rules are derived by child classes from parent classes, this rule also authorizes Discovery to update the name attribute in any child classes for the cmdb_ci_computer class.

2. ServiceWatch is exclusively authorized to update the name attribute in the cmdb_ci_linux_server class.

3. ServiceWatch is exclusively authorized to update all attributes in the cmdb_ci_linux_server class, as configured by leaving the Attributes field empty in the rule.

Authorization for all attributes in a class
You can authorize a discovery source to update all attributes in a class. However, this authorization can be overridden for some of the attributes by rules for child classes in which specific attributes are listed.
For example, if only example rules #1 and #3 are created, then Discovery is authorized to update the name attribute in the cmdb_ci_linux_server class. ServiceWatch is authorized to update all other attributes in the class except for the name attribute.

To override the authorization of Discovery to update the name attribute, example rule #2 is added to specifically authorize ServiceWatch to update the attribute.

**Authorization to only specific attributes in a class**

If you want to authorize a discovery source to update specific attributes in a class, list these attributes in the reconciliation rule for the discovery source. A rule that grants access to specific attributes in a class overrides other rules with an empty attribute list that grants access to the entire class.

Example rule #1 grants Discovery with exclusive authority to update the name attribute of the cmdb_ci_computer class. All other discovery sources are prevented from updating the name attribute of any CI in the cmdb_ci_computer class.

**Child class rules overrides parent class rules**

Any reconciliation rules defined for a child class override the rules defined for its parent class.

For example, rule #1 lets Discovery update the name attribute in the cmdb_ci_computer class and all of its child classes. However, rule #2 for the cmdb_ci_linux_server child class, which overrides rule #1 for the parent class, explicitly authorizes ServiceWatch to update this attribute in the child class.

As a result:

- Discovery cannot update the name attribute of the child cmdb_ci_linux_server class. Only ServiceWatch is authorized to update this attribute.
- Discovery is authorized to update the name attribute of CI records in all other child classes of the cmdb_ci_computer class.

**Overlapping rules**

Rules that authorize different discovery sources for the same attributes of the same class can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 but authorizes a different discovery source:

- ServiceWatch is authorized to update the name attribute in the cmdb_ci_computer class.
Like example rule #1, this new rule applies to the name attribute in the cmdb_ci_computer class so both Discovery and ServiceWatch can update the attribute. Any reconciliation rules are enforced to prevent the discovery sources from overwriting each other's updates.

**Domain separation**

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays the child domain version.

**Create a CI reconciliation rule**

A reconciliation rule specifies class attributes that discovery sources are authorized to update, and prevents unauthorized discovery sources from overwriting the attributes' values. A reconciliation rule also specifies the prioritization among multiple discovery sources. Without reconciliation rules, discovery sources are allowed to overwrite each other's updates to attribute values.

**Before you begin**
Role required: itil has read access, itil_admin (on top of itil) has full access.

**About this task**
Reconciliation rules are used in conjunction with data refresh rules to determine reconciliation steps for a CI. These rules determine if, when, and by which discovery source a CI can be updated. If multiple discovery sources are authorized to update the same class attributes, assign a priority to each of these discovery sources to prevent them from overwriting each other's updates.

After an authorized discovery source updates an attribute, subsequent updates are accepted only from the same discovery source or from a discovery source with a higher priority. Updates from a discovery source with a lower priority are rejected, unless these two conditions are met:

- The lower priority source is the first source updating the CI.
- The CI became stale based on data refresh rules for the CI class.

Precedence order of reconciliation rules:
• Rule configured for a specific attribute, has precedence over rule set with **Apply to all attributes** (regardless of priority value).

• Between two rules for the same attribute or between two rules set with **Apply to all attributes**, the rule that is specific directly for the class has precedence over the derived rule.

• Between two rules for the same attribute or between two rules set with **Apply to all attributes** at the same class level, precedence is determined by rule priorities.

Information about the last discovery source that updates each attribute is stored in the Data Source History `[cmdb_datasource_last_update]` table.

Reconciliation rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI's class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest discovery source to update the CI, within a time period. The time period is specified by the Effective Duration time in the data refresh rule for the class for the discovery source. In this case, if another authorized discovery source, with a lower priority attempts to update the stale CI attribute, the update is allowed.

**Procedure**

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to open the CI Classes hierarchy list. Then select a class for which to create a reconciliation rule.
3. In the class navigation bar, expand **Class Info** and then click **Reconciliation Rules**.
4. In the Reconciliation Rules section, click **Add** to create a rule or select an existing rule to edit.
5. Fill out the fields on the **Add Data Sources & Prioritize** tab, and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this reconciliation rule.</td>
</tr>
<tr>
<td>Discovery Source</td>
<td>The discovery source that you are configuring this rule for.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of <strong>Source</strong> within other discovery sources for the specified attributes. Smaller numbers designate</td>
</tr>
</tbody>
</table>
You can add multiple pairs of **Discovery Source** and **Priority**.

6. Fill out the fields on the **Select Attributes** tab, and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to all attributes</td>
<td>Authorizes the specified discovery sources to update all attributes of the specified class.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This rule will be overridden by any rule that applies to a specific attribute. In which case, instead of using this option, you can directly include all attributes for <strong>Attributes</strong>.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes, from the current or from a parent class, that the specified discovery sources are authorized to update. Available only if <strong>Apply to all attributes</strong> is not selected.</td>
</tr>
<tr>
<td>Update with Null</td>
<td>Attributes that the specified discovery sources can update with a null value. By default, authorized discovery sources cannot overwrite a non-null value with a null value. Attributes in this list, which are not in the <strong>Attributes</strong> list, are not included with the attributes that the discovery sources can update with a null value.</td>
</tr>
</tbody>
</table>

7. Fill out the fields on the **Set Filter Condition** tab, and then click **Save**.
### Field | Description
--- | ---
Filter Condition | Conditions that CIs must meet for the rule to be applicable. For example, to apply this rule only to CIs that are associated with the Finance department, select this condition: [Department] [is] [Finance].

**What to do next**

- Click the filter icon (🔍) and select:
  - **Attributes**: To show only reconciliation rules for a specific attribute.
  - **Discovery sources**: To show only reconciliation rules for a specific discovery source.

- Click **Preview Rule** to see per attribute, discovery sources that are authorized to update that attribute, in precedence order.

- Click **Preview Data** to see all attributes for a specific CI. Also, for each attribute, the current CMDB value and discovery sources reported values for the attribute.

  ✉ **Note**: Available only if Multisource CMDB is enabled.

- **Recompute CI attribute values**.

  ✉ **Note**: Available only if Multisource CMDB is enabled.

- Navigate to **Configuration > Identification/Reconciliation > Reconciliation Definitions** to see a list view of all definitions of reconciliation rules.

**Create data refresh rules**

Specify data refresh rules to determine if a CI is stale for a specific discovery source. Such CIs can then be updated by a lower-priority authorized discovery source.

**Before you begin**

Role required: itil has read access, itil_admin (on top of itil) has full access.

**About this task**

Data refresh rules are used in conjunction with reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which discovery source a CI can be updated.
Procedure

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data refresh rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Refresh Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Data Refresh Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discovery source</td>
<td>Discovery source of the class.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test. If the fields specified in the reconciliation rule for the CI's class were not updated by the specified discovery source within the specified time period — the CI is determined to be stale for that discovery source. If you enter a value with a prefix that is valid and a suffix that is not, such as $15\times$ — the valid portion of the value is used (‘15’). If the entire value is invalid — the default value of 0 is used.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies that the rule is active.</td>

</tbody>
</table>

5. Click Save.

Create an IRE data source rule

When using Identification and Reconciliation Engine (IRE), you can prevent a specific discovery (data) source from inserting new CIs for a specific class. Create IRE data source rules for discovery sources that you don't trust in creating CIs but continue to trust in updating those CIs that exist.

Before you begin
Role required: itil_admin
About this task
For example, an IP scan tool that discovers network gear but does not discover servers and therefore creates server CIs without details. You can prevent such discovery source from creating specific CIs, while still permitting it to update those specific CIs if they exist. IRE data source rules are stored in the IRE Data Source Rule [cmdb_ire_data_source_rule] table.

- Child classes derive IRE data source rules from parent classes like identification rules do.
- IRE data source rules that are specified for a child class, override any IRE data source rules derived from a parent class.

When IRE processes an insert operation that is prohibited by an IRE data source rule, the insert operation fails. This failure happens when the discovery source and CI class in the insert operation and in an IRE data source rule, match. When CreateOrUpdateCIEnhanced() is used, IRE stores the failed payload in the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table for future potential use.

If later, a permitted discovery source attempts to insert that same CI, then IRE inserts the CI after merging it with the matching CI from the partial payloads. IRE then deletes the partial payload from the CMDB IRE Partial Payloads [cmdb_ire_partial_payloads] table, and allows future updates by the discovery source specified in the rule.

IRE data source rules do not apply to lookup and related items, and only a single rule can be active for any class/discovery source pair.

Procedure
1. Navigate to Configuration > Identification/Reconciliation > IRE Data Source Rule.
2. In the list view, click New and fill out the IRE Data Source Rule form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates the IRE data source rule.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The class (and child classes) that the specified discovery (data) source is not allowed to create CIs of.</td>
</tr>
<tr>
<td>Data source</td>
<td>Discovery (data) source that is not allowed to create CIs of the specified class.</td>
</tr>
</tbody>
</table>
### Field Description

| Insert Not Allowed | Enables the specified discovery (data) source from inserting new CIs from the specified class, to the CMDB. |

3. Click **Submit**.

**Results**

If a payload item with an insert request, and in which the discovery source and the CI class match the discovery source and the CI class specified in the IRE data source rule:

1. The insert operation fails and IRE logs the following message:
   
   `INSERT_NOT_ALLOWED_FOR_SOURCE` Insert into `[xyz]` is blocked for data source `[xyz]` by IRE data source rule.

2. If using `CreateOrUpdateCIEnhanced()`, then IRE stores the payload item as a partial payload in the CMDB IRE Partial Payloads `[cmdb_ire_partial_payloads]` table.

If later, a permitted discovery source successfully inserts a CI that matches the CI from a partial payload item:

1. The current CI is merged with the matching CI from the partial payload, applying reconciliation rules as needed.

2. The respective partial payload in the CMDB IRE Partial Payloads `[cmdb_ire_partial_payloads]` table is deleted.

3. Later payloads in which the non-permitted discovery source updates the respective CI, run successfully.

4. IRE allows the discovery source, that was previously prohibited from inserting the CI, to update that same CI which now exists in the CMDB.

**Detecting duplicate CIs**

When the identification process encounters duplicate CIs, it groups each set of duplicate CIs into a de-duplication task for review and remediation. A large number of duplicate CIs might be due to weak identification rules. You can configure the identification engine to reconcile duplicate CIs.

During CMDB Identification, processing of duplicate CIs is determined by the properties `glide.identification_engine.skip_duplicates` (set to true by default) and `glide.identification_engine.skip_duplicates.threshold` (set to 5 by default),
and on the number of duplicate CIs that are detected. You can configure these properties so duplicate CIs are automatically reconciled, skipping duplication.

- If `glide.identification_engine.skip_duplicates` is true, and the number of duplicate CIs is less than the threshold specified by `glide.identification_engine.skip_duplicates.threshold`, then the oldest of the duplicate CIs is picked as a match and gets updated. That oldest duplicate CI also becomes the master CI for that set of duplicate CIs. The rest of the duplicate CIs are tagged as duplicates by setting the cmdb_ci's `duplicate_of` to the appropriate master CI. During matching, the identification engine filters out any CI that is tagged as duplicate of any CI.

- If `glide.identification_engine.skip_duplicates` is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs are updated.

In either case, de-duplication tasks are always created.

ℹ️ Note: For a duplicate CI, if any of the CI's attributes, other than `duplicate_of`, is updated by IRE processing, then the CI is no longer considered a duplicate CI. In that situation, the value of `duplicate_of` is cleared in the CI.

For more information about these properties, see Properties for Identification and Reconciliation.

**Review de-duplication tasks**

For information about reviewing and remediating de-duplicate tasks, and how the master CI is used, see Duplicate CIs.

**Generate and simulate payload execution using identification simulation**

Identification simulation is a central location for automatically constructing a payload that is guaranteed to be complete and valid. You can then simulate the processing of the payload by the identification and reconciliation engine (IRE) and examine the results before actually submitting it for execution by IRE.

Use identification simulation to construct an input payload, and simulate processing of the payload by IRE. You can then examine the results, adjust identification rules if needed, and re-run the simulation of the updated payload.

Use the identification simulation to:
• Automatically construct input payload that is based on existing identification rules, hosting and containment rules.

• Simulate execution of a payload (automatically constructed by identification simulation, or manually created).

• Browse payload output and execution log messages for a simulated run.

⚠️ Note: Identification simulation does not commit any updates to the CMDB.

Automatically generate payload using identification simulation

Use identification simulation to automatically construct an input payload for a specified class. The constructed payload is complete with any required dependent CIs, correctly structured, and syntactically valid for processing by the identification and reconciliation engine (IRE).

Before you begin
Role required: admin

About this task
The payload that is constructed during identification simulation is for the specified class. For a dependent CI class, you will be prompted for information about all dependencies. After you provide the required details, identification simulation constructs the payload based on your input.

Procedure
1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.

2. In the Start with CI Class box click Start.

3. On the Payload Information form, in the Data source field, select the data source that is associated with this class update. For the ServiceNow Discovery data source, select ServiceNow.

4. Select the Class in the payload.
   a. In the Criterion Attributes area select the CI identifier attributes and then specify the values that uniquely identify a CI.
   b. In the Additional Attributes area specify attributes and values that matching CIs will be updated with.
5. For dependent CIs associated with dependent identification rules, fill out the **Criterion Attributes** and **Additional Attributes** sections in all **Container level** sections that display.

6. Click **Generate Script**. If any errors indicate that there are missing fields, fill in the missing fields and then click **Generate Script** again.

**What to do next**

- Click **Run Simulation** to simulate processing of the payload by IRE.
- Examine the results of the simulation, fine-tune the payload as needed, and combine with other payloads for other classes as desired. After finalizing the payload, use the `createOrUpdateCI()` API to execute the payload by IRE which will result in actual updates to the CMDB.
- Click **Copy Script** to copy the JSON script into the clipboard. You can then paste that script into a third party software or to another screen of the identification simulation.

**Simulate payload processing using identification simulation**

Use identification simulation to simulate the identification and reconciliation engine (IRE) process of CI identification for an input payload. Provide a valid payload, which was constructed using identification simulation or that was created manually.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Configuration > Identification/Reconciliation**, and click **Identification Simulation**.

2. **Optional:** To run a simulation of an existing payload:
   a. Click **Start** in the **Start with Existing Payload** tile.
   b. On the **Insert JSON Payload** page, select the **Data source** that is associated with this class update.
   c. **Optional:** Select **Use Enhanced Identification** to apply the `identifyCIEnhanced` API for enhanced CI identification, instead of using the `identifyCI` API.
   d. Paste the JSON payload into the empty canvas.
3. Optional: To construct a new payload click **Start** in the **Start with CI Class** tile. See **Automatically generate payload using identification simulation** for more information.

4. Click **Run Simulation** to simulate processing of the payload by IRE.

**What to do next**

1. Examine the results of the simulation in the results pane, and fine-tune the payload as needed:
   a. Click **Run #1** to display the **Context ID** and the **Run ID** of the simulated run.
   b. Click the drop down arrow next to **Run #1** to display additional details.
      • **Input**: Displays the payload for the simulation.
      • **Logs**: Displays all the logged messages that IRE generated while simulating processing of the payload, according to the specified logging level.
      • **Output**: Displays the output payload returned by IRE.

2. After finalizing the payload, use the `createOrUpdateCI()` API to execute the payload by IRE which will result in actual updates to the CMDB.

**Set logging level for identification simulation**

Identification simulation logs each step of a simulated payload processing. You can then examine these run logs to determine if a payload was processed as expected, and if identification rules are effective. You can adjust the level of logging so it is helpful, and so that the amount of messages is not excessive or insufficient.

**Before you begin**

Role required: admin

**Procedure**

1. Navigate to **Configuration > Identification/Reconciliation**, and click **Identification Simulation**.

2. Click the **Settings** icon.

3. Select logging level for the identification and reconciliation engine (IRE) under **IE Log Level** and for the service cache under **Service Cache Log Level**. The logging levels are displayed in ascending order, from the minimum level to the maximum level of logging.

4. Click on the **Settings** icon again to close the **Settings** dialog box.
Examine run logs

Identification simulation provides run logs which are generated by Identification and Reconciliation Engine (IRE). You can access these run logs for payload runs, to examine results and for debugging purposes. IRE payload output logs appear in a user friendly format on a central page.

Before you begin
Role required: admin

About this task
Also, internal applications that use IRE (such as Discovery) can call an internal API to provide a URL to viewing IRE run logs.

Logging is in the context of a specific run of the identification engine, and you can filter the log list by a specific data source and time range. Up to 1000 run logs that are up to 2 months old are listed, grouped by Context IDs, and run times. You can use the glide.identification_logs.max_run_ids property to modify the 1000 limit.

You can control the logging level by using the glide.discovery.identification.log_level Discovery system property and setting the value to one of the following:

- Info
- Warn
- Error
- Debug
- DebugVerbose
- DebugObnoxious

Note: IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

Procedure

1. Navigate to Configuration > Identification/Reconciliation > Identification Logs.
2. Filter the runs list as follows:
   a. Source: Select the data source for which to display run logs.
   b. Time Range: Specify a time range for which to display run logs.
      The Runs list displays all runs for the specified data source, during the specified time range.
3. In the **Runs** list, click a **Run #** to display its **Context ID** and **Run ID**.

   A unique Context ID is associated with each specific payload that is run. Each run of that payload, is associated with a unique Run ID. A single Context ID for a payload that is run multiple times is associated with multiple Run IDs.

4. Click the drop down arrow for a **Run #** to display additional details.

   - **Input**: Displays the payload for the run.
   - **Logs**: Displays all the logged messages that the identification engine generated while running the payload, according to the specified logging level.
   - **Output**: Displays the output payload returned by the identification engine.

**IRE error messages**

The Identification and Reconciliation Engine (IRE) generates the following errors and messages. Depending on settings, these messages appear in the Identification Logging pane and in the system logs.

For information about lookup-based CI identification and qualifier chains, see [Create or edit a CI identification rule](#).

**Note**: IRE performs an initial verification of a payload before processing identification rules. If IRE detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

Delete or update the appropriate IRE data source rule to let data source [abc] insert CIs of the [xyz] class.  
Or, wait for another permitted data source to create the same CI. |

---

**CI reclassification during IRE processing**

During the Identification and Reconciliation Engine (IRE) CI identification process, a CI might need to be reclassified to a different `sys_class_name` type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

The class of a CI can be upgraded, downgraded, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see [Reclassify a CI](#). You can use system properties and payload flags to configure the IRE behavior of CI reclassification, globally or individually per CI.

⚠️ **Note:** CI reclassification is possible only between two classes that have identical identification rules.

**Configure automatic CI reclassification using system properties**

You can use system properties to configure system-wide IRE behavior for CI reclassification.
• The following properties enable or disable automatic reclassification updates that are specified in a payload. These properties are set to true in the base system, enabling processing of CI updates, including CI reclassification updates.

To disable any automatic reclassification update, set the respective property to false. In that case, IRE rejects a payload (or a payload item in Enhanced IRE) with the respective reclassification updates, and creates a reclassification task.

○ glide.class.upgrade.enabled
○ glide.class.downgrade.enabled
○ glide.class.switch.enabled

• The following properties enable IRE to process CI updates with reclassification operations. However, depending on the property setting, IRE processes or skips the reclassification update. These properties are set to false in the base system, in which case IRE processes CI updates including any CI reclassifications.

Set a property to true to configure IRE to process CI updates but not the CI respective reclassification update.

○ glide.identification_engine.update_without_switch_enabled
○ glide.identification_engine.update_without_downgrade_enabled
○ glide.identification_engine.update_without_upgrade_enabled

This set of properties takes precedence over the previous set of properties (glide.class.<reclassification>.enabled). For example, with the following conflicting property settings, the second property takes precedence over the first:

○ glide.class.downgrade.enabled = false
○ glide.identification_engine.update_without_downgrade_enabled = true

Example for IRE processing of a payload item with a switch of a CI from Linux Server to Window Server. With the following default property settings in the base system, IRE updates the attributes including the class switch:

• glide.class.switch.enabled = true
• glide.identification_engine.update_without_switch_enabled = false

However, with the following property settings, IRE updates the attributes but skips the class switch:
glide.class.switch.enabled = true

glide.identification_engine.update_without_switch_enabled = true

For more information about CI reclassification-related properties, see Properties for Identification and Reconciliation.

Configure automatic CI reclassification in input payloads

You can use flags which correspond to the system properties, in the input payload of the CreateOrUpdateCIEnhanced() or the createOrUpdateCI() APIs. In the payload, set these flags to true or false to temporarily override the respective system property settings, at the payload item level.

Payload flags that control reclassification behavior:

• classUpgrade
• classDowngrade
• classSwitch
• updateWithoutUpgrade
• updateWithoutDowngrade
• updateWithoutSwitch

The following sample JSON payload enables automatic reclassification for the specified CI:

```
{ items: [{className: 'cmdb_ci_server', classUpgrade: true, classDowngrade: true,
            classSwitch: true, values: {name: 'linux123', serial_number: '12srt567', ip_address:
            '10.2.3.4'}}, ]}
```

Reclassification restriction rules

Prevent IRE from downgrading or switching a CI class during payload processing to help prevent data loss. A reclassification restriction rule prevents a CI class change for specific source and target classes, while still processing any other property updates for the CI.

You can use a reclassification restriction rule, for example, to prevent a CI class downgrade from cmdb_ci_linux_server (source class) to cmdb_ci_server (target class). Or, to prevent a CI class switch from Linux Server to Windows Server. Reclassification restriction rules can be useful when using a Service Graph connector which might lead to a class downgrade or switch, and a potential loss of important data.

To control the application of reclassification restriction rules:
• Use the `glide.identification_engine.reclassification_restriction_rules_enabled` system property to globally enable or disable the application of active reclassification restriction rules. This property is set to `true` by default.

• Use the `skipReclassificationRestrictionRules` payload flag in an IRE payload to prevent the application of active reclassification restriction rules.

For example, a payload with the `skipReclassificationRestrictionRules` flag:

```json
{
  "items": [
    {
      "className": "cmdb_ci_server",
      "values": {
        "short_description": "Linux server description",
        "name": "Linux Server 1"
      },
      "settings": {
        "skipReclassificationRestrictionRules": "true"
      }
    }
  ]
}
```

For information about how to create a reclassification restriction rule, see Create a reclassification restriction rule.

Create a reclassification restriction rule

Reduce data loss during IRE processing by preventing a CI class change for specific source and target classes. A reclassification restriction rule affects only the `class` attribute and does not prevent the update to the rest of the CI properties.

Before you begin
Role required: Itil_admin (Itil has read privilege only)

About this task
If during IRE processing of a payload, a CI needs to be reclassified (downgrade or switch class), IRE checks reclassification restriction rules. If any reclassification restriction rule applies to the current CI reclassification, IRE processes the CI properties update, but skips the CI reclassification.

IRE output provides specific details about any processing related to reclassification restriction rules.
A reclassification restriction rule applies only to the direction between the specified source and the target classes. The rule doesn’t prevent a reclassification in the opposite direction, from the specified target class to the source class. To restrict reclassification between two classes in both directions, specify two separate reclassification restriction rules, one for each direction.

**Procedure**

1. Enter `cmdb_ire_reclassification_restriction.list` in the filter navigator.
2. Fill out the Reclassification Restriction form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the reclassification restriction rule.</td>
</tr>
<tr>
<td>Source table</td>
<td>Current CI class.</td>
</tr>
<tr>
<td>Source inheritance</td>
<td>Whether to apply the reclassification restriction rule to child classes of Source table.</td>
</tr>
<tr>
<td>Target class</td>
<td>Reclassification target class.</td>
</tr>
<tr>
<td>Target inheritance</td>
<td>Whether to apply the reclassification restriction rule to child classes of Target table.</td>
</tr>
<tr>
<td>Type</td>
<td>CI reclassification type: <strong>Downgrade</strong> or <strong>Switch</strong>.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**What to do next**

In the Reclassification Restrictions list view, you can activate or deactivate a reclassification restriction rule by setting its **Active** value to true or false.

**View a reclassification task**

When automatic CI reclassification is disabled, reclassification tasks are created for CIs that could not be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

**Before you begin**

Role required: admin or itil
Procedure
1. Navigate to **Configuration > Identification/Reconciliation > Reclassification Tasks**.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

**What to do next**
After examining the task details, you can locate the CI that is noted in the task Description and manually reclassify it. For details, see [Reclassify a CI](#).

**CMDB dependent relationship rules**
Service definitions consist of CI types and relationship types. Dependent relationship rules define the dependency structure of the CI types and the relationship types in these service definitions, helping in CI identification and in the construction of business service maps.

The dependencies that are defined by these rules are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Dependent relationship rules are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define dependent relationship rules that specify how the new CI type is related to existing types in the CMDB.

Dependent relationship rules consist of hosting and containment rules (dependent relationship rules), each type modeling the data from a different perspective of the CI. Containment rules represent CIs’ configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs’ placement in a business definition, describing what CIs run on.
Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

Manage dependent relationship rules:

• To access rules at the class level, use the CI Class Manager. Navigate to Configuration > CI Class Manager.

• To access grouped rules, use the Metadata Editor. Navigate to Configuration > Identification/Reconciliation > Metadata Editor.

The plugins that have been activated on an instance determine which hosting and containment rules exist in a base system.

**Hosting rules**

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type 'Application' 'Runs On::Runs', the CI type 'Hardware'.

A CI can be hosted on multiple resources (such as Windows and Linux). This CI is represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, should satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules [cmdb_metadata_hosting] table.

**Containment rules**

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts used to represent logical CIs, for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as 'Contained By::Contains'), and a child CI type. For example,
you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contained By’ CI type ‘WAR File’.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule, you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules [cmdb_metadata_containment] table.

Reference rules
Reference rules are used mostly by Cloud Management to represent all of the possible valid combinations of pairs of referencing and referenced CIs in the service definition.

• Reference rules are a flat set of rules that can be only one level deep.
• Reference rules always involve resources, typically virtual entities. Each reference rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can reference, or by which another CI type can be referenced. Both the CI classes should be able to live independent of each other.
• A referencing rule consists of a parent CI type, a relationship type (such as Provisioned From::Provisioned) and a child CI type. For example, you can have a referencing rule that specifies that the CI type ‘Virtual Machine’ Provisioned From::Provisioned, the CI type ‘Image’.
• A CI can reference multiple resources (for example, a VM Instance can have a reference relation with both the Image and the Hardware templates). This CI is represented by a referencing rule for the CI with each resource that the CI can be referenced from.
• The reference rule cannot be part of the CI identification.
• Reference rules are stored in the CMDB Metadata Reference Rules [cmdb_metadata_reference] table.

Rules requirements
The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop-down lists in the Metadata Editor.
• Given a CI type that is as a child in a containment rule: Not this CI type or its children can be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.

• Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you cannot be hosted on Tomcat, if Tomcat has any containment rules).

• Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.

• Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.

• Hosting rules cannot create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.

Example: Hosting and containment rules model

Hosting rules that model the diagram:
• Tomcat 'Runs on' Hardware

Containment rules that model the diagram:
• Tomcat 'Contains' Configuration File
• Tomcat 'Contains' WAR
• WAR has two endpoints for JDBC with MySQL:
  ◦ Inbound
  ◦ Outbound
Example: Valid set of rules

<table>
<thead>
<tr>
<th>Tomcat Hosted Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td>Linux Hosted Computer</td>
</tr>
</tbody>
</table>

The second metadata entry triggers the third requirement, which is satisfied (it is a hosting rule, not a containment rule).

Create dependent relationship rules

Create hosting and containment rules (dependent relationship rules) for CI classes to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

You can create a basic hosting or containment rule in the CI Class Manager. Or, use the Metadata Editor to create groups of hosting and containment rules, and inbound or outbound endpoints in containment rules. The CI Class Manager and the Metadata Editor are synchronized, and you can use each of those tools to display and edit a dependent rule.

Create a dependent relationship rule for a CMDB class

Use the CI Class Manager to create a basic dependent relationship rule (hosting or containment relationship rule) for a CMDB class.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

The class for which you create dependent relationship rule, must have a dependent identification rule.

Procedure

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and select the class for which you want to create a hosting or a containment rule.
3. In the class navigation bar, click Dependent Relationships.
4. In the Dependent Relationships view, click Add dependency.
5. Fill out the details in the Add Dependent Relationship Rule dialog box.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Designation of whether this rule is a hosting rule or a containment rule.</td>
</tr>
<tr>
<td>This Class</td>
<td>The class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Target Class</td>
<td>The target class for the dependent relationship rule. The designation of this class as a child or parent class, is based on the specified Relationship.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

**What to do next**
You can click **Reset to derived** and then confirm the operation to delete all dependent relationship rules that were added specifically for the selected class. Only dependent relationships that are derived from a parent class, remain.

For more information about child and parent classes, see [Table extension and classes](#).

**Create or edit a collection of containment rules**
Create containment rule for CIs to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

**Before you begin**
Role required: admin

**About this task**
A containment rule is a dependent relationship rule which defines a relationship between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment rules group which is a chain of containment rules. The entire set of containment rules is organized as groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI Type1 of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are noted by blue up and down arrows. After
adding an endpoint, you can not add a containment rule in that branch of the containment rules hierarchy.

**Procedure**

1. Navigate to Configuration > Metadata Editor.
2. In the Metadata Editor, click the Containment Rules tab.
3. Click Add New Rule to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green '+' icon that appears on the right.
4. Complete the Add Containment Rule to <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Enable to use the reverse relationship in the rule.</td>
</tr>
<tr>
<td>Always include in Service Model</td>
<td>Enable to always include the CIs of the specified class in the Service Map if their parent CI (based on the containment relationship) is present in the Service Map.</td>
</tr>
</tbody>
</table>

5. Click Create.
6. Add an endpoint to a child rule:

   a. Point to a child rule for which you want to add an endpoint.

   b. Click the blue "+" icon that appears on the right.

   c. Complete the Add Endpoint To <class> form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Type</td>
<td>The type of endpoint.</td>
</tr>
</tbody>
</table>
Create or edit a collection of hosting rules

Create hosting rule for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

Before you begin
A hosting rule is a dependent relationship rule which defines a relationship between two CIs, structured as: `<CI Type1> <relationship type> <CI Type2>`. To create a hosting rule, you need to add a CI type as `<CI Type1>` in the relationship rule, and then define the second portion of the relationship rule which is the relationship type and `<CI Type2>`. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.

A hosting rule implicitly contains two rules, which are the reversal of each other. When you create the rule '<CI Type1> <relationship type> <CI Type2>', the rule '<CI Type2> <reversed relationship type> <CI Type1>' is automatically added.

Role required: admin

Procedure
1. Navigate to **Configuration > Metadata Editor**.
2. In the Metadata Editor, click the **Hosting Rules** tab.
3. Click **Add New Rule** to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green '+' icon that appears on the right.
4. Complete the **Add Hosted/Hosting Rule to <class>** form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The <code>&lt;CI Type2&gt;</code> in the rule.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Check to reverse relationship in the rule.</td>
</tr>
</tbody>
</table>

5. Click **Create**.
Effective usage of CMDB Identification

Use CMDB Identification effectively.

Identification rules

An independent identification rule identifies a CI based on the CI’s attributes, independently of other CIs.

A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.

2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.

3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged as it can reduce performance. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.

4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry can further reduce performance, as will each additional identifier entry.

5. Create strong identification rules in which the strongest identifier entries and related entries are set with the highest priority.

6. Ensure that the identification rule is at the class level that it needs to be.

Payload

Create the payload using the following order of importance:
1. Payload size — Limit the number of CIs per payload to 500.

2. Avoid duplicate entries in the payload.
Example: If an identification rule has a criterion attribute for the name field, then the following payload has duplicate items resulting in failure:

```javascript
var payload = {
  items: [{
    className: 'cmdb_ci_linux_server',
    values: {
      name: 'Win Server 200',
      ram: '2048'
    }
  }, {
    className: 'cmdb_ci_linux_server',
    values: {
      name: 'Win Server 200',
      ram: '4096'
    }
  }]
};
```

3. Do not pass system data such as the following in the payload.

```javascript
var payload = {
  items: [{
    className: 'cmdb_ci_linux_server',
    values: {
      name: 'Win Server 200',
      sys_domain: 'global',
      sys_domain_path: 'xyz',
      sys_updated_on: '2017-06-15 16:25:11',
      sys_mod_count: 23
    }
  }]
};
```

4. Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.

5. When matching CIs, use CIs’ sysIds if available. If provided, IRE can use the sysId to directly locate a CI without requiring any criterion attributes from the identification rule. In this case, IRE does not use the sysId in the matching process.
   - Example: Independent CI that needs to be updated — sysId is available.

```javascript
var payload = {
  items: [{
    className: 'cmdb_ci_linux_server',
    values: {
      name: 'Win Server 200'
    }
  }]
};
```
• Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

```javascript
var payload = {
  items: [
    {
      className: 'cmdb_ci_app_server_tomcat_war',
      values: {
        name: 'war1',
        short_description: 'my description'
      }
    },
    {
      className: 'cmdb_ci_app_server_tomcat',
      values: {
        sys_id: '194876usytrr65378098'
      }
    },
    {
      className: 'cmdb_ci_linux_server',
      values: {
        sys_id: '09876tysueyt6345lakiu'
      }
    }
  ],
  relations: [
    {
      parent: 1,
      child: 0,
      type: 'Contains::Contained by'
    },
    {
      parent: 1,
      child: 2,
      type: 'Runs on::Runs'
    }
  ]
};
```

• Example: Dependent CI that needs to be updated — sysId is available.

```javascript
var payload = {
  items: [
    {
      className: 'cmdb_ci_app_server_tomcat_war',
      values: {
        sys_id: '039387euey637465sytet',
        short_description: 'my description new'
      }
    }
  ];
```
6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

**Properties for Identification and Reconciliation**

Use the Identification and Reconciliation properties to configure the identification and reconciliation engine (IRE).

These properties are available for Identification and Reconciliation. To view and edit these properties, the admin role is required.

---

### Note:

To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<td>Reconciliation Definition [cmdb_reconciliation_definition]</td>
<td>Reconciliation rules defined for different classes of CIs at the table and field level.</td>
</tr>
<tr>
<td>Identifier Entry [cmdb_identifier_entry]</td>
<td>Rule entries with different priorities assigned to each identifier.</td>
</tr>
<tr>
<td>Duplicate Audit Result [duplicate_audit_result]</td>
<td>Duplicate audit results corresponding to a specific duplicate task. These results are generated automatically during the identification process and should not be added manually.</td>
</tr>
<tr>
<td>RemEDIATE Duplicate Task [reconcile_duplicate_task]</td>
<td>Task to address duplication that is detected during the identification process. Records are generated automatically, and users should not add records manually.</td>
</tr>
<tr>
<td>Reclassification Task [reclassification_task]</td>
<td>Reclassification tasks that were generated during the identification process.</td>
</tr>
<tr>
<td>Data Source History [cmdb_datasource_last_update]</td>
<td>Information about the last data source that updated each attribute. Used to determine if a data source can update a stale CI.</td>
</tr>
<tr>
<td>Data Source Staleness Definition [cmdb_datasource_staleness]</td>
<td>Effective duration per data source. When effective duration is exceeded, then CMDB Health determines that the information provided by that data source is stale.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Identification Engine Context</td>
<td>Input payload, and data source (cmdb_ci’s discovery_source) that will be used as input for a specific identification engine API. Stores information about which specific identification engine API will be called (identifyCI or createOrUpdateCI API). Also stores information about enhanced IRE options used in Identification Simulation.</td>
</tr>
<tr>

Properties for Identification and Reconciliation

**Monitor system foundations in the CSDM and the CMDB Data Foundations Dashboards (Version 1.3.0)**

The ServiceNow® CSDM and CMDB Data Foundations Dashboards store app contains dashboards which provide insights into the key foundational indicators of your CMDB and Common Service Data Model (CSDM). This app provides recommendations to ensure that the CMDB and CSDM are properly configured for optimal usage and to mitigate any potential risks.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The CSDM and CMDB Data Foundations Dashboards store app provides these dashboards which complement each other:

**CMDB Data Foundations dashboard**

Evaluates various configurations and customizations in the CMDB. This dashboard checks that important data is valid and properly configured, and identifies and provides visibility into potential risks in the implementation. Use the CMDB Data Foundations dashboard to prevent issues and support continuous effective functioning of the CMDB.

**CSDM Data Foundations dashboard**
Evaluates the key indicators of the CSDM. This dashboard lets you see if you have the information that you need to get the full benefit of the CSDM. For example, you may see that some of your business service offerings don’t have the required relationship to an application service. Use this dashboard to see those areas and then provide whatever data the CSDM requires.

To access these dashboards, navigate to Configuration, and then select CMDB Data Foundations Dashboard or CSDM Data Foundations Dashboard. You can toggle between the two dashboards by clicking the change dashboard icon (▼) on the title bar of either dashboard.

For an introduction, watch the ServiceNow Data Foundations Dashboards for CSDM and CMDB video.

**CMDB Data Foundations dashboard**

Use the CMDB Data Foundations dashboard to monitor foundational key indicators in CMDB.

**Requirements**

- To access the CMDB Data Foundations dashboard, users must be configured with the admin, itil_admin, or asset roles.

- The CMDB Data Foundations dashboard adds the following scheduled jobs, which must be running:
  
  - **CMDB Get Well Metric Collection**: Calculates and stores details for compliant CIs associated with indicators. Data appears on the dashboard only after the first run of this scheduled job. Indicators' scores are stored in the CMDB Data Foundations Metric Scores [sn_getwell_cmdb_score] table. This job runs daily by default.
  
  - **CMDB Data Foundations PA Metric Collection**: Calculates the total non-compliant CIs associated with indicators. Also, provides trending data over time for the non-compliant CIs associated with indicators.

To access the dashboard, navigate to Configuration > CMDB Data Foundations Dashboard.
The CMDB Data Foundations dashboard has these sets of indicators:

• The **CMDB Data Foundations** tab provides higher priority key indicators.

  Drill down the tiles associated with the indicators in this tab to access Performance Analytics widgets, which are provided by the **CMDB Data Foundations PA Metric Collection** scheduled job.

  ◦ Ensure that the real-time option is selected ( ) and then click **Show Records** to see a list view of the respective CIs.
  ◦ Click the **Breakdowns** context menu to see any available breakdowns.

• The **CMDB Insights** tab provides additional important indicators, which are less critical.

The following columns appear on the CMDB Data Foundations dashboard.

**Name**
This column shows the CMDB indicators. Click the **CMDB Data Foundations** tab or the **CMDB Insights** tab to access the following indicators.

**Hardware CIs with Serial Numbers**
Percentage of Computer or Network Gear CIs with a serial number versus those CIs without one. The indicator is based on the following conditions:

- Class is an instance of Computer or Network Gear
- Status = installed
- Operational status = operational
- Serial number is empty

The complete set of CIs for this indicator consists of the CIs that satisfy the first three conditions. The CIs that satisfy all conditions, are counted as Computer or Network Gear CIs without a serial number.

Note: If the percentage of compliant CIs is less than 70%, then the result displayed for this indicator is set to 0.

The Hardware CIs Missing Serial Number tile shows the total number of CIs which are not in compliance with the indicator, correlating the black portion of the indicator bar. Click the tile to access the Performance Analytics widget for further details, such as the list all those CIs.

The Hardware CIs Missing Serial Number by Key Classes chart shows those CIs that are missing a Serial Number, grouped by key classes. Point to a class bar on the chart to show more details, and click a class bar to access a list view of those CIs for class.

CIs Processed via IRE

Percentage of Hardware [cmdb_ci_hardware] or VMware Virtual Machine Instance [cmdb_ci_vmware_instance] CIs processed via IRE versus those CIs not processed via IRE. The indicator is based on the following conditions:

- Status = installed
- Operational status = operational
- Sys_id is IN (target_sys_id FROM sys_object_source table)

The complete set of CIs for this indicator consists of the CIs that satisfy the first three conditions. The CIs that satisfy all conditions are counted as Hardware [cmdb_ci_hardware] or VMware Virtual Machine Instance [cmdb_ci_vmware_instance] CIs not processed via IRE.

CI with Relationships to Parent and Child
Percentage of non-orphan CIs versus orphan CIs.

The complete set of CIs for this indicator consists of CIs in records from the CI Relationship [cmdb_rel_ci] table. CIs in which [parent.sys_class_name=(empty)] OR [child.sys_class_name=(empty)], are counted as orphan CIs.

The Orphan CIs tile shows the total number of orphan CIs, correlating the black portion of the indicator bar. Click the tile to access the Performance Analytics widget for further details, such as the list all those CIs.

**Active CIs Updated in Last 90 days**

Percentage of Hardware [cmdb_ci_hardware] or VMware Virtual Machine Instance [cmdb_ci_vmware_instance] active CIs that were updated in the past 90 days versus those CIs that were not (stale CIs). The indicator is based on the following conditions:

- Class is an instance of Hardware or VMware Virtual Machine Instance
- Status = installed
- Operational status = operational
- Updated >= 90 days

The complete set of CIs for this indicator consists of CIs that satisfy the first three conditions. The CIs that satisfy all conditions, are counted as stale CIs of the Hardware [cmdb_ci_hardware] and VMware Virtual Machine Instance [cmdb_ci_vmware_instance] classes.

**Note:** If the percentage of compliant CIs is less than 65%, then the result displayed for this indicator is set to 0.

The Active CIs Not Updated in 90 Days tile shows the total number of CIs which are not in compliance with the indicator, correlating the black portion of the indicator bar. Click the tile to access the Performance Analytics widget for further details, such as the list all those CIs.

**Handled Duplicate CIs**

Percentage of duplicate CIs of the Hardware [cmdb_ci_hardware] or VMware Virtual Machine Instance [cmdb_ci_vmware_instance] class, that were remediated, versus those CIs that were not. The indicator is based on the following conditions:
• Class is an instance of Hardware or VMware Virtual Machine Instance
• Status = installed
• Operational status = operational
• Duplicate_of in not empty

The complete set of CIs for this indicator consists of the CIs that satisfy the first three conditions. The CIs that satisfy all conditions are counted as Hardware [cmdb_ci_hardware] or VMware Virtual Machine Instance [cmdb_ci_vmware_instance] duplicate CIs that were not remediated. For more information, see Duplicate CIs.

The Unhandled Duplicate CIs tile shows the total number of CIs which are not in compliance with the indicator, correlating the black portion of the indicator bar. Click the tile to access the Performance Analytics widget for further details, such as the list all those CIs.

Managed CIs with Model Entries

Percentage of Hardware [cmdb_ci_hardware] CIs with a model ID versus those CIs without.

The complete set of CIs for this indicator consists of all the CIs in the Hardware [cmdb_ci_hardware] table. Those CIs in which model_id is null are counted as Hardware CIs missing a model ID.

Unique Locations

Percentage of unique locations versus duplicate locations.

The complete set of locations for this indicator consists of all the locations in the Location [cmn_location] table records, in which name is not null. A duplicate location is defined by Location [cmn_location] table records, in which name is not null, and the same name is used more than once.

CIs With Names

Percentage of Hardware [cmdb_ci_hardware], VMware Virtual Machine Instance [cmdb_ci_vmware_instance], or Application [cmdb_ci_appl] CIs with a name versus those CIs without. The indicator is based on the following conditions:

• Class is an instance of Hardware, VMware Virtual Machine Instance, or Application
• Status = installed
- Operational status = operational
- Name is empty

The complete set of CIs for this indicator consists of CIs that satisfy the first three conditions. The CIs that satisfy all conditions, are counted as Hardware, VMware Virtual Machine Instance, or Application CIs missing a name.

The CIs Missing Names tile shows the total number of CIs which are not in compliance with the indicator, correlating the black portion of the indicator bar. Click the tile to access the Performance Analytics widget for further details, such as the list all those CIs.

**Create Asset Business Rule is Enabled**

Checks for the existence of the Create Asset on insert business rule. If the business rule exists, the score for the indicator is 100. Otherwise, the score is set to 0.

**Custom CMDB Attributes at the Right Level**

Percentage calculation of custom attributes that should be added at a higher level in the CMDB hierarchy. For example, the custom attribute Warranty duration was added three times in the Computer class, instead of adding the attribute once at a higher level in the hierarchy, which is more efficient.

- If (total number of attributes that can be moved up > 10): Percentage is set to 0.
- Otherwise: Percentage is set to \((10 - \text{total number of attributes that can be moved up}) \times 10\).

**Use of Custom Attributes**

Percent calculation of custom attributes that were added to CMDB tables in the base system. Custom attributes are identified by a table name that starts with “cmdb_ci” and a column name that starts with “u_.”

Percentage is calculated as follows:

- If (total custom attribute count > 50): Percentage is set 0.
- If (total custom attribute count < 10): Percentage is set to 100.
- If (total custom attribute count is 10–50): Percentage is set to \((\text{total custom attribute count} - 10)/(50-10)\times100\).
**Priority**
This column shows the priority of an indicator. The priority for an indicator is a calculation of the weight of the indicator and the severity of the actual score. Priority ranges from **1 - Critical** as the highest priority, to the lowest priority which is **5 - Low**.

**Result**
This column shows the percentage number of CIs (or the measured item) which are in compliance with the indicator. A bar shows the percentage of CIs (or the measured item) which are in compliance versus the percentage of items which are not in compliance. The portion on the bar that represents CIs (or the measured item) which are in compliance, uses the following color scheme to note the level of compliance:

- **Red**: 0–50% of the total CIs (or the measured item), are in compliance for the indicator.
- **Yellow**: 50–90% of the total CIs (or the measured item), are in compliance for the indicator.
- **Green**: Above 90% of the total CIs (or the measured item), are in compliance for the indicator.

The portion on the bar that represents the percentage of items which are not in compliance for the indicator, always appears in black. Also, all indicator scores are aligned so that a higher percentage score and a smaller black portion on an indicator bar, always indicate the more optimal state.

⚠️ **Note**: Some indicators use a lower threshold value which impacts the result that appears in the dashboard. For these indicators, if the percentage of compliant CIs is less than the lower threshold value, then the result appears as 0 for the indicator.

**Remediation playbook URL**
This column provides links to remediation playbook articles in Now Support. These knowledge articles provide context for the respective issue, guidelines to help remediate the issue, and other necessary details to bring CIs into compliance. Click the link and use your Now Support credentials to access the knowledge article.

**CSDM Data Foundations dashboard**
The CSDM Foundations dashboard evaluates the data (specifically, the key foundational indicators) used in the Common Service Data Model (CSDM)
framework. The key foundational indicators give you insight into the CSDM framework and help you identify any potential problem areas.

**About the dashboard**
Use the CSDM Data Foundations dashboard to monitor and gain insights into the key foundational indicators of the CSDM framework.

This dashboard lets you see if the CSDM framework has what it needs to provide the full benefit of the model. For example, you may see that some of your business service offerings don't have the required relationship to an application service. Use this dashboard to see those areas and then provide whatever data the CSDM framework requires.

**Key foundational indicators grouped by implementation stage**
The key foundational indicators are grouped by the CSDM implementation stage (foundation, crawl, walk, run, and fly). Each stage has a separate tab. For information about these stages, see Common Service Data Model framework implementation stages.

The CSDM Data Foundations dashboard provides the following information:
Name
A list of the key foundational indicators for each of the CSDM implementation stages.

Priority
The priority given to that key foundational indicator. The priority is a calculation of the weight of the indicator and the severity of the actual score. Priority ranges from 1 - Critical (the highest priority), to 5 - Low (the lowest priority).

Result
A color-coded bar showing the percentage of configuration items (CIs) (or the measured item) which are in compliance with the key foundational indicator.

- Red: 0–50% of the total CIs (or the measured item) that are in compliance for the key foundational indicator.
- Yellow: 50–90% of the total CIs (or the measured item) that are in compliance for the key foundational indicator.
- Green: Above 90% of the total CIs (or the measured item) that are in compliance for the key foundational indicator.
- The portion on the bar that represents the percentage of items that aren't in compliance with the key foundational indicator appear in black.

Remediation playbook URL
Links to remediation playbooks in Now Support. These remediation playbooks are knowledge articles that provide context for the respective issue. The playbooks include the steps for fixing (remediating) the respective issue, and for bringing the CIs into compliance. Click the link and use your Now Support credentials to access the knowledge article.

Use the CSDM Data Foundations dashboard
Use the CSDM Data Foundations dashboard to monitor and evaluate key foundational indicators of the CSDM framework.

Before you begin
Before you use this dashboard for the first time, navigate to System Scheduler > Scheduled Jobs and run the CSDM Get Well Metric Collection job. Otherwise, the dashboard will not have any data.

Role required: app_service_admin, app_service_user, asset, cmdb_read, itil_admin, portfolio_admin, service_viewer, or technology_service_owner
Procedure

1. Navigate to CSDM > Configuration > CSDM Data Foundations Dashboard. The list of key foundational indicators appears on the CSDM Data Foundation dashboard.

2. Click the tab for the CSDM implementation stage (foundation, crawl, walk, run, or fly) that you want to view.

3. Review each line of the results.

4. Look at the percentages and the color-coding shown in the Result column for each of the key foundational indicators.
   - If the percentage is 100%, the CSDM framework has the information it needs. You don't need to do anything else.
   - Otherwise, required information is missing and additional actions are required. Continue with step 5.

Note the indicators on the Foundation tab:

- **Named Product Models with Product Owners**
  - Shows cmdb_model records that meet the following conditions:
    - Status = in production
    - Name and Owner is not empty

- **Business Units with Companies**
  - Shows business unit records where Company field is not empty.

- **Locations with Parents**
  - Shows cmdb_ci records that meet the following conditions:
    - Status = installed
    - Operational status = operational
    - Location and Location.parent is not empty

5. Click the tiles associated with the foundational indicators to access Performance Analytics widgets, which are provided by the CSDM PA Metric Collection scheduled job. These widgets provide trending data over time for the non-compliant CIs associated with the indicator.

- Ensure that the real-time option is selected and then click Show Records to see a list view of the respective CIs.
- Click the Breakdowns context menu to see any available breakdowns.
6. Click a CI from the list view to drill down to the form view. Use the form view to provide the required information. If you don’t see the form, you may not have sufficient access privileges. Talk to your ServiceNow administrator.

7. When you’re finished using the form, click Update or Delete (as applicable) to return to the list view.

8. Navigate to return to the CSDM Data Foundations dashboard.

Results
The key foundational indicator results are available for you to review and analyze.

CMDB Health
Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits contribute to the calculation of health scorecards at the CI, class, and CMDB level.

The health of the CMDB data is monitored and reported for the following KPIs, each further consisting of sub metrics:

- Completeness: CIs are tested for required and recommended fields that are not populated.
- Correctness: CIs are tested against pre-defined data integrity rules such as identification rules (to detect duplicate CIs), orphan CI rules, and stale CI rules.
- Compliance: The CMDB data is audited for adherence to pre-defined certificates.
- Relationships: The health of CI relationships is tested for indicators such as orphan and duplicate relationships. And for compliance with suggested relationships, hosting and containment rules.

After CIs are tested for various health indicators, the results are aggregated at the class level, and eventually at the overall CMDB level. You can configure how health is calculated and the weight of each KPI and each metric at every level of the aggregation. For most health tests, you can configure the health tests themselves.

CMDB Health is domain aware. If the domain separation plugin has been activated, then the CMDB dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.
CI remediation

CMDB Health provides a framework for configuring CI remediation. Remediation lets you proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

Setup

You need to configure CMDB Health related system properties, and health KPI and metric rules, to customize how aggregated data is calculated and other CMDB Health behavior. To start gathering and aggregating health data, you need to enable the CMDB Health-related jobs (CMDB Health Dashboard jobs) which are initially disabled. See Setup and configure CMDB Health for details about enabling these jobs and about configuring other CMDB Health settings.

Domain separation in CMDB Health

This is an overview of domain separation as it pertains to CMDB Health. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Overview

CMDB dashboards should be set up with their own set of rules to best accommodate how the user needs them. CMDB dashboard jobs adhere to those rules to produce reports. These are covered in separate sections below.

How domain separation works in CMDB Health

For dashboards to be the most effective, users should configure the dashboard accordingly. This is done by setting up the orphan, staleness, and inclusion rules to meet their needs, and which then affect the reports displayed on the dashboard.

The settings and metrics define different aspects of each application because each domain can be configured differently. These rules are set up in addition to those that are included in the base system. There are different types of owners for different CIs; each domain has its own set of rules.

⚠️ Note: Domain separation is on by default, but each domain can be configured as needed.

Health Preferences

Configure these preferences during setup:
1. Global system properties that control CMDB Health – System properties are not domain separated. To learn more see CMDB Health system properties.

2. CMDB Health Dashboard Jobs – There is a dashboard job for each major KPI, such as Completeness. That job finds the health of the CIs across all the enabled domains. There is only one job run for all domains and jobs themselves are not domain separated.

   Users can define the frequency with which they want to run jobs; the report runs for all the domains. The more domains included in the job, the longer the job runs.

3. Health Metrics – These selections are domain-separated and adhere to the established “system overrides” logic of domain separation. Changes are made according to the domain for which the user is logged in. Base system values are defined at the global domain. The overriding domain logic means these values apply for all domains. If users want different values for a domain, they must be logged in to a specific domain and change the property from there. The new property setting applies only to that domain and any domain that inherits this domain. To learn more see Health Metrics.

   Note: Regarding the Completeness, Compliance, and Correctness KPIs: Users can disable this KPI if they don’t want to see that as part of the dashboard score. All these settings are domain-separated and the user can define specific properties for the domain.

   a. Weighted averages – These settings can affect all or part of the metrics in Completeness, Compliance, Correctness, and Relationship. They can be set differently for different domains.

   b. Active – This setting is the most important because it affects how long the jobs run. The more domains with flags set to Active, the longer the jobs take. It’s best to select only those domains you wish to be Active and render the rest Active = false. You can set this in Health Preferences. The default settings for global domain are set to Active = true, but you can modify or disable specific domains the user wants to see in the dashboard. Users should consider the domain hierarchy when changing these values. If there is a large number of domains (>100) the job can take a very long time. To mitigate this, set Active to False for all the root domains, thereby disabling all the other domains in the hierarchy. If there is a rule at the top, all child domains inherit that rule.

   c. Failure Threshold, Create Task, Task Assignee Group – All these settings can be set differently for different domains depending on what is needed in each domain.
d. Exceptions – For Relationship metrics (relationship, duplicate relations, orphan relations, stale relations) the failure threshold setting is not domain separated. The Failure Threshold for the global domain is applied to all domains. For example, even if users were to override the Failure Threshold for a domain, the global domain setting for Threshold is still applied.

e. Troubleshooting / Implementation detail – These settings are stored in the `cmdb_health_metric_pref` table, which is domain separated.

Health Rules

Health rules settings are addressed here:

- Required
- Recommended
- Orphan
- Staleness

Most of the CMDB Health Rules are domain separated and provided by the users. Users can define different rules for different domains by logging in to each domain and adding/overriding rules in the CI Class Manager.

These are the rules for the different metrics:

1. Completeness
   a. Required fields – These are based on the class schema defined in the platform’s and is fixed for all domains. These cannot be changed.
   b. Recommended fields – These are domain separated. The table used is `cmdb_recommended_fields`, which is domain separated. The user can set these up for different domains.

2. Correctness
   a. Duplicates – Duplicates are based on Identification rules, which are not domain separated, so the same rules apply to all domains.
   b. Orphan – Orphan rules are domain separated; there are different orphan rules for different domains. The table used is `cmdb_health_orphan_rule` and is domain separated.
   c. Staleness – Staleness rules are domain separated. The table used is `cmdb_health_staleness_rule`. The base system rule (60 days) is set for global domain so is inherited by all domains as the default rule.

3. Compliance
a. Audit – Audit scores are based on the desired state or scripted audits defined in the compliance module by the user.

Audits themselves are domain separated. When audit score evaluation is enabled for a domain, scores become based only on the audits visible in that domain.

Note: Health Inclusion Rules are also domain separated. The table used is `cmdb_health_config`, which is domain separated.

Health Dashboards (CMDB View/ Service View / Group View)

If a user is logged into a domain and views a health dashboard:

1. Only scores for enabled metrics in that domain display (based on the Health Preferences Active flag as discussed above).

2. All scores are based on CIs that are visible from the specific domain. (These are regular domain visibility rules: From that domain you can see CIs in global domain, the specific domain, any child domain of that domain or any domain that gets directly or indirectly contained by that domain.)

3. The dashboard view is based on domain rules defined in domain mapping, as opposed to those provided by the logged-in user. This view overrides any additional domain visibility rules that a logged-in user might have. The admin sets the basic rules, but does not set each individual domain. The admin can give specific users or user groups additional visibility to other domains and the dashboard still does not change. The dashboard strictly follows the domain rules mentioned above, based on the domain hierarchy for the domain in which the user is logged in.

4. As explained in the Health Preferences section, users can define different preference values for any domain which impact the scores reported in the dashboard. Preferences that can impact scores include Weighted Averages, Failure Threshold, and Active.

5. As explained in the CMDB Health Rules section, the scores reported for the metrics are based on the health rules defined for them (staleness, orphan, recommended, audit, and inclusion rules) which can be defined differently for a specific domain (in the CI Class Manager). Only the required metric and duplicate metric are based on rules that apply in all domains.

6. Service View/ Group View – These reports also largely follow the above points. Typically, these views differ from various views/filters for the Health Report. One is based off business rules, the other is based off CMDB Health groups.
**Setup and configure CMDB Health**

The data collection system is highly configurable, however, the base system is minimally configured for aggregating CMDB health data. Most importantly, the CMDB Health Dashboard jobs are disabled by default and data is not collected. To display valuable and meaningful data, you should review and adjust settings.

1. **Review CMDB Health KPIs and metrics** to learn what CMDB Health can monitor, and what needs to be configured to enable and support each metric.

2. **For each KPI and associated metric that you want monitored**, define the necessary rules and fulfill other needed requirements. For example, create orphan rules for detecting orphan records, if you are interested in this metric.

3. **Review and adjust the threshold ranges for best, at risk, and critical states** for the CMDB health metrics scorecards - see **Configure CMDB Health scorecard thresholds**.

4. **Set metric aggregation preferences**, deactivate KPI and metrics that you are not interested in reporting, set failure thresholds, and adjust weighted averages of aggregation - see **Configure KPI and metrics aggregation preferences**.

5. **Narrow the scope of CIs that are included in health calculations** - see **Create health inclusion rule**.

6. **Enable the Health Dashboard jobs for the KPIs that you want reported** - see **Enable and configure a CMDB Health Dashboard job**.

7. **Customize the CI dashboard (optional)**.

**CMDB Health system properties**

Configure the following system properties to customize how CMDB Health is monitored and evaluated.

Role required: itil_admin
**Note:** To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max time in minutes for which individual metric</td>
<td>If processing of a metric exceeds the specified time, CMDB Health processing halts until the next CMDB Health job is scheduled to run.</td>
</tr>
</tbody>
</table>

**Enable and configure a CMDB Health Dashboard job**

Enable and configure the jobs that process CMDB health tests, to start calculating CMDB health scores for the *completeness*, *compliance*, *correctness*, and *relationship* KPI. These health scores are then aggregated into the overall CMDB health report.

**Before you begin**

Role required: admin

**About this task**

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable and configure the respective job for the CMDB health KPI that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or execute it once at any time.

**Procedure**

1. Navigate to **Configuration > CMDB Dashboard > CMDB View**, and then click **CMDB Health Dashboard Jobs**.
2. Select a job that you want to enable or configure.

<table>
<thead>
<tr>
<th>CMDB Health Dashboard job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Dashboard - Completeness Score Calculation</td>
<td>Script for calculating the completeness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Compliance Score Calculation</td>
<td>Script for calculating the compliance KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Correctness Score Calculation</td>
<td>Script for calculating the correctness KPI of CMDB health.</td>
</tr>
</tbody>
</table>

3. Review the default configuration, and update as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Job name. It is recommended that you do not modify the job's name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the job.</td>
</tr>
<tr>
<td>Run</td>
<td>Configure recurring schedule of job execution, or select <strong>On Demand</strong>.</td>
</tr>
<tr>
<td>Time</td>
<td>If <strong>Active</strong> is selected, set the time (hour, minute, and second) to run the job.</td>
</tr>
<tr>
<td>Conditional</td>
<td>If selected, the scripted condition must evaluate to true before the job can run.</td>
</tr>
<tr>
<td>Run this script</td>
<td>The job's script. Modifications to the script are not recommended.</td>
</tr>
</tbody>
</table>

4. Click **Execute Now** to run the job once immediately.

**Results**

After you enable a CMDB Health Dashboard job, the results for the KPI are aggregated and displayed in the CMDB dashboard and CI dashboard, at the CMDB, class, and CI levels.

CMDB Health Dashboard for Helsinki | Overview

**Configure CMDB Health scorecard thresholds**

Configure the thresholds for best, at risk, and critical state definitions for the KPIs and metrics scorecards. You can configure these settings globally for the entire CMDB, or individually per class.
Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task
Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds. For example, scorecards thresholds for completeness:
- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, upper thresholds are set to 67 and lower thresholds are set to 33 for all KPIs and metrics. You can adjust scorecard thresholds to reflect the range of failures that should be used for each health state. Applying the change to a scorecard is based on the selected class in the CI Classes list:
- If the top level Configuration Item class is selected in the CI Classes list, changes to metric scorecards apply to the entire hierarchy.
- If any other class is selected in the CI Classes list, changes to metric scorecards apply to the selected class.

For CMDB groups, you can specify a separate set of scorecard thresholds, per CMDB group/KPI or metric. See Configure CMDB groups scorecard thresholds for more details.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and then select a class to set scorecards for.
3. In the class navigation bar, expand Health.
4. To configure the overall scorecard, select Other Scorecards and then select Overall Scorecard.
5. To configure a scorecard for any of the KPIs (such as Compliance), or for relationship-related metrics (such as duplicate relations):
   a. Select configuration item at the top of the Hierarchy list.
   b. Click a KPI item, Completeness, Compliance, or Correctness.
   c. Click the tab CMDBCompleteness Scorecard, CMDB Compliance Scorecard, or CMDB Correctness Scorecard.
When you select the top-level Configuration Item class, changes to threshold settings in any metric scorecard apply to the entire class hierarchy.

6. To configure a scorecard for any metric:

   a. In the CI Classes list, select the class to which the updated scorecard should apply to. Select the top level Configuration Item to apply the change to the entire hierarchy.

   b. Click the KPI that contains the metric for which you want to configure scorecard. For example, click Completeness to configure the Required Fields scorecard.

   c. Select the scorecard tab of the metric to configure, such as Required Fields Scorecard. You might need to click New to edit the scorecards.

7. Slide the threshold sliders, or enter specific numbers to increase or to decrease the threshold bars to fit your definitions for best, at risk, and critical levels for the scorecard.

8. Click Save.

CMDB Health Dashboard for Helsinki | Overview

Configure CMDB groups scorecard thresholds

Each CMDB group can have its unique set of scorecard thresholds for best, at risk, and critical state definitions for specific KPIs or metrics.

Before you begin
Role required: itil_admin (on top of itil)

About this task
Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds:

- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, for all KPIs and metrics, upper thresholds are set to 67 and lower thresholds are set to 33. You can adjust scorecard thresholds for a specific CMDB group per KPI or metric, to reflect the range of failures that should be used in health reporting.
CMDB groups scorecard thresholds are stored in the [cmdb_health_scorecard_group_threshold] table.

Procedure

1. In the search box in the navigation bar, enter `cmdb_health_scorecard_group_threshold.list` and press the Enter key.
2. In the **CMDB Health Group Scorecard Thresholds** list, click **New**.
3. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper threshold</td>
<td>Upper range of percentage of CIs failing the specified metric tests, that is used to calculate best and at risk states.</td>
</tr>
<tr>
<td>CMDB Group</td>
<td>The CMDB group to which this scorecard threshold setting applies to.</td>
</tr>
<tr>
<td>Lower threshold</td>
<td>Lower range of percentage of CIs failing the specified metric tests, that is used to calculate at risk and critical states.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric to which the scorecard threshold setting applies to.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Related information

- **Configure CMDB Health scorecard thresholds**
- **Configure KPI and metrics aggregation preferences**

Metrics health scorecards are aggregated into their respective KPI, which in return are aggregated into the overall CMDB Health report. Set aggregation preferences for KPIs, and for each of their respective metrics, deactivate KPIs and metrics that you are not interested in reporting, and adjust weighted averages of aggregation.

Before you begin

To start collecting and reporting CMDB health KPIs and metrics, you must first enable and configure the CMDB health dashboard jobs.
Role required: itil_admin (on top of itil)

**About this task**
The completeness KPI for example, consists of the metrics *required fields* and *recommended fields*, each contributing a different weight to the sum. You can configure the proportional weight of required fields and recommended fields within completeness to be 25 and 75 respectively. You can also configure the proportional weight of completeness, compliance and correctness within the aggregated sum of the overall CMDB health.

⚠️ **Note:** Non-active KPI or metrics are displayed on the CMDB dashboard in faded coloring, displaying the most recent aggregations that were calculated when the KPI or metric was active.

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain.

In the ServiceNow base system, the weights of KPIs have default settings, and metrics are globally set.

**Procedure**
1. Navigate to **Configuration > Health Preferences**.
2. Select **Health Metrics** on the right-hand side navigator.
3. From the **Select Metric** list select one of the KPIs such as **Completeness**, or a metric.
   For **Completeness, Compliance** and **Correctness**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the KPI so it is included in the aggregated CMDB health report.</td>
</tr>
<tr>
<td>Weighted Averages</td>
<td>Specify the weight of each metric in the aggregated KPI health report. The sum of weighted averages of all metrics should be 100.</td>
</tr>
</tbody>
</table>

For a metric:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric so it is included in the aggregated health report for the respective KPI.</td>
</tr>
<tr>
<td>Create Task</td>
<td>If a record fails the metric test, create a task with details about the failure. You can then view the task on the CI dashboard, and configure remediation for the task.</td>
</tr>
<tr>
<td>Failure Threshold</td>
<td>When the threshold number of CIs that fail the health metric test is reached, health processing stops for the metric for this cycle.</td>
</tr>
<tr>
<td>Task Assignee Group</td>
<td>An assignment group for the task.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Related information**

CMDB Health Dashboard for Helsinki | Overview

**Set a CI attribute to be mandatory**

Configure a CI attribute as mandatory so it is included in the CMDB Health tests for the **required** metric if enabled. **Required** is a metric of the CMDB Health **completeness** KPI.

**Before you begin**

Role required: itil_admin

**About this task**

When a field is configured as mandatory, then if the **required** metric is enabled, the CMDB health tests check whether that field is populated or not. The CMDB dashboard displays the aggregated report of the percentage of CIs for which one or more required fields is empty.

**Procedure**

1. Navigate to Configuration > CI Class Manager.

2. Click **Hierarchy** to display the CI Classes list. Then select the class with the field that needs to be set as mandatory.
3. In the class navigation bar, expand **Class Info** and then select **Attributes**. In the Attributes view, click **Added**.

4. Locate the attribute that you want to set as mandatory, and then double-click its **Mandatory** value and set it to true. The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

**Note**: Mandatory fields are global. The field is marked as mandatory everywhere it appears on a form. Also, mandatory fields do not appear correctly when using Service Mapping tag-based discovery. For more information, see **Tag-based discovery in Service Mapping**.

**Related information**

- [CMDB Health Dashboard for Helsinki | Overview](#)
- [Make a field mandatory](#)

**Set a CI field to be recommended**

Define a list of CI fields as **recommended**, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness KPI to include recommended fields in its aggregated health reports.

**Before you begin**

Role required: itil has read access, itil_admin (on top of itil) has full access.

**About this task**

Use this for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis. Initially, a derived class is set with the recommended fields that are defined at the parent level. You can add or remove recommended fields for a derived class, setting it with its own recommended fields, without affecting the recommended fields at the parent or sibling levels. If all recommended fields for a derived class are removed, then the derived class automatically derives the recommended fields from its parent class.

For more information about child and parent classes, see **Table extension and classes**.
Procedure

1. Navigate to **Configuration > CI Class Manager**.

2. Click **Hierarchy** to display the CI Classes list. Then select the class that contains the fields that need to be set as recommended.

3. In the class navigation bar, expand **Health** and click **Completeness**. Then click **Recommended Fields**.

4. In the Recommended Fields tab, use the slushbucket to move the fields that you want to designate as recommended, from the **Available** list to the **Selected** list.

5. Click **Save**.

CMDB Health Dashboard for Helsinki | Overview

Create or edit a CMDB Health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health KPI, and weighed into the overall CMDB health report. Orphan rules are defined per class, and only a single orphan rule can be defined per class.

Before you begin

Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task

Specify the conditions that CIs must meet to be considered an orphan CI. Specify attributes that a CI must have, relationships that a CI should not have, or both. In the relationship conditions, you can either specify that the CI has no relationships, or a set of specific relationships that the CI doesn't have.

⚠️ Note: If there is a health inclusion rule for the orphan metric, then the conditions in the health inclusion rule and the conditions in the health orphan rule, shouldn’t be identical.

A health orphan rule can for example, identify a CI of the cmdb_ci_computer class as an orphan CI if the CI is not set with an owner or an asset.

Procedure

1. Navigate to **Configuration > CI Class Manager**.

2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an orphan rule.
3. In the class navigation bar, expand **Health**. Click **Correctness** and then click **Orphan Rule**.

4. Select a rule to edit if one exists, or click **New**. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>The class for which the orphan rule applies.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attribute conditions that a CI must satisfy to be considered an orphan CI. For example, the filter conditions in which both the <strong>Assigned to</strong> and the <strong>Owned by</strong> fields are empty, will identify the matching CIs as orphans.</td>
</tr>
<tr>
<td>Condition</td>
<td>And/Or operation between the <strong>Attributes</strong> conditions and the <strong>Relationship</strong> conditions.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship conditions that a CI must fail in order to be considered an orphan CI. To specify that a CI must have no relationships, choose <strong>Any Relation</strong> and <strong>Any Class</strong> respectively.</td>
</tr>
</tbody>
</table>

5. Click **Submit** or **Update** to save the rule.

**Related information**

CMDB Health Dashboard for Helsinki | Overview

Create or edit a CMDB Health staleness rule

If the staleness metric is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness KPI, and weighs into the overall CMDB health calculation. Staleness rules are defined per class.

**Before you begin**

Role required: itil has read access, itil_admin (on top of itil) has full access.
About this task
The Discovery setting of certain types of CIs as stale takes precedence over a CMDB Health staleness rule defined for the CI. For more information about Discovery marking CIs as stale, see Discovery for VMware vCenter.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a staleness rule.
3. In the class navigation bar, expand Health and then click Correctness. Click Staleness Rule.
4. Select a staleness rule to edit or click New, and then fill out the Staleness Rule form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>The class for which the rule applies.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test.</td>
</tr>
<tr>
<td></td>
<td>If the CI was not updated (based on Updated sys_updated_on) within the specified time period — the CI is determined to be stale.</td>
</tr>
<tr>
<td></td>
<td>If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x — the valid portion of the value is used ('15'). If the entire value is invalid — the value is ignored and the previous valid value is used.</td>
</tr>
</tbody>
</table>

5. Click Submit or Update to save the rule.

Related information
CMDB Health Dashboard for Helsinki | Overview

Create health inclusion rule
Filter the CIs that are included in health calculations and that appear in CMDB health dashboards by defining health inclusion rules. Health inclusion rules can be specified per domain.
Before you begin
Role required: itil has read access, itil_admin (on top of itil) has full access.

About this task
Evaluation for the required, orphan, recommended, duplicate and staleness health metrics, will apply only to CIs that satisfy health inclusion rules. For example, if you want scores of the duplicate metric to appear only for server and network CIs.

Note:
• Creating health inclusion rules at the level of the base cmdb_ci table can potentially filter out health results of all classes in CMDB health dashboards.
• Applying a health inclusion rule to the duplicate metric, is supported only in the global domain.

In addition to any health inclusion rules, identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs. The dashboard itself uses the identification engine (IRE) to identify duplicate CIs and therefore identification inclusion rules are applied.

Inheritance of health inclusion rules:
• If there are no health inclusion rules specified for a child class, then rules specified on a parent class are applied to the child class.
• If health inclusion rules are specified for a child class, then those rules take precedence over rules specified on a parent class.

In the base system, there are no predefined health inclusion rules, in which case all CIs are included in the CMDB Health calculations.

Procedure
1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a health inclusion rule.
3. In the class navigation bar, expand Health and then click Health Inclusion Rules.
4. Click an existing rule to edit or click New and then fill out the Health Inclusion Rules form.
### CMDB Health KPIs and metrics

The overall CMDB health score consists of three Key Performance Indicators (KPIs) which are correctness, compliance and completeness, each further consisting of sub-metrics. Each KPI and metric is associated with a scorecard that determines its contribution to the aggregated health at the overall CMDB level, class, and CI level.

You can configure which KPIs and metrics are included in the aggregated calculation, and set their weight in the aggregation. In the base system, all KPIs and all metrics are included in the aggregated health report.

#### Overall

An aggregation of all three KPIs (correctness, completeness and compliance), according to their overall scorecard weight settings.

#### Correctness

A KPI which is an aggregation of the following metrics, according to the correctness scorecard weight settings.

##### Orphan

Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:

- The CI satisfies the criteria in an orphan rule. This criteria checks for specific attributes that a CI must have, and for CIs that have no relationships or that don't have specific relationships.

- Data is missing for the CI in its respective table, or in one of its parents’ table.

##### Staleness

5. Click **Save** or **Update**.

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>Class this rules applies to.</td>
</tr>
<tr>
<td>Active record condition</td>
<td>Criteria that CIs must meet to be included in the evaluation for the specified health metrics.</td>
</tr>
<tr>
<td>Applies to metric</td>
<td>Metrics that the rule applies to.</td>
</tr>
</tbody>
</table>
Measures the percentage of stale CIs in the CMDB. A CI is stale if it was not updated within the Effective Duration time period that is specified in the staleness rule that applies to the class.

The base system includes a default staleness rule for the Configuration Item [cmdb_ci] class, which sets the Effective Duration time to 60 days. This rule applies to all extended CMDB classes, and can be overridden by class specific staleness rules defined by the user. To determine CI staleness, a staleness rule for the CI's class is used if it exists, otherwise, the default staleness rule is used.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

**Note:** Discovery marks VMware vCenter CIs that no longer physically exist, as stale. By default, this setting takes precedence over a CMDB Health staleness rule defined for the CI. When drilling-down in the CMDB dashboard to Health Results, the **Source** for CIs determined to be stale by Discovery, is **CLOUD_DISCOVERY**. Setting the glide.cmdb.health.src.cmdb_health_audit_only system property to true, ensures that the CMDB dashboard displays health results generated only by CMDB Health. For more information, see CMDB Health system properties and Discovery for VMware vCenter.

**Duplicate**

Measures the percentage of duplicate CIs in the CMDB using identification rules. Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

**Completeness**

A KPI which is an aggregation of the following metrics, according to the completeness scorecard weight settings.

**Required**

Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are specified as mandatory in the system dictionary.

**Recommended**
Measures the percentage of CIs in which fields that are set as recommended, are not populated. Out-of-box, no recommended fields are specified.

You can use the Add Identifier Fields In Recommended Rules scheduled job to set criterion attributes from active identification rules, as recommended fields. You can use the Remove Identifier Fields In Recommended Rules scheduled job to unset criterion attributes from active identification rules, as recommended fields.

Compliance
Based on the results of actual CMDB audit runs.

Audit
Audit compares actual values of specified fields, against expected values defined in template and scripted audits. Based on the Last run date of audits, CMDB Health identifies the set of the most recent complete audit run, and uses those audit results. To pass the CMDB Health audit test, a CI must be in compliance with all audits for that CI. Create a compliance-type audit, for which the results are calculated into the CMDB Health compliance KPI.

Relationships
Measures the health of CI relationships, consisting of the following metrics which are not-configurable:

**Duplicate relationships**
Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

**Orphan relationships**
A relationship that is missing either a parent CI, a child CI, or both.

**Stale relationships**
A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Also reports the following relationship-related summaries:
• Relations not compliant with suggested relations
• Relations not compliant with containment rules
• Relations not compliant with hosting rules

View CMDB health reports

The CMDB dashboard serves as a central location to view aggregated health reports for your CMDB at a glance which helps you understand the CMDB health status. Also, it provides functions to address health issues, and improve CMDB health.

The CMDB dashboard requires some configuration before it can display meaningful data. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the dashboard displays data that is automatically collected and calculated on a recurring schedule. The CMDB dashboard uses the Performance Analytics framework for dashboards and employs some of the capabilities it provides. The CMDB dashboard is domain aware.

Using the CMDB dashboard requires the asset or itil role, and if the system property `glide.cms.enable.responsive_grid_layout` exists, then its value must be true. For more information, see Enable responsive dashboards.

For information about sharing a responsive dashboard (Sharing), see Share a responsive dashboard.

ℹ️ Note: Only users with the itil role can view a CMDB dashboard which has been shared.
Access the CMDB dashboard by navigating to **Configuration > CMDB Dashboard > CMDB View**. On the CMDB dashboard:

- Click **CMDB Health Dashboard Jobs** to enable and manage the jobs that monitor and collect health data for CIs and CI relationships.
- Click the default **CMDB Dashboard - CMDB View** dashboard to list additional CMDB drill-in dashboards.

The CMDB dashboard has two viewing modes. Click **CI Health** or **Relationship Health** to toggle between them.

**CMDB Health view**

The CMDB Health view is the default view for the CMDB dashboard which contains:

- Scorecards detailing the overall health of CIs in your CMDB, per health KPI and metric
- Useful reports showing a breakdown of any duplicate, orphan, or stale CIs by class
- Widgets that list the top 10 incident, alert, and change generating CIs in the CMDB

<i>Note:</i> To improve performance, you can use the system property `glide.cmdb.health.src.top_10_cache_time_in_minutes` to extend browser caching time for those top 10 CIs widgets. The value is set to 30 (minutes) by default.

All the default widgets in the CI Class view can be filtered using the CMDB class hierarchy tree. Initially, the class hierarchy filter is set to the root class, **Configuration Item (All)**. Click **All** to select a different class, filtering all widgets on the dashboard to display data only for the selected class and its child classes.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the configuration of the metric scorecard, and its threshold.

Except for the Overall health scorecard, you can drill into any widget in the CI Class view:
• In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
• In a charts widget: Click a bar to display a list of all the records that the bar represents.
• In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

**Relationship Health view**
The Relationship Health view displays various scorecards for health indicators of CI relationships in your CMDB. It contains charts detailing any duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

Changing the CI Class selection while in the Relationship view has no effect on the data displayed in this view.

**Color codes**
Both, the CI class view and the relationship view, use color codes when displaying aggregated health status. The status definitions are based on each scorecard’s threshold limits that are defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

ℹ️ **Note:** The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries are 0%. Review the scorecard rules which might be ineffective, or the CMDB might be in an unstable state.

**Dashboard layout configuration**
The CMDB dashboard uses some of the capabilities that Performance Analytics provides for responsive dashboards. You can, for example, add or remove widgets from the layout.
For information about adding a widget (Add Widgets) and changing other layout settings such as adding a tab (Create Tab) to the dashboard, see Edit a dashboard. The drop-down that appears when adding a widget, includes CMDB-related widgets that are used in CMDB dashboards and other system widgets which are typically not relevant in CMDB reports.

**Domain separation**

If the Domain Support — Domain Extensions Installer plugin is activated, then the CMDB dashboard is domain aware:

- The CMDB dashboard aggregates and reports health failures and scores based on user’s domain visibility of CIs. If domain visibility lets a user see a CI, then the audit rule in that user’s domain applies to that CI, whether the CI is in the user’s domain or in a contained domain. If a CI fails health tests from different user domains, then separate failure records are created.

- Users can configure KPI and metric settings specific to the needs in their domain. So different domains can have different settings such as active/inactive, and thresholds.

- A child domain derives its immediate parent’s domain health configurations if the child domain does not configure its own. A child domain can override parent’s configurations by modifying them.

**Related information**

- CMDB Health Dashboard for Helsinki | Overview
- Working with responsive dashboards

**View services health reports**

The CMDB service dashboard serves as a central location to view aggregated health reports for services at a glance. Also, it lets you drill into a service to perform remediation actions that address health issues, and that improve CMDB health. The CMDB service dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

**Requirements**

- The Event Management and Service Mapping Core plugin must be activated.

- If the system property glide.cms.enable.responsive_grid_layout exists, then it needs to be set to true. For more information, see Enable responsive dashboards.

- Role required: asset or itil

Configuration

The CMDB service dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. The CMDB service dashboard uses the settings for the Business Service, Manual Service, and Technical Service classes. For each CI that is included in a service, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB service dashboard displays data that is automatically collected and calculated on a recurring schedule.

Note: The CMDB service dashboard doesn’t include all services from the Service [cmdb_ci_service] table. Only services from the cmdb_ci_service_auto table and its descendants (cmdb_ci_service_discovered, cmdb_ci_service_manual, cmdb_ci_query_based_service), are included.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB service dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Access

Access the CMDB service dashboard by navigating to Configuration > CMDB Dashboard > Service View.

Report details

The CMDB service dashboard displays aggregated health for services, and also details for individual services. For a specific service, the CMDB service dashboard displays aggregated health for all the CIs in that service, including the service CI itself. Also it provides useful reports about service classes such as the Business Service class. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per service and lists of the top 10 incident, alert, and change generating CIs in the service.

All default widgets can be filtered using the CMDB service hierarchy tree. Initially, the service hierarchy filter is set to Business Service. Click Business Service to expand it and to select a different class, filtering all widgets on the dashboard to display data only for the selected class, its child classes, or services of that class.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health
results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold. With the exception of the Overall health scorecard, you can drill into any widget in the service dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

**Color codes**

The CMDB service dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

**Related information**

- View CMDB health reports
- View CMDB groups health reports

**View CMDB groups health reports**

The CMDB group view dashboard serves as a central location to view aggregated health reports for CMDB groups at a glance. Also, it lets you drill into a CMDB group to perform remediation actions that address health issues, and that improve CMDB health. The CMDB group view dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.
Configuration

The CMDB group view dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. For each CI that is included in a CMDB group, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB group view dashboard displays data that is automatically collected and calculated on a recurring schedule.

If the system property `glide.cms.enable.responsive_grid_layout` exists, then it needs to be set to true. For more information, see Enable responsive dashboards.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB group view dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Role required: asset or itil

Access

Access the CMDB group view dashboard by navigating to Configuration > CMDB Dashboard > Group View. Then, select a CMDB group from the CMDB Health Group List drop-down list.

Report details

For each CMDB group, the CMDB group view dashboard displays aggregated health for all the CIs in that group. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per CMDB group. In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the CMDB group view dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a chart widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.
Color codes

The CMDB group view dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The 🔄 icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

View CI health

The CI dashboard is a central location displaying health report for an individual CI, history of changes to the CI in a timeline view, and the relation formatter. The CI dashboard also displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI. You can access the CI dashboard from a CI form, or from the CMDB dashboard.

Before you begin

Role required: asset or itil

About this task

The health scores are based on settings of CMDB Health KPIs and metrics. The report is calculated in real-time from data stored in health-related tables which the CMDB Dashboard jobs update on a recurring schedule. The completeness and correctness KPIs are always up to date, but for other KPIs, it is possible that updates to the CMDB are not reflected because one of the dashboard jobs hasn’t run yet, as follows:
• Compliance: Depends on audit cycles and on the 'CMDB Health Dashboard - Compliance Score Calculation' job.

• Relationships: Depends on the 'CMDB Health Dashboard - Correctness Score Calculation' job.

To ensure that the latest updates to these KPIs are reflected on the CI dashboard, navigate to the respective dashboard job, and click **Execute Now**.

**Procedure**

1. On a CI form click **Dashboard**.

2. Or, navigate to **CMDB Dashboard > CMDB Health** and click **CMDB Dashboard - All** to display the class hierarchy. Enter a search string and then select a CI from the **Configuration Items** group.

   The search results are grouped by **Classes** and **Configuration Items** that match the search string.

**Results**

Various widgets in the report display CI's health with the following color codes:

• Green: The CI passed the health test (for example, it is not a duplicate).

• Red: The CI failed the health test (for example, it is a duplicate)

• Grey: The CI was not tested for this metric, because the threshold was not set for the CI (class) in the CI module.

The report displays the change history for the CI in a timeline format, that you can zoom in or out to select a time period for which to display details for. Use the related lists tabs **Change**, **Incident**, **Task**, **Business Services**, and **Alerts** to further drill into additional details.
Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI dashboard in these situations, are described below:

**Duplicate**

- If no identification rules ([cmdb_identifier]) are defined for the CI's class or its ancestors: A notification to that effect appears.
- If only dependent identification rules are defined: **Not applicable** notification appears.

**Orphan**

- If the CI is excluded by health inclusion rules: **Not applicable** notification appears.
- If no orphan rules ([cmdb_health_orphan_rule]) are defined for the CI's class or its ancestors: A notification about missing a rule appears.

**Staleness**

- If the CI is excluded by health inclusion rules: **Not applicable** notification appears.
- If no staleness rules ([cmdb_health_staleness_rule]) are defined for the CI's class or its ancestors: A notification about missing a rule appears.

**Audit**

- If no audits ([cert_audit]) are defined for the CI (CI dashboard checks only desired states and scripted audits): **Not applicable** notification appears.
- If there are audits defined for the CI but the audits did not run: **Not applicable** notification appears.

**Related information**

- Enable and configure a CMDB Health Dashboard job
- Timeline of CI changes
- CI relations formatter
Customize the CI dashboard
You can add, remove or re-arrange content on the CI dashboard to display the CI health statistics that are important to you.

Role required: itil_admin

On a CI form click Dashboard and customize the CI dashboard as follows:

• Drag a tile near its upper edge and drag it to a different location on the dashboard to rearrange the current layout.
• Click the X in the upper right side of a widget to hide the widget.
• Click the + sign in the upper left corner of the dashboard to add content. In the Add content dialog box, select the content to add and the location to place it.
• Click the gear icon in a widget tile to edit widget settings such as title and height.
• Click Reset to Default to revert to the base system settings.

View CI relationships health
View aggregated orphan, stale, and duplicate CI relationships in the CMDB dashboard. You can configure the relationship scorecards, but you cannot configure the underlying relationship KPI health tests.

Before you begin
The CMDB Health Dashboard - Relationship Compliance Processor dashboard job must run to generate data for these reports.

Role required: itil or asset

About this task
CMDB Health measures CI relationship health using a separate KPI and metrics.

Orphan relationship
A relationship that is missing parent, child, or relationship type.

Duplicate relationship
Relationships that have identical parent, child, and relationship type.

Stale relationship
A relationship in which one of the CIs is stale. For a stale CI — its associated relationships are also stale.

In addition, the following relationship compliance reports are available:

Relationships not compliant with all relationship rules
Relationships that do not comply with any relationship governance rule, including suggested relationships and dependent relationship rules.

**Relationships not compliant with suggested relationships**

Suggested CI relationships are used as rules to test if relationships comply with specified suggested relationships.

**Relationships not compliant with containment rules**

Containment rules are used to test if relationships comply with specified containment relationships.

**Relationships not compliant with hosting rules**

Hosting rules are used to test if relationships comply with specified hosting relationships.

For each of the compliance reports, testing a relationship requires a rule (suggested relationship, hosting rule, or containment rule) in which the parent and child CI classes match the parent and child CI classes in the tested relationship. If the relationship types in the rule and in the tested relationship do not match, then the relationship is not in compliance. If an applicable rule is not found, then the relationship is considered to be in compliance. Rules apply to the classes specified in the rule, and also to descendant classes. Therefore, when testing a relationship, rules that apply to ascendant parents of the CIs in the tested relationship are used. If there are multiple rules that match the parent and the child CI classes of the tested relationship, then the tested relationship needs to satisfy only one of these rules to be in compliance.

**Procedure**

1. Navigate to Configuration > CMDB Dashboard > CMDB View.
2. Select the Relationship Health tab.
3. Scroll to the bottom of the page to examine the relationship compliance reports.
   
   Report results are grouped by relationship type, and you can drill down for further details:
   
   - Point to a relationship type to display its label and the % of relationships that are not in compliance.
   - Click on a relationship type to drill down to a detailed list of all the relations of that type that are not compliant. Click on a specific relationship to display more details such as the failure description. The Failure Description field lists only a single rule that the relationship did not comply with, even if there are additional rules that the relationship fails to comply with.
Related information
Enable and configure a CMDB Health Dashboard job

Create CMDB remediation rule
A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

Before you begin
You need to first create and publish a remediation workflow that addresses the CI issue. The workflow can be a regular workflow, or an Orchestration workflow, and the table in the workflow needs to match the task type in the remediation rule. Do not configure the workflow with any filter conditions by setting If condition matches to None, so that the filters of the CMDB remediation rule will apply.

Role required: itil_admin (on top of itil)

Procedure
1. Navigate to Configuration > CMDB Remediations.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Remediation name.</td>
</tr>
<tr>
<td>Task type</td>
<td>Type of CMDB health-related tasks to apply the remediation to.</td>
</tr>
<tr>
<td>Task filter</td>
<td>Filters tasks to apply remediation to. Also applies dot-walking on CI fields so that remediation is applied to tasks associated with matching CIs.</td>
</tr>
<tr>
<td>Execution</td>
<td>• Manual: Remediation is applied manually.</td>
</tr>
<tr>
<td></td>
<td>• Automatic: The workflow is applied once, upon the creation of a task that matches the Task type and Task filter.</td>
</tr>
<tr>
<td>Active</td>
<td>Allowing the workflow to run.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow</td>
<td>The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the Execution setting. You can click the Lookup using list icon, and then click New to create a new workflow.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

Results

If **Execution** is set to Automatic, then the business rule **Run remediations for CMDBHealth task** applies the remediation workflow to CIs that match the Task filter. If **Execution** is set to Manual, then you can manually apply the remediation workflow defined in the rule.

Related information

**Dot-Walking**

**Apply CMDB remediation**

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

**Before you begin**

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which **Execution** is set to **Manual**.

Role required: itil_admin

**About this task**

Except for the duplicate and audit health metrics, you can choose to create tasks for health test failures for a metric. To remediate failures of the duplicate metric, use de-duplication tasks.

For all metrics except for audit, each CI that failed a metric test is associated with a single task. Because a CI can fail multiple audits, a single CI can be associated with multiple audit tasks. The first of those tasks is in the Task field, and any additional tasks are in the Additional Tasks field. To remediate failures of the audit metric, refer to the audit tasks for the audits that the CI failed.
Procedure

1. Navigate to Configuration > CMDB Dashboard, and then click CMDB View, Service View, or Group View.

2. Click on one of the bars in a bar chart on the page. Or, click on a metric tile that is associated with the remediation that you want to apply, and then in a detailed report click on a bar in a bar chart. For example, to remediate an orphan CI, click the Completeness tile.

3. In the Task column in the CMDB Health Results list, select the task that is associated with the CI that you want to remediate. Point to the information icon ( ) for a result record to display the CMDB Health Results dialog box with more details about the health test. The CMDB Health Results list contains records only for the CIs that failed a metric test.

<table>
<thead>
<tr>
<th>Field</th>
<th>Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI</td>
<td>The CI associated with the test results.</td>
</tr>
<tr>
<td>Class Name</td>
<td>The CI’s class.</td>
</tr>
<tr>
<td>Description</td>
<td>Details about the reasons for the CI failing the metric test.</td>
</tr>
<tr>
<td>Last Evaluated On</td>
<td>Time that the CI was evaluated for the metric, and which resulted in failure.</td>
</tr>
<tr>
<td>Metric</td>
<td>The CMDB Health metric associated with this test result.</td>
</tr>
<tr>
<td>Source</td>
<td>Source of the health test failure:</td>
</tr>
<tr>
<td></td>
<td>• CMDB Health Audit: Corresponds to the dashboard</td>
</tr>
<tr>
<td></td>
<td>• Cloud discovery</td>
</tr>
<tr>
<td>Task</td>
<td>The task associated with the health test failure. For the audit metric, if there are multiple failures, then only the first task is listed.</td>
</tr>
<tr>
<td>Additional Tasks</td>
<td>If there are multiple tasks related to the audit metric, contains all tasks</td>
</tr>
<tr>
<td>Field</td>
<td>Column</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>other than the first which is in the Task field.</td>
</tr>
<tr>
<td>Active</td>
<td>Used internally in combination with the To Delete field to determine the correct results set that this failure belongs to.</td>
</tr>
<tr>
<td>To Delete</td>
<td>Used internally in combination with the Active field to determine the correct results set that this failure belongs to.</td>
</tr>
</tbody>
</table>

4. On the task form, click **Remediate**.

5. In the **Run Remediations** dialog box, select the remediation rule that you want to apply.
   The list of remediation rules is based on the type of health metric (such as orphan, stale), and on the filter defined in the rule.

6. Click **Execute**.

**Related information**

</tbody>
</table>
CMDB Health process tracking
Use the following information to track and resolve issues with the CMDB Health processes.

Logging
By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of 'info' and 'warning' messages (which are typically logged at the start and end of each processing cycle), update the system property glide.cmdb.logger.use_syslog.CMDBHealth. For information about using this property, see CMDB Health system properties.

Processing status
If scheduled jobs are enabled, but data is not displaying on the CMDB dashboard, you can check the processing status in the CMDB Health Metric Status [cmdb_health_metric_status] table. Depending on the status of the inactive metric, decide how to proceed.
Initially, the state of all metrics is 'In Progress'.
Possible final states of a metric:

  **Complete**
  All classes are processed and the number of failures is under the maximum failures threshold.

  **Max Failures**
  The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.

  **Daily Time Out Pause**
  The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a KPI depends on the final state of its associated metrics. Possible final state of a KPI:

  **Complete**
  All associated metrics are in Complete state and score calculation is complete.

  **Incomplete**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[cmdb_health_result_rel_all]</td>
<td></td>
</tr>
</tbody>
</table>
Score is not calculated because one of the associated metrics reached its maximum failure thresholds.

**Daily Time Out Pause**

Timed out because one of the associated metrics has reached its processing time limit.

**Processing time**

If processing of a metric times out, you can find out which class takes too long to process. Use this information to find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table [cmdb_health_processor_status]. Status for classes that have been processed for a metric is **Complete**, and for classes that are yet to be processed is **Draft**. By looking at the update time for each class, you can calculate the length of processing time for each class.

**Orphan records due to broken hierarchy**

Orphan rules might detect an orphan CI, which you are not able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. These findings are due to records being deleted in the database from only one table in the CMDB hierarchy.

These CI records are not accessible via GlideRecord and must be deleted directly from the database. Therefore, in this case, to delete an orphan CI from the database you must get help from Customer Service and Support.

Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message "This cmdb_ci_linux_server CI [91054fc24f22520053d6e1d18110c713] is missing record in cmdb_ci_computer table" means that a record of that sys_id must be deleted from the CMDB, cmdb_ci, cmdb_ci_hardware, cmdb_ci_server, and the cmdb_ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

**Scripted audits Skipped**

An error message is logged if the results from a scripted audit are not included in the compliance KPI. The reason can be that the script in the audit was not updated to populate its **Last ran date** field. Without a **Last ran date** value, CMDB Health is unable to identify these run results as part of a recent complete audit run, and skips those results.
CMDB Health process status: failure threshold reached

The CMDB dashboard displays the string ‘failure threshold reached’ when the number of CIs that are failing the metric tests, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status [cmdb_health_metric_status] table is set to Max Failures for this metric.

When the health score of a metric cannot be evaluated, then the processing status of the respective KPI (for example, correctness) is set to Incomplete. The CMDB dashboard displays the string Incomplete score for the respective KPI and for the CMDB Health overall score. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

Review and adjust the following definitions as needed:

- Review and refine the rules defined for the metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it. For Example:
  - Completeness – Review the recommended fields that are causing failures and remove the ones that are not critical for the health score. For more information see Set a CI field to be recommended.
  - Correctness – For the staleness metric, depending on the cause of the failures it might be helpful to increase the value of the glide.cmdb.health.staleness CMDB Health system property.

- Reduce the number of failures by fixing CI records: If after adjusting the metric test rules the max failures for some metrics is still reached, then address the failures by updating CI records with the relevant missing information.

- Increase the failure threshold for the metric that is failing and check if processing for this metric completes successfully in the next cycle. Increasing the failure threshold beyond 500K might reduce overall performance.

CMDB Health process status: incomplete score

The CMDB dashboard displays the string 'incomplete score' for a metric when it fails to calculate the score for the metric.

'incomplete score' is displayed when:

- The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to 'incomplete' in the CMDB Health Metric Status [cmdb_health_metric_status] table. Processing for the failing metric in the current cycle stops, and therefore there are no
aggregated health scores for the sub-metric, the parent parent metric, or the overall CMDB Health.

To remediate, you need to resolve the underlying cause of CIs failing the sub-metric tests. See CMDB Health process status: failure threshold reached for more information about resolving the failures of the sub-metric.

• An error is encountered while processing the sub-metric.

To remediate, examine the system logs system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

Duplicate CIs

When the instance encounters duplicate CIs during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review and remediation.

De-Duplication tasks

De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate.

From a de-duplication task, you can run the Duplicate CI Remediator wizard to reconcile a set of duplicate CIs into a single CI, eliminating the duplication.

Duplicate CI Remediator

The Duplicate CI Remediator is a wizard-like tool that you can use to reconcile a set of duplicate CIs associated with a de-duplication task. You can choose one of the duplicate CIs to retain as an active CI, and then decide how to process the rest of the duplicate CIs. The Duplicate CI Remediator lets you set reconciliation options for attributes, relationships, and related items.

For information about using the Duplicate CI Remediator, see Remediate a de-duplication task.

Properties that affect processing of duplicate CIs

During CMDB Identification, processing of sets of duplicate CIs is determined by:

• Property glide.identification_engine.skip_duplicates (true by default).
• Property glide.identification_engine.skip_duplicates.threshold (5 by default).
• Number of duplicate CIs in a set.

For information about how these properties affect the management of duplicate CIs, see Detecting duplicate CIs.
Master CI

The master CI plays an important role in the remediation of duplicate CIs. The master CI is a single CI from a set of duplicate CIs, that remains active while the rest of the duplicate CIs in the set are potentially retired, deleted, or reconciled into the master CI. Using the Duplicate CI Remediator, you can select a master CI for a set of duplicate CIs associated with a de-duplication task.

The `duplicate_of` attribute in duplicate CIs, is used to store a reference to the master CI. For duplicate CIs which existed in an instance that was upgraded to the New York release or later, the master CI is unknown. After upgrade, `duplicate_of` for those duplicate CIs is set to 'Unknown', indicating that the CI is a duplicate but the master CI is unknown.

Duplicate CIs set

Before remediation, the CIs in a duplicate CIs set are all duplicates of each other. After remediation, a set of duplicate CIs consists of one master CI, and any number of CIs, each considered a duplicate of the master CI. The `duplicate_of` attribute of the master CI is empty. The `duplicate_of` attribute for all the rest of the duplicate CIs in the set, is a reference to the master CI of the set.

If you attempt to modify the value of `duplicate_of` directly on a CI form or by using a script, the following restrictions are enforced to ensure data integrity:

- A CI cannot be its own master CI (you cannot set a CI as a duplicate of itself).
- A CI and its master CI cannot be from different domains.
- The `duplicate_of` attribute of the master CI cannot reference any CI as its master CI (you cannot set a CI as a duplicate of another duplicate CI to create a chain of duplicate CIs).

If you attempt to set a CI as a duplicate of another duplicate CI, then the CI is set as a duplicate of the master CI of the duplicate CI you are trying to set. If the master CI of the duplicate CI you are trying to set is 'Unknown', the operation fails.

Example: Attempt to set a CI as duplicate of another duplicate CI

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: <code>duplicate_of</code> = empty</td>
<td>CI1: <code>duplicate_of = CI2</code></td>
<td>CI1: <code>duplicate_of = CI3</code></td>
</tr>
<tr>
<td>CI2: <code>duplicate_of</code> = CI3</td>
<td></td>
<td>CI2: <code>duplicate_of = CI3</code></td>
</tr>
<tr>
<td>CI3: Master CI</td>
<td></td>
<td>CI3: Master CI</td>
</tr>
</tbody>
</table>

If CI2 is a duplicate of 'Unknown', the operation fails.

- If a master CI becomes a duplicate of another CI, then it can no longer be a master CI. All CIs that were duplicates of that master CI are set as duplicates of the new master CI.

**Example: Attempt to set a master CI as duplicate of another CI**

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: duplicate_of = CI4</td>
<td>CI4: duplicate_of = CI5</td>
<td>CI1: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI2: duplicate_of = CI4</td>
<td></td>
<td>CI2: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI3: duplicate_of = CI4</td>
<td></td>
<td>CI3: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI4: Master CI</td>
<td></td>
<td>CI4: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI5: duplicate_of = empty</td>
<td></td>
<td>CI5: Master CI</td>
</tr>
</tbody>
</table>

- If a master CI becomes a duplicate of a CI within the same duplicate CI set, then the selected duplicate becomes the master CI in the duplicate CI set. The rest of the duplicate CIs in the set are set as duplicates of the new master CI.

**Example: Attempt to set a master CI as duplicate of a CI within the duplicate CIs set**

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: duplicate_of = CI4</td>
<td>CI4: duplicate_of = CI1</td>
<td>CI1: Master CI</td>
</tr>
<tr>
<td>CI2: duplicate_of = CI4</td>
<td></td>
<td>CI2: duplicate_of = CI1</td>
</tr>
<tr>
<td>CI3: duplicate_of = CI4</td>
<td></td>
<td>CI3: duplicate_of = CI1</td>
</tr>
<tr>
<td>CI4: Master CI</td>
<td></td>
<td>CI4: duplicate_of = CI1</td>
</tr>
</tbody>
</table>

- You cannot delete a CI that is the master CI of duplicate CIs. To delete a master CI, you must first disassociate that master CI with all of its duplicate CIs. Either delete all duplicate CIs that are associated with that master CI, or remove the reference to that master CI from all `duplicate_of` attributes in any duplicate CIs that have it.

**Review de-duplication tasks**

Review details of de-duplication tasks, and then potentially remediate a de-duplication task.
About this task
Role required: itil to view and itil_admin to remediate a de-duplication task.

If a duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

Procedure
1. Navigate to Configuration > Identification/Reconciliation > De-duplication Tasks.
2. Select a task.

Remediate Duplicate Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique task number.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Person who is responsible for resolving the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description for the task.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Details describing how the CI was identified as a duplicate.</td>
</tr>
<tr>
<td></td>
<td>☀ Note: Not available in de-duplication tasks that were created prior to the London release. The field also contains user notes about the decisions and steps of resolving the task.</td>
</tr>
<tr>
<td>Priority</td>
<td>Task priority.</td>
</tr>
<tr>
<td>State</td>
<td>State of the de-duplication task as it progresses through resolution.</td>
</tr>
</tbody>
</table>

3. In the related lists section, click the Duplicate Audit Results tab to see the list of duplicate CIs in this task. You can click a CI to display more CI details.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate CI</td>
<td>Reference to the duplicate CI.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field is a document ID type, which means that it can reference any record on any table. If the referenced CI is deleted as part of resolving duplicate tasks, then this field is empty.</td>
</tr>
<tr>
<td>Relationship</td>
<td>For a duplicate CI that is a dependent CI, this field shows the relationship between the duplicate CI and depend on CI.</td>
</tr>
<tr>
<td>Depend on CI</td>
<td>If the duplicate CI is a dependent CI, then this field displays the depend on CI.</td>
</tr>
<tr>
<td>Discovery source</td>
<td>Discovery method used for the CI.</td>
</tr>
</tbody>
</table>

**What to do next**
Analyze de-duplication tasks to determine which CIs should remain active and which of the duplicate CIs in the Duplicate Audit Results lists are stale or incorrect. Click **Remediate** to remediate a de-duplication task (requires the itil_admin role).

**Related information**
- Relation qualifier
- Document ID field

**Manually create a de-duplication task**
Manually create a de-duplication task when it cannot be automatically created. You can then use the Duplication CI Remediator to remediate the manually created task.

In some situations, duplicate CIs are not automatically detected and de-duplication tasks are not automatically generated. Such situation happens with a class for which identification rules are not defined and the identification engine cannot be applied. However, you still want to reconcile these duplicate CIs by utilizing the Duplicate CI Remediator.

Use the **CMDBDuplicateTaskUtils** API to manually create a de-duplication task in which all duplicate CIs are specified. The de-duplication tasks that you create manually and the automatically created tasks, are stored in the same table ([reconcile_duplicate_task]) and are processed in the same manner.

**Note:** You can manually create a de-duplication task only for CMDB CIs and a CI can be specified as a duplicate CI only in a single de-duplication task.
Remediate a de-duplication task

Remediate a de-duplication task by using the Duplicate CI Remediator wizard. Use the wizard to guide you through the duplicate CI reconciliation process or to apply a custom workflow.

Before you begin

Important concepts associated with the Duplicate CI Remediator:

**Master CI**

The master CI is one of the duplicate CIs that you want to retain as an active CI while potentially retiring or deleting the rest of the duplicate CIs. The first step in the Duplicate CI Remediator is to select a master CI for the remediation process. The Duplicate CI Remediator lets you choose which attribute values, relationships, and related items from the duplicate CIs to reconcile into the master CI. Alternatively, you can choose not to consolidate any data and retain the master CI as it is.

**Default related items list**

A list of related items that is used globally in the Duplicate CI Remediator for all de-duplication tasks. All items from the default related items list are selected by default to be merged to the master CI, on the **Merge Relationships and Related Items** tab. Adding or removing items from that slushbucket does not affect the default related items list. See **Manage default related items list** for more information.

ℹ️ **Note:** Asset related tables are not included in the default related items list and therefore they are not available for merge.

Review **Properties for duplicate CIs** for information about important properties that affect how the Duplicate CI Remediator operates. Including the glide.duplicate_ci_remediator.dry_run property that determines if the Duplicate CI Remediator actually updates the CMDB or not.

Role required: itil user to read and itil_admin to write

**About this task**

As you progress through the tabs of the Duplicate CI Remediator, CIs are not updated. All updates are applied only in the final step, after you click **Remediate**.
Note:

• Merging of attributes and related items that are associated with assets is not supported in the Duplicate CI Remediator.

• The Duplicate CI Remediator behaves differently in remediations that involve a large number of duplicate CIs or where the duplicates are serial numbers. For information about those special cases, see the 'Special remediation scenarios' section at the bottom.

Procedure

1. Navigate to Configuration > Identification/Reconciliation > De-duplication Tasks.

2. Open the de-duplication task that you want to remediate. On the task form, click Remediate.

3. In the RemEDIATE dialog box, select either of the following options:

• **Use the Duplicate CI Remediator (Recommended):** Use the wizard to consolidate duplicate CIs according to your configurations and settings. Follow the Duplicate CI Remediator tabs to configure the reconciliation.

• **Use a custom remediation workflow:** Use an existing CMDB remediation rule or select Add New to create a new one.
  
  ◦ On the CMDB Remediation Rule form, set Task type to Remediate Duplicate Task and select Active.
  
  ◦ On the Workflow form, set Table to Remediate Duplicate Task [reconcile_duplicate_task] and If condition matches to None.
  
  ◦ Ensure that the associated workflow remediates duplicate CIs. In the Remediate dialog box, click Next to start the workflow and to exit the Duplicate CI Remediator. The RemEDIATE Duplicate Task form appears, where you can update the State of the task.

4. On the Select Master CI tab in the Duplicate CI Remediator:

   a. Select the master CI for this reconciliation using either of the following lists of duplicate CIs. For any CI, you can click the Name link to display the CI’s attributes, or click the Related Items link to display the number of related items.

   • **Recommended:** A subset of the All list, containing only system recommended master CIs. System recommendations are based on checking the duplicate CIs for the following criteria:
     
     ◦ CI with most related items.
     
     ◦ CI with most relationships.
- Newest discovered CI.
- Newest updated CI.
- Oldest created CI.
- Previous master CI, if one was previously selected.

- **All**: All duplicate CIs for the de-duplication task.

Either option lets you review a summary of the remediation settings before starting the remediation.

**b.** Select one of the following options to choose whether to consolidate any attribute values, relationships, or related items from any of the duplicate CIs into the master CI:

- **Remediate Manually**: Lets you specify which attribute values, relationships, and related items from duplicate CIs to consolidate into the master CI.
- **Use Master CI**: Retains master CI attribute values, merges relationships, and merges only the default related items.

Skip to step number 7 as this selection skips all configurations other than choosing the action for the duplicate CIs on the **Determine Duplicate CI Actions** page.

**5.** On the **Merge Attribute Values** tab review inconsistent values of each attribute. For each attribute, choose to retain the master CI’s value, or choose a value from a duplicate CI for the master CI to be set with. Then click **Next**.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Attribute for which there are different values.</td>
</tr>
<tr>
<td>Master CI Value</td>
<td>Attribute value in the master CI.</td>
</tr>
<tr>
<td>Other Values</td>
<td>The number of unique Attribute values within the duplicate CIs.</td>
</tr>
</tbody>
</table>

To override the master CI attribute value with a duplicate CI value:

**a.** Click the **Other Values** link.

**b.** In the attribute dialog box, click **Unique Values** to display only unique attribute values, or **All** to display all attribute values including identical values.
c. Select a value for the master CI **Attribute** to be set with. You can click **Reset to Original** to undo the selection of a different attribute value for the master CI.

d. Click **Select**.
